APPENDIX F

City of Everett Sewer Discharge Authorization

November 16, 2021

Mr. Neil Robins
Clear Water Services
2525 W. Casino Rd, Suite 7A,B
Everett, WA 98204

Dear Mr. Robins,

On November 11th, 1 sample was received by our laboratory and assigned our laboratory project number EV21110067. The project was identified as your WAI21POENT. The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Glen Perry
Laboratory Director

EVERETT
WASHINGTON

September 16, 2021

Taylor Lenderman
Strider Construction
4721 Northwest Dr
Bellingham WA 98226

Subject: Discharge Authorization No. MD-41-2021
2600 Federal Avenue, Everett WA 98201
Expires: September 30, 2022

Dear Mr. Lenderman:

Strider Construction, is hereby authorized to discharge site related water from site remediation. Discharge will be allowed for the permit duration. The discharge will be allowed upon the City's receipt of the signed acceptance of this letter and with the proper notification to the City that the work will proceed. No other water sources are allowed to be discharged under this authorization, other than what is listed above.

This authorization is based on the information you provided; we understand that this work is an ongoing. Discharge will be allowed based on compliance with the conditions of this authorization.

The point of discharge will be within the city's sewer collection system as directed by your City representative.

You will be billed for the amount discharged to the city sewers based on the total flow. Your sewer bill will be invoiced monthly and will be calculated on our current sewer rate (currently $8.176 per 100 cubic feet) plus the industrial surcharge of $0.19 per thousand gallons of flow.

You must meter and track the amount discharged to the city sewers. You must also know the approximate flow rate at all times, as we will need to know especially during wet weather

This Discharge Authorization is issued with the following conditions:

1) You must comply with the general use and discharge requirements of the Industrial Pretreatment Ordinance #3070-08 as amended (attached), as well as any applicable Federal and State regulations.

2) The City solely reserves the right to modify, suspend, or terminate this authorization at any time once issued.

3) Your City representative and point of contact for discharge is Brian Doolan at 425-257-8828 (cell at 425-501-5124) or bdoolan@everettwa.gov. You need to notify Brian prior to discharge and when your project is completed. You must also report monthly flows to Brian.

Public Works

3200 Cedar Street
Everett, WA 98201

425.257.8800
425.257.8882 fax

everettpw@everettwa.gov
everettwa.gov/pw

4) Discharge can only occur during non-rain impacted flow periods. Your point of contact will receive notification to immediately stop discharging within 30 minutes.

5) The point of discharge shall be as directed by the City's project representative and limited to a flow of 200 gallons per minute or less. Higher rates must be first approved by Brian Doolan and be for limited durations.

6) Discharge will only be for water related to construction at the specific location identified in the DA application. Other sources must be pre-approved.

7) All flow shall be routed through a system to remove any free floatables and settleable solids or be free of floatable and settleable solids. Strider Construction will monitor and prevent that there are no floatable and settleable solids in discharge and shall use an onsite storage tank for pre-settlement needs related to high sediment or turbidity prior to discharge to the City's sewers. The City will inspect the tank and volume prior to discharge; with the ability and permission to inspect during the work as needed. Contact Brian for inspection of the tank at least a working day prior to your discharge request.

8) At any time, the City can direct the point of discharge to an alternative location that best suits the City.

9) Discharge operations shall comply with the City's Noise Ordinance.

10) Strider Construction is solely responsible for spills of any kind related to the discharge operations, including reporting to Department of Ecology, clean-up, and any repairs or restoration, and costs for City to oversee and respond. The City must be notified immediately of any spill.

11) City of Everett personnel may take samples of the effluent for analysis and may inspect your site to verify compliance at any time.

12) Maximum rate of flow shall not cause capacity problems in the receiving sewer or at any point downstream of the discharge; the City may modify the flow rate at any time.

13) The discharge is subject to these limits:

As	0.5	mg/L
Cd	0.24	mg/L
Cr	5.0	mg/L
Cu	3.0	mg/L
Pb	1.9	mg/L
Hg	0.1	mg/L
Ni	2.83	mg/L
Ag	0.49	mg/L
Zn	4.0	mg/L
CN-	0.65	mg/L
Nonpolar FOG	200	mg/L

Should lab samples indicate higher than allowed discharge limits, then a treatment plan to bring the discharge below the allowable limits will be required.

All discharge data from the site shall be reported. The total amount of flow to the sanitary sewer shall be reported at the completion of the discharge along with the data required. Please send reports to the following:

Brian Doolan
M & O Supervisor
City of Everett
3200 Cedar Street
Everett, WA 98201

14) The City reserves the right to bill Strider Construction fees for city work beyond our normal site monitoring for sewer related regulatory compliance or for overseeing this discharge authorization.

15) Strider Construction must install a meter to monitor the flow rate of discharge and report the monthly volumes to Brian Doolan. Brian must inspect and approve the meter installation prior to discharge. The meter shall not be removed or replaced without notifying the City first. Strider Construction will not exceed 200 gallons per minute and must keep a log for the discharge volumes noted. The log and amount of flow must be submitted to Brian at the end of the project.

Please contact me at 425 257-8828 (bdoolan@everettwa.gov) if you have any questions.

Sincerely,

Brian Doolan, PE
Maintenance & Operations Supervisor

Archaeological Monitoring Report

Cultural Resource Consultants

TECHNICAL MEMO 2110B-1

DATE: November 18, 2022

TO: Nathan Watson
KPFF

FROM: Margaret Berger, Principal Investigator

RE: Archaeological Monitoring Report for the Norton Terminal Development & MTCA 3rd Interim Action, Everett, Snohomish County, Washington

The attached form contains our final report for the above referenced project. Archaeological monitoring of project ground disturbance did not result in the identification of any archaeological resources. No additional cultural resources investigation is recommended at this time. Please contact our office if you have any questions about our findings and/or recommendations.

Management Summary

This report describes the archaeological monitoring report for the Norton Terminal Development & Model Toxics Control Act (MTCA) 3rd Interim Action project in Everett, Snohomish County, Washington. On behalf of Port of Everett, KPFF contracted Cultural Resource Consultants (CRC) to provide archaeological monitoring during ground disturbing activities with potential to exceed the depth of existing fill in compliance with Section 106 of the National Historic Preservation Act (NHPA) and Washington's State Environmental Policy Act (SEPA). Further, the work was funded in part by Washington State Department of Ecology through an Oversight Remedial Action Grant. As a result, the work was done in compliance with Governor Inslee's Executive Order 21-02 (formerly 05-05). Archaeological monitoring conducted by CRC on 34 days from October 2021 to August 2022 did not result in the identification of any archaeological resources. Project activities requiring archaeological monitoring are complete. No additional cultural resources investigation is recommended at this time.

1.0 Administrative Data

1.1 Overview

Report Title: Archaeological Monitoring Report for the Norton Terminal Development & MTCA 3rd Interim Action, Everett, Snohomish County, Washington

Author (s): Margaret Berger

Report Date: November 18, 2022

Location: This physical address for the project is 2600 Federal Ave E, Everett, WA 98201.

Legal Description: The legal description for the project is Section 19 of Township 29 North, Range 05 East, W.M. This project is located on Snohomish County Tax Parcels 29051900300100, 29051900300200, 29051900200900, 29051900201500, 29051900201000, 29051900201100, 00437461700200, 00597761803000, 00597761800600, and 00597761801000.

USGS 7.5' Topographic Map(s): Everett, WA (Figure 1).

Total Area Involved: Approximately 33 acres.

Regulatory Nexus/#: Section 106 of NHPA; SEPA.

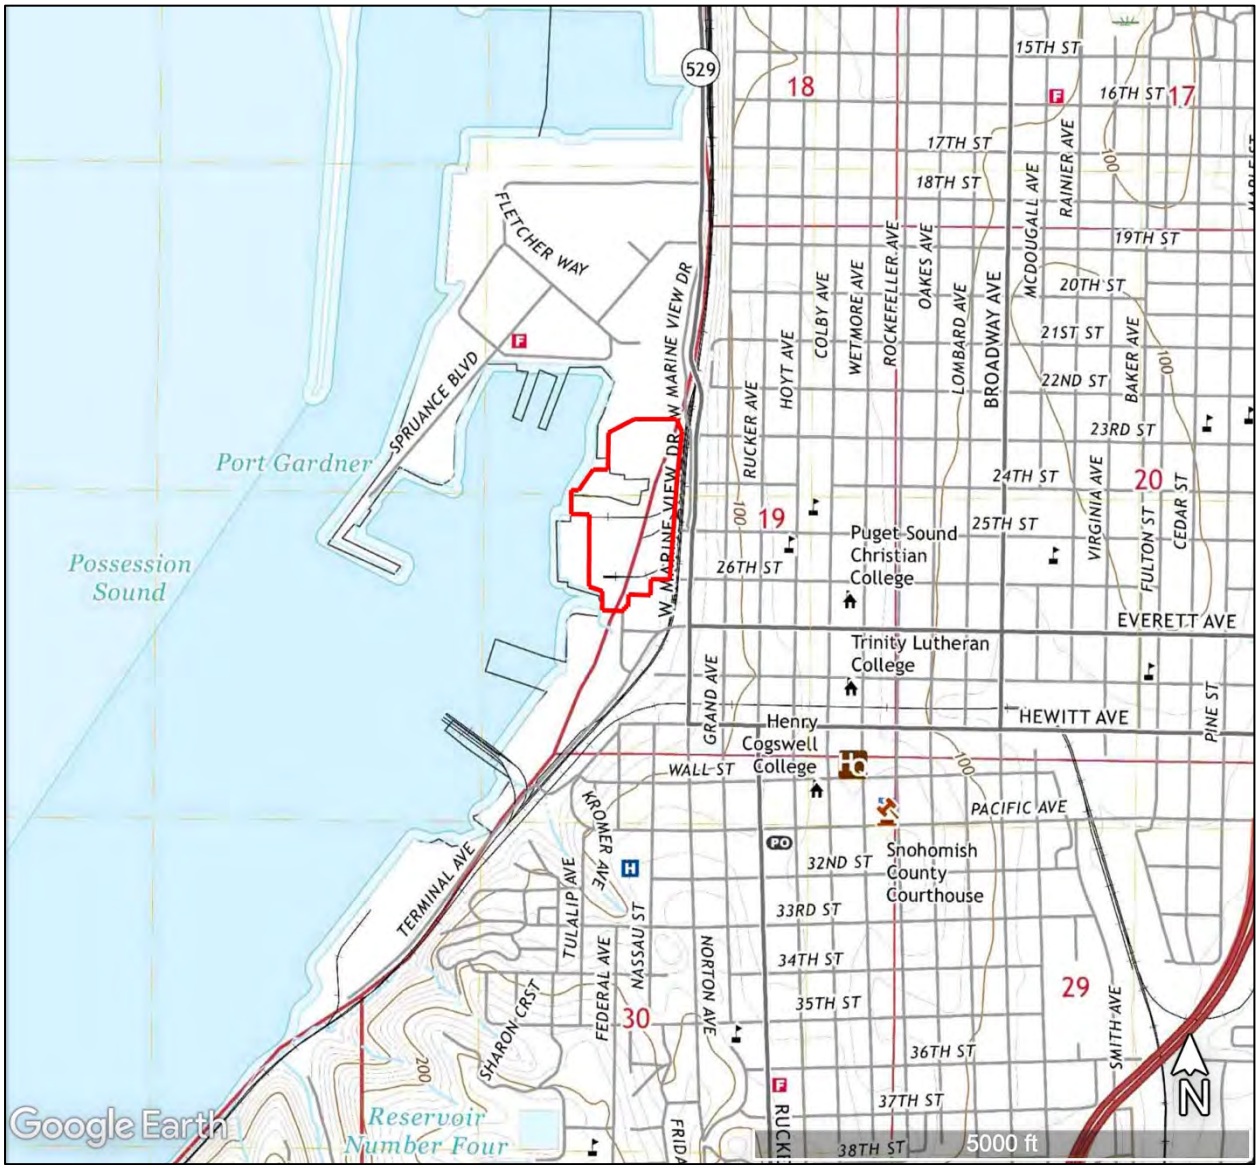

Figure 1. Topographic quadrangle (USGS 2020) annotated with the project location.

1.2 Research Design

CRC's work was intended, in part, to assist in addressing state regulations pertaining to the identification and protection of cultural resources (e.g., RCW 27.44, RCW 27.53, RCW 68.60). The Archaeological Sites and Resources Act (RCW 27.53) prohibits knowingly disturbing archaeological sites without a permit from the Washington State Department of Archaeology and Historic Preservation (DAHP), the Indian Graves and Records Act (RCW 27.44) prohibits knowingly disturbing Native American or historic graves, and the Abandoned and Historic Cemeteries and Historic Graves Act (RCW 68.60) calls for the protection and preservation of historic era cemeteries and graves.

This project is subject to oversight by the Washington State Department of Ecology (Ecology) and has received a U.S. Department of Transportation Better Utilizing Investment to Leverage

Development (BUILD) Grant. It is being completed in compliance with SEPA, Section 106 of the NHPA, and Executive Order (EO) 21-02.

SEPA requires that impacts to cultural resources be considered during the public environmental review process. Under SEPA, DAHP is considered the agency with technical expertise in regard to cultural resources and provides formal opinions to national and state level governments and agencies on a site's significance and the impact of proposed projects upon such sites. Properties evaluated for eligibility for local registers are reviewed by the responsible preservation program.

EO 21-02, signed by Governor Jay Inslee on April 7, 2021, aims to protect Washington's history from unnecessary damage by requiring any state funded project or investment to consider impacts to cultural resources. Agencies must contact DAHP, the Governor's Office of Indian Affairs (GIOA), and concerned tribes, and allow them time to review the project's scope and respond.

Under Section 106, agencies involved in a federal undertaking must take into account the undertaking's potential effects to historic properties within the defined Area of Potential Effects (APE) (36 CFR 800.16(l)(1)). Historic properties are typically defined as buildings, structures, sites, districts, or objects at least 50 years old. The Section 106 process involves identifying and inventorying historic properties within the APE and evaluating those properties to determine if they are eligible for listing on the National Register of Historic Places (NRHP). If NRHP eligible historic properties are identified within the APE, then potential adverse effects to the historic properties must be assessed, and a resolution of adverse effects recommended.

1.3 Project Description

Port of Everett sought to implement an integrated cleanup and redevelopment plan at Norton Terminal by installing a site-wide (33 acre) environmental pavement cap under an Agreed Order with Ecology that will double as a marine terminal cargo pad. The pavement cap will provide permanent environmental controls and state of-the-art stormwater treatment for the first time in the property's history (Figure 2). Prior cleanup efforts on the property have included removing contaminated sediments and capping areas with clean fill material. However, there is potential for archaeological deposits to occur beneath the extent of prior disturbances and filling. Archaeological monitoring was conducted during project actions with potential to exceed the depth of fill on the property as determined by a previous cultural resources assessment (Rinck et al. 2013). Monitoring was conducted following the protocols outlined in an archaeological monitoring plan developed for earlier interim cleanup actions on the property (Rinck 2013). Project actions requiring archaeological monitoring included utility potholing, trenching for electrical vaults, and trenching for stormwater outfalls and vaults. These actions occurred within the area described above and depicted in Figures 1 – 3.

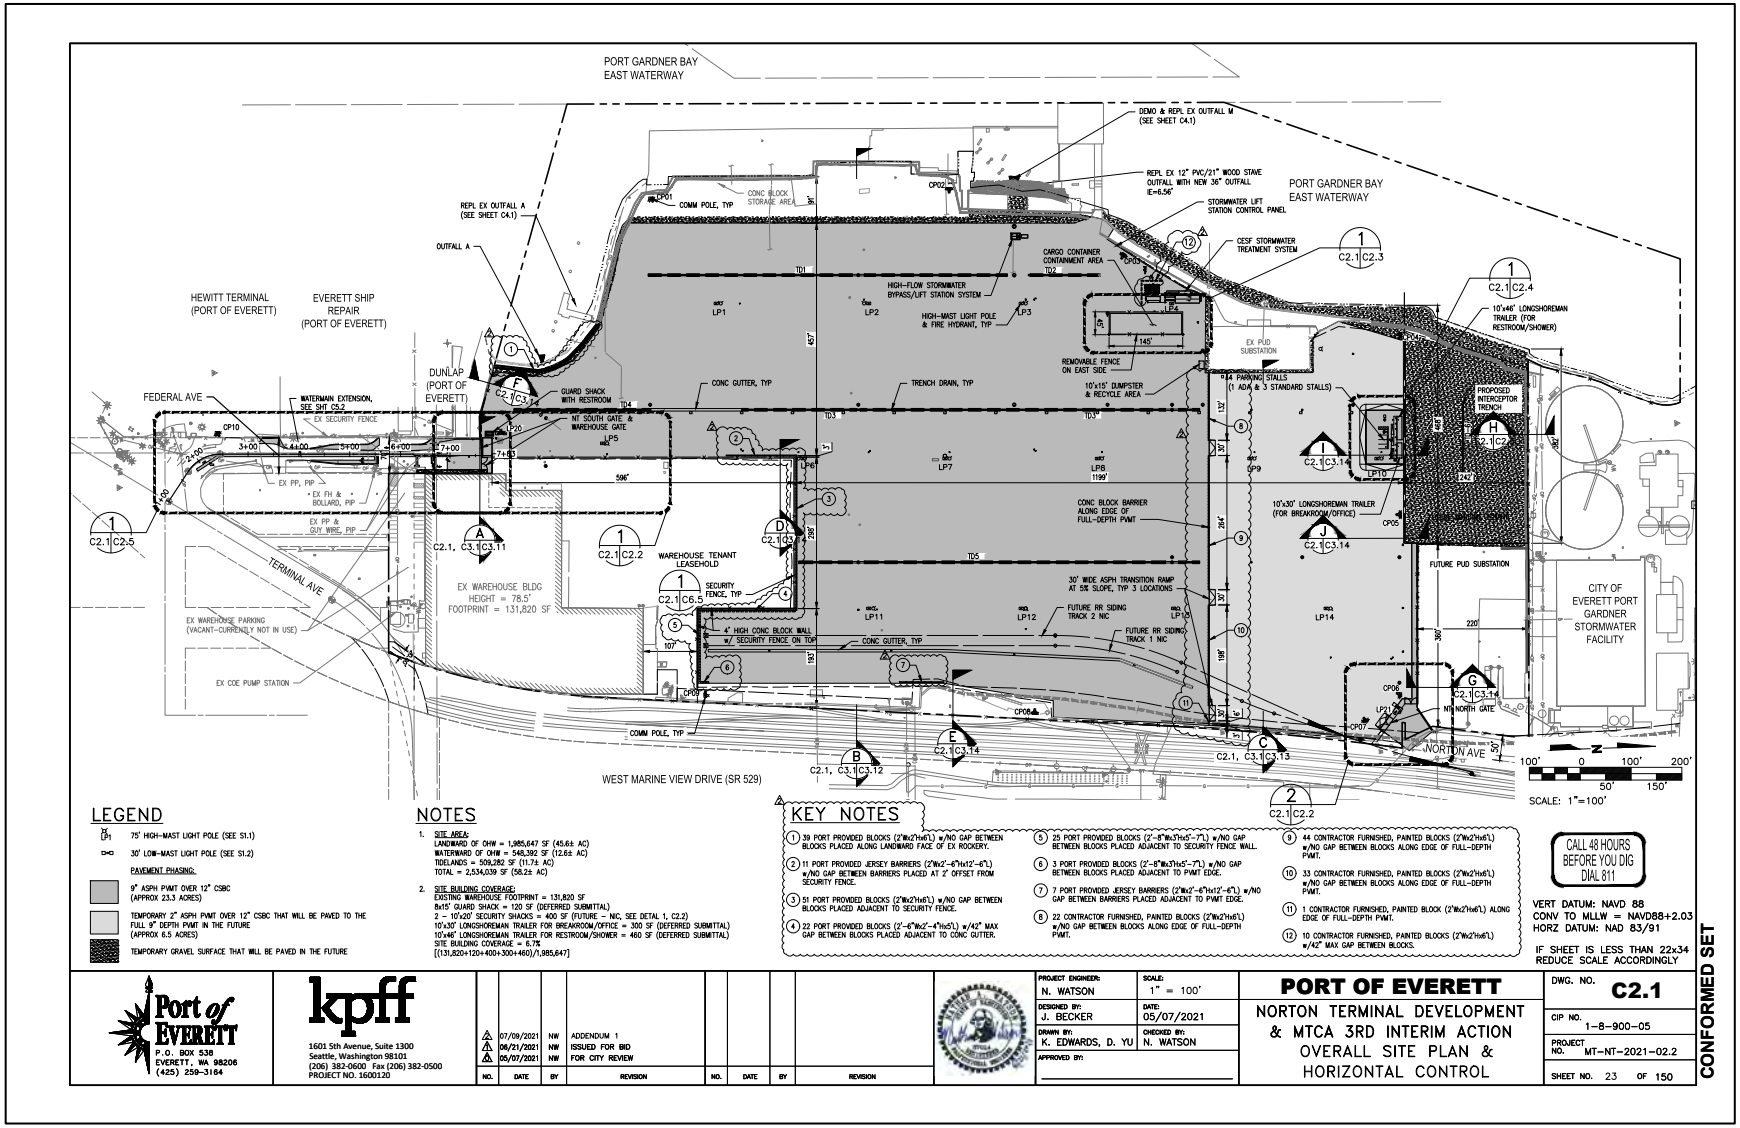

Figure 2. Proposed site plan, provided by KPFF.

Figure 3. August 2020 satellite imagery annotated with red polygon containing all locations monitored by CRC for this project (base map: Google Earth 2022).

2.0 Archaeological Monitoring Summary

Monitoring occurred between October 2021 and August 2022 on a total of 34 days (Table 1). Archaeological monitoring conducted by or under the supervision of a "professional archaeologist" (RCW 27.53.030 (11)). Monitoring was completed by CRC Archaeologists Margaret Berger, Jessica Gardner, and Ian Kretzler. The monitoring effort was supervised by

CRC Principal Investigator Margaret Berger. Detailed observations and photographs are captured in the Daily Archaeological Monitoring Logs (Appendix B).

The goal of monitoring was to observe subsurface conditions and identify any buried precontact or postcontact archaeological resources. During ground disturbing work with potential to exceed the depth of fill deposits on the property (typically 7 feet below ground surface or deeper), the archaeologist stood in close proximity to construction equipment in order to view subsurface deposits as they were exposed and remained in close communication with equipment operators to ensure adequate opportunity for observation and documentation. Archaeological monitoring focused on identifying potential buried surfaces, anthropogenic sediments, and archaeological features such as shell middens, hearths, burials, or artifact-bearing strata underlying modern fill deposits. The monitoring archaeologist inspected project excavations and, when necessary, recovered sediments for indications of such archaeological resources.

Ground disturbing methods consisted of machine excavated trenching. Observed sediments generally consisted of recent and older fill, dredge spoils, and tide flat deposits. Recent fill was typically observed as clean, well-sorted, loose brown sand and gravel. Older fill included gravelly sands and pieces of demolition debris from the removal of the previously documented mill buildings and facilities that occupied the property from the early 1900s until the 2013. These items included brick fragments, rebar, concrete slabs and rubble, abandoned pipes, and tiles, are described in detail in the Daily Archaeological Monitoring Logs; however, none were formally recorded given their secondary context in fill material. Dredge spoils typically consisted of dark gray gravelly silty sands with occasional shell fragments. Tide flat deposits, sometimes intact but often at least partially disturbed by prior construction, were generally identifiable as gray to dark gray sand with variable silt and clay content. Beach deposits were encountered in only two areas, and were identified as gravelly, cobbly coarser sands.

Table 1. Summary of Archaeological Monitoring.

Date	**Monitor**	**Project Component**	**Archaeology Observed**	**General Sediments**

3.0 Results and Recommendations

No archaeological deposits were identified during monitoring of the project's ground disturbing activities. The project activities with potential to intersect native deposits, which required monitoring, are complete. No additional cultural resources investigation is recommended at this time.

4.0 Limitations of this Assessment

No cultural resources study can assess with complete certainty whether archaeological sites, historic properties, or traditional cultural properties exist at a given location. The information presented in this report is based on professional opinions derived from CRC's analysis and interpretation of available documents, records, literature, and information identified in this report. The conclusions and recommendations presented apply to current and reasonably foreseeable project conditions. The data, conclusions, and interpretations in this report should not be construed as a warranty of subsurface conditions. They do not apply to site changes of which CRC is not aware and has not had the opportunity to evaluate.

Appendix A. Archaeological Monitoring Logs.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: October 25, 2021, 8:30 to 11:15 AM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility potholing with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was overcast with temperatures in the low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:30 AM and met with Port of Everett, Strider Construction Company, and Landau Associates staff to review the project's monitoring and inadvertent discovery plan, and the day's planned activities. Utility potholing would be conducted using a large excavator (Deere 245G LC) to dig test pits in several locations across the property. The archaeologist would be on site to monitor those with potential to exceed the depth of fill deposits on site. This consisted of four test pits in the southern, central, and western portions of the project.

- Test Pit 1 contained pea gravel (fill) from 0 to 6 inches; and brownish gray gravelly sand with concrete rubble, wood, and brick fragments (fill) from 6 inches to 3 ft. This pit was abandoned at 3 ft below surface.
- Test Pit 2 contained light brown sand with rebar and concrete rubble (fill) from 0 to 4 ft and was abandoned at 4 ft below surface.
- Test Pit 3 contained light brown sand with rebar, lumber, and concrete rubble (fill) from 0 to 4 ft; and gray sand and clay with wooden pilings (dredge spoils) from 4 to 8 ft. This pit was terminated 8 ft below surface.
- Test Pit 4 contained brown sand (fill) from 0 to 2 ft; light to dark gray sand and clay with lots of concrete rubble and some metal fragments (fill) from 2 to 5 ft; and gray to brownish gray sand and clay (tide flat) from 5 to 8.5 ft. This test pit was terminated 8.5 ft below surface.

No archaeological material was observed. The archaeologist departed after the completion of Test Pit 4 as none of the other planned test pits were expected to reach native sediments.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: January 17, 2022, 8:00 AM to 4:15 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility pre-digging with potential to encounter non-fill deposits.

GENERAL FIELD CONDITIONS: Weather was overcast with periodic light rain; temperatures were in the low to high 40s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and met Port of Everett and Strider Construction Company staff to review excavation plans for the week. Construction personnel planned to excavate several trenches to identify and remove debris and buried structural features. Trenches were aligned with proposed utility lines and were backfilled after pre-digging. Utility installation will occur at a later date. The archaeologist monitored excavation of trenches likely to extend below fill deposits, which are present up to approximately 7 feet below surface. Pre-digging began near the west-central edge of the project. A Hitachi ZX245USLC excavator was used to excavate one primary trench and two adjacent trenches (Figure 1). The archaeologist divided the monitored area into seven trench segments (S1, S2, etc.). Segments measured about 14 feet wide and varied in length. Some segments (e.g., S7) were expanded to isolate and remove buried concrete structures. Segments were excavated to between 8 and 12 feet below surface (ft bs). They contained fill and dredge spoil deposits with significant quantities of concrete, rebar, and other debris (Figures 2 – 4). Groundwater was usually encountered between 8 and 9 ft bs. Trench segment locations are shown in Figure 5.

