Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite 28 days of collection.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.1.3 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.1.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.1.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Metals (EPA 200.8)

2.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.2.3 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.2.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.2.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 PAH (EPA 8270D SIM)

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.3.3 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.3.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R were within laboratory specified control limits with the exception of recoveries for Phenanthrene, Fluoranthene, Pyrene, Benz(a)anthracene, Chrysene, Benzo(k)Fluoranthene, and Benzo(a)pyrene. For all these analytes the parent sample contained more than 4x the spiked amount, so no qualification was needed.

The MS/MSD RPD were within the project control limits.

2.3.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.3.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.4 PCBs (EPA 8082A)

2.4.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.4.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.4.3 Laboratory Control Samples/Laboratory Control Sample Duplicate (LCS/LCSD)

All LCS and LCSD %R were and within the laboratory specified control limits.

2.4.4 Matrix Spike (MS)

MS %R were within the project control limits.

2.4.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.4.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.5 Diesel & Motor Oil Range Hydrocarbons (NWTPH-Dx)

2.5.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.5.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.5.3 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.5.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.5.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.5.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

3 Qualified Data Summary

No sample results were qualified as a result of validation, with the exception of non-detect result, which received a U qualifier.

Data Qualifier Definitions

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Project No. 110207 • October 15, 2015

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Validation Reports and EDDs\RI\Validation Report 2015 supplemental data - LMB\DV Report - KC Everett Mill - Oct 2015 - GW.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected from September 30 through October 8, 2015 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for PAHs, PCBs, TPH, SVOCs and TSS by Friedman and Bruya, Inc. (F&B). Analysis for metals, mercury and PCBs was subcontracted to ALS Environmental (ALS). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury - Dissolved	EPA 1631E	ALS
Metals (As, Cu, Ni, Pb, Zn) - Dissolved	EPA 200.8	ALS
PAH	EPA 8270D-SIM	F&B
PCB Aroclors	EPA 8082	ALS & F&B
SVOC	EPA 8270D	F&B
TPH - Diesel with Silica Gel Cleanup	NWTPH-Dx	F&B
Total Suspended Solids (TSS)	SW 2540D	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 509564

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis						
Sample ID	Sample Date	Sample Type	Sample Matrix	Hg	Metals	PAHs	PCBs	SVOCs	TPH -DX	TSS
DAST-MW-101-093015	9/30/2015	N	GrWtr				x			x
GF9-MW-4-093015	9/30/2015	N	GrWtr			x			x	x
OMS-MW-2-093015	9/30/2015	N	GrWtr	x	x	x	x		x	x
PM-500-093015	9/30/2015	FD	GrWtr			x		x		x
PM-MW-5-093015	9/30/2015	N	GrWtr			x		x		x
REC1-MW-8-093015	9/30/2015	N	GrWtr			x			x	x

2.1 Mercury (EPA 1631E)

2.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite 28 days of collection.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. Mercury was detected in two method blanks at levels greater than the MDL but less than the RDL. All associated sample results were greater than 10 times the blank concentrations. No qualification or action was needed.

2.1.3 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.1.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.1.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Metals (EPA 200.8)

2.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. Copper and Zinc were detected in the method blank at levels above the MDL but below the RDL. All associated sample results were greater than 10 times the blank contamination. No qualification or action was needed.

2.2.3 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

2.2.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.2.6 Overall Assessment

Accuracy was acceptable based on the LCS recoveries. Precision with this matrix was not explicitly demonstrated, however general precision was demonstrated with lab instrument QC. The data are of known quality and are acceptable for use as qualified.

2.3 PAH (EPA 8270D SIM)

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.3.3 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

2.3.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

2.3.5 Field Duplicate

Sample PM-500-093015 was submitted to the laboratory as a blind field duplicate of sample PM-MW-5-093015. As no MS/MSD were run for these samples, the field duplicate was used to assess matrix-based precision for all samples.

The RPD for the field duplicate sample with its parent sample was within control limits for this method with the exception of results for Anthracene and Pyrene, which exceeded the control limit. All associated sample results for these analytes have been qualified J/UJ.

2.3.6 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis with the exception of sample OMS-MW-2-093015, which had a benzo(a)anthracene-d12 recovery below lower control limits. All associated results for this sample have been qualified J/UJ.

2.3.7 Overall Assessment

Accuracy was acceptable based on the LCS recoveries, and precision was acceptable based on the LCS/LCSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.4 PCBs (EPA 8082A)

2.4.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.4.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.4.3 Laboratory Control Samples/Laboratory Control Sample Duplicate (LCS/LCSD)

All LCS and LCSD %R and RPD were and within the laboratory specified control limits.

2.4.4 Matrix Spike/ Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

2.4.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.4.6 Column RPD

The RPD between instrument columns for Aroclor 1248 results for sample DAST-MW-101-093015 exceeded control limits. The result has been qualified J and results should be considered approximate.

2.4.7 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.5 SVOCs (EPA 8270D)

2.5.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.5.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.5.3 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits, with the following exceptions:

For Hexachlorocyclopentadiene the LCS/LCSD RPD exceeded control limits. Associated sample results were qualified UJ.

For Bis(2-ethylhexyl)phthalate the LCSD %R exceeded the upper control limit. The LCS %R was within control limits – no results were qualified.

2.5.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

2.5.5 Field Duplicate

Sample PM-500-093015 was submitted to the laboratory as a blind field duplicate of sample PM-MW-5-093015. As no MS/MSD were run for these samples, the field duplicate was used to assess matrix-based precision for all samples.

The RPD for the field duplicate sample with its parent sample was within control limits for this method with the exception of results for Pentachlorophenol, which exceeded the control limit. All associated sample results for this analyte have been qualified J/UJ.

2.5.6 Internal Standard

Results for Di-n-octyl phthalate in samples PM-MW-5-093015 and PM-500-093015 were flagged by the laboratory for poor internal standard recovery. Results have been qualified J to indicate values are estimated.

2.5.7 Overall Assessment

Accuracy was acceptable based on the LCS recoveries, and precision was acceptable based on the LCS/LCSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.6 Diesel & Motor Oil Range Hydrocarbons (NWTPH-Dx)

2.6.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.6.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.6.3 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.6.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

2.6.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.6.6 Overall Assessment

Accuracy was acceptable based on the LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.7 Total Suspended Solids (NWTPH-Dx)

2.7.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.7.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.7.3 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.7.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

2.7.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.7.6 Overall Assessment

Accuracy was acceptable based on the LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG 510139

One groundwater sample was split and sent to two labs for PCB analysis. The split sent to ALS for analysis had "ALS" appended to the sample id to help distinguish the results. The sections below describe the results of the data quality review for this SDG by laboratory.

Sample Index

			Analysis/Lab	
Sample ID	**Sample Date**	**Sample Matrix**	**PCBs / F&B**	**PCBs / ALS**
DAST-MW-101-100815	10/8/2015	GrWtr	x	
DAST-MW-101-100815 ALS	10/8/2015	GrWtr		x

3.1 PCBs (EPA 8082A) by ALS

3.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

3.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

3.1.3 Laboratory Control Samples/Laboratory Control Sample Duplicate (LCS/LCSD)

All LCS %R were and within the laboratory specified control limits.

3.1.4 Matrix Spike/ Matrix Spike Duplicates (MS/MSD)

All MS and MDS %R and RPD were within laboratory specified control limits.

3.1.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

3.1.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 PCBs (EPA 8082A) by F&B

3.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

3.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

3.2.3 Laboratory Control Samples/Laboratory Control Sample Duplicate (LCS/LCSD)

All LCS and LCSD %R were and within the laboratory specified control limits. The LCS/LCSD RPD exceeded the control limit for Aroclor 1260. Associated sample result was qualified UJ.

3.2.4 Matrix Spike/ Matrix Spike Duplicates (MS/MSD)

No Matrix Spike or Duplicate analyses were reported with these analytical results. Laboratory was consulted, and indicates that insufficient sample quantity was provided to create a matrix spike or matrix duplicate.

3.2.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

3.2.6 Column RPD

The RPD between instrument columns for Aroclor 1248 results for sample DAST-MW-101-100815 exceeded control limits. The result has been qualified J and results should be considered approximate.

3.2.7 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values, except as noted above. The data are of known quality and are acceptable for use as qualified.

4 Qualified Data Summary

Qualified sample results are listed below. This list does not include non-detected values simply qualified U.

Qualified Sample Results for 509564

Sample ID	Analyte	Qualifier	Qualification Reason
DAST-MW-101-093015	Aroclor 1248	J	RPD between instrument columns exceeded control limit.
GF9-MW-4-093015	Anthracene	J	Field Duplicate RPD Exceeds control limit.
	Pyrene	J	Field Duplicate RPD Exceeds control limit.
OMS-MW-2-093015	Acenaphthene	J	1 of 2 surrogate recoveries below lower control limit.
	Acenaphthylene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Anthracene	UJ	1 of 2 surrogate recoveries below lower control limit. Field Duplicate RPD Exceeds control limit.
	Benz(a)anthracene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Benzo(a)pyrene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Benzo(b)fluoranthene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Benzo(g,h,i)perylene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Benzo(k)fluoranthene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Chrysene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Dibenz(a,h)anthracene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Fluoranthene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Fluorene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Indeno(1,2,3-cd)pyrene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Naphthalene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Phenanthrene	UJ	1 of 2 surrogate recoveries below lower control limit.
	Pyrene	UJ	1 of 2 surrogate recoveries below lower control limit. Field Duplicate RPD Exceeds control limit.

Sample ID	Analyte	Qualifier	Qualification Reason
PM-500-093015	Anthracene	J	Field Duplicate RPD Exceeds control limit.
	Hexachlorocyclopentadiene	UJ	LCS/LCSD RPD exceeded control limit.
	Pentachlorophenol	J	Field Duplicate RPD Exceeds control limit.
	Pyrene	J	Field Duplicate RPD Exceeds control limit.
PM-MW-5-093015	Anthracene	J	Field Duplicate RPD Exceeds control limit.
	Hexachlorocyclopentadiene	UJ	LCS/LCSD RPD exceeded control limit.
	Pentachlorophenol	J	Field Duplicate RPD Exceeds control limit.
	Pyrene	J	Field Duplicate RPD Exceeds control limit.
REC1-MW-8-093015	Anthracene	J	Field Duplicate RPD Exceeds control limit.
	Pyrene	J	Field Duplicate RPD Exceeds control limit.

Qualified Sample Results for 510139

Sample ID	Analyte	Qualifier	Qualification Reason
DAST-MW-101-100815	Aroclor 1248	J	RPD between instrument columns exceeded control limit.
	Aroclor 1260	UJ	LCS/LCSD RPD Exceeded control limit.

Data Qualifier Definitions

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
SDG	sample delivery group
SIM	selective ion monitoring
SVOCs	semi-volatile organic compounds
VOCs	volatile organic compounds

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during August and September 2013 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Field Sample ID	Laboratory Sample ID	Sampling Date	Sample Type	Analysis					
				VOC	SVOC PAHs	PCB	Metals	TPH-Gx	TPH-Dx
FARM-TP-1-10	308310-01	08/20/13	Soil	X			X	X	X

Notes:

[(A)] - Arsenic, cadmium, chromium, copper, mercury, nickel, and zinc

Metals - Antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc, unless otherwise noted.

PAHs - Polycyclic aromatic hydrocarbons

PCB - Polychlorinated biphenyl

SVOC - Semivolatile organic compound

T – Total metals

TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon

TPH-G - Gasoline range total petroleum hydrocarbon

VOC - Volatile organic compound

X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Semi-volatile Organic Compounds (SVOCs)	SW846 Method 8270D	
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In some cases where cooler temperature was outside the 4±2°C criteria; samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

Sample HDS-SP-1 was not preserved immediately upon collection as required by the method. Target compounds were not detected in this sample at or above their reporting limits. Since the analysis was performed in a relatively short holding time (4 days) of collection, rather than being rejected, VOCs results for this sample were qualified (UJ) as estimated.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >20% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%, or

the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D value be within ±20%.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs). Methylene chloride was consistently present in method blanks at levels greater than the method detection limits but less than RLs. Methylene chloride results greater than RLs but less than 10x the levels found in the method blanks were qualified (U) as non-detected at the reported values.

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	Data Qualifier
308474	HA1-2	Dichlorodifluoromethane	8%	8%	10-142%	**R**

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses.

Naphthalene, 1,2,4-trichlorobenzene, 1,2-dichlioriobenzene, 1,3-dichlorobenzene, and 1,4-dichliorobenzene were also reported from SVOCs analysis (Method 8270D). These compounds were to be reported from the SVOCs analysis, in favor of the lower detection limits.

1.11 Field Duplicates

Field duplicates were not submitted for VOCs analyses in these SDGs.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs by GC/MS (EPA Method SW8270D)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water samples within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

The method require that a GC/MS tuning analysis be performed using decafluorotriphenylphosphine (DFTPP) at the beginning of each 12-hour period prior to any analysis, and specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99, and (4) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The CCV criteria require that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the %D be within ±20%, and (3) the RF be >0.01 for poor response compounds and >0.05 for all other compounds.

Calibration verifications were performed at the required frequency. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), with the exceptions as follows:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
308310	GCMS8 8/22/13, 8:00	2,4-Dinitrophenol 4,6-Dinitro-2-methylphenol	25.8% 23.8%	Low	FARM-TP-1-25	**UJ**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All %R values were within the laboratory control limits.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	MSD %R	Control Limit	Data Qualifier
308474	HA1-2 HA9-2	Hexachlorocyclopentadiene	23% 14%	- 13%	50-150%	**UJ**
308474	HA9-2	2,4-Dichlorophenol	43%	35%	50-150%	**UJ**
309241	HDS-SP-1	Benzoic Acid	36%	44%	50-150%	**UJ**

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. All %R and RPD values either met the laboratory control criteria, or the outliers had no adverse effects on data usability (*e.g.,* biased high %R or RPD value for a compound that was not detected in samples), except for the following:

SDG	Compound	RPD	Control Limit	Affected Sample	Data Qualifier
308474	2,4-Dinitrophenol	24%	20%	HA1-2 HA2-2 HA3-2 HA4-2 HA5-2 HA6-2 HA7-2 HA8-2	**UJ**

2.9 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD or concentration difference values either met the laboratory control criteria or the outlier had no adverse effects on data usability (*e.g.,* high RPD value for a compound that was not detected in samples), except for the following:

SDG	Sample	Compound	Concentration Difference	Control Limit	Data Qualifier
309241	HDS-SSW-2	Benzo(b)fluoranthene	0.0047 µg/kg	0.002 µg/kg	**UJ**

2.10 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

2.11 Reporting Limits and Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

2.12 Field Duplicates

Field duplicates were not submitted for SVOCs analyses in these SDGs.

2.13 Overall Assessment of SVOCs Data Usability

SVOCs data are of known quality and acceptable for use, as qualified.

3. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

3.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

3.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20%.

3.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were not applicable for data evaluation because the samples contained high levels of target PAHs and required dilution analysis; no data were qualified in these cases.

3.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values met the project control criteria.

3.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

3.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. In some cases samples required dilution for definitive quantitation of target compounds; the RLs were raised accordingly.

3.11 Field Duplicates

One set of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

3.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

4. PCB Aroclors (EPA Method SW8082A)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

4.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for

characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

4.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

4.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

4.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits, except that the Aroclor 1260 RPD value (25%) for the MS/MSD analyses performed on sample FARM-STOCKPILE-1 (SDG: 308386) was outside the control criteria (20%). The Aroclor 1260 result for this sample was qualified (J) as estimated.

4.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD or concentration difference values met the laboratory control criteria.

4.9 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

4.10 Field Duplicates

Field duplicates were not submitted for PCB Aroclors analysis in these SDGs.

4.11 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

5. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

Sample HDS-SP-1 was not preserved immediately upon collection as required by the method. TPH-Gasoline was not detected in this sample at or above their reporting limits. Since the analysis was performed in a relatively short holding time (4 days) of collection, rather than rejected, TPH-Gasoline result for this sample was qualified (UJ) as estimated.

5.2 Initial Calibration (ICAL)

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

5.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

5.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

5.10 Field Duplicates

Field duplicates were not submitted for TPH-Gasoline analyses in these SDGs.

5.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use, as qualified.

6. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

6.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

6.2 Initial Calibration

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

6.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

6.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

6.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

6.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

6.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

6.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

6.10 Field Duplicates

One set of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

6.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

7. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

7.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

7.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

7.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS method require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <15% if average response factor approach is employed.

All ICALs met the method requirements.

7.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 76 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

7.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank.

7.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

7.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values either met the laboratory control limits or the outliers were not applicable for matrix effect evaluation (e.g. sample concentration >4x spiking level), except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	Affected Sample	Data Qualifier
308474	HA1-2	Nickel	66%	66%	69-112%	HA1-2 HA2-2 HA3-2 HA4-2 HA5-2 HA6-2 HA7-2 HA8-2 HA9-2	**J**
309241	Batch QC	Nickel	128%	121%	69-112%	HDS-ESW-2 HDS-NSW-2 HDS-WSW-2 HDS-SSW-2 HDS-BTM-4 HDS-SP-1	**J**

7.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

7.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

7.10 Field Duplicates

Field duplicates were not submitted for metals analyses in these SDGs.

7.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason

308474-09	HA9-2	2,4-Dichlorophenol	**UJ**	MS/MSD %R values biased low; LCS/LCSD RPD value was >20%

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason
309537-01 309537-02	DAST-B08-092713 DAST-B09-092713	Anthracene Pyrene Benzo(g,h,i)perylene Indeno(1,2,3-cd)pyrene Benzo(b)fluoranthene Fluoranthene Benzo(k)fluoranthene Chrysene Benzo(a)pyrene Dibenzo(a,h)anthracene Benz(a)anthracene Acenaphthene Phenanthrene Fluorene	**UJ/J**	Field duplicate result was outside project advisory criteria
309241-04	HDS-SSW-2	Benzo(b)fluoranthene	**J**	Laboratory duplicate analysis concentration difference was >2xRL

Table II. Data Qualifiers are defined as follows:

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Analyte	Units	RL	Parent & Field Duplicate Sample Result		RPD	Delta	Data Qualifier
			DAST-B08-092713	DAST-B09-092713			
Diesel Range TPH	mg/kg	50	ND	ND		0	
Oil Range TPH	mg/kg	250	ND	ND		0

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CDD	chlorinated dibenzo-p-dioxin
CDF	chlorinated dibenzofuran
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EDL	estimated detection limit
EMPC	estimated maximum possible concentration
EPA	U.S. Environmental Protection Agency
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
HRGC	high-resolution gas chromatograph
HRMS	high-resolution mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP	inductively coupled plasma
ICP/MS	inductively coupled plasma/ mass spectrometer
ICSA	ICP interference check sample solution A
ICV	initial calibration verification
IPR	initial precision and recovery
ISC	isomer specificity check
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
m/z	mass-to-charge ratio

MDL	method detection limit
µg/kg	microgram per kilogram
mg/kg	milligram per kilogram
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics; EPA 2011 – Dioxins/Furans)
OPR	ongoing precision and recovery
pg/g	pictogram per gram
PCBs	polychlorinated biphenyls
PCDD	polychlorinated dibenzo-*p*-dioxin
PCDF	polychlorinated dibenzofuran
PEM	performance evaluation mixture
QA/QC	quality assurance/quality control
QAPP	quality assurance project plan
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
S/N	signal-to-noise ratio
SDG	sample delivery group
SICP	selected ion current profile
SIM	selective ion monitoring
SPLP	Synthetic precipitation procedure
WDM	window defining mixture

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during August and September 2013 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc and ALS Environmental Services, Inc. in Houston, Texas.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Notes:

Laboratory sample ID prefixed with "E" was a laboratory identity assigned by ALS in Houston, Texas

[(A)] - Antimony, arsenic, cadmium, chromium, copper, mercury, nickel, and zinc

Dioxins - Polychlorinated dioxins and furans

Metals - Arsenic, cadmium, copper, lead, mercury, nickel, and zinc, unless otherwise noted.

Misc. - Miscellaneous

PAHs - Polycyclic aromatic hydrocarbons

PCB - Polychlorinated biphenyl

SPLP - Synthetic precipitation leaching procedure; leachate analyzed for copper, lead, and/or zinc

TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon

TPH-G - Gasoline range total petroleum hydrocarbon

X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	Friedman & Bruya, Inc. (F&BI) Seattle, WA
PCB Aroclors	SW846 Method 8082A	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Synthetic Precipitation Leaching Procedure	SW846 Method 1312	
Polychlorinated dioxins and Furans	SW846 Method 8290A	ALS Environmental Services, Inc. Houston, Texas

Notes:

1. SW846 - *USEPA Test Methods for Evaluating Solid Waste, Physical/Chemical Methods,* SW-846, Third Edition, December 1996.
2. EPA Methods - *USEPA Methods for Chemical Analysis of Water and Wastes,* EPA–600/4-79-020, March 1983 Revision.
3. EPA Method 1631E - *Mercury in Water by Oxidation, Purge and Trap, and Cold Vapor Atomic Fluorescence Spectrometry,* Office of Water, U.S. Environmental Protection Agency, August 2002, EPA-821-R-02-019.
4. NWTPH Methods – *Washington State Department of Ecology, Analytical Methods for Petroleum Hydrocarbons*, Publication No. ECY 97-602, June 1997.

DATA VALIDATION FINDINGS

1. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

1.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20%.

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

1.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were not applicable for data evaluation because the samples contained high levels of target PAHs and required dilution analysis; no data were qualified in these cases.

1.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
309532	RCD-S01-1.5-093013	Benzo(b)fluoranthene Fluoranthene	88% 79%	115% 102%	50-125% 31-144%	25% 27%	J

Note: RPD control criterion = ±20%

1.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. In some cases samples required dilution for definitive quantitation of target compounds; the RLs were raised accordingly. Results for remaining (un-diluted) target compounds were to be reported from the initial analysis in favor of the lower detection limits.

1.11 Field Duplicates

Field duplicates were not submitted for polychlorinated dioxins and furans analyses in these SDGs.

1.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

2. PCB Aroclors (EPA Method SW8082A)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

2.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

2.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

2.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

2.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits.

2.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

2.8 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

2.9 Field Duplicates

One set of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.10 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

3. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

3.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

3.2 Initial Calibration

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

3.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

3.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

3.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

3.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

3.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

3.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

3.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

3.10 Field Duplicates

Field duplicates were not submitted for polychlorinated dioxins and furans analyses in these SDGs.

3.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

4. Total & SPLP Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

4.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

4.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS method require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <15% if average response factor approach is employed.

All ICALs met the method requirements.

4.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 76 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

4.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank.

4.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

4.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values either met the laboratory control limits or the outliers were not applicable for matrix effect evaluation (e.g. sample concentration >4x spiking level), except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
309515	DAST-S01-092713	Zinc	128%	100%	55-129%	25%	All samples in this SDG	**J**
310229	GF11-S01-1.5	Copper Zinc	108% 140%	167% 269%	57-120% 59-148%	43% 63%	All samples in this SDG	**J**
310229	GF11-S02-1.5	SPLP/Lead	342%	28%	50-150%	170%	GF11-S02-1.5	**J**

310290	BBH-S01-1.5-101513	Mercury	72%	90%	62-140%	22%	BBH-S01-1.5-101513 BBH-S02-1.5-101513 BBH-S03-1.5-101513 BBH-S04-1.5-101513 BBH-S05-1.5-101513 BBH-S06-1.5-101513 BBH-S07-1.5-101513 BBH-S08-1.5-101513 BBH-S09-1.5-101513 BBH-S10-1.5-101513 BBH-S11-1.5-101513 BBH-S12-1.5-101513 BBH-S13-1.5-101513 BBH-S14-1.5-101513 BBH-S15-1.5-101513 BBH-S17-1.5-101513 BBH-S18-1.5-101513 BBH-S19-1.5-101513 BBH-S20-1.5-101513	**J**
310290	BBH-S21-1.5-101513	Antimony	88%	112%	54-116%	24%	BBH-S21-1.5-101513 BBH-S22-1.5-101513 BBH-S31-1.5-101513	**J**
310291	BBH-B12-03-101613	Mercury	95%	134%	62-140%	34%	BBH-B05-02-101613 BBH-B06-03-101613 BBH-B08-03-101613 BBH-B09-03-101613	**J**
310291	BBH-B12-03-101613	Nickel	91%	198%	69-112%	74%	BBH-B01-03-101613 BBH-B02-02-101613 BBH-B03-03-101613 BBH-B04-02-101613 BBH-B05-02-101613 BBH-B06-03-101613 BBH-B07-03-101613 BBH-B08-03-101613 BBH-B09-03-101613 BBH-B10-04-101613 BBH-B11-03-101613 BBH-B12-03-101613	**J**

Note: RPD control criterion = ±20%

4.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

4.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

4.10 Field Duplicates

One set of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

4.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

5. Polychlorinated Dioxins/Furans by HRGC/HRMS (EPA Method SW8290)

5.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

EPA SW846 Method 8290 recommends a holding time of 30 days for solid samples stored in the dark at 4°C and completely analyzed within 45 days of extraction. All samples were extracted and analyzed within the recommended holding times.

5.2 HRGC/HRMS Instrument Performance Check

The method requires that (1) for mass calibration and resolution, the laboratory must provides evidence of mass spectrometer resolution > 10,000 at the beginning and end of each 12-hour analytical sequence. If mass calibration and resolution tuning are not correctly performed, interferences may degrade chlorinated dibenzo-*p*-dioxin and chlorinated dibenzofuran (CDD/CDF) identification and quantitation; (2) the mass spectrometer selected ion monitoring (SIM) scan descriptor switching times are determined by the analysis of the Window Defining Mixture (WDM) which contains the first and last eluting isomers in each homologue; and (3) chromatographic resolution is verified by analyzing one of two Isomer Specificity Check (ISC) solutions, depending on

the Gas Chromatograph (GC) column used for analysis. All HRGC/HRMS instrument performance checks met the criteria.

5.3 Initial Calibration (ICAL)

The method requires that (1) the chromatographic peak separation between the 2,3,7,8-TCDD peak and the 1,2,3,8-TCDD peak and between the 2,3,7,8-TCDF peak and the 2,3,4,7-TCDF peak and must be resolved with a valley of < 25%; (2) the ion abundance ratio be within a ± 15% window around the theoretical abundance ratio; (3) the retention times (RTs) of the isomers must fall within the appropriate RT windows established by the WDM analysis. In addition, the absolute RT of the internal standard $^{13}C_{12}$-1,2,3,4-TCDD must exceed 25 minutes on the DB-5 (or equivalent) column and 15 minutes on the DB-225 (or equivalent) column; (4) the instrument sensitivity (signal-to-noise [S/N] ratio) must be >10:1; (5) the percent relative standard deviation (%RSD) be <20% for native isomers and < 30% for labeled isomers; (6) all initial calibration standards (CSs) must be analyzed at the correct concentration levels; (7) initial calibrations must be performed when the contract is awarded, whenever significant instrument maintenance is performed (e.g., ion source cleaning, GC column replacement, etc.), or if calibration verification criteria are not met. All ICALs met the method requirements.

5.4 Calibration Verification

The method requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, (2) the percent difference (%D) be within ±20% for native isomers and be within ±30% for labeled isomers, and (3) the ion abundance ratio, retention times, relative retention times, instrument sensitivity meet the criteria for initial calibrations. All calibration verification analyses met the criteria.

5.5 Method Blanks

Method blanks were prepared and analyzed as required for each preparation batch. Selected target compounds were detected in method blanks. Sample results less than 5x the level found in the associated method blank were qualified (U) as non-detects at the reported values. Qualified data were summarized in **SUAMMRY** section at the end of this report.

5.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the method. The recovery met the method control limits for all target and labeled compounds.

5.7 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS and MSD analyses were not performed on a project sample in this SDG.

5.8 Labeled Compounds

Nine labeled internal standards and one cleanup recovery standard were added to all samples as required by the method. All %R values for internal standards and cleanup standard met the method requirement.

5.9 Target Compound Identification

All detected target congeners were properly identified. The ion ratios for a number of detection did not meet the method criteria; these results were qualified as non-detected at their reported values, as summarized in **SUMMARY, Table I.**

5.10 Reporting Limits, Estimated Detection Limits (EDLs), and Compound Quantitation

Correct internal standards, quantitation ions, and average RFs were used to quantitate target compound detections. The RLs were supported with adequate ICAL calibration concentrations. Sample-specific EDLs and RLs were adjusted with sample weights, internal standard peak height, and noise levels as required by the method.

Selected target congeners in a number of samples had chlorodiphenyl ether interference present in their retention time region. The affected results were qualified (J) as estimated.

5.11 Second Column Confirmation

All positive detection of 2,3,7,8-TCDF were re-analyzed on the DB-225 column for confirmation and results reported from the second column (DB-225) should be used for data interpretation.

5.12 Field Duplicates

Field duplicates were not submitted for polychlorinated dioxins and furans analyses in these SDGs.

5.13 Overall Assessment of Polychlorinated Dioxins/Furans Data Usability

Polychlorinated dioxins and furans data were of known quality and acceptable for use as qualified.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason
310290-01	BBH-S01-1.5-101513	Mercury	J	MS/MSD RPD value >20%

Table II. Data Qualifiers are defined as follows:

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Approved By: _____ Date: ***6/23/2014***

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Analyte	Units	RL	Parent & Field Duplicate Sample Result		RPD	Delta	Data Qualifier
			DAST-B08-092713	DAST-B09-092713			
Mercury	mg/kg	0.1	ND	0.1		0.1	
Lead	mg/kg	1	28.1	39.1	28%		
Nickel	mg/kg	1	21.4	21.5	0%		
Arsenic	mg/kg	1	8.49	13.7	38%		**J/J**
Cadmium	mg/kg	1	2.05	2.19		0.14	
Copper	mg/kg	1	55.7	64.4	14%		
Zinc	mg/kg	5	91	110	17%		
Aroclor 1260	mg/kg	0.1	0.31	0.34		0.03	
Aroclor 1254	mg/kg	0.1	0.29	0.4		0.11	
Aroclor 1221	mg/kg	0.1	ND	ND		0	
Aroclor 1232	mg/kg	0.1	ND	ND		0	
Aroclor 1248	mg/kg	0.1	ND	ND		0	
Aroclor 1016	mg/kg	0.1	ND	ND		0	
Aroclor 1242	mg/kg	0.1	ND	ND		0	

Notes:
Delta – Concentration difference between the parent sample and its field duplicate
mg/kg – milligram per kilogram
ND – The analyte was not detected at or above the RL.
RL – Reporting limit
RPD – Relative percent difference

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EPA	U.S. Environmental Protection Agency
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP/MS	inductively coupled plasma/ mass spectrometer
ICV	initial calibration verification
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
MDL	method detection limit
µg/kg	microgram per kilogram
mg/kg	milligram per kilogram
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics)
OPR	ongoing precision and recovery
PCBs	polychlorinated biphenyls
QA/QC	quality assurance/quality control
RF	response factor

RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
SDG	sample delivery group
SIM	selective ion monitoring
SVOCs	semi-volatile organic compounds
VOCs	volatile organic compounds

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during October and November 2013 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Field Sample ID	Laboratory Sample ID	Sampling Date	Sample Type	Analysis

Notes:
[(A)] - Antimony, arsenic, cadmium, chromium, copper, mercury, nickel, and zinc
Metals - Arsenic, cadmium, chromium, copper, mercury, nickel, and zinc, unless otherwise noted.
PAHs - Polycyclic aromatic hydrocarbons
PCBs - Polychlorinated biphenyl
TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon
TPH-Gx - Gasoline range total petroleum hydrocarbon
VOC - Volatile organic compound
X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In some cases where cooler temperature was outside the 4±2°C criteria; samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >20% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D value be within ±20%.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples).

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs).

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits.

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations. In cases where target compound concentrations exceeded ICAL calibration ranges, proper dilution analyses were performed for definitive quantitation of the compounds. Only affected compounds were to be reported from dilution analyses.

1.11 Field Duplicates

Field duplicates were not submitted for VOCs analyses in these SDGs.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. PAHs by GC/MS - SIM (EPA Method SW8270D-SIM)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20%.

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were not applicable for data evaluation because the samples contained high levels of target PAHs and required dilution analysis; no data were qualified in these cases.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values met the project control criteria.

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

2.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

2.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. In some cases samples required dilution for definitive quantitation of target compounds; the RLs were raised accordingly, and the compounds reported from the dilution analysis. The remaining (un-diluted) target compounds were to be reported from the initial analysis for the lower detection limits.

2.11 Field Duplicates

Six sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

3. PCB Aroclors (EPA Method SW8082A)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

3.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

3.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

3.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

3.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits.

3.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.8 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

3.9 Field Duplicates

Field duplicates were not submitted for PCB Aroclors analysis in these SDGs.

3.10 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

4. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

4.2 Initial Calibration (ICAL)

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

4.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

4.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high analyte concentrations. No data qualifying actions were taken in these cases.

4.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

4.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

4.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

4.10 Field Duplicates

Field duplicates were not submitted for TPH-Gasoline analyses in these SDGs.

4.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use, as qualified.

5. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

5.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water should be extracted within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

5.2 Initial Calibration

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits, outside the control limits due to matrix interference, or diluted below quantitation limits due to high petroleum hydrocarbon concentrations. No data qualifying actions were taken in these cases.

5.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

5.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method.

5.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

5.10 Field Duplicates

Four sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

6. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

6.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

6.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

6.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS method require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <15% if average response factor approach is employed.

All ICALs met the method requirements.

6.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 76 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank, except for the following:

SDG	Blank ID	Analyte	Concentration in Blank (mg/kg)	Affected Sample	Sample Result (mg/kg)	Data Qualifier
311028	I3-748mb	Arsenic	0.358 J	BAST-B051-5.0 BAST-B504-5.0	1.92 1.37	**J**
310510	I3-730mb	Arsenic	0.83 J	BAST-S030-3.0 BAST-S033-3.0	7.31 1.69	**J**

6.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

6.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values either met the laboratory control limits or the outliers were not applicable for matrix effect evaluation (e.g. sample concentration >4x spiking level), except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
310510	Batch QC	Copper Lead	97% 59%	137% 81%	57-120% 59-148%	34% 31%	BAST-S030-3.0 BAST-S033-3.0	**J**
310406 310407	BAST-S015-3.0	Zinc	78%	61%	55-129%	24%	BAST-S010-3.5 BAST-S015-3.0 BAST-B027-7.0 BAST-B037-7.0	**J**
310226 310227	Batch QC	Copper Lead	108% 140%	167% 269%	57-120% 59-148%	43% 63%	RCD-S09-2 DAST-B10-4 DAST-S11-2	**J**

Note: RPD control criteria = ±20%

6.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

6.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

6.10 Field Duplicates

Two sets of field duplicates were submitted for metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

6.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason
310510-01 310510-06 311028-01 311028-02	BAST-S030-3.0 BAST-S033-3.0 BAST-B051-5.0 BAST-B504-5.0	Arsenic	**J**	Analyte detected in MB and sample was <10x the MB
310226-01 310227-01 310227-02	RCD-S09-2 DAST-B10-4 DAST-S11-2	Copper	**J**	MS/MSD %R and RPD values outside control criteria
310226-01 310227-01 310227-02	RCD-S09-2 DAST-B10-4 DAST-S11-2	Lead	**J**	MS/MSD %R and RPD values outside control criteria
310406-03 310406-08 310407-03 310407-08	BAST-S010-3.5 BAST-S015-3.0 BAST-B027-7.0 BAST-B037-7.0	Zinc	**J**	MS/MSD RPD value >20%
310510-01 310510-06	BAST-S030-3.0 BAST-S033-3.0	Lead	**J**	MS/MSD RPD value outside control criteria
310510-01 310510-06	BAST-S030-3.0 BAST-S033-3.0	Copper	**J**	MSD %R and MS/MSD RPD values outside control criteria
310361-26 310361-27	BAST-S07-3.5 BAST-B500-3.5	Benz(a)anthracene	**J**	Field duplicate RPD >35%

Table II. Data Qualifiers are defined as follows:

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Approved By: _____ Date: ***6/23/2014***

Mingta Lin, Senior Project Chemist

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Analyte	Units	RL	Parent & Field Duplicate Sample Result		RPD	Delta	Data Qualifier
			BAST-S07-3.5	**BAST-B500-3.5**			
Bunker C	mg/kg	250	9300	9700	4%

Notes:
Delta – Concentration difference between the parent sample and its field duplicate
mg/kg – milligram per kilogram
ND – The analyte was not detected at or above the RL.
RL – Reporting limit
RPD – Relative percent difference

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
BTEX	benzene, toluene, ethylbenzene, and *m-, p-, & o*-xylenes
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EPA	U.S. Environmental Protection Agency
EPH	extractable petroleum hydrocarbon
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP/MS	inductively coupled plasma/ mass spectrometer
ICV	initial calibration verification
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
MDL	method detection limit
µg/kg	microgram per kilogram
mg/kg	milligram per kilogram
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics)
OPR	ongoing precision and recovery
PCBs	polychlorinated biphenyls

PID	photo-ionization detector
QA/QC	quality assurance/quality control
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
SDG	sample delivery group
SIM	selective ion monitoring
SVOCs	semi-volatile organic compounds
VOCs	volatile organic compounds
VPH	volatile petroleum hydrocarbon

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during September 2013 to January 2014 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Fremont Aanlytical, Inc. in Seattle, Washington and ALS Environmental Services, Inc. in Kelso, Washington.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

Field Sample ID	Laboratory Sample ID	Sampling Date	Sample Type	Analysis						
				VOC	PAHs	PCBs	Metals	TPH-Gx	TPH-Dx	Misc.

Notes:

[(A)] - Arsenic, cadmium, chromium, copper, mercury, nickel, and zinc
EPH - Extractable petroleum hydrocarbon
FMR - Formaldehyde
Metals - Antimony, arsenic, cadmium, chromium, copper, mercury, nickel, and zinc, unless otherwise noted.
Misc. - Miscellaneous
PAHs - Polycyclic aromatic hydrocarbons
PCBs - Polychlorinated biphenyl
pp - Priority pollutant metals, *i.e.,* antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc
SPLP - Synthetic precipitation leaching procedure; the leachates were analyzed for copper (SPLP/Cu) and/or arsenic (SPLP/As).
TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon
TPH-Gx - Gasoline range total petroleum hydrocarbon
VOC - Volatile organic compound
VPH - Volatile petroleum hydrocarbon
X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
BTEX	SW846 Method 8021B	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Extractable Petroleum Hydrocarbon	NWTPH-EPH	Fremont Analytical, Inc. Seattle, WA
Volatile Petroleum Hydrocarbon	NWTPH-VPH	
Formaldehyde	SW846 Method 8315A	ALS Environmental Services, Inc. Kelso, Washington

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In some cases where cooler temperature was outside the 4±2°C criteria; samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

All samples in SDG: 401294 were not preserved in methanol upon collection. The analyses were performed within a relatively short period of time (3 days) of collection. VOCs results for these samples, rather than being rejected, were qualified (UJ) for non-detects and (J) for detects as estimated.

Soil samples should be preserved at the time of collection. Soil samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >20% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D value be within ±20%.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
401108	GCMS9 1/10/14, 11:34	Bromomethane	40.9%	Low	UST29-S37-6-010914 UST29-S38-6-010914 UST29-S39-9-010914 UST29-S40-9-010914 UST29-S41-6-011014	**UJ**

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs). Methylene chloride was detected in selected method blanks at levels greater than their method detection limits but less than the RLs. Methylene chloride results for samples associated with these blanks were evaluated and qualified (U) as non-detected at the reported values, as summarized in **SUMMARY, Table I.**

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples), except for the following:

SDG#	LCS ID	Analyte	LCS %R	LCSD %R	Control Limit	Affected Sample	Data Qualifier
401069	LCS	Methylene Chloride	56%	-	62-119%	All samples in this SDG	**UJ**

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits.

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations.

1,4-dioxane and vinyl acetate were reported from the mass spectrum library search, the reported RLs were considered estimated. These compounds were not detected in any of the field samples; the results were qualified (UJ) to indicate that the RLs were estimated values.

In cases where a sample was analyzed for both VOCs (Method 8260C) and SVOCs (Method 8270D), the results for 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2,4-trichlorobenzene, hexachlorobutadiene, and naphthalene were to be reported from the SVOCs analysis, in favor of the lower detection limits.

In cases where a sample was analyzed for both VOCs (Method 8260C) and PAHs (Method 8270-SIM), the result for naphthalene was to be reported from the PAHs analysis, in favor of the lower detection limit.

1.11 Field Duplicates

Three sets of field duplicates were submitted for VOCss analyses. VOCs were not detected at or above RLs in these sample; the field precision met the project advisory criteria.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs and PAHs by GC/MS and GC/MS - SIM (EPA Method SW8270D and SIM)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20%. The CCVs met the requirements, except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
401108	GCMS6 1/10/14, 23:53	Indeno(1,2,3-cd)perylene	24.3%	Low	UST29-S37-6-010914	**UJ**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were not applicable for data evaluation because the samples contained high levels of target PAHs and required dilution analysis; no data were qualified in these cases.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
312363	UST29-S01-3-122313	Naphthalene	99%	78%	44-129%	24%	J

		Benzo(a)pyrene				69%	
		Indeno(1,2,3-cd)pyrene				45%	
		Dibenz(a,h)anthracene				36%	
		Benzo(g,h,i)perylene				54%	
401294	NRU-SP01-1-012414	2,4-Dinitrophenol	29%	37%	50-150%	24%	UJ
		4,6-Dinitro-2-methylphenol	32%	42%		27%	
		4-Nitrophenol	9%	136%		175%	
		Hexachlorocyclopentadiene	12%	21%		55%	

Note: RPD control criteria = ±20%

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits, except for the following:

SDG#	LCS ID	Analyte	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
401212	LCS/LCSD	Indeno(1,2,3-cd)pyrene	77%	60%	62-119%	25%	BV-S01-6-011714 BV-S04-6-011714	UJ

Note: RPD control criteria = ±20%

2.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
UST70-S03-4-112113	Phenanthrene-d_{10} Chrysene-d_{12} Perylene-d_{12}	227614 223106 174616	460769 494494 421270	Benzo(b)fluoranthene Chrysene Fluoranthene Pyrene	**J**
BUST-504-FD	Perylene-d_{12}	279707	126697	Benzo(k)fluoranthene Dibenzo(a,h)anthracene Indeno(1,2,3-cd)pyrene	**J**
UST29-S23-12-010714 (Diluted Analysis)	Chrysene-d_{12}	202737	406511	Benz(a)anthracene Chrysene	**J**

2.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. In some cases samples required dilution for definitive quantitation of target compounds; the RLs were raised accordingly, and the compounds reported from the dilution analysis. The remaining (un-diluted) target compounds were to be reported from the initial analysis for the lower detection limits.

2.11 Field Duplicates

Fourteen sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

3. PCB Aroclors (EPA Method SW8082A)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and (5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

3.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%.

Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

3.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

3.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

3.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits.

3.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.8 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

3.9 Field Duplicates

Field duplicates were not submitted for PCB Aroclors analysis in these SDGs.

3.10 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

4. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

All samples in SDG: 401294 were not preserved in methanol upon collection. The analyses were performed within a relatively short period of time (3 days) of collection. TPH-Gasoline results for these samples, rather than being rejected, were qualified (UJ) for non-detects and (J) for detects as estimated.

Soil samples should be preserved in methanol at the time of collection. Soil samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

4.2 Initial Calibration (ICAL)

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

4.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

4.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

4.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

4.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

4.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

4.10 Field Duplicates

Three sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

4.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use, as qualified.

5. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

5.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

5.2 Initial Calibration

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

5.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

5.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method. In some cases where sample chromatographic patterns resembled Bunker C fuel, the results were quantitated and reported as Bunker C fuel accordingly. No anomalies were identified relative to target compound identification.

5.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

The Bunker C fuel concentration in sample BUST-S67-3 exceeded instrument calibration range; the result was qualified (J) as estimated.

5.10 Field Duplicates

Fourteen sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

6. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

6.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

6.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

6.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS method require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <15% if average response factor approach is employed.

All ICALs met the method requirements.

6.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 76 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample), except for the following:

SDG	CCV ID	Analyte	%R	Affected Sample	Data Qualifier
311391	11/20/13, 15:11	Zinc	111%	BUST-S46-4 BUST-S46A-8 BUST-S47-12 BUST-S44-8	J

SDG	CCV ID	Analyte	%R	Affected Sample	Data Qualifier
				BUST-S45-12 BUST-S40-4 BUST-S41-8 BUST-S42-12 BUST-B29-12 BUST-B30-12 BUST-B31-12 BUST-B32-12	
312058	12/5/2013, 12:02	Lead	112.7%	BUST-S60-6	**J**
401212	1/20/14, 13:26 1/20/14, 13:42	Zinc	112.5% 111.3%	BV-B02-8-011714	**J**

6.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank.

6.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

6.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values either met the laboratory control limits or the outliers were not applicable for matrix effect evaluation (e.g. sample concentration >4x spiking level), except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
312336	BUST-S68-3	Copper	41%	39%	57-120%	5%	BUST-S68-3	**J**

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
401294	NRU-SP04-2-012414	Zinc Arsenic	134% 113%	91% 90%	55-129% 70-118%	38% 23%	NRU-SP01-1-012414 NRU-SP01-2-012414 NRU-SP01-3-012414 NRU-SP02-1-012414 NRU-SP02-2-012414 NRU-SP02-3-012414 NRU-SP03-1-012414 NRU-SP03-2-012414 NRU-SP03-3-012414 NRU-SP04-1-012414 NRU-SP04-2-012414 NRU-SP04-3-012414 NRU-SP05-1-012414 NRU-SP05-2-012414 NRU-SP05-3-012414 NRU-SP06-1-012414 NRU-SP06-2-012414 NRU-SP06-3-012414	J

Note: RPD control criteria = ±20%

6.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

6.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

6.10 Field Duplicates

Two sets of field duplicates were submitted for metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

6.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

7. Formaldehyde by HPLC/UV (EPA Method 8315A)

7.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil samples should be derivatized and extracted within seven days of sample collection. All derivatized sample extracts should be analyzed within three days after preparation. The sample was prepared and analyzed within the required holding times.

7.2 Instrument Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

7.3 Calibration Verification

CCV analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

7.4 Method Blanks

A method blank was prepared and analyzed in each preparation batch as required. Formaldehyde was not detected at or above the RL in method blanks.

7.5 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

7.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods. The %R values were within the laboratory control limits.

7.7 Field Duplicates

Field duplicates were not submitted for formaldehyde analysis in these SDGs.

7.8 Overall Assessment of Formaldehyde Data Usability

Formaldehyde data are of known quality and acceptable for use, as qualified.

8. Extractable Petroleum Hydrocarbon (EPH) by GC/FID (Method NWTPH-EPH)

8.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

8.2 Initial Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.990, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

Initial calibration information was not submitted for review in these SDGs.

8.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±30% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

8.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks, except for the following:

SDG	Method Blank ID	Compound	MB Conc.	Affected Sample	Original Result	Qualified Result	Unit
312058	6129	Aliphatic C8-C10	0.499 J	BUST-B39-12 BUST-S58-12	1.04 J 1.18 J	**5.63 U** **5.64 U**	**mg/kg**
312058	6129	Aromatic C8-C10	1.0 J	BUST-B39-12 BUST-S58-12	2.65 J 3.76 J	**5.63 U** **5.64 U**	**mg/kg**

8.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

8.6 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency. The %R values met the laboratory control criteria.

