RE: Project: Seaport Landing
ARI Job No.: AUD1

Dear Madi:

Please find enclosed the original chain of custody record and the final results for the sample from the project referenced above. One water sample was received on January 14, 2016. The sample was analyzed for SVOCs, dioxins/furans, PCBs, NWTPH-Dx and total and dissolved metals as requested. It was noted upon sample receipt that no bottle was received for TSS analysis. This analysis was canceled as instructed.

The percent difference (%D) for benzoic acid was not within control limits for the CCAL that bracketed the SVOC analysis of this sample. All positive results for this compound have been flagged with a "Q" qualifier to denote the high %D.

The remaining analyses proceeded without incident of note.

An electronic copy of these reports will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Subject: Re: Incoming Seaport Stormwater

This sample arrived and we're logging it but we did not receive a TSS bottle and there are no additional ambers for the organics so we don't have extra volume that we can use...

On 1/13/2016 10:24 AM, Mary Benzinger wrote:

> Hi Mark,
> We are shipping one stormwater sample (sample name Storm-01) to ARI today. This sample is associated with the Seaport project (1044.02.01). It will need to be analyzed for SMS parameters, Dioxins/Furans, TPH, and TSS. The COC includes an attachment that indicates the SVOC list and target reporting limits.

Data Reporting Qualifiers

Effective 12/31/13

Inorganic Data

U	Indicates that the target analyte was not detected at the reported concentration
*	Duplicate RPD is not within established control limits
B	Reported value is less than the CRDL but ≥ the Reporting Limit
N	Matrix Spike recovery not within established control limits
NA	Not Applicable, analyte not spiked
H	The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
L	Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

Organic Data

U	Indicates that the target analyte was not detected at the reported concentration
*	Flagged value is not within established control limits
B	Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
J	Estimated concentration when the value is less than ARI's established reporting limits
D	The spiked compound was not detected due to sample extract dilution
E	Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

AUD1 : 00008

Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).

S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte

NA The flagged analyte was not analyzed for

NR Spiked compound recovery is not reported due to chromatographic interference

NS The flagged analyte was not spiked into the sample

M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"

Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.

EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" **(Dioxin/Furan analysis only)**

C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column

P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference

X Analyte signal includes interference from polychlorinated diphenyl ethers. **(Dioxin/Furan analysis only)**

Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. **(Dioxin/Furan analysis only)**

AUD1 : 00003

Geotechnical Data

A — The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.

F — Samples were frozen prior to particle size determination

SM — Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations

SS — Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis

W — Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: Project: GHHSA
ARI Job Nos.: XN64, XO00

Dear Mike:

Please find enclosed the original chain of custody records and the final results for the samples from the project referenced above.

Analytical Resources, Inc. (ARI) accepted fourteen sediment samples on November 8, 2013. Six samples were placed on hold as instructed. The remaining samples were analyzed for NWTPH-G, SVOCs, dioxins/furans, PCBs, NWTPH-Dx, total metals, porewater salinity and conventional parameters as requested. No porewater was extracted from samples CR04, CR05 or CR06. Porewater salinity is not available for these samples.

The percent recovery for the surrogates, bromobenzene and trifluorotoluene, were low following the initial NWTPH-G analysis of sample CR06-2.5. This sample was re-extracted and re-analyzed. The percent recoveries for both surrogates were low for the re-analysis. Since the percent recoveries for all spikes and surrogates were within established QC limits for the corresponding MB and LCS, it was concluded that the sample matrix was the cause of the low surrogate recoveries. No further corrective actions were taken. The results for the original analysis only have been submitted.

The percent differences (%Ds) for two compounds were high for the CCALs that bracketed the SIM-SVOA analyses of these samples. All positive results have been flagged with a "Q" qualifier to denote the high %Ds.

The percent recovery for the surrogate, TCMX, was low following the initial PCB analysis of sample CR01-10cm. Since the percent recovery for the surrogate, DCBP, was within established QC limits for this sample, no corrective actions were taken.