Segment 1 contained:

- 0-6 ft bs: light brown gravelly sand with wood pilings, rebar, concrete, and other debris (fill); pea gravel present 1-2 ft bs along the northern edge of the trench near its western terminus; the top of a concrete manhole was identified 2.5 ft bs
- 6-8 ft bs: light brown fill and dark brown very gravelly silt and sand with same debris (fill / dredge spoils)

Segment 2 contained:

- 0-4 ft bs: medium brown sand with wood pilings, rebar, concrete, and other debris (fill)
- 4-6 ft bs: light yellowish brown gravelly sand with same debris (fill)
- 6-8 ft bs: dark gray silt and sand with wood pilings (fill / dredge spoils)

Segment 3 contained:

- 0-5 ft bs: light brown gravelly sand with wood pilings, rebar, concrete, and other debris (fill)
- 5-6 ft bs: grayish brown very gravelly sand with same debris (fill)
- 6-8 ft bs: grayish brown sand with same debris (fill); removed concrete manhole and associated pipes
- 8-10 ft bs: dark gray silt and sand with wood pilings (fill / dredge spoils)

Segment 4 contained:

- 0-5 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 5-6 ft bs: grayish brown very gravelly sand with same debris (fill)
- 6-8: grayish brown sand with same debris (fill)
- 8-10: dark gray very gravelly silt and sand with wood pilings (fill / dredge spoils)

Segment 5 contained:

- 0-3 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 3-4 ft bs: gray and dark brown very gravelly sand with same debris (fill)
- 4-8 ft bs: mottled yellowish brown and gray sand and dark gray sand with wood pilings (fill / dredge spoils)
- 8-10 ft bs: gray silt and sand (fill); concrete, wood, and metal pipe at base of trench

Segment 6 contained:

- 0-5 ft bs: light brown to yellowish brown gravelly sand with rebar, concrete, and other debris (fill)
- 5-6 ft bs: above fill and gray sand and silt (fill / dredge spoils)
- 6-10 ft bs: gray silt and sand with wood debris and concrete, wood, and metal pipe (fill / dredge spoils)

Segment 7 contained:

- 0-5 ft bs: light brown to yellowish brown gravelly sand with rebar, concrete, and other debris (fill); linear concrete panels and concrete, wood, and metal pipe identified; removal required expanding the size of the trench
- 5-6 ft bs: above fill and gray sand and silt, concrete debris (fill / dredge spoils)
- 6-12 ft bs: gray silt and sand with concrete, wood pilings, and concrete, wood, and metal pipe (fill / dredge spoils)

No archaeological materials were observed during trench excavation. Trench excavation paused at 4:15 PM. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: January 17, 2022, 8:00 AM to 4:15 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility pre-digging with potential to encounter non-fill deposits.

GENERAL FIELD CONDITIONS: Weather was overcast with periodic light rain; temperatures were in the low to high 40s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and met Port of Everett and Strider Construction Company staff to review excavation plans for the week. Construction personnel planned to excavate several trenches to identify and remove debris and buried structural features. Trenches were aligned with proposed utility lines and were backfilled after pre-digging. Utility installation will occur at a later date. The archaeologist monitored excavation of trenches likely to extend below fill deposits, which are present up to approximately 7 feet below surface. Pre-digging began near the west-central edge of the project. A Hitachi ZX245USLC excavator was used to excavate one primary trench and two adjacent trenches (Figure 1). The archaeologist divided the monitored area into seven trench segments (S1, S2, etc.). Segments measured about 14 feet wide and varied in length. Some segments (e.g., S7) were expanded to isolate and remove buried concrete structures. Segments were excavated to between 8 and 12 feet below surface (ft bs). They contained fill and dredge spoil deposits with significant quantities of concrete, rebar, and other debris (Figures 2 – 4). Groundwater was usually encountered between 8 and 9 ft bs. Trench segment locations are shown in Figure 5.

Segment 1 contained:

- 0-6 ft bs: light brown gravelly sand with wood pilings, rebar, concrete, and other debris (fill); pea gravel present 1-2 ft bs along the northern edge of the trench near its western terminus; the top of a concrete manhole was identified 2.5 ft bs
- 6-8 ft bs: light brown fill and dark brown very gravelly silt and sand with same debris (fill / dredge spoils)

Segment 2 contained:

- 0-4 ft bs: medium brown sand with wood pilings, rebar, concrete, and other debris (fill)
- 4-6 ft bs: light yellowish brown gravelly sand with same debris (fill)
- 6-8 ft bs: dark gray silt and sand with wood pilings (fill / dredge spoils)

Segment 3 contained:

- 0-5 ft bs: light brown gravelly sand with wood pilings, rebar, concrete, and other debris (fill)
- 5-6 ft bs: grayish brown very gravelly sand with same debris (fill)
- 6-8 ft bs: grayish brown sand with same debris (fill); removed concrete manhole and associated pipes
- 8-10 ft bs: dark gray silt and sand with wood pilings (fill / dredge spoils)

Segment 4 contained:

- 0-5 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 5-6 ft bs: grayish brown very gravelly sand with same debris (fill)
- 6-8: grayish brown sand with same debris (fill)
- 8-10: dark gray very gravelly silt and sand with wood pilings (fill / dredge spoils)

Segment 5 contained:

- 0-3 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 3-4 ft bs: gray and dark brown very gravelly sand with same debris (fill)
- 4-8 ft bs: mottled yellowish brown and gray sand and dark gray sand with wood pilings (fill / dredge spoils)
- 8-10 ft bs: gray silt and sand (fill); concrete, wood, and metal pipe at base of trench

Segment 6 contained:

- 0-5 ft bs: light brown to yellowish brown gravelly sand with rebar, concrete, and other debris (fill)
- 5-6 ft bs: above fill and gray sand and silt (fill / dredge spoils)
- 6-10 ft bs: gray silt and sand with wood debris and concrete, wood, and metal pipe (fill / dredge spoils)

Segment 7 contained:

- 0-5 ft bs: light brown to yellowish brown gravelly sand with rebar, concrete, and other debris (fill); linear concrete panels and concrete, wood, and metal pipe identified; removal required expanding the size of the trench
- 5-6 ft bs: above fill and gray sand and silt, concrete debris (fill / dredge spoils)
- 6-12 ft bs: gray silt and sand with concrete, wood pilings, and concrete, wood, and metal pipe (fill / dredge spoils)

No archaeological materials were observed during trench excavation. Trench excavation paused at 4:15 PM. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: January 18, 2022, 7:50 AM to 4:20 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility pre-digging with potential to encounter non-fill deposits.

GENERAL FIELD CONDITIONS: Weather was overcast with periodic light rain; temperatures were in the low to high 40s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:50 AM and met with Strider Construction Company staff to review excavation plans for the day. Excavation methodology remained unchanged from the previous day. A Hitachi ZX245USLC excavator was used to extend the utility trench east and south in order to identify and remove debris and buried structural features (Figure 1). The trench was then backfilled. The archaeologist divided the monitored area into eight trench segments. (Segment numbers were continued from the previous day.) They measured 14 feet wide and varied in length. Segment 13 was expanded to isolate and remove larger debris. Segments were excavated to between 8 and 12 feet below surface (ft bs). They contained fill and dredge spoils, which decreased in thickness as trench excavation proceeded to the east. Redeposited tide flat and, at the base of the trench, likely intact tide flat deposits were present below fill and dredge spoils (Figures 2 – 6). Groundwater was encountered between 9 and 10 ft bs. Trench segment locations are shown in Figure 7.

Segment 8 contained:

- 0-4 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 4-8 ft bs: light grayish brown gravelly sand, same debris (fill)
- 8-12 ft bs: dark gray sand and silt, concrete, wood and concrete pilings (fill / dredge spoils)

Segment 9 contained:

- 0-3 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 3-6 ft bs: light grayish brown to light yellowish brown gravelly sand, same debris (fill)
- 6-7 ft bs: dark gray sand and silt, same debris (fill / dredge spoils)
- 7-8 ft bs: medium brown and gray sand, little debris (tide flat)

Segment 10 contained:

- 0-3 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)

- 3-5 ft bs: dark gray sand and silt with concrete and wood pilings and other debris (fill / dredge spoils)
- 5-9 ft bs: medium brown to yellowish brown sand with same pilings and debris (dredge spoils / redeposited tide flat)
- 9-12: gray sand, no debris (tide flat)

Segment 11 contained:
- 0-2 ft bs: light brown gravelly sand with rebar, concrete, and other debris (fill)
- 2-4 ft bs: dark gray to dark brown gravelly sand with same debris (fill)
- 4-9: light gray and light brown sand with wood and concrete pilings and little other debris (dredge spoils / redeposited tide flat)
- 9-12: gray sand, no debris (tide flat)

Segment 12 contained:
- 0-3 ft bs: light brown sand with rebar, concrete, and other debris (fill)
- 3-5 ft bs: dark brown and dark gray very gravelly sand with buried concrete pad, I beams, and concrete pilings (fill)
- 5-9 ft bs: medium brown and gray sand, concrete with wood and concrete pilings and little other debris (dredge spoils / redeposited tide flat)

Segment 13 contained:
- 0-3 ft bs: light brown sand with rebar, concrete, and other debris (fill)
- 3-5 ft bs: dark brown and dark gray very gravelly sand with buried concrete structures and other debris (fill); removal required expanding the size of the trench
- 5-9 ft bs: medium brown and gray sand, concrete with wood and concrete pilings and little other debris, <1% shell fragments (dredge spoils / redeposited tide flat)

Segment 14 contained:
- 0-3 ft bs: light brown sand with rebar, concrete, and other debris (fill)
- 3-4 ft bs: dark brown and dark gray sand and silt with buried concrete structures and other debris (fill)
- 4-8 ft bs: medium brown to yellowish brown gravelly sand with buried constructed structures and other debris, concentration of bricks along eastern wall, <1% shell fragments (dredge spoils / redeposited tide flat)
- 8-10 ft bs: gray sand, <1% shell fragments, below concrete structures (tide flat)

No archaeological materials were observed during trench excavation. Trench excavation paused at 4:20 PM. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: January 19, 2022, 7:50 AM to 3:50 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility pre-digging with potential to encounter non-fill deposits.

GENERAL FIELD CONDITIONS: Weather was overcast with periodic light rain; temperatures were in the low to high 40s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:50 AM and met with Strider Construction Company staff to review excavation plans for the day. Excavation methodology remained mostly unchanged from the previous day. A Hitachi ZX245USLC excavator was used to extend the utility trench south in order to identify and remove debris and buried structural features (Figure 1). A series of smaller trenches were excavated to the southeast (Figure 2). All trenches were backfilled once debris was identified and removed. The archaeologist divided the monitored area into eight trench segments. (Segment numbers were continued from the previous day.) They measured 14 feet wide and varied in length. In the main trench, segments were excavated up to 8 feet below surface (ft bs). Groundwater was usually encountered about 8 ft bs. Buried concrete structures and associated debris were identified throughout the trench. These structures were present under thin deposits of fill and surrounded by redeposited tide flat sediments, likely dredge spoils (Figure 3). Visibility of deposits underlying concrete structures was limited due to the density of debris and presence of groundwater. When visible, these deposits appeared to consist primarily of dredge spoils, with limited intact tide flats. Excavation of the smaller trenches reached about 5 ft bs. They contained fill and redeposited tide flat sediments (Figure 4). Trench segment locations are shown in Figure 5.

Segment 15 contained:

- 0-1 ft bs: light brown gravelly sand with concrete, rebar, and other debris (fill)
- 1-2 ft bs: dark gray gravelly sand with same debris (fill)
- 2-8 ft bs: medium brown and dark gray gravelly sand with concrete, rebar, ceramic pipes, and concrete structures, <1% shell fragments (dredge spoils / redeposited tide flat)

Segment 16 contained:

- 0-1 ft bs: light brown gravelly sand with concrete, rebar, and other debris (fill)
- 1-1.5 ft bs: dark gray gravelly sand with same debris (fill)

- 1.5-8 ft bs: medium brown and gray very gravelly sand with concrete, rebar, and buried concrete structures, <1% shell fragments (dredge spoils / redeposited tide flat)

Segment 17 contained:
- 0-4 ft bs: light brown to medium brown gravelly sand with concrete, rebar, and concrete structures, <1% shell fragments (dredge spoils / redeposited tide flat)
- 4-5 ft bs: dark gray sand and silt with same debris (fill / dredge spoils)
- 5-8 ft bs: when visible, dark gray sand and silt with same debris (fill / dredge spoils)

Segment 18 contained:
- 0-2 ft bs: light brown gravelly sand with concrete, rebar, and other debris (fill)
- 2-4 ft bs: gray and dark gray gravelly sand with same debris and buried concrete structures (fill / dredge spoils); southern wall contained grayish brown sand (redeposited tide flat) between 3 and 4 ft bs

Segment 19 contained:
- 0-3 ft bs: light brown gravelly sand with concrete, rebar, and other debris (fill)
- 3-5: gray, dark gray, and medium brown gravelly sand with same debris (fill / dredge spoils / redeposited tide flat)

Segments 20, 21, and 22 contained:
- 0-5 ft bs: light brown to light yellowish brown sand with little debris, concrete at base of trench, <1% shell fragments (fill / dredge spoils / redeposited tide flat)

No archaeological materials were observed during trench excavation. Trench excavation paused at 3:50 PM. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: January 20, 2022, 8:00 AM to 2:15 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility pre-digging with potential to encounter non-fill deposits.

GENERAL FIELD CONDITIONS: Weather was overcast with periodic light rain; temperatures were in the low to high 40s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and met with Strider Construction Company staff to review excavation plans for the day. Excavation methodology remained mostly unchanged from the previous day. A Deere 245G LC excavator was used to extend the utility trench south in order to identify and remove debris and buried structural features (Figure 1). The trench was backfilled once debris was identified and removed. The archaeologist divided the monitored area into two trench segments. (Segment numbers were continued from the previous day.) Segments measured 14 feet wide and varied in length. They were excavated up to 10 feet below surface (ft bs). Groundwater was usually encountered about 8 ft bs. Buried concrete and rebar pilings were identified throughout the trench. Pilings were buried under and surrounded by redeposited tide flat sediments, likely dredge spoils. Deposits of dense shell similar to the one identified the previous day were observed in near-surface dredge spoils and near the base of concrete pilings. Shells near the base of the pilings were situated in a sedimentary matrix consisting of gray to dark gray sand. These sediments may represent intact or redeposited portions of the tide flat. The archaeologist inspected excavated shell deposits for characteristic midden soils, charcoal, fire-modified rock, faunal remains, and other artifacts. None were observed. The archaeologist interpreted the shell deposits as non-cultural in origin and determined that most if not all had been disturbed by the installation of the pilings and/or dredging. Trench segment locations are shown in Figure 4.

Segment 23 contained:

- 0-5 ft bs: light brown to medium brown gravelly sand with rebar, concrete, and other debris, <1% shell fragments (dredge spoils / redeposited tide flat)
- 5-8 ft bs: light brown and dark gray gravelly sand with buried concrete pilings and other debris (dredge spoils / redeposited tide flat)
- 8-10 ft bs: gray sand, little debris (tide flat)

Segment 24 contained:

- 0-6 ft bs: medium brown gravelly sand with rebar, concrete, and other debris, pockets of dense shell (dredge spoils / redeposited tide flat)
- 6-7 ft bs: dark gray gravelly sand, concrete with buried concrete pilings and other debris (dredge spoils / redeposited tide flat)
- 7-8 ft bs: gray to dark gray sand, pockets of dense shell (redeposited / intact tide flat)

No archaeological materials were observed monitoring of trench excavation. Ground disturbing activities concluded at 2:15 PM. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: March 14, 2022, 7:40 AM to 1:20 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was overcast with some light rain showers and temperatures in the 40s to low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:40 AM and was directed to Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the west-central part of the property at the west end of a previously excavated duct bank trench. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Hitachi 245 US LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

Two adjacent but slightly offset, roughly square trenches were excavated. Each was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The first trench reached a maximum depth of 10 ft below surface. Sediments consisted entirely of brown to grayish brown medium- to coarse-grained sand with rebar, concrete rubble, and brick fragments (fill). The second trench was offset to the northeast and reached a maximum depth of 12 ft below surface. This trench contained the same medium- to coarse-grained sand with rebar, concrete rubble, and brick fragments (fill) with concrete and rebar in the base of the trench.

No native sediments were observed. Cultural materials were limited to demolition debris from the previously documented mill buildings. No archaeological material was observed. The archaeologist departed after utility vault excavation was complete for the day, with plans to return the following work day.

FIGURES

Figure 1. Satellite imagery annotated with the approximate location of the monitored utility vault excavation.

Figure 2. Overview of utility vault excavation on March 14, 2022; view to the east-southeast.

Figure 3. Typical stratigraphic profile observed during utility vault excavation on March 14, 2022; view to the northwest.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: March 15, 2022, 8:00 AM to 4:00 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was overcast to partly cloudy with temperatures in the high 40s to low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the southwestern part of the property, south of a previously excavated duct bank trench directly south of the vaults installed yesterday. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Hitachi 245 US LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

Two pairs of adjacent but slightly offset, roughly square trenches were excavated. Each trench was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench.

The first trench reached a maximum depth of 10 ft below surface. Sediments consisted entirely of brown to grayish brown medium- to coarse-grained sand with rebar, concrete rubble, and brick fragments (fill). The second trench was offset to the southeast and also reached a maximum depth of 10 ft below surface. This trench contained the same sandy sediments and pockets of black and reddish brown (burned) sand with rebar, concrete rubble, and brick fragments (fill), with potentially native gleyed gray finer sands exposed in the bottom < 0.25 ft (marine/tide flat deposit) that were quickly covered by groundwater.

The second pair of trenches was located south of the first, at the south end of an already installed utility duct bank. Both trenches reached a maximum depth of 10 ft below surface and contained brown to grayish brown medium- to coarse-grained sand with rebar, concrete rubble, small waterworn shell fragments, and brick fragments (fill and reworked dredge spoils) down to approximately 9.75 ft below surface, underlain by potentially native gleyed gray finer sands (marine/tide flat deposit) from 9.75 to 10 ft below surface.

Excavation into native sediments today was limited to scraping in the bottom < 0.25 ft of the trenches. Cultural materials were limited to demolition debris from the previously documented mill buildings and reworked dredge spoils. No archaeological material was observed. The archaeologist departed after utility vault excavation was complete for the day, with plans to return the following work day.

FIGURES

Figure 1. Satellite imagery annotated with the approximate locations of the monitored utility vault excavation.

Figure 2. Overview of subsurface conditions during utility vault excavation the morning of March 15, 2022; view to the northeast.

Figure 3. Overview of subsurface conditions during utility vault excavation the afternoon of March 15, 2022; view to the southeast.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: March 16, 2022, 8:00 AM to 1:30 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was mostly cloudy with temperatures in the 40s to low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the southern and central parts of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Hitachi 245 US LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

Two pairs of adjacent but slightly offset, roughly square trenches were excavated. Each trench was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench.

The first pair was located at the east end of a previously installed duct bank south of the vaults installed yesterday, and reached a maximum depth of 10 ft below surface. Sediments consisted of brown to grayish brown medium- to coarse-grained sand with pockets of black and reddish brown (burned) sand, small waterworn shell fragments, rebar, dimensional lumber, concrete rubble, and brick fragments (fill and reworked dredge spoils). The second trench was offset to the southeast, also reached a maximum depth of 10 ft below surface, and encountered the same sediments.

The second pair of trenches was located north of the vaults installed on March 14. Both trenches reached a maximum depth of 8 ft below surface and contained the same massive brown to grayish brown medium- to coarse-grained sand (fill) from 0 to 6 ft below surface. Finer gray sands were present 6 to 6.5 ft below surface and interpreted as dredge spoils due to the presence of more fill sands with pockets of black and reddish brown (burned) sand, rebar, concrete rubble, and brick fragments from 6.5 ft to 8 ft below surface.

No native sediments were observed today. Cultural materials were limited to demolition debris from the previously documented mill buildings and reworked dredge spoils. No archaeological material was observed. The archaeologist departed after utility vault excavation was complete for the day, with plans for another CRC archaeologist to be on site the following work day.

FIGURES

Figure 2. Typical subsurface conditions observed the morning of March 16, 2022; view to the northeast.

Figure 3. Typical stratigraphic profile observed during utility vault excavation the afternoon of March 16, 2022; view to the north.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: March 17, 2022, 8:00 AM to 3:00 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility vault excavation with the potential to encounter non-fill deposits.

GENERAL FIELD CONDITIONS: Weather was overcast with periodic light rain, with temperatures between 45 and 50 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and met with Strider Construction Company staff to review excavation plans for the day. Construction personnel planned to install multiple concrete utility vaults in the west-central portion of the project. A Komatsu PC 490LC excavator was used to excavate a pit measuring approximately 15 feet wide (N-S) and 30 feet long (E-W) to a depth of 8 feet below surface (Figure 1). The pit contained light brown, pebbly sand with little debris and less than 1 percent shell fragments up to 5 feet below surface (Figure 2). These sediments were interpreted as dredge spoils or redeposited tide flat. Between 5 and 8 feet below surface, the pit contained dark gray sand and silt, likely redeposited tide flat, with concrete, rebar, wood pilings, and other debris. No archaeological materials were identified.

After installing the vault, the pit was extended to the north (Figure 3). The extension measured 30 feet wide (N-S) and 20 feet long (E-W) and was excavated to about 5 feet below surface. As in the larger pit, subsurface deposits consisted of light brown, pebbly sand with few shell fragments and little debris. No archaeological materials were identified. Three vaults were installed in the pit extension.

The locations of monitored vault pits are shown in Figure 5.

Ground disturbing activities concluded at 3:00 PM. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT – MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE: March 21, 2022

MONITOR: Jessica Gardner

GENERAL FIELD CONDITIONS: Weather was cool and rainy, with an occasional wind and temperatures ranging from 40 to 50 degrees Fahrenheit.

PROJECT COMPONENT MONITORED: Excavation of two vault locations and a pair of utility trenches within the project, which had a potential to encounter non-fill deposits.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE: The archaeologist arrived on site at 8 am and met with construction personnel to discuss the proposed excavations. The crew intends to excavate a series of vaults which may reach or exceed 7 feet (ft) below the current surface. An additional crew appears to be a floating crew who continued the excavation of a utility trench near the center of the project and who initiated vault excavations in locations where cement was expected. Excavations were conducted with a pair of large Hitachi and Deere excavation rigs using 4 ft smooth and 2 to 3 ft toothed buckets, as necessary. Encountered concrete foundations were broken up using a hydraulic breaker attachment. Observed excavations included the continuation of an east-to-west utility trench near the center of the project location and two vault pits (Figure 1).

The archaeologist observed the excavation of a 22 m segment of a parallel pair of utility trenches, being just west of center and a set of concrete forms located there. The northern trench ranged from 7 to 9 ft wide and ranged in depth from 3 ft at the west end to near 7 ft at the east end as it descended to avoid a previously installed pipe. The profile can be described as approximately 2 ft of recent fill (brown gravelly sand) above rebar-reenforced concrete forms set in dredge spoils (dark gray silty sand) to depth (Figure 2). There was a significant volume of concrete foundations present which took much time to break apart for removal. The southern trench was 3 ft wide and remained shallow at 3 ft or less, with sediments composed of recent fill materials.

A single-vault pit was excavated in the southeast corner of the project location, within 40 m north of the existing Kimberly-Clark Warehouse at the south end of the project. The excavation was anticipated to be up to 5 ft deep and the crew started without the archaeologist. However, location conditions necessitated a deeper excavation, which was observed. A steel-cased cement piling was present in the southwest corner and required a mass-excavation to remove. Much of the removed sediment was saturated and ground water was present less than 5 ft below the surface. A profile can be described as approximately 2 ft of recent fill (brown gravelly sand) above dredge materials (dark gray silty sand) to depth (Figure 3). Several wood pilings were noted on the west half of the pit and were broken and partially removed during excavation. A mass of concrete was noted in the dredge materials along the south edge of the pit but did not

impede the excavation. A buried main was encountered along the east edge of the pit, at the toe of the bench-slope, and surrounded in pea gravels.

Excavation of a vault pit was started approximately 75 m south of the utility trench, and along the center line of the project location for a pair of vaults. Excavation was not completed by the end of the day due to the significant present of rebar-reenforced cement in the pit location. The profile can be described as approximately 2 ft of recent fill (brown gravelly sand) above cement foundations with 2-3 ft of pit-run fill (gray to brownish gray gravelly sand) (Figure 4).

No archaeological materials or deposits were observed.

FIGURES

Figure 1. Satellite image of south half of the project location, annotated with locations of the observed utility trench segment (red line) and south and southeast vault pits.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT – MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE: March 22, 2022

MONITOR: Jessica Gardner

GENERAL FIELD CONDITIONS: Weather was mild and sunny, with an occasion wind and temperatures ranging from 50 to 60 degrees Fahrenheit.

PROJECT COMPONENT MONITORED: Excavation of three vault pit locations and continued excavation of a utility trench.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE: The archaeologist arrived on site at 8 am and met with construction personnel to discuss the proposed excavations. The crew will continue with the planned excavations and methods as outlined in yesterday's monitoring log (3-21-2022). Excavations observed today included the continued excavation of the utility trench and southern vault, as well as the excavation of two pairs of vaults near the center of the project location (Figure 1).

The southern pit from yesterday was continued and completed for the installation of a pair of vaults. The pit reached a depth of approximately 7 ft at the northwest vault and 8 ft at the southeast vault. This was due to the presence of a concrete slab under the northwest vault which allowed for less fill. The southeast vault was set above a foundation/wall surrounded by saturated dredge fine sand/silty sand which had to be removed and replaced with additional quarry rock fill. The wall was demolished by a hydraulic crimper attachment on an excavator. The final profile appeared to be approximately 2 ft of recent fill above rebar-reenforced concrete surrounded by fill (Figure 2). This fill appeared to be approximately 3 ft of imported gravelly sand above silty sand/ fine grained sand, determined likely to be dredged sediments.

Two vault pairs were installed near the center of the project (center vaults 1 and 2). Given their proximity, it is unsurprising that both pits had similar profiles, with approximately 2 ft of recent fill (brown gravelly sand) above rebar-reenforced concrete over dredged sediments (dark gray silty sand). The southern of the two pits (center vault 2) included lenses of wood debris and wood pilings in the dredged deposits (Figure 3).

The crew continued trying to break up the concrete present in the utility trench and to extend the trench further to the east. Progress was slow and the trench was only extended approximately 5 m east at the surface fill level. No changes were observed in the profile. The trench was partially backfilled by the end of the day to stabilize the trench and provide a pad for the excavator to sit on while digging.

No archaeological materials or deposits were observed.

Figure 6. Representative image of south vault location. Profile shows recent fill above concrete and rebar masses, surrounded by sandy fill above dredged sediments. View to the northeast.

Figure 7. Representative image of the profiles of the center vault pits, showing the north wall of the southeast vault of the center vault 2 location. Profile of recent fill above concrete and rebar masses over dredged sediments with wood pilings and lenses of wood debris.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT – MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE: March 23, 2022

MONITOR: Jessica Gardner

GENERAL FIELD CONDITIONS: Weather was mild and sunny in the morning becoming blustery and rainy by the afternoon. Temperatures ranged in the 40 and 50 degrees Fahrenheit.

PROJECT COMPONENT MONITORED: Excavation of three vault pit locations.

ARCHAEOLOGY OBSERVED: None**.**

NARRATIVE: The archaeologist arrived on site at 8 am and met with construction personnel to discuss the proposed excavations. The crew will continue with the planned excavations and methods as outlined in Monday's monitoring log (3-21-2022). Excavations observed today included the excavation of three pairs of vaults spread out across the southern half of the project location (Figure 1). These are noted as the east, west, and south vault pits.

The west vault pit was located along the western edge of the project, near the northeast corner of the dock. The profile can be described as approximately 2 feet (ft) of recent fill (brown gravelly sand) above 2-3 ft of rubble and fill (brownish-gray fine to medium grained sand with some gravels) above gray sand. Metal pipes were observed approximately 2-3 ft below the surface, including a steel-cased, wood-lined or capped pipe at the southwest edge of the pit (Figure 2). Wood pilings were observed at the base of the northwestern half of the pit, while a concrete pipe approximately 12 inch in diameter was noted at the base of the pit for the southeast of the two vaults, and oriented east-to-west (Figure 3). The pipe shattered where excavated but remained largely intact in the side walls. The crew capped it with grout before installing the quarry spall base and vault. The pipe sat in a layer of dark gray silty sand to very fine sand, which was likely a dredged fill deposit.

A second pit (South vault 2) was excavated just southwest of the south vault pit observed on Monday and Tuesday. The profile can be described as approximately 2 ft of recent fill above a concrete slab, supported by gridded, rebar-reenforced, concrete, foundational footers, which extended 7-8 ft below the surface (Figure 4). The footers were surrounded by dredge materials (dark gray silty sand).