8.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required. All %R and RPD values met the project control limits, except for the following:

SDG#	LCS ID	Analyte	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
311258	5838	Aromatic C8-C10	-	67.4%	70-130%	5.25%	BUST-S16-8-111213 BUST-S17-8-111213	**J**
312058	6129	Aromatic C8-C10 Aromatic C10-C12	55.5 33.4	57.5 19.6	70-130%	-	BUST-B39-12 BUST-S58-12	**J**
401318	6467	Aliphatic C8-C10	60.5%	52.1%	70-130%	-	NRU-B5-16-012714	**J**

Note: RPD criteria = ±20%.

8.8 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were adjusted with sample volumes and moisture contents.

8.9 Field Duplicates

Field duplicates were not submitted for EPH analysis in these SDGs.

8.10 Overall Assessment of EPH Data Usability

EPH data are acceptable for use as qualified, based on the information submitted by the laboratory.

9. Volatile Petroleum Hydrocarbon by GC/FID (Method NWTPH-VPH)

9.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved with methanol at the time of collection, and analyzed within 14 days of collection. All samples were analyzed within the required holding times.

9.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20%, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.990, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

Initial calibration information was not submitted for review in these SDGs.

9.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (% value within ±20% for the carbon range components and ±15% for individual target compounds).

9.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

9.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

9.6 Matrix Spike (MS)

MS analyses were performed on project or batch QC samples at the required frequency. The %R values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	Control Limit	Affected Sample	Data Qualifier
401318	NRU-B5-16-012714	Aliphatics C10-C12 Aromatics C10-C12	-18.5% 43.8%	57-120%	NRU-B5-16-012714	J

9.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

9.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

9.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were consistent with method-recommended practical quantitation limits, and were adjusted with sample volumes and moisture contents.

9.10 Field Duplicates

Field duplicates were not submitted for VPH analysis in these SDGs.

9.11 Overall Assessment of VPH Data Usability

VPH data are acceptable for use as qualified, based on the information submitted by the laboratory.

10. BTEX by GC/PID (EPA Method SW8021B)

10.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved in methanol at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

10.2 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. The ICAL met the requirements.

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

10.3 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20. Calibration verifications met the requirements.

10.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs.

10.5 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. The %R and RPD values met the project control limits.

10.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

10.7 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency. All %R values were within the project control limits.

10.8 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations.

10.9 Field Duplicates

Field duplicates were not submitted for BTEX analysis in these SDGs.

10.10 Overall Assessment of BTEX Data Usability

BTEX data are of known quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

ACRONYMS

%D	percent difference
%D_f	percent drift
%R	percent recovery
%RSD	percent relative standard deviation
AMU	atomic mass unit
BTEX	benzene, toluene, ethylbenzene, and *m-, p-, & o*-xylenes
CCB	continuing calibration blank
CCC	calibration check compound
CCV	continuing calibration verification
CF	calibration factor
CLP	U.S. EPA Contract Laboratory Program
COC	chain-of-custody
CVAFS	cold vapor atomic fluorescent spectrometry
DFTPP	decafluorotriphenylphosphine
ECD	electron capture detector
EPA	U.S. Environmental Protection Agency
EPH	extractable petroleum hydrocarbon
FID	Flame ionization detector
GC/MS	gas chromatograph/mass spectrometer
ICAL	initial calibration
ICB	initial calibration blank
ICP/MS	inductively coupled plasma/ mass spectrometer
ICV	initial calibration verification
LCS	laboratory control sample
LCSD	laboratory control sample duplicate
MDL	method detection limit
µg/kg	microgram per kilogram
mg/kg	milligram per kilogram
MS	matrix spike
MSD	matrix spike duplicate
NFGs	CLP National Functional Guidelines for Data Review (EPA 2008 – Organics; EPA 2010 – Inorganics)
OPR	ongoing precision and recovery
PCBs	polychlorinated biphenyls

PID	photo-ionization detector
QA/QC	quality assurance/quality control
RF	response factor
RL	reporting limit
RPD	relative percent difference
RRT	relative retention time
SDG	sample delivery group
SIM	selective ion monitoring
SVOCs	semi-volatile organic compounds
VOCs	volatile organic compounds
VPH	volatile petroleum hydrocarbon

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for soil samples collected during October 2013 to March 2014 for the referenced project. The laboratory reports validated herein were submitted by Friedman & Bruya, Inc. and Fremont Aanlytical, Inc. in Seattle, Washington and ALS Environmental Services, Inc. in Kelso, Washington.

A level III data validation was performed on this laboratory report. The validation followed the procedures specified in USEPA CLP Functional Guidelines ([NFGs], EPA 2008 – Organics; EPA 2010 – Inorganics), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with those specified in the quality assurance project plans ([QAPPs], Aspect, 2009) and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report.

Samples and the associated analyses validated herein are summarized as follows:

				Analysis

Notes:

[(A)] - Arsenic, cadmium, chromium, copper, mercury, nickel, and zinc

Cu - Sample was analyzed for copper only

EPH - Extractable petroleum hydrocarbon

FMR - Formaldehyde

Metals - Antimony, arsenic, cadmium, chromium, copper, mercury, nickel, and zinc, unless otherwise noted.

Misc. - Miscellaneous

PAHs - Polycyclic aromatic hydrocarbons

Pb - Sample was analyzed for lead only

PCBs - Polychlorinated biphenyl

pp - Priority pollutant metals, *i.e.,* antimony, arsenic, beryllium, cadmium, chromium, copper, lead, mercury, nickel, selenium, silver, thallium, and zinc

SPLP - Synthetic precipitation leaching procedure; the leachates were analyzed for copper (SPLP/Cu) and/or arsenic (SPLP/As).

TPH-Dx - Diesel and motor oil range total petroleum hydrocarbon

TPH-Gx - Gasoline range total petroleum hydrocarbon

VOC - Volatile organic compound

VPH - Volatile petroleum hydrocarbon

X - The analysis was requested and performed on the sample.

The analytical parameters requested for the samples, the respective analytical methods, and the analytical laboratories are summarized below:

Parameter	Analytical Method	Analytical Laboratory
Volatile Organic Compounds (VOCs)	SW846 Method 8260C	Friedman & Bruya, Inc. (F&BI) Seattle, WA
Polycyclic Aromatic Hydrocarbons (PAHs)	SW846 Method 8270D-SIM	
PCB Aroclors	SW846 Method 8082A	
BTEX	SW846 Method 8021B	
TPH - Gasoline Range	NWTPH-Gx	
TPH - Diesel & Motor Oil Range	NWTPH-Dx	
Total Metals	EPA Method 200.8	
Mercury	EPA Method 1631E	
Extractable Petroleum Hydrocarbon	NWTPH-EPH	Fremont Analytical, Inc. Seattle, WA
Volatile Petroleum Hydrocarbon	NWTPH-VPH	
Formaldehyde	SW846 Method 8315A	ALS Environmental Services, Inc. Kelso, Washington

DATA VALIDATION FINDINGS

1. VOCs by GC/MS (EPA Method SW8260C)

1.1 Sample Management and Holding Time

Samples were received in the laboratory intact and in consistence with the accompanying chain-of-custody (COC) documentation. In some cases where cooler temperature was outside the 4±2°C criteria; samples were hand-delivered to the laboratory the same day of collection. The cooler temperature exceedance had no significant effects on data quality. No other anomalies were identified in relation to sample preservation, handling, and transport.

All samples in SDGs: 402099, 402220, and 402265 were not preserved in methanol upon collection. The analyses were performed within a relatively short period of time (less than seven days) of collection. VOCs results for these samples, rather than being rejected, were qualified (UJ) for non-detects and (J) for detects as estimated.

Soil samples should be preserved at the time of collection. Soil samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

1.2 GC/MS Instrument Performance Check

The method require that (1) gas chromatograph/mass spectrometer (GC/MS) tuning analysis be performed, using bromofluorobenzene (BFB), at the beginning of each 12-hour period prior to any analysis, and (2) specific mass ions meet the criteria provided in the method. All instrument performance checks met the requirements.

1.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. ICALs either met the requirements or the outliers had no adverse effects on data usability (*e.g.,* %RSD >20% for a compound not detected in samples).

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

1.4 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D value be within ±20%.

Calibration verifications either met the requirements, or the exceedance had no adverse effects on data usability (*e.g.,* biased high CCV recovery for a compound not detected in samples), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
403091	GCMS4 3/7/14, 14:00	Bromomethane	25.6%	Low	SHB-S03-3-030614 SHB-S04-3-030614 SHB-S05-3-030614 SHB-S06-3-030614 SHB-B01-5-030614 SHB-B02-5-030614 SHB-B03-5-030614 SHB-500	**UJ**

1.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the reporting limits (RLs).

1.6 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. Percent recovery (%R) and relative percent difference (RPD) values either met the project control limits, or the outliers had no adverse effects on data usability (*e.g.,* biased high recovery for a compound not detected in samples).

1.7 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

1.8 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency (≥5% of the samples analyzed for VOCs). All %R values were within the project control limits, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
310458	CONC-SP-01-102313	1,1,2,2-tetrachloroethane	21%	13%	28-140%	47%	**UJ**

Note that the %R values for the lower-boiling-point VOCs in the MSD analyses performed on samples NRS-500-021214 (SDG: 402161) and NRS-SP08-1-021914 (SDG: 402265) appeared to be a result of mishandling of the MSD samples, rather than matrix effects. Data were not qualified on this basis.

1.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria.

1.10 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations.

1,4-dioxane and vinyl acetate were reported from the mass spectrum library search, the reported RLs were considered estimated. These compounds were not detected in any of the field samples; the results were qualified (UJ) to indicate that the RLs were estimated values.

In cases where a sample was analyzed for both VOCs (Method 8260C) and SVOCs (Method 8270D), the results for 1,2-dichlorobenzene, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2,4-trichlorobenzene, hexachlorobutadiene, and naphthalene were to be reported from the SVOCs analysis, in favor of the lower detection limits.

In cases where a sample was analyzed for both VOCs (Method 8260C) and PAHs (Method 8270-SIM), the result for naphthalene was to be reported from the PAHs analysis, in favor of the lower detection limit.

1.11 Field Duplicates

Five sets of field duplicates were submitted for VOCss analyses. VOCs were not detected at or above RLs in these sample; the field precision met the project advisory criteria.

1.12 Overall Assessment of VOCs Data Usability

VOCs data are of known quality and acceptable for use, as qualified.

2. SVOCs and PAHs by GC/MS and GC/MS - SIM (EPA Method SW8270D and SIM)

2.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days and water within seven days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

2.2 GC/MS Instrument Performance Check

DFTPP tuning was performed within each 12-hour interval. All required ion abundance ratios met the method requirements.

2.3 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. All ICALs met the requirements.

An ICV standard (second source standard) was analyzed to verify the calibration curve. %D values were either within ±30%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

2.4 Calibration Verification (CCV)

The analytical method requires that (1) continuing calibration verifications be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20%. The CCVs met the requirements, except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
401174	GCMS8 1/21/14, 12:29	Benzoic Acid	27.8%	Low	STIL-G9-011414 STIL-G10-011414 STIL-G11-011414 STIL-G12-011414	**UJ**

402347	GCMS6 2/27/14, 7:07 2/27/14, 17:03	Indeno(1,2,3-cd)pyrene	-27.0% -24.6%	High	BAST-B78-4-022414 BAST-S87-2-022414 BAST-S90-4-022514	**UJ**

2.5 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks. 1,4-Dichlorobenzene was detected at a level greater than the method detection limit but less than the RL in the method blank associated with samples in SDGs 402099 and 402220. 1,4-Dichlorobenzene detections in these samples were less than 10x the level found in the method blank and were qualified (U) as non-detects at the reported values, as summarized in **SUMMARY, Table I**.

2.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits or at levels that had no adverse effects on data quality (*e.g.,* biased-high recovery for compounds that were not detected in samples). In some cases surrogate spike %R values were not applicable for

data evaluation because the samples contained high levels of target PAHs and required dilution analysis; no data were qualified in these cases.

2.7 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency (≥5% of samples analyzed). All %R and RPD values met the project control criteria, except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Data Qualifier
402099	NRS-SP01-1-021014	Hexachlorocyclopentadiene	29%	15%		64%	**UJ**
		2,4-Dinitrophenol	81%	47%	50-150%	53%	**UJ**
		Pyrene	114%	143%		23%	**J**
402099	NRS-SP07-3-021014	Hexachlorocyclopentadiene	16%	8%		67%	
		2,4-Dinitrophenol	30%	24%	50-150%	22%	**UJ**
		4,6-Dinitro-2-methylphenol	37%	32%		14%	
403027	CN-S01-3-030314	Benz(a)anthracene	84%	150%	23-144%	56%	
		Benzo(a)pyrene	87%	138%	39-128%	45%	**J**
		Benzo(b)fluoranthene	94%	164%	31-144%	54%	
		Chrysene	87%	186%	45-122%	73%	

Note: RPD control criteria = ±20%

2.8 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits, except for the following:

SDG#	LCS ID	Analyte	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
401212	LCS/LCSD	Indeno(1,2,3-cd)pyrene	77%	60%	62-119%	25%	BV-S01-6-011714 BV-S04-6-011714	**UJ**
402263	LCS/LCSD	*cis*-1,3-Dichloropropene	71%	-	75-136%	-	NRS-S27-8-021814 NRS-S28-8-021814 NRS-B09-10-021814 NRS-S29-8-021914	**UJ**
		Dibromochloromethane	64%		72-132%			
		trans-1,3-Dichloropropene	72%		74-125%			

Note: RPD control criteria = ±20%

2.9 Internal Standards

The method requires that (1) internal standard retention time be within ±30 seconds from that of the associated 12-hour calibration standard, and (2) the area counts of all internal standards be within –50% to +100% of the associated 12-hour calibration standard. All internal standards in the sample and associated QC analyses met the criteria, except for the following:

SDG#	Sample ID	Internal Standard	Sample Response Area	CCV Response Area	Affected Compound	Data Qualifier
310458	CONC-SP-01-102313	Chrysene-d_{12} Perylene-d_{12}	505384 371993	1522710 881878	Benz(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Benzo(k)fluoranthene Benzyl butyl phthalate *bis*(2-ethylhexyl) phthalate Chrysene Dibenzo(a,h)anthracene Di-n-octyl phthalate Indeno(1,2,3-cd)pyrene Pyrene	**J** **J** **J** **J** **J** **UJ** **UJ** **J** **J** **UJ** **J** **J**
310458	CONC-SP-02-102313	Chrysene-d_{12} Perylene-d_{12}	535966 339158	1522710 881878	Benz(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Benzo(k)fluoranthene Benzyl butyl phthalate *bis*(2-ethylhexyl) phthalate Chrysene Dibenzo(a,h)anthracene Di-n-octyl phthalate Indeno(1,2,3-cd)pyrene Pyrene	**J** **J** **J** **J** **J** **UJ** **UJ** **J** **J** **UJ** **J** **J**
310458	CONC-SP-05-102313	Chrysene-d_{12}	600742	1522710	Benz(a)anthracene Benzyl butyl phthalate *bis*(2-ethylhexyl) phthalate Chrysene Pyrene	**J**
310458	CONC-SP-06-102313	Chrysene-d_{12} Perylene-d_{12}	587148 403106	1522710 881878	Benz(a)anthracene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Benzo(k)fluoranthene Benzyl butyl phthalate *bis*(2-ethylhexyl) phthalate Chrysene Dibenzo(a,h)anthracene Di-n-octyl phthalate Indeno(1,2,3-cd)pyrene Pyrene	**J** **J** **J** **J** **J** **UJ** **UJ** **J** **UJ** **UJ** **J** **J**
402099	NRS-SP02-3-021014	Chrysene-d_{12}	1064719	2390680	Benz(a)anthracene Benzyl butyl phthalate *bis*(2-ethylhexyl) phthalate Chrysene Pyrene	**J**
403089	CN-S24-6-030714	Perylene-d_{12}	272282	130766	Benzo(a)pyrene Benzo(b)fluoranthene Benzo(g,h,i)perylene Dibenzo(a,h)anthracene Indeno(1,2,3-cd)pyrene	**J**

Note that samples listed above were also analyzed at dilutions to confirm the presence and effects of sample matrices on internal standard quantitation. The initial analyses provided optimal data usability. Therefore, the PAHs/SVOCs results were to be reported from the initial analyses as qualified above, and the dilution analyses discarded.

2.10 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations. In some cases samples required dilution for definitive quantitation of target compounds; the RLs were raised accordingly, and the compounds reported from the dilution analysis. The remaining (un-diluted) target compounds were to be reported from the initial analysis for the lower detection limits.

2.11 Field Duplicates

Eleven sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

2.12 Overall Assessment of PAHs Data Usability

PAHs data are of known quality and acceptable for use, as qualified.

3. PCB Aroclors (EPA Method SW8082A)

3.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection and extracts analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times.

3.2 Initial Calibration

The method requires that (1) a minimum of 5-point calibration be performed using the mixture of Aroclor 1016 and 1260, (2) a single-point calibration be performed for the other five Aroclors to establish calibration factors (CFs) and for Aroclor pattern recognition, (3) at least 3 peaks (preferably 5 peaks) must be chosen for each Aroclor for characterization, (4) the %RSD values of Aroclor 1016 and 1260 CFs must be ≤20%, and

(5) if dual column analysis is chosen, both columns should meet the requirements. All ICALs met the requirements.

3.3 Calibration Verification

CCV analyses should be performed for each 12-hour analysis sequence prior to sample analyses, and the %D be within ±20%. Calibration verifications were performed at the required frequency. All %D values either met the control criteria or biased high for target compounds that were not detected in the associated samples.

3.4 Method Blanks

Method blanks were prepared and analyzed as required. PCB Aroclors were not detected at or above the MDLs in the method blanks.

3.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the laboratory control limits.

3.6 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

MS/MSD analyses were performed on project samples or batch QC samples at the required frequency. All %R and RPD values were within the laboratory control limits.

3.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. All %R and RPD values were within the project control limits.

3.8 Method Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations and achieved the project target quantitation limits.

3.9 Field Duplicates

Field duplicates were not submitted for PCB Aroclors analysis in these SDGs.

3.10 Overall Assessment of PCB Aroclors Data Usability

PCB Aroclor data are of known quality and acceptable for use.

4. TPH-Gasoline by GC/FID (Method NWTPH-Gx)

4.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

All samples in SDGs: 402099, 402220, and 402265 were not preserved in methanol upon collection. The analyses were performed within a relatively short period of time (less than seven days) of collection. TPH-Gasoline results for these samples, rather than being rejected, were qualified (UJ) for non-detects and (J) for detects as estimated.

Soil samples should be preserved in methanol at the time of collection. Soil samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

4.2 Initial Calibration (ICAL)

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

4.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

4.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

4.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

4.6 Matrix Spike and Matrix Spike Duplicate

MS/MSD analyses were not performed for TPH-Gasoline analyses; instead, duplicate and LCS analyses in combination were performed.

4.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

4.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

4.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

4.10 Field Duplicates

Five sets of field duplicates were submitted for PAHs analyses. Field duplicate results for detected target compounds, RPD (or concentration difference) values, and data qualification were presented in **Appendix A**.

4.11 Overall Assessment of TPH-Gasoline Data Usability

TPH-Gasoline data are of known quality and acceptable for use, as qualified.

5. TPH-Diesel & Motor Oil by GC/FID (Method NWTPH-Dx)

5.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

5.2 Initial Calibration

The method criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be ≥0.995, (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be ≥0.990, and (4) the back-calculated %D value for each calibration standard be within ±15%. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

5.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±20% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

5.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks.

5.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of

target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

5.6 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

5.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required. All %R values met the project control limits.

5.8 Target Compound Identification

Selected sample extracts were cleaned up with acid and silica gel treatment to minimize the biogenic interference with target compound identification, as required by the project. The laboratory reported results as diesel #2 (C10 - C25) and motor oil (C25 - C36), as required by the method. In some cases where sample chromatographic patterns resembled Bunker C fuel, the results were quantitated and reported as Bunker C fuel accordingly. No anomalies were identified relative to target compound identification.

5.9 Reporting Limits and Target Compound Quantitation

The reported RLs were supported with adequate ICAL concentrations.

The Bunker C fuel concentration in sample BUST-S67-3 exceeded instrument calibration range; the result was qualified (J) as estimated.

5.10 Field Duplicates

Fourteen sets of field duplicates were submitted for TPH-Diesel and TPH-Motor Oil analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

5.11 Overall Assessment of TPH-Diesel and Motor Oil Data Usability

TPH-Diesel and TPH-Motor Oil data are of known quality and acceptable for use, as qualified.

6. Total Metals by ICP/MS and CVAFS (EPA Methods 200.8 and 1631E)

6.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil and water samples should be analyzed within 180 days for metals and 28 days for mercury. Samples were analyzed within the required holding times.

6.2 ICP/MS Tuning

Instrument tuning was performed at the required frequency. The stability check (%RSD <5%), mass calibration (mass difference <0.1 AMU), and resolution check (peak width <1.0 AMU at 5% peak height) met the NFG and method criteria.

6.3 Initial Calibration (ICAL)

The ICP/MS method requires that (1) a blank and one calibration standard be used in establishing the analytical curve, and (2) the average of replicate exposures be reported for all standards, QC, and sample analyses.

The CVAFS method require that (1) a blank and five calibration standards be employed to establish the analytical curve, (2) the linearity of the calibration curve should meet the criteria of correlation coefficient ≥ 0.995 for linear regression, and (3) the %RSD <15% if average response factor approach is employed.

All ICALs met the method requirements.

6.4 Calibration Verification (ICV and CCV)

Initial calibration verifications (ICVs) and continuing calibration verifications (CCVs) for ICP/MS and GFAA and ongoing precision recovery (OPR) were analyzed at the required frequency. The %R values either met the control criteria (90 – 110% for metals, 76 – 123% for mercury) or the exceedance had no adverse effects on data usability (e.g., high-bias %D value where the target compound was not detected in associated sample).

6.5 Blanks

Calibration Blanks: Initial calibration blanks (ICBs) and continuing calibration blanks (CCBs) were not analyzed after calibration verification standards. Target analytes were either not detected at or above the RLs in the ICBs and CCBs, or sample results affected by the ICB/CCB detections were qualified as results of detections in preparation blanks.

Preparation Blanks: Preparation blanks were prepared and analyzed as required. Target analytes were either not detected at or above the RLs in the preparation blanks, or sample results were greater than 10X the detection in the associated blank, except for the following:

SDG	Method Blank ID	Compound	MB (µg/L)	Affected Sample	Original Result	Qualified Result	Unit
311028	I3-748	Arsenic	0.358 J	BAST-B051-5.0 BAST-B504-5.0	1.92 1.37	1.92 J 1.37 J	**mg/kg**

6.6 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the project control limits, or the exceedance had no adverse effects on data usability (e.g., high-bias %R value where the target compound was not detected in associated sample).

6.7 Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the adequate frequency (>5% of field sample). The %R and RPD values either met the laboratory control limits or the outliers were not applicable for matrix effect evaluation (e.g. sample concentration >4x spiking level), except for the following:

SDG#	Parent Sample ID	Analyte	MS %R	MSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
401111	Cemex-QS-011014	Zinc	39%	45%	50-150%	14%	BUST-S68-3	**J**
402099	NRS-SP01-1-021014	Mercury	54%	64%	62-140%	17%	NRS-SP01-1-021014	**J**
402128	BAST-S069-3-021114	Mercury	56%	32%	62-140%	55%	BAST-S069-3-021114 BAST-507	**J**

Note: RPD control criteria = ±20%

6.8 Internal Standards

At least three internal standards were added to all field and QC samples for ICP/MS analyses. All percent relative intensity values were within the method criteria (60 - 125%).

6.9 Method Reporting Limits and Analyte Quantitation

Sample-specific RLs were supported with adequate initial calibration concentrations.

6.10 Field Duplicates

Seven sets of field duplicates were submitted for metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

6.11 Overall Assessment of Metals Data Usability

Metal data are of known quality and acceptable for use, as qualified.

7. Formaldehyde by HPLC/UV (EPA Method 8315A)

7.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport, as discussed in Section 1.1.

Soil samples should be derivatized and extracted within seven days of sample collection. All derivatized sample extracts should be analyzed within three days after preparation. The sample was prepared and analyzed within the required holding times.

7.2 Instrument Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

An ICV (second source) standard was analyzed to verify the calibration curve. %D values were within ±20%.

7.3 Calibration Verification

CCV analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (±20%).

7.4 Method Blanks

A method blank was prepared and analyzed in each preparation batch as required. Formaldehyde was not detected at or above the RL in method blanks.

7.5 Matrix Spike (MS) and MS Duplicate (MSD)

MS and MSD analyses were performed on project and batch QC samples at the proper frequency. The %R and RPD values met the laboratory control criteria.

7.6 Laboratory Control Samples (LCS)

LCS analyses were performed as required by the methods. The %R values were within the laboratory control limits.

7.7 Field Duplicates

Two sets of field duplicates were submitted for metals analyses. Field duplicate results, RPD (or concentration difference) values, and data qualification for detected TPH-Diesel or Motor Oil were presented in **Appendix A**.

7.8 Overall Assessment of Formaldehyde Data Usability

Formaldehyde data are of known quality and acceptable for use, as qualified.

8. Extractable Petroleum Hydrocarbon (EPH) by GC/FID (Method NWTPH-EPH)

8.1 Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be extracted within 14 days of collection. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the recommended holding times.

8.2 Initial Calibration

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.990, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

Initial calibration information was not submitted for review in these SDGs.

8.3 Calibration Verification

The method requires that (1) a mid-range check standard be analyzed prior to and after each analytical batch, and (2) the percent drift (%D) value be within ±20% of the true value.

Calibration verification was performed at required frequency. The %D values were either within the ±30% criterion or at levels that had no adverse effects on data quality (e.g., high-bias %D value where the target compound was not detected in associated sample).

8.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs in the method blanks, except for the following:

SDG	Method Blank ID	Compound	MB Conc.	Affected Sample	Original Result	Qualified Result	Unit
401241	**6467**	Aromatic C8-C10	0.992 J	BAST-S59-7-012114	1.06	**5.19 U**	**mg/kg**
402219	**6751**	Aromatic C8-C10	1.96 J	BAST-S075-4-021714	14.0 J	**52.5 U**	**mg/kg**

8.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

8.6 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency. The %R values met the laboratory control criteria.

8.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required. All %R and RPD values met the project control limits, except for the following:

SDG#	LCS ID	Analyte	LCS %R	LCSD %R	Control Limit	RPD	Affected Sample	Data Qualifier
402219	6751	Aromatic C8-C10 Aromatic C10-C12	47.0% 28.2%	55.0% 34.8%	70-130%	-	BAST-S59-7-012114	**J**

Note: RPD criteria = ±20%.

8.8 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were consistent with method-recommended pratical quantitation limits and were adjusted with sample volumes and moisture contents.

8.9 Field Duplicates

Field duplicates were not submitted for EPH analysis in these SDGs.

8.10 Overall Assessment of EPH Data Usability

EPH data are acceptable for use as qualified, based on the information submitted by the laboratory.

9. Volatile Petroleum Hydrocarbon by GC/FID (Method NWTPH-VPH)

9.1 Sample Management and Holding Times

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved with methanol at the time of collection, and analyzed within 14 days of collection. All samples were analyzed within the required holding times.

9.2 Initial Calibration (ICAL)

The method linearity criteria require that (1) if linear average RFs is chosen as the quantitation option, the %RSD of RFs be ≤20%, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.990, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.990. Initial calibration met the criteria for all target compounds.

Initial calibration information was not submitted for review in these SDGs.

9.3 Calibration Verification

Continuing calibration verification (CCV) analyses were performed at the required frequency for all analytical sequences as required by the method. The %D values for all CCVs met the method criterion (% value within ±20% for the carbon range components and ±15% for individual target compounds), except for the following:

SDG	CCV ID	Compound	%D	Bias	Affected Sample	Data Qualifier
401241	6483A	Methyl-*tert*-butyl ether	23.9%	Low	BAST-S59-7-012114	**UJ**

9.4 Method Blanks

Method blanks were prepared and analyzed as required. No target compounds were detected at or above the RLs in the method blanks.

9.5 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were either within the project control limits, or outside the control limits due to matrix interference, or diluted below quantitation limits due to high levels of target or non-target compounds in the samples. No data qualifying actions were taken in these cases.

9.6 Matrix Spike (MS)

MS analyses were performed on project or batch QC samples at the required frequency. The %R values were within the laboratory control limits, except for the following:

SDG#	Parent Sample ID	Compound	MS %R	Control Limit	Affected Sample	Data Qualifier
401318	NRU-B5-16-012714	Aliphatics C10-C12 Aromatics C10-C12	-18.5% 43.8%	57-120%	NRU-B5-16-012714	**J**

9.7 Laboratory Control Sample (LCS)

LCS analyses were performed as required by the method. All %R values were within the laboratory control limits.

9.8 Laboratory Duplicate Analysis

Duplicate analyses were performed on project and batch QC samples at the proper frequency. All RPD and concentration difference values met the laboratory control criteria.

9.9 Reporting Limits and Target Compound Quantitation

Sample-specific RLs were consistent with method-recommended practical quantitation limits, and were adjusted with sample volumes and moisture contents.

9.10 Field Duplicates

Field duplicates were not submitted for VPH analysis in these SDGs.

9.11 Overall Assessment of VPH Data Usability

VPH data are acceptable for use as qualified, based on the information submitted by the laboratory.

10. BTEX by GC/PID (EPA Method SW8021B)

10.1 Sample Management and Holding Time

No anomalies were identified in relation to sample preservation, handling, and transport as discussed in Section 1.1.

Soil samples should be preserved in methanol at the time of collection. Soil and water samples should be analyzed within 14 days of collection. All samples were analyzed within the required holding times.

10.2 Initial Calibration (ICAL)

The ICAL criteria require that (1) if linear average RFs is chosen as the quantitation option, at least five standards at different concentrations should be analyzed and the percent relative standard deviation (%RSD) of response factors (RFs) be ≤20% for the analyte, (2) if least-square linear regression is chosen for quantitation, the correlation coefficient (r) be >0.995, and (3) if six-point non-linear (quadratic) curve is chosen for quantitation, the coefficient of determination (r^2) be >0.99. The ICAL met the requirements.

An initial calibration verification (ICV) standard (second source standard) was analyzed to verify the calibration curve. Percent difference (%D) values were either within ±20%, or the exceedance had no adverse effects on data usability (*e.g.,* biased high ICV recovery for a compound not detected in samples).

10.3 Calibration Verification (CCV)

The CCV criteria requires that (1) continuing calibrations be analyzed at the beginning of each 12-hour analysis period prior to the analysis of method blank and samples, and (2) the %D be within ±20. Calibration verifications met the requirements.

10.4 Method Blanks

Method blanks were prepared and analyzed as required. Target compounds were not detected at or above the RLs.

10.5 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD were prepared and analyzed as required by the method. The %R and RPD values met the project control limits.

10.6 Surrogate Spikes

Surrogate spikes were added to all samples as required by the method. All surrogate spike %R values were within the project control limits.

10.7 Matrix Spike (MS)

MS analyses were performed on project and batch QC samples at the proper frequency. All %R values were within the project control limits.

10.8 Reporting Limit and Target Compound Quantitation

RLs were supported with adequate initial calibration concentrations.

10.9 Field Duplicates

Field duplicates were not submitted for BTEX analysis in these SDGs.

10.10 Overall Assessment of BTEX Data Usability

BTEX data are of known quality and acceptable for use.

SUMMARY

Table I. Data Affected by QC Anomalies:

Laboratory ID	Sample ID	Analyte	Qualifier	Qualified Reason

Notes:
%R - Percent recovery
CCV - Continuing calibration verification
DL - Dilution analysis
FD - Field duplicate

LCL - Lower control limit
LCS - Laboratory control sample
LCSD - Laboratory control sample duplicate
MB - Method blank
MS - Matrix spike
MSD - Matrix spike duplicate
RPD - Relative percent difference
UCL - Upper control limit

Table II. Data Affected by Detections in Method Blank

SDG#	Sample ID	Compound	Original Result	Adjusted Result	Unit	Report Section
401241	BAST-S59-7-012114	Aromatics C8-C10 (EPH)	1.06 J	**5.19 U**	mg/kg	**8.4**
402219	BAST-S075-4-021714	Aromatics C8-C10 (EPH)	14.0 J	**52.5 U**	mg/kg	**8.4**

Table III. Data Qualifiers are defined as follows:

Data Qualifier	Definition
DNR	The result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Approved By:  Date: ***6/23/2014***

Appendix A

Field duplicate RPD is indicative of field and laboratory precision and sample homogeneity in combination. The CLP National Functional Guidelines or *Work Plan* do not specify criteria for field duplicate evaluation. An advisory criterion of 35% was applied to evaluating the RPD values of field duplicate results that are ≥5xRL. For results that are <5xRL, an advisory criterion of ±2RL was applied to evaluating the concentration differences. The RPD (or concentration difference as applicable) values and data qualification for detected compounds in field duplicates are presented as follows:

Analyte	Units	RL	Parent & Field Duplicate Sample Result		RPD	Delta	Data Qualifier
			BAST-S010-3.5	**BAST-502-3.2**

Notes:
Delta – Concentration difference between the parent sample and its field duplicate
mg/kg – milligram per kilogram
ND – The analyte was not detected at or above the RL.
RL – Reporting limit
RPD – Relative percent difference

DATA VALIDATION REPORT

Kimberly Clark Worldwide Site Upland Area
Interim Action Confirmational Groundwater Monitoring
May 2014
SDGs 405224, 405255, 405285, 405290, 405253, 405254, K1404940, K1405926, K1409540

Project No. 110207 • October 7, 2014

V:\110207 KC Everett Mill\Deliverables\Confirmational GW Monitoring Report\App B\KC IA May 2014 Data Validation.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected during May 12 through 15, 2014 for Kimberly Clark Worldwide Upland Site Interim Action Confirmational Groundwater Monitoring. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section. The metals data were sent to a separate lab for analysis, and are presented in Sections 8, 9, and 10 at the end of the report.

Samples were analyzed for non-metals analytes by Friedman & Bruya, Inc in Seattle, Washington, and for metals analytes by ALS Environmental in Kelso, Washington. The analytical methods are summarized below:

Analysis	Method	Laboratory
Polycyclic Aromatic Hydrocarbons (PAHs)	SW8270D-SIM	Friedman & Bruya, Inc
TPH - Gasoline Range and BTEX[1]	NWTPH-Gx/EPA 8021B	Friedman & Bruya, Inc
TPH - Diesel and Motor Oil Ranges	NWTPH-Dx	Friedman & Bruya, Inc
Total and Dissolved Metals	EPA 200.8	ALS
Total and Dissolved Mercury	EPA 1631E	ALS

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. A qualified laboratory electronic data deliverable (EDD) is also submitted with this report.

[1] BTEX = benzene, toluene, ethylbenzene, and xylenes

2 Data Validation Findings for SDG 405224

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

* = Total and dissolved metals analysis, otherwise only total metals

2.1 PAHs by SW8270-SIM

2.1.1 *Sample Receipt, Preservation, and Holding Times*

Water samples should be extracted within 7 days of collection and soil within 14 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees Celsius [C]), and holding times were acceptable.

2.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

2.1.3 *Surrogates*

All surrogate spike recoveries were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No data qualification was necessary.

2.1.4 *Laboratory Control Samples (LCS/LCSD)*

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) percent recovery (%R) and relative percent difference (RPD) were within the project control limits.

2.1.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

Matrix spike (MS) and matrix spike duplicate (MSD) %R and RPD were within the project control limits.

2.1.6 *Field Duplicates*

Field duplicates are an indication of both field and laboratory precision. According to the EPA National Functional Guidelines, there are no set criteria for field duplicate evaluation, but the following advisory criteria were used. For results greater than or equal to the analytical reporting limit (RL), the advisory RPD is 35%. For results <5 times the RL, the difference between the sample and the duplicate should be <RL.

One set of blind field duplicates was submitted for this analysis, UST71-MW104-051214 and UST71-MW500-051214. The RPD for the field duplicate pair was within the control limits specified above.

2.1.7 *Reported Results and Reporting Limits (RL)*

The results for acenaphthene and fluorene in sample UST70-MW102-051214 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as do-not-report (DNR) in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The reporting limits outlined in the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013) were met or were elevated accordingly due to high concentrations of target analytes.

2.1.8 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B and EPA 8021B

2.2.1 *Sample Receipt, Preservation, and Holding Times*

Soil and water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

2.2.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

2.2.3 *Surrogates*

All %R were within control limits.

2.2.4 *Laboratory Control Samples (LCS)*

LCS %R and RPD were within the project control limits.

2.2.5 *Laboratory Duplicates*

For laboratory duplicate results that are greater than the RL, the RPD control limit is 20%. For laboratory duplicate results less than 5 times the RL, the difference between the sample and duplicate must be less than the reporting limit.

RPD values met the control criteria for laboratory duplicates.

2.2.6 *Field Duplicates*

One set of blind field duplicates was submitted, UST71-MW104-051214 and UST71-MW500-051214. All RPD were within the control limits.

2.2.7 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

2.2.8 *Overall Assessment*

Accuracy was acceptable based on the LCS recoveries, and precision was acceptable based on the laboratory and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Diesel- and Oil-Range TPH by NWTPH-Dx

2.3.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable (see Section 2.1.1).

2.3.2 *Method Blanks*

Target analytes were not detected at or above RLs in the method blanks.

2.3.3 *Surrogates*

All %R were within control limits or were not applicable due to sample matrix interference.

2.3.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

2.3.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

2.3.6 *Field Duplicates*

One set of blind field duplicates was submitted, UST71-MW104-051214 and UST71-MW500-051214. All RPD were within the control limits.

2.3.7 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

2.3.8 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG 405255

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte									
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs	Mercury	Arsenic	Copper	Lead	Nickel	Zinc
BA6-MW101-051314	5/12/2014	GrWtr	x			x

UST71-MW103-051314	5/12/2014	GrWtr	x			x			x*			x*

* = Total and dissolved metals analysis, otherwise only total metals

3.1 PAHs by SW8270-SIM

3.1.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

3.1.3 *Surrogates*

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No qualification of the results was necessary.

3.1.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

3.1.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

3.1.6 *Field Duplicates*

One set of blind field duplicates was submitted, BCT-MW104-051314 and BCT-MW500-051314. All RPD were within the control limits.

3.1.7 *Reported Results and Reporting Limits (RL)*

The results for naphthalene, acenaphthene and fluorene in sample UST71-MW103-051314 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The result for acenaphthene in sample BA6-MW101-051314 also exceeded the linear range and was qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

3.1.8 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries and precision was acceptable based on the MS/MSD, LCS/LCSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

3.2.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.2.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

3.2.3 *Surrogates*

All %R were within control limits.

3.2.4 *Laboratory Control Samples (LCS)*

LCS %R and RPD were within the project control limits.

3.2.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

3.2.6 *Field Duplicates*

One set of blind field duplicates was submitted, BCT-MW104-051314 and BCT-MW500-051314. All RPD were within the control limits.

3.2.7 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

3.2.8 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Diesel- and Oil-Range TPH by NWTPH-Dx

3.3.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.3.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

3.3.3 *Surrogates*

All %R were within control limits.

3.3.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

3.3.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

3.3.6 *Field Duplicates*

One set of blind field duplicates was submitted, BCT-MW104-051314 and BCT-MW500-051314. All RPD were within the control limits.

3.3.7 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

3.3.8 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4 Data Validation Findings for SDG 405285

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte							
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs	Mercury	Arsenic	Copper	Lead
BCT-MW105-051414	5/14/2014	GrWtr	x	x	x	x	x		x	x

* = Total and dissolved metals analysis, otherwise only total metals

4.1 PAHs by SW8270-SIM

4.1.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

4.1.3 *Surrogates*

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No qualification of the results was necessary.

4.1.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

4.1.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

There were no MS/MSD associated with this SDG.

4.1.6 *Reported Results and Reporting Limits (RL)*

The results for acenaphthene in sample BCT-MW105-051414 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as do-not-report (DNR) in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The results for fluorene and acenaphthene in sample DAST-MW101-051414 also exceeded the linear range and was qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

4.1.7 *Overall Assessment*

Accuracy was acceptable based on the LCS and surrogate spike recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

4.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

4.2.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.2.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

4.2.3 *Surrogates*

All %R were within control limits.

4.2.4 *Laboratory Control Samples (LCS)*

LCS %R and RPD were within the project control limits.

4.2.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

There were no MS/MSD associated with this SDG.

4.2.6 *Laboratory Duplicates*

All RPD were within the control limits.

4.2.7 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

4.2.8 *Overall Assessment*

Accuracy was acceptable based on the LCS and surrogate spike recoveries, and precision was acceptable based on the laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4.3 Diesel- and Oil-Range TPH by NWTPH-Dx

4.3.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.3.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

4.3.3 *Surrogates*

All percent recoveries were within control limits or were at levels that had no adverse effects on data quality.

4.3.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

4.3.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

There were no MS/MSD associated with this SDG.

4.3.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

4.3.7 *Overall Assessment*

Accuracy was acceptable based on the LCS and surrogate spike recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

5 Data Validation Findings for SDG 405290

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte						
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs	Mercury	Copper	Lead
BCT-MW102-051514	5/15/2014	GrWtr	x	x	x	x	x	x	x

* = Total and dissolved metals analysis

5.1 PAHs by SW8270-SIM

5.1.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

5.1.3 *Surrogates*

All surrogate spike %R were within control limits or were not applicable due to sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No qualification of the results was necessary.

5.1.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

5.1.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

There were no MS/MSD associated with this SDG.

5.1.6 *Reported Results and Reporting Limits (RL)*

The results for naphthalene and acenaphthene in sample BCT-MW107-051514 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as do-not-report (DNR) in the undiluted sample. The remaining analytes were reported from the undiluted sample.

Naphthalene, acenaphthene, and fluorene in BCT-MW108-051514 and acenaphthene in BCT-MW103-051514 exceeded the linear range and were qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

5.1.7 *Overall Assessment*

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

5.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

5.2.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.2.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

5.2.3 *Surrogates*

All %R were within control limits.

5.2.4 *Laboratory Control Samples (LCS)*

LCS %R and RPD were within the project control limits.

5.2.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

5.2.6 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

5.2.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

5.3 Diesel- and Oil-Range TPH by NWTPH-Dx

5.3.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.3.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

5.3.3 *Surrogates*

All %R were within control limits.

5.3.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

5.3.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

There were no MS/MSD associated with this SDG.

5.3.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

5.3.7 *Overall Assessment*

Accuracy was acceptable based on the surrogate spike and laboratory control sample recoveries and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6 Data Validation Findings for SDG 405253

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte			
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs
NRP-MW2-051314	5/13/2014	GrWtr	x	x	x	x
NRU-MW101-051314	5/13/2014	GrWtr	x	x	x	x
NRU-MW102-051314	5/13/2014	GrWtr	x	x	x	x

6.1 PAHs by SW8270-SIM

6.1.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

6.1.3 *Surrogates*

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference. No qualification of the results was necessary.

6.1.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

6.1.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

6.1.6 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

6.1.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

6.2.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.2.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

6.2.3 *Surrogates*

All %R were within control limits or were at levels that had no adverse effects on data quality.

6.2.4 *Laboratory Control Samples (LCS)*

LCS %R and RPD were within the project control limits.

6.2.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

6.2.6 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

6.2.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.3 Diesel- and Oil-Range TPH by NWTPH-Dx

6.3.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.3.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

6.3.3 *Surrogates*

All %R were within control limits or were at levels that had no adverse effects on data quality.

6.3.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

6.3.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

6.3.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

6.3.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

7 Data Validation Findings for SDG 405254

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte			
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs
NRS-MW101-051314	5/13/2014	GrWtr	x	x	x	x
NRS-MW102-051314	5/13/2014	GrWtr	x	x	x	x

7.1 PAHs by SW8270-SIM

7.1.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

7.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

7.1.3 *Surrogates*

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference. No qualification of the results was necessary.

7.1.4 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

7.1.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

7.1.6 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

7.1.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

7.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

7.2.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

7.2.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

7.2.3 *Surrogates*

All percent recoveries were within control limits or were at levels that had no adverse effects on data quality.

7.2.4 *Laboratory Control Samples (LCS)*

LCS %R and RPD were within the project control limits.

7.2.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

7.2.6 *Reported Results and Reporting Limits (RL)*

All reporting limits were met as outlined in the QAPP.

7.2.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

7.3 Diesel- and Oil-Range TPH by NWTPH-Dx

7.3.1 *Sample Receipt, Preservation, and Holding Times*

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

7.3.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

7.3.3 *Surrogates*

All %R were within control limits.

7.3.4 *Laboratory Control Samples (LCS)*

LCS and LCSD %R and RPD were within the project control limits.

7.3.5 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

7.3.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

7.3.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

8 Data Validation Findings for SDG K1404940 (Metals Analysis)

In accordance with the QAPP, the groundwater samples were submitted to ALS in Kelso, Washington, for metals analyses, as they have particular expertise performing trace metals analyses in saline water matrices. Friedman and Bruya combined groundwater samples from multiple SDGs into a single batch for transfer to ALS. The specific metals analytes for each sample in this ALS SDG are tabulated in the preceding sections. The sections below describe the results of the data quality review, separated into mercury and the other metals.

8.1 Mercury by EPA 1631E

8.1.1 *Sample Receipt, Preservation, and Holding Times*

Water samples should be analyzed within 28 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

8.1.2 *Method Blanks*

Target analytes were either not detected at or above the reporting levels in the method blanks, except for one method blank associated with sample BBH-MW103-051314. The result was greater than 10 times the blank concentration so no qualification was required.

8.1.3 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

8.1.4 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

8.1.5 *Field Duplicates*

One set of blind field duplicates was submitted, BCT-MW101-051314 and BCT-MW500-051314. All RPD were within the control limits specified above.

8.1.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

8.1.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries and precision was acceptable based on the LCS/LCSD, MS/MSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

8.2 Total Metals by EPA 200.8 and 6010C

Depending on the well, groundwater samples were analyzed for arsenic, copper, lead, nickel, and/or zinc.

8.2.1 *Sample Receipt, Preservation, and Holding Times*

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable, with the following exceptions. Six of the coolers were received at a temperature below 2 degrees C, but no action was taken as this did not affect the data quality. Sample bottles from BCT-MW102-051514 (1 of 2 totals) and UST71-MW103-051314 (2 of 2 totals) were received at pH >2, but had sufficient nitric acid added by the lab to achieve the pH requirements within 2 weeks of collection as outlined in the method (USEPA, 1994). Therefore, no data qualifiers are assigned.

To reduce the analytical interferences due to high concentrations of dissolved solids, samples identified as having high specific conductance in the field (UST70-MW2-051214 and RCD-MW101-051214) were prepared by the reductive precipitation method (USEPA, 1997).

8.2.2 *Method Blanks*

Target analytes were either not detected at or above the reporting levels in the method blanks, or sample results were greater than 10 times the detection in the blank.

8.2.3 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

8.2.4 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

8.2.5 *Laboratory Duplicates*

All RPD were either within the control limits or the control limits were not applicable.

8.2.6 *Field Duplicates*

Two sets of blind field duplicates were submitted, BCT-MW101-051314 and BCT-MW500-051314; and UST71-MW104-051214 and UST71-MW500-051214. All RPD were within the control limits specified above.