A small amount of contamination was detected in the method blank associated with the sulfide analyses of these samples. Sulfide was detected in all samples associated with this blank. The concentrations of sulfide measured in all samples associated with this blank were significantly greater than the concentration found in the blank for all samples except CR04-10cm. This sample only was re-prepared and re-analyzed. The re-analysis proceeded without incident of note. The result for the re-analysis only has been submitted for this sample. The results for the original analyses have been submitted for all other samples.

4611 South 134th Place, Suite 100 • Tukwila WA 98168 • **206-695-6200** • **206-695-6201** fax

Sediment

2 December 2013

A matrix duplicate (MD) was prepared and analyzed for sulfide in conjunction with sample CR04-10cm. The RPD was high following the analysis of the MD. Since the percent recovery for sulfide was within acceptable QC limits for the corresponding LCS, it was concluded that a lack of sample homogeneity was the cause of the high RPD. No corrective actions were taken.

A matrix spike (MS) was prepared and analyzed for TOC in conjunction with sample CR04-10cm. The percent recovery was low following the analysis of the MS. The MS was re-prepared and re-analyzed. The percent recovery was low for the re-analysis. Since the percent recovery for TOC was within acceptable QC limits for the corresponding SRM and LCS, it was concluded that the sample matrix was the cause of the low MS recoveries. No further corrective actions were taken. The result for the original analysis only has been submitted for the MS.

An MD was prepared and analyzed for total metals in conjunction with sample CR06-2.5. The RPDs for chromium, copper and mercury were high following the analysis of the MD. Since the percent recoveries for all elements were within acceptable QC limits for the corresponding LCS, it was concluded that a lack of sample homogeneity was the cause of the high RPDs. No corrective actions were taken.

An MS was prepared and analyzed for total metals in conjunction with sample CR06-2.5. The percent recovery for mercury was low following the analysis of the MS. Since the percent recovery for mercury was within acceptable QC limits for the corresponding LCS, it was concluded that the sample matrix was the cause of the low MS recovery. No corrective actions were taken.

The remaining analyses proceeded without incident of note.

An electronic copy of this report and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Hi Mark, you are correct on all statements. The SMS marine chemicals we want analyzed are in Table 2 of the attached (should be the same table we circulated in August). Table 3 includes a summary of the methods we discussed.

Please let us know if you have any questions.
Thanks,
MRM

Mike:

I just have a few items to clarify on these samples:

1) For those samples that request 'butylbenzylphthalate and PCP' only, we are to only do those two compounds, not the full SMS SVOC list, correct?

2) Is the request for 'SMS compounds' the full list of compounds in the table you sent in August?

3) Is '% fines' the same as grain size?

I think that's all we need. We'll get them logged and started as soon as possible.

Mark H.

Madi:

Okay, there are a couple of questions:

1) Is 'phenol' just plain phenol (by 8270), or PCP?

2) For CR04-5, we didn't receive large jars for porewater extraction. We received 4-8oz, 1-4oz and 1-2oz. We can us the 8oz but it won't leave much leftover.

3) For CR06-2.5, we didn't receive "VOA" jars. We can use the 4oz conventionals jar here and then give it to the conventionals lab if that works for you.

Got it. We'll get these tests added.

Mark H.

On 11/12/2013 12:20 PM, Madi Novak wrote:

Hi Mark,

I'd like to add analyses beyond what is already noted on the COC as follows:

CR04-10cm analyze for phenol
CR05-10cm analyze for phenol
CR06-10cm analyze for phenol
CR04-5 please analyze for conventionals (toc, tvs, total solids, ammonia, total sulfides, pore water sulfides) and phenol.
CR06-2.5 please analyze for SMS constituents, dioxins/furans, NWTPH-Gx and NWTPH-Dx

Please let me know if you have any questions.