A pit was excavated for a pair of vaults east of center of the project location. The profile varied between each vault portion, being the northwest and southeast vaults (Figure 5 and 6). The profile for the southeast vault can be described as

- 1.5-2 ft of recent fill (brown gravelly sand)
- 6-10 inches dark gray silty sand,
- 6 inches matted wood debris

- Approximately 2 ft of gray sand
- Approximately 2 ft of dark gray silty sand

Wood pilings were noted in the lower deposits. Given the profile observed in the adjacent vault pit, all deposits are likely composed of fill and/or dredge sediments.

The northwest vault profile can be described as

- 2 ft of recent fill (brown gravelly sand)
- 2 ft of grayish brown medium grained sand
- 1-2 ft of yellowish-brown silt/ silt loam
- 1-2 ft of dark gray silty sand above
- a sloping deposit (0-12 inches) of gray to dark gray fine to medium grained sand with a dense deposit of whole to moderately fragmented bent-nosed clam (*Macoma)* shells.

A small portion of the matted wood observed in the southeast vault pit was also visible in the southeast corner of the northwest vault pit. The shell deposit was investigated and determined to be natural given the presence of a single species, a lack of organic or charcoal staining, and a lack of definitively cultural materials (fire-modified rock, wood or stone tools, plant fibers, etc.).

No archaeological materials or deposits were observed.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: March 24, 2022, 8:00 AM to 4:00 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was partly cloudy with temperatures in the high 30s to low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the east-central and southeastern parts of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

The first vault excavated was in the east-central part of the property, approximately 100 meters north of the warehouse and directly north of a utility vault monitored by CRC the previous day. Sediments from the ground surface to a depth of 6 feet consisted of the same loose brown sand (fill) seen near surface throughout the property. Gleyed sands with a peaty aroma and wood debris were present from 6 to 8 ft below surface below surface along with some small, waterworn shell fragments, interpreted as disturbed tide flat sediments or dredge spoils.

A pair of adjacent but slightly offset, roughly square trenches was then excavated in the southeastern part of the property. Each trench was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The profile of both trenches was brown very gravelly sand (recent fill) from surface to 2 ft; uniform grayish brown loose sand (fill) from 2 to 4 ft below surface; and gleyed gray sands with concrete footings and rubble (dredge spoils or disturbed tide flat) from 4 to 8 ft below surface. Metal cables and rebar were present in the base of the second trench in this pair.

No intact native sediments were observed today. Cultural materials were limited to demolition debris from the previously documented mill buildings. No archaeological material was observed. The archaeologist departed after utility vault excavation was complete for the day, with plans for another CRC archaeologist to be on site the following work day.

FIGURES

Figure 1. Satellite imagery annotated with the approximate locations of the monitored utility vault excavation.

Figure 2. Subsurface conditions observed the morning of March 24, 2022; view to the west-northwest.

Figure 3. Overview of utility vault excavation the afternoon of March 24, 2022; view to the south-southeast.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT – MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE: March 25, 2022

MONITOR: Jessica Gardner

GENERAL FIELD CONDITIONS: Weather was mild and sunny with temperatures in the 50s degrees Fahrenheit.

PROJECT COMPONENT MONITORED: Excavation of one vault pit location.

ARCHAEOLOGY OBSERVED: None**.**

NARRATIVE: The archaeologist arrived on site at 8 am and met with construction personnel to discuss the proposed excavations. The crew will continue with the planned excavations and methods as outlined in Monday's monitoring log (3-21-2022). Excavations observed today included the excavation of a pair of vaults at a single location, northeast of center of the project location (Figure 1).

The profile varied between each vault portion, being the northeast and southwest vaults. The profile for the southwest vault can be described as

- 1.5-2 feet (ft) of recent fill (brown gravelly sand)
- 4-6 inches of asphalt or concrete pad in sections,
- 2-3 ft dark gray to very dark brown loamy sand with brick and other construction debris,
- 1-3 ft of very dark brown to black sandy loam with construction debris and sulfur concentrations over a slanting surface of
- Brown and gray silty sand (Figure 2).

These were all determined to be fill deposits. A very large log lay at the base of the pit within the very dark brown to black sandy loam, was oriented north to south, and measured 3-4 ft in diameter. The pit was extended to 8 ft below the surface (10 ft below finished grade) to remove it.

The northeast vault profile can be described as:

- 2 ft of recent fill (brown gravelly sand)
- 5 ft of brown and gray silty sand with some debris, crossed by seven modern-era utility pipes set in pea gravel (Figure 3).

Pipes included, in order of depth: one 2-inch PVC pipe, two 8-inch HDPE pipes, one 6-inch cast-iron/steel pipe, two 12-inch HDPE pipes, and one 8-inch steel pipe. The pipes were oriented east to west, northwest to southeast, and variations in between. The upper four were broken off and capped with grout, the lower three being left in place.

No archaeological material or deposits were present.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: April 4, 2022, 8:10 AM to 4:10 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: After a brief weather delay due to hail and heavy rain, weather was partly cloudy to sunny with temperatures in the mid- to high 40s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:10 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the west-central and eastern parts of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed. Each trench was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench.

Beginning at 9:00 AM after the hail and heavy rain passed, the first vault was excavated in the west-central part of the property and encountered loose brown very gravelly sand (recent fill) to a depth of 2.5 ft below surface; loose gray gravelly sand with wood debris and brick fragments (fill) from 2.5 to 6 ft below surface; and gleyed gray silt and sand (dredge spoils) from 6 to 7 ft below surface. The second vault was located approximately 10 meters to the south and contained loose brown very gravelly sand (recent fill) to a depth of 2 ft below surface, underlain by gray to black gravelly sand with wood debris, old pipes, and concrete rubble (fill). A third vault was adjacent to the southeast of the second, and exposed the same sedimentary profile.

A pair of adjacent but slightly offset, roughly square trenches was then excavated in the eastern part of the property. The profile of both trenches was brown very gravelly sand (recent fill) from surface to 4 ft, underlain by gray sand, silt and clay with wood debris, old pipes, rebar, and steel I-beams (disturbed tide flat) from 4 to 8 ft below surface.

No intact native sediments were observed today. Cultural materials were limited to demolition debris from the previously documented mill buildings. No archaeological material was observed. The archaeologist departed after utility vault excavation was complete for the day, with plans to return the following work day.

CRC PROJECT NO. 2110B

DATE AND TIME: April 5, 2022, 8:30 AM to 12:30 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was overcast to mostly cloudy with temperatures in the low 40s to low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:30 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the northeastern part of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

A pair of adjacent but slightly offset, roughly square trenches was excavated approximately 100 meters north of the vaults placed yesterday afternoon and exposed similar sediments. Each trench was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The profile of the first trench was brown very gravelly sand (recent fill) from surface to 4 ft, underlain by gray sand, silt and clay with wood debris, old pipes, rebar, and steel I-beams (dredge spoils) from 4 to 8 ft below surface. The second trench, adjacent and offset slightly to the southwest, contained the same brown very gravelly sand (recent fill) from surface to 4 ft; the same gray sand, silt and clay with wood debris, old pipes, rebar, and steel I-beams (dredge spoils) from 4 to 6 ft below surface; and wood chips, sawdust, and other milled wood debris in a matrix of gray gravelly coarse sand (fill/disturbed beach) from 6 to 15 ft below surface.

No intact native sediments were observed today. Cultural materials were limited to demolition debris and wood waste from the previously documented mill. No archaeological material was observed. The archaeologist departed after utility vault excavation was complete for the day, with plans to return when requested by the Port (schedule to be determined).

CRC PROJECT NO. 2110B

DATE AND TIME: April 11, 2022, 8:30 AM to 2:00 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Outfall M/Stormwater facilities excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was overcast with temperatures in the low 40s to low 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:30 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of a 20-ft deep trench to house Outfall M and stormwater structures in the west-central part of the property, which was anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

The maximum depth of excavation was within an approximately 20-x-20-ft square bounded by the shoring box. The profile consisted of mixed gray and brown gravelly sand with woody debris and milled lumber scraps (mixed fill) to a depth of 10 ft below surrounding grade. This was underlain by loose gray sand with logs and pilings (dredge spoils) from 10 to 16 ft below surrounding grade. Groundwater was present approximately 15 ft below surface. Excavation halted for the day so that the trench could be dewatered.

No intact native sediments were observed today. Cultural materials were limited to demolition debris and wood waste from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return for completion of the trench the following work day.

DATE AND TIME: April 21, 2022, 8:40 AM to 1:25 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Outfall M/Stormwater facilities and utility pothole excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was mostly cloudy with temperatures in the mid 40s to mid 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:30 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of an approximately 20-ft deep trench to house Outfall M and stormwater structures in the west-central part of the property, which was anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

The work area was directly north of the excavation monitored on April 11, 2022. The maximum depth of excavation was within an approximately 20-x-20-ft square bounded by the shoring box. The profile consisted of brown gravelly sand from surface to 5 ft (recent fill), brown laminated silt and sand from 5 to 7 ft, gray laminated silt and sand with dimensional lumber and pilings from 7 to 9 ft, and loose gray sand with concrete pilings from 9 to 15 ft below surrounding grade. Groundwater was present approximately 15 ft below surface, obscuring any visibility of deeper sediments.

Following completion of the above, a utility pothole was excavated in the southern part of the project, near TP 1 monitored in October 2021. Sediments in the pothole consisted of angular gravel from 0 to 6 inches (recent fill) and brownish gray gravelly sand with demolition debris (fill) to a depth of 8 ft below surface. Groundwater was present approximately 7 ft below surface. Total dimensions of the pothole were approximately 10 ft east-west by 25 ft north-south.

No intact native sediments were observed today. Cultural materials were limited to demolition debris and pilings from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return the following work day.

PROJECT COMPONENT MONITORED: Trenches for dewatering wells in SDMH 7 stormwater facilities location with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Light rain with temperatures around 50 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:15 AM and located the Strider Construction Company crew tasked with excavating trenches to install dewatering wells ahead of installing the SDMH 7 stormwater facilities in the southern part of the property. This work was anticipated to reach up to 10 ft below surface and potentially exceed the depth of fill deposits in this location. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

This work occurred near the pothole excavation monitored on April 21, 2022, and generally exposed the same subsurface conditions. Five trenches were excavated and each trench measured approximately 8-x-10-ft in area. The profile in each consisted of brown to brownish gray gravelly sand with demolition debris including brick fragments, concrete rubble, and wood (fill) to a depth of 4 to 8 ft below surface, underlain by mixed brown and gray sand, silt, and clay with concrete rubble (disturbed tide flat) to a depth of 10 ft below surface. Groundwater was present approximately 8 ft below surface.

No intact native sediments were observed today. Cultural materials were limited to demolition debris from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return the following work day.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 4, 2022, 8:00 AM to 11:30 AM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was overcast with temperatures in the high 40s to mid 50s Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the western and central parts of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

One roughly square trench was excavated immediately south of the previously monitored Outfall M/Stormwater facilities. The trench measured approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of the trench. The profile consisted of brown gravelly sand (recent fill) to a depth of 2 ft, underlain by laminar beds of brown, gray, and orange-brown silt and sand from 2 to 4 ft, and massive gray silt and sand with wood, metal, and concrete (fill) from 4 to 8 ft below surface.

Next, two adjacent but slightly offset, roughly square trenches were excavated in the central part of the property. Each was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The sediments in both trenches consisted of brown gravelly sand (recent fill) to a depth of 2 ft underlain by dark gray to black stained gravelly sand with brick fragments, metal wires, rebar, concrete rubble, and metal pipe fragments (fill) from 2 to 10 ft below surface.

No intact native sediments were observed today. Cultural materials were limited to demolition debris from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return when requested by the Port (schedule to be determined).

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 9, 2022, 7:30 to 11:30 AM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility vault excavation with the potential to encounter non-fill deposits (Figure 1).

GENERAL FIELD CONDITIONS: Weather was overcast to partly sunny, with temperatures between 45 and 50 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:30 AM and met with Strider Construction Company staff to review excavation plans for the day. Construction personnel planned to install one concrete utility vault (SDMH 7) near the southern boundary of the project. The area had been previously excavated, and several dewatering pumps had been installed (Figure 2). A Komatsu PC 490LC excavator was used to reexcavate a pit measuring approximately 10 feet long and 10 feet wide to a depth of 10 feet below surface. Subsurface deposits consisted of brown, pebbly sand with some concrete, brick, and other construction debris (recent backfill) and brown to dark brown, pebbly sand with extensive construction debris and contaminated soils (fill / dredge spoils) (Figure 3). Groundwater was present at the base of the pit. Installation of the utility vault required that the pit be excavated to approximately 13 feet below surface. Because of extensive groundwater, additional dewatering pumps were installed (Figure 4). Excavation paused until the following day.

No non-fill sediments or archaeological materials were identified. The archaeologist departed at 11:30 AM following the pause in excavation.

Figure 4. Dewatering pumps installed in the vault pit.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 10, 2022, 7:30 AM to 2:45 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility vault excavation with the potential to encounter non-fill deposits (Figure 1).

GENERAL FIELD CONDITIONS: Weather was overcast to partly sunny, with temperatures between 45 and 60 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:30 AM and met with Strider Construction Company staff to review excavation plans for the day. The previous day, several dewatering pumps were installed in the excavation pit for SDMH 7. Due to overnight rainfall, significant groundwater remained in the pit. Construction personnel decided to wait until dewatering pumps cleared the pit of most standing water. This occurred around 10:30 AM. A Komatsu PC 490LC excavator was then used to extend the depth of the pit to 13 feet below surface, revealing the same fill / dredge spoils observed closer to the surface (Figure 2). The utility vault was installed, and a new trench was excavated. The 6-foot-wide trench extended 80 feet west from the utility vault and was excavated to about 10 feet below surface. Subsurface deposits consisted of mixed gray, brown, and grayish brown, pebbly sand to silty sand with ample construction debris, particularly brick fragments and large pieces of concrete (Figure 3). These sediments were interpreted as fill / dredge spoils. Near the base of the trench, multiple wood pilings and black, contaminated soils were observed. The trench terminated near the western edge of the project. There, the trench was expanded to 8 feet wide and excavated to 13 feet below surface (Figure 4). Between 12 and 13 feet below surface, fill / dredge spoils were underlain by gray, silty sand with no construction debris. These were likely tide flat deposits. No archaeological materials were observed.

At 2:45 PM, construction personnel shifted from trench excavation to utility installation and backfilling. The archaeologist departed soon thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 11, 2022, 7:30 AM to 2:15 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility vault excavation with the potential to encounter non-fill deposits (Figure 1).

GENERAL FIELD CONDITIONS: Weather was overcast to partly sunny, with temperatures between 45 and 60 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:30 AM and met with Strider Construction Company staff to review excavation plans for the day. Shortly thereafter, a Komatsu PC 490LC excavator began digging a new trench extending east of SDMH 7 (Figure 2). The 6-foot-wide trench was excavated to 8 feet below surface. Near SDMH 7, the trench contained fill consisting of brown, pebbly and cobbly sand with ample concrete debris. A large deposit of brick fragments was present between 1 and 3 feet below surface in this area (Figure 3). As the trench was extended east, construction personnel encountered existing utilities. Two of these utilities were left in place, one was removed. A concrete manhole was also left in place. Subsurface deposits in the vicinity of existing utilities consisted of brown to yellowish brown sand with few rocks and no construction debris. It likely stemmed from more recent fill deposition. At its eastern terminus, the trench was expanded to about 10 feet long and 10 feet wide and excavated to 14 feet below surface. At about 12.5 feet below surface, fill transitioned to gray, pebbly silty sand (Figure 4). Some of these sediments were contaminated, based on the oily smell they emitted. Otherwise, however, they appeared to be intact, tide flat deposits. No archaeological materials were observed.

At 2:15 PM, construction personnel shifted from trench excavation to backfilling and installation of SDMH 9 at the eastern terminus of the trench. The archaeologist departed soon thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 12, 2022, 7:40 AM to 12:40 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility excavation with the potential to encounter non-fill deposits (Figure 1).

GENERAL FIELD CONDITIONS: Weather was overcast to rainy, with temperatures between 50 and 55 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:40 AM and met with Strider Construction Company staff to review excavation plans for the day. Shortly thereafter, a Hitachi ZX 240 LC excavator began digging a new trench extending south from SDMH 7 (Figure 2). The 6-foot-wide trench was excavated to 10 feet below surface. The trench contained fill consisting of brown with some yellowish brown and gray, pebbly sand with ample construction debris, especially brick fragments, concrete, and wood pilings (Figure 3). The trench was extended approximately 100 feet to the south, terminating at the previously installed SDMH 8 at the southern edge of the project (Figure 4).

No non-fill sediments and no archaeological materials were observed. At 12:40 PM, construction personnel shifted to installing utilities and backfilling. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 23, 2022, 7:30 AM to 2:15 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility excavation with the potential to encounter non-fill deposits (Figure 1).

GENERAL FIELD CONDITIONS: Weather was overcast, with temperatures between 55 and 61 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:30 AM and met with Strider Construction Company staff to review excavation plans for the day. Shortly thereafter, a Deere 245G LC Mid-Size Excavator began digging a square pit measuring about 10 feet long on each side (Figure 2). The pit was located about 150 feet northeast of previously installed SDMH 7. It contained fill and non-fill sediments (Figure 3). Fill consisting of brown to yellowish brown sand to silty sand with trace construction debris extended to 5 feet below surface. Fill / dredge spoils consisting of dark grayish brown silty sand with wood pilings were present between 5 and 7 feet below surface. Likely intact tide flat deposits consisting of very dark gray silty sand with 40 percent small to medium shell fragments were present between 7 and 9 feet below surface. Shell fragments were not localized but spread across the entire base of the pit. They were interpreted as a natural, non-midden shell deposit. They likely represent the former surface of the tide flat. Wood pilings extended into tide flat deposits. Additional tide flat deposits were present between 9 and 11 feet below surface. They contained 5 percent small to medium shell fragments. Once excavation was completed, construction personnel placed angular spalls and fine sand fill at the base of the pit. An electrical vault was then installed (Figure 4).

Following installation, a new 10-foot-square pit was excavated northwest of the first pit. A similar stratigraphic sequence was observed, and an electrical vault was installed following excavation (Figure 5).

A third 10-foot-square pit was then excavated about 30 feet south of the first pit and south of a previously installed vault. The pit contained fill consisting of brown, yellowish brown, and gray sand to silty sand, which extended to 5 feet below surface. About 10 percent small to medium shell fragments were observed between 4 and 5 feet below surface. Likely intact tide flat deposits consisting of very dark gray sand with no shell fragments were present between 5 and 10 feet below surface. A utility vault was installed following excavation.

Lastly, a fourth 10-foot-square pit was excavated between the third pit and the previously installed vault. It contained a similar stratigraphic sequence as the third pit. A utility vault was installed following excavation.

No archaeological materials were observed during excavation. At 2:15 PM, construction personnel shifted to final installation tasks and pit backfilling. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: May 26, 2022, 8:00 AM to 2:30 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was mostly cloudy to overcast with temperatures in the mid 50s to low 60s degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and located the Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the southern part of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

This work occurred near the SDMH 7 facilities monitored during the week of May 9, 2022, and exposed similar subsurface conditions. Two pairs of adjacent but slightly offset, roughly square trenches were excavated in the southern part of the property. Each trench was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The sediments in all four trenches consisted of grayish to yellowish brown gravelly sand with ceramic and metal pipe fragments, wooden pilings, brick fragments, and concrete rubble (fill) to a depth of 7.5 ft, underlain by moist dark gray to black silt, sand, and clay (tide flat) from 7.5 to 8 ft below surface.

Intact native sediments observed today were limited to the bottom 6 inches of the excavations. Cultural materials were limited to demolition debris from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return when requested by the Port (schedule to be determined).

FIGURES

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: July 6, 2022, 8:00 AM to 4:00 PM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was mostly cloudy with temperatures in the low 60s to low 70s °F.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the northcentral of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

Two adjacent but slightly offset, roughly square trenches were excavated. Each was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The sediments in both trenches consisted of brown gravelly sand (recent fill) to a depth of 3 ft underlain by gray silt, sand, and clay from 3 to 8 ft, and gray soft wet sandy clay (tide flat) from 8 to 10 ft below surface. A few steel I-beams were present beginning approximately 1-ft below surface.

A second pair of trenches with approximately the same dimensions was excavated approximately 120 ft to the north of the first. Sediments consisted of brown gravelly sand with asphalt, concrete, and rebar (recent fill) to a depth of 2.5 ft, underlain by gray silt, sand, and clay from 2.5 to 7 ft, and gray soft wet sandy clay (tide flat) from 7 to 10 ft below surface. Four metal-wrapped concrete piles were present beginning approximately 1 ft below surface.

A third pair of trenches with approximately the same dimensions was excavated approximately 120 ft to the north of the second. Sediments consisted of brown gravelly sand (recent fill) to a depth of 2.5 ft, underlain by gray silt, sand, and clay from 2.5 to 7 ft, and gray soft wet sandy clay (tide flat) from 7 to 10 ft below surface. Concrete beams and steel I-beams were exposed approximately 8 ft below surface.

Another trench with approximately the same dimensions was excavated approximately 80 ft to the north of the third. Sediments consisted of brown sand with sparse gravels (recent fill) to a depth of 4 ft, underlain by gray gravelly cobbly sand with wood and concrete rubble (older fill) from 4 to 5 ft, and gray soft wet sandy clay (tide flat) from 5 to 10 ft below surface. An existing water line was present in the south edge of the trench approximately 3 ft below surface. The second trench in this pair will be excavated tomorrow.

Some areas of apparently intact tide flat deposits were observed today underlying older and recent fill deposits. Cultural materials were limited to demolition debris from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return the following day.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: July 7, 2022, 7:00 AM to 9:15 AM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Utility vault excavation with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was mostly cloudy with temperatures in the low 60s °F.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:00 AM and located Strider Construction Company's utility vault installation crew. The day's work was planned to consist of excavation of trenches to house utility vaults in the northcentral of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC with a 6-ft wide smooth bucket, switching to a 4-ft wide toothed bucket when needed.

Work continued with excavation of the second trench in the pair begun yesterday afternoon. Sediments consisted of brown sand with sparse gravels (recent fill) to a depth of 4 ft, underlain by gray gravelly cobbly sand with wood and concrete rubble (older fill) from 4 to 5 ft, and gray soft wet sandy clay (tide flat) from 5 to 10 ft below surface.

Two adjacent but slightly offset, roughly square trenches were excavated approximately 50 ft to the east. Each was approximately 20-x-20-ft, with sloped or stepped walls. The maximum depth of excavation was within an 11-x-11-ft square approximately in the center of each trench. The sediments in both trenches consisted of brown gravelly sand (recent fill) to a depth of 5 ft underlain by gray gravelly silt, sand, and clay from 5 to 6 ft, and gray soft wet sandy clay (tide flat) from 6 to 9 ft below surface. Wooden pilings and a drain pipe were encountered approximately 7 ft below surface.

Some areas of apparently intact tide flat deposits were observed today underlying older and recent fill deposits. Cultural materials were limited to demolition debris from the previously documented mill. No archaeological material was observed. The archaeologist departed after excavation was finished for the day, with plans to return when requested by the Port (schedule to be determined).

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: July 13, 2022, 8:00 AM to 2:00 PM.

MONITOR: Ian Kretzler.

PROJECT COMPONENT MONITORED: Utility excavation with the potential to encounter non-fill deposits (Figure 1).

GENERAL FIELD CONDITIONS: Weather was clear and sunny, with temperatures between 60 and 72 degrees Fahrenheit.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 8:00 AM and met with Strider Construction Company staff to review excavation plans for the day. Soon after, construction personnel began excavating holes for utility vaults. Over the course of the day, a Hitachi ZX245USLC and a Komatsu PC 490LC were used to excavate seven vaults (Figures 1 – 3, Table 1). Each vault hole measured approximately 8.5-feet-square and extended to between eight and 10 feet below surface. They contained fill consisting of brown, pebbly and cobbly sand with concrete, rebar, and other construction debris (Figure 4). Fill extended to about five feet below surface. It was underlain by dredge spoils consisting of dark gray, sandy silt to silty sand with debris from wood pilings (Figure 4). In five vaults, dredge spoils extended to the base of excavation. In vault #3, tide flat deposits consisting of dark gray coarse sand with no construction debris were present between six and nine feet below surface. Similar tide flat deposits appeared mixed with dredge spoils between seven and nine feet below surface in vault #6. In vault #7, concrete and rebar structural elements were encountered three feet below surface (Figure 5). Removal of these elements slowed excavation. The base of the hole, approximately eight feet below surface, did not extend below the base of the concrete. Angular spalls and fabric were placed at the base of each vault hole following excavation.

No shell fragments or other archaeological sites were observed during archaeological monitoring. At 2:30 PM, construction personnel shifted to backfilling and installing utility vaults. The archaeologist departed shortly thereafter.

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: July 25, 2022, 7:00 AM to 10:00 AM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Excavation of Outfall A and Outfall M spillways with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was sunny with temperatures in the low 60s °F.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:00 AM and located Strider Construction Company's utility excavation crew. The day's work was planned to consist of excavation of two spillways for outfalls on the western edge of the property. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation in the upland portions of both work areas was monitored previously and did not identify any native soils or potential archaeological deposits. However, the spillways would involve excavation at the toe of the existing riprap seawall, which was not involved in any prior monitored activities.

Excavation was conducted using a Komatsu PC 490 LC with a 4-ft wide toothed bucket. The target depth of excavation was -2 ft MLLW (mean lower low water) in an approximately 10-x-15-ft area waterward of the seawall in both locations. The spillway at Outfall A in the southern part of the project was excavated first. The ground surface in this location consisted of riprap boulders, concrete rubble, and a few brick fragments. The underlying sediments consisted of wet brown very gravelly sand with small (naturally occurring) shells. The target depth of excavation was -2 ft MLLW (mean lower low water) in an approximately 10-x-15-ft area waterward of the seawall.

The spillway at Outfall M was then excavated using the same equipment and methods. Additionally, an existing PVC drain pipe was removed. The surface of this work area consisted of riprap boulders and concrete. Underlying sediments consisted of very gravelly brown sand and black-stained wet silt and sand with small (naturally occurring) shells and a very strong hydrogen sulfide odor.

No archaeological material was observed, nor were any clearly native sediments. The archaeologist departed after excavation in the previously unmonitored locations was completed, with plans to return when requested by the Port (schedule to be determined).

FIGURES

DAILY ARCHAEOLOGICAL MONITORING LOG
PORT OF EVERETT - MIE/MTCA 3RD INTERIM ACTION
CRC PROJECT NO. 2110B

DATE AND TIME: August 1, 2022, 7:45 AM to 9:15 AM.

MONITOR: Margaret Berger

PROJECT COMPONENT MONITORED: Excavation at SDMH 9 with potential to exceed depth of fill.

GENERAL FIELD CONDITIONS: Weather was partly cloudy with temperatures in the low 70s °F.

ARCHAEOLOGY OBSERVED: None.

NARRATIVE:

The archaeologist arrived on site at 7:45 AM and located Strider Construction Company's utility excavation crew. The activity to be monitored consisted of excavating a trench connecting to the existing SDMH (storm drain manhole) 9. Depths of excavation were anticipated to potentially exceed the depth of fill deposits on site. Excavation was conducted using a Komatsu PC 490 LC mounted with a 4-ft wide toothed bucket, 6-ft wide smooth bladed bucket, or 2-ft wide smooth bladed bucket depending on conditions.

The ground surface in this location consisted of angular gravels. This was underlain by clean brown sand (fill) to a depth of approximately 10 ft below surface. Wet gray sand with some gravel and cobbles was present 10 to 10.5 ft below surface. The trench was approximately 6 ft wide and 15 ft long. One piece of lumber was found 8 ft below surface, metal pipes were encountered 3 to 4 ft below surface, and geotextile fabric was found 1.5 ft below surface.

Potentially native sediments were encountered in the deepest 6 inches of the trench, but no archaeological material was observed. The archaeologist departed after excavation was completed. This was the final project activity slated for archaeological monitoring.