8.2.7 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

8.2.8 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the laboratory and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

9 Data Validation Findings for SDG K1405926 (Metals Analysis)

In accordance with the QAPP, the groundwater samples were submitted to ALS in Kelso, Washington, for metals analyses, as they have particular expertise performing trace metals analyses in saline water matrices. Friedman and Bruya combined groundwater samples from multiple SDGs into a single batch for transfer to ALS. The specific metals analytes for each sample in this ALS SDG are tabulated in the preceding sections. Based on the results of the total metals analysis (reviewed in Section 8), certain samples were analyzed for dissolved metals. The sections below describe the results of the data quality review, separated into dissolved mercury and the other dissolved metals.

9.1 Dissolved Mercury by EPA 1631E

9.1.1 *Sample Receipt, Preservation, and Holding Times*

Water samples should be analyzed within 28 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

9.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

9.1.3 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

9.1.4 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

9.1.5 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

9.1.6 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

9.2 Dissolved Metals by EPA 200.8 and 6010C

9.2.1 *Sample Receipt, Preservation, and Holding Times*

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable. Sample bottles from UST71-MW103-051314 (1 of 2 dissolved) were received at pH >2, but had sufficient nitric acid added by the lab to achieve the pH requirements within 2 weeks of collection as outlined in the method (USEPA, 1994). Therefore, no data qualifiers are assigned.

To reduce the analytical interferences due to high concentrations of dissolved solids, samples identified as having high specific conductance in the field (RCD-MW101-051214) were prepared by the reductive precipitation method (USEPA, 1997).

9.2.2 *Method Blanks*

Target analytes were either not detected at or above the reporting levels in the method blanks, or sample results were greater than 10 times the detection in the blank.

9.2.3 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

9.2.4 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

9.2.5 *Laboratory Duplicates*

All RPD were either within the control limits or the control limits were not applicable.

9.2.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

9.2.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

10 Data Validation Findings for SDG K1409540 (Metals Analysis)

In accordance with the QAPP, the groundwater samples were submitted to ALS in Kelso, Washington, for metals analyses, as they have particular expertise performing trace metals analyses in saline water matrices. Friedman and Bruya combined groundwater samples from multiple SDGs into a single batch for transfer to ALS. The specific metals analytes for each sample in this ALS SDG are tabulated in the preceding sections. Based on the results of the total metals analysis (reviewed in Section 8), certain samples were later analyzed for dissolved metals. The section below describes the results of the data quality review for supplemental dissolved metals analyses.

10.1 Dissolved Metals by EPA 200.8 and 6010C

10.1.1 *Sample Receipt, Preservation, and Holding Times*

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable. Dissolved metals analyses were not completed for samples UST71-MW101-051214 and UST71-MW102-051214 because field filtered sample bottles were not submitted.

10.1.2 *Method Blanks*

Target analytes were not detected at or above the reporting levels in the method blanks.

10.1.3 *Laboratory Control Samples (LCS/LCSD)*

LCS and LCSD %R and RPD were within the project control limits.

10.1.4 *Matrix Spike/Matrix Spike Duplicates (MS/MSD)*

MS and MSD %R and RPD were within the project control limits.

10.1.5 *Laboratory Duplicates*

All RPD were either within the control limits or the control limits were not applicable.

10.1.6 *Reported Results and Reporting Limits (RL)*

All target RLs were met as outlined in the QAPP.

10.1.7 *Overall Assessment*

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the LCS/LCSD and laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

11 Qualified Data Summary

Qualified Data Summary Table

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
UST70-MW102-051214 DAST-MW101-051414	405224-01 405285-11	Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
UST71-MW103-051314 BCT-MW108-051514	405255-05 405290-02	Naphthalene Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
BA6-MW101-051314 BCT-MW105-051414 BCT-MW103-051514	405255-08 405285-10 405290-04	Acenaphthene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
BCT-MW107-051514	405290-01	Naphthalene Acenaphthene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Phenanthrene Fluorene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene	DNR	A more appropriate result is reported. Use undiluted result.

Data Qualifier Definitions

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

S:\Kimberly Clark\Everett Mill 110207\Data\Lab Data\Interim Action\Confirmational GW Monitoring\Data Validation\KC IA August 2014 Data Validation.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected during August 11 through 14, 2014 for Kimberly Clark Worldwide Upland Site Interim Action Confirmational Groundwater Monitoring. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section. The metals data were sent to a separate lab for analysis, and are presented in Sections 7 at the end of the report.

Samples were analyzed for non-metals analytes by Friedman & Bruya, Inc in Seattle, Washington, and for metals analytes by ALS Environmental in Kelso, Washington. The analytical methods are summarized below:

Analysis	Method	Laboratory
Polycyclic Aromatic Hydrocarbons (PAHs)	SW8270D-SIM	Friedman & Bruya, Inc
TPH - Gasoline Range and BTEX[1]	NWTPH-Gx/EPA 8021B	Friedman & Bruya, Inc
TPH - Diesel and Motor Oil Ranges	NWTPH-Dx	Friedman & Bruya, Inc
Total and Dissolved Metals	EPA 200.8	ALS
Total and Dissolved Mercury	EPA 1631E	ALS

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. A qualified laboratory electronic data deliverable (EDD) is also submitted with this report.

[1] BTEX = benzene, toluene, ethylbenzene, and xylenes

2 Data Validation Findings for SDG 408183

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

2.1 PAHs by SW8270-SIM

2.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection and soil within 14 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees Celsius [C]), and holding times were acceptable. Sample UST71-MW500-081114 was incorrectly labeled as UST70-MW500-081114 in the lab report, but is correctly named in the EDD.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.1.3 Surrogates

All surrogate spike recoveries were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No data qualification was necessary.

2.1.4 Laboratory Control Samples (LCS/LCSD)

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) percent recovery (%R) and relative percent difference (RPD) were within the project control limits.

2.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Matrix spike (MS) and matrix spike duplicate (MSD) %R and RPD were within the project control limits, except for benzo(a)pyrene in sample UST71-MW104-081114. This sample had MS and MSD %R values of 58% and 59%, which was below the acceptance criteria of 60-86%. This result was flagged as UJ.

2.1.6 Field Duplicates

Field duplicates are an indication of both field and laboratory precision. According to the EPA National Functional Guidelines, there are no set criteria for field duplicate evaluation, but the following advisory criteria were used. For results greater than or equal to the analytical reporting limit (RL), the advisory RPD is 35%. For results <5 times the RL, the difference between the sample and the duplicate should be <RL.

One set of blind field duplicates was submitted for this analysis, UST71-MW104-081114 and UST71-MW500-081114. The RPD for the field duplicate pair was within the control limits specified above.

2.1.7 Reported Results and Reporting Limits (RL)

The results for acenaphthene and fluorene in sample BA6-MW101-081114 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as do-not-report (DNR) in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The results for naphthalene, acenaphthene and fluorene in sample SHB-MW101-081114 also exceeded the linear range and were qualified in the same manner.

The reporting limits outlined in the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013) were met or were elevated accordingly due to high concentrations of target analytes.

2.1.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

2.2.1 Sample Receipt, Preservation, and Holding Times

Soil and water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable. Sample UST71-MW500-081114 was incorrectly labeled as UST70-MW500-081114 in the lab report, but is correctly named in the EDD.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.2.3 Surrogates

All %R were within control limits.

2.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

2.2.5 Laboratory Duplicates

For laboratory duplicate results that are greater than the RL, the RPD control limit is 20%. For laboratory duplicate results less than 5 times the RL, the difference between the sample and duplicate must be less than the reporting limit.

RPD values met the control criteria for laboratory duplicates.

2.2.6 Field Duplicates

One set of blind field duplicates was submitted, UST71-MW104-081114 and UST71-MW500-081114. All RPD were within the control limits specified above.

2.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP (Quality Assurance Project Plan).

2.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the lab and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Diesel- and Oil-Range TPH by NWTPH-Dx

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable (see Section 2.1.1). Sample UST71-MW500-081114 was incorrectly labeled as UST70-MW500-081114 in the lab report, but is correctly named in the EDD.

2.3.2 Method Blanks

Target analytes were not detected at or above RLs in the method blanks.

2.3.3 Surrogates

All percent recoveries were within control limits or were at levels that had no adverse effects on data quality.

2.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

2.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.3.6 Field Duplicates

One set of blind field duplicates was submitted, UST71-MW104-081114 and UST71-MW500-081114. All RPD were within the control limits specified above.

2.3.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

2.3.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG 408213

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte

3.1 PAHs by SW8270-SIM

3.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No qualification of the results was necessary.

3.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

3.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

3.1.6 Reported Results and Reporting Limits (RL)

The results for naphthalene and phenanthrene in sample UST71-MW-103-081214 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as do-not-report (DNR) in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The result for acenaphthene in sample BCT-MW-103-081214 also exceeded the linear range and was qualified in the same manner.

The results for acenaphthene and fluorene in sample DAST-MW-101-081314 also exceeded the linear range and were qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

3.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

3.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.2.3 Surrogates

All %R were within control limits.

3.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

3.2.5 Laboratory Duplicates

RPD values met the control criteria for laboratory duplicates.

3.2.6 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

3.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

3.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Diesel- and Oil-Range TPH by NWTPH-Dx

3.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.3.3 Surrogates

All %R were within control limits.

3.3.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

3.3.5 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

3.3.6 Overall Assessment

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

4 Data Validation Findings for SDG 408237

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte						
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs	Diss Copper	Diss Lead	Diss Mercury

4.1 PAHs by SW8270-SIM

4.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No qualification of the results was necessary.

4.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

4.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, except for benz(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-c,d)pyrene, dibenzo(a,h)anthracene, and benzo(g,h,i)perylene in sample BCT-MW101-081414, which exceeded the RPD control limit of 20% and had %R below the lower control limit for the MS. These results were flagged as UJ. The MS %R for phenanthrene in this sample fell below the control limit, but because the MSD %R was acceptable and the RPD, no action was taken.

4.1.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-081414 and BCT-MW500-081414. All RPD were within the control limits specified above.

4.1.7 Reported Results and Reporting Limits (RL)

The results for naphthalene, acenaphthene, and phenanthrene in sample BCT-MW108-081414 exceeded the instrument calibration range, requiring the sample to be diluted and

re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The results for naphthalene and acenaphthene in sample BCT-MW107-081414 also exceeded the linear range and was qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

4.1.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

4.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.2.3 Surrogates

All %R were within control limits.

4.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

4.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

4.2.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-081414 and BCT-MW500-081414. All RPD were within the control limits specified above.

4.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

4.2.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4.3 Diesel- and Oil-Range TPH by NWTPH-Dx

4.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.3.3 Surrogates

All %R were within control limits.

4.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

4.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, except for the diesel range hydrocarbon results in sample BCT-MW101-081414, which exceeded the RPD control limit of 20% with a value of 22%. This result was flagged as UJ.

4.3.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-081414 and BCT-MW500-081414. All RPD were within the control limits specified above.

4.3.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

4.3.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

5 Data Validation Findings for SDG 408211

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte			
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs
NRS-MW-102-081214	8/12/2014	GrWtr	x	x	x	x
NRS-MW-101-081214	8/12/2014	GrWtr	x	x	x	x

5.1 PAHs by SW8270-SIM

5.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference. No qualification of the results was necessary.

5.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

5.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

5.1.6 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

5.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

5.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

5.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.2.3 Surrogates

All %R were within control limits.

5.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

5.2.5 Laboratory Duplicates

RPD values met the control criteria for laboratory duplicates.

5.2.6 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

5.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP (Quality Assurance Project Plan).

5.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the MS/MSD and laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

5.3 Diesel- and Oil-Range TPH by NWTPH-Dx

5.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.3.3 Surrogates

All %R were within control limits.

5.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

5.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD submitted with this SDG.

5.3.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

5.3.7 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6 Data Validation Findings for SDG 408212

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte			
			TPH-Dx	TPH-Gx	BTEX	Low Level PAHs
NRU-MW-102-081214	8/12/2014	GrWtr	x	x	x	x
NRP-MW-2-081214	8/12/2014	GrWtr	x	x	x	x
NRU-MW-101-081214	8/12/2014	GrWtr	x	x	x	x

6.1 PAHs by SW8270-SIM

6.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.1.3 Surrogates

All surrogate spike recoveries were within control limits or were not applicable due to sample matrix interference. No qualification of the results was necessary.

6.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

6.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

6.1.6 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP (Quality Assurance Project Plan).

6.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.2 TPH-Gasoline and BTEX by NWTPH-Gx and EPA 8021B

6.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.2.3 Surrogates

All %R were within control limits.

6.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

6.2.5 Laboratory Duplicates

RPD values met the control criteria for laboratory duplicates.

6.2.6 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

6.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

6.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the MS/MSD and laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

6.3 Diesel- and Oil-Range TPH by NWTPH-Dx

6.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.3.3 Surrogates

All %R were within control limits.

6.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

6.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

6.3.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

6.3.7 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

7 Data Validation Findings for SDG K1408718 (Metals Analysis)

In accordance with the QAPP, the groundwater samples were submitted to ALS in Kelso, Washington, for metals analyses, as they have particular expertise performing trace metals analyses in saline water matrices. Friedman and Bruya combined groundwater samples from multiple SDGs into a single batch for transfer to ALS. The specific metals analytes for each sample in this ALS SDG are tabulated in the preceding sections. The sections below describe the results of the data quality review, separated into mercury and the other metals. The groundwater samples for metals analysis were field-filtered, therefore the results are reported as dissolved metals.

7.1 Dissolved Mercury by EPA 1631E

7.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 28 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

7.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

7.1.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

7.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

7.1.5 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-081414 and BCT-MW500-081414. All RPD were within the control limits specified above.

7.1.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP (Quality Assurance Project Plan).

7.1.7 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and field duplicates relative percent difference values. The data are of known quality and are acceptable for use as qualified.

7.2 Dissolved Metals by EPA 200.8 and 6010C

7.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable. Samples UST71-MW-102-081114 and UST71-MW-103-081214 were received at pH>2, but had sufficient nitric acid added by the lab to achieve the pH requirements within 2

weeks of collection as outlined in the method (USEPA, 1994). Therefore, no data qualifiers are assigned.

To reduce the analytical interferences due to high concentrations of dissolved solids, samples identified as having high specific conductance in the field (UST70-MW2-081114, RCD-MW101-081114, UST71-MW101-081214) were prepared by the reductive precipitation method (USEPA, 1997).

7.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

7.2.3 Laboratory Control Samples (LCS)

LCS and LCSD %R and RPD were within the project control limits.

7.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

7.2.5 Laboratory Duplicates

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

7.2.6 Field Duplicates

Two sets of blind field duplicates was submitted, BCT-MW101-081414 and BCT-MW500-081414; and UST71-MW104-081114 and UST71-MW500-081114. All RPD were within the control limits specified above.

7.2.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP (Quality Assurance Project Plan).

7.2.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the laboratory duplicates relative percent difference values. The data are of known quality and are acceptable for use as qualified.

8 Qualified Data Summary

Qualified Data Summary Table

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
UST71-MW104-081114	408183-09	Benzo(a)pyrene	UJ	MS/MSD %R below control limits.
BA6-MW101-081114 DAST-MW-101-081314	408183-04 408213-18	Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
SHB-MW101-081114 BCT-MW108-081414	408183-07 408237-01	Naphthalene Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
UST71-MW-103-081214	408213-03	Naphthalene Phenanthrene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Acenaphthene Fluorene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
BCT-MW-103-081214	408237-09	Acenaphthene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
BCT-MW107-081414	408213-09	Naphthalene Acenaphthene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
BCT-MW101-081114	408237-04	Diesel Range Hydrocarbons	UJ	MS/MSD %R below control limits.
		Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	UJ	MS/MSD %RPD above control limits, MS/MSD %R below control limits.

Data Qualifier Definitions

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Project No. 110207 • December 8, 2014

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Data Validation - Delia\KC IA Nov 2014 Data Validation.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected during November 3 through 6, 2014 for Kimberly Clark Worldwide Upland Site Interim Action Confirmational Groundwater Monitoring. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section. The metals data were sent to a separate lab for analysis, and are presented in Section 7 at the end of the report.

Samples were analyzed for non-metal analytes by Friedman & Bruya, Inc in Seattle, Washington, and for metal analytes by ALS Environmental in Kelso, Washington. The analytical methods are summarized below:

Analysis	Method	Laboratory
Polycyclic Aromatic Hydrocarbons (PAHs)	SW8270D-SIM	Friedman & Bruya, Inc
TPH - Gasoline Range and BTEX[1]	NWTPH-Gx/EPA 8021B	Friedman & Bruya, Inc
TPH - Diesel and Motor Oil Ranges	NWTPH-Dx	Friedman & Bruya, Inc
Total and Dissolved Metals	EPA 200.8	ALS
Total and Dissolved Mercury	EPA 1631E	ALS

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

[1] BTEX = benzene, toluene, ethylbenzene, and xylenes

2 Data Validation Findings for SDG 411039

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

2.1 PAHs (SW8270-SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees Celsius [C]), and holding times were acceptable.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.1.3 Surrogates

All surrogate spike recoveries were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No data qualification was necessary.

2.1.4 Laboratory Control Samples (LCS/LCSD)

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) percent recovery (%R) and relative percent difference (RPD) were within the project control limits.

2.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Matrix spike (MS) and matrix spike duplicate (MSD) %R and RPD were within the project control limits, except for the sixteen semivolatile target compounds in sample BCT-MW101-110314. Each analyte had an RPD above the control limit of 20% and were flagged as estimated (UJ).

2.1.6 Field Duplicates

Field duplicates are an indication of both field and laboratory precision. According to the EPA National Functional Guidelines, there are no set criteria for field duplicate evaluation, but the following advisory criteria were used. For results greater than or equal to the analytical reporting limit (RL), the advisory RPD is 35%. For results <5 times the RL, the difference between the sample and the duplicate should be <RL.

One set of blind field duplicates was submitted for this analysis, BCT-MW101-110314 and BCT-MW500-110314. The RPD for the field duplicate pair was within the control limits specified above.

2.1.7 Reported Results and Reporting Limits (RL)

The reporting limits outlined in the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013) were met.

2.1.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

2.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.2.3 Surrogates

All %R were within control limits.

2.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

2.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.2.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-110314 and BCT-MW500-110314. All RPD were within the control limits specified above.

2.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP (Quality Assurance Project Plan).

2.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate spike, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

2.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

2.3.2 Method Blanks

Target analytes were not detected at or above RLs in the method blanks.

2.3.3 Surrogates

All percent recoveries were within control limits or were at levels that had no adverse effects on data quality.

2.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

2.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.3.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-110314 and BCT-MW500-110314. All RPD were within the control limits specified above.

2.3.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

2.3.8 Overall Assessment

Accuracy was acceptable based on the surrogate spike, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD, and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG 411066

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte		
			TPH-Dx/Oil	TPH-Gx/BTEX	Low Level PAHs
NRS-MW101-110414	11/4/2014	GrWtr	x	x	x
NRS-MW102-110414	11/4/2014	GrWtr	x	x	x

3.1 PAHs (SW8270-SIM)

3.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.1.3 Surrogates

All %R were within control limits.

3.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

3.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

3.1.6 Reported Results and Reporting Limits (RL)

The reporting limits outlined in the QAPP were met.

3.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

3.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.2.3 Surrogates

All %R were within control limits.

3.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

3.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

3.2.6 Reported Results and Reporting Limits (RL)

The reporting limits were met as outlined in the QAPP.

3.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

3.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.3.3 Surrogates

All %R were within control limits.

3.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

3.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

3.3.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

3.3.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

4 Data Validation Findings for SDG 411067

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte								
			TPH-Dx/Oil	TPH-Gx/BTEX	Low Level PAHs	Mercury	Arsenic	Copper	Lead	Nickel	Zinc
BCT-MW105-110414	11/4/2014	GrWtr	x	x	x	x		x	x		
BCT-MW106-110414	11/4/2014	GrWtr	x	x	x	x		x	x		
BCT-MW107-110414	11/4/2014	GrWtr	x	x	x	x		x	x		
BCT-MW108-110414	11/4/2014	GrWtr	x	x	x	x		x	x		
HBV-MW101-110414	11/4/2014	GrWtr	x		x						
HB-MW1R-110414	11/4/2014	GrWtr				x	x	x	x	x	x
UST71-MW102-110414	11/4/2014	GrWtr	x		x			x			x
UST70-MW102-110414	11/4/2014	GrWtr	x		x		x	x		x	x
UST70-MW2-110414	11/4/2014	GrWtr	x		x		x	x		x	x
UST70-MW101-110414	11/4/2014	GrWtr	x		x		x	x		x	x
RCD-MW101-110414	11/4/2014	GrWtr	x		x	x	x	x		x	

4.1 PAHs (SW8270-SIM)

4.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations, with one exception. The %R for benzo(a)anthracene-d12 in HBV-MW101-110414 (194 percent) was above the control limit of 150 percent. Because the recovery was greater than the upper control limit, the detected semivolatile target compounds in this sample will be qualified as estimated (J), and the non-detected target compounds will not be qualified.

4.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

4.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

4.1.6 Reported Results and Reporting Limits (RL)

The results for naphthalene, acenaphthene, and phenanthrene in samples BCT-MW107-110414 and BCT-MW108-110414 exceeded the instrument calibration range, requiring the samples to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted samples. The remaining analytes were reported from the undiluted samples.

The results for acenaphthene in sample UST70-MW102-110414 also exceeded the linear range and was qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

4.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

4.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.2.3 Surrogates

All %R were within control limits.

4.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

4.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

4.2.6 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

4.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

4.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.3.3 Surrogates

All %R were within control limits.

4.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

4.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

4.3.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

4.3.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

5 Data Validation Findings for SDG 411116

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte		
			TPH-Dx/Oil	TPH-Gx/BTEX	Low Level PAHs
NRU-MW101-110514	11/5/2014	GrWtr	x	x	x
NRU-MW102-110514	11/5/2014	GrWtr	x	x	x
NRP-MW2-110514	11/5/2014	GrWtr	x	x	x

5.1 PAHs (SW8270-SIM)

5.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference. No qualification of the results was necessary.

5.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

5.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

5.1.6 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

5.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

5.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

5.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.2.3 Surrogates

All %R were within control limits.

5.2.4 Laboratory Control Samples (LCS)

LCS and LCSD %R and RPD were within the project control limits.

5.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

5.2.6 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP (Quality Assurance Project Plan).

5.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

5.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

5.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.3.3 Surrogates

All %R were within control limits.

5.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

5.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

5.3.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

5.3.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6 Data Validation Findings for SDG 411119

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte							
			TPH-Dx/Oil	TPH-Gx/BTEX	Low Level PAHs	Mercury	Arsenic	Copper	Lead	Zinc
UST71-MW104-110514	11/5/2014	GrWtr	x		x			x		x
UST71-MW101-110514	11/5/2014	GrWtr	x		x			x		x
UST71-MW500-110514	11/5/2014	GrWtr	x		x			x		x
DAST-MW101-110514	11/5/2014	GrWtr	x		x	x		x		
UST29-MW101-110514	11/5/2014	GrWtr	x	x	x					
BA6-MW101-110514	11/5/2014	GrWtr	x		x					
UST71-MW103-110514	11/5/2014	GrWtr	x		x			x		
SHB-MW101-110514	11/5/2014	GrWtr	x	x	x	x		x		
SHB-MW102-110514	11/5/2014	GrWtr	x	x	x	x		x		
UST29-MW103-110614	11/6/2014	GrWtr	x	x	x					
UST29-MW102-110614	11/6/2014	GrWtr	x	x	x					
CN-MW101-110614	11/6/2014	GrWtr	x		x		x	x	x	
CN-MW102-110614	11/6/2014	GrWtr	x		x		x	x	x	
CN-MW103-110614	11/6/2014	GrWtr	x		x		x	x	x	
CN-MW104-110614	11/6/2014	GrWtr	x		x		x	x	x	

6.1 PAHs (SW8270-SIM)

6.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations, with one exception. The %R for sample UST71-MW103-110514 were below the control limits because the surrogates were not added prior to extraction and should be considered estimates. Because the MS and LCS %R were within the limits for this sample, no qualification of the results was necessary.

6.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

6.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, with one exception. The RPDs for indeno(1,2,3-c,d)pyrene, dibenz(a,h)anthracene, and benzo(g,h,i)perylene in UST71-MW104-110514 were above the control limit of 20%. The results for these analytes were qualified as estimated (UJ).

6.1.6 Field Duplicates

One set of blind field duplicates was submitted, UST71-MW104-110514 and UST71-MW500-110514. All RPD were within the control limits specified above.

6.1.7 Reported Results and Reporting Limits (RL)

The results for acenaphthene and fluorene in sample DAST-MW101-110514 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted sample. The remaining analytes were reported from the undiluted sample.

The results for acenaphthene, fluorene, and phenanthrene in sample UST71-MW103-110514, acenaphthene in UST29-MW102-110614, and naphthalene and acenaphthene in CN-MW101-110614 also exceeded the linear range and was qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes.

6.1.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the field duplicate, MS/MSD, and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

6.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.2.3 Surrogates

All %R were within control limits.

6.2.4 Laboratory Control Samples (LCS)

LCS and LCSD %R and RPD were within the project control limits.

6.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

There were no MS/MSD associated with this SDG.

6.2.6 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

6.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate spikes and LCS recoveries, and precision was acceptable based on the LCS/LCSD and RPD values. The data are of known quality and are acceptable for use as qualified.

6.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

6.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.3.3 Surrogates

All %R were within control limits.

6.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

6.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

6.3.6 Field Duplicates

One set of blind field duplicates was submitted, UST71-MW104-110514 and UST71-MW500-110514. All RPD were within the control limits specified above.

6.3.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

6.3.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the field duplicate, MS/MSD, and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

7 Data Validation Findings for SDG K1412631 (Metals Analyses)

In accordance with the QAPP, the groundwater samples were submitted to ALS in Kelso, Washington, for metals analyses, as they have particular expertise performing trace metals analyses in saline water matrices. Friedman and Bruya combined groundwater samples from multiple SDGs into a single batch for transfer to ALS. The specific metals analytes for each sample in this ALS SDG are tabulated in the preceding sections. The sections below describe the results of the data quality review, separated into mercury and the other metals. The groundwater samples for metals analysis were field-filtered, therefore the results are reported as dissolved metals.

7.1 Dissolved Mercury (EPA 1631E)

7.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 28 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

7.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

7.1.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

7.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

7.1.5 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-110314 and BCT-MW500-110314. All RPD were within the control limits specified above.

7.1.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

7.1.7 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and field duplicates relative percent difference values. The data are of known quality and are acceptable for use as qualified.

7.2 Dissolved Metals (EPA 200.8 and 6010C)

7.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

To reduce the analytical interferences due to high concentrations of dissolved solids, samples identified as having high specific conductance in the field (UST70-MW2-

110414, RCD-MW101-110414) were prepared by the reductive precipitation method (USEPA, 1997).

7.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

7.2.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

7.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

7.2.5 Laboratory Duplicates

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

7.2.6 Field Duplicates

Two sets of blind field duplicates were submitted, BCT-MW101-110314 and BCT-MW500-110314; and UST71-MW104-110514 and UST71-MW500-110514. All RPD were within the control limits specified above.

7.2.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP (Quality Assurance Project Plan).

7.2.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD, laboratory and field duplicates relative percent difference values. The data are of known quality and are acceptable for use as qualified.

8 Qualified Data Summary

Qualified Data Summary Table

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
BCT-MW101-110314	411039-01	Acenaphthene Fluorene Naphthalene Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	UJ	MS/MSD %RPD above control limits.
HBV-MW101-110414	411067-05	Acenaphthene Fluorene Naphthalene Phenanthrene Anthracene Fluoranthene Pyrene	J	Surrogate %R above control limit.
UST71-MW104-110514	411119-01	Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	UJ	MS/MSD %R below control limits.
BCT-MW107-110414 BCT-MW108-110414	411067-03 411067-04	Naphthalene Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
UST70-MW102-110414 UST29-MW102-110614	411067-08 411119-11	Acenaphthene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
DAST-MW101-110514	411119-04	Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.
UST71-MW103-110514	411119-07	Phenanthrene Acenaphthene Fluorene	DNR	Result outside of instrument calibration range. Use diluted result.
		Naphthalene Acenaphthylene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
CN-MW101-110614	411119-12	Naphthalene Acenaphthene	DNR	Result outside of instrument calibration range. Use diluted result.
		Acenaphthylene Fluorene Phenanthrene Anthracene Fluoranthene Pyrene Benz[a]anthracene Chrysene Benzo(a)pyrene Benzo(b)fluoranthene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	DNR	A more appropriate result is reported. Use undiluted result.

Data Qualifier Definitions

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Data Validation - Delia\KC IA Feb 2015 Data Validation.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected during February 17 through 19, 2015 for Kimberly Clark Worldwide Upland Site Interim Action Confirmational Groundwater Monitoring. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section. The metals data were sent to a separate lab for analysis, and are presented in Section 7 at the end of the report.

Samples were analyzed for non-metal analytes by Friedman & Bruya, Inc in Seattle, Washington and Fremont Analytical in Seattle, Washington, and for metal analytes by ALS Environmental in Kelso, Washington. The analytical methods are summarized below:

Analysis	Method	Laboratory
Polycyclic Aromatic Hydrocarbons (PAHs)	SW8270D-SIM	Friedman & Bruya, Inc
TPH - Gasoline Range and BTEX[1]	NWTPH-Gx/EPA 8021B	Friedman & Bruya, Inc
TPH - Diesel and Motor Oil Ranges with Silica Gel	NWTPH-Dx	Friedman & Bruya, Inc
Extractable Petroleum Hydrocarbons (EPH)	NWEPH	Fremont Analytical
Total and Dissolved Metals	EPA 200.8	ALS
Total and Dissolved Mercury	EPA 1631E	ALS

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

[1] BTEX = benzene, toluene, ethylbenzene, and xylenes

2 Data Validation Findings for SDG 502284

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte		
			TPH-Dx/Oil w/ SG	TPH-Gx/BTEX	Low Level PAHs
NRS-MW101-021715	2/17/2015	GrWtr	x	x	x
NRS-MW102-021715	2/17/2015	GrWtr	x	x	x

2.1 PAHs (SW8270D-SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees Celsius [C]), and holding times were acceptable.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.1.3 Surrogates

All percent recoveries (%R) were within control limits.

2.1.4 Laboratory Control Samples (LCS/LCSD)

Laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) percent recovery (%R) and relative percent difference (RPD) were within the project control limits.

2.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

Matrix spike (MS) and matrix spike duplicate (MSD) %R and RPD were within the project control limits, with the exception of eight analytes. However, because the parent sample was from a different SDG and the interference was likely due to the sample matrix, no results were qualified.

2.1.6 Reported Results and Reporting Limits (RL)

The reporting limits (RLs) outlined in the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013) were met.

2.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

2.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.2.3 Surrogates

All %R were within control limits.

2.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

2.2.5 Laboratory Duplicate

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

2.2.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

2.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

2.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.3.3 Surrogates

All %R were within control limits.

2.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

2.3.5 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

2.3.6 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG 502285

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte		
			TPH-Dx/Oil w/ SG	TPH-Gx/BTEX	Low Level PAHs
NRU-MW101-021715	2/17/2015	GrWtr	x	x	x
NRU-MW102-021715	2/17/2015	GrWtr	x	x	x
NRP-MW2-021715	2/17/2015	GrWtr	x	x	x

3.1 PAHs (SW8270D-SIM)

3.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations. No qualification of the results was necessary.

3.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

3.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, with the exception of seven analytes. However, because the parent sample was from a different SDG and the interference was likely due to the sample matrix, no results were qualified.

3.1.6 Reported Results and Reporting Limits (RL)

The results for acenaphthene and fluorene in sample NRU-MW102-021715 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted sample. The remaining analytes were reported from the undiluted samples.

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

3.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

3.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.2.3 Surrogates

All %R were within control limits.

3.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

3.2.5 Laboratory Duplicate

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

3.2.6 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

3.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

3.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

3.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

3.3.3 Surrogates

All %R were within control limits.

3.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

3.3.5 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

3.3.6 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

4 Data Validation Findings for SDG 502286

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

Sample ID	Sample Date	Sample Matrix	Analyte							
			TPH-Dx/Oil w/ SG	TPH-Gx/ BTEX	Low Level PAHs	Arsenic	Copper	Lead	Mercury	Zinc

4.1 PAHs (SW8270D-SIM)

4.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.1.3 Surrogates

All %R were within control limits.

4.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

4.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, with the exception of seven analytes. However, because the parent sample was from a different SDG and the interference was likely due to the sample matrix, no results were qualified.

4.1.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

4.1.7 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries and precision was acceptable based on the MS/MSD and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

4.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

4.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

4.2.3 Surrogates

All %R were within control limits.

4.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

4.2.5 Laboratory Duplicate

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

4.2.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

4.2.7 Overall Assessment

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

4.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

4.3.2 Method Blanks

Target analytes were not detected at or above RLs in the method blanks.

4.3.3 Surrogates

All %R were within control limits.

4.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

4.3.5 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

4.3.6 Overall Assessment

Accuracy was acceptable based on the surrogate spike and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

5 Data Validation Findings for SDG 502297

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

5.1 PAHs (SW8270D-SIM)

5.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations.

5.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

5.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, with several exceptions. The %R and/or RPD were outside the control limits for benz(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(a)pyrene, indeno(1,2,3-

c,d)pyrene, dibenz(a,h)anthracene, and benzo(g,h,i)perylene. These analytes were qualified as estimated (J) in the parent sample, UST71-MW104-021814.

5.1.6 Field Duplicates

Field duplicates are an indication of both field and laboratory precision. According to the EPA National Functional Guidelines, there are no set criteria for field duplicate evaluation, but the following advisory criteria were used. For results greater than or equal to the analytical RL, the advisory RPD is 35%. For results <5 times the RL, the difference between the sample and the duplicate should be <RL.

One set of blind field duplicates was submitted for this analysis, UST71-MW104-021815 and UST71-MW500-021815. The RPD for the field duplicate pair was within the control limits specified above.

5.1.7 Reported Results and Reporting Limits (RL)

The results for naphthalene, acenaphthene, fluorene, and phenanthrene in sample UST71-MW103-021815 exceeded the instrument calibration range, requiring the sample to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted sample. The remaining analytes were reported from the undiluted samples.

The results for naphthalene and acenaphthene in sample SHB-MW101-021815 and acenaphthene in UST70-MW102-021815 also exceeded the linear range and were qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

5.1.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

5.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

5.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.2.3 Surrogates

All %R were within control limits.

5.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

5.2.5 Laboratory Duplicate

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

5.2.6 Field Duplicates

One set of blind field duplicates was submitted, UST71-MW104-021815 and UST71-MW500-021815. All RPD were within the control limits specified above.

5.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

5.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the laboratory and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

5.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

5.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.3.3 Surrogates

All %R were within control limits.

5.3.4 Laboratory Control Samples (LCS/LCSD)

LCS %R were within the project control limits, however, the LCSD %R and RPD were above the project control limits. All positive sample results were qualified as estimated (J).

5.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

5.3.6 Field Duplicates

One set of blind field duplicates was submitted, UST71-MW104-021815 and UST71-MW500-021815. All RPD were within the control limits specified above.

5.3.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

5.3.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD, LCS/LCSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

5.4 Extractable Petroleum Hydrocarbons (NWEPH)

5.4.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 14 days of collection. Extracted samples must be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

5.4.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

5.4.3 Surrogates

All %R were within control limits.

5.4.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

5.4.5 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

5.4.6 Overall Assessment

Accuracy was acceptable based on the surrogate and LCS recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6 Data Validation Findings for SDG 502330

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

6.1 PAHs (SW8270-SIM)

6.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be extracted within 7 days of collection. Extracted samples should be analyzed within 40 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.1.3 Surrogates

All surrogate spike %R were within control limits or were not applicable due to sample matrix interference or sample dilution below quantitation limits because of high petroleum hydrocarbon concentrations.

6.1.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

6.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, with one exception. The RPDs for fluorene, phenanthrene, anthracene, benzo(k)fluoranthene, indeno(1,2,3-c,d)pyrene, dibenz(a,h)anthracene, and benzo(g,h,i)perylene in BCT-MW101-021915 were above the control limit of 20%. The results for these analytes were qualified as estimated (UJ).

6.1.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-021915 and BCT-MW500-021915. All RPD were within the control limits specified above.

6.1.7 Reported Results and Reporting Limits (RL)

The results for naphthalene, acenaphthene, and fluorene in samples BCT-MW107-021915 and BCT-MW108-021915 exceeded the instrument calibration range, requiring the samples to be diluted and re-analyzed. These analytes were reported from the dilution and qualified as DNR in the undiluted samples. The remaining analytes were reported from the undiluted samples.

The results for acenaphthene and fluorene in sample DAST-MW-101-021915 also exceeded the linear range and were qualified in the same manner.

The reporting limits outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

6.1.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the field duplicate, MS/MSD, and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.2 TPH-Gasoline and BTEX (NWTPH-Gx and EPA 8021B)

6.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.2.3 Surrogates

All %R were within control limits.

6.2.4 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

6.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

6.2.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-021915 and BCT-MW500-021915. All RPD were within the control limits specified above.

6.2.7 Reported Results and Reporting Limits (RL)

All reporting limits were met as outlined in the QAPP.

6.2.8 Overall Assessment

Accuracy was acceptable based on the surrogate spikes, MS, and LCS recoveries, and precision was acceptable based on the MS/MSD and RPD values. The data are of known quality and are acceptable for use as qualified.

6.3 Diesel- and Oil-Range TPH (NWTPH-Dx)

6.3.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 14 days of collection.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

6.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

6.3.3 Surrogates

All %R were within control limits.

6.3.4 Laboratory Control Samples (LCS/LCSD)

LCS and LCSD %R and RPD were within the project control limits.

6.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

6.3.6 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-021915 and BCT-MW500-021915. All RPD were within the control limits specified above.

6.3.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

6.3.8 Overall Assessment

Accuracy was acceptable based on the surrogate, MS, and LCS recoveries, and precision was acceptable based on the field duplicate, MS/MSD, and LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

7 Data Validation Findings for SDG K1501795 (Metals Analyses)

In accordance with the QAPP, the groundwater samples were submitted to ALS in Kelso, Washington, for metals analyses, as they have particular expertise performing trace metals analyses in saline water matrices. Friedman and Bruya combined groundwater samples from multiple SDGs into a single batch for transfer to ALS. The specific metal analytes for each sample in this ALS SDG are tabulated in the preceding sections. The sections below describe the results of the data quality review, separated into mercury and the other metals. The groundwater samples for metals analysis were field-filtered, therefore the results are reported as dissolved metals.

7.1 Dissolved Mercury (EPA 1631E)

7.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 28 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable, with one exception. Sample RCD-MW101-021815 was incorrectly labeled as RCD-MW102-021815, but the lab was able to determine the correct Sample ID through process of elimination. No further action was needed.

7.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

7.1.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

7.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

7.1.5 Field Duplicates

One set of blind field duplicates was submitted, BCT-MW101-021915 and BCT-MW500-021915. All RPD were within the control limits specified above.

7.1.6 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

7.1.7 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

7.2 Dissolved Metals (EPA 200.8)

7.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable.

To reduce the analytical interferences due to high concentrations of dissolved solids, samples identified as having high specific conductance in the field (UST70-MW2-021915, RCD-MW101-021915) were prepared by the reductive precipitation method (USEPA, 1997).

7.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

7.2.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

7.2.4 Matrix Spike (MS)

MS %R were within the project control limits.

7.2.5 Laboratory Duplicates

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

7.2.6 Field Duplicates

Two sets of blind field duplicates were submitted, BCT-MW101-021915 and BCT-MW500-021915; and UST71-MW104-021815 and UST71-MW500-021815. All RPD were within the control limits specified above.

7.2.7 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

7.2.8 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the laboratory duplicate and field duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

8 Qualified Data Summary Table

Sample ID	Laboratory ID	Analyte	Qualifier	Qualified Reason
UST71-MW104-021815	502297-04	Benz(a)anthracene Chrysene Benzo(b)fluoranthene Benzo(k)fluoranthene Benzo(a)pyrene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	UJ	MS/MSD %R and RPD outside control limits.
UST71-MW104-021815 UST29-MW103-021815 UST71-MW103-021815 SHB-MW101-021815	502297-04 502297-08 502297-09 502297-11	Diesel Range Hydrocarbons	J	LCS/LCSD %R and RPD above control limits.
BCT-MW101-021915	502330-03	Fluorene Phenanthrene Anthracene Benzo(k)fluoranthene Indeno(1,2,3-cd)pyrene Dibenzo(a,h)anthracene Benzo(ghi)perylene	UJ/J	MS/MSD %R and RPD outside control limits.

Data Qualifier Definitions

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Project No. 110207 • April 29, 2015

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Data Validation - Delia\KC IA Feb 2015 Data Validation.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected on April 20, 2015 for Kimberly Clark Worldwide Upland Site Interim Action Confirmational Groundwater Monitoring. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for metal analytes by ALS Environmental in Kelso, Washington. The analytical methods are summarized below:

Analysis	Method	Laboratory
Total and Dissolved Metals	EPA 200.8	ALS
Total and Dissolved Mercury	EPA 1631E	ALS

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report (DNR) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG K1504093

Sample ID	Sample Date	Sample Matrix	Analyte				
			Arsenic	Copper	Lead	Mercury	Zinc
BBH-MW103-021715	2/17/2015	GrWtr	x	x	x	x	x

2.1 Dissolved Mercury (EPA 1631E)

2.1.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 28 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable, with one exception. Sample BBH-MW103-042015 had a pH > 2 upon sample receipt, however, sufficient nitric acid was added to lower the pH more than 16 hours before analysis. No further action was needed.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.1.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

2.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits.

2.1.5 Reported Results and Reporting Limits (RL)

The RLs outlined in the QAPP were met or were elevated accordingly due to high concentrations of target analytes. RLs were acceptable for their intended use.

2.1.6 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Dissolved Metals (EPA 200.8)

2.2.1 Sample Receipt, Preservation, and Holding Times

Water samples should be analyzed within 180 days of extraction.

Sample receipt, preservation (2-6 degrees C), and holding times were acceptable. Sample BBH-MW103-042015 had a pH > 2 upon sample receipt, however, sufficient nitric acid was added to lower the pH more than 16 hours before analysis. No further action was needed.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks.

2.2.3 Laboratory Control Samples (LCS)

LCS %R were within the project control limits.

2.2.4 Matrix Spike (MS)

MS %R were within the project control limits.

2.2.5 Laboratory Duplicates

For laboratory duplicate results that are greater than the reporting limit, the RPD control limit is 20%. For laboratory duplicate results less than five times the reporting limit, the difference between the sample and duplicate must be less than the reporting limit.

All RPD were within the control limits specified above.

2.2.6 Reported Results and Reporting Limits (RL)

All target RLs were met as outlined in the QAPP.

2.2.7 Overall Assessment

Accuracy was acceptable based on the MS and LCS recoveries, and precision was acceptable based on the laboratory duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Qualified Data Summary Table

No data were qualified.

Data Qualifier Definitions

Data Qualifier	Definition
DNR	Do not report; the result should be reported from an alternative analysis.
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Project No. 110207 • February 25, 2016

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected from November 16 through 18 2015 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for PAHs, TPH/BTEX by Friedman and Bruya, Inc. (F&B). Analysis for metals, and mercury was subcontracted to ALS Environmental (ALS). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury - Dissolved	EPA 1631	ALS
Metals (As, Cu, Ni, Pb, Zn) - Dissolved	EPA 200.8	ALS
PAH	EPA 8270D-SIM	F&B
TPH - Diesel with Silica Gel Cleanup	NWTPH-DXSG	F&B
TPH Gasoline / BTEX	NWTPH-GBTEX	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report or rejected (R) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 511246

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

UST71-MW103-111815	11/18/2015	N	GrWtr	x	x	

2.1 PAH (EPA 8270D SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis with the exception of the following samples, which had a benzo(a)anthracene-d12 recovery below lower control limits:

MW-1-11815

MW-2-111815

PM-MW8-111715

All associated results for these sample have been qualified J/UJ.

2.1.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

2.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the project control limits, except as follows:

Benz(a)anthracene %R was high in both the MS and MSD.

Benzo(a)pyrene %R was high in the MS.

Benzo(b)fluoranthene %R was high in the MS.

Detected results for these analytes in associated samples have been qualified J.

2.1.6 Field Duplicate

Field Duplicate RPD values were within specified control limits.

2.1.7 Dilutions and Range

Dilutions were run on three samples do to results exceeding the instrument calibration range. The exceedances were qualified R (rejected), and should not be used. Other analyte results in the dilutions have been rejected in favor of the original result.

2.1.8 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries (except as noted above), and precision was acceptable based on the LCS/LCSD, MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Diesel & Motor Oil Range Hydrocarbons (NWTPH-DXSG)

2.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.2.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.2.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.2.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

2.2.7 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Gasoline Range Hydrocarbons and BTEX (NWTPH-GBTEX)

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.3.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.3.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.3.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

2.3.7 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG K1513350

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

3.1 Dissolved Mercury (EPA 1631)

3.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

3.1.2 Method Blanks

Two of the three method blanks reported contained detections of mercury above the MDL but below the RL. Only 1 associated sample had a result <10x the highest blank detection: BBH-MW104-111615. The mercury result for this sample has been qualified

J. All other results where greater than 10x the blank contamination and do not require qualification.

3.1.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

3.1.5 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.1.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 Dissolved Metals (EPA 200.8)

3.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

3.2.2 Method Blanks

One of the two method blanks reported contained a detection of zinc above the MDL but below the RL. All associated results where greater than 10x the blank contamination and do not require qualification.

3.2.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

3.2.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits.

3.2.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits, except for Lead and Zinc. Results in the FD and its parent for these analytes have been qualified J.

3.2.7 Laboratory Qualifications

The following results were qualified J by the laboratory:

Arsenic for BBH-MW104-111615

Lead for REC3-MW1R-111715

No reason was provided regarding the qualification by the lab, but the results appear to be detected values between the MDL and RL. The qualification of "estimated" (J) is appropriate for these results and has been maintained.

3.2.8 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4 Qualified Data Summary

Qualified sample results are listed below. This list does not include non-detected values simply qualified U.

Qualified Sample Results for 511246

Sample ID	Analyte	Qualifier	Qualification Reason
BCT-MW107-111715	Acenaphthene	R	Rejected in favor of lower dilution
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution

	Benzo(b)fluoranthene	UJ	Surrogate recovery Low
	Benzo(g,h,i)perylene	UJ	Surrogate recovery Low
	Benzo(k)fluoranthene	UJ	Surrogate recovery Low
	Chrysene	UJ	Surrogate recovery Low
	Dibenzo(a,h)anthracene	UJ	Surrogate recovery Low

Sample ID	Analyte	Qualifier	Qualification Reason
	Fluoranthene	UJ	Surrogate recovery Low
	Fluorene	UJ	Surrogate recovery Low
	Indeno(1,2,3-cd)pyrene	UJ	Surrogate recovery Low
	Naphthalene	UJ	Surrogate recovery Low
	Phenanthrene	UJ	Surrogate recovery Low
	Pyrene	UJ	Surrogate recovery Low
UST29-MW101-111615	Benz(a)anthracene	J	MS/MSD %R High
	Benzo(a)pyrene	J	MS %R High
	Benzo(b)fluoranthene	J	MS %R High
UST71-MW103-111815	Acenaphthene	R	Exceeded instrument calibration range.
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	J	MS/MSD %R High
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	J	MS %R High
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	J	MS %R High
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution
	Dibenzo(a,h)anthracene	R	Rejected in favor of lower dilution
	Fluoranthene	R	Rejected in favor of lower dilution
	Fluorene	R	Rejected in favor of lower dilution
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution
	Naphthalene	R	Exceeded instrument calibration range.
	Phenanthrene	R	Exceeded instrument calibration range.
	Pyrene	R	Rejected in favor of lower dilution

Qualified Sample Results for K1513350

Sample ID	Analyte	Qualifier	Qualification Reason
BBH-MW103-111615	Lead	J	Field Dup Delta Exceeds Control Criteria
	Zinc	J	Field Dup Delta Exceeds Control Criteria
BBH-MW104-111615	Arsenic	J	Qualified Estimated by Lab. Detect >MDL and <RL.
	Mercury	J	Result <10x Blank Contamination.
BBH-MW500-111615	Lead	J	Field Dup Delta Exceeds Control Criteria
	Zinc	J	Field Dup Delta Exceeds Control Criteria
REC3-MW1R-111715	Lead	J	Qualified Estimated by Lab. Detect >MDL and <RL.