Thank you,

Client: Maul Foster & Alongi	**ARI Job No.:** XN64
Client Project: GHHSA	**Client Project No.:** 0863.01.01

Case Narrative

1. Seven samples were submitted for testing and preparation on November 12, 2013 and were in good condition.
2. The samples were submitted for pore water extraction by the United States Army Corp of Engineers draft interim guidelines. Four samples to be submitted for sulfide analysis would not yield the required pore water volume. The three pore water samples to be submitted for salinity analysis did yield sufficient volume for analysis. All centrifuge bottles were decontaminated, pre-rinsed with hexane and allowed to dry completely. All spoons were decontaminated, pre-rinsed with dichloromethane and allowed to air dry completely. All samples were centrifuged in a pre-cooled centrifuge (4°C) at 3,000 x g for 30 minutes, decanted and then placed in another pre-cooled centrifuge (4°C) and spun at 7,000-x g for 30 minutes. The samples were decanted into small HDPE sample bottles with no preservation.
3. Four samples were submitted for grain size analysis according to Puget Sound Estuary Protocol (PSEP) methodology. The samples were originally split under the required volume required in PSEP. The samples were resplit, and the original bench sheets are included in the raw data. The samples were run in a single batch and one sample from another job was chosen for triplicate analysis. The triplicate data is reported on the QA summary. The samples contained woody or other organic matter which may have broken down during the sieving process, affecting grain size analysis. The samples displayed an oil-like sheen and left an oil-like residue on the equipment after processing.
4. The data is reported in summary tables and plots.
5. There were no other noted anomalies in the samples or methods on this project.

Analytical Resources, Incorporated
Analytical Chemists and Consultants

Data Reporting Qualifiers

Effective 2/14/2011

Inorganic Data

U — Indicates that the target analyte was not detected at the reported concentration

* — Duplicate RPD is not within established control limits

B — Reported value is less than the CRDL but ≥ the Reporting Limit

N — Matrix Spike recovery not within established control limits

NA — Not Applicable, analyte not spiked

H — The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible

L — Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

Organic Data

U — Indicates that the target analyte was not detected at the reported concentration

* — Flagged value is not within established control limits

B — Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.

J — Estimated concentration when the value is less than ARI's established reporting limits

D — The spiked compound was not detected due to sample extract dilution

E — Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

Q — Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).

YNSU : 000015

S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte

NA The flagged analyte was not analyzed for

NR Spiked compound recovery is not reported due to chromatographic interference

NS The flagged analyte was not spiked into the sample

M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses

M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"

Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.

EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" **(Dioxin/Furan analysis only)**

C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column

P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference

X Analyte signal includes interference from polychlorinated diphenyl ethers. **(Dioxin/Furan analysis only)**

Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. **(Dioxin/Furan analysis only)**

XNGU : 00017

Geotechnical Data

A	The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
F	Samples were frozen prior to particle size determination
SM	Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
SS	Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
W	Weight of sample in some pipette aliquots was below the level required for accurate weighting

				Trifluorotoluene	26.8%
				Bromobenzene	21.6%

Gasoline values reported in mg/kg (ppm)

Quantitation on total peaks in the gasoline range from Toluene to Naphthalene.

GAS: Indicates the presence of gasoline or weathered gasoline.
GRO: Positive result that does not match an identifiable gasoline pattern.

Results corrected for soil moisture content per Section 11.10.5 of EPA Method 8000C.

RE: Project: GHHSA
ARI Job No.: XQ70

Dear Mike:

Please find enclosed copies of the original chain of custody records and the final results for the samples from the project referenced above. These samples were originally accepted on November 8, 2013. These samples were analyzed for SVOCs, dioxins/furans, PCBs, NWTPH-Dx and total mercury as requested on 12/6/13.

The percent differences (%Ds) for several compounds were high for the CCALs that bracketed the SVOA and SIM-SVOA analyses of these samples. All positive results have been flagged with a "Q" qualifier to denote the high %Ds.

All samples were initially analyzed for SVOAs and SIM-SVOAs on 12/16/13. The areas for the internal standards were not within control limits following the analyses of these samples. All samples were diluted and re-analyzed on 12/19/13. The re-analyses proceeded without incident of note. The results for the re-analyses only have been submitted.