Fine-Grained Soils	Very Soft	0 to 2
	Soft	2 to 4
	Medium Stiff	4 to 8
	Stiff	8 to 15
	Very Stiff	15 to 30
	Hard	>30

Test Symbols

FC = Fines Content
G = Grain Size
M = Moisture Content
A = Atterberg Limits
C = Consolidation
DD = Dry Density
K = Permeability
Str = Shear Strength
Env = Environmental
PiD = Photoionization Detector

Component Definitions

Descriptive Term	Size Range and Sieve Number
Boulders	Larger than 12"
Cobbles	3" to 12"
Gravel	3" to No. 4 (4.75 mm)
Coarse Gravel	3" to 3/4"
Fine Gravel	3/4" to No. 4 (4.75 mm)
Sand	No. 4 (4.75 mm) to No. 200 (0.075 mm)
Coarse Sand	No. 4 (4.75 mm) to No. 10 (2.00 mm)
Medium Sand	No. 10 (2.00 mm) to No. 40 (0.425 mm)
Fine Sand	No. 40 (0.425 mm) to No. 200 (0.075 mm)
Silt and Clay	Smaller than No. 200 (0.075 mm)

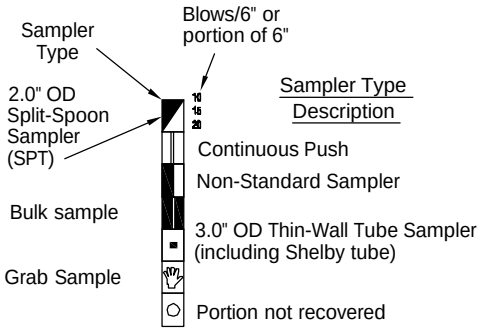
(3) Estimated Percentage

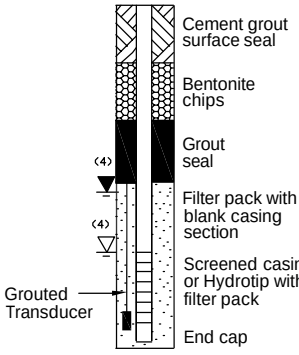
Percentage by Weight	Modifier
<5	Trace
5 to 15	Slightly (sandy, silty, clayey, gravelly)
15 to 30	Sandy, silty, clayey, gravelly)
30 to 49	Very (sandy, silty, clayey, gravelly)

Moisture Content

Dry - Absence of moisture, dusty, dry to the touch
Slightly Moist - Perceptible moisture
Moist - Damp but no visible water
Very Moist - Water visible but not free draining
Wet - Visible free water, usually from below water table

Symbols





(1) Percentage by dry weight
(2) (SPT) Standard Penetration Test (ASTM D-1586)
(3) In General Accordance with Standard Practice for Description and Identification of Soils (ASTM D-2488)
(4) Depth of groundwater — ATD = At time of drilling; Static water level (date); BGS = below ground surface
(5) Combined USCS symbols used for fines between 5% and 15% as estimated in General Accordance with Standard Practice for Description and Identification of Soils (ASTM D-2488)

Classifications of soils in this report are based on visual field and/or laboratory observations, which include density/consistency, moisture condition, grain size, and plasticity estimates and should not be construed to imply field or laboratory testing unless presented herein. Visual-manual and/or laboratory classification methods of ASTM D-2487 and D-2488 were used as an identification guide for the Unified Soil Classification System.

Boring Log

Aspect CONSULTING

Project Number	Boring Number	Sheet
110207	MW-01 (DP-15)	1 of 1

Project Name: Kimberly Clark
Location: Everett, WA
Driller/Method: Cascade Drilling / Direct Push Probe-Limited Access
Sampling Method: Continuous Core

Ground Surface Elev.: 14.41
Depth to Water (ft BGS):
Start/Finish Date: 2/15/2012

Depth / Elevation (feet)	Borehole Completion	Sample Type/ID	Tests	PID (ppm)	Blows/ 6"	Material Type	Description	Depth (ft)
14 to -15	5" Flush-mount monument and thermos cap; Concrete surface seal 0' to 2'; 3/8" Hydrated bentonite chips 2' to 2.5"; 2/12 Silica sand filter pack 2.5' to 13'; 1" Diameter PVC pre-packed .001 slot screen 3' to 13'; Threaded cap; Slough	CC-1	DP-15-3-4	0		Asphalt	Asphalt, gravel	
				0		Gravel	Very moist, brown to gray, silty, sandy GRAVEL (GM); poorly graded fine-to-medium, subrounded gravel, 2" bed of charred organics at 1'	1
				0		Sand	Very moist, brown, gravelly SAND (SP); poorly graded fine-to-medium sand	2
				0				3
				0		Silty Sand	Very moist, brown, very silty SAND (SM); fine sand	4
		CC-2	DP-15-6.5-7.5	0		Sand	Very moist, brown SAND (SP); poorly graded fine-to-medium sand Fill debris from 4.75' to 6.5': charred wood, nails, ceramic, black and orange debris	5
				0				6
				0				7
				0		Gravel	Wet, gray, very sandy GRAVEL (GP); fine, rounded gravel	8
				0		Sand	Wet, gray SAND (SP); poorly graded fine-to-medium sand	9
				0				10
				0				11
		CC-3		0		Silt	Wet, gray, sandy SILT (ML)	12
				0		Sand	Wet, gray SAND (SP); poorly graded fine-to-medium sand, frequent silt laminae	13
				0				14
				0			Bottom of boring at 15 ' BGS	15
16 to 29								16 to 29

Notes:

"R" in well ID denotes a replacement well.

"-" denotes no measurement collected.

All depths to water and elevations are in feet.

Horizontal coordinates relative to Washington State Plane North. Elevations relative to NAVD88 vertical datum.

*: Refer to tidal study description in Section 2.

**: Measurements collected during groundwater sampling; therefore measurements collected at variable tidal stages - not a snapshot set of measurements.

Notes:

"R" in well ID denotes a replacement well.

"-" denotes no measurement collected.

All depths to water and elevations are in feet.

Horizontal coordinates relative to Washington State Plane North. Elevations relative to NAVD88 vertical datum.

*: Refer to tidal study description in Section 2.

**: Measurements collected during groundwater sampling; therefore measurements collected at variable tidal stages - not a snapshot set of measurements.

Notes:

"R" in well ID denotes a replacement well.

"-" denotes no measurement collected.

All depths to water and elevations are in feet.

Horizontal coordinates relative to Washington State Plane North. Elevations relative to NAVD88 vertical datum.

*: Refer to tidal study description in Section 2.

**: Measurements collected during groundwater sampling; therefore measurements collected at variable tidal stages - not a snapshot set of measurements.

ACRONYMS

%R	percent recovery
BTEX	benzene, ethylbenzene, toluene, *m-, p-, & o*-xylenes
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	Cold vapor atomic fluorescent spectrometry
EPA	U.S. Environmental Protection Agency
GC/ECD	gas chromatograph/electron capture detector
GC/FID	gas chromatograph/flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
GC/PID	gas chromatograph/photo ionization detector
ICP/MS	inductively coupled plasma/ mass spectrometer
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics)
PAHs	Polycyclic aromatic hydrocarbons
PCBs	polychlorinated biphenyls
QA/QC	quality assurance/quality control
RL	reporting limit
RPD	relative percent difference
SDG	sample delivery group
SVOCs	semi-volatile organic compounds
TDS	total dissolved solids
TPH	Total petroleum hydrocarbons
TSS	total suspended solids
VOCs	Volatile organic compounds

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil and groundwater samples collected during the months of February and May in 2012 for the referenced project. The laboratory reports reviewed herein were submitted by Friedman & Bruya, Inc.

A summary (Level II) data review was performed on these laboratory reports. The review followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the review were based on the current performance-based control limits established by the laboratory (laboratory control limits).

The data review findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report. Samples and the associated analyses validated herein are summarized as follows:

Notes:

[(A)]: The sample was not analyzed for BTEX.

[(B)]: Metals analyzed for this sample included antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc.

EDB: 1,2-Dibromoethane

Hg: Mercury; For water samples, analyses were performed on filtered aliquots and reported as “dissolved mercury”.

Metals: Arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, and zinc. For water samples, metals analyses were performed on filtered aliquots and reported as "dissolved metals".
PAHs: Polycyclic aromatic hydrocarbons
PCBs: Polychlorinated biphenyls
SVOCs: Semivolatile organic compounds
TDS: Total dissolved solids
TPH-Dx: Diesel and motor oil range total petroleum hydrocarbon (TPH)
TPH-G: Gasoline range TPH; sample was also analyzed for BTEX (benzene, ethylbenzene, toluene, *m-, p-, & o*-xylenes).
TSS: Tot.al suspended solids
VOCs: Volatile organic compounds
X: The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. Seattle, Washington
Semi-volatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
BTEX	SW846 Method 8021B	
1,2-Dibromoethane (EDB)	SW846 Method 8011	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Total Suspended Solids (TSS)	SM Method 2540D	
Total Dissolved Solids (TDS)	SM Method 2540C	Aquatic Research Inc. Seattle, Washington

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. No anomalies were identified in relation to sample preservation, handling, and transport.

Soil and water samples should be extracted (soil only) and analyzed within 14 days of collection. All samples were analyzed within the required holding time.

1.2 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs) in the method blanks.

1.3 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed for soil and water samples as required by the method. All percent recovery (%R) and relative percent difference (RPD) values met the laboratory control criteria.

1.4 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.5 Matrix Spike (MS)

MS analyses were performed on water sample MW-4-021712. The %R values were within the laboratory control limits.

1.6 Overall Assessment of VOCs Data Usability

Based on the information submitted by the laboratory in the laboratory reports, VOCs data are acceptable for use.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above RLs in the method blanks.

2.3 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All percent recovery (%R) values were within the laboratory control limits.

2.4 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were performed on soil sample DP-19-2.5-3.5. LCS/LCSD analyses were performed for water samples in lieu of MS/MSD (see Section 2.6). All %R and RPD values met the laboratory control criteria.

2.5 Laboratory Duplicate

Laboratory duplicate analyses were performed on soil sample DP-19-2.5-3.5. All RPD or concentration difference values met the laboratory control criteria.

2.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed for soil and water samples as required by the method. All %R and RPD values met the project control criteria.

2.7 Overall Assessment of SVOCs Data Usability

Based on the information submitted in the laboratory reports, SVOCs data are acceptable for use.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the MDLs in the method blanks.

3.3 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were inapplicable for data evaluation because the samples contained high levels of target PAHs and requested dilution analysis; no data were qualified on this basis.

3.4 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed with each analytical batch. All %R and RPD values were either within the project control limits or the outliers had no adverse effects on data usability (*e.g.,* biased-high recovery for compounds that were not detected in samples).

3.5 Overall Assessment of PAHs Data Usability

Based on the information submitted in the laboratory reports, PAHs data are acceptable for use.

4. PCB Aroclors by GC/EDC (EPA Method SW8082A)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

4.2 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the RLs in the method blanks.

4.3 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

4.4 Laboratory Duplicate

Laboratory duplicate analyses were performed on samples DP-19-2.5-3.5 and CB-2. All RPD or concentration difference values met the laboratory control criteria.

4.5 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed for soil and water samples as required by the method. All %R and RPD values were within the project control limits.

4.6 Overall Assessment of PCB Aroclors Data Usability

Sample CB-1 was re-extracted and re-analyzed for confirmative purposes. PCB Aroclors results for this sample should be reported from the initial analysis; the results from the re-analysis were to be disregarded.

Based on the information submitted in the laboratory reports, PCB Aroclor data are acceptable for use.

5. TPH-Gasoline and BTEX by GC/FID-PID (NWTPH-Gx/EPA Method SW8021B)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport.

Soil and water samples should be extracted (soil samples only) and analyzed within 14 days. All samples were extracted and analyzed within the required holding times.

5.2 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above RLs in the method blanks.

5.3 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

5.4 Laboratory Duplicate

Laboratory duplicate analyses were performed on soil samples DP-1-2.5-3, DP-16-6-7. Laboratory duplicate analyses for water samples were performed on a batch QC sample. The RPD or concentration difference values met the laboratory control criteria.

5.5 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values met the laboratory control limits.

5.6 Overall Assessment of TPH-G and BTEX Data Usability

Based on the information submitted in the laboratory reports, TPH-G and BTEX data are acceptable for use.

6. TPH-Diesel & Motor Oil (Methods NWTPH-Dx)

6.1 Holding Time

Soil samples should be extracted within 14 days of collection, and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding time.

6.2 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

6.3 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

6.4 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on sample were performed for soils on samples DP-14-3-4, DP-19-2.5-3.5. LCS/LCSD analyses were performed in lieu of MS/MSD for water samples (see Section 6.5). The %R and RPD values met the laboratory control criteria.

6.5 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS analyses were performed for soil; LCS/LCSD analyses were performed for water samples as required by the method. All %R and RPD values met the project control criteria.

6.6 Target Compound Identification

Sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

6.7 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

Based on the information submitted in the laboratory reports, TPH-Diesel and TPH-Motor Oil data are acceptable for use.

7. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

7.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for ICP/MS metals and 28 days for mercury. Samples were analyzed within the required holding times.

7.2 Method Blanks

Method blanks were prepared and analyzed as required. Target analytes were not detected at or above the RLs in the method blanks.

7.3 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS analyses were performed for soil; LCS/LCSD analyses were performed for water samples as required by the method. All %R and RPD values met the project control criteria.

7.4 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on soil samples DP-16-6-7 and CB-1 for total metals (analyzed with ICP/MS) and mercury. MS analysis was performed on water sample MW-5-021712 for dissolved mercury. All %R and RPD values met the laboratory control criteria.

7.5 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

7.6 Overall Assessment of Metals Data Usability

Based on the information submitted in the laboratory reports, metals data are acceptable for use.

8. 1,2-Dibromoethane (EDB) by GC/ECD (EPA Method SW8011)

8.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport.

Water samples should be extracted and analyzed within 28 days of collection. All samples were analyzed within the required holding time.

8.2 Method Blank

Method blanks were prepared and analyzed at the required frequency. EDB was not detected at or above the RL in method blanks.

8.3 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were not performed on a project samples. LCS/LCSD analyses were performed in lieu of MS/MSD (see Section 8.4).

8.4 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the methods. All %R and RPD values met the laboratory control criteria.

8.5 Overall Assessment of EDB Data

Based on the information submitted in the laboratory report, EDB data are acceptable for use.

9. Total Dissolved Solids (TDS) and Total Suspended Solids (TSS)

9.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport. Water samples should be analyzed within seven days of collection for TDS and TSS. All samples were analyzed within the required holding times.

9.2 Method Blanks

Method blanks were prepared and analyzed as required by the methods. TDS and TSS were not detected at or above the RLs in method blanks.

9.3 Laboratory Duplicate

Laboratory duplicate analysis was performed on sample MW6-021712. The RPD value met the laboratory control criteria.

9.4 Laboratory Control Samples (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed for TSS. The %R and RPD values were within the laboratory control limits.

9.5 Overall Assessment of TDS and TSS Data Usability

Based on the information submitted in the laboratory report, TDS and TSS data are acceptable for use.

SUMMARY

Data qualification is summarized as follows:

Laboratory ID	Sample ID	Analyte	Adjusted Result	Qualifier	Qualified Reason
No data qualifiers were assigned as a result of QC outliers in these SDGs.					

Data Qualifiers are defined as follows:

Data Qualifier	Definition
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
ARI	Analytical Resources, Inc. – Tukwila, Washington
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CDD	chlorinated dibenzo-p-dioxin
CDF	chlorinated dibenzofuran
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DDD	dichlorodiphenyldichloroethane
DDE	dichlorodiphenyldichloroethylene
DDT	dichlorodiphenyltrichloroethane
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EDB	1,2-dibromoethane
EDL	estimated detection limit
EMPC	estimated maximum possible concentration
EPA	U.S. Environmental Protection Agency
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
GPC	gel permeation chromatography
HPLC	high performance liquid chromatography
HRGC	high-resolution gas chromatograph
HRMS	high-resolution mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP	inductively coupled plasma
ICP/MS	inductively coupled plasma/ mass spectrometer

ICSA	ICP interference check sample solution A
ICV	initial calibration verification
IPR	initial precision and recovery
ISC	isomer specificity check
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
m/z	mass-to-charge ratio
MDL	method detection limit
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans)
OPR	ongoing precision and recovery
pg/g	pictogram per gram
PCBs	polychlorinated biphenyls
PCDD	polychlorinated dibenzo-*p*-dioxin
PCDF	polychlorinated dibenzofuran
PEM	performance evaluation mixture
PSEP	Puget Sound Estuary Program
QA/QC	quality assurance/quality control
QAPP	quality assurance project plan
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
S/N	signal-to-noise ratio
SAP	sampling and analysis plan
SDG	sample delivery group
SICP	selected ion current profile
SIM	selective ion monitoring
SRM	standard reference material
SVOCs	semi-volatile organic compounds
TDS	total dissolved solids
TSS	total suspended solids
TOC	total organic carbon
TS	total solids

VOCs	volatile organic compounds
WDM	window defining mixture
µg/kg	microgram per kilogram

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during May and June 2012 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Columbia Analytical Services, Inc. (CAS, part of ALS Group).

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans) and EPA Region 10 SOP (EPA 1996), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

				Analysis

Notes:

* Sample was also analyzed for total suspended solids (TSS)
** Sample was also analyzed for total suspended solids (TSS), ammonia, and dissolved sulfide
*** Sample was also analyzed for TSS, ammonia, dissolved sulfide, and formaldehyde
^ Sample was also analyzed for TSS and dibromoethane (EDB)
^^ Sample was also analyzed for dissolved sulfide, and ammonia.
Metals: Antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc
PAHs - Polycyclic aromatic hydrocarbons
PCBs - Polychlorinated biphenyls
SVOCs - Semivolatile Organic Compounds
TOC – Total Organic carbon
TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon
TPH-G - Gasoline range total petroleum hydrocarbon
VOCs - Volatile Organic Compounds
X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. Seattle, WA
Semivolatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Total Organic Carbon (TOC)	ASTM D4129-05M	Columbia Analytical Services, Inc. Kelso, WA (Part of ALS Group)
Total Suspended Solids (TSS)	SM Method 2540D	
Dissolved sulfide	SM 4500-S2-D	
1,2-Dibromoethane (EDB)	SW846 Method 8011	
Ammonia as Nitrogen	EPA Method 350.1	
Formaldehyde	SW846 Method 8315A	
Dioxins/Furans	SW846 Method 8290	Columbia Analytical Services, Inc. Houston, TX (Part of ALS Group)

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. No anomalies were identified in relation to sample preservation, handling, and transport.

Soil and water samples should be extracted (soil only) and analyzed within 14 days of collection. All samples were analyzed within the required holding time.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples), with the exceptions of following:

ICV ID	Compound	%D (%)	Bias	Affected Sample	Data Qualifier
GCMS9 5/23/12, 2:43	Dichlorodifluoromethane Chloromethane	26.3 22.2	Low	All soil samples in SDGs 205364 205381 205404 205423	**UJ**

ICV ID	Compound	%D (%)	Bias	Affected Sample	Data Qualifier
GCMS9 5/30/12, 15:55	Dichlorodifluoromethane	32.1	Low	All soil in SDGs 205441 206006 206068	**UJ**

1.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

CCV ID	Compound	%D (%)	Bias	Affected Sample	Data Qualifier
GCMS9 6/1/12, 2:55	Dichlorodifluoromethane	25.6	Low	GF-B-8-7.5-9 UST68-MW-2-10-11 UST68-MW-2-10-11D	**UJ**
GCMS4 6/1/12, 16:31	Bromomethane Chloroethane Hexachlorobutadiene	20.1 21.5 21.4	Low	UST71-B-1-12-13 UST71-B-2-13-14 UST71-B-3-18-19 UST71-B-4-12.5-13.5 UST70-B-1-3-4 UST70-B-1-3-4-D	**UJ**
GCMS4 6/5/12, 10:44	Bromomethane Chloroethane	21.8 20.6	Low	NRP-B-8-11-12	**UJ**
GCMS9 6/7/12, 17:50	Dibromochloromethane Bromoform 1,2-Dibromo-3-chloropropane	26.2 37.2 20.7	Low	UST68-MW-1-060612 UST68-MW-2-060612 UST68-MW-4-060612 UST68-MW-5-060612 REC7-MW-3-060612 REC7-MW-4-060612	**UJ**
GCMS9 6/8/12, 9:53	Methylene chloride Bromoform	24.3 23.7	Low	MW-1-060612 MW-2-060612 OMS-MW-1-060612	**UJ**
GCMS9 6/12/12, 16:33	Dichlorodifluoromethane Bromoform	21.7 34.3	Low	REC3-MW-1-060712 MW-4-060812 MW-4-060812-D	**UJ**

1.5 Blanks

Method Blanks: Method blanks were prepared and analyzed as required. Target compounds were either not detected at or above the reporting limits (RLs), or detected in the method blanks at levels that had no significant effects on data quality (*e.g.,* sample results >5x the level found in the method blank).

Trip Blanks: One trip blank was collected on 5/23/2012 and analyzed for VOCs. Target compounds were not detected at or above the RLs in this trip blank.

Equipment Rinsate Blank: One equipment rinsate blank, sample RB-NRP-3-060112, was collected on 6/1/2012 and analyzed for VOCs. Target compounds were not detected at or above the RLs in this sample.

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples), with the exceptions as follows:

LCS ID	Compound	%R (%)		Control Limit (%)	Associated Sample	Data Qualifier
		LCS	LCSD			
02-0880 LCS 02-0880 LCSD (SDG: 206067)	Dichlorodifluoromethane Bromoform	67 - -	68 68	70-130	REC7-MW-1-060512 NRP-MW-3-060512 REC7-MW-2-060512 NRP-MW-2-060512 REC6-MW-2-060512 MW-5-060512 MW-3-060512	**UJ**
02-0996 LCS 02-0996 LCSD	Bromoform	64	65	70-130	REC3-MW-1-060712 MW-4-060812 MW-4-060812-D	**UJ**
02-1013 LCS 02-1013 LCSD	Bromoform	- -	68		UST71-MW-1-060712 UST70-MW-2-060712 REC5-MW-1-060812	**UJ**

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on samples GF-B-10-1-2.5, GF-B-1-1-2.5, NRP-MW-3-6.5-7.5, UST71-B-1-12-13, NRP-B-7-19-20, and UST68-MW-2-060612. The %R values were within the project control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R (%)	Control Limit (%)	Data Qualifier
205381	GF-B-10-1-2.5	Dichlorodifluoromethane Chloromethane	19 47	50-150	**UJ**
205404	GF-B-1-1-2.5	Dichlorodifluoromethane	23	50-150	**UJ**
205423 205441	NRP-MW-3-6.5-7.5	Dichlorodifluoromethane Chloromethane Vinyl chloride Bromomethane Chloroethane Trichlorofluoromethane 1,1-Dichloroethene Methylene chloride trans-1,2-Dichloroethene 1,1-Dichloroethane 2,2-Dichloropropane Chloroform 1,1,1-Trichloroethane 1,1-Dichloropropene Carbon tetrachloride Benzene Trichloroethene (TCE) Tetrachloroethene (PCE) 1,2,4-Trichlorobenzene Hexachlorobutadiene 1,2,3-Trichlorobenzene	4 23 19 30 30 15 30 46 30 45 40 49 39 40 35 47 44 43 49 45 49	50-150	**UJ**
206006	NRP-B-7-19-20	Dichlorodifluoromethane	7	50-150	**UJ**

1.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on sample REC7-MW-1-060512 (SDG: 206067). All RPD or concentration difference values met the laboratory control criteria.

1.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.11 Reporting Limit and Target Compound Quantitation

The sample-specific MDLs and MRLs were adjusted with sample amount extracted and MRLs were supported with adequate initial calibration concentrations. The project requirements for quantitation limits were achieved.

Vinyl acetate and 1,4-dioxane reported in samples REC6-MW-2-060512 and MW-3-060512 and the method blank associated with these samples were based on a tentatively identified compound (TIC) search against the laboratory library. The compounds were not detected in any of the samples; the MRLs reported were based on 10 times the standard MRLs for other VOCs. Vinyl acetate and 1,4-dioxane results in samples REC6-MW-2-060512 and MW-3-060512 were qualified (UJ) as estimated.

1.12 Field Duplicates

Seven sets of field duplicates were submitted for VOCs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

1.13 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be extracted within 14 days and water samples within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
GCMS8 5/31/12, 11:33	Pyrene	36.1%	High	GF-B-14-7.5-9 GF-B-2-2.5-4	**J**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS/MSD analyses were not performed for SVPCs analyses; instead, laboratory duplicates in combination with LCS/LCSD analyses were performed.

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the project control criteria, or the outliers had no adverse effects on data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples).

2.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on sample GF-B-10-1-2.5 (SDG: 205381) and GF-B-8-7.5-9 (SDG: 205441). All RPD or concentration difference values met the laboratory control criteria.

2.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

SDG #	Sample ID	Internal Standard	Internal Standard %R	Control Limit	Affected Compound	Data Qualifier
205423	GF-B-6-1-2.5	Perylene-d_{12}	49.4%	50-200%	Di-*n*-octyl phthalate	**UJ**

Sample GF-B-11-1-2.5 was diluted and re-analyzed with acceptable internal standard recoveries. Both results were reported and original data (undiluted) should be used for data interpretation.

2.11 Reporting Limits and Compound Quantitation

The sample-specific MDLs and reporting limits (RLs) were adjusted with sample amount extracted and moisture content. RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

2.12 Field Duplicates

Samples NRP-MW-3-060512 and NRP-MW-3-060512D were field duplicates. Sample results, RPD (or concentration difference) values, and data qualification for detected compounds were summarized in **Appendix A**.

2.13 Overall Assessment of SVOCs Data Usability

SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport. Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

3.5 Blanks

Method Blanks: Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

Equipment Rinsate Blank: One **equipment** rinsate blank, sample RB-NRP-3-060112, was collected on 6/1/2012 and analyzed for PAHs. Target compounds were not detected at or above the RLs in this sample.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples), except qualified below. In some cases surrogate spike %R values were inapplicable for data evaluation because the samples contained high levels of target PAHs and requested dilution analysis; no data were qualified on this basis. The remaining anomalies were summarized in the following:

Sample ID	Surrogate	%R (%)	Control Limit (%)	Affected Compound	Data Qualifier
NRP-B-2-8-10D	Benzo(a)anthracene-d_{12}	162	35-159	Fluoranthene Pyrene Chrysene Indeno(1,2,3-cd)pyrene	**J**
MW-1-060612 MW-2-060612 OMS-MW-1-060612	Benzo(a)anthracene-d_{12}	29 28 31	50-129	Fluoranthene Pyrene Benz(a)anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	**UJ**
REC3-MW-1-060712 UST70-MW-2-060712	Benzo(a)anthracene-d_{12}	35 45	50-129	Fluoranthene Pyrene Benz(a)anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene	**UJ**

3.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on samples REC2-B-12-17-18 (SDG: 205364), REC2-B-5-7-8 (SDG: 205381), NRP-MW-3-6.5-7.5 (SDG: 205423), UST71-B-4-28-29 (SDG: 206006), and REC3-MW-1-8.5-9.5 (SDG: 206068). The %R and RPD values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	RPD	Control Limit	Data Qualifier
205423	NRP-MW-3-6.5-7.5	Naphthalene	37	- -	- -	44-129	**J**

Note: "- -" indicated that the value was within the control limit.

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Internal Standard %R	Control Limit	Affected Compound	Data Qualification
UST-70-B-1-3-4	Phenanthrene-d_{10}	49.9%	50-200%	Anthracene Fluoranthene Phenanthrene	**UJ** **J** **J**

3.10 Reporting Limits and Target Compound Quantitation

The sample-specific RLs were adjusted with sample amount extracted and RLs were supported with adequate initial calibration concentrations.

3.11 Field Duplicates

Four sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. PCB Aroclors (EPA Method SW8082A)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

4.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements.

All ICALs met the requirements.

4.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

4.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits, except for the following:

Sample ID	Surrogate	%R	Control Limit	Affected Compound	Data Qualifier
GF-B-14-1-2.5	Tetrachloro-*m*-xylene	17%	50-150%	All PCB Aroclors	**UJ**

4.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were not performed for PCB Aroclors analyses; instead, duplicate and LCS/LCSD analyses in combination were performed.