Data Qualifier Definitions

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

DATA VALIDATION REPORT

Kimberly Clark – Everett Mill
Groundwater Testing
February 2016
SDG 602158, K1601360

Prepared by:
Aspect Consulting, LLC
401 Second Ave South, Suite 201
Seattle, WA 98104

Project No. 110207 • February 25, 2016

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected from February 8 through 10, 2016 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for PAHs, TPH/BTEX by Friedman and Bruya, Inc. (F&B). Analysis for metals, and mercury was subcontracted to ALS Environmental (ALS). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury - Dissolved	EPA 1631	ALS
Metals (As, Cu, Pb, Zn) - Dissolved	EPA 200.8	ALS
PAH	EPA 8270D-SIM	F&B
TPH - Diesel with Silica Gel Cleanup	NWTPH-DXSG	F&B
TPH Gasoline / BTEX	NWTPH-GBTEX	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report or rejected (R) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 602158

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

2.1 PAH (EPA 8270D SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis with the exception of the following samples, which had a benzo(a)anthracene-d12 recovery below lower control limits:

MW-1-020916

MW-2-020916

All associated results for these sample have been qualified J/UJ.

2.1.4 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.1.6 Field Duplicate

Field Duplicate RPD values were within specified control limits.

2.1.7 Dilutions and Range

Dilutions were run on three samples do to results exceeding the instrument calibration range. The exceedances were qualified R (rejected), and should not be used. Other analyte results in the dilutions have been rejected in favor of the original result.

2.1.8 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Diesel & Motor Oil Range Hydrocarbons (NWTPH-DXSG)

2.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.2.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.2.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.2.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

2.2.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Gasoline Range Hydrocarbons and BTEX (NWTPH-GBTEX)

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.3.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.3.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.3.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

2.3.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG K1601360

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

UST71-MW-101-020916	2/9/2016	N	GrWtr	x	x
UST71-MW-102-021016	2/10/2016	N	GrWtr	x	x
UST71-MW-103-020916	2/9/2016	N	GrWtr	x	x

3.1 Dissolved Mercury (EPA 1631)

3.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

3.1.2 Method Blanks

One of the three method blanks reported contained detections of mercury above the MDL but below the RL. All results where greater than 10x the blank contamination and do not require qualification.

3.1.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.1.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

3.1.5 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.1.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.2 Dissolved Metals (EPA 200.8)

3.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

3.2.2 Method Blanks

One of the two method blanks reported contained a detection of copper above the MDL but below the RL. All associated results where greater than 10x the blank contamination and do not require qualification.

3.2.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

One of Matrix Spikes had copper %R below the lower control limit, however the amount of analyte in the parent sample exceeded 4x the amount spiked so no results needed to be qualified. All other MS/MSD %R and RPD were within the laboratory specified control limits.

3.2.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits.

3.2.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits, except for Lead. Results in the FD and its parent for this analyte have been qualified J.

3.2.7 Laboratory Qualifications

The following results were qualified J by the laboratory:

Lead for BBH-MW-104-020816 and REC3-MW-1R-020916

Zinc for BBH-MW-600-020816

No reason was provided regarding the qualification by the lab, but the results appear to be detected values between the MDL and RL. The qualification of "estimated" (J) is appropriate for these results and has been maintained.

3.2.8 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4 Qualified Data Summary

Qualified sample results are listed below. This list does not include non-detected values simply qualified U.

Qualified Sample Results for 602158

Sample ID	Analyte	Qualifier	Qualification Reason
BCT-MW-107-020916	Acenaphthylene	R	Rejected in favor of lower dilution.
	Anthracene	R	Rejected in favor of lower dilution.
	Benz(a)anthracene	R	Rejected in favor of lower dilution.
	Benzo(a)pyrene	R	Rejected in favor of lower dilution.
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution.
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution.
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution.
	Chrysene	R	Rejected in favor of lower dilution.
	Dibenzo(a,h)anthracene	R	Rejected in favor of lower dilution.
	Fluoranthene	R	Rejected in favor of lower dilution.
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution.
	Pyrene	R	Rejected in favor of lower dilution.
BCT-MW-108-020916	Acenaphthylene	R	Rejected in favor of lower dilution.

Project No. 110207 • November 29, 2016

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Validation Reports and EDDs\Interim Action\Confirmation GW\DV Report - KC Everett Mill - May 2016 - GW.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected from May 23 through 24 2016 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for PAHs, TPH/BTEX by Friedman and Bruya, Inc. (F&B). Analysis for metals, and mercury was subcontracted to ALS Environmental (ALS). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury - Dissolved	EPA 1631E	ALS
Metals (As, Cu, Ni, Pb, Zn) - Dissolved	EPA 200.8	ALS
PAH	EPA 8270D-SIM	F&B
TPH - Diesel with Silica Gel Cleanup	NWTPH-DXSG	F&B
TPH Gasoline / BTEX	NWTPH-GX/SW8021B	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report or rejected (R) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 605449

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis		
Sample ID	**Sample Date**	**Type**	**Matrix**	**TPH-DXSG**	**GX / BTEX**	**PAH**
BCT-MW105-052416	5/24/2016	N	WG	X	X	X
BCT-MW108-052416	5/24/2016	N	WG	X	X	X
GF9-MW-3-052416	5/24/2016	N	WG	X		X

UST29-MW101-052416	5/24/2016	N	WG			X

2.1 PAH (EPA 8270D SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis. No qualification or action was needed.

2.1.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

2.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the laboratory specified control limits.

2.1.6 Dilutions and Range

Dilutions were run on some samples due to results exceeding the instrument calibration range. The exceedances were qualified R (rejected), and should not be used. Other analyte results in the dilutions have been rejected in favor of the original result.

2.1.7 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD, and precision was acceptable based on the LCS/LCSD, and MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Diesel & Motor Oil Range Hydrocarbons (NWTPH-DXSG)

2.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.2.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.2.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.2.6 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, and MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Gasoline Range Hydrocarbons and BTEX (NWTPH-GX / BTEX)

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.3.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.3.4 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.3.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG K1605616

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis	
Sample ID	Sample Date	Sample Type	Sample Matrix	Hg	Metals
BBH-MW-101-052316	5/23/2016	N	WG	X	X
BBH-MW-102-052316	5/23/2016	N	WG	X	X
BBH-MW-103-052316	5/23/2016	N	WG	X	X
BBH-MW104-052416	5/24/2016	N	WG	X	X
BBH-MW-500-052316	5/23/2016	FD	WG	X	X
CN-MW-101-052316	5/23/2016	N	WG		X
GF11-MW101-052416	5/24/2016	N	WG	X	
RCD-MW-101-052316	5/23/2016	N	WG		X
SHB-MW-101-052316	5/23/2016	N	WG	X	X
UST70-MW-101-0523116	5/23/2016	N	WG		X
UST70-MW102-052416	5/24/2016	N	WG		X
UST70-MW2-052416	5/24/2016	N	WG		X

3.1 Sample Receipt and Preservation

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Sample GF11-MW101-052416 had been misnamed on the COC as GF-MW101-052416. This has been corrected in the EDD. The lab also appended addition date info to the end of each sample ID. These have been corrected back to the IDs specified on the COC.

3.2 Dissolved Mercury (EPA 1631E)

3.2.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.2.2 Method Blanks

One of the three method blanks reported contained detections of mercury above the MDL but below the RL. Two associated samples had results <10x the highest blank detection. The mercury result for these samples have been qualified J. All other results where greater than 10x the blank contamination and do not require qualification.

3.2.3 Laboratory Control Samples (LCS)

All LCS (and assorted blank spike) %R were within the laboratory and method specified control limits.

3.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

3.2.5 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.2.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Dissolved Metals (EPA 200.8)

3.3.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.3.2 Method Blanks

One of the two method blanks reported contained a detection of copper above the MDL but below the RL. All associated results where greater than 10x the blank contamination and do not require qualification.

3.3.3 Instrument Blanks

Lab report indicates detections in the instrument blanks (ICB/CCB) for Lead up to 0.011 ug/l. All associated results < 10x the blank detections have been qualified as estimated (J).

3.3.4 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.3.5 Matrix Spike (MS)

All MS %R were within the laboratory specified control limits, with the exception of Copper. The sample amount was >4x the spike amount, so no qualification is needed or applied.

3.3.6 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits, with the exception of Zinc, which exceeded control. All associated results for Zinc have been qualified as estimated (J/UJ).

3.3.7 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits, except for Copper. Results in the FD and its parent for Copper have been qualified J.

3.3.8 Laboratory Qualifications

Detected result values between the MDL and RL were qualified as estimated (J) by the laboratory. This qualification is appropriate for these results and has been maintained.

3.3.9 Overall Assessment

Accuracy was acceptable based on the LCS and MS recoveries, and precision was acceptable based on the Lab Duplicate, and Field Duplicate RPD values, except as noted above. The data are of known quality and are acceptable for use as qualified.

4 Data Validation Findings for SDG 605456

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis		
Sample ID	**Sample Date**	**Type**	**Matrix**	**TPH-DXSG**	**GX / BTEX**	**PAH**
BCT-MW104-052416	5/24/2016	N	WG	X	X	X
UST71-MW102-052416	5/24/2016	N	WG	X		X

4.1 PAH (EPA 8270D SIM)

4.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

4.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

4.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis. No qualification or action was needed.

4.1.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

4.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the laboratory specified control limits.

4.1.6 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD, and precision was acceptable based on the LCS/LCSD, and MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

4.2 Diesel & Motor Oil Range Hydrocarbons (NWTPH-DXSG)

4.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

4.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

4.2.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

4.2.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

4.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

No MS or MSD were reported with this dataset.

4.2.6 Laboratory Flags

The laboratory flagged one Diesel Range result "X" to indicate that the sample chromatographic pattern does not resemble the fuel standard used for quantitation. This qualifier has been retained in the validation. Result values are acceptable for use, but users should be aware that numeric result may not represent to a known petroleum fuel contaminant.

4.2.7 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

4.3 Gasoline Range Hydrocarbons and BTEX (NWTPH-GX / BTEX)

4.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

4.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

4.3.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

4.3.4 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

4.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

4.3.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

5 Data Validation Findings for SDG K1605613

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis	
Sample ID	**Sample Date**	**Type**	**Matrix**	**Hg**	**Metals**
UST71-MW102-052316	5/23/2016	N	WG	X	
UST71-MW102-052416	5/24/2016	N	WG		X

5.1 Sample Receipt and Preservation

Sample receipt, and preservation (2-6 degrees C) were acceptable.

The lab appended addition date info to the end of each sample ID. These have been corrected back to the IDs specified on the COC.

5.2 Dissolved Mercury (EPA 1631E)

5.2.1 Holding Times

Samples were analyzed within the requisite holding time limit.

5.2.2 Method Blanks

One of the three method blanks reported contained detections of mercury above the MDL but below the RL. The associated sample results all exceeded 10x the highest blank detection, and do not require qualification.

5.2.3 Laboratory Control Samples (LCS)

All LCS (and assorted blank spike) %R were within the laboratory and method specified control limits.

5.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

5.2.5 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

5.3 Dissolved Metals (EPA 200.8)

5.3.1 Holding Times

Samples were analyzed within the requisite holding time limit.

5.3.2 Method Blanks

The method blank reported contained a detection of copper above the MDL but below the RL. All associated results where greater than 10x the blank contamination and do not require qualification.

5.3.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

5.3.4 Matrix Spike (MS)

All MS %R were within the laboratory specified control limits.

5.3.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits.

5.3.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS recoveries, and precision was acceptable based on the Lab Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

6 Data Validation Findings for SDG 605444

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis		
Sample ID	**Sample Date**	**Type**	**Matrix**	**TPH-DXSG**	**GX / BTEX**	**PAH**
BCT-MW-103-052316	5/23/2016	N	WG	X	X	X
BCT-MW-106-052316	5/23/2016	N	WG	X	X	X
BCT-MW-107-052416	5/24/2016	N	WG	X	X	X
BCT-MW-621-052316	5/23/2016	N	WG	X	X	X
MW-1-052416	5/24/2016	N	WG	X	X	X
MW-2-052416	5/24/2016	N	WG	X	X	X
REC3-MW1R-052316	5/23/2016	N	WG			X
UST71-MW101-052316	5/23/2016	N	WG	X		X
UST71-MW103-052416	5/24/2016	N	WG	X		X

6.1 PAH (EPA 8270D SIM)

6.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

6.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

6.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis, with the following exception:

Benzo(a)anthracene-d12 %R was low for sample MW-1-052416. Lab flagging indicated potential matrix interference. Associated results for this sample have been qualified UJ (estimated).

No further qualification or action was needed.

6.1.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

6.1.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

MS and MSD %R and RPD were within the laboratory specified control limits.

6.1.6 Dilutions and Range

Dilutions were run on some samples due to results exceeding the instrument calibration range. The exceedances were qualified R (rejected), and should not be used. Other analyte results in the dilutions have been rejected in favor of the original result.

6.1.7 Laboratory Flags

Lab narrative noted an internal standard failure on the analysis of sample UST71-MW-103-052416. Lab assessment suggests matrix interference as a possible cause. Results were flagged J by the lab. These results have been qualified as estimated (J/UJ).

6.1.8 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD, and precision was acceptable based on the LCS/LCSD, and MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.2 Diesel & Motor Oil Range Hydrocarbons (NWTPH-DXSG)

6.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

6.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

6.2.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

6.2.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

6.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

6.2.6 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, and MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

6.3 Gasoline Range Hydrocarbons and BTEX (NWTPH-GX / BTEX)

6.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

6.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

6.3.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

6.3.4 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

6.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

6.3.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

7 Data Validation Findings for SDG K1605614

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis	
Sample ID	**Sample Date**	**Type**	**Matrix**	**Hg**	**Metals**
MW-1-052416	5/24/2016	N	WG		X
MW-2-052416	5/24/2016	N	WG		X

REC3-MW1R-052316	5/23/2016	N	WG	X	X
UST71-MW101-052316	5/23/2016	N	WG	X	X
UST71-MW103-052416	5/24/2016	N	WG	X	X

7.1 Sample Receipt and Preservation

Sample receipt, and preservation (2-6 degrees C) were acceptable.

The lab appended addition date info to the end of each sample ID. These have been corrected back to the IDs specified on the COC.

7.2 Dissolved Mercury (EPA 1631E)

7.2.1 Holding Times

Samples were analyzed within the requisite holding time limit.

7.2.2 Method Blanks

One of the three method blanks reported contained detections of mercury above the MDL but below the RL. One associated sample had results <10x the highest blank detection. The mercury result for that sample have been qualified J. All other results where greater than 10x the blank contamination and do not require qualification.

7.2.3 Laboratory Control Samples (LCS)

All LCS (and assorted blank spike) %R were within the laboratory and method specified control limits.

7.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

7.2.5 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD RPD values. The data are of known quality and are acceptable for use as qualified.

7.3 Dissolved Metals (EPA 200.8)

7.3.1 Holding Times

Samples were analyzed within the requisite holding time limit.

7.3.2 Method Blanks

The method blank reported contained a detection of Copper above the MDL but below the RL. All associated results where greater than 10x the blank contamination and do not require qualification.

The method blank also contained a detection of Lead above the MDL but below the RL. Associated sample results were <10x the blank detection level, and have been qualified as estimated (J).

7.3.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

7.3.4 Matrix Spike (MS)

All MS %R were within the laboratory specified control limits.

7.3.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits, with the exception of Lead, which exceeded control. All associated results for Lead have been qualified as estimated (J).

7.3.6 Laboratory Qualifications

Detected result values between the MDL and RL were qualified as estimated (J) by the laboratory. This qualification is appropriate for these results and has been maintained.

7.3.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS recoveries, and precision was acceptable based on the Lab Duplicate, and Field Duplicate RPD values, except as noted above. The data are of known quality and are acceptable for use as qualified.

8 Qualified Data Summary

Qualified sample results are listed below. This list does not include non-detected values simply qualified U.

Qualified Sample Results for 605449

Sample ID	Analyte	Qualifier	Qualification Reason
BCT-MW108-052416	Acenaphthene	R	Result Exceeds Instrument Range
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution
	Dibenz(a,h)anthracene	R	Rejected in favor of lower dilution
	Fluoranthene	R	Rejected in favor of lower dilution
	Fluorene	R	Rejected in favor of lower dilution
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution
	Naphthalene	R	Result Exceeds Instrument Range
	Phenanthrene	R	Rejected in favor of lower dilution
	Pyrene	R	Rejected in favor of lower dilution
GF9-MW-3-052416	Acenaphthene	R	Result Exceeds Instrument Range
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution
	Dibenz(a,h)anthracene	R	Rejected in favor of lower dilution
	Fluoranthene	R	Rejected in favor of lower dilution
	Fluorene	R	Result Exceeds Instrument Range
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution
	Naphthalene	R	Result Exceeds Instrument Range
	Phenanthrene	R	Rejected in favor of lower dilution
	Pyrene	R	Rejected in favor of lower dilution
SHB-MW-101-052316	Acenaphthene	R	Result Exceeds Instrument Range
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution

Sample ID	Analyte	Qualifier	Qualification Reason
	Dibenz(a,h)anthracene	R	Rejected in favor of lower dilution
	Fluoranthene	R	Rejected in favor of lower dilution
	Fluorene	R	Rejected in favor of lower dilution
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution
	Naphthalene	R	Rejected in favor of lower dilution
	Phenanthrene	R	Rejected in favor of lower dilution
	Pyrene	R	Rejected in favor of lower dilution

Qualified Sample Results for K1605616

Sample ID	Analyte	Qualifier	Qualification Reason
BBH-MW-101-052316	Zinc	J	Lab Dup RPD/Delta exceeds control limit.
BBH-MW-102-052316	Arsenic	J	Results between DL and RL are estimated.
	Lead	J	Detected result <10x ICB/CCB detections
	Mercury	J	Result <10x MB detection.
	Zinc	J	Lab Dup RPD/Delta exceeds control limit.
BBH-MW-103-052316	Copper	J	Field Dup RPD Exceeds Control Limit
	Zinc	J	Lab Dup RPD/Delta exceeds control limit.
BBH-MW104-052416	Arsenic	J	Results between DL and RL are estimated.
	Lead	J	Detected result <10x ICB/CCB detections. Results between DL and RL are estimated.
	Mercury	J	Result <10x MB detection.
	Zinc	J	Lab Dup RPD/Delta exceeds control limit.
BBH-MW-500-052316	Copper	J	Field Dup RPD Exceeds Control Limit
	Zinc	J	Lab Dup RPD/Delta exceeds control limit.

Qualified Sample Results for 605456

Sample ID	Analyte	Qualifier	Qualification Reason
UST71-MW102-052416	Diesel Range TPH	X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Qualified Sample Results for K1605613

No results have been qualified for this SDG.

Qualified Sample Results for 605444

Sample ID	Analyte	Qualifier	Qualification Reason
BCT-MW-107-052416	Acenaphthene	R	Result Exceeds Instrument Range
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution

	Dibenz(a,h)anthracene	R	Rejected in favor of lower dilution.
	Dibenz(a,h)anthracene	UJ	The internal standard associated with the analyte is out of control limits

Sample ID	Analyte	Qualifier	Qualification Reason
	Fluoranthene	R	Result Exceeds Instrument Range
	Fluorene	R	Result Exceeds Instrument Range
	Indeno(1,2,3-cd)pyrene	J	The internal standard associated with the analyte is out of control limits
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution.
	Naphthalene	R	Result Exceeds Instrument Range
	Phenanthrene	R	Result Exceeds Instrument Range
	Pyrene	R	Result Exceeds Instrument Range

Qualified Sample Results for K1605613

Sample ID	Analyte	Qualifier	Qualification Reason
PM-MW-8-052316	Lead	J	<10x Blank Contamination level. Lab Dup Outside Control Limit.
	Mercury	J	<10x Blank Contamination Level
REC3-MW1R-052316	Lead	J	<10x Blank Contamination Level. Result detected between MDL and RL. Lab Dup Outside Control Limit.

Data Qualifier Definitions

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	According to lab, the sample chromatographic pattern does not resemble the fuel standard used for quantitation.

DATA VALIDATION REPORT

Kimberly Clark – Everett Mill
Groundwater Testing
August 2016
SDG 608337, K1609776

Prepared by:
Aspect Consulting, LLC
401 Second Ave South, Suite 201
Seattle, WA 98104

Project No. 110207 • November 29, 2016

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Validation Reports and EDDs\Interim Action\Confirmation GW\DV Report - KC Everett Mill - August 2016 - GW.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for groundwater samples collected from August 17 through 18 2016 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for PAHs, TPH/BTEX by Friedman and Bruya, Inc. (F&B). Analysis for metals, and mercury was subcontracted to ALS Environmental (ALS). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury - Dissolved	EPA 1631E	ALS
Metals (As, Cu, Ni, Pb, Zn) - Dissolved	EPA 200.8	ALS
PAH	EPA 8270D-SIM	F&B
TPH - Diesel with Silica Gel Cleanup	NWTPH-DXSG	F&B
TPH Gasoline / BTEX	NWTPH-GX/SW8021B	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report or rejected (R) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 608337

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

UST71-MW103-081816	8/18/2016	N	WG	X	X	X

2.1 PAH (EPA 8270D SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis with the exception of the following samples, which had a benzo(a)anthracene-d12 recovery below lower control limits:

MW-1-081716

MW-2-081716

REC3-MW1R-081816

All associated results for these sample have been qualified J/UJ.

2.1.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

2.1.5 Dilutions and Range

Dilutions were run on some samples do to results exceeding the instrument calibration range. The exceedances were qualified R (rejected), and should not be used. Other analyte results in the dilutions have been rejected in favor of the original result.

2.1.6 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD recoveries, and precision was acceptable based on the LCS/LCSD RPD values. The data are of known quality and are acceptable for use as qualified.

2.2 Diesel & Motor Oil Range Hydrocarbons (NWTPH-DXSG)

2.2.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.2.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.2.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.2.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS/LCSD %R and RPD were within the laboratory specified control limits.

2.2.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.2.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

2.2.7 Lab Applied Qualifiers

The lab flagged all detected results for Diesel Range with an "X" indicating that the chromatographic pattern observed in the sample does not resemble the fuel standard used for quantitation. This implies that the Diesel Range results are likely not the result of diesel fuels. Results flagged as such by the lab have been qualified X to indicate this distinction.

2.2.8 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

2.3 Gasoline Range Hydrocarbons and BTEX (NWTPH-GBTEX)

2.3.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.3.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.3.3 Surrogates (SUR)

All surrogate recoveries where within the laboratory specified control limits.

2.3.4 Laboratory Control Samples (LCS)

All LCS %R were within the laboratory specified control limits.

2.3.5 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

2.3.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

2.3.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG K1609776

Groundwater samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis	
Sample ID	Sample Date	Sample Type	Sample Matrix	Hg	Metals
BBH-MW101-081816	8/18/2016	N	WG	X	X

RCD-MW-101-081816	8/18/2016	N	WG		X
REC3-MW1R-081816	8/18/2016	N	WG	X	X
SHB-MW101-081716	8/17/2016	N	WG	X	X
UST70-MW101-081716	8/17/2016	N	WG		X
UST70-MW102-081716	8/17/2016	N	WG		X
UST70-MW2-081816	8/18/2016	N	WG		X
UST71-MW101-081716	8/17/2016	N	WG	X	X
UST71-MW103-081816	8/18/2016	N	WG	X	X

3.1 Sample Receipt and Preservation

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Sample MW-1-081716 had been misnamed on the COC as MW-101-081716. This has been corrected in the EDD. The lab also appended addition date info to the end of each sample ID. These have been corrected back to the IDs specified on the COC.

3.2 Dissolved Mercury (EPA 1631E)

3.2.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.2.2 Method Blanks

Two of the three method blanks reported contained detections of mercury above the MDL but below the RL. Mercury results <10x the blank concentration have been qualified J. All other results where greater than 10x the blank contamination and do not require qualification.

3.2.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

3.2.5 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.2.6 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Dissolved Metals (EPA 200.8)

3.3.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.3.2 Method Blanks

All method blank results were below the detection limit threshold. No qualification was needed.

3.3.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.3.4 Matrix Spike (MS)

All MS%R were within the laboratory specified control limits.

3.3.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits, with the exception of Zinc. Zinc results in all associated samples have been qualified as estimated (J).

3.3.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.3.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS recoveries, and precision was acceptable based on the Lab Duplicate and Field Duplicate RPD values, except as noted above. The data are of known quality and are acceptable for use as qualified.

4 Qualified Data Summary

Qualified sample results are listed below. This list does not include non-detected values simply qualified U.

Qualified Sample Results for 608337

Sample ID	Analyte	Qualifier	Qualification Reason
BCT-MW103-081716	Diesel Range TPH	X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation
BCT-MW104-081816	Diesel Range TPH	X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation
BCT-MW-107-081816	Acenaphthene	R	Result Exceeds Instrument Range
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution
	Dibenz(a,h)anthracene	R	Rejected in favor of lower dilution
	Diesel Range TPH	X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation
	Fluoranthene	R	Rejected in favor of lower dilution
	Fluorene	R	Rejected in favor of lower dilution
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution
	Naphthalene	R	Result Exceeds Instrument Range
	Phenanthrene	R	Rejected in favor of lower dilution
	Pyrene	R	Rejected in favor of lower dilution
BCT-MW108-081816	Acenaphthene	R	Result Exceeds Instrument Range
	Acenaphthylene	R	Rejected in favor of lower dilution
	Anthracene	R	Rejected in favor of lower dilution
	Benz(a)anthracene	R	Rejected in favor of lower dilution
	Benzo(a)pyrene	R	Rejected in favor of lower dilution
	Benzo(b)fluoranthene	R	Rejected in favor of lower dilution
	Benzo(g,h,i)perylene	R	Rejected in favor of lower dilution
	Benzo(k)fluoranthene	R	Rejected in favor of lower dilution
	Chrysene	R	Rejected in favor of lower dilution
	Dibenz(a,h)anthracene	R	Rejected in favor of lower dilution

Sample ID	Analyte	Qualifier	Qualification Reason
	Diesel Range TPH	X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation
	Fluoranthene	R	Rejected in favor of lower dilution
	Fluorene	R	Result Exceeds Instrument Range
	Indeno(1,2,3-cd)pyrene	R	Rejected in favor of lower dilution
	Naphthalene	R	Result Exceeds Instrument Range
	Phenanthrene	R	Rejected in favor of lower dilution
	Pyrene	R	Rejected in favor of lower dilution
BCT-MW500-081716	Diesel Range TPH	X	The sample chromatographic pattern does not resemble the fuel standard used for quantitation
MW-1-081716	Acenaphthene	UJ	Surrogate recovery below lower control limit.
	Acenaphthylene	UJ	Surrogate recovery below lower control limit.
	Anthracene	UJ	Surrogate recovery below lower control limit.
	Benz(a)anthracene	UJ	Surrogate recovery below lower control limit.
	Benzo(a)pyrene	UJ	Surrogate recovery below lower control limit.
	Benzo(b)fluoranthene	UJ	Surrogate recovery below lower control limit.

Data Qualifier Definitions

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.

Data Qualifier	Definition
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	Chromatographic pattern observed does not resemble fuel standard pattern.

S:\Kimberly Clark\Everett Mill 110207\Data\Validation\Validation Reports and EDDs\RI\DV Report - KC Everett Mill - October 2016 - Seep.docx

1 Introduction

This report summarizes the findings of the United States Environmental Protection Agency (USEPA) Stage 2A data validation performed on analytical data for seep samples collected on October 20 2016 for Kimberly Clark Everett Mill RI-FS sampling. This data quality review is divided into sections by sample delivery group (SDG). A complete list of samples and analyses for each SDG is provided in the Sample Index at the beginning of each section.

Samples were analyzed for PAHs by Friedman and Bruya, Inc. (F&B). Analysis for metals, mercury, ammonia and salinity was subcontracted to ALS Environmental (ALS). The analytical methods are summarized below:

Analysis	Method	Laboratory
Mercury - Dissolved	EPA 1631E	ALS
Metals (As, Cu, Ni, Pb, Zn) - Dissolved	EPA 200.8	ALS
Ammonia as Nitrogen	EPA 350.1	ALS
Salinity	SM 2520B	ALS
PAH	EPA 8270D-SIM	F&B

The validation followed the procedures documented in the analytical methods, the Quality Assurance Project Plan (QAPP; in Appendix A to Aspect, 2013), *National Functional Guidelines for Organic Data Review* (USEPA, 1999), and *National Functional Guidelines for Inorganic Data Review* (USEPA, 2004).

Data assigned a J qualifier (estimated) may be used for site evaluation purposes but the reasons for qualification should be taken into account when interpreting sample concentrations. Data marked as do-not-report or rejected (R) should not be used under any circumstances. Values without qualification meet all data measurement quality objectives and are suitable for use.

Data qualifier definitions and a summary table of the qualified data are included in the Qualified Data Summary at the end of this report. Data qualifiers have been incorporated into the project chemistry database to reflect the validation in this report.

2 Data Validation Findings for SDG 610298

Seep samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis
Sample ID	**Sample Date**	**Type**	**Matrix**	**PAH**
SEEP-3-102016	10/20/2016	N	W	
SEEP-500-102016	10/20/2016	FD	W	X

2.1 PAH (EPA 8270D SIM)

2.1.1 Sample Receipt, Preservation, and Holding Times

Sample receipt, and preservation (2-6 degrees C) were acceptable.

Samples were analyzed within the requisite holding time limit.

2.1.2 Method Blanks

Target analytes were not detected at or above the reporting levels in the method blanks. No qualification or action was needed.

2.1.3 Surrogate Recovery

Surrogate recoveries where acceptable for all samples in this analysis.

2.1.4 Laboratory Control Samples/ Laboratory Control Sample Duplicates (LCS/LCSD)

All LCS and LCSD %R and RPD were within the laboratory specified control limits.

2.1.5 Field Duplicate (FD)

All Field Duplicate RPD were within acceptance criteria.

2.1.6 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD recoveries, and precision was acceptable based on the LCS/LCSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3 Data Validation Findings for SDG K1612830

Seep samples in this SDG, and the chemical analyses performed on them, are tabulated below. The sections below describe the results of the data quality review for this SDG by analyte group (analysis).

Sample Index

				Analysis			
Sample ID	Sample Date	Sample Type	Sample Matrix	Hg	Metals	NH3	Salinity
SEEP-10-102016	10/20/2016	N	AQ	X	X	X	X
SEEP-11-102016	10/20/2016	N	AQ	X	X	X	X
SEEP-12-102016	10/20/2016	N	AQ	X	X	X	X
SEEP-13-102016	10/20/2016	N	AQ	X	X	X	X
SEEP-3-102016	10/20/2016	N	AQ	X	X	X	X
SEEP-500-102016	10/20/2016	FD	AQ	X	X	X	X

3.1 Sample Receipt and Preservation

Sample receipt, and preservation (2-6 degrees C) were acceptable.

The lab appended additional date info to the end of each sample ID. These have been corrected back to the IDs specified on the COC.

3.2 Dissolved Mercury (EPA 1631E)

3.2.1 Holding Times/Misc.

Samples were analyzed within the requisite holding time limit.

Sample SEEP-13-102016 is reported as TOTAL mercury, rather than dissolved.

3.2.2 Method Blanks

One of the three method blanks reported contained detections of mercury above the MDL but below the RL. Mercury results <10x the blank concentration have been qualified J.

3.2.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.2.4 Matrix Spike/Matrix Spike Duplicates (MS/MSD)

All MS/MSD %R and RPD were within the laboratory and method specified control limits.

3.2.5 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.2.6 Laboratory Qualifications

Detected result values between the MDL and RL were qualified as estimated (J) by the laboratory. This qualification is appropriate for these results and has been maintained.

3.2.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS/MSD recoveries, and precision was acceptable based on the MS/MSD and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.3 Dissolved Metals (EPA 200.8)

3.3.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.3.2 Method Blanks

All method blank results were below the detection limit threshold. No qualification was needed.

3.3.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.3.4 Laboratory Qualifications

Detected result values between the MDL and RL were qualified as estimated (J) by the laboratory. This qualification is appropriate for these results and has been maintained.

3.3.5 Matrix Spike (MS)

All MS%R were within the laboratory specified control limits, with the exception of Arsenic which had a low %R. Associated Arsenic results have been qualified as estimated (J/UJ) to indicate a potential low bias.

3.3.6 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits.

3.3.7 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.3.8 Overall Assessment

Accuracy was acceptable based on the LCS and MS recoveries (except as noted above), and precision was acceptable based on the Lab Duplicate and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.4 Ammonia as Nitrogen (EPA350.1)

3.4.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.4.2 Method Blanks

The method blanks reported contained detections above the MDL but below the RL. Ammonia results <10x the blank concentration have been qualified as estimated (J).

3.4.3 Laboratory Control Samples/Laboratory Control Sample Duplicates (LCS/LCSD)

The LCS/LCSD %R and RPD were within the laboratory and method specified control limits.

3.4.4 Matrix Spike/Matrix Spike Duplicate (MS/MSD)

All MS/MSD %R and RPD were within the laboratory specified control limits.

3.4.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits.

3.4.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.4.7 Overall Assessment

Accuracy was acceptable based on the LCS/LCSD and MS/MSD recoveries, and precision was acceptable based on the LCS/LCSD, MS/MSD, Lab Duplicate and Field

Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

3.5 Salinity (SM2520B)

3.5.1 Holding Times

Samples were analyzed within the requisite holding time limit.

3.5.2 Method Blanks

All method blank results were below the detection limit threshold. No qualification was needed.

3.5.3 Laboratory Control Samples (LCS)

The LCS %R was within the laboratory and method specified control limits.

3.5.4 Matrix Spike (MS)

All MS%R were within the laboratory specified control limits.

3.5.5 Lab Duplicate (LD)

All Lab Duplicate RPDs were within specified control limits.

3.5.6 Field Duplicate (FD)

Field Duplicate RPD values were within specified control limits.

3.5.7 Overall Assessment

Accuracy was acceptable based on the LCS and MS recoveries, and precision was acceptable based on the Lab Duplicate and Field Duplicate RPD values. The data are of known quality and are acceptable for use as qualified.

4 Qualified Data Summary

Qualified sample results are listed below. This list does not include non-detected values simply qualified U.

Qualified Sample Results for 610298

No results were qualified in this SDG

Qualified Sample Results for K1612830

Sample ID	Analyte	Qualifier	Qualification Reason
SEEP-10-102016	Arsenic	J	MS %R Low. Result between MDL and RL.
	Mercury	J	Result detected <10x MB.
SEEP-11-102016	Arsenic	J	MS %R Low. Result between MDL and RL
	Lead	J	Result between MDL and RL
	Mercury	J	Result detected between MDL and RL. Result detected <10x MB.
	Zinc	J	Result between MDL and RL
SEEP-12-102016	Arsenic	J	MS %R Low.
SEEP-13-102016	Arsenic	J	MS %R Low. Result between MDL and RL
SEEP-3-102016	Ammonia as Nitrogen	J	Detected result <10x MB detection
	Arsenic	J	MS %R Low.
SEEP-500-102016	Ammonia as Nitrogen	J	Detected result <10x MB detection
	Arsenic	J	MS %R Low.

Data Qualifier Definitions

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
R	The sample results are unusable due to the quality of the data generated because certain criteria were not met. The analyte may or may not be present in the sample.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.
X	Chromatographic pattern observed does not resemble fuel standard pattern.

Data Validation Report – EPA Stage 2B

January 25, 2017

Project: Everett East Waterway

Project Number: 141205-01.03

This report summarizes the review of analytical results for four diffusive-gradient thin film (GST) samples collected on October 20, 2016. The samples were collected by Anchor QEA, LLC, and submitted to Analytical Resources, Inc. (ARI), in Tukwila, Washington. The samples were analyzed for sulfide by Standard Method 4500-S2D.

ARI sample data group (SDG) number 16J0346 was reviewed in this report. Sample IDs are presented in Table 1.

Table 1
Sample IDs

Sample ID	Lab Sample ID
EEW-SEEP3-DGT-161020	16J0346-01
EEW-SEEP12-DGT-161020	16J0346-02
EEW-SEEP11-DGT-161020	16J0346-03
EEW-SEEP10-DGT-161020	16J0346-04

Data Validation and Qualifications

The following comments refer to the laboratory's performance in meeting the quality assurance/quality control (QA/QC) guidelines outlined in the analytical procedures. Laboratory results were reviewed using the laboratory control limits and the following guidelines:

- USEPA Test Methods for Evaluating Solid Waste: Physical/Chemical Methods (SW-846, Third Edition; USEPA 1986)
- USEPA National Functional Guidelines for Inorganic Superfund Data Review (USEPA 2016b)

Unless noted in this report, laboratory results for the samples listed above were within QC criteria.

Field Documentation

Field documentation was checked for completeness and accuracy. The chain-of-custody form was signed by ARI at the time of sample receipt. Samples were received within the correct temperature range and in good condition.

Holding Times and Sample Preservation and Analytical Methods

Samples were appropriately preserved and analyzed within holding times.

Laboratory Method Blanks and Calibration Blanks

Laboratory method blanks and calibration blanks were analyzed at the required frequencies. All method blanks were free of target analytes at the method reporting limit.

Initial Calibrations and Calibration Verifications

Initial calibrations and calibration verifications met method criteria

Laboratory Control Sample

A laboratory control samples (LCS) was analyzed at the required frequency. The LCS recovery value was within laboratory control limits.

Matrix Spike and Matrix Spike Duplicate Samples

No matrix spike or matrix spike duplicate sample results were reported with this sample set.

Laboratory Duplicates

No laboratory duplicate sample results were reported with this sample set.

Method Reporting Limits

Reporting limits were acceptable as reported. All values were reported using the laboratory reporting limits. Values were reported as undiluted or when diluted, the reporting limit reflects the dilution factor.

Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical method and the requested sample analyses were completed. Accuracy was acceptable as demonstrated by the calibration and LCS recovery values. Precision could not be evaluated because no duplicate analyses were conducted. Results are acceptable as reported.

Data Validation Report – EPA Stage 2A

August 22, 2017

Project: Everett East Waterway/Kimberly Clark

Project Number: 160105-02.02

This report summarizes the review of analytical results for 13 diffusive gradient in thin film (DGT) groundwater, surface water, and porewater samples collected on July 13 and 26, 2017. The samples were collected by Aspect Consulting and Anchor QEA, LLC, and submitted to Analytical Resources, Inc. (ARI) in Tukwila, Washington. The samples were analyzed for acid volatile sulfide (AVS) by Standard Method 4500-S2D.

The DGT AVS results in ARI sample data group (SDG) numbers 17G0155 and 17G0297 (were reviewed in this report. Sample IDs and matrices are presented in Table 1.

Table 1
Sample IDs and Matrices

Sample ID	Lab Sample ID	Matrix
LP-MW-2-071317	17G0155-01	Groundwater
Rec6-MW2-071317	17G0155-02	Groundwater
LP-MW-4-071317	17G0155-03	Groundwater
LP-MW-5-071317	17G0155-04	Groundwater
LP-MW-1-071317	17G0155-05	Groundwater
LP-MW-3-071317	17G0155-06	Groundwater
LP-MW-6-071317	17G0155-07	Groundwater
LP-MW-7-071317	17G0155-08	Groundwater
LP-MW-21-071317	17G0155-09	Groundwater
LP-SW-3-072617	17G0297-01	Surface water
PW-5-072617	17G0297-02	Porewater
LP-SW-2-072617	17G0297-03	Surface water
LP-SW-1-072617	17G0297-04	Surface water

Note:
1. Blind field duplicate sample LP-MW-21-071317 for SDG 17G0155 was erroneously labeled in the field as LP-MW-20-071317, and is corrected here and in the project database.

Data Validation and Qualifications

The following comments refer to the laboratory's performance in meeting the quality assurance/quality control (QA/QC) guidelines outlined in the analytical procedures. Laboratory results were reviewed using the laboratory control limits and the following guidelines:

- USEPA 1986 (SW-846, Third Edition), Test Methods for Evaluating Solid Waste: Physical/Chemical Methods.
- USEPA National Functional Guidelines for Inorganic Superfund Data Review (USEPA 2016b)

Sample results were evaluated using laboratory quality control criteria.

Field Documentation

Field documentation was checked for completeness and accuracy. The chain-of-custody forms were signed by ARI at the time of sample receipt. Samples were received in good condition. Field duplicate sample LP-MW-21-071317 reported in SDG 17G0155 was erroneously labeled in the field as LP-MW-20-071317, and is corrected here and in the project database.

Holding Times and Sample Preservation

Samples were analyzed within holding times. Samples collected on July 13th were received within the recommended preservation temperature range (2°C – 6°C). Samples collected on July 26th were not iced and were received above the recommended temperature range at 16.4°C. Samples were received within a few hours of collection, however, so results are not expected to be impacted and no data were qualified.

Laboratory Method Blanks

Laboratory method blanks were analyzed at the required frequencies. All method blanks were free of sulfide.

Field Quality Control

One field duplicate sample was submitted with these sample sets. Results are summarized in Table 1. The relative percent difference RPD value was low and no data were qualified.

Table 2
Field Duplicate Results

Analyte	LP-MW-7-071317	LP-MW-21-071317	RPD
AVS	2.9 µmol	3.07 µmol	5.7%

Laboratory Control Samples

Laboratory control samples (LCS) were analyzed at the required frequency. All LCS recoveries were within laboratory control limits.

Matrix Spike and Matrix Spike Duplicate Samples

No matrix spike (MS)/matrix spike duplicate (MSD) samples were analyzed in association with these sample sets.

Laboratory Duplicates

No laboratory duplicates were analyzed in association with these sample sets.

Method Reporting Limits

Reporting limits were acceptable as reported. All values were reported using the laboratory reporting limits. Values were reported as undiluted or when diluted, the reporting limit reflects the dilution factor.

Result Qualification

As noted by the field sample collection crew and documented in communications with the laboratory, the DGT sampler apparatus associated with sample LP-SW-2-072617 was damaged over the course of deployment. The DGT membrane ripped which exposed the underlying silver iodide gel to ambient surface water conditions. Therefore, the associated sample result has been rejected.

Overall Assessment

As was determined by this evaluation, the laboratory followed the specified analytical method and all requested sample analyses were completed. Accuracy was acceptable as demonstrated by the LCS recovery values Precision was also acceptable as demonstrated by the field duplicate RPD value. Most data are acceptable as reported. One result has been rejected due to sampler apparatus failure. Table 2 summarizes the qualifier applied to the sample results reviewed in this report.

Table 3
Qualified Data

Sample ID	Analyte	Reported Result	Qualified Result	Reason
LP-SW-2-072617	AVS	1.49 µmol	R	Sampler apparatus failure

INTRODUCTION

This report presents and discusses findings of the data validation performed on analytical data for samples collected from March to July 2017 for the referenced project. The laboratory reports validated herein were submitted by ALS Environmental, Inc. (ALS-Houston), assigned ALS sample delivery group (SDG) numbers: E1700233, E1700606, E1700607, and E1700742.

A Stage 4 validation (as defined by EPA 2009) was performed on all PCB congener data. The validation followed guidance specified by EPA (2016), with modifications to accommodate project and analytical method requirements. The numerical quality assurance/quality control (QA/QC) criteria applied to the validation were in accordance with method requirements and the current performance-based control limits established by the laboratory (laboratory control limits). Instrument calibration, frequency of QC analyses, and analytical sequence requirements were evaluated against the respective analytical methods.

Validation findings are discussed in each section pertinent to the QC parameter for each type of analysis. Qualified data with applied data qualifiers are summarized in the **Summary** section at the end of this report. Samples and the associated analyses validated herein are summarized as follows:

					Analysis
SDG #	**Field Sample ID**	**Laboratory ID**	**Sampling Date**	**Matrix**	**PCB Congeners**

Notes:
* - LP-MW-5-071017 and LP-MW-20-071017 is a field duplicate sample pair.
X - The analysis was requested and performed on the sample.

Analytical methods in respect to analytical parameters validated herein and the laboratory performing the analyses are summarized below:

Parameter	Analytical Method	Laboratory
PCB Congeners	USEPA Method 1668A/ALS SOP	ALS Environmental, Inc., Houston, Texas

Notes:
1. USEPA Method 1668A - *Chlorinated Biphenyl Congeners in Water, Soil, Sediment, Biosolids, and Tissue by HRGC/HRMS*. April 2010.
2. ALS SOP - *Chlorinated Biphenyl Congeners in Water, Soil, Sediment, Bio solids and Tissue by Isotope Dilution HRGC/HRMS.* ALS Environment, Inc., Houston, Texas. ALS SOP Number: HMS-1668, June 21, 2013.

DATA VALIDATION FINDINGS

1. PCB Congeners by EPA Method 1668A: High-resolution Gas Chromatography and High-resolution Mass Spectrometry (HRGC/HRMS)

1.1 Sample Management and Holding Times

Soil samples were received at 15.8°C in good condition and are consistent with the accompanying chain of custody form. All soil samples were stored in a refrigerator at 4°C upon receipt at the laboratory. PCB congeners are stable at room temperature, the higher cooler temperature had no significant impact on data quality. Data were not qualified on this basis. No other anomalies were identified in relation to sample preservation, handling, and transport.

Soil and aqueous samples should be extracted within 30 days. Extracts should be analyzed within 40 days of extraction. All samples were extracted and analyzed within the required holding times, except that aqueous sample HB-MW-IR-030717 (Laboratory ID: E1700233-001) was extracted 4 days past the required holding time; all PCB congeners results for this sample were qualified (UJ) for non-detects and (J) for detects as estimated.

1.2 HRGC/HRMS Instrument Performance Check

The EPA Method 1668A and laboratory criteria for instrument performance checks are as follows:

Mass Spectrometer Resolution: (1) The resolution check should be performed, using perfluorokerosene (PFK) or equivalent standard materials, prior to initial calibration and at the start and end of each 12-hour shift, (2) the resolution should be ≥8,000 throughout the mass range and ≥10,000 resolving power at m/z 330.9792 (or any other significant PFK fragments in the range of 300 to 350), and (3) the deviation between the exact m/z and the theoretical m/z must be less than 5 ppm for monitored isomers.

Column Performance: (1) A combined 209 congener standard should be analyzed prior to initial calibration and continuing calibration verification, (2) peak for congener 34 should be resolved from 23 and peak for congener 187 resolved from 182 peak with a valley of ≤40%, (3) congeners 156 and 157 should co-elute within 2 seconds at their peak maximum, and (4) the absolute retention time (RT) for congener 209 should be >55 minute for SPB-octyl or an alternate column.

HRGC/HRMS instrument performance checks met the criteria.

1.3 Initial Calibration

The EPA Method 1668A criteria for initial calibration are: (1) a minimum of five standards should be employed for native congeners and labeled compounds, (2) the percent relative standard deviation (%RSD) of isomer response should be ≤20%, (3) the ion abundance ratios should be within the control limits listed in EPA Method 1668A, Table 8, (4) the signal-to-noise (S/N) ratio should be >10 for all native and labeled compounds in the first calibration standard (CS1), and (5) response factor (RF) should be determined using one-point calibration for congeners quantitated with internal standard method. Initial calibrations met the criteria.