The remaining analyses proceeded without incident of note.

An electronic copy of this report and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Subject: RE: XN64-GHHSA
From: "Mike Murray" <mmurray@maulfoster.com>
Date: 12/6/2013 11:22 AM
To: "Mark Harris" <markh@arilabs.com>
CC: "Madi Novak" <mnovak@maulfoster.com>, "Mary Benzinger" <mbenzinger@maulfoster.com>

Hi Mark, we finished our initial evaluation and would like to run some follow-up analysis.

Since we are up against the hold time for mercury, the mercury analysis would have to happen pretty soon.

We would like to run archived samples: CR04-2.5 and CR05-2.5 for dioxin/furans and mercury.

We would like to run archived samples: CR04-10cm, CR04-2.5, CR05-10cm, and CR05-2.5 for SVOCs, PCBs and TPH-Dx.

Standard TAT is fine.

Lastly could you provide us with a cost for this follow-up analysis for our budget?

Let me know if you have any questions.

Thanks and have a nice weekend.
Mike

Mary:

No problem. It's in 2 parts due to the size of the file.

This is one of two and the EDD for XN64.

Mark H.

Hi Mark,
Thanks for the final EDD and cover letter.
Since there are so many parts to this report, and I don't want to miss anything, could you send these as a single report?
Thank you!

All:

Attached are the final EDD for the bulk of the sediment samples (XO00 was for the porewaters and that one was complete and final.) and a copy of the narrative. No data have change so I omitted the actual sample reports. If you'd like those re-sent and an 'intact'/complete report, let me know. The hard copy will mail tomorrow.

Let me know if you have any questions.

Mark H.

Cooler Receipt Form

ARI Client Maul Foster & Alongi Project Name GHH3A

COC No(s): _____ (NA) Delivered by Fed-Ex UPS (Courier) Hand Delivered Other: MC Delivery

Assigned ARI Job No: XN64 Tracking No: _____ (NA)

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler?	YES	(NO)
Were custody papers included with the cooler?	(YES)	NO
Were custody papers properly filled out (ink, signed, etc.)	(YES)	NO

Temperature of Cooler(s) (°C) (recommended 2 0-6.0 °C for chemistry) 3.2 0.4 5.2

Time: 1830

If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: 90877452

Cooler Accepted by: JM Date 11/8/13 Time 1830

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?		YES	(NO)
What kind of packing material was used?	Bubble Wrap (Wet Ice) Gel Packs Baggies Foam Block Paper Other		
Was sufficient ice used (if appropriate)?		NA (YES)	NO
Were all bottles sealed in individual plastic bags?		YES	(NO)
Did all bottles arrive in good condition (unbroken)?		(YES)	NO
Were all bottle labels complete and legible?		(YES)	NO
Did the number of containers listed on COC match with the number of containers received?		(YES)	NO
Did all bottle labels and tags agree with custody papers?		(YES)	NO
Were all bottles used correct for the requested analyses?		(YES)	NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)		(NA) YES	NO
Were all VOC vials free of air bubbles?		(NA) YES	NO
Was sufficient amount of sample sent in each bottle?		(YES)	NO
Date VOC Trip Blank was made at ARI		(NA)	

Was Sample Split by ARI: (NA) YES Date/Time: _____ Equipment _____ Split by: _____

Samples Logged by: JM Date. 11/12/13 Time 1240

Analytical Chemists and Consultants

Data Reporting Qualifiers

Effective 2/14/2011

Inorganic Data

U — Indicates that the target analyte was not detected at the reported concentration

* — Duplicate RPD is not within established control limits

B — Reported value is less than the CRDL but ≥ the Reporting Limit

N — Matrix Spike recovery not within established control limits

NA — Not Applicable, analyte not spiked

H — The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible

L — Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

Organic Data

U — Indicates that the target analyte was not detected at the reported concentration

* — Flagged value is not within established control limits

B — Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.