4.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on client samples REC3-MW-1-8.5-9.5 (SDG: 206068), GF-B-10-1-2.5 (SDG: 205381), GF-B-8-7.5-9 (SDG: 205441), and REC3-MW-1-8.5-9.5 (SDG: 206068). All RPD or concentration difference values met the laboratory control criteria.

4.9 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were adjusted with sample amount extracted and moisture content. RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

Aroclor 1260 was detected in sample GF-B-15A-10-11.5. Aroclor 1254 was detected in sample GF-B-8-1-2.5. The dual column RPD values were less than 40% for both detections.

4.10 Field Duplicates

Field duplicates were not submitted for PCB analyses in these SDGs.

4.11 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use, as qualified.

5. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport. Soil and water samples should be extracted (soil only) and analyzed within 14 days. All samples were extracted and analyzed within the required holding times.

5.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

5.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on samples Gf-B-13-10-11.5, GF-B-2-2.5-4, GF-B-3-1-2.5, NRP-B-8-8.5-9.5, and NRP-MW-2-060512 and several non-client samples. All RPD and concentration difference values met the laboratory control criteria.

5.9 Reporting Limits and Target Compound Quantitation

The sample-specific RLs were adjusted with sample amount extracted and supported with adequate initial calibration concentrations.

5.10 Field Duplicates

Six sets of field duplicates were submitted for TPH-Gasoline analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use.

6. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

6.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport. Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

6.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using individual petroleum product reference standards to ensure the proper identification and quantitation of petroleum hydrocarbons in samples, (2) the calibration curve include a sufficiently low standard to provide the necessary reporting limits, and (3) the linear working range of the instrument be defined.

The ICAL met the method requirements. The linearity of the ICAL curves were verified with %RSD values of RFs (%RSD ≤20%, according to EPA SW 846 Method 8000), and was acceptable for both TPH-Diesel and TPH-Motor Oil.

6.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±15% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±15% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample), except for the following:

Instrument ID	Compound	%D (%)	Bias	Affected Sample	Data Qualifier
GC#1 6/1/12, 15:26	TPH-Diesel	18.5	Low	GF-B-3-1-2.5 GF-B-3-7.5-9 GF-B-3-11-12.5 GF-B-5-1-2.5 GF-B-5-7.5-9 GF-B-6-1-2.5 GF-B-6-7.5-9	**UJ** **UJ** **UJ** **J** **J** **UJ** **J**

				NRP-MW-1-060812-D	**UJ**

6.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

6.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

6.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed at the required frequency. The %R and RPD values met the laboratory control limits.

6.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

6.8 Target Compound Identification

Sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

6.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations. Sample-specific RLs were adjusted to sample weight and moisture content.

Several positive TPH-Diesel and TPH-Motor Oil detections had chromatographic pattern that did not resemble the fuel standard for quantitation.

6.10 Field Duplicates

Four sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

6.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

7. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

7.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding time.

7.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

7.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

For mercury, the method requires that (1) a blank and five calibration standards be employed to establish the analytical curve, and (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995.

All ICALs met the method requirements.

7.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 80 – 120% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample), except for the following:

CCAL ID	Analyte	%R	Affected Sample	Data Qualifier
25 ppb i2-40d (3) 6/8/12, 13:59	Total Arsenic	84.4%	REC-MW-4-060612 MW-2-060612	**J**
25 ppb i2-40d (9) 6/12/12, 14:25	Dissolved Arsenic Dissolved Selenium	116.4% 77.2%	REC3-MW-1-060712	**J**

7.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were not detected at or above the RLs in the ICBs and CCBs.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were not detected at or above the RLs in the preparation blanks.

Equipment Rinsate Blank: One equipment rinsate blank, sample RB-NRP-3-060112, was collected on 6/1/2012 and analyzed for metals and mercury as required. Trace amount of zinc was detected in this rinse blank at 1.43 µg/L. Zinc concentrations in the associated samples were greater than 10 times the level found in the equipment rinsate blank. No data qualification action was necessary. No other target analytes were detected at or above the RLs in this sample.

7.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

7.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on client samples GF-B-10-1-2.5 (SDG: 205381), GF-B-4-2.5-4 (SDG: 205404), GF-B-8-1-2.5 (SDG: 205441), RB-NRP-3-060112 (SDG: 206022), REC7-MW-1-060512 (SDG: 206067), REC5-MW-1-6.5-7.5 (SDG: 206068), and REC7-MW-4-060612 (SDG: 206098) for all target analytes. The %R and RPD values met the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	RPD	Control Limit	Affected Sample	Data Qualifier
206067	REC7-MW-1-060512	Dissolved Selenium	- -	- -	22	20	REC7-MW-1-060512 NRP-MW-3-060512 REC7-MW-2-060512 NRP-MW-2-060512 REC6-MW-2-060512 MW-5-060512 MW-3-060512	**J**
206098	REC7-MW-4-060612	Beryllium Cadmium	45 - -	46 46	- - 62	68-151 86-115	UST68-MW-1-060612 UST68-MW-2-060612 UST68-MW-4-060612 UST68-MW-5-060612 REC7-MW-3-060612 REC7-MW-4-060612 MW-1-060612 MW-2-060612 OMS-MW-1-060612	**J/UJ**

Note: "- -" indicated that the value was within the control limit.

7.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%), except for the following:

Sample ID	Internal Standard	%R	Control limit	Affected Analytes	Data Qualifier
REC7-MW-3-060612	Germanium Indium Holmium	40% 49% 55%	60-125%	All dissolved metals	**J/UJ**
REC7-MW-4-060612	Germanium Indium Holmium	39% 46% 52%	60-125%	All dissolved metals	**J/UJ**
MW-1-060612	Germanium Indium Holmium	41% 49% 56%	60-125%	All dissolved metals	**J/UJ**

Sample ID	Internal Standard	%R	Control limit	Affected Analytes	Data Qualifier
MW-2-060612	Germanium Indium Holmium	39% 45% 53%	60-125%	All dissolved metals	**J/UJ**
OMS-MW-1-060612	Germanium Indium Holmium	40% 46% 55%	60-125%	All dissolved metals	**J/UJ**
REC7-MW-4-060612	Germanium Indium Holmium	34% 39% 47%	60-125%	All total metals	**J/UJ**
MW-2-060612	Germanium Indium Holmium	33% 39% 49%	60-125%	All total metals	**J/UJ**
REC3-MW-1-060712	Germanium Indium Holmium	38% 40% 40%	60-125%	All dissolved metals	**J/UJ**
UST70-MW-2-060712	Germanium Indium Holmium	54% 57% 59%	60-125%	All dissolved metals	**J/UJ**

7.9 Method Reporting Limits and Analyte Quantitation

The sample-specific RLs were adjusted with sample amount extracted and supported with adequate initial calibration concentrations. The QAPP requirements for RLs were achieved.

7.10 Field Duplicates

Five sets of field duplicates were submitted for Metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

7.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

8. 1,2-Dibromoehtane (EDB) by GC/ECD (EPA Method SW8011A)

8.1 Holding Times

Soil and water samples should be extraction and analyzed within 28 days of collection. All samples were analyzed within the required holding time.

8.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. The %R value were within the control limits of 80 – 120%.

8.3 Continuing Calibration Verification (CCV)

Continuing calibration verification (CCV) analyses were performed at the required frequency. All %R values were within the control limits of 80 – 120%.

8.4 Method Blank

Method Blank: Method blanks were analyzed at the required frequency. EDB was not detected at or above the RL in method blanks.

8.5 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were not performed on a project sample in these SDGs. EDB was not detected in samples requiring this analysis; the analytical precision and accuracy was evaluated against the LCS/LCSD results.

8.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the methods. All %R and RPD values were within the laboratory control limits.

8.7 Field Duplicates

One set of field duplicates was submitted for EDB analysis. EDB was not detected at or above the RL in either sample; the field precision met the project control criteria.

8.8 Reporting Limits and Target Compound Quantitation

The reported RL was supported with adequate ICAL concentrations. EDB was not detected in samples in these SDGs; a second column confirmation was therefore not required.

8.9 Overall Assessment of EDB Data

EDB data are of known quality and acceptable for use.

9. Polychlorinated Dioxins/Furans by HRGC/HRMS (EPA Method SW8290)

9.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

EPA SW846 Method 8290 recommends a holding time of 30 days for solid samples stored in the dark at 4°C and completely analyzed within 45 days of extraction (Section 6.4). All samples were extracted and analyzed within the recommended holding times.

9.2 HRGC/HRMS Instrument Performance Check

The method requires that (1) for mass calibration and resolution, the laboratory must provides evidence of mass spectrometer resolution > 10,000 at the beginning and end of each 12-hour analytical sequence. If mass calibration and resolution tuning are not correctly performed, interferences may degrade chlorinated dibenzo-p-dioxin and chlorinated dibenzofuran (CDD/CDF) identification and quantitation; (2) the mass spectrometer selected ion monitoring (SIM) scan descriptor switching times are determined by the analysis of the Window Defining Mixture (WDM) which contains the first and last eluting isomers in each homologue; and (3) chromatographic resolution is verified by analyzing one of two Isomer Specificity Check (ISC) solutions, depending on the Gas Chromatograph (GC) column used for analysis.

All HRGC/HRMS instrument performance checks met the criteria.

9.3 Initial Calibration (ICAL)

The method requires that (1) the chromatographic peak separation between the 2,3,7,8-TCDD peak and the 1,2,3,8-TCDD peak and between the 2,3,7,8-TCDF peak and the 2,3,4,7-TCDF peak and must be resolved with a valley of < 25%; (2) the ion abundance ratio be within a ± 15% window around the theoretical abundance ratio; (3) the retention times (RTs) of the isomers must fall within the appropriate RT windows established by the WDM analysis. In addition, the absolute RT of the internal standard $^{13}C_{12}$-1,2,3,4-TCDD must exceed 25 minutes on the DB-5 (or equivalent) column and 15 minutes on the DB-225 (or equivalent) column; (4) the instrument sensitivity (signal-to-noise [S/N] ratio) must be >10:1; (5) the percent relative standard deviation (%RSD) be <20% for native isomers and < 30% for labeled isomers; (6) all initial calibration standards (CSs) must be

analyzed at the correct concentration levels; (7) initial calibrations must be performed when the contract is awarded, whenever significant instrument maintenance is performed (e.g., ion source cleaning, GC column replacement, etc.), or if calibration verification criteria are not met.

All ICALs met the method requirements.

9.4 Calibration Verification

The method requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the percent difference (%D) be within ±20% for native isomers and be within ±30% for labeled isomers, and (3) the ion abundance ratio, retention times, relative retention times, instrument sensitivity meet the criteria for initial calibrations.

All calibration verification analyses met the criteria.

9.5 Method Blanks

Method blanks were prepared and analyzed as required for each preparation batch. Target compounds were either not detected at or above their estimated detection limits (EDLs), or associated sample results were >5x the level found in the method blanks. Note that positive detections in method blanks were not used to assess data quality if the detection in method blanks did not meet the method ion abundance ratio requirements. No data were qualified in relation to detections in method blanks.

9.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the method. The recovery met the method control limits for all target and labeled compounds.

9.7 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS and MSD analyses were performed on sample GF-B-2-2.5-4. The %R and RPD values met the control limits for all spiked congeners, except that the RPD value for OCDD (52%) was outside the control criteria (20%). The OCDD result for sample GF-B-2-2.5-4 was qualified (J) as estimated.

9.8 Labeled Compounds

Nine labeled internal standards and one cleanup recovery standard were added to all samples as required by the method.

The %R values for selected internal standards and cleanup standard were less than the lower control limit of 40%. Affected sample results were qualified as follows:

Sample ID	Internal Standard	%R (%)	Affected Congener	Data Qualification
GF-B-4-2.5-4	$^{13}C_{12}$-OCDD	32	OCDD	**J**
			OCDF	**UJ**
GF-B-5-1-2.5	$^{13}C_{12}$-OCDD	29	OCDD	**J**
			OCDF	**J**
GF-B-13-10-11.5	$^{13}C_{12}$-1,2,3,6,7,8-HxCDD	39	2,3,7,8-TCDD	**UJ**
	$^{13}C_{12}$-1,2,3,4,6,7,8-HpCDD	39	1,2,3,7,8-PeCDD	**UJ**
	$^{13}C_{12}$-OCDD	32	1,2,3,4,7,8-HxCDD	**UJ**
	$^{13}C_{12}$-2,3,7,8-TCDF	39	1,2,3,6,7,8-HxCDD	**UJ**
	$^{37}Cl_4$-2,3,7,8-TCDD	39	1,2,3,7,8,9-HxCDD	**UJ**
			1,2,3,4,6,7,8-HpCDD	None (U, IAR out)
			OCDD	**J**
			2,3,7,8-TCDF	**UJ**
			1,2,3,7,8-PeCDF	**UJ**
			2,3,47,8-PeCDF	**UJ**
			1,2,3,4,7,8-HxCDF	**UJ**
			1,2,3,6,7,8-HxCDF	**UJ**
			1,2,3,7,8,9-HxCDF	**UJ**
			2,3,4,6,7,8-HxCDF	**UJ**
			1,2,3,4,6,7,8-HpCDF	**J**
			1,2,3,4,7,8,9-HpCDF	**J**
			OCDF	**UJ**
			Total TCDD	**UJ**
			Total PeCDD	**J**
			Total HxCDD	**J**
			Total HpCDD	**UJ**
			Total TCDF	**UJ**
			Total PeCDF	**J**
			Total HxCDF	**UJ**
			Total HpCDF	**J**
GF-B-7-1-2.5	$^{13}C_{12}$-OCDD	37	OCDD	**J**
			OCDF	**J**

Note: Positive detections were flagged (J) and non-detects were flagged (UJ). In a case where the ion ratio for the detection did not meet the method criteria (IAR out), the result was not qualified herein.

9.9 Target Compound Identification

All detected target congeners were properly identified. The ion ratios for a number of detection did not meet the method criteria; these results were qualified as non-detected at their reported values, as summarized below:

Sample ID	Congener	Ion Abundance Ratio	Control Limits	Data Qualification
GF-B-15A-1-2.5	2,3,7,8-TCDD	0.51	0.65-0.89	**0.537 U**
	1,2,3,7,8-PeCDD	1.90	1.32-1.78	**0.876 U**
	1,2,3,7,8-PeCDF	2.11	1.32-1.78	**0.938 U**
	2,3,47,8-PeCDF	1.28	1.32-1.78	**1.5 U**
	1,2,3,7,8,9-HxCDF	0.75	1.05-1.43	**0.268 U**
GF-B-2-2.5-4	2,3,7,8-TCDD	0.59	0.65-0.89	**0.467 U**
	1,2,3,7,8-PeCDD	2.58	1.32-1.78	**0.831 U**
	1,2,3,4,7,8-HxCDD	1.46	1.05-1.43	**1.2 U**
	1,2,3,4,7,8,9-HpCDF	0.83	0.88-1.20	**0.444 U**
GF-B-1-1-2.5	1,2,3,4,7,8-HxCDD	1.74	1.05-1.43	**0.151 U**
	1,2,3,7,8,9-HxCDD	1.55	1.05-1.43	**0.453 U**

	2,3,7,8-TCDF	1.10	0.65-0.89	**0.672 U**
	2,3,4,7,8-PeCDF	1.23	1.32-1.78	**0.248 U**
	1,2,3,4,7,8-HxCDF	1.48	1.05-1.43	**0.273 U**
	1,2,3,6,7,8-HxCDF	1.48	1.05-1.43	**0.216 U**
GF-B-5-1-2.5	2,3,7,8-TCDD	0.92	0.65-0.89	**0.687 U**
	1,2,3,4,7,8,9-HpCDF	0.68	0.88-1.20	**1.65 U**
GF-B-6-1-2.5	1,2,3,6,7,8-HxCDD	0.91	1.05-1.43	**0.419 U**
	2,3,7,8-TCDF	0.62	0.65-0.89	**0.398 U**
GF-B-8-1-2.5	1,2,3,7,8-PeCDD	1.09	1.32-1.78	**0.513 U**
	2,3,7,8-TCDF	0.94	0.65-0.89	**3.37 U**
	2,3,4,7,8-PeCDF	1.88	1.32-1.78	**1.65 U**
GF-B-10-1-1.25	2,3,7,8-TCDF (DB-225)	0.64	0.65-0.89	**0.661 U**
GF-B-13-1-2.5	2,3,7,8-TCDF	0.64	0.65-0.89	**0.739 U**
	1,2,3,7,8-PeCDF	1.06	1.32-1.78	**0.208 U**
	OCDF	0.72	0.76-1.02	**2.29 U**
GF-B-13-10-11.5	1,2,3,4,6,7,8-HpCDD	1.32	0.88-1.20	**0.587 U**
GF-B-11-1-2.5	1,2,3,4,7,8-HxCDD	1.57	1.05-1.43	**1.63 U**
	1,2,3,7,8,9-HxCDD	1.51	1.05-1.43	**3.33 U**
GF-B-7-1-2.5	1,2,3,4,7,8-HxCDF	0.72	1.05-1.43	**0.288 U**
	1,2,3,4,6,7,8-HpCDF	1.24	0.88-1.20	**0.57 U**
GF-B-7-10-11.5	1,2,3,7,8-PeCDF	1.03	1.32-1.43	**0.255 U**
	1,2,3,4,7,8-HxCDF	1.96	1.05-1.43	**0.355 U**
	2,3,7,8-TCDF	0.64	0.65-0.89	**1.21 U**
	2,3,7,8-TCDF (DB-225)	0.61	0.65-0.89	**0.401 U**

Note: 2,3,7,8-TCDF (DB-225) - the 2,3,7,8-TCDF result reported from the DB-225 column.

9.10 Reporting Limits, Estimated Detection Limits (EDLs), and Compound Quantitation

Correct internal standards, quantitation ions, and average RFs were used to quantitate target compound detections. The RLs were supported with adequate ICAL calibration concentrations. Sample-specific EDLs and MRLs were adjusted with sample weights, internal standard peak height, and noise levels as required by the method.

The following target congeners had chlorodiphenyl ether interference present in their retention time region.

Sample ID	Congener	Sample Conc.	Data Qualification
GF-B-15A-1-2.5	1,2,3,7,8-PeCDD	0.876 J	**None (U)**
	1,2,3,4,7,8-HxCDF	1.91 J	**J**
GF-B-2-2.5-4	1,2,3,7,8-PeCDF	1.07 J	**J**
	1,2,3,4,7,8-HxCDF	1.63 J	**J**
	2,3,4,6,7,8-HxCDF	2.97	**J**
GF-B-5-1-2.5	1,2,3,7,8-PeCDF	1.98 J	**J**
	1,2,3,4,7,8-HxCDF	5.91	**J**
GF-B-8-1-2.5	1,2,3,7,8-PeCDF	1.26 J	**J**
	2,3,4,6,7,8-HxCDF	1.17 J	**J**
GF-B-10-1-1.25	1,2,3,7,8-PeCDF	0.456 J	**J**

The 1,2,3,7,8-PeCDD result in sample GF-B-15A-1-2.5 was previously qualified as non-detect (0.876 U) due to ion abundance ratio anomaly and no additional qualification needed. All other positive detections in samples above were flagged (J).

9.11 Second Column Confirmation

Second-column confirmation is required for any sample analyzed on a DB-5 (or equivalent) column in which 2,3,7,8-TCDF is reported, or where 2,3,7,8-TCDF is reported as an Estimated Maximum Possible Concentration (EMPC) at or above the MRLs.

All positive detection of 2,3,7,8-TCDF were re-analyzed on the DB-225 column for confirmation and results reported from the second column (DB-225) should be used for data interpretation.

9.12 Overall Assessment of Polychlorinated Dioxins/Furans Data Usability

Polychlorinated dioxins and furans data were of known quality and acceptable for use as qualified.

10. Formaldehyde by HPLC/UV (EPA Method 8315A)

10.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1. Note that only one water sample, sample REC6-MW-2-060512, was analyzed for formaldehyde in these SDGs.

Water samples should be derivatized and extracted within 3 days of sample collection. All derivatized sample extracts should be analyzed within 3 days after preparation. The sample was prepared and analyzed within the required holding times.

10.2 Instrument Calibration

Initial calibration data for formaldehyde analysis were not provided in the data package.

10.3 Calibration Verification

Calibration verification data were not provided in the data package.

10.4 Method Blank

Method Blank: A method blank was prepared and analyzed in the preparation batch as required. Formaldehyde was not detected at or above the RL in method blank.

10.5 Matrix Spike (MS)

MS analyses were performed on project samples at the required frequency (one per batch or <20 samples) for sulfide, formaldehyde, and ammonia. The %R and RPD values for ammonia, formaldehyde, and sulfide were within the control limits.

10.6 Laboratory Control Samples (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the methods. The %R and RPD values were within the laboratory control limits.

10.7 Overall Assessment of Formaldehyde Data Usability

Based on the information submitted by the laboratory, the formaldehyde result for sample REC6-MW-2-060512 was acceptable for use.

11. Conventional Parameters (TOC, TSS, Ammonia, and Dissolved Sulfide)

11.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Aqueous samples should be analyzed within 7 days of collection for dissolved sulfide and TSS, and 28 days for ammonia. TOC in soil samples should be anayzed within 28 days.

11.2 Instrument Calibration

The initial calibrations were established for ammonia and sulfide analyses using one blank and at least five levels of standards. The correlation coefficients (r) of the initial calibration curves were >0.995, and met the method criteria.

11.3 Calibration Verification

ICV and CCV analyses were performed for ammonia and sulfide as required by the methods. All ICV and CCV %R values were within the laboratory control limits (90 – 110%).

11.4 Blanks

Calibration Blanks: ICBs and CCBs were analyzed for ammonia and sulfide as required by the methods. No target analytes were positively reported in ICBs and CCBs at or above the MDLs.

Method Blanks: Method blanks were prepared and analyzed for TOC, TSS, ammonia, and sulfide as required by the methods. No target analytes were detected at or above the RLs in method blanks.

11.5 Laboratory Replicate Analyses

Laboratory duplicate analyses were formed on sample REC6-MW-2-060512 for sulfide and a batch QC sample for ammonia at the required frequency (one per batch or <20 samples). The RPD values were within the project control limits.

11.6 Matrix Spike (MS)

MS analyses were performed on project samples at the required frequency (one per batch or <20 samples) for TOC, sulfide, and ammonia. The %R values were within the control limits.

11.7 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods. All LCS %R values were within the laboratory control limits.

11.8 Method Reporting Limits

The MRLs were supported with adequate initial calibration concentrations. Sample-specific RLs achieved the project requirements for quantitation limits.

11.9 Field Duplicates

Two sets of field duplicates were submitted for TSS analyses. One set of field duplicates was submitted for 1,2-dibromoethane analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

11.10 Overall Assessment of Conventional Parameters Data Usability

Data are of known quality and acceptable for use.

SUMMARY

Data qualification is summarized as follows:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason
205364-03 205364-04 205364-05 205364-20 205364-21	GF-B-15A-1-2.5 GF-B-15A-7.5-9 GF-B-15A-10-11.5 GF-B-14-1-2.5 GF-B-14-7.5-9	Dichlorodifluoromethane Chloromethane	**UJ**	ICV %D values outside the control limit - low bias

Data Qualifiers are defined as follows:

Data Qualifier	Definition
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

APPENDIX A

The precision criterion (≤ 35%) was applied to evaluating the relative percent difference (RPD) values of field duplicate results greater than five times the RL (5xRL). For results less than 5xMRL, an advisory criterion of 2xRL was applied to evaluating the concentration differences. The RPD and concentration difference values for detected analytes and data qualification are presented as follows:

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CDD	chlorinated dibenzo-p-dioxin
CDF	chlorinated dibenzofuran
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DDD	dichlorodiphenyldichloroethane
DDE	dichlorodiphenyldichloroethylene
DDT	dichlorodiphenyltrichloroethane
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EDB	1,2-dibromoethane
EDL	estimated detection limit
EMPC	estimated maximum possible concentration
EPA	U.S. Environmental Protection Agency
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
GPC	gel permeation chromatography
HPLC	high performance liquid chromatography
HRGC	high-resolution gas chromatograph
HRMS	high-resolution mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP	inductively coupled plasma
ICP/MS	inductively coupled plasma/ mass spectrometer
ICSA	ICP interference check sample solution A

ICV	initial calibration verification
IPR	initial precision and recovery
ISC	isomer specificity check
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
m/z	mass-to-charge ratio
MDL	method detection limit
µg/kg	microgram per kilogram
µg/L	microgram per liter
mg/kg	milligram per kilogram
mg/L	Milligram per liter
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans)
OPR	ongoing precision and recovery
pg/g	pictogram per gram
PCBs	polychlorinated biphenyls
PCDD	polychlorinated dibenzo-*p*-dioxin
PCDF	polychlorinated dibenzofuran
PEM	performance evaluation mixture
PSEP	Puget Sound Estuary Program
QA/QC	quality assurance/quality control
QAPP	quality assurance project plan
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
S/N	signal-to-noise ratio
SAP	sampling and analysis plan
SDG	sample delivery group
SICP	selected ion current profile
SIM	selective ion monitoring
SRM	standard reference material
SVOCs	semi-volatile organic compounds
TSS	total suspended solids

TOC	total organic carbon
VOCs	volatile organic compounds
WDM	window defining mixture

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during June and July 2012 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Columbia Analytical Services, Inc. (CAS, part of ALS Group).

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans) and EPA Region 10 SOP (EPA 1996), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Notes:

Laboratory sample ID prefixed with "K" was a laboratory identity assigned by CAS-ALS in Kelso, Washington. Metals analyses performed by CAS-ALS included a reductive precipitation procedure for sample preparation. Selenium was analyzed with SW846 Method 7742 - a borohydride reduction atomic absorption method. Mercury was not included (analyzed by F&BI and reported separately in previous SDGs).

Laboratory sample ID prefixed with "E" was a laboratory identity assigned by CAS-ALS in Houston, Texas.

A - Ammonia

D – Dissolved metals

Dioxin - Polychlorinated dioxins and furans

F – Formaldehyde

Metals: Antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc

PAHs - Polycyclic aromatic hydrocarbons

PCBs - Polychlorinated biphenyls

S – Dissolved sulfide

SVOCs - Semivolatile Organic Compounds

T – Total metals

TOC – Total Organic carbon
TSS - Total suspended solids
TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon
TPH-G - Gasoline range total petroleum hydrocarbon
VOCs - Volatile Organic Compounds
X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. Seattle, WA
Semivolatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
pH	SW846 Method 9045D	
Total Organic Carbon (TOC)	ASTM D4129-05M	Columbia Analytical Services, Inc. Kelso, WA (Part of ALS Group)
Total Suspended Solids (TSS)	SM Method 2540D	
Dissolved Sulfide	SM 4500-S2-D	
Selenium	SW846 Method 7742	
Ammonia as Nitrogen	EPA Method 350.1	
Formaldehyde	SW846 Method 8315A	
Dioxins/Furans	SW846 Method 8290	Columbia Analytical Services, Inc. Houston, TX (Part of ALS Group)

Notes:

1. SW846 - *USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,* SW-846, Third Edition, December 1996.
2. EPA Methods - *USEPA Methods for Chemical Analysis of Water and Wastes,* EPA–600/4-79-020, March 1983 Revision.
3. EPA Method 1631E - *Mercury in Water by Oxidation, Purge and Trap, and Cold Vapor Atomic Fluorescence Spectrometry,* Office of Water, U.S. Environmental Protection Agency, August 2002, EPA-821-R-02-019.
4. ASTM – American Society of Testing and Materials
5. NWTPH Methods – *Washington State Department of Ecology, Analytical Methods for Petroleum Hydrocarbons*, Publication No. ECY 97-602, June 1997.
6. SM – Standard Methods for the Examination of Water and Wastewater, American Public Health Association, 20th Edition, 1995.

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. No anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs).

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples.