An initial calibration verification standard (second source standard) was analyzed to verify the calibration curve. The percent difference for each target compound is less than or equal to 30% and the initial calibration is assumed to be valid.

1.4 Calibration Verification

The EPA Method 1668A criteria require that: (1) continuing calibration verifications be performed at the beginning of each 12-hour shift using the mid-point calibration standard (CS3), (2) the %D value should be within the control limits listed in EPA Method 1668A, Table 6, and (3) the ion abundance ratios, retention times, relative retention times, and S/N ratios should meet the same criteria as for initial calibrations. All calibration verification analyses met the criteria.

1.5 Method Blanks

Method blank evaluation and data qualifying follows three guidance documents – the LDW Method Blank Contamination Decision Rules (USGS 2016), ESEPA NFG (EPA 2016), and EPA Region 10 Guidance (EPA 2014).

A method blank was prepared and analyzed as required for each preparation batch. A number of target compounds were detected at levels greater than their estimated detection limits (EDLs) or method reporting limits (MRLs) in method blanks. For low level PCB congener detections (*i.e.,* <10 *p*g/L for water and <10 *n*g/kg for soil) in the method blank, associated positive congener results in field samples were considered acceptable and no data qualifiers were assigned. For higher level PCB congener detections (*i.e.,* ≥10 *p*g/L for water and ≥10 *n*g/kg for soil) in the method blank, positive results greater than the MRL but less than five times the level found in the method blank were qualified (U) at the reported values. For positive field results less than five times the level found in the method bland and less than the MRL were qualified (U) at the MRL. Data affected by detections in method blanks were qualified and presented below:

Method Blank ID	Analyte	Blank Result	Affected Sample	Original Result	Qualified Result	Unit

1.6 Initial Precision and Recovery Study (IPR) and Ongoing Precision and Recovery (OPR)

IPR study results were not included in the data package. The laboratory stated that the results were maintained at the laboratory.

The laboratory performed laboratory control sample (LCS) and LCS duplicate (LCSD) analyses in lieu of OPR. See Section 1.7.

1.7 Laboratory Control Sample (LCS) and LCS Duplicate (LCSD)

LCS and LCSD analyses were performed as required by the method. Several spike recoveries were greater than the upper control limit of 150%. The LCS and LCSD recoveries anomalies and impact on associated sample results are summarized in the followings:

LCS and LCSD Batch ID	Spiked Congener	Percent Recovery	Affected Sample ID	Sample Conc.	Data Qualification
EQ1700111-02	PCB 152	152 %	CMS-MW-1R-030717	11.4 J	J
			BCT-MW-102-030717	7.77 J	J
			BCT-MW-108-030717	2.67 J	J
			CN-MW-103-030717	50.3 U	None
			UST29-MW-103-030717	50.4 U	None
			DAST-MW-101-030717	78.8	J
			UG-MW-2R-030717	2.51 J	J
EQ1700111-02 EQ1700111-03	PCB s183 + 185	283 % 293%	CMS-MW-1R-030717	57.8 J	J
			BCT-MW-102-030717	37.0 J	
			BCT-MW-108-030717	44.0 J	
			CN-MW-103-030717	22.5 J	
			UST29-MW-103-030717	13.8 J	
			DAST-MW-101-030717	361	
			UG-MW-2R-030717	69.5 J	

All other %R and relative percent difference (RPD) values were within the laboratory control limits.

1.8 Matrix Spike and Matrix Spike Duplicate (MS/MSD)

One soil MS/MSD pair was prepared and analyzed at the required frequency. MS/MSD analyses were performed on sample LD-B-03-42 (E1700606-001). Almost all the spike recoveries were diluted out by a factor of 5. No impact on data quality was concluded.

1.9 Labeled Compound Recovery

Twenty-seven labeled internal standards and three cleanup recovery standards were added to all samples as required by the method. The labeled internal standards and cleanup standards percent recoveries met the project and method requirements. Several internal standard and cleanup standard recoveries were less than the lower control limit. Internal standard recoveries anomalies and impact on associated sample results are summarized in the followings:

Sample ID	Internal Standard	Percent Recovery	Affected Congener	Sample Conc.	Data Qualification

1.10 Target Compound Identification

Target compound identification was evaluated by examining if: (1) the signals for the two exact m/z's being monitored were present, and maximized within ±2 seconds of one another, (2) the S/N ratio of each of the two exact m/z's must be greater than or equal to 2.5, (3) the ion abundance ratios were within the method control limits, and (4) the relative retention time (RRT) or retention time (RT) of the peaks were within the method control limits or laboratory control limits.

All detected target congeners were properly identified with the exceptions of the following congeners, which had ion abundance ratios outside of the control limits:

Sample ID	Congener	Ion Abundance Ratio	Control Limits	Data Qualification

1.11 Reporting Limits, Estimated Detection Limits (EDLs) and Compound Quantitation

Correct internal standards, quantitation ions, and average RFs were used to quantitate target compound detections. The MRLs were supported with adequate ICAL calibration concentrations. Sample-specific EDLs were adjusted with sample weights, internal standard peak height, and noise levels as required by the method. In general, sample-specific MRLs were significantly elevated (from the project goal for quantitation limits) due to the high PCB congener concentrations in samples. Samples required dilutions for proper instrument analyses and the MRLs were therefore elevated proportionally. The project goal for quantitation limits were attained to in these cases.

A verification calculation was performed on 10% of the reported calibration, laboratory QC analyses, and sample results. No anomalies were found. The verification calculation worksheets were maintained in project files for requests.

1.12 Field Duplicates

One field duplicate pair (LP-MW-5-071017 and LP-MW-20-071017) was submitted for PCB congeners analyses. All results met the advisory QC criteria for field duplicates. Field duplicate data are presented in Appendix A.

1.13 Overall Assessment of PCB Congener Data Usability

Some results were affected by the detections in the method blank and the biased-low labeled compound recovery (see Sections 1.5 and 1.9); the results might potentially bias high. Some results were qualified due to ion abundance ratio exceeded the control limits (see Section 1.10). Data users are advised to take this into consideration while using these data for the study.

PCB congener data were of known quality and acceptable for use, as qualified.

DTA QUALIFICATION SUMMARY

Table I. Qualified Data – Affected by QC Anomalies

Laboratory Sample ID	Field Sample ID	Analyte	Data Qualifier	Data Qualified Reason

Notes:
HT_P: The preparation of the sample was performed past the required holding time.

ION: The ion abundance ratio did not meet the method requirement.
MB: The result was affected by the detection of this compound in the associated method blank.
LSR-L: Labeled standard recovery value was less than lower control limit.
LCS/LCSD_H: The percent recovery value of laboratory control sample (LCS) and/or LCS duplicate (LCSD) was greater than the upper control limit.

Table II. Data Qualifier Definition

Data Qualifier	Definition
J	The analyte was detected above the reported quantitation limit, and the reported concentration was an estimated value.
U	The analyte was analyzed for, but was considered not detected at the reporting limit or reported value.
UJ	The analyte was analyzed for, and the associated quantitation limit was an estimated value.

Memorandum

To: Mark Sadler and Hanna Lintukorpi, City of Everett
Erik Gerking, Port of Everett
Mike Brose, Kimberly-Clark
Steve Germiat, Aspect Consulting
Andy Kallus and Sandra Caldwell, Washington State Department of Ecology

From: Kate Snider and Erin Murray, Floyd|Snider

Date: February 5, 2021

Project No: COEv-Env1

Re: **Utility Property Cleanup Action Plan Memorandum**

INTRODUCTION

This technical memorandum was prepared on behalf of the City of Everett (City) to present the proposed remedial approach for the Utility Property located at 2600 Federal Avenue, in Everett, Washington (Figure 1).

The Utility Property is "Unit E" of the Kimberly-Clark Worldwide, Inc. (K-C) Site (K-C Site). It is the City's desire that this technical memorandum be used by the Port to develop the Cleanup Action Plan (CAP) for the overall K-C Site, because the City, the Port, and the Washington State Department of Ecology (Ecology) have agreed on the remedial approach for the Utility Property presented in this memorandum. Andy Kallus, Site Manager at Ecology, provided approval of this memorandum on February 2, 2021. In his approval, Mr. Kallus stated, "We agree with the information and conclusions provided in the subject memo. The memorandum can be used by the Port and K-C to develop the CAP for the overall site which includes Unit E."

The City purchased the Utility Property to repurpose the wastewater treatment plant facility for operation by the City's Public Works Department as an element of the City's combined sewer overflow (CSO) control program.

Soil and groundwater have been characterized throughout the Utility Property in multiple investigations conducted by K-C (as documented in the 2016 Draft Remedial Investigation and Feasibility Study [RI/FS]) and locally by the City in the vicinity of a swale adjacent to the southern property boundary of the Utility Property. In May 2020, the available data from the Utility Property were reviewed with Ecology and it was determined that remediation would not be

Certified B Corporation

required on the Utility Property. With the exception of one slight exceedance of diesel- and oil-range total petroleum hydrocarbons (TPH) in one location sampled by K-C, there were no exceedances of industrial cleanup levels (CULs). It was agreed that the remedial approach for the property would include institutional controls, pipe and swale decommissioning, and installation and maintenance of pavement and clean surface material throughout the property.

This memorandum provides the remedial approach that was developed in coordination with Ecology to ensure that the conditions at the Utility Property are protective of human health and the environment. In addition, this memorandum provides a summary of the investigations that have been conducted on the Utility Property, including a summary of the results of the swale sampling activities conducted in October 2019 by the City.

SITE DESCRIPTION, LOCATION, AND BACKGROUND

The Utility Property was historically used for timber storage by the Clark-Nickerson Lumber Company mill (late 1800s through early 1930s). Later, the parcel was developed as a part of the K-C pulp/paper mill's wastewater treatment plant (Aspect 2014). The treatment plant is still in place but is not currently in use. The remaining portion of the property has been used as a parking lot. The Utility Property is the northernmost unit in the K-C cleanup site (Unit E). In 2012, Ecology and K-C entered an Agreed Order for the upland K-C cleanup site. The main contaminants of concern (COCs) for the Utility Property and adjacent property to the south are select metals, carcinogenic polycyclic aromatic hydrocarbons (cPAHs), and TPH, as described in the RI Data Report by Aspect Consulting (Aspect 2014).

SUMMARY OF SUBSURFACE INVESTIGATIONS

The following subsection provides a summary of the soil investigations that have been completed at the Utility Property. Table 1 provides a summary of all samples compared to Model Toxics Control Act (MTCA) Method C/A industrial soil CULs, the preliminary cleanup levels (PCLs) for the K-C Site, and the Floyd|Snider Sampling and Analysis Plan (SAP) PCLs (Floyd|Snider 2019). Figure 1 provides a summary of exceedances of these criteria.

Aspect 2012/2013 Remedial Investigation

As part of the RI investigation for the K-C Site, soil and groundwater sampling was conducted to determine nature and extent of contamination. Throughout the Utility Property, eight borings were advanced and four monitoring wells were installed. The Aspect RI Data Report provides details on the results of the investigation. In summary, there were detections of polycyclic aromatic hydrocarbons, metals, and TPH in soil (Aspect 2014). Copper and zinc exceeded their respective PCLs in a few locations and cPAHs exceeded the saturated zone PCL in some locations. However, at locations with corresponding groundwater samples, groundwater data are in compliance for cPAHs, which empirically demonstrates that these low-level exceedances of cPAHs are not causing leaching at levels of concern. The only location with cPAHs exceeding in soil that had corresponding groundwater samples is shown in Figure 1. No samples exceeded the

MTCA Method C/A industrial soil CULs in soil except for one sample that exceeded the oil-range organics (ORO) PCL of 2,000 milligrams per kilogram (mg/kg) with a concentration of 2,300 mg/kg.

With the exception of two slight exceedances of copper and sulfides at two of the monitoring wells during one event, there were no exceedances of the PCLs in groundwater.

Floyd|Snider 2019 Swale Investigation

On October 3, 2019, Floyd|Snider conducted a subsurface investigation in order to characterize the soil beneath the swale along the southern property line of the K-C Site property. Refer to Attachment 1 for details on the geology and field observations. Test pit samples were analyzed for the applicable K-C COCs (i.e., metals, cPAHs, and TPH).

At TP-2, the excavator bucket broke an 8-inch-diameter concrete pipe at approximately 3 feet below ground surface. The pipe, which ran from east to west, appeared to contain a small amount of water. This pipe will be plugged and abandoned, as described below.

The Floyd|Snider *Utility Property Swale Test Pit Sampling Results Memorandum* provides details on the results of the investigation (Attachment 1). In summary, although there were some detections for TPH and cPAHs, there were no exceedances of the PCLs for TPH or cPAHs at any of the sample locations. Metals were detected in every sample, with elevations of the PCLs for select metals at each sample location. Metals with PCL exceedances include arsenic, copper, nickel, and zinc, as shown in Figure 1. There were no exceedances of the MTCA Method C/A industrial CULs at any location in the swale.

All data were successfully uploaded to submitted to Ecology's Environmental Information Management system in coordination with the Ecology Project Manager for the K-C Site, Andy Kallus. These data have been provided to K-C for their inclusion in the RI/FS for the Site.

REMEDIAL APPROACH FOR THE UTILITY PROPERTY

The following actions have been developed in coordination with Ecology to ensure that the conditions at the Utility Property are protective of human health and the environment and to be included in the K-C Site CAP as the only remedial requirements applicable to the Utility Property.

Institutional Controls

A restrictive Environmental Covenant will be required on the Utility Property to ensure that the land use remains industrial. The Environmental Covenant will also require maintenance of pavement and clean surface materials in landscaped areas.

Decommissioning of Pipe and Swale

In December 2020, the abandoned stormwater pipe identified near TP-2 in the 2019 investigation was abandoned according to the methods for drainage pipe abandonment described in Appendix C of the K-C Work Plan for Second Interim Action (Aspect 2019a). Refer to Photograph 1 in Attachment 2.

The swale area was first grubbed to remove vegetation and then backfilled with the clean, Ecology-approved Parcel O Dredge Sand (Aspect 2019b; Photograph 2 in Attachment 2). A temporary earthen berm was constructed to separate drainage on the two properties (Photograph 3 in Attachment 2) and the area will eventually be paved as described below.

Pavement, Drainage, and Clean Landscaped Areas

The City plans to repurpose the existing water treatment industrial tanks and selected buildings at the Utility Property as a component of future CSO control facilities.

As part of the City's redevelopment of the Utility Property, all surface areas of the property will be paved, except for areas of landscaping or open space and the stormwater and combined sewer treatment and storage structures. Any areas that are not contained under paving must have data showing that surface materials (within the top 3 feet) meet MTCA Method A cleanup standards.

As described above, the swale adjacent to the southern boundary of the Utility Property has been backfilled and paved and a drainage barrier will be constructed so all stormwater from the Utility Property will be managed on City property and runoff from Port property will be managed by the Port on their property. As part of the Port's and City's redevelopment, each entity will install measures to contain and manage drainage on their own property. The four existing monitoring wells will be kept in place until the final CAP is in place and Ecology allows their decommissioning.

CONCLUSION

Because there are no exceedances of industrial CULs in soil or groundwater at the Utility Property, no active remediation is required. The remedial approach for the Utility Property described above will ensure protection of human health and the environment.

It is anticipated that at the time the CAP for the K-C Site is developed by the Port, these remedial elements will be the only requirements defined for the Utility Property.

Any concerns or questions regarding these requirements should be directed to Tim Benedict, Deputy City Attorney, tbenedict@everettwa.gov, (425) 257-8669. Mr. Benedict should also be included in CAP development when that moves forward.

Notes:

BOLD Exceeds Floyd|Snider 2019 SAP preliminary cleanup level.

BOLD/RED Exceeds MTCA Method C/A industrial soil cleanup level.

Sample is assumed saturated based on recorded site groundwater levels.

95 Exceeds preliminary cleanup level for saturated soils.

-- Data not reported.

1 The criteria in this column are the MTCA human health industrial direct contact cleanup levels (i.e., values are MTCA Method C, unless no criterion was available, and then MTCA A industrial soil CUL was used). The TPH cleanup level of 2,000 mg/kg is based on protection of groundwater.

2 The Floyd|Snider SAP preliminary cleanup levels used were MTCA Method A Industrial soil cleanup levels, unless no criterion was available, and then screening levels presented in Aspect Consulting's Remedial Investigation Data Report were used. For metals, these values were often the background numbers from Washingon State Department of Ecology's 1994 *Natural Background Soil Metals Concentrations in Washington State,* with the exception of arsenic; for arsenic, MTCA established 20 mg/kg as background (WAC 173-340-900 Table 740-1).

Re: **Utility Property Swale Test Pit Sampling Results Memorandum**

INTRODUCTION

This technical memorandum was prepared on behalf of the City of Everett (City) to present the results of the swale sampling activities conducted in October 2019 on the Utility Property, located at 2600 Federal Avenue, in Everett, Washington. The objective of the October 2019 sampling was to inform whether there is contaminated soil that requires excavation and offsite disposal prior to filling and abandonment of the swale. The sampling was also conducted to ensure that the data are appropriate for both an evaluation against applicable industrial criteria and for profiling for waste characterization if offsite disposal is necessary.

The soil sampling was conducted in October 2019 in accordance with the 2019 Swale Sampling and Analysis Plan (SAP) memorandum (Floyd|Snider 2019). A summary of the investigation objectives, the sampling scheme, field sampling methods and protocols, and analytical results are summarized in this soil sampling results memorandum.

SUMMARY OF FIELD ACTIVITIES

Sampling was conducted on October 3, 2019. In order to characterize the swale soil, four test pit locations were selected along the swale (Figure 1). Test pits were dug via backhoe by City staff, just north of the standing water on the side slope of the swale. Three of the test pits (TP-2 through TP-4) extended down to approximately 6 feet below ground surface (bgs). At location TP-1, only the top 0- to 2-foot sample was collected because groundwater was encountered at 2 feet bgs. This was the only location where groundwater was encountered; all samples collected in this event represent unsaturated conditions.

At each test pit location, the soil removed by the backhoe was screened for signs of contamination in accordance with the SAP. Field screening was completed through the use of a photoionization detector and observations of the presence of staining and odor. Field screening indications at all locations and depths were negative, so sampling proceeded as follows.

Certified B Corporation

At each location, samples were collected at 2-foot intervals from the soil surface down to the final excavation surface. Each sample was homogenized and submitted for analysis of the following applicable Kimberly-Clark contaminants of concern, as shown in Table 1:

- Diesel- and heavy oil-range total petroleum hydrocarbons (TPH) by NWTPH-Dx
- Metals (antimony, arsenic, copper, lead, nickel, and zinc) by U.S. Environmental Protection Agency (USEPA) Method 6020B and USEPA 7471 for mercury
- Carcinogenic polycyclic aromatic hydrocarbons (cPAHs) by USEPA Method 8270D

At TP-2, the top 0- to 2-foot sample was collected and analyzed for the following additional analytes for potential waste characterization purposes:

- Semivolatile organic compounds (SVOCs) by USEPA Method 8270D
- Volatile organic compounds (VOCs) by USEPA Method 8260C
- Resource Conservation and Recovery Act 8 metals (arsenic, barium, cadmium, chromium [total], lead, mercury, selenium, silver) by Method 6020B and USEPA 7471 for mercury.

Samples were collected in accordance to Floyd|Snider's standard guidelines for shallow soil sampling (Attachment 2 of the SAP) and placed into appropriate containers for lab analysis by Analytical Resources, Inc., and the Everett Environmental Laboratory (laboratory at the Waste Water Treatment Plant) for metals. All excavated test pit soil was backfilled into the test pit locations after sample collection.

Decontamination Procedures

Following procedures in the SAP, all field equipment that contacted any sample material was decontaminated prior to collection of the next sample.

Field Quality Assurance and Quality Control

In accordance with the SAP, one field duplicate was collected and submitted for analysis. Additionally, one rinsate blank quality control sample was collected upon the completion of sample processing. The results of the data quality review are summarized in the Data Assurance/Quality Review section of this memorandum.

RESULTS

This section summarizes field observations, analytical data, and comparison to screening levels.

Field Observations

Upon arrival at the site, approximately 1 foot of standing water was observed at the bottom of the swale. Due to the standing water, sample locations were shifted just north of the bottom of the swale, on the side slope of the swale in order to avoid flooding of the test pits.

TP-3 was dug right at the edge of the standing water and became flooded soon after collection of the 0- to 2-foot interval sample. To avoid water from pouring into the test pits, the remaining locations were placed slightly northward on the slope of the swale.

The soil samples consisted primarily of silty sand with trace gravel and organic matter in the top 4 feet. At about 4 feet bgs, sand in the swale became siltier and denser as locations became closer to the East Waterway.

While digging TP-2, the excavator bucket broke an 8-inch concrete pipe at approximately 3 feet bgs. The pipe, which ran from east to west, appeared to contain a small amount of water. City personnel were notified and came to the site to inspect the broken pipe in order to provide further direction. It was determined that the pipe was abandoned and the water likely came from groundwater, indicating that the pipe did not need to be repaired at that time. Excavation continued once City approval was received. When the removal action is being completed, the inactive pipe will be plugged and abandoned according to the methods described in Appendix C of the Kimberly-Clark Work Plan for the second interim action (Aspect 2019) and in coordination with Kimberly-Clark, who is implementing the Interim Action.

Large chunks of concrete were present from 1.5 to 2 feet bgs at locations TP-2 and TP-4, and shell fragments and wood debris were noted in the 4- to 6-foot intervals at these locations. The concrete fragments in the swale are construction debris, and their origin is unknown to the City.

At all locations, a geotextile fabric was present approximately 6 inches beneath a layer of quarry spalls.

No evidence of chemical impacts (e.g., odor, sheen) were observed in any of the soil samples.

Photographs of the test pit excavations are presented in Attachment 1.

Analytical Results

The soil data were compared to the screening levels included in Table 1 of the SAP. The screening levels consist of Model Toxic Control Act (MTCA) Method A Industrial cleanup levels or the unsaturated industrial land use screening level presented in Aspect Consulting's Remedial Investigation Data Report for the Kimberly-Clark Mill Site (Aspect 2014).

Although there were some detections for TPH and cPAH, there were no exceedances at any of the sample locations. Metals were detected in every sample, with elevations of the screening levels for select metals at each sample location. The metal exceedances at each sample location are shown in Figure 1.

Metals with screening level exceedances include arsenic, copper, nickel, and zinc. Each of these metals have screening levels that are based on background concentrations. The background values are specific to Puget Sound and are from the Washington State Department of Ecology's (Ecology's) 1994 *Natural Background Soil Metals Concentrations in Washington State,* with the

exception of arsenic; for arsenic, MTCA established 20 milligrams per kilogram (mg/kg) as background (Washington Administrative Code 173-340-900 Table 740-1). In summary, results at each location are as follows:

- At TP-1, the nickel concentration was only 49 mg/kg in the 0- to 2-foot interval, slightly greater than the screening level of 48 mg/kg.
- TP-2 exceedances include arsenic, copper, nickel, and zinc in the top 4 feet. The 4- to 6-foot interval at TP-2 bounded the impacted soil with no metal exceedances.
- TP-3 exceedances include copper and zinc in the 0- to 2-foot interval and copper, nickel, and zinc in the 4- to 6-foot interval. The 2- to 4-foot interval of TP-3 had no exceedances.
- At TP-4, copper and zinc exceedances were only within the top 2 feet. The impacted soil at TP-4 is bounded by the 2- to 6-foot interval, which had no exceedances.

DATA ASSURANCE/QUALITY REVIEW AND ENVIRONMENTAL INFORMATION MANAGEMENT SYSTEM SUBMITTAL

A Compliance Screening (Stages 1 & 2A) data quality review was performed on TPH, VOCs, SVOCs, and metals data resulting from laboratory analysis. The analytical data were validated in accordance with USEPA's *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA 2017a) and/or *National Functional Guidelines for Organic Superfund Data Review* (USEPA 2017b). A total of 11 soil and 2 quality control water samples were submitted in two sample delivery groups (SDGs). SDG 19J0091 was submitted to Analytical Resources, Inc., in Tukwila, Washington, for chemical analysis by NWTPH-Dx, USEPA 8260C, and USEPA 8270D. SDG 54676 was submitted to City of Everett Environmental Laboratory, in Everett, Washington, for chemical analysis by USEPA 6020B and USEPA 7471. For all SDGs, the analytical holding times were met, and the method blanks had no detections greater than the reporting limits. The matrix spike (MS), MS duplicate (MSD), laboratory control sample (LCS), LCS duplicates (LCSD), and surrogate recoveries, MS/MSD, and LCS/LCSD relative percent differences all met USEPA requirements. Data are determined to be of acceptable quality for use as reported by the laboratory, with some laboratory qualifiers being updated to conform to the final qualifiers used for data table reporting and database storage.

All data will be submitted to Ecology's Environmental Information Management (EIM) system in coordination with the Ecology Project Manager for the Kimberly-Clark Site, Andy Kallus.

This information has been provided to Kimberly-Clark for their inclusion in the Remedial Investigation/Feasibility Study.

Re: **Background Arsenic in Groundwater – K-C Worldwide Site Upland Area**

This memorandum documents our determination of a natural background concentration of arsenic in groundwater at the Kimberly-Clark (K-C) Worldwide Site Upland Area (Site). The Model Toxics Control Act cleanup regulation (MTCA; Chapter 173-340 of the Washington Administrative Code [WAC 173-340]) requires that cleanup levels not be set at levels below natural background concentrations (WAC 173-340-720[7][c]). The evaluation was completed to define a natural background concentration of arsenic to select an appropriate cleanup level for arsenic in groundwater at the Site.

We calculated a background groundwater concentration for arsenic at the Site using data and procedures utilized by the Washington State Department of Ecology (Ecology) for the statewide arsenic background study (Ecology, 2021[1]) in accordance with the MTCA methods for defining background concentrations (WAC 173-340-709). The data was provided by Ecology, who also identified a subset of the data that can be considered representative of regional groundwater quality for the Everett waterfront area and is appropriate for use in evaluating Site background groundwater quality. Ecology obtained the data from the Washington Department of Health Drinking Water Division Sentry database for public water supply wells reported between 2003 and 2010. The data consists of an average arsenic concentration for each location with non-detect results included in the point averaging at a value of one-half (1/2) the reported detection limit. Attachment A includes a map showing the locations of wells included in this evaluation (displayed in yellow) (Figure A1), along with a raw summary of the data from those wells (Attachment A2).

[1] Washington State Department of Ecology, 2021, Draft Natural Background Groundwater Arsenic Concentrations in Washington State, Results of a Study, Toxics Cleanup Program, Ecology Publication No. 14-09-044, July 2021 Draft.

A total of 39 data points were identified in the Everett waterfront area for evaluation of background groundwater arsenic concentrations. The data was assigned a code of either "0", if the point-averaged data was comprised of all non-detect values, or "1", if the point-averaged data was a mix of non-detect and detected values or all detected values, consistent with Ecology's methodology for evaluating statewide arsenic in groundwater (Ecology, 2021).

The dataset was evaluated for potential outliers using ProUCL and two potential outliers were removed from the dataset. There are no potential outliers for the 1% significance level in the remaining dataset of 37 data points. The statistics on the uncensored (detect results only) log-transformed dataset indicates a mild skewness of 0.226 (kurtosis = -0.902) (Attachment B).

Since the dataset is partially censored (containing non-detect values), only the distribution of the detected portion of the dataset was used in the data distribution evaluation. The ProUCL Goodness of Fit Test Statistics indicate that the data appear lognormal at the 5% significance level (Attachment B).

The background threshold value (BTV) was calculated in ProUCL for a lognormal distribution, using the censored (non-detect) data at ½ the detection limit and a 90/90 upper tolerance level (UTL). ProUCL uses bootstrap methods and lognormal distribution-based equations on Kaplan Meier (KM) or regression on order statistics (ROS) methods to compute UTLs. Based on the mild skewness of the dataset, the ProUCL technical guidance recommends the use of KM estimates and bootstrap methods, which yield 90/90 UTL values of 9.07 and 8.8, respectively (Attachment A). Based on this, we propose that the background arsenic concentration for groundwater at the Site be established at 9 micrograms per liter (ug/l).

Limitations

Work for this project was performed for the Port of Everett (Client), and this memorandum was prepared in accordance with generally accepted professional practices for the nature and conditions of work completed in the same or similar localities, at the time the work was performed. This memorandum does not represent a legal opinion. No other warranty, expressed or implied, is made.

All reports prepared by Aspect Consulting for the Client apply only to the services described in the Agreement(s) with the Client. Any use or reuse by any party other than the Client is at the sole risk of that party, and without liability to Aspect Consulting. Aspect Consulting's original files/reports shall govern in the event of any dispute regarding the content of electronic documents furnished to others.

60	**DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.**											
61												
62	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
63	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
64	and consists of observations collected from clean unimpacted locations.											
65	The use of USL tends to provide a balance between false positives and false negatives provided the data											
66	represents a background data set and when many onsite observations need to be compared with the BTV.											
67												

APPENDIX F

Derivation of Area-Specific Risk-Based TPH Soil Preliminary Cleanup Levels for Industrial Use Area

F. Derivation of Area-Specific Risk-Based TPH Soil Preliminary Cleanup Levels for Industrial Use Area

The Washington State Model Toxics Control Act (MTCA; Chapter 173-340 WAC) allows for establishing a standard Method B (unrestricted use) or standard Method C (industrial use) soil cleanup level for total petroleum hydrocarbons (TPH)—protective of human direct contact and groundwater—using analytical data from the Volatile Petroleum Hydrocarbon (VPH) and/or Extractable Petroleum Hydrocarbon (EPH) analysis conducted on site-specific soil samples [WAC 173-340-740(3)(b)(iii)(B)(III); WAC 173-340-745(5)(b)(iii)(B)(III)]. The EPH analysis quantifies concentrations of aromatic and aliphatic hydrocarbons typically in five carbon ranges covering the diesel and oil ranges (typically C8–C10, C10–C12, C12–C16, C16–C21, C21–C34). The VPH analysis quantifies concentrations of aromatic and/or aliphatic hydrocarbons typically in five carbon ranges covering the gasoline range (C5–C6, C6–C8, C8–C10) and light end of the diesel range (C10–C12, C12–C13). MTCA dictates that the VPH analysis be used for gasoline-range petroleum, and the EPH analysis be used for diesel-range and oil-range petroleum (WAC 173-340-900 Table 830-1). Because some carbon ranges overlap and are reported from both the VPH and EPH analyses, the higher detected concentration for each range reported from either analysis is used in this analysis (refer to tables in this appendix, where the lower-concentration values are shaded gray to denote not being used in the analysis). This includes using the higher values from the aromatic C12-13 range by the VPH method or the aromatic C12-16 range by the EPH method, in accordance with Ecology (2016). Other adjustments made to equivalent carbon fraction concentrations to avoid concentration double counting, in accordance with Ecology (2016), included subtracting xylenes concentration from the aromatic C8-10 concentration, subtracting naphthalene concentration from the aromatic C10-12 concentration, and subtracting total carcinogenic polycyclic aromatic hydrocarbons (cPAH) concentration from the aromatic C21-34 concentration.

As discussed in the main body of the RI/FS, the portion of the Upland Area, potentially excluding the Warehouse Subunit of Unit A, will remain in traditional industrial use (as a marine terminal); therefore, industrial soil cleanup levels apply and are calculated in this appendix. For TPH within the Warehouse Subunit of Unit A, where releases of multiple petroleum product types apparently occurred, Method A soil cleanup levels for unrestricted land use are applied, and that TPH is not addressed in this appendix.

To calculate risk-based soil TPH preliminary cleanup levels (PCLs) for industrial use, detected concentrations of the TPH fractions from the VPH/EPH analysis and associated detected volatile organic compounds (VOCs) and PAHs, including both cPAHs and naphthalene, are input into Ecology's MTCAtph workbook (http://www.ecy.wa.gov/programs/tcp/tools/toolmain.html). The MTCAtph software uses conservative default toxicity values for hydrocarbons in each carbon range to calculate acceptable TPH soil concentrations based on direct contact with the soil for industrial

exposure (adult worker lifetime occupational exposure; MTCA Method C). In accordance with MTCA (WAC 173-340-745(4)(b)(iii)(B)(III)), the MTCAtph calculations of acceptable direct-contact TPH concentrations account for dermal contact exposure in addition to soil ingestion, which is not considered for other chemicals. In accordance with Ecology policy, the TPH PCLs for soil direct contact are based on noncarcinogenic toxic effects. The direct-contact carcinogenic effects are addressed by compliance with soil PCLs for the individual carcinogens in the TPH mixture (e.g., benzene, cPAHs).

A different module of the MTCAtph workbook predicts dissolved-phase groundwater hydrocarbon concentrations from soil leaching to evaluate the soil-leaching-to-groundwater pathway. However, the soil-to-groundwater worksheet evaluates risks for drinking water exposure, which is not an exposure pathway considered for Upland Area groundwater. Therefore, the worksheet's predicted leachable concentrations of TPH were compared against the 500 micrograms per liter (µg/L) TPH groundwater screening level for marine protection (based on human health); the predicted leachable concentrations of naphthalene were compared against the 89 µg/L groundwater screening level for vapor intrusion (industrial use), which is also protective of the marine environment[1]; and the predicted leachable concentrations of total cPAHs, converted to the toxic equivalent concentration of benzo(a)pyrene (TEQ), per MTCA, were compared against the 0.015 µg/L groundwater screening level for marine protection. The average measured site-specific aquifer fractional organic carbon content (f_{oc}) of 0.0079 (0.79 percent) was used in the MTCAtph workbook, along with MTCA-default values for the rest of the hydrogeologic parameters.

Note that the MTCAtph workbook can assess direct-contact and groundwater-protection risks at higher or lower TPH concentrations than measured in the sample, assuming the same relative proportion of petroleum fractions (i.e., proportionally increasing or decreasing their concentrations for the calculations). The MTCAtph output sheets for the analysis of direct-contact and groundwater-protection scenarios for each sample are included as Attachment E-1 to this appendix.

In accordance with MTCA, soil PCLs for TPH also must not result in an accumulation of non-aqueous phase liquid (NAPL, aka "free product") on or in groundwater – i.e., the PCL must be at or below the residual saturation concentration for the specific petroleum product in its specific subsurface conditions. For all areas of residual TPH considered in this appendix, the soil contamination is below the water table (saturated conditions).

Note that, during the interim action, Bunker C oil NAPL was observed in the Bunker C above ground storage tank (AST) excavation area north of the Warehouse (see photographs 5 and 6 in the Interim Action Report; Aspect [2015a]). That soil was not sampled to quantify the TPH concentration prior to its removal, but that concentration would very likely have exceeded the maximum detected residual soil TPH concentrations in areas evaluated in this appendix. For example, at another Bunker C oil site (Georgia-Pacific West site in Bellingham), Aspect collected a pair of soil samples containing visible Bunker C oil free product and detected TPH concentrations of 88,000 and 97,000 milligrams per kilogram (mg/kg; Aspect, 2013d) – more than three times higher than the maximum detected residual TPH concentrations in areas evaluated in this appendix.

[1] Naphthalene groundwater screening level based on marine protection is 4,900 µg/L (Table 5-1).

Given the many decades since the petroleum releases occurred at the Site, the lack of free product accumulation on or in groundwater, and the lack of dissolved-phase hydrocarbons in groundwater[2] following completion of the interim actions, it is probable that the residual soil TPH concentrations remaining in each area are below residual saturation concentrations in accordance with WAC 173-340-747(10)(c)).

However, considering the different type/age/mixtures of petroleum releases and heterogeneous soil types within the Upland Area, Ecology estimated a single TPH soil concentration that represents a reasonably conservative residual saturation limit throughout the Upland Area. Based on literature values (API, 2000; USEPA, 1995), Ecology conservatively estimated a site-specific residual saturation limit as the soil TPH concentration equal to 10 percent of the air-filled soil porosity based on NAPL density values derived from the MTCAtph workbook for each of the 13 Upland Area soil samples with VPH/EPH data.[3] By this methodology, the median soil TPH concentration calculated for 10 percent of air-filled porosity for the 13 samples was 7,700 mg/kg, which is applied as the residual saturation concentration for all residual soil TPH within the Upland Area for purposes of this evaluation.

For each sample, the most stringent calculated value from the direct-contact (land-use-dependent) and leaching-to-groundwater pathways is determined. For areas with more than one soil sample with VPH/EPH analysis, the similarity of petroleum product between samples is evaluated based on histograms of the relative proportion of hydrocarbon fractions comprising the TPH concentration (from VPH/EPH data). Finally, for each area evaluated, the median of the most stringent values from samples representing the same petroleum product is calculated for that area, in accordance with Ecology (2016) guidance. The proposed soil TPH PCL for each area is then taken as the most stringent of the site-wide residual saturation limit and the area-specific concentrations protective of direct contact and leaching to groundwater.

Most but not all soil samples analyzed using EPH and/or VPH analytical methods were also analyzed for TPH using the NWTPH analytical methods. Notable differences occur in the TPH concentration as measured by the NWTPH methods versus by the VPH/EPH methods for each sample, largely because the NWTPH methods, even with use of silica gel cleanup, quantify polar non-hydrocarbon compounds. Figure E-1 illustrates the differences between concentrations of TPH (gasoline + diesel + oil ranges combined) measured by VPH/EPH methods vs by NWTPH methods for Upland Area soil samples evaluated in this appendix plus five samples collected within the Warehouse Subunit of Unit A[4]. As noted on the lower plot of that figure, the median TPH concentration reported from VPH/EPH methods was 57 percent of that reported from NWTPH methods for the eleven samples. Because of the substantial differences in TPH concentrations quantified by the two different analytical methods, this appendix presents the proposed soil TPH PCLs relative to the VPH/EPH analytical results (input data to the MTCAtph

[2] Lack of elevated dissolved-phase hydrocarbon concentrations is a very strong indicator that free product is not present.

[3] This included samples collected from beneath the warehouse that are no longer included in this evaluation.

[4] The five samples with varying product types collected from the Warehouse Subunit were not used for derivation of area-specific PCLs but are useful for this comparative assessment.

software), and relative to the NWTPH analytical results by incorporating the ratios of TPH measured by VPH/EPH methods to TPH measured by NWTPH methods for each sample. The calculated soil TPH PCL and analytical method therefore need to be matched for compliance monitoring.

For purposes of this appendix, the term "TPH" refers to the complete petroleum mixture including gasoline, diesel, and oil ranges, unless otherwise specifically qualified to be a specific range.

The following sections present the derivation of Method C soil PCLs for residual petroleum products in two specific areas of the Upland Area where residual TPH remains in place following the interim actions: the Bunker C Underground Storage Tanks (USTs) area of Unit B and the Hydraulic Barker area of Unit C. For each area, tables are included that present the soil sample data used in the evaluation along with a plot of the relative percentages of hydrocarbon fractions comprising the petroleum product. The tables also include, for each sample analyzed, the TPH concentrations calculated by the MTCAtph workbook to be protective for industrial soil direct contact and leaching to groundwater. Empirical groundwater data are incorporated with respect to determining soil concentrations protective of leaching dissolved-phase hydrocarbons to groundwater for each product type/area. The proposed soil TPH PCL for the petroleum product/area is then determined as the most stringent value protective of all exposure pathways, including the residual saturation (free product accumulation). At the end of this appendix, Table E-3 summarizes the calculated soil TPH PCLs for residual petroleum products in both areas evaluated.

F.1. Calculated Soil TPH PCLs for Unit B

F.1.1. Bunker C USTs 71, 72, 73 Interim Action Area

As described in the Interim Action Report (Aspect, 2015), the first interim action did not remove Bunker C fuel oil-contaminated soil located beneath monolithic concrete foundation elements on the north and south sides of the USTs 71, 72, 73 Area. Four samples of the residual impacted soils—BUST-B39 and BUST-S58 on the north wall and BUST-S16 and BUST-S17 on the south wall (see Figure 6-B2 in main body of this report)—were run for EPH analyses in addition to analyses for NWTPH-Dx (quantified as Bunker C) and PAHs. Table E-1 presents the NWTPH-Dx, EPH, and PAH data for the samples.

As illustrated by the histograms on Table E-1, the relative proportion of hydrocarbon fractions comprising the detected TPH are very similar in the four samples, indicating they are the same heavy oil product. The TPH concentrations measured by the EPH analysis range from 13 to 88 percent (median 21 percent) of the TPH concentrations measured by the NWTPH analysis. Detected total cPAH (TEQ) concentrations range from approximately 0.6 to 1.3 mg/kg in the four samples (Table E-1).

There are no other locations in this area with TPH concentrations greater than RI screening levels beyond the four samples analyzed for VPH/EPH.

The Bunker C USTs 71, 72, and 73 were removed from beneath the water table in this area in 1989, so petroleum releases (directly into groundwater) were at least 25 years old

and likely considerably older. No separate-phase NAPL was observed during drilling or in the completed monitoring wells within this area, and no mobile NAPL was observed at the open excavation cuts where the residual Bunker C-contaminated soil (up to 28,000 mg/kg TPH) was left in place beneath foundation elements. During the interim action, heavy petroleum sheen was observed when excavating in the area of the former UST saddles (see photographs 29 and 30 in Aspect [2015a]), but that water/sheen and the contaminated soil around it was subsequently removed.

F.1.1.1. Soil-to-Groundwater (Leachability) Pathway

The MTCAtph leaching analysis indicates that the Bunker C contamination in this area, even at its maximum theoretical concentration (100% NAPL; greater than 77,000 mg/kg), will not leach hydrocarbons to groundwater at concentrations of concern (Table E-1). Confirmational groundwater monitoring well UST71-MW-103 is positioned immediately downgradient (west) of the residual soil on the south edge of the interim action excavation, and well UST71-MW-104 is positioned immediately downgradient of the residual soil on the excavation's north edge. Wells UST71-MW-101 and UST71-MW-102 are positioned along the downgradient edge of the main excavation, with UST71-MW-101 being downgradient of UST71-MW-104 (well locations are depicted on Figure 6-B1 in main body of this report). More than sufficient time has elapsed for soil contamination in this area to migrate to groundwater, particularly since the UST releases occurred below the water table.

Results from the eight quarterly confirmational groundwater monitoring rounds conducted following interim action excavation are as follows:

- On the north end of the excavation, no groundwater TPH or PAH exceedances were detected in four rounds of monitoring[5] at well UST71-MW-104 positioned immediately downgradient of the residual soil containing highest TPH and cPAH concentrations in this area (up to 28,000 mg/kg TPH measured by NWTPH, and up to 1.3 mg/kg total cPAH (TEQ)).
- Downgradient of UST71-MW-104, no TPH or PAH exceedances were detected at well UST71-MW-101 in eight rounds of monitoring.
- At well UST71-MW-102, not directly downgradient from either of the areas of residual soil contamination, oil-range TPH exceedances (up to 2,200 µg/L) were detected in four of seven samples collected (inadequate water was available in this well to collect a sample during the August 2016 event). As discussed in the RI, this is the one well on Site where oil-range TPH is detected in groundwater. Total cPAH (TEQ) exceedances were detected in the first two samples collected (0.04 and 0.14 µg/L), but not in the last five samples collected from this well. No naphthalene exceedances were detected during the seven monitoring events.
- On the south end of the excavation, no groundwater TPH exceedances were detected at well UST71-MW-103 positioned immediately downgradient of the residual soil containing TPH concentrations up to 8,400 mg/kg. However, in each

[5] Ecology agreed that well UST71-MW-104 did not require sampling during confirmation monitoring rounds 5 through 8.

of the eight monitoring rounds, well UST71-MW-103 had detected exceedances for total cPAH (TEQ) (0.04 to 0.23 µg/L). A naphthalene exceedance (110 µg/L) was also detected in this well during the last of the eight sampling events (August 2016). The detected PAH concentrations show no clear trends over the eight quarters.

- Note that the two wells with detected TPH and/or PAH exceedances in groundwater, UST71-MW-102 and -103, hit refusal on buried structure during drilling, so the well screens could not be placed to the depth planned and they thus intercept a limited saturated thickness. The wells recovered slowly and could not be developed to the degree desired, and consequently their groundwater samples have been more turbid than observed in the other wells in this area. Over the complete period of monitoring, wells UST71-MW-102 and -103 had the average turbidities of 47 and 95 NTU, respectively, compared to 8 and 7 NTU in wells UST71-MW-101 and -104, respectively, suggesting turbidity bias as a cause for the detected groundwater exceedances in wells UST71-MW-102 and -103. In accordance with the *Confirmational Groundwater Monitoring Plan* (Aspect, 2014), groundwater samples with field-measured turbidity greater than 25 NTU were centrifuged by the laboratory prior to PAH analysis.

There is poor correlation between locations with groundwater TPH/PAH exceedances and locations of the highest residual petroleum concentrations in soil beneath foundation elements. The combined MTCAtph modeling and empirical groundwater data indicate that residual soil petroleum concentrations left in place on the north side of the excavation are protective of leachability to groundwater. In contrast, the empirical groundwater data indicate consistent PAH exceedances and inconsistent TPH exceedances along the southern portion of the excavation, despite MTCAtph modeling indicating the residual soil concentrations there (lower than occur on north side of excavation) are protective of leachability. That discrepancy, and the fact that the two wells with groundwater exceedances in this area could not be properly developed and have turbid groundwater samples, suggests that the groundwater exceedances are attributable to non-representative samples rather than leaching from the residual soils.

The combined weight of evidence from monitoring of the four wells and the MTCAtph leaching predictions suggests that maximum existing TPH soil concentrations in this area are protective of groundwater.

Most importantly, downgradient shoreline wells (UST 70 wells and REC3-MW-1R) have had no groundwater TPH or PAH exceedances, indicating there has not been groundwater transport of hydrocarbons from the UST 71 excavation area to the shoreline during the minimum 25 years since the petroleum releases occurred.

F.1.1.2. Soil Direct-Contact Exposure Pathway

For an industrial land use, the MTCAtph analysis calculates soil concentrations ranging from 50,000 to 57,000 mg/kg for the four samples, with a median of 55,000 mg/kg as measured by VPH/EPH (270,000 mg/kg measured by NWTPH) to be protective for soil direct contact (Table E-1). All existing soil TPH concentrations in this area are less than

that concentration and are therefore protective of direct contact under a continued industrial use.

F.1.1.3. Proposed Soil TPH PCLs for USTs 71, 72, 73 Area

Incorporating the collective area-specific data outlined above, the residual soil TPH concentrations throughout the area are protective of direct contact. The weight of evidence—considering MTCAtph leaching predictions, lack of groundwater exceedances adjacent to the highest residual soil TPH concentrations, and groundwater exceedances limited to turbid groundwater samples collected adjacent to lower-concentration residual soils—indicates that residual soils throughout the area are protective of leaching to groundwater. However, the site-wide residual saturation limit is more stringent than concentrations protective of direct contact and leaching. Therefore, the soil TPH PCL for the Bunker C UST Area is set equal to 7,700 mg/kg measured by NWTPH methods (Tables E-1 and E-3).

F.2. Calculated Soil TPH PCLs for Unit C

F.2.1. Hydraulic Barker Building Interim Action Area

Prior to the second interim action in 2020, the soil sample from the Hydraulic Barker Building area with the highest detected TPH concentration (7,710 mg/kg in the 12-foot soil sample from HB-MW-1R) was run for EPH analysis. The TPH concentration measured by the EPH analysis (4,201 mg/kg) was 54 percent of the TPH concentration measured by the NWTPH-Dx analysis, and the detected total cPAH (TEQ) concentration was 0.42 mg/kg in the sample. The predominance of diesel-range hydrocarbons (more than 60 percent aliphatic hydrocarbons in the C16-C21 range) and relatively low cPAH concentrations indicate a diesel-range petroleum product in this area. Table E-2 presents the NWTPH-Dx, EPH, and PAH data for the sample.