J — Estimated concentration when the value is less than ARI's established reporting limits

D — The spiked compound was not detected due to sample extract dilution

E — Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

Q — Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).

S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte

NA The flagged analyte was not analyzed for

NR Spiked compound recovery is not reported due to chromatographic interference

NS The flagged analyte was not spiked into the sample

M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses

M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"

Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.

EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" **(Dioxin/Furan analysis only)**

C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column

P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference

X Analyte signal includes interference from polychlorinated diphenyl ethers. **(Dioxin/Furan analysis only)**

Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. **(Dioxin/Furan analysis only)**

YQ7Q : QQQ12

Geotechnical Data

A	The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
F	Samples were frozen prior to particle size determination
SM	Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
SS	Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
W	Weight of sample in some pipette aliquots was below the level required for accurate weighting

APPENDIX G

DATA VALIDATION MEMORANDA

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 0863.01.03 | APRIL 10, 2017 | GRAYS HARBOR HISTORICAL SEAPORT AUTHORITY

This report reviews the analytical results for sediment samples collected by the Maul Foster & Alongi, Inc. (MFA) project team on the property located at 500 North Custer Street in Aberdeen, Washington. The samples were collected in November 2013.

Analytical Resources, Incorporated (ARI) performed the analyses. ARI report XN64_XO00_GHHSA_rpt, which contains reports XN64 and XO00, and report XQ70_MFA_GHHSA_rpt, which contains XQ70, were reviewed. Three of the sediment samples were processed by ARI to obtain pore water and were reported in XO00. Follow-up analyses were performed on XN64 samples and reported in XQ70. The analyses performed and samples analyzed are listed below. Some analyses may not have been performed on all samples.

Analysis	Reference
Ammonia Nitrogen	USEPA 350.1 Modified
Diesel and Motor Oil	NWTPH-Dx
Dioxins/Furans	USEPA 1613B
Gasoline	NWTPH-G
Grain Size	PSEP 1986
Polychlorinated Biphenyls	USEPA 8082A
Pore Water Conductivity	USEPA 120.1
Pore Water Salinity	SM 2520B
Preserved and Total Solids	SM 2540G
Semivolatile Organic Compounds	USEPA 8270D/8270D SIM
Total Mercury	USEPA 7471A
Total Metals	USEPA 6010C
TOC	Plumb
Total Sulfides	USEPA 376.2
Total Volatile Solids	SM 2540E

NWTPH = Northwest Total Petroleum Hydrocarbons.
Plumb = Procedures for handling and chemical analysis of sediment and water samples (Plumb, 1981).
PSEP = Puget Sound Estuary Protocols.
SIM = selective ion monitoring.
SM = Standard Methods for the Examination of Water and Wastewater.
TOC = total organic carbon.
USEPA = U.S. Environmental Protection Agency.

Samples Analyzed

CR04-5	-	-
CR06-2.5	-	-

SDG = sample delivery group.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008, 2010, 2011), appropriate laboratory and method-specific guidelines (ARI, 2013; USEPA, 1986), and the dioxin rules memorandum developed by MFA and approved by the Washington State Department of Ecology (MFA, 2012).

Data validation procedures were modified, as appropriate, to accommodate quality control (QC) requirements for methods not specifically addressed by the functional guidelines (e.g., total volatile solids).

Any result reported as exceeding the calibration range of the instrument was qualified as an estimate and assigned a "J" flag.

USEPA Method 1613B results reported as estimated maximum potential concentrations (EMPCs) were qualified by the reviewer with "U" (non-detect) at the reported EMPC value.

In report XQ70, the USEPA Method 1613B OCDD results for samples CR05-2.5 and CR04-2.5 exceeded the instrument calibration range. National Functional Guidelines for dioxin/furan data review state that laboratories are not required to take action when OCDD exceeds instrument calibration range (USEPA, 2011) The OCDD results were qualified "J" as estimated.