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on samples GF-B-12-1-2.5, OMS-B-1-0-1-070512, and CMS-B-1-2-3-070612. The %R values were within the project control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R (%)	Control Limit (%)	Data Qualifier
206410	GF-B-12-1-2.5	1,1,1-Trichloroethane 1,1-Dichloroethane Chloroethane Trichlorofluoromethane 1,1-Dichloroethene 1,1-Dichloropropene 2,2-Dichloropropane *cis*-1,2-Dichloroethene Bromomethane *trans*-1,2-Dichloroethene Chloromethane Tetrachloroethene	44 48 43 24 38 43 35 49 43 47 31 49	50-150	**UJ**
206410	GF-B-12-1-2.5	Dichlorodifluoromethane	6	50-150	**R**
207068	OMS-B-1-0-1-070512	Dichlorodifluoromethane Trichlorofluoromethane Vinyl chloride Chloromethane	13 49 45 47	50-150	**UJ**

SDG#	Parent Sample ID	Compound	MS %R (%)	Control Limit (%)	Data Qualifier
207085	CMS-B-1-2-3-070612	Dichlorodifluoromethane	5	50-150	**R**

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses.

Vinyl acetate and 1,4-dioxane were reported in selected samples and the method blanks associated with these samples. These compounds were subjected to the tentative identification search (TIC) in the instrument library and were not detected in these samples. The reported MRLs for these compounds were based on 10 times the standard MRLs for other VOCs. Vinyl acetate and 1,4-dioxane results in these samples were qualified (UJ) as estimated.

Naphthalene, 1,2,4-trichlorobenzene, 1,2-dichlioriobenzene, 1,3-dichlorobenzene, and 1,4-dichliorobenzene were also reported from SVOCs analysis (Method 8270D). These compounds were to be reported from the SVOCs analysis, in favor of the lower detection limits, for samples analyzed by both methods except samples Boiler-B-3-1-2-070512 and HW-B-1-0-1 due to their excessive dilution for the SVOCs analysis.

1.11 Field Duplicates

Three sets of field duplicates were submitted for VOCs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be extracted within 14 days and water samples within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The CCV criteria require that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
206410	GCMS8 7/6/12, 18:55	Pyrene	-32.6%	High	GF-B-9-7.5-9D	**J**
206446	GCMS8 7/9/12, 7:53	Pyrene	-32.6%	High	HW-B-2-3-4 HW-MW-1-0-1 HW-MW-1-3-4 HW-MW-1-6-7	**J**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS/MSD analyses were not performed for SVOCs analyses; instead, laboratory duplicates in combination with LCS/LCSD analyses were performed.

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the laboratory control criteria, or the outliers had no adverse effects on data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples), except for the following:

SDG	Compound	%R (%)		Control Limit (%)	RPD (%)	Control Limit (%)	Affected Sample	Data Qualifier
		LCSD	LCSD					
206410	Pyrene	86	126	58-120	38	20	GF-B-9-1-2.5 GF-B-9-7.5-9 GF-B-9-7.5-9D	**J**
206446	Pyrene	86	126	58-120	38	20	HW-B-1-6-7 HW-B-2-3-4 HW-B-2-6-7 HW-MW-1-0-1 HW-MW-1-3-4 HW-MW-1-6-7	**J**

2.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on sample GF-B-12-7.5-9 (SDG: 206410) and Boiler-B-5-1-1.5-070612 (SDG: 207068). All RPD or concentration difference values met the laboratory control criteria.

2.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Internal Standard %R	Control Limit	Affected Compound	Data Qualifier
HW-B-1-0-1	Perylene-d_{12}	40.3%	50-200%	Indeno(1,2,3-cd)pyrene Di-n-octyl phthalate Benzo(a)pyrene Benzo(b)fluoranthene Dibenzo(a,h)anthracene Benzo(g,h,i)perylene Benzo(k)fluoranthene	**UJ**
HW-B-1-6-7	Phenanthrene-d_{12}	48.4%	50-200%	N-Nitrosodiphenylamine 4-Nitroaniline 4,6-Dinitro-2-methylphenol 4-Bromophenyl phenyl ether Hexachlorobenzene Pentachlorophenol Phenanthrene Anthracene Carbazole Di-*n*-butyl phthalate Fluoranthene	**UJ** **UJ** **UJ** **UJ** **UJ** **UJ** **J** **UJ** **UJ** **UJ** **J**
Boiler-B-4-1-1.5-070612	Perylene-d_{12}	212%	50-200%	Benzo(b)fluoranthene	**J**

2.11 Reporting Limits and Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. Samples Boiler-B-3-1-2-070512 and HW-B-1-0-1 required a 1:100 dilution due to the high levels of target and non-target compounds in these samples; the RLs were raised accordingly.

Selected samples were also analyzed for PAHs with Method 8270D-SIM. PAHs results for these samples were to be reported from the Method 8270D-SIM analysis, in favor of the lower detection limits.

2.12 Field Duplicates

Samples GF-B-9-7.5-9 and GF-B-9-7.5-9D were field duplicates. SVOCs were not detected at or above the RLs in either sample. The field precision met the project advisory criteria.

2.13 Overall Assessment of SVOCs Data Usability

SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport. Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.05 for all compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

3.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples), except qualified below. In some cases surrogate spike %R values were inapplicable for data evaluation because the samples contained high levels of target PAHs and requested dilution analysis; no data were qualified on this basis. The remaining anomalies were summarized in the following:

Sample ID	Surrogate	%R (%)	Control Limit (%)	Affected Compound	Data Qualifier
REC2-B-10-5-6	Anthracene-d_{10} Benzo(a)anthracene-d_{12}	0 162	50-150 35-159	All PAHs	**J/UJ**

3.7 Matrix Spike (MS)

MS analyses were performed on samples GF-B-12-7.5-9 (SDG: 206410), REC2-B-10-10-11 (SDG: 206410), OMS-B-2-2-3-070512 (SDG: 207068). The %R values met the project control criteria.

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria. The recovery for one of the surrogates, phenanthrene-d_{10}, in sample OMS-B-3-2-3-070612 (SDG: 207068) was less than the lower control limit. The sample was diluted and re-analyzed with acceptable internal standard recovery. Compounds associated with phenanthrene-d_{10} were to be reported from the dilution analysis for this sample.

3.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

3.11 Field Duplicates

Three sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. PCB Aroclors (EPA Method SW8082A)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport. Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

4.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

4.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

4.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

4.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were not performed for PCB Aroclors analyses; instead, duplicate and LCS/LCSD analyses in combination were performed.

4.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on samples HW-B-2-0-1 (SDG: 206448) and OMS-B-1-0-1-070512 (SDG: 207068), and REC3-MW-1-8.5-9.5 (SDG: 206068). All RPD or concentration difference values met the laboratory control criteria.

4.9 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

Aroclor 1254 and Aroclor 1260 were detected in four samples in SDG 207085. The dual column RPD values were less than 40% for both detections.

4.10 Field Duplicates

Samples GF-B-9-7.5-9 and GF-B-9-7.5-9D were field duplicates. PCB Aroclors were not detected at or above the RLs in either sample. The field precision met the project advisory criteria.

4.11 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

5. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

5.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

5.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on batch QC samples. All RPD and concentration difference values met the laboratory control criteria.

5.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

5.10 Field Duplicates

Two sets (one for soil and one for water) of field duplicates were submitted for TPH-Gasoline analysis. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use.

6. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

6.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport. Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times, except that sample Boiler-B-3-1-2-070512 was extracted six days past the required holding time. TPH-Diesel and TPH-Motor Oil results for this sample were qualified (J) as estimated.

6.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using individual petroleum product reference standards to ensure the proper identification and quantitation of petroleum hydrocarbons in samples, (2) the calibration curve include a sufficiently low standard to provide the necessary reporting limits, and (3) the linear working range of the instrument be defined.

The ICAL met the method requirements. The linearity of the ICAL curves were verified with %RSD values of RFs (%RSD ≤20%, according to EPA SW 846 Method 8000), and was acceptable for both TPH-Diesel and TPH-Motor Oil.

6.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±15% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±15% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

6.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to

matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

6.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on samples GF-B-9-1-2.5 (SDG: 206410), and CMS-B-1-0-1-070612 (SDG: 207085). The %R and RPD values met the laboratory control criteria.

6.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

6.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

The TPH-Diesel reported in sample CMS-B-2-2-3-070612 did not match chromatographic patterns with those of the calibration standards.

6.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

6.10 Field Duplicates

Three sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

6.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

7. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

7.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding time.

7.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

7.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

For mercury, the method requires that (1) a blank and five calibration standards be employed to establish the analytical curve, and (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995.

All ICALs met the method requirements.

7.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 80 – 120% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample), except for the following:

CCAL ID	Analyte	%R	Affected Sample	Data Qualifier
7/9/12, 16:42:54	Mercury	128%	Boiler-B-2-1-2-070512	**J**

7.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank, except for the following:

Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit
K1205623-MB	Dissolved Beryllium	0.0005 J	REC3-MW-1-060712 UST70-MW-2-060712	0.0012 J 0.0014 J	0.02 U 0.02 U	µg/L
K1205623-MB	Dissolved Thallium	0.005 J	REC3-MW-1-060712 UST70-MW-2-060712	0.007 J 0.014 J	0.02 U 0.02 U	µg/L
K1205560-MB	Dissolved Beryllium	0.0005 J	MW-2-060612 MW-2-060612 OMS-MW-1-060612 REC7-MW-3-060612 REC7-MW-4-060612 REC7-MW-4-060612	0.0005 J 0.0023 J 0.0012 J 0.0009 J 0.0090 J 0.0005 J	0.02 U 0.02 U 0.02 U 0.02 U 0.02 U 0.02 U	µg/L

K1205560-MB	Dissolved Thallium	0.005 J	MW-1-060612 MW-2-060612 OMS-MW-1-060612 REC7-MW-3-060612 REC7-MW-4-060612	0.005 J 0.005 J 0.026 0.006 J 0.012 J	0.02 U 0.02 U 0.026 J 0.02 U 0.02 U	µg/L

7.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

7.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project samples at the adequate frequency (>5% of field sample). The %R and RPD values met the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	Control Limit	RPD	Control Limit	Affected Sample	Data Qualifier
206410	NRP-B-16-0-1	Chromium Nickel	148 130	63-120 54-125	54 50	20	GF-B-12-1-2.5 GF-B-12-7.5-9 GF-B-9-1-2.5 GF-B-9-7.5-9 NRP-B-10-0-1 NRP-B-10-3-4 NRP-B-14-0-1 NRP-B-14-3-4 NRP-B-16-0-1 NRP-B-16-3-4 NRP-B-9-0-1 NRP-B-9-3-4	**J**

Note: "- -" indicated that the value was within the control limit.

7.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

7.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

7.10 Field Duplicates

Three sets of field duplicates were submitted for Metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

7.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

8. Polychlorinated Dioxins/Furans by HRGC/HRMS (EPA Method SW8290)

8.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

EPA SW846 Method 8290 recommends a holding time of 30 days for solid samples stored in the dark at 4°C and completely analyzed within 45 days of extraction. All samples were extracted and analyzed within the recommended holding times.

8.2 HRGC/HRMS Instrument Performance Check

The method requires that (1) for mass calibration and resolution, the laboratory must provides evidence of mass spectrometer resolution > 10,000 at the beginning and end of each 12-hour analytical sequence. If mass calibration and resolution tuning are not correctly performed, interferences may degrade chlorinated dibenzo-*p*-dioxin and chlorinated dibenzofuran (CDD/CDF) identification and quantitation; (2) the mass spectrometer selected ion monitoring (SIM) scan descriptor switching times are determined by the analysis of the Window Defining Mixture (WDM) which contains the first and last eluting isomers in each homologue; and (3) chromatographic resolution is verified by analyzing one of two Isomer Specificity Check (ISC) solutions, depending on the Gas Chromatograph (GC) column used for analysis. All HRGC/HRMS instrument performance checks met the criteria.

8.3 Initial Calibration (ICAL)

The method requires that (1) the chromatographic peak separation between the 2,3,7,8-TCDD peak and the 1,2,3,8-TCDD peak and between the 2,3,7,8-TCDF peak and the 2,3,4,7-TCDF peak and must be resolved with a valley of < 25%; (2) the ion abundance ratio be within a ± 15% window around the theoretical abundance ratio; (3) the retention

times (RTs) of the isomers must fall within the appropriate RT windows established by the WDM analysis. In addition, the absolute RT of the internal standard $^{13}C_{12}$-1,2,3,4-TCDD must exceed 25 minutes on the DB-5 (or equivalent) column and 15 minutes on the DB-225 (or equivalent) column; (4) the instrument sensitivity (signal-to-noise [S/N] ratio) must be >10:1; (5) the percent relative standard deviation (%RSD) be <20% for native isomers and < 30% for labeled isomers; (6) all initial calibration standards (CSs) must be analyzed at the correct concentration levels; (7) initial calibrations must be performed when the contract is awarded, whenever significant instrument maintenance is performed (e.g., ion source cleaning, GC column replacement, etc.), or if calibration verification criteria are not met. All ICALs met the method requirements.

8.4 Calibration Verification

The method requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the percent difference (%D) be within ±20% for native isomers and be within ±30% for labeled isomers, and (3) the ion abundance ratio, retention times, relative retention times, instrument sensitivity meet the criteria for initial calibrations. All calibration verification analyses met the criteria.

8.5 Method Blanks

Method blanks were prepared and analyzed as required for each preparation batch. Selected target compounds were detected in method blanks. Sample results less than 5x the level found in the associated method blank were qualified (U) as non-detects at the reported values. Qualified data were summarized in **SUAMMRY** section at the end of this report.

8.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the method. The recovery met the method control limits for all target and labeled compounds.

8.7 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS and MSD analyses were performed on sample GF-B-2-2.5-4. The %R and RPD values met the control limits for all spiked congeners, except that the RPD value for OCDD (52%) was outside the control criteria (20%). The OCDD result for sample GF-B-2-2.5-4 was qualified (J) as estimated.

8.8 Labeled Compounds

Nine labeled internal standards and one cleanup recovery standard were added to all samples as required by the method.

The %R values for selected internal standards and cleanup standard were less than the lower control limit of 40%. Affected sample results were qualified as follows:

Sample ID	Internal Standard	%R (%)	Affected Congener	Data Qualifier
Boiler-B-3-1-2-070512	$^{13}C_{12}$-OCDD $^{13}C_{12}$-1,2,3,4,7,8-HxCDF $^{13}C_{12}$-2,3,4,6,7,8-HxCDF $^{13}C_{12}$-1,2,3,4,6,7,8-HpCDF	27 34 31 37	OCDD OCDF 1,2,3,4,7,8-HxCDF 2,3,4,6,7,8-HxCDF 1,2,3,4,6,7,8-HpCDF	**J** **J** **UJ** **UJ** **J**
GF-B-4-2.5-4	$^{13}C_{12}$-OCDD	32	OCDD OCDF	**J** **UJ**

8.9 Target Compound Identification

All detected target congeners were properly identified. The ion ratios for a number of detection did not meet the method criteria; these results were qualified as non-detected at their reported values, as summarized as follows:

Laboratory ID	Sample ID	Congener	Ion Ratio	Control Limit	Data Qualifier
E1200626-002	GF-B-15A-1-2.5	1,2,3,7,8,9-HxCDF	0.75	1.05-1.43	**U**

8.10 Reporting Limits, Estimated Detection Limits (EDLs), and Compound Quantitation

Correct internal standards, quantitation ions, and average RFs were used to quantitate target compound detections. The RLs were supported with adequate ICAL calibration concentrations. Sample-specific EDLs and RLs were adjusted with sample weights, internal standard peak height, and noise levels as required by the method.

Selected target congeners in a number of samples had chlorodiphenyl ether interference present in their retention time region. The affected results were qualified (J) as estimated.

8.11 Second Column Confirmation

All positive detection of 2,3,7,8-TCDF were re-analyzed on the DB-225 column for confirmation and results reported from the second column (DB-225) should be used for data interpretation.

8.12 Field Duplicates

Samples GF-B-9-2.5-3.5 and GF-B-9-2.5-3.5-D were field duplicates submitted for dioxins/furans analysis. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

8.13 Overall Assessment of Polychlorinated Dioxins/Furans Data Usability

Polychlorinated dioxins and furans data were of known quality and acceptable for use as qualified.

9. Formaldehyde by HPLC/UV (EPA Method 8315A)

9.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be derivatized and extracted within 3 days of sample collection. All derivatized sample extracts should be analyzed within 3 days after preparation. The sample was prepared and analyzed within the required holding times.

9.2 Instrument Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <15% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

9.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

9.4 Method Blanks

A method blank was prepared and analyzed in each preparation batch as required. Formaldehyde was not detected at or above the RL in method blanks.

9.5 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on samples REC6-MW-1-070612-D and REC6-MW-2-060512. The %R and RPD values met the laboratory control criteria, except that the RPD value (56%) was outside the control criterion (40%) in the MS/MSD performed on REC6-MW-1-070612-D. The formaldehyde result for sample REC6-MW-1-070612-D was qualified (J) as estimated.

9.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods. The %R values were within the laboratory control limits.

9.7 Field Duplicates

Samples REC6-MW-1-070612 and REC6-MW-1-070612-D were field duplicates submitted for formaldehyde analysis. Field duplicate results, concentration difference value, and data qualification were presented in **Appendix A**.

9.8 Overall Assessment of Formaldehyde Data Usability

Formaldehyde data are of known quality and acceptable for use as qualified.

10. Conventional Parameters (TOC, TSS, pH, Ammonia, and Dissolved Sulfide)

10.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be analyzed within 7 days of collection for dissolved sulfide and TSS, and 28 days for ammonia. TOC in soil samples should be analyzed within 28 days.

10.2 Instrument Calibration

The initial calibrations were established for ammonia and sulfide analyses using one blank and at least five levels of standards. The correlation coefficients (r) of the initial calibration curves were >0.995, and met the method criteria.

10.3 Calibration Verification

ICV and CCV analyses were performed for ammonia and sulfide as required by the methods. All ICV and CCV %R values were within the laboratory control limits (90 – 110%).

10.4 Blanks

Calibration Blanks: ICBs and CCBs were analyzed for ammonia and sulfide as required by the methods. No target analytes were positively reported in ICBs and CCBs at or above the MDLs.

Method Blanks: Method blanks were prepared and analyzed for TOC, TSS, ammonia, and sulfide as required by the methods. No target analytes were detected at or above the RLs in method blanks, except for the following:

Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit
K1205623-MB	Ammonia	0.023 J	REC3-MW-1-060712	0.041 J	0.05 U	**µg/L**

10.5 Laboratory Replicate Analyses

Laboratory duplicate analyses were formed on samples REC7-MW-1-060512, REC7-MW-3-060612 for sulfide, sample GF-B-12-7.5-9 for TOC, batch QC samples for ammonia and pH. The RPD (or concentration difference) values were within the project control limits.

10.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on sample REC7-MW-3-060612 for sulfide. The %R and RPD values met the laboratory control criteria.

10.7 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods fort ammonia, sulfide, TOC, and pH analysis. All LCS %R values were within the laboratory control limits. LCS/LCSD analyses were performed for TSS; the %R and RPD values met the laboratory control criteria.

10.8 Method Reporting Limits

The MRLs were supported with adequate initial calibration concentrations.

10.9 Field Duplicates

Two sets of field duplicates were submitted for TSS analyses. One set of field duplicates was submitted for TOC, TSS, pH, and ammonia analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

10.10 Overall Assessment of Conventional Parameters Data Usability

Conventional parameters data are of known quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Analyte	Units	RL	Parent & Field Duplicate Sample Result				RPD	Delta	Data Qualifier

Notes:

B – The anakyte was also detected in the associated blank.
Delta – Concentration difference between the parent sample and its field duplicate
J – The reported value for the analyte was an estimated value.
K – The ion ratio for this detection did not meet the method requirement.
mg/kg – milligram per kilogram
mg/L – milligram per liter
*p*g/g – pictogram per gram
RL – Reporting limit
RPD – Relative percent difference
U – The analyte was not detected at or above the reporting limit.
µg/L – microgram per liter

VOCs	volatile organic compounds

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during August and September 2012 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Columbia Analytical Services, Inc. (CAS, part of ALS Group) in Kelso, Washington.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Field Sample ID	Laboratory Sample ID	Sample Date	Sample Type	Analysis					
				VOCs	SVOCs PAHs	PCBs	TPH-G TPH-Dx	Metals	Miscellaneous

Notes:

Laboratory sample ID prefixed with "K" was a laboratory identity assigned by CAS-ALS in Kelso, Washington. Metals analyses performed by CAS-ALS included a reductive precipitation procedure for sample preparation. Selenium was analyzed with SW846 Method 7742 - a borohydride reduction atomic absorption method. Mercury was not included (analyzed by F&BI and reported separately in previous SDGs).

As - Arsenic
D – Dissolved metals
EDB - 1,2-dibromoethane
F – Formaldehyde
Metals: Antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc
N – Ammonia as Nitrogen
PAHs - Polycyclic aromatic hydrocarbons
Pb - Lead
PCBs - Polychlorinated biphenyls
S – Dissolved sulfide
SVOCs - Semivolatile Organic Compounds
T – Total metals
TSS - Total suspended solids
TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon
TPH-G - Gasoline range total petroleum hydrocarbon
VOCs - Volatile Organic Compounds
X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Semi-volatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
1,2-Dibromothenae (EDB)	SW846 Method 8011A	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Total Suspended Solids (TSS)	SM Method 2540D	Columbia Analytical Services, Inc. Kelso, WA (Part of ALS Group)
Dissolved Sulfide	SM 4500-S2-D	
Metals (for brackish water samples)	EPA Method 200.8	
Selenium (for brackish water samples)	SW846 Method 7742	
Ammonia as Nitrogen	EPA Method 350.1	
Formaldehyde	SW846 Method 8315A

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In some cases where cooler temperature was outside the 4±2°C criteria; samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

Sample REC1-MW-5-6.5-7.5 was not preserved immediately upon collection as required by the method. Target compounds were not detected in this sample at or above their reporting limits. Since the analysis was performed in a relatively short holding time (3 days) of collection, rather than rejected, VOCs results for this sample were qualified (UJ) as estimated.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >15% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±20%, or

the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
208463	GCMS9 090414.D	Bromoform	20.4%	Low	NRP-MW-3-083012 REC6-MW-2-083012 REC7-MW-1-083012 REC7-MW-2-083012	**UJ**
208491	GCMS9 090414.D	Bromoform	20.4%	Low	NRP-MW-1-083112 NRP-MW-2-083112	**UJ**

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs).

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R (%)	Control Limit (%)	Data Qualifier
209028	REC1-MW-1-13-14	Dichlorodifluoromethane	9	10-60	**R**
209066	NRP-B-19-13-14	Dichlorodifluoromethane	9	10-60	**R**
209095	NRP-B-20-12-13	Dichlorodifluoromethane	8	10-60	**R**

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses. The RLs were raised due to high moisture content in samples REC1-MW-7-13-14, REC1-MW-6-12.5-13.5 and REC1-MW-6-17-18.

Vinyl acetate and 1,4-dioxane were reported in selected samples and the method blanks associated with these samples. These compounds were subjected to the tentative identification search (TIC) in the instrument library and were not detected in these samples. The reported MRLs for these compounds were based on 10 times the standard MRLs for other VOCs; vinyl acetate and 1,4-dioxane results in these samples were qualified (UJ) as estimated.

Naphthalene, 1,2,4-trichlorobenzene, 1,2-dichlioriobenzene, 1,3-dichlorobenzene, and 1,4-dichliorobenzene were also reported from SVOCs analysis (Method 8270D). These compounds were to be reported from the SVOCs analysis, in favor of the lower detection limits.

1.11 Field Duplicates

Eight sets of field duplicates were submitted for VOCs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water samples within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The CCV criteria require that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
209213	GCMS8 9/17/12, 18:31	*bis*(2-Chloroisopropyl)ether	27.6%	Low	REC1-MW-9-091312	**UJ**
209220	GCMS8 9/19/12, 18:57	*bis*(2-Chloroisopropyl)ether	26.7%	Low	HB-MW-1-091412 HB-MW-1-091412-D	**UJ**
209095	GCMS8 9/21/12, 1:26	*bis*(2-Chloroisopropyl)ether	30.7%	Low	HB-B-1-2-3 HB-B-1-3-4 HB-B-1-6-7 HB-B-2-1-1.5 HB-MW-1-1.5-2 HB-MW-1-6-7	**UJ**
209095	GCMS8 9/22/12, 12:21	*bis*(2-Chloroisopropyl)ether Benzoic Acid	29.7% 31.6%	Low	HB-B-1-2-3 HB-B-2-5-6 HB-B-2-6-7 HB-MW-1-1.5-2-D HB-MW-1-3-3.5	**UJ**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks, except for the following:

SDG	Method Blank ID	Compound	MB Conc.	Affected Sample	Result	Data Qualifier	Unit
208426	083116.D	Diethyl phthalate	2	REC3-MW-1-082912 MW-6-082912	1 1	**U**	**µg/L**

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS/MSD analyses were not performed for SVOCs analyses; instead, laboratory duplicates in combination with LCS/LCSD analyses were performed.

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the laboratory control criteria, or the outliers had no adverse effects on data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples).

2.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD or concentration difference values either met the laboratory control criteria or the outlier had no adverse effects on data usability (*e.g.,* high RPD value for a compound that was not detected in samples).

2.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
HB-MW-1-091412	Perylene-d_{12}	1211792	2573250	Di-n-octyl phthalate	**UJ**
HB-MW-1-1.5-2	Perylene-d_{12}	3240706	1272460	Di-n-octyl phthalate Benzo(g,h,i)perylene Indeno(1,2,3-cd)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(a)pyrene Dibenzo(a,h)anthracene	**J/UJ**

Note: J/UJ - Detects were qualified (J) and non-detects qualified (UJ) as estimated.

2.11 Reporting Limits and Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

2.12 Field Duplicates

Three sets of field duplicates were submitted for SVOCs analyses. SVOCs were not detected at or above the RLs in these samples. The field precision met the project advisory criteria.

2.13 Overall Assessment of SVOCs Data Usability

SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.05 for all compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,*

biased high CCV recovery for a compound not detected in samples), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
209066	GCMS6 9/17/12, 17:07	Indeno(1,2,3-cd)pyrene	-21.1%	High	Boiler-B-3B-4-5 Boiler-HA-2A-1-1 Boiler-HA-2B-0-1 Boiler-HA-2C-0-1 Boiler-HA-2C-2-3 DA-B-1-1-2 DA-B-1-5-6 GF9-B-1-5-6 GF9-MW-1-5.5-6.5	**J**
	GCMS6 9/18/12, 06:36	Indeno(1,2,3-cd)pyrene	-28.9%	High	HB-MW-1-091412 HB-MW-1-091412-D	**J**
	GCMS6 9/20/12, 08:23	Indeno(1,2,3-cd)pyrene	-23.4%	High	Boiler-B-3B-1-2	**J**

3.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were inapplicable for data evaluation because the samples contained high levels of target PAHs and requested dilution analysis; no data were qualified on this basis.

3.7 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R values met the project control criteria.

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits, except for the followings:

SDG	Compound	%R (%)		Control Limit (%)	RPD (%)	Control Limit (%)	Affected Sample	Data Qualifier
		LCS	LCSD					
209095	Pyrene	70	101	53-127	36	20	DA-MW-1-1-2 DA-MW-1-5-6 DA-MW-1-7-8 NRP-B-20-10-11 NRP-B-20-12-13 NRP-B-20-8-9 NRP-B-21-10.5-11.5 NRP-B-21-10.5-11.5 NRP-B-21-14-15 NRP-B-21-14-15 NRP-B-21-7-8 REC1-MW-4-13-14	**J**

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
MW-3-082712	Naphthalene-d_8 Acenaphthene-d_{10} Phenathrene-d_{10}	98016 65771 153429	294570 171030 332651	Anthracene Fluoranthene Acenaphthylene Phenanthrene Naphthalene	**J/UJ**

Internal standard recovery in samples CMS-MW-1-082912, UST71-MW-1-082912, MW-5-083112 biased low and severe matrix interference was observed on these analyses. PAHs results for these samples were to be reported from the dilution analyses.

3.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. The RLs were raised due to high moisture content in samples REC1-MW-7-13-14, REC1-MW-6-12.5-13.5 and REC1-MW-6-17-18.

3.11 Field Duplicates

Six sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. PCB Aroclors (EPA Method SW8082A)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

4.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

4.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

4.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

4.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were not performed for PCB Aroclors analyses; instead, duplicate and LCS/LCSD analyses in combination were performed.