During the second interim action, soils represented by the HB-MW-1R sample were excavated and landfilled to address elevated PCB concentrations in groundwater from HB-MW-1R. In accordance with the Work Plan for Second Interim Action (Aspect, 2019), final excavation verification samples were analyzed to document residual concentrations of TPH and metals for purposes of this RI/FS, but the interim action excavation was not expanded based on the record sample results. As described in the Completion Report for the Second Interim Action (Aspect, 2021), 17 out of 18 record samples had TPH (D+O) concentrations below 2,000 mg/kg; however, one sample collected from the excavation bottom (HBX-B-02) contained a TPH (D+O) concentration of 19,100 mg/kg using the NWTPH-Dx analysis. The HBX-B-02 sample was collected within approximately 2 feet of the HB-MW-1R location. Mild petroleum sheen was observed on water in the Hydraulic Barker excavation while it was being advanced and dewatered, but no sheen was observed in the HBX-B-02 sample location, and no free product accumulation was observed anywhere in the excavation. No cPAHs and no PCBs were detected in the HBX-B-02 soil sample (Aspect, 2021).

Operations of the Hydraulic Barker Building ceased by 1982, when the Log Pond was filled and the mill transitioned from importing and de-barking/chipping logs to importing wood chips from K-C's Riverside facility on the east side of Everett. Therefore,

petroleum release(s) in this area occurred more than 35 years ago. Based on the age of petroleum release(s), there is a high level of confidence that NAPL in this area has migrated in the subsurface as far as it is going to as a separate mobile phase. Consistent with that, no accumulation of free product was observed prior to the second interim action during drilling of the six soil borings and two monitoring well borings in this area, nor in the completed monitoring well HB-MW-1R in this area (even with soil within the well's screened interval depth containing 7,710 mg/kg TPH), nor in the 2020 interim excavation.

F.2.1.1. Soil-to-Groundwater (Leachability) Pathway

The MTCAtph leaching model indicates that the TPH contamination in this area, even at its maximum theoretical concentration (100% NAPL; greater than 72,000 mg/kg), will not leach hydrocarbons to groundwater at concentrations of concern (Table E-2). Consistent with the MTCAtph model predictions, groundwater samples collected prior to the second interim action from the HB-MW-1R well demonstrate no exceedances of TPH or PAHs in groundwater with the highest-concentration soil, despite the fact that the highest-TPH-concentration soil is located within the depth interval of the monitoring well screen. Likewise, TPH was not detected in the groundwater sample collected from adjacent original well HB-MW-1, which had 1,440 mg/kg soil TPH within its screened interval. As stated above, more than sufficient time has elapsed for soil contamination in this area to migrate to groundwater, particularly since the soil contamination is beneath groundwater.

The combined weight of evidence from the empirical groundwater data and the MTCAtph leaching predictions suggests that maximum existing TPH soil concentrations in this area are protective of groundwater.

F.2.1.2. Soil Direct-Contact Exposure Pathway

For an industrial land use, the MTCAtph analysis calculates soil concentrations of 170,000 mg/kg as measured by EPH, and 310,000 mg/kg as measured by NWTPH-Dx, to be protective for soil direct contact (Table E-2). All remaining soil TPH concentrations in this area are less than that concentration and are therefore protective of direct contact under a continued industrial use.

F.2.1.3. Proposed Soil TPH PCLs for Hydraulic Barker Building Area

Incorporating the collective area-specific data outlined above, the residual soil TPH concentrations throughout the area are protective of direct contact and leaching to groundwater. However, the site-wide residual saturation limit is more stringent than concentrations protective of direct contact and leaching. Therefore, the soil TPH PCL for the Hydraulic Barker Building Area is set equal to 7,700 mg/kg measured by NWTPH methods (Tables E-1 and E-3).

Soil TPH Concentrations Protective of Leaching to Groundwater

The soil concentrations protective of leaching to groundwater calculated by MTCAtph are 100% NAPL (78,000 to 83,000 mg/kg). The calculations are consistent with empirical data indicating that existing TPH soil concentrations on the north and south sides of the BUST excavation area do not result in accumulation of petroleum free product on or in groundwater, and indicate that the soils on the north side do not produce groundwater dissolved-phase exceedances. Groundwater samples from wells on the south side of the excavation area had oil-range TPH exceedances, but those samples may not be representative of groundwater quality as an artifact of well construction/development. The weight of evidence indicates that maximum existing TPH soil concentrations in this area are protective of groundwater (refer to text):

6,000 mg/kg TPH measured by VPH/EPH methods
28,000 mg/kg TPH measured by NWTPH methods

Calculated Method C Soil TPH Concentrations Protective of Direct Contact (Non-cancer Hazard Index = 1) (mg/kg)

Soil TPH Concentrations Protective of Groundwater

The MTCAtph workbook calculates that soil containing 100% NAPL (73,000 mg/kg) is protective of groundwater. Empirical data indicate that the TPH soil concentrations present prior to the 2nd Interim Action excavation did not result in accumulation of petroleum free product on groundwater, and did not produce groundwater dissolved-phase exceedances. Therefore, as per MTCA, the maximum TPH soil concentrations in this area are protective of groundwater: The maximum TPH concentration (19,100 mg/kg by NWTPH) was detected in a record soil sample collected during the 2nd Interim Action. That sample was not analyzed by the EPH method but it was located within 2 feet of well HB-MW01R, where EPH analysis was conducted, and is thus considered to be the same product type with same relative percentages of petroleum fractions as detected in HB-MW-1R location (refer to text).

10,000 mg/kg TPH measured by VPH/EPH methods
19,000 mg/kg TPH measured by NWTPH methods

Calculated Method C Soil TPH Concentrations Protective of Direct Contact

	HB-MW-1R (12 ft)	
Measured by VPH/EPH methods	170,000

C	Hydraulic Barker Building Area	Diesel-range fuel oil	HB-MW-1R	7,700	19,000	310,000	7,700

Notes:

(a) Value established by Ecology.

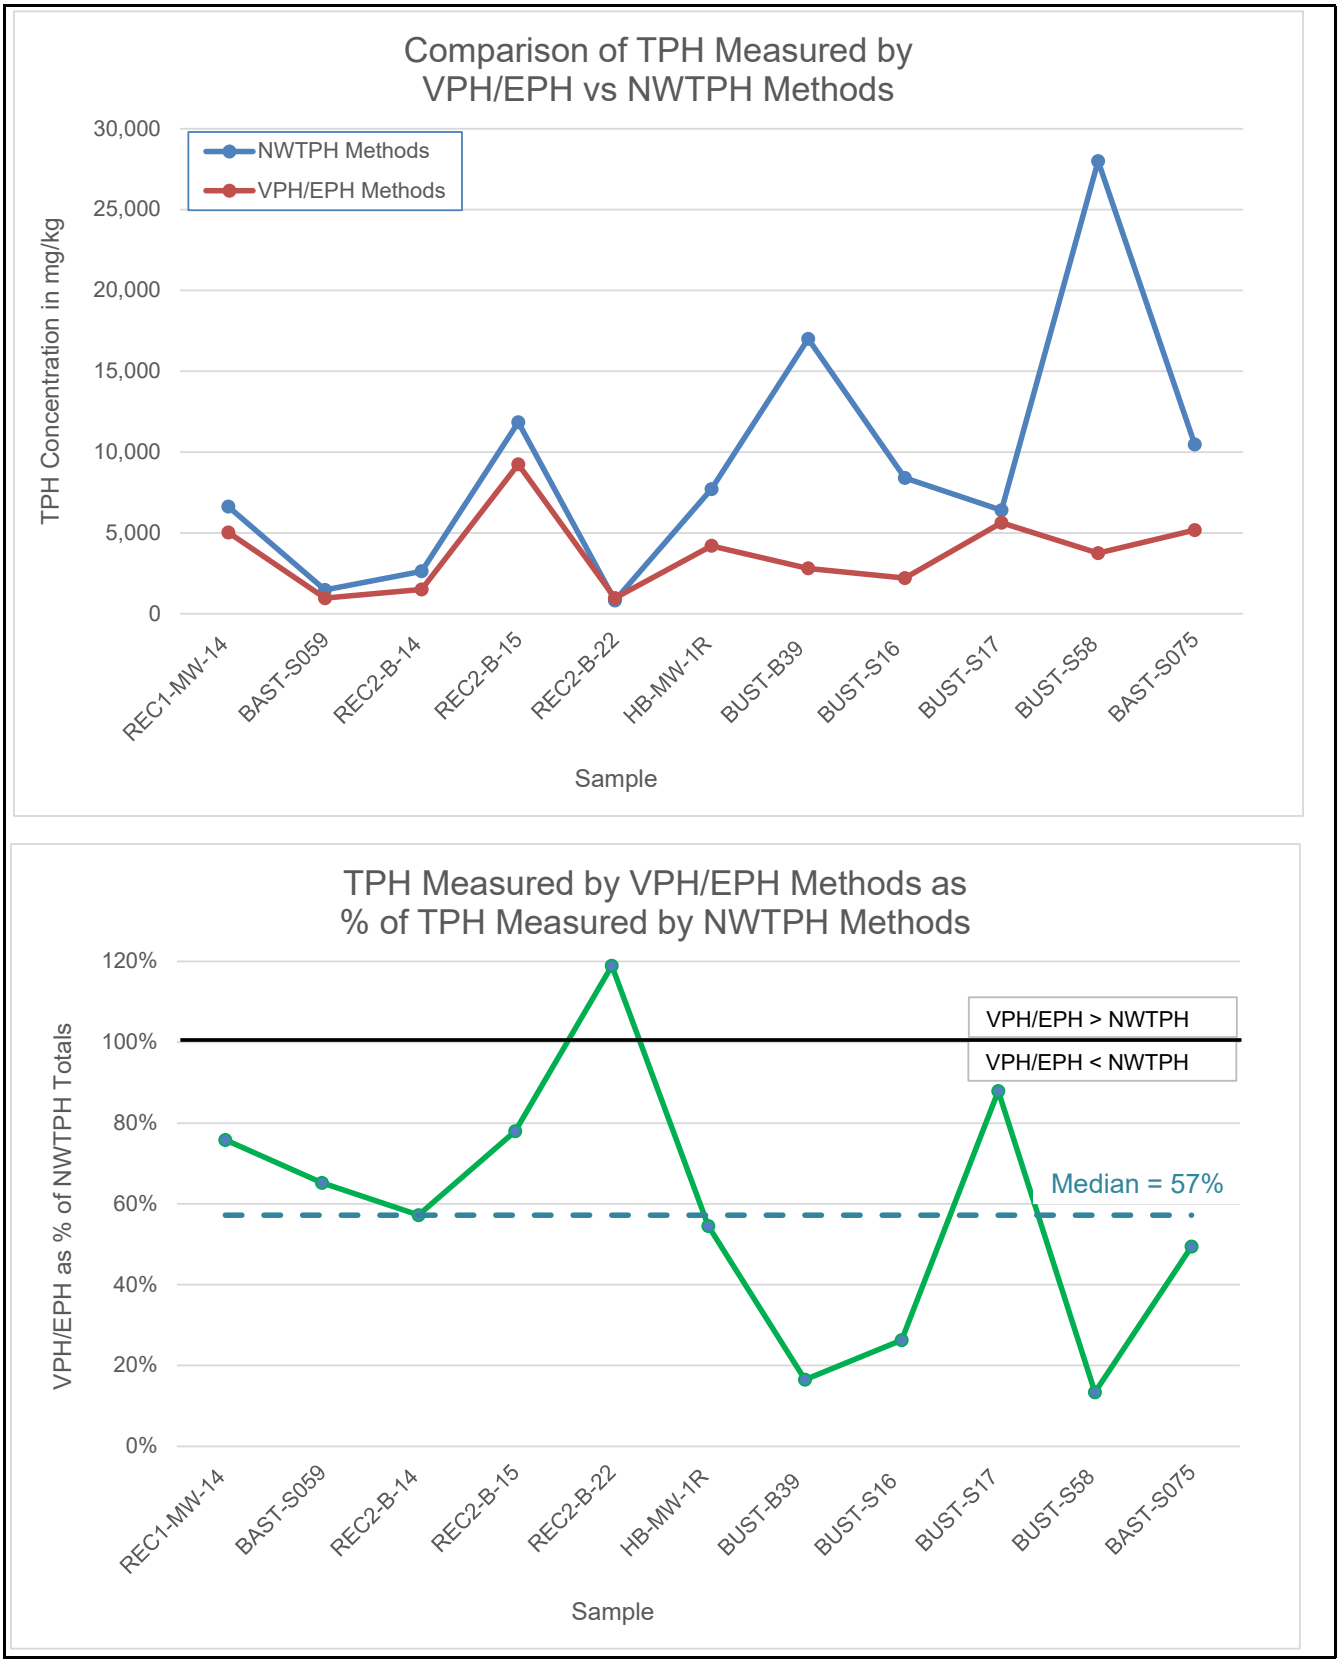
(b) Values based on empirical demonstration.

(c) Values determined from Ecology's MTCAtph Workbook calculations.

(d) Indicated by weight of evidence, despite one well with poor water level recovery and resulting apparent turbidity bias in groundwater sample results.

(e) All values are concentrations as measured by NWTPH methods. Refer to Tables B-1 and B-2 for area-specific comparison of concentrations measured by NWTPH vs EPH/VPH methods.

APPENDIX F
FIGURES



Note: Includes data from five samples with varying product types collected from the Warehouse Subunit of Unit A that was ultimately not used for derivation of area-specific PCLs for TPH but is useful for this comparative assessment.

DIRECT CONTACT - CURRENT CONDITION

Measured TPH Soil Conc, mg/kg = 2800.61

HI = 5.0E-02 **Pass**

MTCA Eq. 745-3 (1)

TPH Cleanup Level (mg/kg) (HI = 1) = 56165.33

2 Significant Figures = 56000

Check Residual Saturation (WAC 340-747(10))

The overall TPH Method C direct contact protective cleanup level is based on a noncancer HI of 1. *See* WAC 173-340-745(5)(b)(iii)(B)(III). The TPH Cleanup Level at 2 significant figures is considered to be sufficiently protective even though in some cases it may slightly exceed an HI of 1.0.

Adjustments: The overal TPH soil direct contact protective cleanup level may need to be adjusted downward to account for exposure to other noncarcinogens within the petroleum mixture (*see* WAC 173-340-740(5)(a)). MTCA Equation 745-4 is used to evaluate noncancer effects from other noncarcinogens (i.e., not listed herein) within the petroleum mixture.

To assess the Vapor pathway for petroleum mixtures, see Ecology's Guidance for Evaluating Soil VI in WA State.

TEST ADJUSTED CONDITION

Input TPH Soil Conc, mg/kg =

HI =

The Test Adjusted Condition tool allows the user to test whether a particular TPH soil concentration is protective of human health direct contact noncancer effects. *The Workbook uses the same composition ratio as for the measured data (note: the A1 Soil Data Entry must be populated to perform this calculation).*

The tool may be useful for making any necessary downward adjustments to the TPH protective cleanup level. **For example**, downward adjusting to account for HI contributions from other noncarcinogens within the petroleum mixture that are not reflected in this spreadsheet.

Use the "Soil Calculator" to calculate noncancer HQs for other noncarcinogens within the petroleum mixture (i.e., not included in this spreadsheet), and evaluate their contribution to the total HI. The cumulative noncancer effects threshold is an HI of 1.

Soil Calculator

Notes:

(1) Default exposure assumptions provided in the MTCA Rule for these equations were used with the exception of the following dermal exposure parameters: GI and ABS. Updates for these parameters were made consistent with EPA's *Risk Assessment Guidance for Superfund, Vol. I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment)* . Final. July 2004. EPA/540/R/99/005. The updated values are provided in the Chemical Database worksheet. For more information, see Ecology's July 2021 CLARC Guidance titled: *Toxicity Data and Physical/Chemical Properties for Petroleum Mixtures.*

(2) Noncancer results for the petroleum mixture that exceed a hazard index (HI) of 1 "Fail" compliance with Method C cleanup requirements and are not sufficiently protective. Note that the TPH Cleanup Level at 2 significant figures is considered to be sufficiently protective even though in some cases it may slightly exceed an HI of 1.0.

DIRECT CONTACT - CURRENT CONDITION

Measured TPH Soil Conc, mg/kg = 5622.85

HI = 1.0E-01 **Pass**

MTCA Eq. 745-3 (1)

TPH Cleanup Level (mg/kg) (HI = 1) = 53742.81

2 Significant Figures = 54000

Check Residual Saturation (WAC 340-747(10))

The overall TPH Method C direct contact protective cleanup level is based on a noncancer HI of 1. *See* WAC 173-340-745(5)(b)(iii)(B)(III). The TPH Cleanup Level at 2 significant figures is considered to be sufficiently protective even though in some cases it may slightly exceed an HI of 1.0.

Adjustments: The overal TPH soil direct contact protective cleanup level may need to be adjusted downward to account for exposure to other noncarcinogens within the petroleum mixture (*see* WAC 173-340-740(5)(a)). MTCA Equation 745-4 is used to evaluate noncancer effects from other noncarcinogens (i.e., not listed herein) within the petroleum mixture.

To assess the Vapor pathway for petroleum mixtures, see Ecology's Guidance for Evaluating Soil VI in WA State.

TEST ADJUSTED CONDITION

Input TPH Soil Conc, mg/kg =

HI =

The Test Adjusted Condition tool allows the user to test whether a particular TPH soil concentration is protective of human health direct contact noncancer effects. *The Workbook uses the same composition ratio as for the measured data (note: the A1 Soil Data Entry must be populated to perform this calculation).*

The tool may be useful for making any necessary downward adjustments to the TPH protective cleanup level. **For example**, downward adjusting to account for HI contributions from other noncarcinogens within the petroleum mixture that are not reflected in this spreadsheet.

Use the "Soil Calculator" to calculate noncancer HQs for other noncarcinogens within the petroleum mixture (i.e., not included in this spreadsheet), and evaluate their contribution to the total HI. The cumulative noncancer effects threshold is an HI of 1.

Soil Calculator

Notes:

(1) Default exposure assumptions provided in the MTCA Rule for these equations were used with the exception of the following dermal exposure parameters: GI and ABS. Updates for these parameters were made consistent with EPA's *Risk Assessment Guidance for Superfund, Vol. I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment)* . Final. July 2004. EPA/540/R/99/005. The updated values are provided in the Chemical Database worksheet. For more information, see Ecology's July 2021 CLARC Guidance titled: *Toxicity Data and Physical/Chemical Properties for Petroleum Mixtures.*

(2) Noncancer results for the petroleum mixture that exceed a hazard index (HI) of 1 "Fail" compliance with Method C cleanup requirements and are not sufficiently protective. Note that the TPH Cleanup Level at 2 significant figures is considered to be sufficiently protective even though in some cases it may slightly exceed an HI of 1.0.

DIRECT CONTACT - CURRENT CONDITION

Measured TPH Soil Conc, mg/kg = 4200.36

HI = 2.5E-02 **Pass**

MTCA Eq. 745-3 (1)

TPH Cleanup Level (mg/kg) (HI = 1) = 170434.14

2 Significant Figures = 170000

Check Residual Saturation (WAC 340-747(10))

The overall TPH Method C direct contact protective cleanup level is based on a noncancer HI of 1. *See* WAC 173-340-745(5)(b)(iii)(B)(III). The TPH Cleanup Level at 2 significant figures is considered to be sufficiently protective even though in some cases it may slightly exceed an HI of 1.0.

Adjustments: The overal TPH soil direct contact protective cleanup level may need to be adjusted downward to account for exposure to other noncarcinogens within the petroleum mixture (*see* WAC 173-340-740(5)(a)). MTCA Equation 745-4 is used to evaluate noncancer effects from other noncarcinogens (i.e., not listed herein) within the petroleum mixture.

To assess the Vapor pathway for petroleum mixtures, see Ecology's Guidance for Evaluating Soil VI in WA State.

TEST ADJUSTED CONDITION

Input TPH Soil Conc, mg/kg =

HI =

The Test Adjusted Condition tool allows the user to test whether a particular TPH soil concentration is protective of human health direct contact noncancer effects. *The Workbook uses the same composition ratio as for the measured data (note: the A1 Soil Data Entry must be populated to perform this calculation).*

The tool may be useful for making any necessary downward adjustments to the TPH protective cleanup level. **For example**, downward adjusting to account for HI contributions from other noncarcinogens within the petroleum mixture that are not reflected in this spreadsheet.

Use the "Soil Calculator" to calculate noncancer HQs for other noncarcinogens within the petroleum mixture (i.e., not included in this spreadsheet), and evaluate their contribution to the total HI. The cumulative noncancer effects threshold is an HI of 1.

Soil Calculator

Notes:

(1) Default exposure assumptions provided in the MTCA Rule for these equations were used with the exception of the following dermal exposure parameters: GI and ABS. Updates for these parameters were made consistent with EPA's *Risk Assessment Guidance for Superfund, Vol. I: Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment)* . Final. July 2004. EPA/540/R/99/005. The updated values are provided in the Chemical Database worksheet. For more information, see Ecology's July 2021 CLARC Guidance titled: *Toxicity Data and Physical/Chemical Properties for Petroleum Mixtures.*

(2) Noncancer results for the petroleum mixture that exceed a hazard index (HI) of 1 "Fail" compliance with Method C cleanup requirements and are not sufficiently protective. Note that the TPH Cleanup Level at 2 significant figures is considered to be sufficiently protective even though in some cases it may slightly exceed an HI of 1.0.

Target Groundwater TPH concentration adjusted previously if any:

Target Groundwater TPH Conc, ug/L: 500

CALCULATE PROTECTIVE CONDITION OR TEST SOIL CONDITION

Calculate Protective TPH Soil Condition for Potable Groundwater Quality @ HI = 1 — @ HI = 1

Test Current or Adjusted TPH Soil Condition — Enter TPH Soil Conc (mg/kg)

Enter a TPH soil concentration greater than "0" before testing soil conditions. Errors will occur if the Test TPH scenarios are run at a TPH Soil Conc of "0", or when left blank.

1. Using Solver Function — Test TPH Soil Conc

2. Alternative: If button above does not work — Test TPH (Alternative)

Calculate Protective Soil Condition for a Target TPH Groundwater Cleanup Level — Protection of Target TPH GW Conc

MODEL RESULTS

Selected Soil Leaching Criterion: Protection of Target TPH Groundwater Concentration

Protective TPH Soil Concentration, mg/kg = 100% NAPL

Protective TPH GW Concentration, ug/L = 1.84E+02 *@ 2 sig figures* **180**

HI @ Well = NA

DETAILED MODEL RESULTS

Type of model used for computation:	4-Phase Model
Computation completed?	Yes!
Initial Weighted Average MW of NAPL, g/mol:	272.0
Equilibrated Weighted Average MW of NAPL, g/mol:	272.0
Initial Weighted Average Density of NAPL, kg/L:	0.837
Volumetric NAPL Content, QNAPL :	1.3E-01
NAPL Saturation (%), QNAPL/n:	30.20%
100% NAPL, mg/kg	72573.3

Mass Distribution Pattern @ 4-phase in soil pore system:

Total Mass distributed in Water Phase: 0.00% in Solid: 0.10%

Total Mass distributed in Air Phase: 0.00% in NAPL: 99.90%

Please Check Soil Residual Saturation TPH Levels: Refer to Table 747-5!

Notes:

(1) Default exposure assumptions provided in the MTCA Rule for these equations were used. All of the aliphatic fractions, including aromatic fractions up to EC21, are sufficiently volatile based on their Henry's law, and have been assigned an INH value 2. Aromatic fractions greater than EC21 to EC34 are dominated by high molecular weight PAHs) and are not considered to be sufficiently volatile. These are evaluated using an INH of 1. The updated values are provided in the Chemical Database worksheet. For more information, see Ecology's July 2021 CLARC Guidance titled: *Toxicity Data and Physical/Chemical Properties for Petroleum Mixtures.*

(2) Noncancer results for the petroleum mixture that exceed a hazard index (HI) of 1 "Fail" compliance with Method B cleanup requirements and are not sufficiently protective.

APPENDIX H

Background Information Regarding Ammonia and Sulfide

H. Background Information Regarding Ammonia and Sulfide

This appendix presents background information regarding ammonia and sulfide that is pertinent to measuring concentrations of the toxic forms of each compound and thereby assessing their environmental risks. The following sections provide a brief overview of the environmental geochemistry of ammonia and sulfide, and then describe the methods used to calculate, from analytical results, the concentrations of the toxic forms of ammonia and sulfide.

H.1. Overview of Ammonia and Sulfide Geochemistry

H.1.1. Ammonia

In the environment, ammonia is natural part of the nitrogen cycle and is produced from anaerobic bacterial processes such as the decomposition of organic matter. Ammonia is a primary form of nitrogen in waters containing low dissolved oxygen levels, and is typically present at higher concentrations in marine sediment porewater compared to overlying surface waters.

'Total free ammonia' is the sum of unionized ammonia (NH_3) and ammonium ion (NH_4^+) concentrations. Since NH_3 is more toxic to benthic and aquatic organisms, federal/state water quality and risk-based porewater benchmarks are based on the NH_3 concentration.

In aqueous solutions, an equilibrium exists between the NH_3 and NH_4^+ species, and their relative proportion is affected by pH, temperature, and salinity as follows:

- **pH.** The proportion of total free ammonia present as NH_3 increases with higher pH; at pH levels less than 8, less than 10 percent of total free ammonia is present as NH_3.
- **Temperature.** The proportion of total free ammonia present as NH_3 increases with higher temperature.
- **Salinity.** The proportion of total free ammonia present as NH_3 decreases with higher salinity.

Both NH_3 and NH_4^+ are soluble in water. However, NH_3 is volatile, particularly at higher temperatures. In addition, NH_3 and NH_4^+ are readily aerobically biologically transformed to nitrite and nitrate in waters containing dissolved oxygen.

H.1.2. Sulfide

Sulfide is also ubiquitous in natural marine sediments, as large quantities of hydrogen sulfide are produced by sulfate-reducing microorganisms utilizing the relatively high concentrations of sulfate present in marine waters to anaerobically degrade organic matter.

Natural marine sediments, as well as dredged marine sediments that were used historically to create most of the upland soil at the Site, typically contain from 0.01 percent to 1 percent bulk sulfide, largely in the form of stable insoluble iron and manganese sulfide minerals. Like ammonia, dissolved sulfide is typically present at higher concentrations in marine sediment porewater compared to overlying surface waters.

'Total free sulfide' is the sum of hydrogen sulfide (H_2S), hydrosulfide ion (HS^-), and disulfide ion (S^{2-}) concentrations. Since H_2S is more toxic to benthic and aquatic organisms, federal/state water quality and risk-based porewater benchmarks are based on the H_2S concentration.

In aqueous solutions, an equilibrium exists between the H_2S, HS^-, and S^{2-} species, and, like ammonia, their relative proportion is affected by pH, temperature, and salinity as follows:

- **pH.** The proportion of total free sulfide present as H_2S decreases with higher pH (opposite that of NH_3), as illustrated on Figure G-1; at pH levels less than 8, more than 10 percent of total free sulfide is present as H_2S.
- **Temperature.** The proportion of total free sulfide present as H_2S decreases with higher temperature.
- **Salinity.** The proportion of total free sulfide present as H_2S decreases with higher salinity.

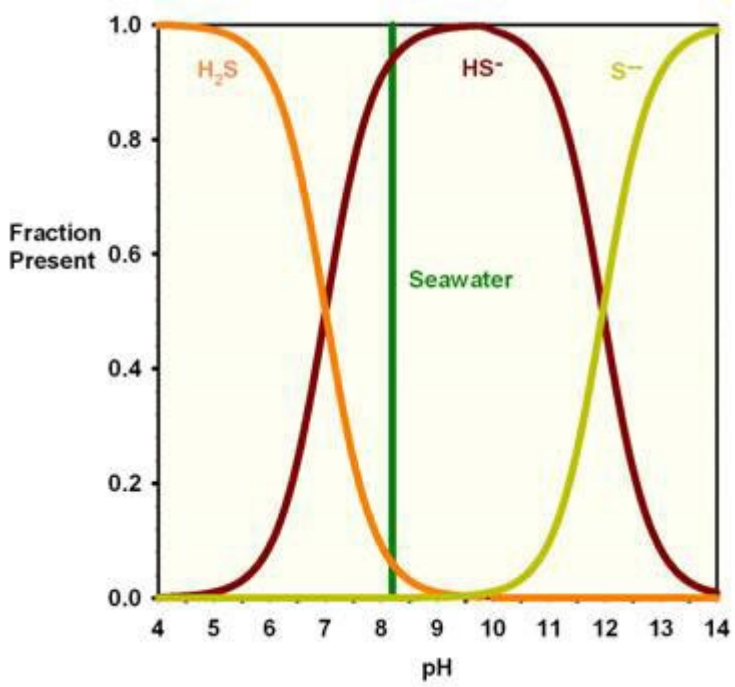

Figure H-1. Distribution of Sulfide Species H_2S, HS^-, and S^{-2} as a Function of Water pH (from http://reefkeeping.com/issues/2005-12/rhf/)

H_2S is highly volatile and when exposed to oxygen is rapidly oxidized (chemically) into sulfate or other nontoxic sulfur species, often within minutes (Ostlund and Alexander,

1963). Until the recent development of more reliable passive sampling methods (see Attachment G1), the volatility and rapid chemical oxidation of H_2S posed difficulties in accurately measuring groundwater and porewater H_2S concentrations in the environment.

H.1.3. Groundwater-Surface Water Interactions

As shallow groundwaters at the Site approach the point of discharge into surface sediments and embankment slopes of the adjacent East Waterway, the higher dissolved oxygen and sulfate concentrations present in marine waters (relative to Site groundwater) disperse into nearshore groundwater. Conceptual groundwater-surface water interactions are depicted on Figure G-2.

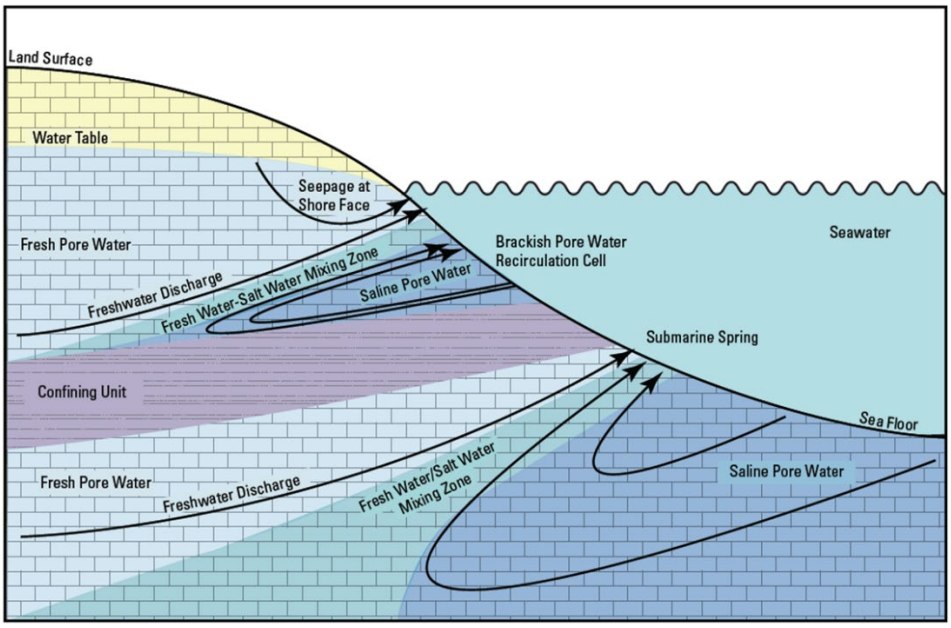

Figure H-2. Groundwater – Surface Water Interactions (from Swarzenski et al. 2004)

As outlined above, sulfate dispersing into near-surface marine sediments with relatively high organic matter concentrations (e.g., sediments and shoreline soils containing wood debris) can increase H_2S production by sulfate-reducing microorganisms. However, concurrent increased dissolved oxygen concentrations in this groundwater transitional zone raises the oxidation-reduction potential, which can retard anaerobic microbial production of NH_3 and H_2S as aerobic processes predominate (Figure G-3). Moreover, increasing dissolved oxygen concentrations in this transition zone stimulate rapid biological transformation of NH_3 to nitrite and nitrate, and even more rapid chemical oxidation of H_2S to sulfate, thus reducing their toxicity.

Because of the complex geochemistry of the transition zone, direct measurement of NH_3 and H_2S is necessary to accurately characterize concentrations within this zone. Moreover, because of chemical and aerobic transformations of NH_3 and H_2S to less-toxic forms in this transition zone, the primary environmental risks posed by elevated NH_3 and

H_2S concentrations are to benthic invertebrates residing at the point of discharge within surface sediments, not to overlying surface waters.

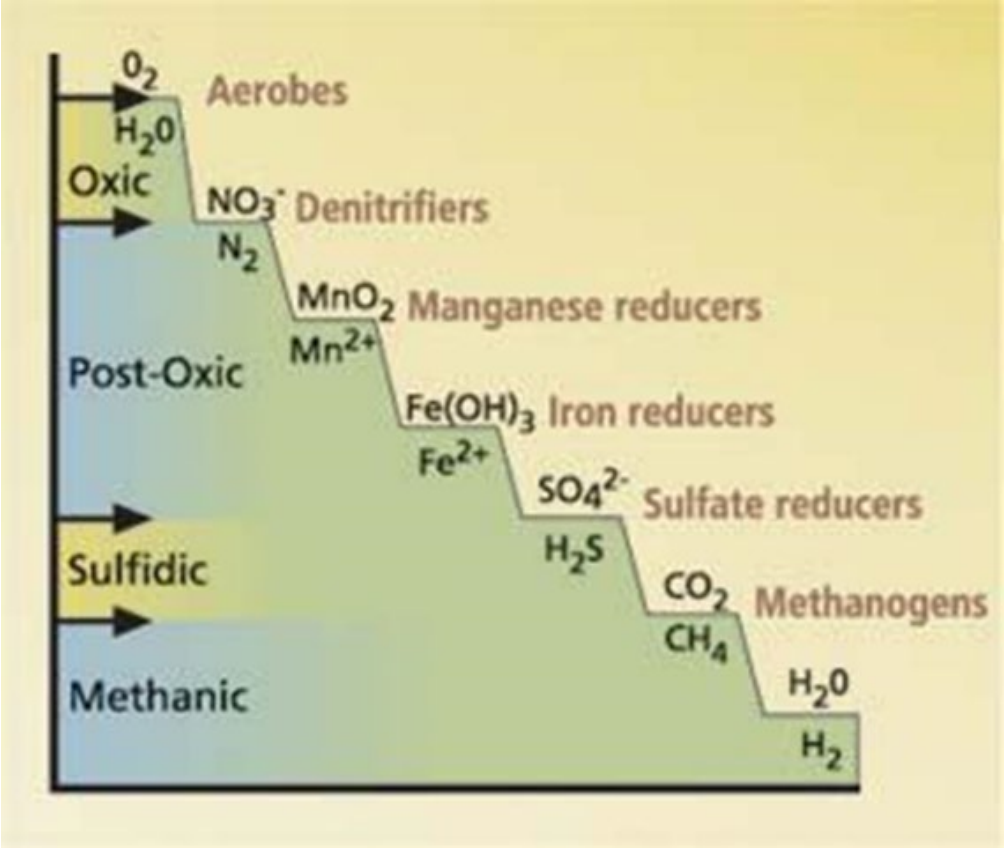

Figure H-3. Microbial Thermodynamic Controls Along the Oxidation-Reduction Scale

H.2. Determination of NH_3 and H_2S Concentrations

H.2.1. Un-ionized Ammonia (NH_3)

The analytical method used to quantify total ammonia concentrations in water samples was EPA Method 350.1. The NH_3 concentrations were calculated using the laboratory-reported total ammonia concentration, field-measured temperature, field-measured pH, and (calculated) salinity for each water sample, applying the algorithm included in Ecology's online PWSPREAD.xls workbook[1]. The sample salinity was calculated from field-measured specific electrical conductance (EC) and temperature using the algorithm in the PWSPREAD workbook.

H.2.2. Hydrogen Sulfide (H_2S)

The analytical method used to quantify total dissolved sulfide concentrations in water samples collected between 2012-2014 was Standard Method 4500-S2-D. However, the

[1] http://www.ecy.wa.gov/programs/eap/pwspread/pwspread.html.

detected concentrations of total dissolved sulfide in field-filtered water samples may include significant amounts of colloidal sulfide minerals that can pass through a 0.45-micron filter, and therefore overstate the concentration of free H_2S that is the measure of sulfide toxicity. Based on paired sample comparisons, as summarized in the main body of the RI/FS report, the total dissolved sulfide method commonly overstates estimated free H_2S concentrations by approximately 100- to 1,000-fold, and thus is of limited value for comparison with cleanup levels that are based on H_2S. However, there is a high degree of confidence that total dissolved sulfide concentrations below cleanup levels would not pose a toxicity risk.

In contrast to Standard Method 4500-S2-D, the *in situ* diffusive-gradients-in-thin-films (DGT) passive sampling protocol is designed specifically to quantify free H_2S concentrations in water for direct comparison with regulatory criteria based on H_2S. The DGT methodology is described in Aspect and Anchor QEA (2015) and Anchor QEA (2015). Attachment G1 presents verification data for the DGT analytical method, confirming its accuracy as a reproducible method for quantifying free H_2S concentrations.

The DGT measurements of free sulfide include both H_2S and HS^- because both species will diffuse into the gel and react with the silver iodide. Because much of the free sulfide will be in the HS^- form at pH greater than 7 (see Figure G-1 above), and since toxicity has been related specifically to H_2S, it is necessary to calculate the H_2S concentration from the free sulfide concentrations measured by DGT. Table G-1 presents the H_2S calculations for Site water samples based on sample-specific measured pH, temperature, and salinity, including equations used to calculate sample-specific dissociation constants (from Millero et al, 1988; Phillips et al, 1997).

Abstract

The pK_1* for the dissociation of H_2S

has been measured in artificial seawater as a function of salinity (S = 5–40) and temperature (5°– 25°C). Results have been fitted to an equation of the form

$$pK_1^* = pK_1 + AS^{1/2} + BS$$

where pK_1 is the value at infinite dilution given by

$$pK_1 = -98.080 + 5{,}765.4/T + 15.0455 \ln T$$
$$A = -0.1570$$
$$B = 0.0135$$

(σ = 0.033 in pK*, mol kg^{-1} seawater). The results at S = 35 show a 0.08 shift in pK* from the results in the literature, as was also found in 0.7 m NaCl solutions. The results are in good agreement with the apparent pK_1' results when adjusted to the same pH scale. Using values for the apparent activity coefficient of the proton, we combined our results with those results to derive the consensus values of

$$A = -0.1498$$
$$B = 0.0119$$

(σ = 0.028 in pK_1*).

Equilibrium equation for H2S calculation from Phillips et al (1997)

$$[H_2S] = [\text{total } S^{2-}] \times (1-(1/(1 + 10^{(pK_a - pH)})))$$

Re: Method Development and Verification Study for Sulfide Measurement in Porewater Using Diffusive-Gradients-in-Thin-Films (DGT)

This document presents the results of a laboratory verification study of a passive porewater sampling technique for dissolved sulfide using Diffusive Gradients in Thin-films (DGT). The method, developed over the last two decades (Teasdale et al. 1999; Rearick et al. 2005), is finding increasing use as a reliable in situ technique for quantifying sulfide levels in sediment porewater. The method is based on the reaction of sulfide with silver iodide (AgI), a white powder impregnated in a gel to produce silver sulfide (Ag_2S), a black solid. The intensity of the color developed is proportional to the amount of sulfide accumulated in the gel.

For this study, we developed a calibration curve using optical densitometry (OD) to quantify the amount of sulfide accumulated in the DGT device over a dissolved sulfide concentration range of 0 to 6 mg/L sulfide. To verify the DGT technique, sulfide was extracted from exposed DGTs and quantified using two different extraction and analysis methods:

- Extraction of chromium reducible sulfur (CRS) from the DGT gel and analysis by sulfide ion-specific electrode
- Extraction of the DGT gel by nitric acid/hydrogen peroxide (commonly used in selective sequential extraction schemes to quantify metals associated with sulfides) and analysis of total sulfur released by ICP-MS

Results from both methods were in excellent agreement and quantitative recovery of sulfide from the DGT gels was confirmed by comparison with the theoretical mass of accumulated sulfide calculated using a mass-transfer model. Sulfide recoveries from the DGT gels averaged 101.0% and 96.9% for the CRS and nitric acid/peroxide extraction methods, respectively.

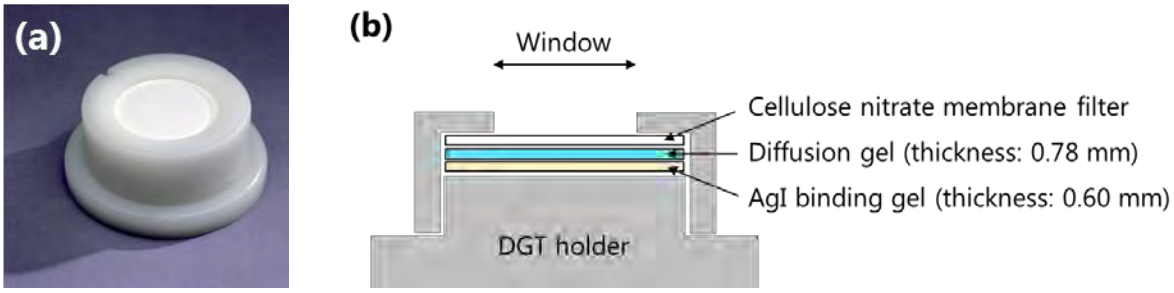
Materials and Methods

DGT Samplers

DGT piston devices for deployment in soil were obtained from DGT® Research (http://www.dgtresearch.com). The DGT samplers were preloaded for sulfide measurement and

consist of a standard DGT holder containing a 0.6 mm thick silver iodide (AgI) impregnated binding gel layer, overlain by a 0.78 mm thick polyacrylamide diffusive gel, and held in place by a 0.45 µm cellulose nitrate membrane filter (Figure 1). The window size of the DGT sampler is 2.54 cm^2. Prior to use, the DGT assemblies were deoxygenated by immersion in 0.01 M sodium nitrate purged with high-purity nitrogen gas for at least 2 days to remove any residual oxygen.

Figure 1
DGT piston assembly (a) and cross-section view (b)



* DGT® Research: http://www.dgtresearch.com/

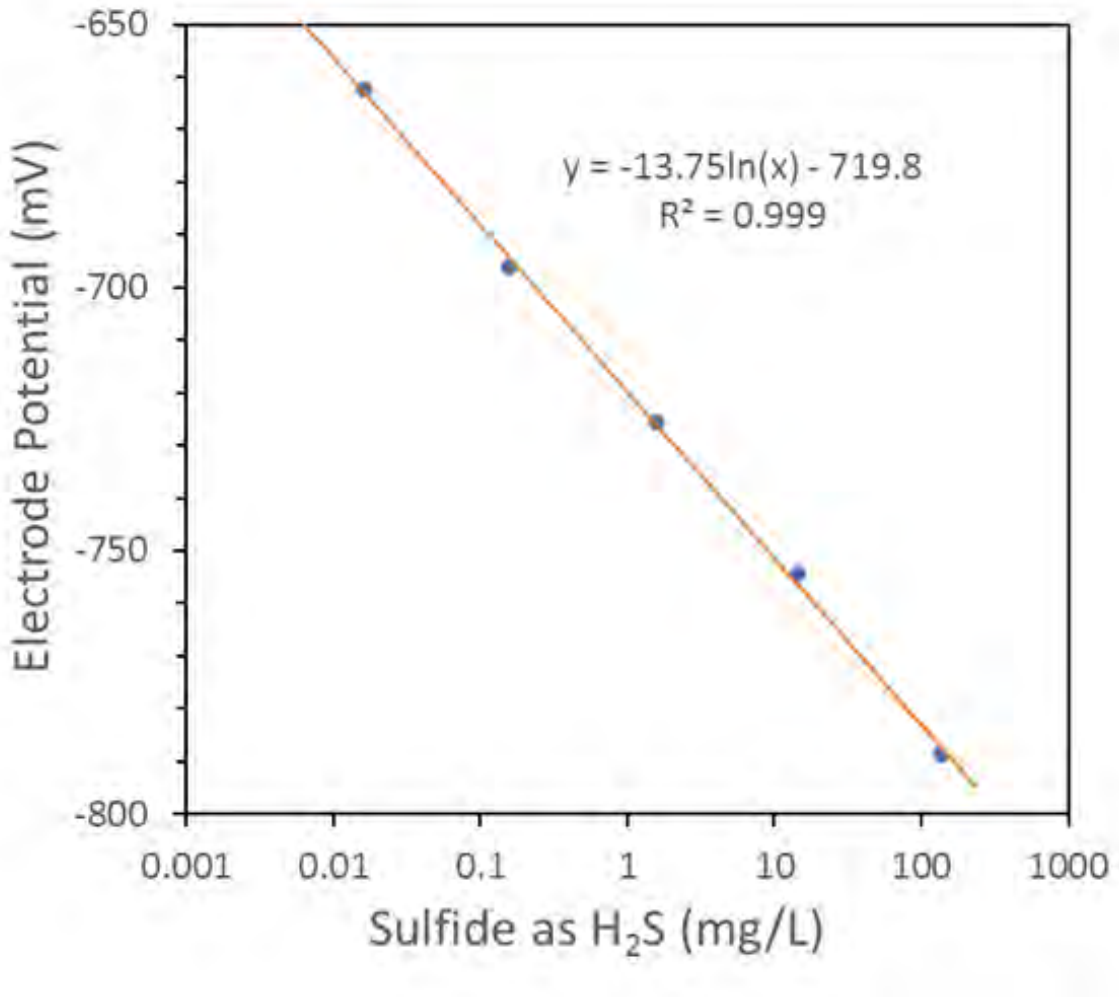
Preparation of Stock Sulfide Solutions

All sulfide solutions were prepared from a stock solution of approximately 1,000 mg/L as S (1,063 mg/L as H_2S). The stock solution was prepared by first washing a crystal of sodium sulfide nonahydrate ($Na_2S{\cdot}9H_2O$) with deionized (DI) water to remove oxidation products, blotting it dry on tissue paper, accurately weighing it, and dissolving it in deoxygenated DI water. Between uses, the stock solution was stored under nitrogen sealed in a Mylar bag with oxygen absorber packets to minimize exposure to oxygen. The sulfide stock solution was standardized daily by iodometric titration (Standard Method 4500-S2-F; APHA 2005).

Sulfide Measurement by Ion Selective Electrode

Dissolved sulfide concentrations were measured by Standard Method 4500-S2-G (APHA 2005) using a Thermo Scientific silver sulfide solid-state ion selective electrode (ISE) connected to a Thermo Scientific Orion Star A211 potentiometer. Alkaline anti-oxidant buffer (Thermo Scientific Orion 941609) was added to samples and standards to inhibit oxidation of sulfide by oxygen and to provide a constant ionic strength and pH during analysis. A five-point calibration curve was developed daily (Figure 2).