All data are considered acceptable for their intended use with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

In report XN64, the USEPA Method 8270D results for phenol, pentachlorophenol, and butylbenzylphthalate from samples CR04-10cm, CR04-5, CR05-10cm, and CR06-10cm were extracted and analyzed six days after the recommended 14-day holding time. All detected results have been qualified "J" as estimated, and all non-detect results have been qualified "UJ" as estimated.

In report XQ70, samples CR04-10cm, CR05-10cm, CR05-2.5, and CR04-2.5 were extracted for analysis by NWTPH-Dx, USEPA Method 8082A, and USEPA Method 8270D/8270D SIM after the recommended 14-day holding time. Samples CR05-2.5 and CR04-2.5 were prepared and analyzed for USEPA Method 7471A total mercury after the recommended 28-day holding time. All detected results have been qualified "J" as estimated, and all non-detect results have been qualified "UJ" as estimated.

The remaining extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch.

If an analyte was detected in a sample and in the associated method blank at less than ten times the method blank concentration, the sample result was qualified. USEPA Method 1613B sample results were qualified if sample concentrations were less than five times the associated method blank concentration. Reporting limits were elevated to the concentrations detected in the samples, and results were qualified as not detected "U" at the elevated method reporting limit (MRL).

For USEPA Method 1613B, if an analyte was detected in a sample and in the associated method blank below the reporting limit but above the estimated detection limit, sample detections below the level found in the method blank were qualified as "U" at the reporting limit.

In report XN64 and XQ70, the USEPA Method 1613B method blanks had detections for some analytes below the MRL and some detections for 1,2,3,4,6,7,8-HpCDD and OCDD above the MRL. All associated sample results were greater than five times the method blank concentrations; thus, no results were qualified.

In report XN64, the USEPA Method 376.2 sulfide method blank prepared on November 12, 2013, had a total sulfide detection of 0.17 milligram per kilogram (mg/kg). All associated sample detections were greater than ten times the method blank detection; thus, no results were qualified.

All remaining laboratory method blanks were non-detect.

Trip Blanks

Trip blanks were not submitted for this sampling event, as volatile organic compounds were not analyzed.

Equipment Rinsate Blanks

Equipment rinsate blanks were not collected for this sampling event. Equipment was decontaminated after each sample was collected in accordance with the sediment sampling and analysis plan (MFA, 2013).

SURROGATE RECOVERY RESULTS

When appropriate, individual samples were spiked with surrogate compounds to evaluate laboratory performance.

In report XN64, NWTPH-Gx surrogate recoveries for sample CR06-2.5 exceeded the lower percent recovery limits for both trifluorotoluene and bromobenzene. The associated result was qualified by the reviewer as follows:

Sample	Component	Original Result (mg/kg)	Qualified Result (mg/kg)
CR06-2.5	Gasoline	54 U	54 UJ

The reviewer took no action based on minor surrogate outliers or surrogate percent recoveries that were outside acceptance limits because of dilutions necessary to quantify high concentrations of target analytes present in the samples. The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance and QC for samples with surrogate outliers were within acceptance limits.

All remaining surrogate recoveries were within acceptance limits.

LABELED ANALOG STANDARD RECOVERY RESULTS

All USEPA Method 1613B Modified samples were spiked with C13 labeled analog standards to quantify the recovery of individual target compounds. All C13 labeled analog standard recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency.

In report XN64, the USEPA Method 7471A MS exceeded the upper percent recovery acceptance limit for total mercury. The exceedance was minor and the laboratory control sample (LCS) had acceptable recovery; thus, no results were qualified.

In report XN64, the case narrative states that the USEPA 376.2 sulfide matrix duplicate exceeded relative percent difference (RPD) acceptance criteria. The matrix duplicate RPD results were not included in the QC report. The remaining batch QC had acceptable recoveries, and the laboratory stated that sample heterogeneity likely was the cause of the RPD exceedance. No results were qualified.