4.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD or concentration difference values met the laboratory control criteria.

4.9 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

4.10 Field Duplicates

Field duplicates were not submitted for PCB Aroclors analysis.

4.11 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

5. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

Sample REC1-MW-5-6.5-7.5 was not preserved immediately upon collection as required by the method. TPH-Gasoline was not detected in this sample at or above their reporting limits. Since the analysis was performed in a relatively short holding time (3 days) of

collection, rather than rejected, TPH-Gasoline result for this sample was qualified (UJ) as estimated.

5.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

5.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

5.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

5.10 Field Duplicates

Seven sets of field duplicates were submitted for TPH-Gasoline analysis. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Gasoline were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use, as qualified.

6. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

6.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

6.2 Initial Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

6.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

6.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

6.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

6.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

6.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

6.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

6.10 Field Duplicates

Eight sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

6.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

7. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

7.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

7.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

7.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS and GFAA methods require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <21% if average response factor approach is employed.

All ICALs met the method requirements.

7.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 79 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample), except for the following:

SDG	CCAL ID	Analyte	%R	Affected Sample	Data Qualifier
208463	9/5/12, 12:27	Arsenic	87.8%	NRP-MW-4-083012 NRP-MW-5-083012 REC7-MW-2-083012	**UJ**
208491	9/5/12, 12:27	Arsenic	87.8%	AP-MW-1-083112	**UJ**
209066	9/14/12, 11:47	Beryllium	87.0%	Boiler-B-3A-1-2 Boiler-B-3A-4-5 Boiler-B-3A-6.5-7.5 Boiler-B-3B-1-2 Boiler-B-3B-4-5 Boiler-MW-1-10-11 Boiler-MW-1-12-13 Boiler-MW-1-16-17 REC5-HA-1-0-1	**UJ**

7.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank, except for the following:

Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit

7.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

7.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values met the laboratory control limits.

7.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%), except that the %R value for germanium in sample Boiler-B-3B-1-2 (132%) was outside the upper control limit. All associated analytes were reported from the dilution analysis (internal standard recovery acceptable), except beryllium. The beryllium result was to be reported from the initial analysis and qualified (UJ) as estimated.

7.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

7.10 Field Duplicates

Eight sets of field duplicates were submitted for Metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected analytes were presented in **Appendix A**.

7.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

8. Formaldehyde by HPLC/UV (EPA Method 8315A)

8.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be derivatized and extracted within 3 days of sample collection. All derivatized sample extracts should be analyzed within 3 days after preparation. The sample was prepared and analyzed within the required holding times, except that sample REC6-MW-2-083012 was extracted four days past the required holding time. The formaldehyde result for this sample was qualified (UJ) as estimated.

8.2 Instrument Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <15% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if

six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

8.3 Calibration Verification

CCV analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

8.4 Method Blanks

A method blank was prepared and analyzed in each preparation batch as required. Formaldehyde was not detected at or above the RL in method blanks.

8.5 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

8.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods. The %R values were within the laboratory control limits.

8.7 Field Duplicates

Samples REC6-MW-1-082812 and REC6-MW-1-082812-D were field duplicates submitted for formaldehyde analysis. Formaldehyde was not detected in either sample; the field precision met the advisory criteria.

8.8 Overall Assessment of Formaldehyde Data Usability

Formaldehyde data are of known quality and acceptable for use, as qualified.

9. Conventional Parameters (TSS, Ammonia, and Dissolved Sulfide)

9.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be analyzed within 7 days of collection for dissolved sulfide and TSS, and 28 days for ammonia.

9.2 Instrument Calibration

The initial calibrations were established for ammonia and sulfide analyses using one blank and at least five levels of standards. The correlation coefficients (r) of the initial calibration curves were >0.995, and met the method criteria.

9.3 Calibration Verification

ICV and CCV analyses were performed for ammonia and sulfide as required by the methods. All ICV and CCV %R values were within the laboratory control limits (90 – 110%).

9.4 Blanks

Calibration Blanks: ICBs and CCBs were analyzed for ammonia and sulfide as required by the methods. No target analytes were positively reported in ICBs and CCBs at or above the MDLs.

Method Blanks: Method blanks were prepared and analyzed for TOC, TSS, ammonia, and sulfide as required by the methods. No target analytes were detected at or above the RLs in method blanks.

9.5 Laboratory Replicate Analyses

Laboratory duplicate analyses were formed on samples REC3-MW-1-082912 for ammonia and sulfide, REC7-MW-3-082812 for sulfide. The RPD (or concentration difference) values were within the project control limits.

9.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on sample REC3-MW-1-082912 for ammonia and sulfide REC7-MW-3-082812 for sulfide. The %R and RPD values met the laboratory control criteria.

9.7 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods fort ammonia and sulfide analysis. All LCS %R values were within the laboratory control limits. LCS/LCSD analyses were performed for TSS; the %R and RPD values met the laboratory control criteria.

9.8 Method Reporting Limits

The MRLs were supported with adequate initial calibration concentrations.

9.9 Field Duplicates

Two sets of field duplicates were submitted for ammonia and sulfide analyses. Four sets of field duplicates were submitted for TSS analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected analytes were presented in **Appendix A**.

9.10 Overall Assessment of Conventional Parameters Data Usability

Conventional parameters data are of known quality and acceptable for use.

10. 1,2-Dibromoehtane (EDB) by GC/ECD (EPA Method SW8011A)

10.1 Holding Times

Water samples should be extraction and analyzed within 28 days of collection. All samples were analyzed within the required holding time.

10.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. The %R value were within the control limits of 80 – 120%.

10.3 Continuing Calibration Verification (CCV)

Continuing calibration verification (CCV) analyses were performed at the required frequency. All %R values were within the control limits of 80 – 120%.

10.4 Method Blank

Method Blank: Method blanks were analyzed at the required frequency. EDB was not detected at or above the RL in method blanks.

10.5 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were not performed on a project sample in these SDGs. EDB was not detected in samples requiring this analysis; the analytical precision and accuracy was evaluated against the LCS/LCSD results.

10.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the methods. All %R and RPD values were within the laboratory control limits.

10.7 Field Duplicates

One set of field duplicates was submitted for EDB analysis. EDB was not detected at or above the RL in either sample; the field precision met the project control criteria.

10.8 Reporting Limits and Target Compound Quantitation

The reported RL was supported with adequate ICAL concentrations. EDB was not detected in samples in these SDGs; a second column confirmation was therefore not required.

10.9 Overall Assessment of EDB Data Usability

EDB data are of known quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason
K1208721-002	REC6-MW-2-083012	Diss. Sulfide	**J**	Field duplicate RPD >35%.

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Notes:
Delta – Concentration difference between the parent sample and its field duplicate
mg/kg – milligram per kilogram
mg/L – milligram per liter
ND – The analyte was not detected at or above the RL.
RL – Reporting limit
RPD – Relative percent difference
µg/L – microgram per liter

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
CCB	continuing calibration blank
CCV	continuing calibration verification
CDD	chlorinated dibenzo-p-dioxin
CDF	chlorinated dibenzofuran
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EDL	estimated detection limit
EMPC	estimated maximum possible concentration
EPA	U.S. Environmental Protection Agency
EPH	extractable petroleum hydrocarbon
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
HRGC	high-resolution gas chromatograph
HRMS	high-resolution mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP	inductively coupled plasma
ICP/MS	inductively coupled plasma/ mass spectrometer
ICSA	ICP interference check sample solution A
ICV	initial calibration verification
IPR	initial precision and recovery
ISC	isomer specificity check
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
m/z	mass-to-charge ratio

MDL	method detection limit
µg/kg	microgram per kilogram
mg/kg	milligram per kilogram
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans)
OPR	ongoing precision and recovery
pg/g	pictogram per gram
PCBs	polychlorinated biphenyls
PCDD	polychlorinated dibenzo-*p*-dioxin
PCDF	polychlorinated dibenzofuran
PEM	performance evaluation mixture
PID	photoionization detector
QA/QC	quality assurance/quality control
QAPP	quality assurance project plan
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
S/N	signal-to-noise ratio
SDG	sample delivery group
SICP	selected ion current profile
SIM	selective ion monitoring
SPLP	synthetic precipitation leaching procedure
SVOCs	semi-volatile organic compounds
VOCs	volatile organic compounds
VPH	volatile petroleum hydrocarbon
WDM	window defining mixture

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during October and December 2013 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc., Fremont Analytical, Inc. in Seattle, Washington, and ALS Environmental Services, Inc. in Houston, Texas.

A level III (or Level 2B as defined in EPA 2009) data validation was performed on these laboratory reports, except those for Extractable Petroleum Hydrocarbon (EPH) and Volatile Petroleum Hydrocarbon (VPH) analyses (performed by Fremont Analytical, Inc.). A Level II (or Level 2A as defined in EPA 2009) validation was performed on EPAH and VPH data.

The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans) and EPA Region 10 SOP (EPA 1996), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **SUMMARY** section at the end of this report. Samples and the associated analyses validated herein are summarized as follows:

Notes:

Laboratory sample identities prefixed with "E" were assigned by ALS Environmental Services, Inc. – Houston, Texas.
Congener – PCB congeners
Dioxins – Polychlorinated dioxins and furans
EPH – Extractable petroleum hydrocarbon
GW – Groundwater
Metals - Arsenic, chromium, copper, mercury, nickel, and zinc
Misc. - Miscellaneous
PAHs - Polycyclic aromatic hydrocarbons
PCBs - Polychlorinated biphenyls
SPLP – Synthetic precipitation leaching procedure; leachates were analyzed for copper (SPLP/Cu), nickel (SPLP/Ni), and/or arsenic (SPLP/As)
SVOCs - Semivolatile organic compound
TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon
TPH-Gx - Gasoline range total petroleum hydrocarbon
TSS – Total ksuspended solids
VOCs - Volatile organic compound
VPH – Volatile petroleum hydrocarbon
X - The analysis was requested and performed on the sample.
X+Cd – Metals listed above plus cadmium

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
BTEX	SW846 Method 8021B	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Total Suspended Solids (TSS)	SM2540D	
Extractable Petroleum Hydrocarbon	NWTPH-EPH	Fremont Analytical, Inc. Seattle, WA
Volatile Petroleum Hydrocarbon	NWTPH-VPH	
Polychlorinated Dioxins/Furans	SW846 Method 8290A	ALS Environmental Services, Inc. Houston, Texas
PCB Congeners	SW846 Method 8082A	ALS Environmental Services, Inc. Kelso, Washington

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In some cases where cooler temperature was outside the 4±2°C criteria; samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be preserved at the time of collection, and analyzed within 14 days of collection. All samples were preserved and analyzed within the required holding times.

Sample HDS-SP-1 was not preserved immediately upon collection as required by the method. Target compounds were not detected in this sample at or above their reporting limits. Since the analysis was performed in a relatively short holding time (4 days) of collection, rather than being rejected, VOCs results for this sample were qualified (UJ) as estimated.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >20% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D value be within ±20%.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), except for the following:

SDG#	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
310487	GCMS9 10/30/13, 7:05	Bromomethane	29.7%	Low	SHB-MW2-7-102413 SHB-MW20-5-102413 SHB-MW2-13-102413 LP-MW2-7-102413 LP-MW2-10.5-102413 LP-MW2-16-102413	**UJ**
311294	GCMS9 11/18/13, 18:05	Acetone	22.6%	Low	PM-B4-10.5-111313	**UJ**
311340	GCMS9 11/18/13, 18:05	Acetone	22.6%	Low	PM-B3-6.5-111513 PM-B3-11-111513	**UJ**

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs). Methylene chloride was present in selected method blanks at levels greater than the method detection limits but less than RLs. Methylene chloride results greater than RLs but less than 10x the levels found in the method blanks were qualified (U) as non-detected at the reported values, as summarized in **SUMMARY, Table I**.

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples), except for the following:

SDG#	Compound	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
310511	Dibromomethane	81%	79%	80-111%	1%	BA-MW-6-1.5-102513 BA-MW-10-1.5-102513 BA-MW-5-2-102513 BA-MW-7-1.5-102513	**UJ**

SDG#	Compound	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
311375	1,4-Dichlorobenzene	78%	78%	79-117%	0%	PM-B5-12-111813	**UJ**
311392	1,4-Dichlorobenzene	78%	78%	79-117%	0%	SHB-B4-5.5-111913 SHB-B4-7.5-111913 SHB-B4-11.5-111913 SHB-B2-6-111913 SHB-B2-8-111913 SHB-B2-9-111913	**UJ**
311392	1,1,2,2,-Tetrachloroethane	82%	83%	83-125%	1%	SHB-B4-5.5-111913 SHB-B4-7.5-111913 SHB-B4-11.5-111913 SHB-B2-6-111913 SHB-B2-8-111913 SHB-B2-9-111913	**UJ**
311420	1,1,2,2,-Tetrachloroethane	82%	83%	83-125%	1%	PM-B1-1.5-112013 PM-B1-6-112013 PM-B1-10-112013 PM-B6-3-112013 PM-B6-6-112013	**UJ**

Note:
RPD control limit: ≤20%

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution

analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses.

Naphthalene, 1,2,4-trichlorobenzene, 1,2-dichlioriobenzene, 1,3-dichlorobenzene, and 1,4-dichliorobenzene were also reported from SVOCs analysis (Method 8270D). These compounds were to be reported from the SVOCs analysis, in favor of the lower detection limits.

1.11 Field Duplicates

Two sets of field duplicates were submitted for VOCs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

1.12 Overall Assessment of VOCs Data Usability

1,2-Dichloroenzene, 1,3-dichlorobenezene, 1,4-dichlorobenzene, 1,2,4-trichlorobenezene, hexachlorobutadiene, and, naphthalene were reported from both the VOCs (SW8260C) and SVOCs (SW8270D) analyses. In case where a sample was analyzed for both analyses, results for these compounds were to be reported from the SVOCs analysis in favor of the lower detection limits.

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The CCV criteria require that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
310431	GCMS8 10/31/13, 12:01	4,6-Dinitro-2-methylphenol	23.5%	Low	TM-MW-3-10-102213 TM-MW-1-12-102213	**UJ**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
310459	TM-MW20-6.5-102313	Phenanthrene Fluoranthene Pyrene Indeno(1,2,3-cd)pyrene Benzo(g,h,i)perylene	119% 134% 128% 91% 89%	142% 174% 230% 130% 128%	50-150%	24% 26% 57% 35% 36%	**J**

Note: RPD control limit: ≤20%

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the laboratory control criteria, or the outliers had no adverse effects on

data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples).

2.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. Internal standards in samples and associated QC analyses either met the criteria, or a dilution analysis was performed to determine if the outlying internal standard recovery was a result of matrix interference. Unreportable data for these samples were summarized in **SUMMARY, Table I** in the end of this report; optimal results that were still affected by the internal standard outliers were qualified as follows:

SDG#	Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
310487	LP-MW2-10.5-102413	Chrysene-d12 Perylene-d12	771815 527146	1973590 1394590	Benz(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Benzo(k)fluoranthene Benzyl butyl phthalate Chrysene Dibenzo(a,h)anthracene Di-n-octyl phthalate Indeno(1,2,3-cd)pyrene	**J**
310487	LP-MW1-12-102413	Chrysene-d12 Perylene-d12	619373 452510	1973590 1394590	Benz(a)anthracene Benzo(g,h,i)perylene Chrysene Pyrene	**J**

2.10 Reporting Limits and Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

2.11 Field Duplicates

Ten sets of field duplicates were submitted for SVOCs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.12 Overall Assessment of SVOCs Data Usability

Naphthalene was reported from both the SVOCs (SW8270D) and PAHs (SW8270D-SIM) analyses. In case where a sample was analyzed for both analyses, the naphthalene result was to be reported from the PAHs analysis in favor of the lower detection limit. SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20%.

3.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples), except for the following:

SDG#	Sample ID	Surrogate Spike	%R	Control Limit	Affected Compound	Data Qualifier
311340	Rec2-B15-111513	Anthracene-d10 Benzo(a)anthracene-d10	20% 19%	50-150% 50-129%	All PAHs	**UJ**

In some cases where surrogate spike %R values were not applicable for data evaluation because the samples contained high levels of target PAHs and required dilution analysis; no data were qualified in these cases.

3.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
311323	Rec2-B13-5-111413	Benzo(g,h,i)perylene Indeno(1,2,3-cd)pyrene Naphthalene	79% 93% 0%	62% 73% 0%	37-133% 28-146% 44-129%	24 24 0	**J**
311392	GF9-B3-11-111913	Anthracene Benz(a)anthracene Benzo(a)pyrene Indeno(1,2,3-cd)pyrene Naphthalene Acenaphthylene Dibenzo(a,h)anthracene Acenaphthene Benzo(g,h,i)perylene Benzo(k)fluoranthene Fluorene	- - - - - - - - - - -	- - - - - 4% 2% 19% 36% 16% 19%	 50-150% 	92% 49% 44% 83% 37% - 191% 131% 79% 138% 133%	**J** **J** **J** **J** **J** **UJ** **UJ** **UJ** **UJ** **UJ** **UJ**

Note:
RPD control limit: ≤20%
"-" indicates that the value was within the control limit.

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. Internal standards in samples and associated QC analyses either met the criteria, or a dilution analysis was performed to determine if the outlying internal standard recovery was a result of matrix interference. Optimal result for each affected compound was determined between the initial and dilution analyses in these cases. Unreportable data for these samples were summarized in **SUMMARY, Table I** in the end of this report; optimal results that were still affected by the internal standard outliers were qualified as follows:

SDG#	Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
311257	CMS-MW1R-8.5-111213	Naphthalene-d8 Acenaphthene-d10 Phenanthrene-d10 Chrysene-d12 Perylene-d12	258754 143015 241274 205316 192188	567879 320195 515501 612037 602298	Naphthalene Benzo(a)pyrene Acenaphthylene Chrysene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benz(a)anthracene Benzo(g,h,i)perylene	**J** **UJ** **J** **J** **J** **UJ** **UJ** **UJ** **J** **J**

3.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. In some cases samples required dilution to definitive quantitate target compounds whose concentrations exceeded calibration range during the initial analysis; the af.

3.11 Field Duplicates

Fifteen sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. PCB Aroclors and PCB Congeners by GC/ECD (EPA Method SW8082A)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days (one year if frozen at ≤-20°C) of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

4.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260 for Aroclors and individual compounds for congeners, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of average CFs for Aroclor 1016, Aroclor 1260 and individual congeners must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

4.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%. Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples, except for the following:

SDG#	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
310582	GC7, 11/1/13, 19:24, CLP1	Aroclor 1016	20.4%	Low	BA-MW-2-2-102913	**UJ**

4.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

4.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
310582	BA-MW-2-2-102913	PCB 74 PCB 110	52% 77%	44% 67%	70-130%	9% 10%	J

4.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits, except for the following:

SDG#	LCS ID	Compound	LCS %R	Control Limit	Affected Sample	Data Qualifier
310582	KWG1400786-3	PCB 119	64%	70-130%	BA-MW-2-2-102913	UJ

4.8 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

In cases where the dual column RPD value was >40% for detections at levels greater than the RL, the result was qualified (J) as estimated. Data qualified in this manner were summarized in **SUMARRY, Table I** at the end of this report.

4.9 Field Duplicates

Four sets of field duplicates were submitted for PCB Aroclors analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

4.10 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclors data are of known quality and acceptable for use.

5. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved at the time of collection and analyzed within 14 days of collection. Six of the soil samples were not preserved immediately upon collection as required by the method. TPH-Gasoline was not detected in these samples at or above their reporting limits. Since the analyses on these samples were performed in a relatively short holding time (4 days) of collection. Therefore, rather than rejected, TPH-Gasoline results for these samples were qualified (UJ) as estimated.

5.2 Initial Calibration (ICAL)

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

5.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

5.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

5.10 Field Duplicates

Twelve sets of field duplicates were submitted for TPH-Gasoline analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use, as qualified.

6. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

6.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

6.2 Initial Calibration

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

6.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

6.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

6.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

6.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

6.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

6.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

6.10 Field Duplicates

Twenty-five sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

6.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

7. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

7.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

7.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

7.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS method require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <15% if average response factor approach is employed.

All ICALs met the method requirements.

7.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 76 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

7.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank.

7.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

7.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values either met the laboratory control limits or the outliers were not applicable for matrix effect evaluation (e.g. sample concentration >4x spiking level), except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
311294	PM-MW-2-12-111313	Lead	122%	169%	59-148%	32%	PM-MW-2-12-111313 PM-MW-502-12-111313	**J**

Note: RPD control criterion is ≤20%

7.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

7.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

7.10 Field Duplicates

Nineteen sets of field duplicates were submitted for metals analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

7.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

8. Extractable Petroleum Hydrocarbon (EPH) by GC/FID (Method NWTPH-EPH)

8.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. Sample Rec1-MW14-11-103113 (Lab ID: 311015-05) was extracted past the required holding time; EPH results for this sample were qualified (J) for detects and (UJ) for non-detects as estimated.

The extractions of samples HB-MW-1R-12-111113 (Lab ID: 311228-08), Rec1-MW13-6-110113 (Lab ID: 311309-03), Rec2-B14-9-111413 (Lab ID: 311323-07), and Rec2-B15-6.5-111513 (Lab ID: 311340-04) were performed excessively (>2x required holding time) past the required holding time. EPH results for these samples were qualified (J) for detects as estimated and (R) for non-detects to be rejected.

8.2 Initial Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.990, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

Initial calibration information was not submitted for review in these SDGs.

8.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±30% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

8.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks, except for the following:

SDG	Method Blank ID	Compound	MB Conc.	Affected Sample	Original Result	Qualified Result	Unit
311039	MB-6395	Aliphatic C8-C10 Aromatic C8-C10	0.566 0.911	Rec1-MW13-6-110113	4.03 J 2.08 J	**5.05 U** **5.05 U**	**mg/kg**
311228	MB-6395	Aliphatic C8-C10 Aromatic C8-C10	0.566 0.911	HB-MW-1R-12-111113	1.03 J 1.78 J	**5.52 U** **5.52 U**	**mg/kg**
311323	MB-6395	Aromatic C8-C10	0.911	Rec2-B14-9-111413	2.25 J	**5.55 U**	**mg/kg**
311340	MB-6395	Aromatic C8-C10	0.911	Rec2-B15-6.5-111513	1.88 J	**5.11 U**	**mg/kg**

8.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

8.6 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency. The %R values met the laboratory control criteria.

8.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required. All %R and RPD values met the project control limits, except for the following:

SDG#	LCS ID	Analyte	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
311039	6395	Aliphatic C8-C10 Aromatic C8-C10 Aromatic C10-C12	50.0% 51.1% 39.4%	45.7% 37.0% 21.0%	70-130%	9.03% 32.1% 61.0%	Rec1-MW13-6-110113	**J**
311228	6395	Aliphatic C8-C10 Aromatic C8-C10 Aromatic C10-C12	50.0% 51.1% 39.4%	45.7% 37.0% 21.0%	70-130%	9.03% 32.1% 61.0%	HB-MW-1R-12-111113	**J/UJ**
311323	6395	Aliphatic C8-C10 Aromatic C8-C10 Aromatic C10-C12	50.0% 51.1% 39.4%	45.7% 37.0% 21.0%	70-130%	9.03% 32.1% 61.0%	Rec2-B14-9-111413	**J**
311340	6395	Aliphatic C8-C10 Aromatic C8-C10 Aromatic C10-C12	50.0% 51.1% 39.4%	45.7% 37.0% 21.0%	70-130%	9.03% 32.1% 61.0%	Rec2-B15-6.5-111513	**J**

Note: RPD criteria: ≤20%.

8.8 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were consistent with method-recommended pratical quantitation limits and were adjusted with sample volumes and moisture contents.

8.9 Field Duplicates

Field duplicates were not submitted for EPH analysis in these SDGs.

8.10 Overall Assessment of EPH Data Usability

EPH data are acceptable for use as qualified, based on the information submitted by the laboratory.

9. Volatile Petroleum Hydrocarbon by GC/FID/PID (Method NWTPH-VPH)

9.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved with methanol at the time of collection, and analyzed within 14 days of collection. Sample Rec1-MW14-11-103113 (Lab ID: 311015-05) was analyzed past the required holding time; VPH results for this sample were qualified (J) for detects and (UJ) for non-detects as estimated.

The analyses of samples Rec1-MW13-6-110113 (Lab ID: 311309-03), Rec2-B14-9-111413 (Lab ID: 311323-07), and Rec2-B15-6.5-111513 (Lab ID: 311340-04) were performed excessively (>2x required holding time) past the required holding time. VPH results for these samples were qualified (J) for detects as estimated and (R) for non-detects to be rejected.

9.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20%, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.990, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

Initial calibration information was not submitted for review in these SDGs.

9.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (% value within ±20% for the carbon range components and ±15% for individual target compounds).

9.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were either not detected at or above the RLs in the method blanks, or sample results were greater than five times the detection in the associated method blank.

9.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target and/or non-target compounds in the samples. No data qualifying actions were taken in these cases.

9.6 Matrix Spike (MS)

MS analyses were performed on project or batch QC samples at the required frequency. The %R values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	Control Limit	Affected Sample	Data Qualifier
311340	Rec2-B15-6.5-111513	Aliphatics C8-C10 Naphthalene	37.6% -10.5%	70-130%	Rec2-B15-6.5-111513	J

9.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

9.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

9.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were consistent with method-recommended practical quantitation limits, and were adjusted with sample volumes and moisture contents.

9.10 Field Duplicates

Field duplicates were not submitted for VPH analysis in these SDGs.

9.11 Overall Assessment of VPH Data Usability

VPH data are acceptable for use as qualified, based on the information submitted by the laboratory.

10. Polychlorinated Dioxins/Furans by HRGC/HRMS (EPA Method SW8290A)

10.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

EPA SW846 Method 8290A recommends a holding time of 30 days for solid samples stored in the dark at 4°C and completely analyzed within 45 days of extraction. All samples were extracted and analyzed within the recommended holding times.

10.2 HRGC/HRMS Instrument Performance Check

The method requires that (1) for mass calibration and resolution, the laboratory must provides evidence of mass spectrometer resolution > 10,000 at the beginning and end of each 12-hour analytical sequence. If mass calibration and resolution tuning are not correctly performed, interferences may degrade chlorinated dibenzo-*p*-dioxin and chlorinated dibenzofuran (CDD/CDF) identification and quantitation; (2) the mass spectrometer selected ion monitoring (SIM) scan descriptor switching times are determined by the analysis of the Window Defining Mixture (WDM) which contains the first and last eluting isomers in each homologue; and (3) chromatographic resolution is verified by analyzing one of two Isomer Specificity Check (ISC) solutions, depending on the Gas Chromatograph (GC) column used for analysis. All HRGC/HRMS instrument performance checks met the criteria.

10.3 Initial Calibration (ICAL)

The method requires that (1) the chromatographic peak separation between the 2,3,7,8-TCDD peak and the 1,2,3,8-TCDD peak and between the 2,3,7,8-TCDF peak and the 2,3,4,7-TCDF peak and must be resolved with a valley of < 25%; (2) the ion abundance ratio be within a ± 15% window around the theoretical abundance ratio; (3) the retention times (RTs) of the isomers must fall within the appropriate RT windows established by the WDM analysis. In addition, the absolute RT of the internal standard $^{13}C_{12}$-1,2,3,4-TCDD must exceed 25 minutes on the DB-5 (or equivalent) column and 15 minutes on the DB-225 (or equivalent) column; (4) the instrument sensitivity (signal-to-noise [S/N] ratio) must be >10:1; (5) the percent relative standard deviation (%RSD) be <20% for native isomers and < 30% for labeled isomers; (6) all initial calibration standards (CSs) must be analyzed at the correct concentration levels; (7) initial calibrations must be performed when the contract is awarded, whenever significant instrument maintenance is performed (e.g., ion source cleaning, GC column replacement, etc.), or if calibration verification criteria are not met. All ICALs met the method requirements.

10.4 Calibration Verification

The method requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the percent difference (%D) be within ±20% for native isomers and be within ±30% for labeled isomers, and (3) the ion abundance ratio, retention times, relative retention times, instrument sensitivity meet the criteria for initial calibrations. All calibration verification analyses met the criteria.