Figure 2
Example calibration curve for sulfide ISE



Calibration Curve for the Densitometric Determination of Sulfide

DGT sampler assemblies were exposed in duplicate to test solutions prepared at 8 different sulfide concentrations (0 to 6 mg/L as H_2S) for 24 hours. The solutions were prepared in 0.7 M sodium chloride to simulate seawater ionic strength. To minimize sulfide loss, tests were prepared in glass jars with cone seal caps, all solutions were purged with N_2 gas before addition of the sulfide stock solution, and headspace in the glass containers was minimized. Sulfide concentrations in the standard solutions were monitored by ISE before and after deploying the DGT assemblies.

Following the 24-hour exposure period, the DGT assemblies were retrieved and rinsed with DI water. The binding gel layers were removed and placed on blotting paper. The binding gels were then laid on a thin cellophane sheet (Bio-Rad), and covered with a second cellophane sheet. The sheet assembly was then placed in a vacuum gel dryer (Bio-Rad, Model 583) and dried for 2 hours at 60°C. The dried sheet was digitally scanned (Konica Minolta BizHub-C364) and saved as a gray-scale image. Gel analysis software (UN-SCAN-IT Gel Version 7.1) was used to measure and record the gray-scale intensity of each binding gel on the scanned image.

Extraction and Quantification of Sulfide in DGT Binding Gels

Sulfide was extracted from the exposed DGT binding gels by a modified CRS method (Burton et al., 2008) as well as a nitric acid/peroxide extraction method. Six replicate sulfide-exposed DGT samplers were prepared by exposing the devices to a 3.00 mg/L H_2S solution for 24 hours. Three DGTs were extracted by each method to quantitatively assess sulfide recovery and method reproducibility.

The modified CRS method developed by Burton et al. (2008) was adopted to this study. Briefly, an acidic chromium(II) solution was added to a gas-tight reaction vessel containing the sulfide-reacted binding gel to convert sulfide to hydrogen sulfide gas, which was trapped in an alkaline zinc acetate solution contained in a small centrifuge tube placed inside the reaction vessel. On completion of the extraction, dissolved sulfide concentrations in the trapping solutions were immediately measured by ISE.

A nitric acid/peroxide extraction is one of the steps employed in some selective sequential extraction procedures to quantify metals associated with organic matter and/or sulfides in soil and sediment (Tessier et al. 1979, Zimmerman and Weindorf 2010) and was used to extract sulfur from the DGT. In brief, the sulfide-reacted binding gel is extracted in acidic hydrogen peroxide followed by nitric acid. A detailed description of the procedure is provided in Appendix A. Sulfide released form the gel to the extraction fluid is oxidized to sulfate which is analyzed as total sulfur by Inductively Coupled Plasma Optical Emission Spectrometry (ICP-OES). ICP-OES analysis of the extracts was performed in the analytical geochemistry laboratory of the Geology Department at Portland State University. A procedural blank was also prepared and analyzed and sample results were blank corrected.

Results

Determination of Sulfide in DGT Samplers by Optical Densitometry

Dissolved sulfide concentrations in test solutions were measured before and after deployment of the DGT assemblies (Table 1). Sulfide losses from the solutions over the 24-hour exposure period ranged from 13 to 26 % and averaged 20 %. This is comparable to losses reported by Rearick et al. (2005)

due to oxidation, volatilization, or adsorption. The digital images of the sulfide-accumulated binding gels are shown in Figure 3 and the measured gray-scale intensities of the gels are given in Table 1.

Figure 3
Gray-scale images of DGT binding gels exposed to sulfide standard solutions for 24 hours

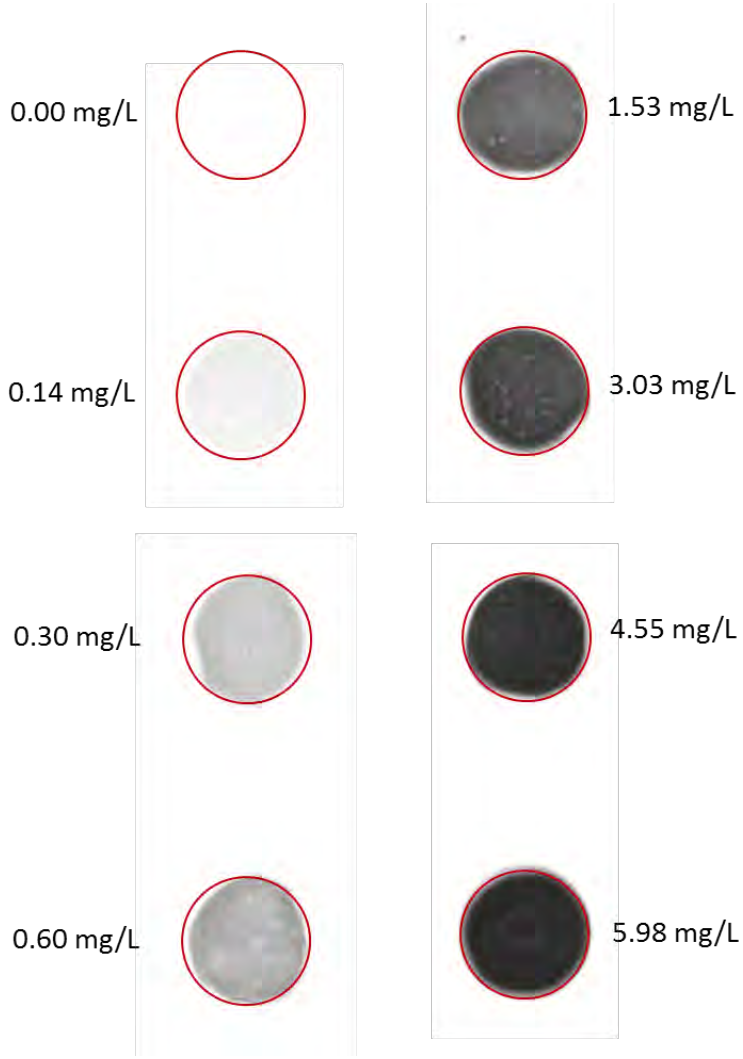


Table 1
Sulfide Mass Balance and Optical Densitometry Results

Solution	Target Concentration (mg/L as H_2S)	Measured Sulfide Concentration (mg/L as H_2S)[1]			Sulfide Loss[2] (%)	Gray-Scale Intensity[3]		
		Initial	Final	Average		1	2	Average
1	0.00	0.00	0.00	0.00	-	0	0	0 (0)
2	0.17	0.16	0.12	0.14	26%	6	14	10 (4)
3	0.34	0.33	0.26	0.30	23%	33	52	43 (10)
4	0.68	0.67	0.52	0.60	23%	100	77	89 (12)

7	5.10	4.86	4.24	4.55	13%	183	195	189 (6)
8	6.80	6.64	5.31	5.98	20%	194	193	194 (1)

Notes:

1. Measured by ISE.
2. Sulfide loss (%) during the experiments may be attributed to oxidation, volatilization, or adsorption.
3. Two DGTs were exposed at each sulfide concentration.

A calibration curve was developed by plotting the gray-scale intensity dissolved sulfide exposure concentrations and fitting the data to a function relating intensity to exposure sulfide concentration. As shown in Figure 4, the data were well fit by an exponential function (Equation 1) over the entire range of sulfide concentrations tested (0 – 6 mg/L as H_2S).

Equation 1 is useful for gray-scale intensities greater than about 10 (corresponding to sulfide concentrations greater than 0.15 mg/L). For lower concentrations, a three-point calibration curve was developed using the lowest concentration gel data. For the low range calibration, a power function was found to fit the data best (Equation 2).

Equation 1 is recommended for estimating porewater sulfide concentrations from DGT gels for gray-scale intensity greater than 10 and Equation 2 is appropriate for gray-scale intensity less than or equal to 10.

Equation 1. DGT calibration curve for sulfide concentration using optical densitometry (24-hour exposure)

$$S = 0.1156 \times \exp\{0.0196 \times I\}$$

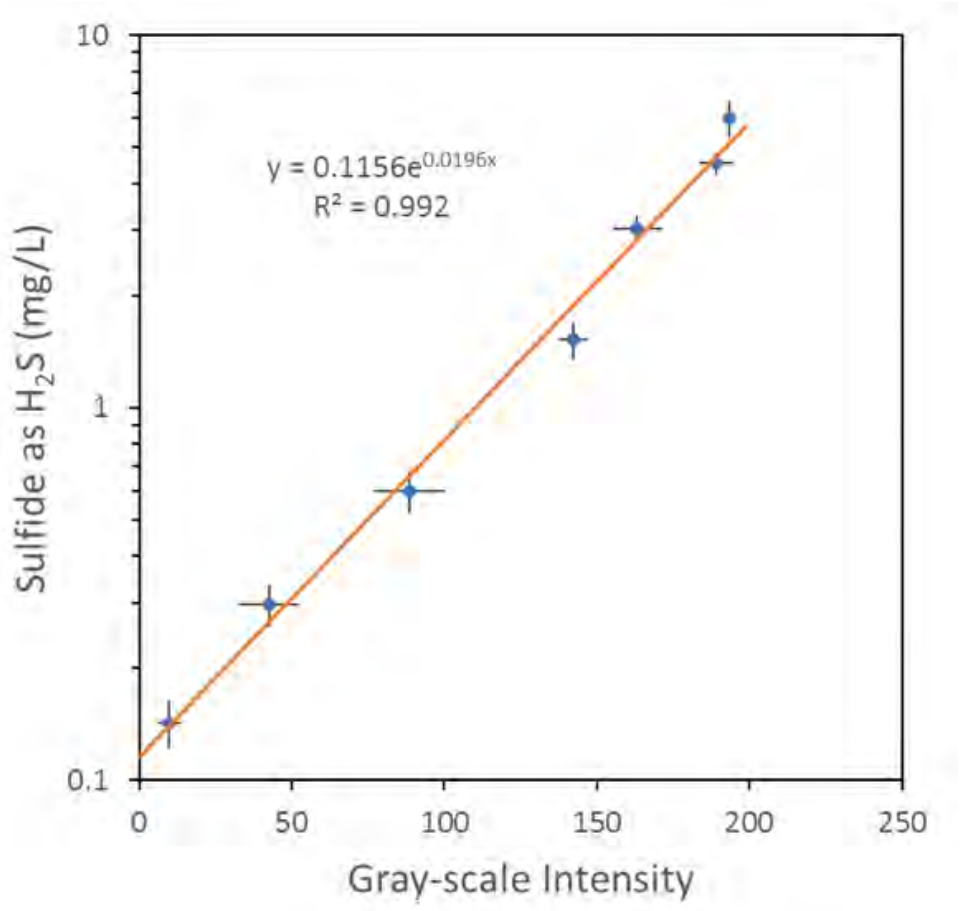
$$R^2 = 0.992$$

where:

S = sulfide concentration (mg/L as H_2S)

I = gray-scale intensity of binding gel image (10-256)

Figure 4
DGT calibration curve for a 24-hour exposure period



Equation 2. Low-range DGT calibration curve for sulfide concentration using optical densitometry (24-hour exposure)

$$S = 0.0304 \times I^{0.6298}$$

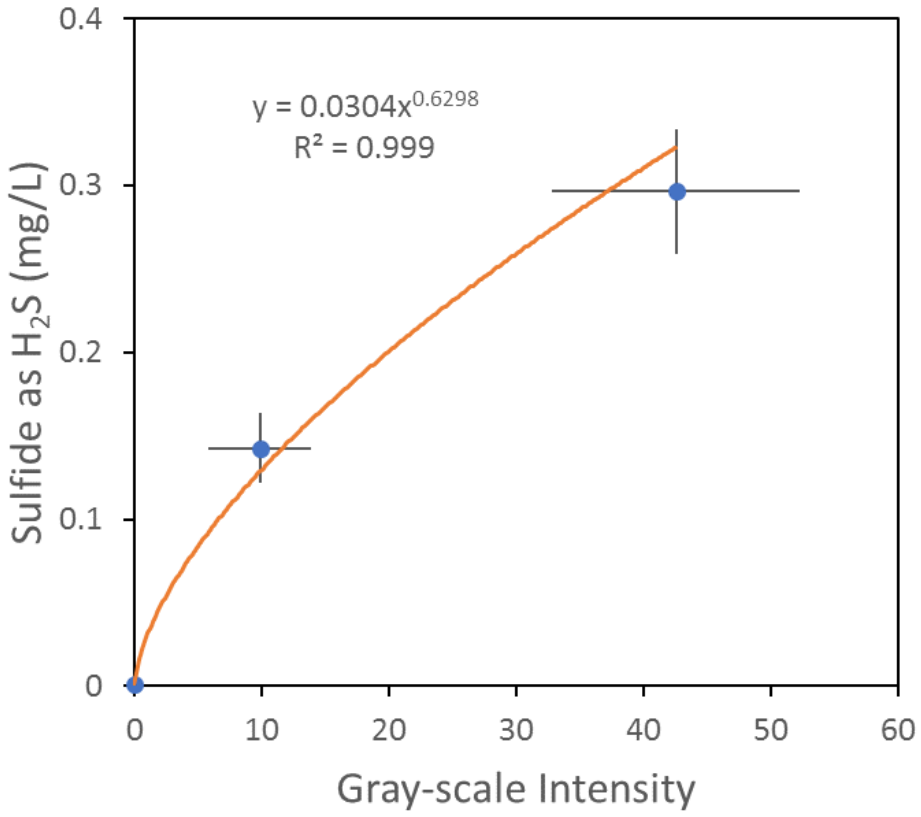
$$R^2 = 0.999$$

where:

S = sulfide concentration (mg/L as H_2S)

I = gray-scale intensity of binding gel image (0-10)

Figure 5
Low-range DGT calibration curve for a 24-hour exposure period



Verification of Sulfide Accumulation in DGT Samplers

Sulfide recovered from DGT binding gels after exposure to 3.00 mg/L H_2S solution for 24 hours by the CRS and nitric acid/peroxide extraction methods are summarized in Table 2. The sulfide mass extracted by the two methods is in very good agreement and excellent sulfide mass recoveries were obtained.

Table 2
Verification of Sulfide Accumulation in DGT

Extraction Method	Measured Sulfide Concentration (mg/L as H_2S)[1]			Mass of Sulfide Extracted from DGT (µg as H_2S)		Theoretical Mass of Sulfide Accumulated in DGT (µg as H_2S)[2]	Recovery (%)[3]
	Initial	Final	Average				
Chromium Reducible Sulfur	3.65 ±0.11	2.34 ±0.04	2.99	1	13.5	13.9	97
				2	13.6		98
				3	15.2		109
				Average	14.1		101
Nitric acid /Peroxide	3.65 ±0.11	2.36 ±0.01	3.00	1	12.9	13.9	92
				2	14.5		104
				3	13.4		96
				Average	13.6		98

Notes:

1. Measured by iodometric titration.
2. Calculated with Equation 2 using the average sulfide concentration, $D=1.65\times10^{-6}$ cm^2/s (derived from data in Teasdale et al. 1999), t=86,400 s, A=2.54 cm^2, and Δg=0.078 cm.
3. Recovery=100×(mass of sulfide extracted)/(theoretical mass of sulfide accumulated)

The extracted sulfide masses were compared to the theoretical amount accumulated calculated using the mass-transfer equation for sulfide accumulation in the DGT assembly (Equation 3) and used to calculate percent recoveries (Table 2).

Equation 3. Model equation for calculating sulfide mass accumulation in DGT binding gel (Teasdale et al. 1999)

$$M = \frac{CDtA}{\Delta g}$$

where:

M	=	mass of sulfide accumulated in binding gel (mg as H_2S)
C	=	sulfide concentration in solution (mg/cm^3 as H_2S)
D	=	effective diffusion coefficient of sulfide in DGT (cm^2/s)
t	=	exposure time (s)
A	=	cross-sectional area of DGT window (cm^2)
Δg	=	thickness of diffusion layer (cm)

The sulfide mass recoveries were in excellent agreement with the theoretical sulfide mass accumulated calculated by equation 3 and averaged 101 % of theoretical for the CRS method and 98 % for the nitric acid/peroxide extraction (Table 2).

Summary

The present study verified the DGT method for passive sampling of dissolved sulfide by establishing a quantitative relationship between dissolved sulfide concentrations in the range of 0 to 6 mg/L and the gray-scale intensity developed by the DGT binding gel after a 24-hour exposure period, and confirmed that the sulfide accumulated in the DGT gel agreed with the amount expected from theory. The results of this study show that the DGT method with quantification by optical densitometry gives accurate and reproducible results for dissolved sulfide concentrations and calibration curves were developed for field application of the DGT devices.

Appendix A

Nitric acid/peroxide extraction procedure

Fluid 1: 0.02 M nitric acid
Fluid 2: 30% hydrogen peroxide adjusted to pH 2 with nitric acid
Fluid 3: 3.2 M ammonium acetate in 20% v/v nitric acid

1. Place a sulfide exposed DGT binding gel in a 50 mL centrifuge tube
2. Add 3 mL of fluid 1 and 5 mL of fluid 2 and heat in shaker-water bath at 85 ± 2 °C for 2 hours
3. 3. Add 3 mL of fluid 2 and heat for an additional 3 hours
4. After cooling, add 5 mL of fluid 3, dilute to 20 mL and agitate for 30 minutes at room temperature
5. Centrifuge at 10,000 rpm for 25 minutes (if solid is present)
6. Decant fluid
7. Repeat steps 3-6 with DI water (if solid is present)
8. Combine all decanted fluid, acidify with nitric acid to pH <2
9. Dilute with DI water to a final volume of 50 mL and submit for analysis

40													
41						Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.							
42						Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers							
43						and consists of observations collected from clean unimpacted locations.							
44						The use of USL tends to provide a balance between false positives and false negatives provided the data							
45						represents a background data set and when many onsite observations need to be compared with the BTV.

24												
25						**Nonparametric Distribution Free Background Statistics**							
26						Data do not follow a Discernible Distribution (0.05)							
27												
28						**Kaplan Meier (KM) Background Statistics Assuming Normal Distribution**							
29				Mean		9.725				SD		16.02
30				95% UTL95% Coverage		40.4				95% KM UPL (t)		36.43
31				95% KM Chebyshev UPL		79.88				90% KM Percentile (z)		30.25
32				95% KM Percentile (z)		36.07				99% KM Percentile (z)		46.99
33				95% KM USL		61.46						
34												
35						**Nonparametric Upper Limits for BTVs(no distinction made between detects and nondetects)**							
36				Order of Statistic, r		104				95% UTL with95% Coverage		47.4
37				Approx, f used to compute achieved CC		1.825				Approximate Actual Confidence Coefficient achieved by UTL		0.904
38				Approximate Sample Size needed to achieve specified CC		124				95% UPL		42.74
39				95% USL		115				95% KM Chebyshev UPL		79.88
40												
41						Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.							
42						Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers							
43						and consists of observations collected from clean unimpacted locations.							
44						The use of USL tends to provide a balance between false positives and false negatives provided the data							
45						represents a background data set and when many onsite observations need to be compared with the BTV.

Suggested UCL to Use

95% KM (Chebyshev) UCL	63.94

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

60												
61	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
62	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
63	and consists of observations collected from clean unimpacted locations.											
64	The use of USL tends to provide a balance between false positives and false negatives provided the data											
65	represents a background data set and when many onsite observations need to be compared with the BTV.

60												
61	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
62	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
63	and consists of observations collected from clean unimpacted locations.											
64	The use of USL tends to provide a balance between false positives and false negatives provided the data											
65	represents a background data set and when many onsite observations need to be compared with the BTV.

99% Percentile (z)	48.35	95% USL	56.88

DL/2 is not a recommended method. DL/2 provided for comparisons and historical reasons

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers
and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data
represents a background data set and when many onsite observations need to be compared with the BTV.

60												
61	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
62	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
63	and consists of observations collected from clean unimpacted locations.											
64	The use of USL tends to provide a balance between false positives and false negatives provided the data											
65	represents a background data set and when many onsite observations need to be compared with the BTV.

62					However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.							
63												
64					ProUCL computes and outputs H-statistic based UCLs for historical reasons only.							
65					H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.							
66					It is therefore recommended to avoid the use of H-statistic based 95% UCLs.							
67					Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

60												
61	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
62	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
63	and consists of observations collected from clean unimpacted locations.											
64	The use of USL tends to provide a balance between false positives and false negatives provided the data											
65	represents a background data set and when many onsite observations need to be compared with the BTV.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

ProUCL computes and outputs H-statistic based UCLs for historical reasons only.

H-statistic often results in unstable (both high and low) values of UCL95 as shown in examples in the Technical Guide.

It is therefore recommended to avoid the use of H-statistic based 95% UCLs.

Use of nonparametric methods are preferred to compute UCL95 for skewed data sets which do not follow a gamma distribution.

User Selected Options		
Date/Time of Computation	ProUCL 5.111/2/2021 15:05:27	
From File	WorkSheet.xls	
Full Precision	OFF	
Confidence Coefficient	95%	
Coverage	95%	
Different or Future K Observations	1	
Number of Bootstrap Operations	2000	

Unit E Arsenic

General Statistics

Total Number of Observations	39	Number of Distinct Observations	38
Minimum	1.3	First Quartile	3.72
Second Largest	19.9	Median	6.05
Maximum	26.9	Third Quartile	8.71
Mean	6.981	SD	5.284
Coefficient of Variation	0.757	Skewness	1.911
Mean of logged Data	1.697	SD of logged Data	0.725

Critical Values for Background Threshold Values (BTVs)

Tolerance Factor K (For UTL)	2.124	d2max (for USL)	2.857

Lognormal GOF Test

Shapiro Wilk Test Statistic	0.978	**Shapiro Wilk Lognormal GOF Test**	
5% Shapiro Wilk Critical Value	0.939	Data appear Lognormal at 5% Significance Level	
Lilliefors Test Statistic	0.0968	**Lilliefors Lognormal GOF Test**	
5% Lilliefors Critical Value	0.14	Data appear Lognormal at 5% Significance Level	

Data appear Lognormal at 5% Significance Level

Background Statistics assuming Lognormal Distribution

95% UTL with 95% Coverage	25.43	90% Percentile (z)	13.81
95% UPL (t)	18.8	95% Percentile (z)	17.96
95% USL	43.24	99% Percentile (z)	29.43

Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.
Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers and consists of observations collected from clean unimpacted locations.
The use of USL tends to provide a balance between false positives and false negatives provided the data represents a background data set and when many onsite observations need to be compared with the BTV.

59	**DL/2 is not a Recommended Method. DL/2 provided for comparisons and historical reasons.**											
60												
61	Note: The use of USL tends to yield a conservative estimate of BTV, especially when the sample size starts exceeding 20.											
62	Therefore, one may use USL to estimate a BTV only when the data set represents a background data set free of outliers											
63	and consists of observations collected from clean unimpacted locations.											
64	The use of USL tends to provide a balance between false positives and false negatives provided the data											
65	represents a background data set and when many onsite observations need to be compared with the BTV.

Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.

Recommendations are based upon data size, data distribution, and skewness.

These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).

However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.

1.0 INTRODUCTION

1.1 PROJECT OBJECTIVE

This report documents results from a combined electromagnetic induction (EM) and magnetic (Mag) survey at the Kimberly-Clark Worldwide Site Upland Area in Everett, WA. The geophysical survey effort was completed to evaluate the infilled former log pond area, focused on evaluating the presence or absence of reportedly buried drums, pipes, or other preferential pathway voids. The ground conductivity portion of the EM measurement provides a good indication of the changes in soil conductivity that are caused by changes in soil moisture, disruption, or physical property contrasts. In addition, it also provides the ability to detect metallic objects (both ferrous and non-ferrous) through the in-phase portion of the EM measurement. The magnetic measurements are highly sensitive to ferrous metals. Each method has the ability to provide a high-resolution plan view map of the distribution of metallic objects or other subsurface obstructions within the survey area.

1.2 PROJECT DESCRIPTION

hydroGEOPHYSICS, Inc. (HGI) performed a dual-method geophysical survey at the Kimberly-Clark Worldwide Site Upland Area, as requested by Aspect Consulting, LLC, between April 3 – 5, 2017. The geophysical surveying used a combination of an operator carried broad field EM conductivity instrument and a backpack mounted Mag instrument which were used to survey the approximately 800 by 300 foot area. The field crew consisted of Mr. Michael McNeill.

1.3 SITE LOCATION AND HISTORY

The Kimberly-Clarke Worldwide Site Upland Area is located near the city of Everett, WA. Figure 1 shows the general location of the Kimberly-Clark Worldwide Site Upland Area. Figure 2 shows the geophysical survey coverage area in more detail. The focus of the current study is an approximate 800 by 300 foot area that was occupied by the infilled former log pond. The majority of former mill buildings and structures have been demolished and cleared, with the current site consisting predominantly of a flat gravel surface.

Figure 1. General Survey Location

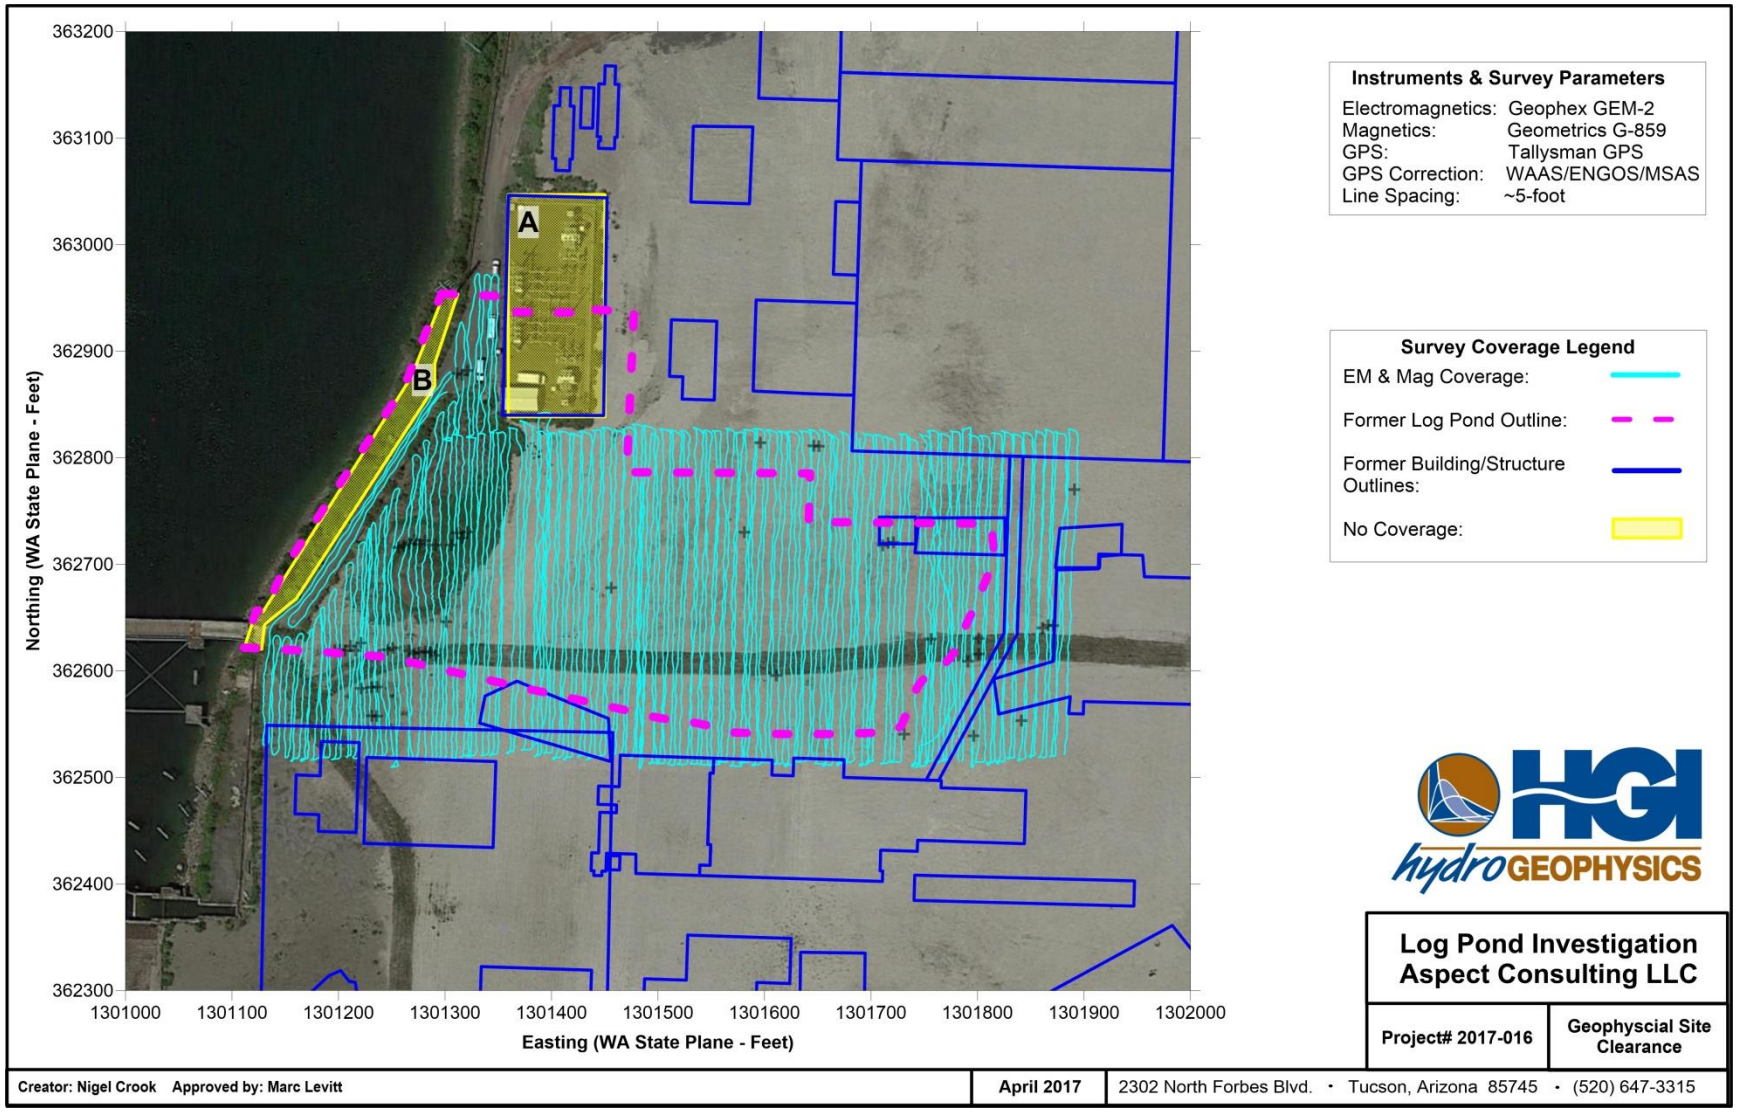
Figure 2. Detailed Coverage for the Electromagnetic Induction and Magnetic Surveys.



2.0 METHODOLOGY

2.1 SURVEY AREA

EM & Mag data were acquired between April 3 and 5, 2017. Data were recorded continuously along an approximate 5 feet survey line spacing to produce the coverage shown in Figure 2.

2.2 SURVEYING LIMITATIONS

The survey coverage is continuous across the majority of the proposed survey area of the former infilled log pond, as detailed in Figure 2. However, there were several areas where it was not possible to collect geophysical data as indicated by the yellow cross-hatch pattern in Figure 2. These correspond to the electrical substation in the northwest corner of the survey area, denoted by (A), and the western edge of the survey area that contained a barricaded road and heavily vegetated region which it was not possible to cover, denoted by (B).

2.3 EQUIPMENT

2.3.1 Magnetic

A Geometrics, Inc. G-859 cesium vapor magnetometer with integrated WAAS/EGNOS enabled Tallysman™ GPS was used to provide magnetic data for the project. The magnetometer and GPS system were mounted on a non-magnetic backpack, with a waist mounted console used to control data collection parameters and record the total magnetic field data. The instrument is commercially available and was designed to provide detection of subsurface ferrous metals by mapping distortions to the measured localized magnetic field. The magnetometer console contains a serial input and necessary firmware that is used to interface with and store GPS data. Interchangeable low voltage 12V dc gel cell batteries are used to power the magnetometer console. A daily inspection is completed by the qualified operator to ensure all components are in satisfactory working condition. Quality assurance tests, including a visual inspection and an instrument check survey line were performed at the beginning and end of each day and each time the instrument power was cycled.

To perform the diurnal correction, a Geometrics, Inc. G-857 proton precession magnetometer was used as a base station to provide a continuous record of changes in the Earth's magnetic to correct the collected total magnetic field survey data.

2.3.2 Electromagnetic Induction

The Geophex Gem-2® electromagnetic instrument was used to provide electromagnetic data. The electromagnetic system is used to detect variations in subsurface soil moisture, soil conductivity, and the presence of subsurface infrastructure (utilities, pipes, tanks, etc.). The GEM-2 consists of a sensor housing (the "ski"), and the electronics console. The console includes the data acquisition, rechargeable battery, and data storage hardware. The console contains one DB9 serial connector for downloading data to a PC using the manufacturer-supplied WinGEM software. The GPS time and location were appended to each electromagnetic data point based on the grid for the magnetic survey. The instrument is commercially available and is widely used within the geophysical arena.

A daily inspection is completed by the qualified operator to ensure all components are in satisfactory working condition. Quality assurance tests, including a visual inspection and an instrument check survey line were performed at the beginning and end of each day and each time the instrument power was cycled.

3.0 QUALITY ASSURANCE

This section describes the methods used to ensure suitable data quality through testing of equipment and documentation of field activities. Instruments were inspected and tested prior to mobilization to the project site, and additional instrument tests were completed just prior to surveying at the project site. All data were run through a preliminary assessment for quality control (QC) in the field to assure quality of data before advancing the survey. Following onsite QC, all data were transferred to the HGI server for storage and detailed data processing and analysis. Each survey grid was recorded with a separate file name that corresponded with a specific functional check file. Data quality was inspected and data files were saved to designated folders on the server. Raw data files were retained in an unaltered format as data editing and processing was initiated. Daily notes on survey configuration, location, equipment used, environmental conditions, proximal infrastructure or other obstacles, and any other useful information were recorded during data acquisition and were saved to the HGI Tucson server.

3.1 MAGNETIC STORM ASSESSMENT

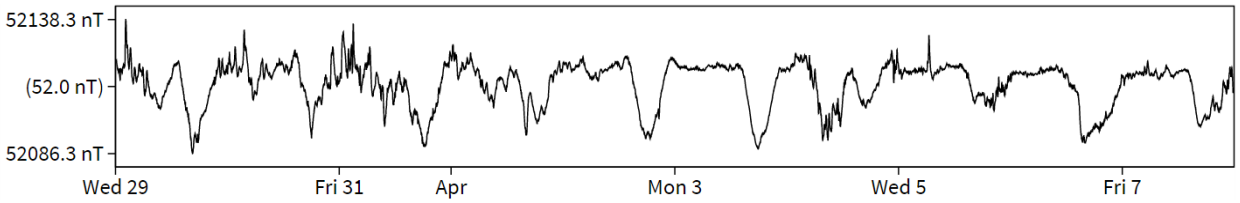
Magnetic storms are produced by sunspot and solar flare activity and can produce significant interference to a magnetic survey. There is usually a sudden onset, during which the field may change by hundreds of nanoTesla (nT) in a few minutes, followed by a slower, erratic return to

® GEM-2 is a registered trademark of Geophex, Ltd.

normality. Time scales vary widely but the effects can persist for hours and sometime days, during which it is sometimes impossible to collect magnetic survey data.

The solar activity was monitored in the lead up and during the survey period using the resources on the National Oceanic and Atmospheric Administration (NOAA) Space Weather Prediction Center website (http://www.swpc.noaa.gov/) as assess the potential for magnetic storms occurring during the survey. The April 3 – 5, 2017 period was characterized as minor geomagnetic storm impacts. In addition, the ground based continuous magnetometer monitoring station at Boulder, CO, indicated small fluctuations in the total magnetic field readings byover the week of the survey (Figure 3)

Figure 3. Total Magnetic Field Measurements from the Ground Based Monitoring Station in Boulder, CO, for the Week of the Everett Magnetic Survey (indicating on average <50nT daily fluctuations in magnetic field).



3.2 PRE-JOB INSTRUMENT INSPECTION

HGI completed a visual inspection of all instrumentation to ensure that damage had not occurred in transport to the project site.

3.3 DAILY INSTRUMENT CHECKS

Daily instrument testing was completed at the start and end of each day, prior to surveying of each grid, and anytime the instrument power was cycled. An instrument check survey line was laid out within the project site at a location outside the former infilled log pond area, and was marked for use on all subsequent instrument checks. Instruments were warmed up for 15 minutes prior to all testing.

Upon completion of the instrument warm up, the EM and Mag instruments were carried over the length of the instrument check survey line, approximately 100 feet in length, and back again. The goal of the instrument check is to ensure that instrumentation are in working condition and are producing repeatable data over a known response, with minimal variation between tests. A metallic object was placed at approximately 80 feet along the survey in order to evaluate response repeatability. The instrument check data was also used to calculate correction factors that were then used to normalize individual data sets from successive survey grids.

Acceptance criteria for this test was to demonstrate that all instrument check runs successfully detected the response feature located at approximately 80 feet along the survey line and that the shape, character and magnitude of the responses were consistent. All instrument check results were analyzed and all were deemed satisfactory. The instrument check results for the electromagnetic in-phase data can be viewed in Figure 4; the electromagnetic conductivity data is shown in Figure 5 and the magnetic total field is summarized in Figure 6.

Figure 4. Instrument Check Results for Electromagnetic In-Phase Data over the Survey Period.

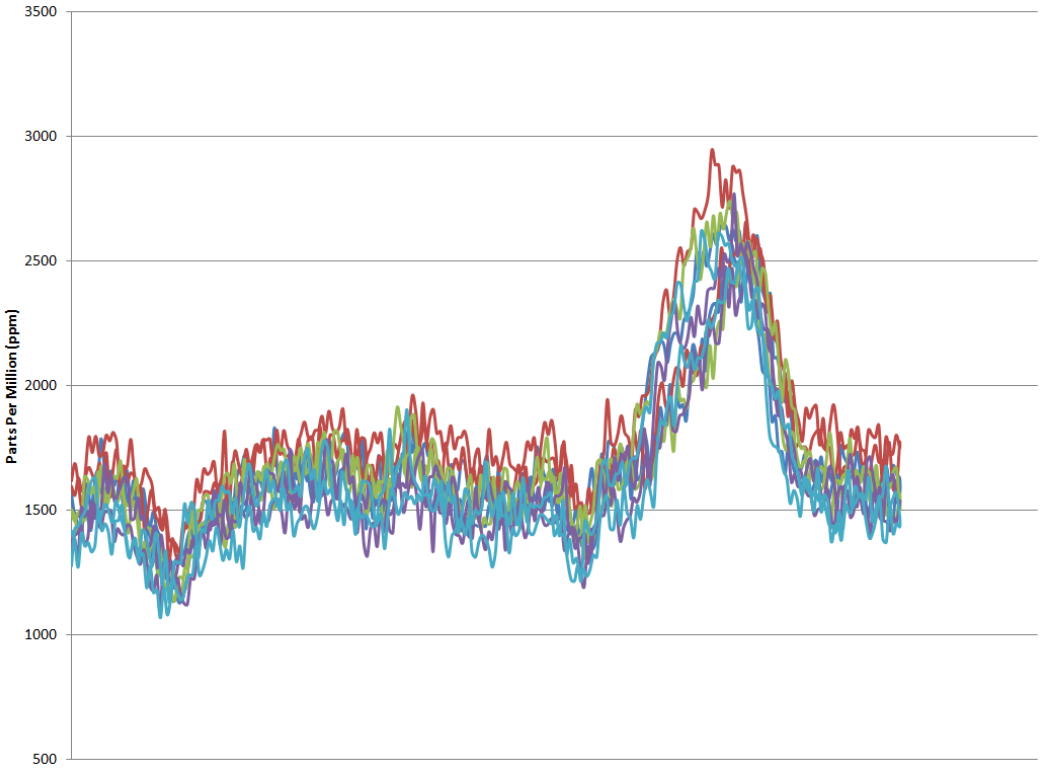


Figure 5. Instrument Check Results for Electromagnetic Conductivity Data over the Survey Period.

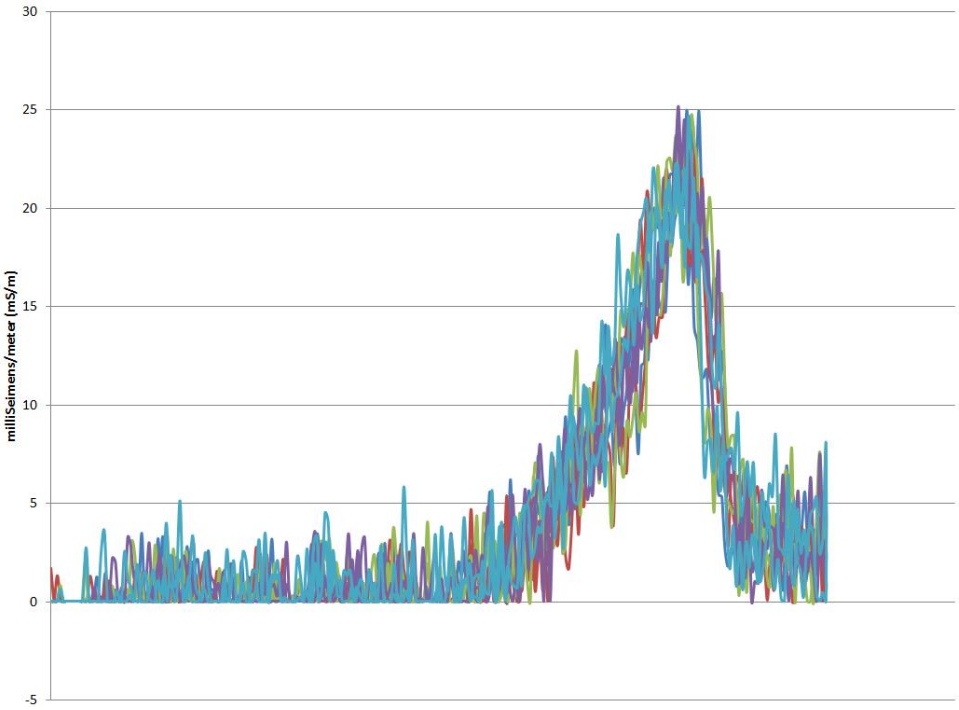

Figure 6. Instrument Check Results for Magnetic Data over the Survey Period (the plot below contains the out and back portions of the instrument check survey line as a continuous profile).

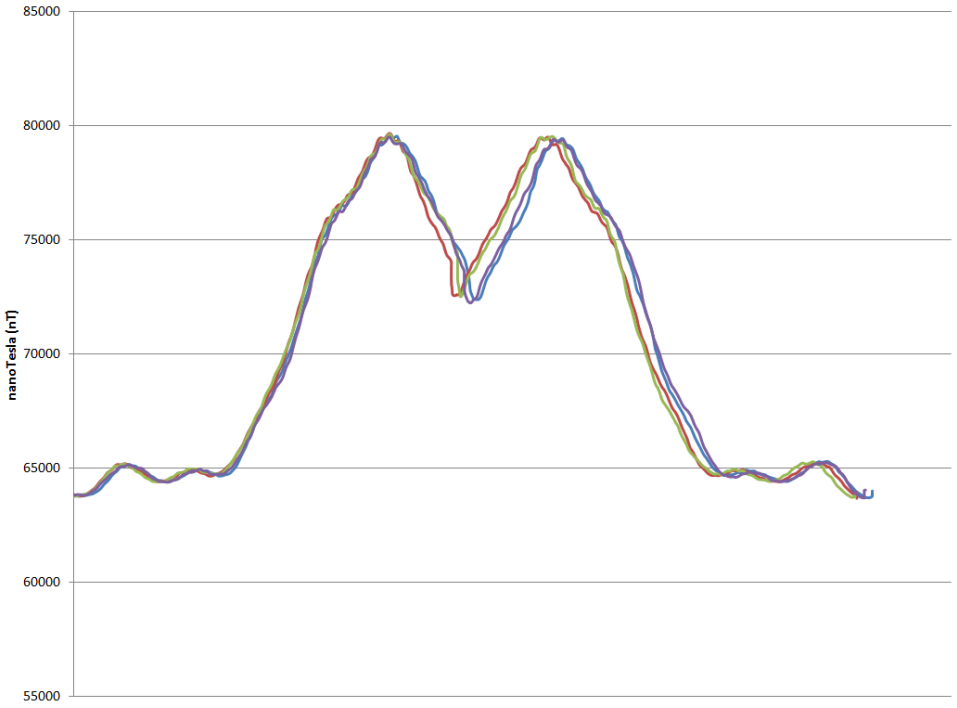

3.4 SURVEY GRID NORMALIZATION

All geophysical instruments exhibit some amount of data drift, with variation occurring in drift magnitude and time. Electromagnetic instruments, like the GEM-2, exhibit significant drift in comparison to magnetic instruments, like the G-859 used for this project.

The process for normalization was as follows:

1. Calculate the mean parameter value for the relative flat response portion of the instrument check survey line, corresponding to the first 60 feet of the line outside the sensitivity to the metal object, for each measurement parameter.
2. Calculate the Normalization Factor by computing the difference between each data set and the baseline calibration recorded on the first day for each instrument.
3. The individual normalization factors for each calibration file were applied to the corresponding field survey data files by adding the dynamic correction factor to the respective measured data.

4.0 DATA ANALYSIS

4.1 DOWNLOADING, PARSING & FIELD QUALITY CONTROL

The magnetic data were downloaded to a field laptop computer using MagMap2000 software. The data were saved in binary format, with the date stamp and location as part of the naming structure. The EM data were downloaded to a field laptop using WinGEM2 software. The data were saved in binary format, with the date stamp and location as part of the naming structure.

4.2 GENERALIZED PROCESSING STEPS

4.2.1 Magnetics Processing and Plotting

The process included the following steps:

1. Removal of diurnal fluctuations was completed using the manufacturer supplied MagMap2000 software (Geometrics, Inc.).
2. Coordinate conversion from UTM to WA State Plane (feet) using Corpscon Software (US Army Corps of Engineers).
3. Assembling the master database table from the individual data files, using Microsoft Excel.

4. Removing data spikes from the individual data files, using Microsoft Excel.
5. Visualization of results using Surfer mapping software (Golden Software, Inc.)

4.2.2 Electromagnetics Processing and Plotting

Electromagnetic data processing was similar to magnetic data processing. The process included the following steps:

1. Running the raw data files though WinGem2 to add electrical conductivity to the files.
2. Coordinate conversion from UTM to WA State Plane (feet) using Corpscon Software (US Army Corps of Engineers).
3. Normalization of data for each individual data collection file, performed to correct for instrument drift that occurs each time the data acquisition system is restarted.
4. Assembling the master database table from the individual data files, using Microsoft Excel.
5. Removing data spikes from the individual data files, using Microsoft Excel.
6. Visualization of results using Surfer mapping software (Golden Software, Inc.)

4.3 DETAILED PROCESSING STEPS

4.3.1 Parameter Conversion (EM)

The raw EM data was run through Geophex's WinGEM2 program to calculate the electrical conductivity. The settings used in WinGEM2 were that the instrument was in a horizontal coplanar orientation, the sensors were separated by 5.45 feet (1.66 meters), and the data was collected 3.3 feet (1 meter) from the ground. This step was applied to both the calibration and data files.