In report XN64, the case narrative states that the Method Plumb (1981) MS had low percent recovery for TOC and that a re-prepared MS also had low recovery. The LCS had acceptable recovery, which indicates matrix interference. The following results were qualified "J" as estimated:

Report	Sample	Component	Original Result (%)	Qualified Result (%)
XN64	CR06-10cm	TOC	35.6	35.6 J
XN64	CR04-10cm	TOC	31.4	31.4 J
XN64	CR05-10cm	TOC	13.6	13.6 J
XN64	CR06-2.5	TOC	49.5	49.5 J
XN64	CR04-5	TOC	16.5	16.5 J
XN64	CR01-10cm	TOC	2.06	2.06 J
XN64	CR02-10cm	TOC	3.21	3.21 J
XN64	CR03-10cm	TOC	2.91	2.91 J

All recoveries were within acceptance limits for percent recovery and RPDs.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. Laboratory duplicate RPDs for USEPA Method 6010C were assessed against the RPD acceptance limit of 35 percent for soil laboratory duplicates, as presented in the National Functional Guidelines for inorganic data review (USEPA, 2010). Minor laboratory duplicate RPD exceedances and exceedances for results near the reporting limit were not qualified by the reviewer.

In report XN64, the USEPA Method 6010C laboratory duplicate exceeded RPD acceptance criteria for total chromium, total copper, and total mercury. The exceedance for total mercury was minor and the associated results were not qualified. The associated batch QC had acceptable recoveries; however, the total chromium and total copper RPD exceedances were significant. The following results were qualified:

Report	Sample	Component	Original Result (mg/kg)	Qualified Result (mg/kg)
XN64	CR06-2.5	Total Chromium	26	26 J
XN64	CR06-2.5	Total Copper	96	96 J
XN64	CR01-10cm	Total Chromium	40	40 J

Report	Sample	Component	Original Result (mg/kg)	Qualified Result (mg/kg)
XN64	CR01-10cm	Total Copper	58	58 J
XN64	CR02-10cm	Total Chromium	38.5	38.5 J
XN64	CR02-10cm	Total Copper	56.3	56.3 J
XN64	CR03-10cm	Total Chromium	48	48 J
XN64	CR03-10cm	Total Copper	65.4	65.4 J

All remaining laboratory duplicate RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/laboratory control sample duplicate (LCSD) is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency.

In report XN64, the USEPA Method 8270D SIM LCS exceeded the instrument calibration range for pentachlorophenol. The LCS percent recovery was within acceptance limits, and the associated sample detections were already qualified as estimated because they were below the MRL; thus, no results were qualified by the reviewer.

All remaining LCS/LCSD analytes were within acceptance limits for percent recovery and RPD.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. No field duplicate samples were submitted for analysis.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy through the end of the sample batch.

National Functional Guidelines for low/medium volatile and semivolatile data review (USEPA, 2008) state that results associated with closing CCV percent drift exceedances between 50 percent and -50 percent do not require qualification. However USEPA Method 8270D states that when CCV percent drift acceptance criteria are met for at least 80 percent of the compounds, non-detects may be reported for compounds that exceed acceptance limits if the laboratory demonstrates that quantitation limit sensitivity can still be achieved. Detected compounds associated with CCV percent drift exceedances may be reported as estimated values.

In report XN64, the USEPA Method 8270D SIM CCV exceeded percent drift criteria for benzyl alcohol and butylbenzylphthalate. In report XQ70, the USEPA Method 8270D and

8270D SIM CCVs also exceeded percent drift criteria for several compounds. Associated sample detections above the MRL were qualified with "J" as estimated. USPEA Method 8270D results associated with report XQ70 were already qualified "J" due to holding time exceedances, as noted above.

Report	Sample	Component	Original Result (µg/kg)	Qualified Result (µg/kg)
XN64	CR02-10cm	Benzyl Alcohol	43 Q	43 J
XN64	CR03-10cm	Benzyl Alcohol	43 Q	43 J

µg/kg = micrograms per kilogram.

Based on available information, all other CCVs were within acceptance limits for percent recovery.