10.5 Method Blanks

Method blanks were prepared and analyzed as required for each preparation batch. Selected target compounds were detected in method blanks. Sample results less than 5x the level found in the associated method blank were qualified (U) as non-detects at the reported values. Qualified data were summarized in **SUAMMRY** section at the end of this report.

10.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the method. The recovery met the method control limits for all target and labeled compounds.

10.7 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS and MSD analyses were not performed on a project sample in this SDG.

10.8 Labeled Compounds

Nine labeled internal standards and one cleanup recovery standard were added to all samples as required by the method. All %R values for internal standards and cleanup standard met the method requirement.

10.9 Target Compound Identification

All detected target congeners were properly identified. The ion ratios for a number of detection did not meet the method criteria; these results were qualified as non-detected at their reported values, as summarized in **SUMMARY, Table I.**

10.10 Reporting Limits, Estimated Detection Limits (EDLs), and Compound Quantitation

Correct internal standards, quantitation ions, and average RFs were used to quantitate target compound detections. The RLs were supported with adequate ICAL calibration concentrations. Sample-specific EDLs and RLs were adjusted with sample weights, internal standard peak height, and noise levels as required by the method.

Selected target congeners in a number of samples had chlorodiphenyl ether interference present in their retention time region. The affected results were qualified (J) as estimated, as summarized in **SUMMARY, Table I**.

10.11 Second Column Confirmation

All positive detection of 2,3,7,8-TCDF were re-analyzed on the DB-225 column for confirmation and results reported from the second column (DB-225) should be used for data interpretation.

10.12 Field Duplicates

One set of field duplicates were submitted for Dioxins/Furans analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

10.13 Overall Assessment of Polychlorinated Dioxins/Furans Data Usability

Polychlorinated dioxins and furans data were of known quality and acceptable for use as qualified.

11. Total Suspended Solids (TSS) by Standard Method 2540D

11.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be analyzed within seven days of collection. The sample was analyzed within the required holding time.

11.2 Laboratory Control Sample (LCS)

LCS analysis was performed as required by the method. The %R value was within the laboratory control limits.

11.3 Laboratory Duplicate Analysis

Laboratory duplicate analysis was performed as required by the method. The RPD value (or concentration difference value, as applicable) met the laboratory control criteria.

11.4 Reporting Limits

The reporting limit for TSS (10 mg/L) met the project requirements.

11.5 Field Duplicates

Only one sample was collected for TSS analysis during this phase of sampling. Field duplicate as not collected for TSS analysis.

11.6 Overall Assessment of TSS Data Usability

TSS data are of know quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason

Notes:
%D – Percent difference
%R - Percent recovery
CCV - Continuing calibration verification
DL - Dilution analysis
LCL - Lower control limit
LCS - Laboratory control sample
LCSD - Laboratory control sample duplicate
MB - Method blank
MS - Matrix spike
MSD - Matrix spike duplicate
RL – Reporting limit
RPD - Relative percent difference
TPH - Total petroleum hydrocarbon
UCL - Upper control limit

Table II. Data Affected by Detections in Method Blanks

SDG#	Sample ID	Compound	Original Result	Adjusted Result	Unit	Report Section

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Approved By:  Date: *12**/27/2015***

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Notes:
Delta – Concentration difference between the parent sample and its field duplicate
mg/kg – milligram per kilogram
ND – The analyte was not detected at or above the RL.
RL – Reporting limit
RPD – Relative percent difference

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
EPA	U.S. Environmental Protection Agency
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP/MS	inductively coupled plasma/ mass spectrometer
ICSA	ICP interference check sample solution A
ICV	initial calibration verification
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
MDL	method detection limit
µg/L	microgram per liter
mg/L	Milligram per liter
MS	matrix spike
MSD	matrix spike duplicate
ng/L	Nanogram per liter
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics)
OPR	ongoing precision and recovery
QA/QC	quality assurance/quality control
QAPP	quality assurance project plan

RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
SDG	sample delivery group
SIM	selective ion monitoring
SVOCs	semi-volatile organic compounds
TSS	total suspended solids
VOCs	volatile organic compounds

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during November 2013 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Columbia Analytical Services, Inc. (CAS, part of ALS Group) in Kelso, Washington.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

				Analysis					
Field Sample ID	Laboratory Sample ID	Sample Date	Sample Type	VOCs	SVOCs	PAHs	TPH-G TPH-Dx	Metals	Miscellaneous

Notes:

Laboratory sample ID prefixed with "K" was a laboratory identity assigned by CAS-ALS in Kelso, Washington. Metals (except mercury) analyses performed by CAS-ALS included a reductive precipitation procedure for sample preparation.

D – Dissolved metals

Metals: Total recoverable and dissolved arsenic, copper, lead, mercury, nickel, and zinc. Not all samples were analyzed for all metals.

NH_3 – Ammonia as Nitrogen

PAHs - Polycyclic aromatic hydrocarbons

S^{-2} – Dissolved sulfide

SVOCs – Semi-volatile Organic Compounds

T – Total recoverable metals

TSS - Total suspended solids

TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon

TPH-G - Gasoline range total petroleum hydrocarbon

VOCs - Volatile Organic Compounds

X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Semi-volatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Mercury	EPA Method 1631E	
Total Suspended Solids (TSS)	SM Method 2540D	Columbia Analytical Services, Inc. Kelso, WA (Part of ALS Group)
Dissolved Sulfide	SM 4500-S2-D	
Total Recoverable Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Ammonia as Nitrogen	EPA Method 350.1

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In case where cooler temperature was outside the 4±2°C criteria, samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

water samples should be acid-preserved at pH<2 immediately and analyzed within 14 days (seven days if not preserved) of collection. All samples were analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >15% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%.

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the

%D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs).

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits.

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution

analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses.

1.11 Field Duplicates

Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The CCV criteria require that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
311145	GCMS8 11/15/13, 06:46	*bis*(2-Chloro-1-methylethyl) ether *bis*(2-Chloroethyl) ether 2-Nitroaniline 4-Nitrophenol	26.4% 24.2% 21.3% 31.4%	Low	TM-MW5-110613 REC7-MW2-110613 TM-MW6-110713 REC6-MW2-110713 PM-MW-1-110613 PM-MW-5-110613 PM-MW7-110713 PM-MW500-110713	**UJ**
311105	GCMS8 11/18/13, 08:12	Benzoic Acid 2,4-Dinitrolphenol	53.0% 28.7%	Low	TM-MW2-110513 BA-MW-4-110513 BA-MW-6-110613	**UJ**

311093	GCMS8 11/14/13, 18:34	*bis*(2-Chloroethyl) ether *bis*(2-chloroisopropyl) ether 4-Niitrophenol	24.3% 24.6% 27.2%	Low	PM-MW6-110513 BA-MW-7-110413 PM-MW-8-110513 BA-MW-5-110513	**UJ**
311093	GCMS8 11/18/13, 08:12	Benzoic Acid 2,4-Dinitrolphenol	53.0% 28.7%	Low	BA-MW-1-110413	**UJ**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
311339	BA-MW2-111513	Phenol Benzoic Acid 4-Nitrophenol	41% 40% 35%	33% 36% 30%	50-150%	11% 3% 14%	**UJ**
311322	REC1-MW10-111413	Phenol Benzoic Acid 4-Nitrophenol	35% 33% 39%	39% 34% 45%	50-150%	11% 3% 14%	**UJ**
311145	PM-MW7-110713	Phenol Benzoic Acid 4-Nitrophenol	37% 31% 31%	39% 30% 31%	50-150%	5% 3% 0%	**UJ**

Note: RPD criteria is ≤20%

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the laboratory control criteria, or the outliers had no adverse effects on data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples), except for the following:

SDG#	Compound	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
311105	2,4-Dimethylphenol	12%	33%	45-100%	93%	TM-MW2-110513 BA-MW-4-110513 BA-MW-3-110513 BA-MW-6-110613	**UJ**
311093	2,4-Dimethylphenol	12%	33%	45-100%	93%	PM-MW6-110513 BA-MW-1-110413 BA-MW-7-110413 PM-MW-8-110513 BA-MW-5-110513	**UJ**

Note: RPD criteria is ≤20%

2.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD or concentration difference values either met the laboratory control criteria or the outlier had no adverse effects on data usability (*e.g.,* high RPD value for a compound that was not detected in samples).

2.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
BA-MW-5-110513	Chrysene-d_{12}	57515	1250920	Benzyl butyl phthalate *bis*(2-Ethylhexyl) phthalate	**UJ**

2.11 Reporting Limits and Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

2.12 Field Duplicates

Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.13 Overall Assessment of SVOCs Data Usability

SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.05 for all compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

3.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were inapplicable for data evaluation because the samples contained high levels of target PAHs and requested dilution analysis; no data were qualified on this basis.

3.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
311339	BA-MW2-111513	Benzo(b)fluoranthene	50%	63%	62-91%	23%	UJ
		Benzo(a)pyrene	47%	63%	60-86%	29%	
311322	REC1-MW10-111413	Benzo(b)fluoranthene	54%	50%	62-91%	8%	UJ
		Benzo(a)pyrene	53%	48%	60-86%	10%	
311145	PM-MW7-110713	Phenanthrene	60%	58%	65-100%	3%	UJ
		Fluoranthene	31%	32%	63-110%	3%	
		Pyrene	33%	31%	63-107%	6%	
		Benz(a)anthracene	10%	32%	60-93%	105%	
		Chrysene	14%	39%	60-102%	94%	
		Benzo(b)fluoranthene	5%	28%	62-91%	139%	
		Benzo(k)fluoranthene	8%	43%	51-98%	137%	
		Benzo(a)pyrene	6%	33%	60-86%	138%	

Note: RPD criteria is ≤20%

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

SDG	Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
311293	REC5-MW1R-111313	Phenathrene-d_{10}	487520	229728	Benzo(a)pyrene	J
		Chrysene-d_{12}	502790	233851	Benzo(b)fluoranthene	
		Pyrene-d_{12}	430713	193355	Benzo(g,h,i)perylene	
					Benzo(k)fluoranthene	
					Indeno(1,2,3-cd)pyrene	

3.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. PAHs sample-specific RLs for samples in SDGs 311093 and 311105 were raised from the standard RLs by a factor of 2 due to insufficient sample volumes.

3.11 Field Duplicates

Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be preserved to pH<2 at the time of collection, and analyzed within 14 days of collection. All samples were preserved and analyzed within the required holding times.

4.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

4.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

4.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

4.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

4.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

4.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

4.10 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Gasoline were presented in **Appendix A**.

4.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use.

5. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

5.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be extracted within seven days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

5.2 Initial Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

5.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

5.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

5.10 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

6. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

6.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, except that incorrect sample containers and preservative were used for total and dissolved mercury samples in SDGs K1313915 and K1313920. Total and dissolved mercury results for all samples in these two SDGs were qualified (J) for detects and (UJ) for non-detected as estimated.

Water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

6.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

6.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS and GFAA methods require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <21% if average response factor approach is employed.

All ICALs met the method requirements.

6.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 79 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks, except for the following:

SDG	Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit
K1312150	CCB2 CCB4	Arsenic, Total	0.08 J 0.24 J	TM-MW2-110513 NRP-MW2-110613	1.35 1.44	1.35 J 1.44 J	µg/L

K1313920	MB	Mercury, Dissolved	0.00014 J	BA-MW-7-110413	0.00137	**0.00137 J**	**µg/L**

6.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

6.7 Laboratory Duplicate Analysis

Laboratory duplicate analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The RPD values met the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Analyte	RPD	Control Limit	Affected Sample	Data Qualifier
K1312256	TM-MW1-110613	Zinc, Total	23.7%	≤20%	TM-MW1-110613 TM-MW5-110613 TM-MW4-110613 REC7-MW2-110613 TM-MW6-110713 REC6-MW2-110713 PM-MW-1-110613 PM-MW-5-110613	J

6.8 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values met the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	Control Limit	Affected Sample	Data Qualifier
K1313877	REC6-MW2-110713	Copper, Dissolved	40.3%	70-130%	PM-MW-5-110613 NRP-MW3-110513 REC1-MW5-110613	J

6.9 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

6.10 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

6.11 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected analytes were presented in **Appendix A**.

6.12 Overall Assessment of Metals Data Usability

The total mercury result in sample BA-MW-5-110513 (Laboratory ID: K1313920-010) was significantly less than its dissolved mercury result (RPD value was >10%). Total and dissolved mercury results for this sample were qualified J) as estimated.

Metal data are of known quality and acceptable for use, as qualified.

7. Conventional Parameters (TSS, Ammonia, and Dissolved Sulfide)

7.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be analyzed within 7 days of collection for dissolved sulfide and TSS, and 28 days for ammonia.

7.2 Instrument Calibration

The initial calibrations were established for ammonia and sulfide analyses using one blank and at least five levels of standards. The correlation coefficients (r) of the initial calibration curves were >0.995, and met the method criteria.

7.3 Calibration Verification

ICV and CCV analyses were performed for ammonia and sulfide as required by the methods. All ICV and CCV %R values were within the laboratory control limits (90 – 110%).

7.4 Blanks

Calibration Blanks: ICBs and CCBs were analyzed for ammonia and sulfide as required by the methods. No target analytes were positively reported in ICBs and CCBs at or above the MDLs, except for the following:

SDG	Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit
K1312256	CCB3 CCB4	Ammonia	0.0028 J 0.0023 J	REC7-MW-3-110613	0.029 J	**0.05 U**	**mg/L**

Method Blanks: Method blanks were prepared and analyzed for TSS, ammonia, and sulfide as required by the methods. No target analytes were detected at or above the RLs in method blanks.

7.5 Laboratory Replicate Analyses

Laboratory duplicate analyses were formed on project samples at the adequate frequency for ammonia and sulfide. The RPD (or concentration difference) values were within the project control limits.

7.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project samples at the adequate frequency for ammonia and sulfide. The %R and RPD values met the laboratory control criteria.

7.7 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods fort ammonia and sulfide analysis. All LCS %R values were within the laboratory control limits. LCS/LCSD analyses were performed for TSS; the %R and RPD values met the laboratory control criteria.

7.8 Method Reporting Limits

The MRLs were supported with adequate initial calibration concentrations.

7.9 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected analytes were presented in **Appendix A**.

7.10 Overall Assessment of Conventional Parameters Data Usability

Conventional parameters data are of known quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason
K1312256-015	PM-MW7-110713	Mercury, Total	J	FD difference >2xRL

Notes:
%D – Percent difference value
%R – Percent recovery value
CCV – Continuing calibration verification
FD – Field duplicate
LCL – Lower control limit

LCS – Laboratory control sample
LCSD – Laboratory control sample duplicate
MS – Matrix spike
MSD – Matrix spike duplicate
Preservation – Incorrect sample container and preservative was used for sample collection
RPD – Relative percent difference
T/D – Total recoverable vs. dissolved metals concentration
UCL – Upper control limit

Notes:
mg/L – milligram per liter
µg/L – microgram per liter

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 20% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Analyte	Units	RL	Parent & Field Duplicate Sample Result		RPD	Delta	Data Qualifier

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
EPA	U.S. Environmental Protection Agency
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP/MS	inductively coupled plasma/ mass spectrometer
ICSA	ICP interference check sample solution A
ICV	initial calibration verification
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
MDL	method detection limit
µg/L	microgram per liter
mg/L	Milligram per liter
MS	matrix spike
MSD	matrix spike duplicate
ng/L	Nanogram per liter
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics)
OPR	ongoing precision and recovery
QA/QC	quality assurance/quality control
QAPP	quality assurance project plan

RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
SDG	sample delivery group
SIM	selective ion monitoring
SVOCs	semi-volatile organic compounds
TSS	total suspended solids
VOCs	volatile organic compounds

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during February 2014 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Columbia Analytical Services, Inc. (CAS, part of ALS Group) in Kelso, Washington.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Field Sample ID	Laboratory Sample ID	Sample Date	Sample Type	Analysis

Notes:

Laboratory sample ID prefixed with "K" was a laboratory identity assigned by CAS-ALS in Kelso, Washington. Metals (except mercury) analyses performed by CAS-ALS included a reductive precipitation procedure for sample preparation.

D – Dissolved metals

Metals: Arsenic, copper, lead, mercury, nickel, and zinc. Not all samples were analyzed for all metals.

NH_3 – Ammonia as Nitrogen

PAHs - Polycyclic aromatic hydrocarbons

S^{-2} – Dissolved sulfide

SVOCs – Semi-volatile Organic Compounds

T – Total recoverable metals

TSS - Total suspended solids

TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon

TPH-G - Gasoline range total petroleum hydrocarbon

VOCs - Volatile Organic Compounds

X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Semi-volatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Mercury	EPA Method 1631E

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In case where cooler temperature was outside the 4±2°C criteria, samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

water samples should be acid-preserved at pH<2 immediately and analyzed within 14 days (seven days if not preserved) of collection. All samples were analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >15% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%.

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the

%D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
402348	GCMS7 2/27/14, 12:45	Dichlorodifluoromethane	25.2%	Low	TM-MW6-022414 OPS-MW-1-022414	**UJ**

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs).

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits.

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses.

1.11 Field Duplicates

Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The CCV criteria require that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
402324	GCMS8 2/26/14, 09:51	Benzoic Acid	-99%	Low	PM-MW6-022314 PM-MW4-022314 BA-MW-6-022314 BA-MW7-022314	**R**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
302396	TM-MW2-022614	Benzoic acid 4-Chloroaniline 3-Nitroaniline 4-Nitrophenol 4-Nitroaniline	12% 31% 31% 13% 32%	-	50-150%	-	**UJ**

Note: RPD criteria is ≤20%

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the laboratory control criteria, or the outliers had no adverse effects on data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples), except for the following:

SDG#	Compound	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
402316	2,4-Dinitrophenol	62%	40%	45-100%	43%	REC1-MW10-022014 REC1-MW500-022014	**UJ**
402324	2,4-Dinitrophenol	40%	-	45-100%	-	PM-MW6-022314 PM-MW4-022314 BA-MW-6-022314 BA-MW7-022314	**UJ**
402348	Hexachlorocyclopentadiene	16%	13%	26-94%	21%	REC6-MW2-022414 TM-MW6-022414 PM-MW1-022414 PM-MW-8-022414 PM-MW-7-022414	**UJ**

402396	Hexachlorocyclopentadiene	16%	13%	26-94%	21%	TM-MW5-022614 TM-MW2-022614 TM-MW500-022614	**UJ**
402409	Hexachlorocyclopentadiene	16%	13%	26-94%	21%	Rec5-MW-1-022714 BA-MW-1-022714	**UJ**

Note: RPD criteria is ≤20%

2.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD or concentration difference values either met the laboratory control

criteria or the outlier had no adverse effects on data usability (*e.g.,* high RPD value for a compound that was not detected in samples).

2.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
BA-MW-6-022314	Perylene-d_{12}	943044	1963940	Di-n-octyl phthalate	**UJ**

Rec7-MW2-022514	Chrysene-d_{12} Perylene-d_{12}	1164838 640215	2638990 1800650	Benzyl butyl phthalate *bis*(2-Ethylhexyl) phthalate Di-n-octyl phthalate	**UJ**

2.11 Reporting Limits and Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

2.12 Field Duplicates

Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.13 Overall Assessment of SVOCs Data Usability

SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.05 for all compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
402324	GCMS6 2/26/14, 07:16	Indeno(1,2,3-cd)pyrene	26.2%	High	BA-MW7-022314	**J**

3.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were inapplicable for data evaluation because the samples contained high levels of target PAHs and requested dilution analysis; no data were qualified on this basis.

3.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
402316	REC1-MW10-022014	Benzo(b)fluoranthene	26%	28%	62-91%	7%	**UJ**
		Benzo(k)fluoranthene	30%	35%	51-98%	15%	
		Benzo(a)pyrene	26%	27%	60-86%	4%	
		Indeno(1,2,3-cd)pyrene	7%	5%	10-98%	33%	
		Dibenzo(a,h)anthracene	5%	5%	10-97%	0%	
		Benzo(g,h,i)perylene	7%	7%	10-102%	0%	

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
402348	LP-MW-1-022414	Chrysene	119%	123%	60-102%	3%	
		Benz(a)anthracene	146%	152%	60-93%	4%	J
		Pyrene	452%	457%	63-107%	1%	
302396	TM-MW2-022614	Acenaphthene	5%	62%	59-109%	170	J
		Benzo(b)fluoranthene	51%	47%	62-91%	8	UJ
		Benzo(k)fluoranthene	49%	50%	51-98%	2	UJ
		Benzo(a)pyrene	47%	45%	60-86%	4	UJ

Note: RPD criteria is ≤20%

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
BA-MW5-022414	Naphthalene-d_8 Phenathrene-d_{10}	1614038 630084	214838 195521`	Chrysene Benz(a)anthracene Pyrene	J
LP-MW-1-022414	Chrysene-d_{12}	398860	197104	Chrysene Benz(a)anthracene Pyrene	J

3.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

3.11 Field Duplicates

Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be preserved to pH<2 at the time of collection, and analyzed within 14 days of collection. All samples were preserved and analyzed within the required holding times.

4.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

4.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

4.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

4.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

4.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

4.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

4.10 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Gasoline were presented in **Appendix A**.

4.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use.

5. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

5.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Water samples should be extracted within seven days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

5.2 Initial Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be <20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

5.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

5.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

5.10 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

6. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

6.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

6.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

6.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS and GFAA methods require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <21% if average response factor approach is employed.

All ICALs met the method requirements.

6.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 79 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks, except for the following:

SDG	Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit
K1401973	CCB3 CCB4 CCB5 CCB6	Lead, Total	0.006 J 0.005 J 0.007 J 0.005 J	NRP-MW-2-022514 Rec7-MW1-022514 Rec7-MW2-022514	0.049 0.030 0.021	**0.049 J** **0.030 J** **0.021 J**	**µg/L**

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank, except for the following:

SDG	Blank ID	Analyte	Detection In Blank	Affected Sample	Original Result	Adjusted Result	Unit
K1401875	MB	Mercury, Total	0.27 J	REC1-MW14-022014	0.37 J	**1.0 U**	**ng/L**
K1402039	MB	Mercury, Total	0.12 J	TM-MW5-022614	0.46 J	**1.0 U**	**ng/L**
K1403954	MB	Mercury, Dissolved	0.36 J	NRP-MW-3-022514	2.53	**2.53 J**	**ng/L**

6.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

6.7 Laboratory Duplicate Analysis

Laboratory oduplicate analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The RPD values met the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Analyte	RPD	Control Limit	Affected Sample	Data Qualifier
K1401911	LP-MW-1-022414	Copper, Total Zinc, Total	27.0% 61.2%	20%	LP-MW-1-022414	J

6.8 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values met the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	Control Limit	Affected Sample	Data Qualifier
K1401911	LP-MW-1-022414	Arsenic, Total	40.5%	50-147%	LP-MW-1-022414	J

6.9 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

6.10 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

6.11 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected analytes were presented in **Appendix A**.

6.12 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

7. Conventional Parameters (TSS, Ammonia, and Dissolved Sulfide)

7.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Water samples should be analyzed within 7 days of collection for dissolved sulfide and TSS, and 28 days for ammonia.

7.2 Instrument Calibration

The initial calibrations were established for ammonia and sulfide analyses using one blank and at least five levels of standards. The correlation coefficients (r) of the initial calibration curves were >0.995, and met the method criteria.

7.3 Calibration Verification

ICV and CCV analyses were performed for ammonia and sulfide as required by the methods. All ICV and CCV %R values were within the laboratory control limits (90 – 110%).

7.4 Blanks

Calibration Blanks: ICBs and CCBs were analyzed for ammonia and sulfide as required by the methods. No target analytes were positively reported in ICBs and CCBs at or above the MDLs.

Method Blanks: Method blanks were prepared and analyzed for TOC, TSS, ammonia, and sulfide as required by the methods. No target analytes were detected at or above the RLs in method blanks.

7.5 Laboratory Replicate Analyses

Laboratory duplicate analyses were formed on project samples at the adequate frequency for ammonia and sulfide. The RPD (or concentration difference) values were within the project control limits.

7.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project samples at the adequate frequency for ammonia and sulfide. The %R and RPD values met the laboratory control criteria.

7.7 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods fort ammonia and sulfide analysis. All LCS %R values were within the laboratory control limits. LCS/LCSD analyses were performed for TSS; the %R and RPD values met the laboratory control criteria.

7.8 Method Reporting Limits

The MRLs were supported with adequate initial calibration concentrations.

7.9 Field Duplicates

Field duplicate results, RPD (or concentration difference) values, and data qualification for detected analytes were presented in **Appendix A**.

7.10 Overall Assessment of Conventional Parameters Data Usability

Conventional parameters data are of known quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Notes:
%D – Percent difference value
%R – Percent recovery value
CCV – Continuing calibration verification
FD – Field duplicate
LCL – Lower control limit
LCS – Laboratory control sample
LCSD – Laboratory control sample duplicate
MS – Matrix spike
MSD – Matrix spike duplicate
RPD – Relative percent difference
UCL – Upper control limit

Table II. Data Affected by Detections in Laboratory Blanks

Laboratory Sample ID	Sample ID	Compound	Original Result	Adjusted Result	Unit	Report Section
K1401876-001	REC1-MW14-022014	Mercury, Total	037 J	**1.0 U**	ng/L	**7.4**

K1402039-001	TM-MW5-022614	Mercury, Total	0.46 J	**1.0 U**	ng/L	**7.4**
K1403954-015	NRP-MW-3-022514	Mercury, Dissolved	2.53	**2.53 J**	ng/L	**7.4**

Notes:
ng/L – nanogram per liter
µg/L – microgram per liter

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 20% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Fluoranthene	µg/L	0.05	1.4	1.9	30%		**J/J**
Fluorene	µg/L	0.05	8.6	9.6	11%	1	
Indeno(1,2,3-cd)pyrene	µg/L	0.01	ND	0.01		0.01	
Naphthalene	µg/L	0.05	54	59	9%		
Phenanthrene	µg/L	0.05	16	19	17%		
Pyrene	µg/L	0.05	0.52	1.2	79%		**J/J**
			TM-MW2-022614	**TM-MW500-022614**			
TPH-Diesel	µg/L	50	ND	ND			
TPH-Motor Oil	µg/L	250	ND	ND			
Total Suspended Solids	mg/L	10	58	ND		58	**J/UJ**

Analyte	Units	RL	Parent & Field Duplicate Sample Result		RPD	Delta	Data Qualifier
Arsenic	µg/L	0.5	2.7	2.7	0%		
Copper	µg/L	0.1	3.54	3.43	3%		
Copper, Dissolved	µg/L	0.1	0.63	0.55	14%		
Lead	µg/L	0.02	0.55	0.576	5%		
Nickel	µg/L	0.2	2.97	3.17	7%		
Zinc	µg/L	0.5	1.4	1.1		0.3	
VOCs	µg/L		ND	ND			
2-Methylnaphthalene	µg/L	0.05	0.075	0.07		0.005	
Acenaphthene	µg/L	0.05	0.62	0.45	32%		**J/J**
Naphthalene	µg/L	0.05	0.085	0.094		0.009	

Notes:
Delta – Concentration difference between the parent sample and its field duplicate
mg/L – milligram per liter
ND – The analyte was not detected at or above the RL.
RL – Reporting limit
RPD – Relative percent difference
µg/L – microgram per liter

DATA VALIDATION REPORT

Kimberly Clark – Everett Mill
Supplemental Soil Analyses
September 2015
SDG 509461

Prepared by:
Aspect Consulting, LLC

Project No. 110207 • October 12, 2015

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Validation Reports and EDDs\RI\Validation Report 2015 supplemental data - LMB\DV Report - KC Everett Mill - Oct 2015 - Soil.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for soil samples collected from September 23 through September 24, 2015 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for mercury, metals, PAHs, PCBs and Diesel TPH by Friedman and Bruya, Inc. (F&B). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury	EPA 1631E	F&B
Metals (As, Cu, Ni, Pb, Zn)	EPA 200.8	F&B
PAH	EPA 8270D-SIM	F&B
PCB Aroclors	EPA 8082	F&B
TPH - Diesel with Silica Gel Cleanup	NWTPH-DX	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 509461

Soil samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).