4.3.2 Coordinate Conversion

After diurnal corrections to the data, the GPS data were converted from Universal Transverse Mercator (UTM) to WA State Plane using Corpscon Version 6 Software (Army Corps of Engineers). GPS data were recorded at an interval of one data point per second and magnetic data were recorded five times per second; the resulting GPS location for each magnetic reading was linearly interpolated within the magnetometer's data acquisition system.

4.3.3 Data Normalization

After inversion, the data were shifted for the day-to-day changes called drift. The day-to-day changes were calculated from a coincident data collection run at the beginning of each collection day that was performed at a calibration site. Slight differences in the daily data records occurred due to environmental or instrument setup changes. Calibration data were acquired along the same survey line, after an instrument warm up period of no less than 15 minutes. The calibration data record was compared to the mean data value for each data file and an offset value, from the previous data file, was calculated.

4.3.4 Assembling Master Table

After coordinate conversion, the data from the individual survey files were combined within a single Microsoft Excel file.

4.3.5 Spike Removal

After assembling the master sheet, large magnitude data spikes were smoothed. This was done to both EM and Mag data to help with the plotting of the data. The features remain unchanged while the magnitudes of the data spikes are reduced.

4.3.6 Data Plotting

The files were gridded in Surfer Version 11 Software (Golden Software, Inc.) using a spatial interpolation algorithm (kriging). The gridding and interpolation allowed a contour plot of data to be placed over a survey area base map for interpretation of linear or discrete objects. In addition, the location of field-observed, above-ground infrastructure were recorded using a GPS and were added to the base map.

5.0 RESULTS & INTERPRETATION

This section contains figures created from the magnetic (Mag) and electromagnetic surveying (EM) effort. These figures and the results within are discussed in the subsequent sections. The objective of the geophysical survey was to evaluate the infilled former log pond area, focused on evaluating the presence or absence of reportedly buried drums, pipes, or other preferential pathway voids.

Electrical conductivity and in-phase measurements from electromagnetic induction were acquired for the frequencies of 1,530 Hz, 5,310 HZ, 9,810 Hz, and 18,330 Hz. The 9,810 Hz frequency is representative of all five frequencies and is selected for presentation in this report. With respect to the geophysical survey objective, contrasts in electrical conductivity of the subsurface could highlight regions containing building foundations, non-metallic wastes, or variations in fill material and moisture content. In addition, the electrical conductivity measurements will be sensitive to the presence of ferrous and non-ferrous metals. The in-phase component is generally not as sensitive to changes in soil conductivities when compared to the electrical conductivity component; the in-phase component tends to respond to the presence of ferrous and non-ferrous metal. The EM data were contoured to show the spatial representation of detected features.

The corrected total magnetic field provides a tool for mapping near-surface ferrous objects. The Mag data were also contoured to show the spatial representation of detected features. The combination of EM and Mag data sets allow some amount of discrimination between ferrous and non-ferrous objects.

5.1 CONTOURED RESULT MAPS

EM conductivity data respond with positive magnitudes, where larger readings can indicate either a larger response, close proximity to a target, or a combination of the two. Therefore, the contoured results are presented with background areas highlighted in pink tones (indicating low magnitude responses), areas with potential variations in fill material or moisture content in green tones, and high magnitude features (for example foundation responses) in yellow to red tones. Based on the large amplitude responses typical of industrial sites it should be noted that the color scale is not linear, for example the variation in conductivity value between the pink and green tones is much smaller (indicating subtle variations in material properties for example) than between the green and red tones.

In contrast, EM in-phase data produce both positive and negative numerical responses to various features depending on the physical location and orientation of instrument to target, the physical

arrangement of the target, the target's physical composition, or some combination of these properties. To highlight these features, the in-phase color scale uses light blue tones to indicate background areas of low magnitude readings, and both red/magenta (positive) and dark blue (negative) tones to indicate high magnitude readings that may indicate above- and below-ground objects.

The Mag total field data is similar to EM in-phase data in that responses can be positive or negative depending on the position and orientation of the sensor to the mapped target, once the regional magnetic field has been removed. It is difficult to calculate the regional magnetic field based on the scale of the current survey area, but we have assumed the regional value is around the average of the total field data. The color scale is therefore similar to the EM in-phase color scale, with yellow tones indicating background low magnitude response and red/magenta (positive) / blue (negative) tones indicating high magnitude responses likely caused by detected objects.

The color-contoured results for the three geophysical measurement data sets are shown in Figures 7 thorough 9. Each plot (geophysical parameter) presents a unique color scale that is designed to highlight detected features. The maps also contain a posting of mapped above-ground surface objects and a base aerial photo for the project site.

Section 7.3 in Appendix A (EXAMPLE EM AND MAG RESPONSES) shows an example of typical EM and Mag responses to subsurface objects, taken from a previous survey at a test facility which contained a number of known subsurface targets. The results highlight the typical dipolar responses observed for an underground metallic pipeline and steel underground storage tank.

Figure 7. Contoured Results for Electromagnetic Conductivity Data (Gray Crosses Denote Locations of Metal Surface Debris and Well Locations).

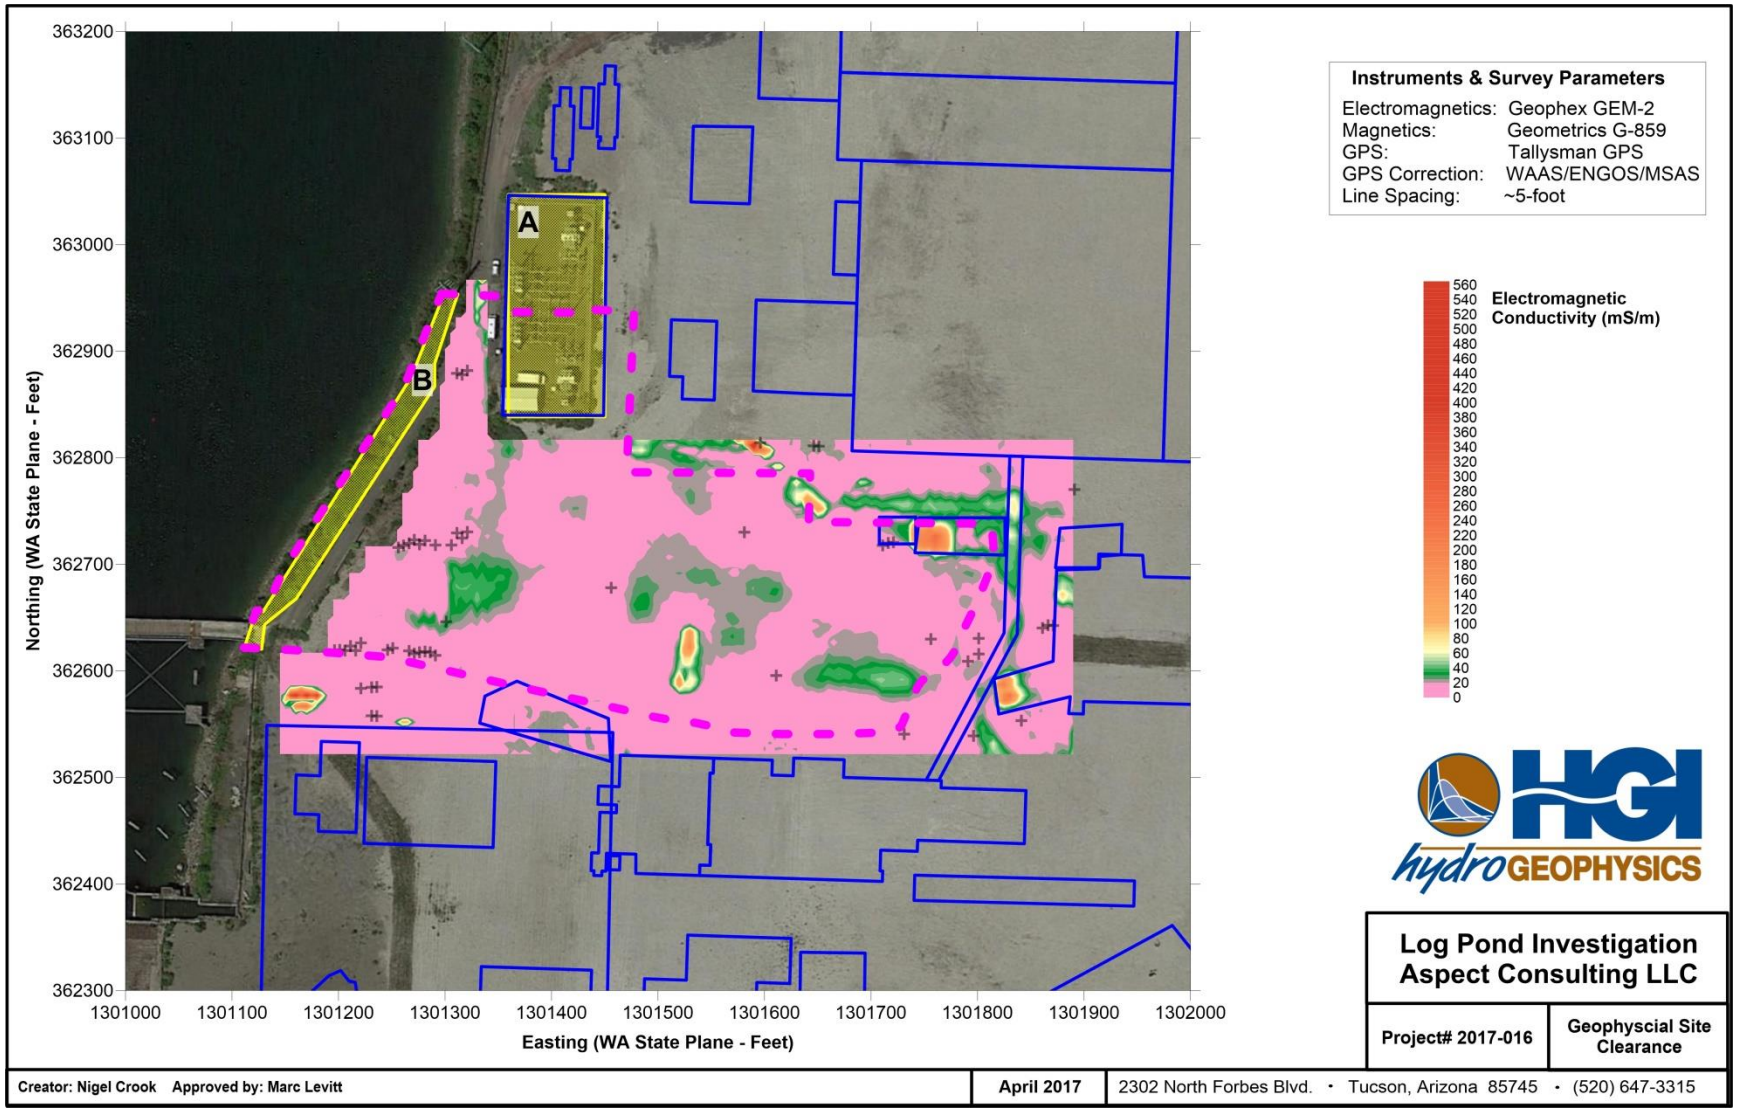

Figure 8. Contoured Results for Electromagnetic In-Phase Data(Gray Crosses Denote Locations of Metal Surface Debris and Well Locations).

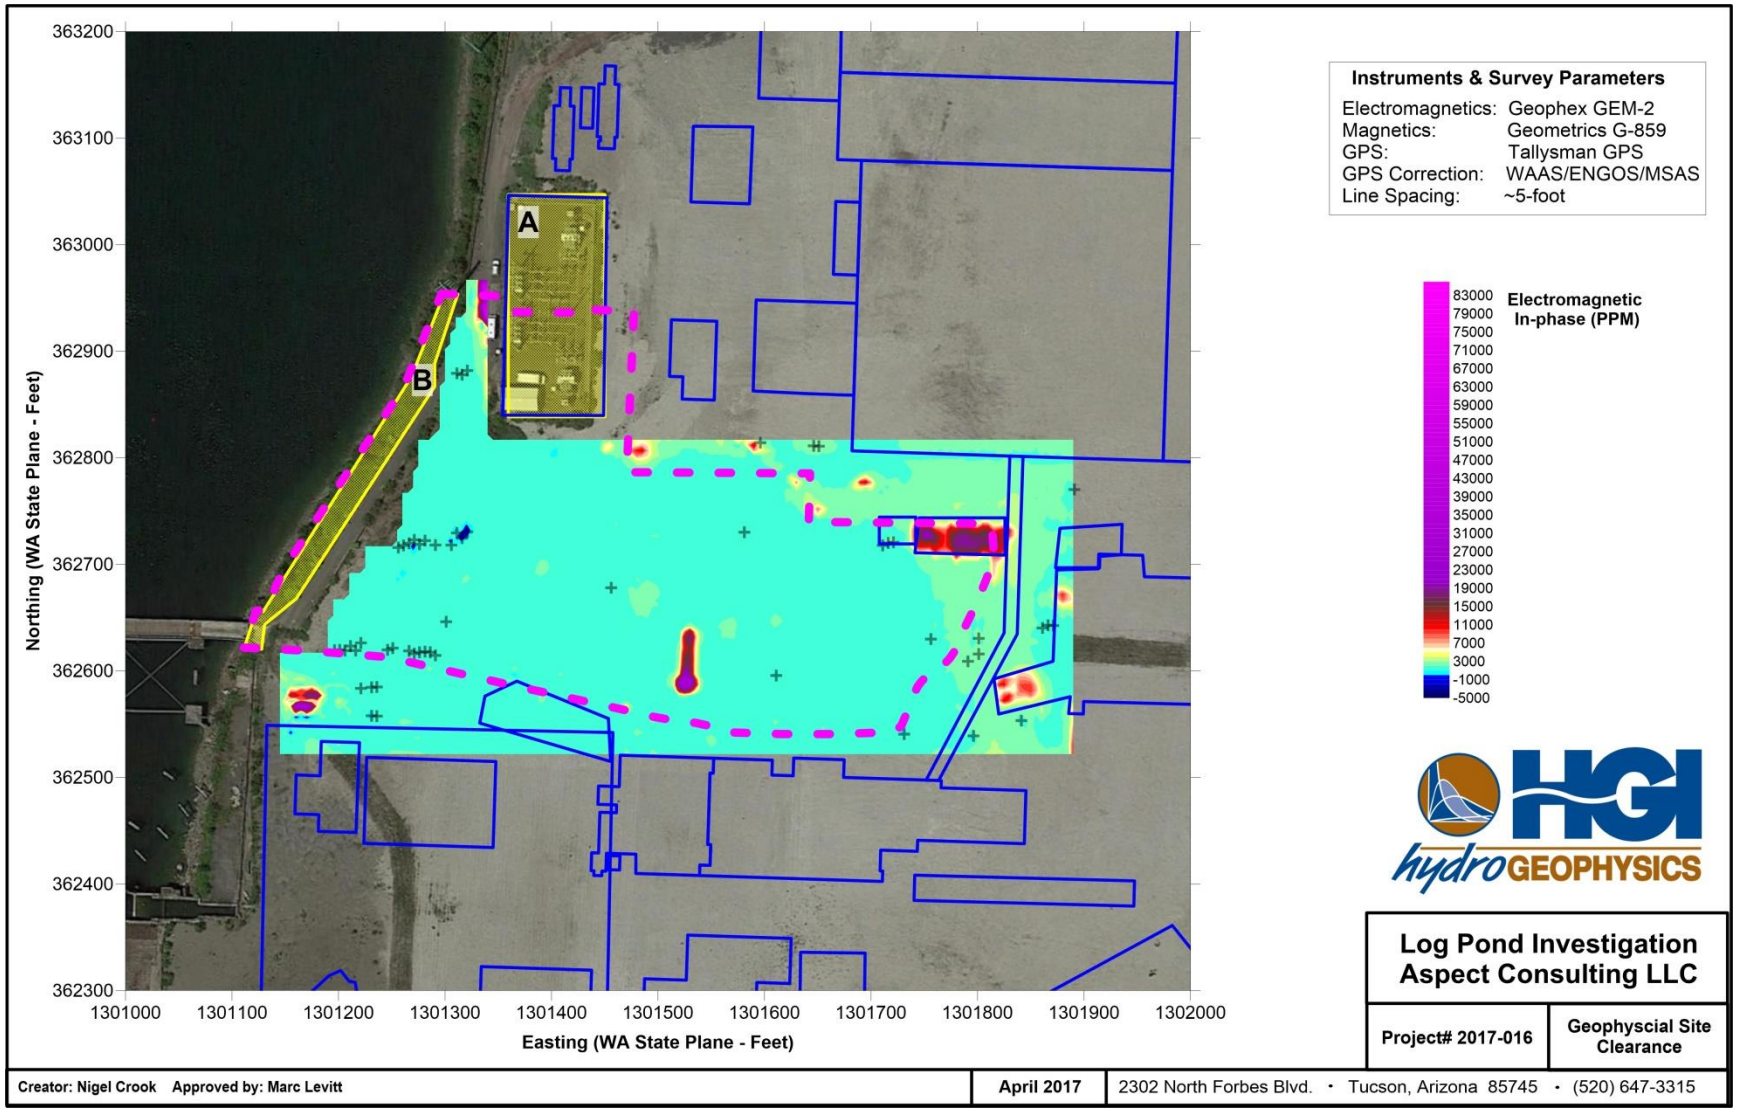

Figure 9. Contoured Results for Magnetic Total Field Data (Gray Crosses Denote Locations of Metal Surface Debris and Well Locations).

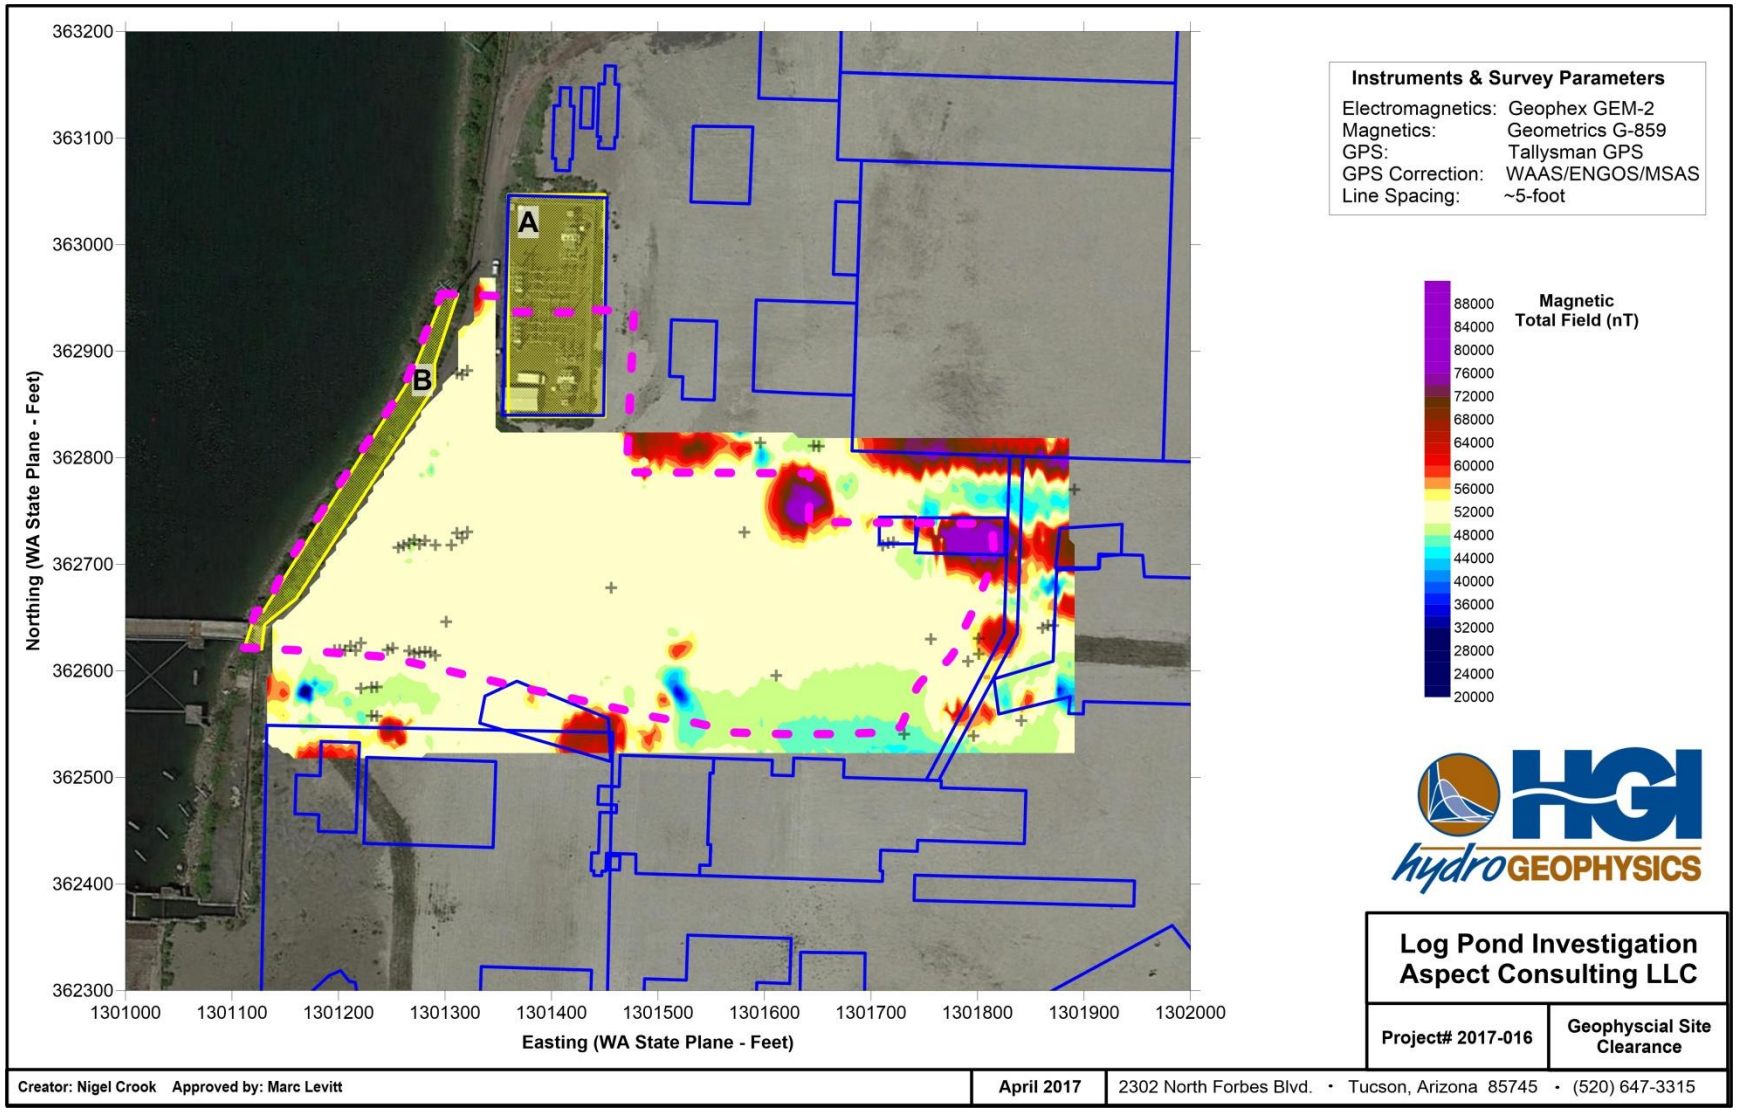

5.1.1 Potential Responses to Former Buildings and Structures

All three geophysical parameters show evidence of high magnitude response coincident with the outlines of former buildings and structures across the site, located along the edges or outside of the former infilled log pond area, (indicated by **(Build)** in Figures 10 through 12). These responses tend to be broad in nature that correspond to a significant portion or particular sections of a number of the building or structure outlines. These responses span both the EM and Mag results, suggesting that these are related to metallic responses in the subsurface. This could indicate that all or sections of the foundations of these structure remain in the subsurface, with the responses related to the rebar reinforcement within the foundations. Alternatively, these could be responses to metal subsurface structures associated with these buildings that remain in place, such as vaults, drainage infrastructure, etc. It is also possible that the debris from the demolition of the previous buildings and structures was simply left in place, which could lead to these former building outlines containing a higher percentage of metal from these structures. The Mag results display a number of additional responses, notably to the building outline along the northeast edge of the survey area, which do not appear in the EM results. This could indicate that these responses are from deeper features below the imaging sensitivity of the EM instrument.

5.1.2 Utilities Responses

There appears to be a number of linear, high magnitude features that run across the northern section of the survey area, located just to the north of the former infilled log pond boundary (indicated by the **dashed dark blue** line in Figures 10 through 12). On industrial sites, linear subsurface responses such as this tend to be associated with utilities or their associated structures, such as concrete vaults or conduits. This appears to run from the building/structure outline in the northeast corner of the former infilled log pond area to the west, before trending northwest, and running along the northern boundary of the survey area towards the current electrical substation area. This response appears more significant in the EM conductivity results, appearing as a high amplitude continuous response, with a much more discontinuous response, subtle responses for the majority of the EM in-phase and Mag results. This could indicate an intermittent metallic content associated with these utilities or structures, or that the utilities were removed and the trenches backfilled with variable demolition debris.

5.1.3 Unknown Below-Ground Responses

There are several features of interest that do not correlate with any known above-ground objects and also do not coincide with the former building and structures outlines.

Feature (C) (Figure 10 through 12), located to the southwest of the infilled log pond area, displays a high amplitude response in both the EM conductivity and in-phase and Mag results.

This would suggest this is a response to a ferrous metal subsurface feature, potentially in the near-surface (upper 10-15 feet) based on the limit of the EM instrument sensitivity. This corresponds to the location of former above ground infrastructure, and based on historic aerial photographs of the site this could be a response to the footings of a supporting tower for this structure, which was likely reinforced with rebar (highlighted by the orange outline in the historic aerial photograph in Figure 13).

The main feature of interest relating to this survey is labelled as feature (D), which is located within the outline of the former infilled log pond. This feature displays a significant high amplitude response in both the EM conductivity and in-phase results. The response in the Mag results again displays a significant response from the average background, although the dipole nature of the structure of this response makes it appear a less significant compared to the EM results. The presence of a response in all three results would suggest this is a response to a ferrous metal subsurface feature, again potentially in the near-surface (upper 10-15 feet) based on the limit of the EM instrument sensitivity. The difference in the nature of the structure of the response would likely reflect the difference in resolution and sensitivity of the two techniques and respective instruments. The EM instrument tends to produce a broad response to features due to the transmitter inducing a signal over the entirety of any metallic object in the subsurface. The magnetometer is a passive instrument and measures the variations in the Earth's magnetic field produce by subsurface features, such as ferrous metal objects. Since the Earth's magnetic field is inclined to the ground surface at these latitudes features such as ferrous metal objects will typically produce dipolar anomalies, similar to the structure observed in the feature (D) results. The multiple high and low amplitudes observed could indicate a number of overlapping signals from multiple ferrous metal targets in the location of feature (D).

We feel the features described in this section may be potential targets of interest for this project, and, while we have used our best judgment from previous experience on similar sites, they should be confirmed via physical investigation.

There are a number of additional areas that show elevated amplitude responses in the EM conductivity survey results, labelled as features (E). These features are not as high amplitude as the previously described features and responses and are only present in the EM conductivity results, suggesting a non-metallic response. Therefore, these could indicate either an increase in the soil moisture in these areas, potential for different backfill/materials in subsurface, or non-metallic debris.

7.0 APPENDIX A: THEORY

This section provides summary level descriptions for the theory behind the different geophysical tools and methods used in the DGM.

7.1 MAGNETOMETRY

Magnetometry is the study of the Earth's magnetic field and is the oldest branch of geophysics. The Earth's field is composed of three main parts:

1. Main field – This field is internal (i.e., from a source within the Earth that varies slowly in time and space).
2. Secondary field – This field is external to the Earth and varies rapidly in time.
3. Small internal fields – These are constant in time and space and are caused by local magnetic anomalies in the near-surface crust.

Of interest to the geophysical survey are the localized anomalies or responses in the magnetic field. These anomalies are either caused by magnetic minerals, mainly magnetite or pyrrhotite, or buried steel, and are the result of contrasts in the magnetic susceptibility (k) with respect to the background sediments. The average values for k are typically less than 1 for sedimentary formations and upwards to 20,000 for magnetite minerals.

The magnetic field is measured with a magnetometer. Magnetometers permit rapid, non-contact surveys to locate buried metallic objects and features. A one person portable field unit can be used virtually anywhere a person can walk; although, they may be sensitive to local interferences, such as fences and overhead wires. Field-portable magnetometers may be single- or dual-sensor. Single-sensor magnetometers measure total field. Dual-sensor magnetometers are called gradiometers and measure gradient of the magnetic field.

Common magnetic survey configurations include total field surveys and gradient surveys. The total field survey use two magnetometers; the first magnetometer is used as a base station to record the Earth's primary field and the diurnally changing secondary field. The second magnetometer is used as a rover to measure the spatial variation of the Earth's field and may include various components (e.g., inclination, declination, and total intensity). By removing the temporal variation and perhaps the static value of the base station from that of the rover, one is left with a residual magnetic field that is the result of local spatial variations only. The rover magnetometer is moved along a predetermined linear grid laid out at the site. Readings are virtually continuous and results can be monitored in the field as the survey proceeds. Gradient surveys use dual-sensor magnetometers, called gradiometers, and measure gradient of the magnetic field. Since both sensors record the same diurnal variation, subtracting one sensor reading from the other for the gradient calculation cancels this out and so a base station is not required.

The shortcoming with most magnetometers is that they only record the total magnetic field (**F**) and not the separate components of the vector field. This shortcoming can make the interpretation of magnetic anomalies difficult, especially since the strength of the field between the magnetometer and target is reduced as a function of the inverse of distance between the magnetometer and target, cubed. Additional complications can include the inclination and declination of the Earth's field, the presence of any remnant magnetization associated with the target, and the shape of the target.

From basic magnetic field theory (Grant and West, 1965), the magnetic field, due either to a point (dipole) source or a three-dimensional finite volume of magnetized material, decays in proportion to r^3 as the distance from the source increases, where r is the separation between the source and the magnetometer. The gradient of the field, on the other hand, decays in proportion to r^4. By means of Fourier transform, it is possible to show that a signal proportional to r^4 has more power at higher spatial frequencies relative to a signal proportional to r^3 (the field itself). Consequently, the magnetic gradient signal due to a given three-dimensional source is more limited in spatial extent, making discrete near-surface bodies appear more pronounced compared to background readings.

Schlinger (1990) showed the effects of a dipole source (i.e., a uniformly magnetized buried sphere on the geomagnetic field at several latitudes). Figure 14 shows where the anomaly is positioned at 0 meters at a depth of 2 meters below ground surface with the measurement at 2 meters above the ground surface. The figure shows the response of both total magnetic field and vertical magnetic gradient. Both plotting methods are sufficient at discriminating bodies in the near surface, but the total field is only useful for determining deeply buried bodies.

The presentation of magnetic data is accomplished with a contour map, where the magnitude of the magnetic field or vertical magnetic gradient data is represented by isopleths. In general, the buried objects will appear as either a mono-polar or dipolar anomalous response. For near-surface infrastructure mapping of steel objects, the values of the magnetic field can be several hundred to several thousand times higher than the background field. Linearly continuous anomalies observed along adjacently acquired data are interpreted as buried pipelines and singular anomalies that are not continuous are interpreted as discrete buried objects (tanks, drums, wells).

7.2 ELECTROMAGNETIC INDUCTION

EM data is typically collected using portable ground conductivity instrumentation. Basically, a transmitting coil induces an electromagnetic field and a receiving coil, at a fixed separation, measures the amplitudes of the in-phase and quadrature components of the resulting magnetic field. Various instruments have different coil spacings and operating frequencies. Spacing and frequency affect depth of signal penetration. Both single-frequency and multi-frequency instruments have been developed for commercial use.

Earth materials have the capacity to transmit electrical currents over a wide range. Earth conductivity is a function of soil type, porosity, permeability, and dissolved salts. Terrain conductivity methods seek to identify various Earth materials by measuring their electrical characteristics and interpreting results in terms of those characteristics. EM techniques are used to measure Earth conductivities of various soil, rock, and water components at individual survey areas. These techniques employ portable, rapid, non-invasive equipment operated at various frequencies depending on range and depth desired.

The recorded electromagnetic field is separated into two sub-components: in-phase and conductivity (also referred to as quadrature). The in-phase component is the most sensitive to metallic objects and is measured in parts per million (ppm). The conductivity component is sensitive to soil condition variations and is measured in log Siemens per meter (log S/m) using the GEM-2 instrument.

The EM method was chosen due to its capability for mapping changes in soil conductivity that are caused by soil moisture variations, disruption, or other physical property contrasts, and also for its ability to detect metallic objects (i.e., ferrous and non-ferrous) and its relatively rapid rate of data acquisition.

Electromagnetic induction methods use a transmitting coil and a receiving coil. The transmitting coil induces eddy currents in the Earth, which then generate magnetic fields that are affected by the earth materials within the excited zone. The receiving coil intercepts the field, resulting in an output voltage that is proportional to the conductivity within the area. Moving these coils results in variations in conductivity that can be interpreted to find buried features or objects.

The transmitting coil frequency and electrical conductivity of the host material primarily determine the depth of investigation for EM techniques. Referred to as skin depth in the literature (Telford et al., 1990), it generally describes the decay of the EM field through a conductive medium. Formally, the skin depth (δ) is defined as the distance through which the field decays to e-1 (~37%) of its original amplitude:

Skin Depth: $$\delta = \sqrt{\frac{2}{(\pi f)\mu\sigma}}$$

Where:

σ = electrical conductivity of the host material

μ = magnetic permeability

f = operating frequency of the instrument

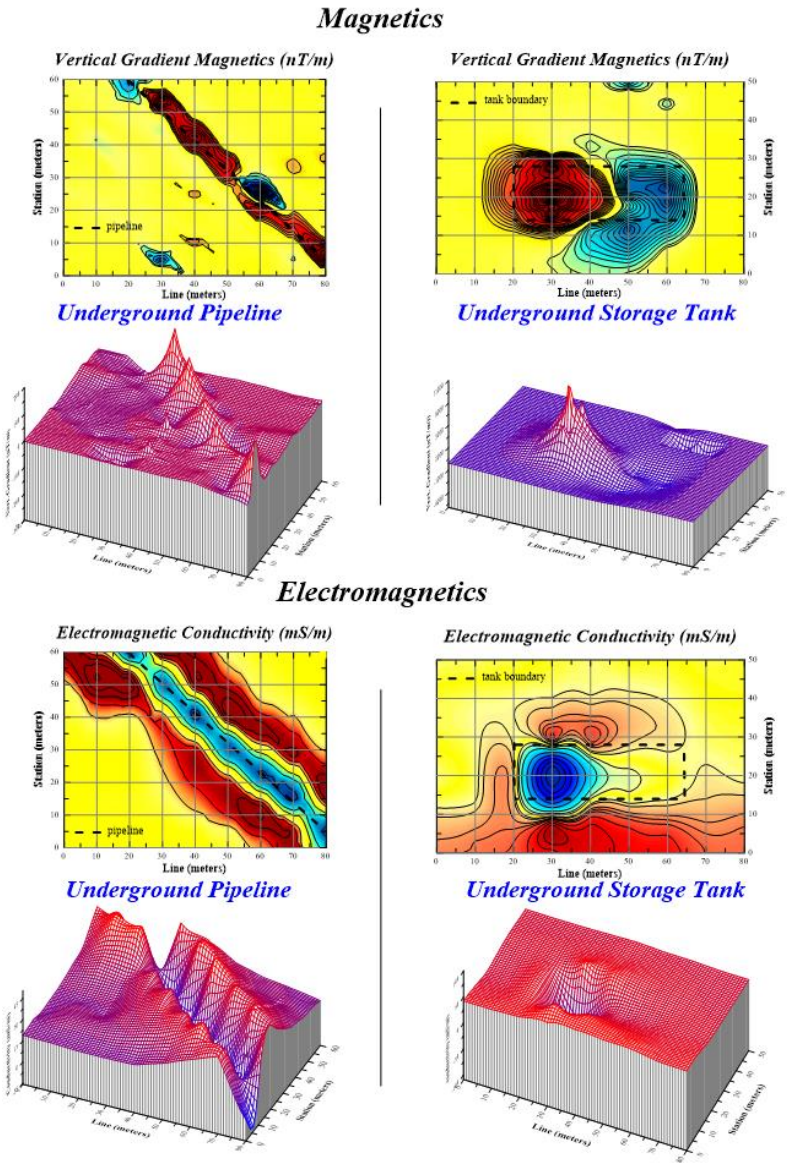
There are several advantages of using a broadband, multi-frequency EM sensor. Since conductivity and permeability of the host material cannot be manipulated, the skin depth can be changed by changing frequencies. In theory, scanning through a frequency window is equivalent to depth soundings, where the results from multiple frequencies can be presented to understand the layering of earth materials. However, in practice HGI has observed that a fixed object of

high conductivity (such as a metal pipe) will appear in all frequencies, eliminating the possibility of depth-specific estimations for individual targets.

7.3 EXAMPLE EM AND MAG RESPONSES

Figure 15 shows an example of typical EM and Mag responses to subsurface objects, taken from a previous survey at a test facility which contained a number of known subsurface targets. The results highlight the typical dipolar responses observed for an underground metallic pipeline and steel underground storage tank. Responses will vary depending on the depth and orientation of the target to the geophysical sensor, as well as the target material of construction and the background geology. However, this does provide a general depiction of the types of responses we can expect from targets in an industrial complex.

Figure 15. Example of Mag (upper four panels) and EM (lower four panels) Responses for Underground Objects from a Test Facility Survey.



May 2017 Log Pond Boring and Trench Photo Log

The core photos from the soil boring activities in the former Log Pond are shown below, in consecutive order based on the boring identification number. Each core photo includes a card identifying the boring number and the depth of the pictured interval in feet below ground surface. Where more than one photo exists for a labeled interval, the core was collected and photographed in more than one continuous run and is depicted from shallow to deep. The photos of the two trenches completed at the former Chip Conveyor foundation follow photos of the soil borings.

APPENDIX M

Detailed Cost Estimate for the Cleanup Alternative

Table M-1. Summary of Cost Estimates for the Cleanup Alternative and Contingent Actions

Project No. AS190583, K-C Worldwide Site Upland Area, Everett, Washington

Cleanup Actions for K-C Worldwide Site Upland Area, Everett, WA	Total Estimated Cost
Baseline Cleanup Action: Completed Actions, Capping of City Utility Property, Groundwater Compliance Monitoring, Cap Inspection and Maintenance, Institutional Controls	$ 29,800,000
Contingent Warehouse Vapor Barrier for Commercial Use	$ 2,000,000
Contingent Warehouse TPH Soil Removal and Capping	$ 3,200,000

Notes:

1) Cost are in 2023 dollars. Costs were estimated using Net Present Value (NPV) analysis, assuming a discount rate of 2.0 percent. for costing purposes, long-term operation and maintenance ("O&M") costs assume a 12-year groundwater compliance monitoring program, and cap inspection/maintenance for a 30-year period consistent with EPA guidance. The estimates have an intended accuracy in the range of -30 to +50 percent.

2) Estimates are rounded to the nearest $100,000.

Table M-2. Cost Estimate for the Cleanup Alternative (Without Contingent Actions)

Project No. AS190583, K-C Worldwide Site Upland Area, Everett, Washington

Site:	K-C Worldwide Site Upland Area, Everett, WA
Remedial Action Description:	**Completed actions; Capping of City Utility Property; Groundwater compliance monitoring; Long-term cap inspection and maintenance; Institutional controls.**
Cost Estimate Accuracy:	FS Screening Level (+50/-30 percent)

CONSTRUCTION COSTS

Item	Quantity	Unit	Unit Cost	Total Cost	Notes
Completed Cleanup Actions					
First Interim Action	1	LS	$ 4,160,000	$ 4,160,000	
Second Interim Action	1	LS	$ 2,250,000	$ 2,250,000	
Third Interim Action	1	LS	$ 22,700,000	$ 22,700,000	
Subtotal - Completed Cleanup Actions				***$ 29,110,000***	
Institutional Controls					
Legal fees	1	LS	$ 20,000	$ 20,000	
Technical and administrative support	1	LS	$ 10,000	$ 10,000	
Soil and Groundwater Management Plan	1	LS	$ 15,000	$ 15,000	
			Subtotal	$ 45,000	
Contingency	10%			$ 4,500	
				$ 49,500	
Groundwater Compliance Monitoring					
Groundwater Compliance Monitoring Plan	1	LS	$ 25,000	$ 25,000	
Install and develop new monitoring wells	12	each	$ 3,000	$ 36,000	
			Subtotal	$ 61,000	
Tax	9.9%			$ 3,564	
Contingency	10%			$ 6,456	
Subtotal - Groundwater Compliance Monitoring				***$ 71,020***	
Cap Inspection and Maintenance					
Cap Inspection and Maintenance Plan	1	LS	$ 15,000	$ 15,000	
			Subtotal	$ 15,000	
Tax	9.9%			$ 1,485	
Contingency	5%			$ 824	
Subtotal - Cap Inspection and Maintenance				***$ 17,309***	
Professional Services (as percent of future capital costs)					
Project administration	3%		$ 137,830	$ 4,135	
Total Estimated Capital Costs				**$ 29,251,965**	

O&M COSTS - Net Present Value

Item	Annual Freq.	Unit Cost	Annual Cost	NPV Cost	Notes
Groundwater Compliance Monitoring					
Quarterly monitoring events, Years 1 and 2	4	$ 20,000	$ 80,000	$ 155,325	
Semiannual monitoring event, Years 3 through 12	2	$ 15,000	$ 30,000	$ 211,231	Assume reduced analyte list relative to Years 1-2.
Annual Reporting, Years 1 and 2	1	$ 25,000	$ 25,000	$ 48,539	
Annual Reporting, Years 3 through 12	1	$ 18,000	$ 18,000	$ 126,738	
Subtotal - Groundwater Compliance Monitoring				***$ 541,833***	
Cap Inspection and Maintenance					
Annual cap inspection	1	$ 8,000	$ 8,000	$ 179,172	Assumes 30 years for NPV, per EPA guidance
Report for annual cap inspection	1	$ 4,000	$ 4,000	$ 89,586	
Subtotal - Cap Inspection and Maintenance				***$ 268,757***	
Professional Services (as percent of Periodic O&M costs)					
Project administration		3%		$ 24,318	
Total, O&M Net Present Value				**$ 566,151**	
TOTAL ESTIMATED COST				**$ 29,800,000**	rounded to nearest $100,000
				$ 690,000	Excluding completed cleanup actions

Notes:

2.0% discount rate applied for NPV analysis based on real interest rates on 30-year Treasury notes and bonds (OMB Circular No. A-94, revised 12/12/2022)
Assumes the warehouse remains in place serving as an environmental cap, no capital costs.
Contingency costs include miscellaneous costs not currently itemized due to the current (preliminary) stage of design development, as well as costs to address unanticipated conditions encountered.
Taxes are not applied to project administration, design, management, monitoring, or reporting costs.

Table M-3. Cost Estimate for Contingent Vapor Barrier within Warehouse

Project No. AS190583, K-C Worldwide Site Upland Area, Everett, Washington

Site:	K-C Worldwide Site Upland Area, Everett, WA		
Remedial Action Description:	**Contingent Vapor Barrier Across Floor of Warehouse Building (for commercial use)**		
Cost Estimate Accuracy:	FS Screening Level (+50/-30 percent)		
Key Assumptions and Quantities:	3.2	acre	Warehouse floor area requiring vapor barrier

CONSTRUCTION COSTS

Item	Quantity	Unit	Unit Cost	Total Cost	Notes
Installation of Impervious Epoxy Vapor Barrier					
Building preparation	1.0	LS	$ 100,000	$ 100,000	Decommission wells, remove interior building features, rehab floo
Installation	139,000	SF	$ 10	$ 1,390,000	Post-applied epoxy-based chemical vapor barrier
			Subtotal	$ 1,490,000	
Tax	9.9%			$ 147,510	
Contingency	20%			$ 298,000	
Subtotal - Vapor Barrier in Warehouse				***$ 1,935,510***	
Professional Services (as percent of capital costs)					
Project administration	3%		$ 1,935,510	$ 58,065	
Total Estimated Capital Costs				**$ 1,993,575**	

O&M COSTS - Net Present Value

Item	Annual Freq.	Unit Cost	Annual Cost	NPV Cost	Notes
Total O&M Costs - Net Present Value				**$ -**	This contingent action has no incremental O&M costs beyond those of the Cleanup Alternative
TOTAL ESTIMATED COST				**$ 2,000,000**	rounded to nearest $100,000

Notes:

encountered.

Taxes are not applied to project administration, design, management, monitoring, or reporting costs.

Table M-4. Cost Estimate for Contingent TPH Soil Removal and Capping, Warehouse Subarea

Project No. AS190583, K-C Worldwide Site Upland Area, Everett, Washington

Site:	K-C Worldwide Site Upland Area, Everett, WA		
Remedial Action Description:	**Contingent Removal of TPH-Contaminated Soils and then Capping in Warehouse Footprint**		
Cost Estimate Accuracy:	FS Screening Level (+50/-30 percent)		
Key Assumptions and Quantities:	2300	tons	Estimated mass of contaminated soil for Subtitle D landfill disposal
	3.2	acre	Warehouse footprint requiring capping after soil removal

CONSTRUCTION COSTS

Item	Quantity	Unit	Unit Cost	Total Cost	Notes
Removal of TPH-Contaminated Soils, then Capping of Warehouse Footprint					
Mobilization/demobilization	1	LS	$ 240,000	$ 240,000	
Soil excavation, transport, Subtitle D disposal	2600	ton	$ 180	$ 468,000	
Excavation dewatering	1	LS	$ 75,000	$ 75,000	discharge to City sanitary sewer
Import, place, and compact gravel borrow	2600	ton	$ 30	$ 78,000	assume quantity equal to removal to restore grade
Construct asphalt cap w/ stormwater infrastructure	3.2	acre	$ 420,000	$ 1,344,000	compacted subgrade, 12" crushed base course, 9" asphalt
Pre-design testing & engineering design	1	LS	$ 100,000	$ 100,000	includes add'l characterization, EDR. bid package and process
Construction management and reporting	1	LS	$ 50,000	$ 50,000	
			Subtotal	$ 2,355,000	
Tax	9.9%			$ 233,145	
Contingency	20%			$ 471,000	
Subtotal - Removal of TPH-Contaminated Soils				***$ 3,059,145***	
Professional Services (as percent of capital costs)					
Project administration	3%		$ 3,059,145	$ 91,774	
Total Estimated Capital Costs				**$ 3,150,919**	

O&M COSTS - Net Present Value

Item	Annual Freq.	Unit Cost	Annual Cost	NPV Cost	Notes
Total O&M Costs - Net Present Value				**$ -**	Inspection/maintenance for the new warehouse area cap is assumed included in that element of the Cleanup Alternative, thus zero additional cost here.
TOTAL ESTIMATED COST				**$ 3,200,000**	rounded to nearest $100,000

Notes:

Costs assume that the Warehouse was previously demolished.

Mobilization/Demobilization costs are assumed to include equipment transport and setup, temporary erosion and sedimentation control (TESC) measures, bonds, and insurance.

Contingency costs include miscellaneous costs not currently itemized due to the current (preliminary) stage of design development, as well as costs to address unanticipated conditions encountered.

Taxes are not applied to project administration, design, management, monitoring, or reporting costs.