REPORTING LIMITS

ARI used routine reporting limits for non-detect results, except when samples required dilutions because of limited sample or extract volume, high analyte concentrations, and/or matrix interferences.

Detections below the MRL were reported for some analyses: results for USEPA Method 1613B were reported to estimated detection limits, and results for USEPA Methods 8082A, 8270D, and 8270D SIM were reported to method detection limits. Some NWTPH-Gx, USEPA Method 8082A, and USEPA Method 8270D reporting limits were raised because of chromatographic interference or matrix interference. All samples in report XQ70 were diluted 1:5 for USEPA Method 8270D/8270D SIM analyses due to matrix interference.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies.

In report XN64, the case narrative states that the USEPA Method 7471A MS exceeded the lower acceptance limit for total mercury; however, the MS exceeded the upper acceptance limit.

In report XO00, conductivity was not indicated on the chain of custody but was analyzed for pore water extracts of samples CR01-10cm, CR02-10cm, and CR03-10cm.

All samples submitted for pore water extraction (CR01-10cm, CR02-10cm, CR03-10cm, and CR04-5) produced insufficient volume for USEPA Method 376.2 sulfides analysis. The volume of extracted pore water was sufficient to perform the remaining analyses.

No additional issues were found.

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 1044.02.01 | APRIL 10, 2017 | GRAYS HARBOR HISTORICAL SEAPORT AUTHORITY

Maul Foster & Alongi, Inc. (MFA) conducted an independent review of the quality of analytical results for groundwater, sediment, soil, and stormwater samples collected at the leased tideland and in-water portion of the Seaport Landing site, located adjacent to the Chehalis River at 500 North Custer Street in Aberdeen, Washington. The samples were collected on October 12 through 16, 2015, and January 12, 2016.

Analytical Resources, Inc. (ARI) in Tukwila, Washington, and NVL Laboratories (NVL) in Seattle, Washington, performed the analyses. ARI report numbers AON0, AON1, AON2, AON3, AOT3, AOV8, AOV9, AOW1, AOW2, ART5, ASF7, and AUD1 were reviewed. The analyses performed and samples analyzed are listed below. Additional samples were submitted to ARI on hold and were archived at -18 degrees Celsius (°C). Portions of samples reported in AOV8, AOV9, and AOW2 were subcontracted to NVL for asbestos analysis and results are appended to AOV8, AOV9, and AOW2, respectively. Report ART5 is a follow-up to report AOW1 and contains results originally requested, but not reported in AOW1. Report ASF7 is a follow-up to report AOV9 and contains results for tests requested in addition to those reported in AOV9.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2014a,b,c) and appropriate laboratory and method-specific guidelines (ARI, 2014; USEPA, 1986).

Data validation procedures were modified, as appropriate, to accommodate quality control requirements for methods not specifically addressed by the functional guidelines (e.g., NWTPH-Dx).

Where appropriate, the data were qualified using the following qualifiers:

J The analyte was positively identified but the associated numerical value is an approximate concentration because either there was an issue with the quality of the data generated or the concentration of the analyte was between the reporting limit (RL) and half the RL or the estimated detection limit (EDL).

J+ The result is an estimated value but may be biased high.

U Analysis was conducted, but the analyte was not detected at or above the selected RL. The value may represent an adjusted RL or the sample-specific EDL.

UJ The analyte was not detected (see definition of "U" and "J" qualifiers above). The reported value should be considered approximate.

R The sample results are unusable because certain quality control criteria were not met. The analyte may or may not be present in the sample.

GENERAL ASSESSMENT

Results for total and dissolved metals in water were reviewed to identify inconsistencies in any one sample. All total metals results were greater than dissolved metals results or within a reasonable relative percent difference (RPD).

ARI did not use second column confirmation for 2,3,7,8-TCDF. The reviewer confirmed that the analytical column used for USEPA Method 1613B analysis met requirements for 2,3,7,8-TCDD and 2,3,7,8-TCDF isomer specificity, therefore not requiring second column confirmation.

In reports AON1, AON2, AON3, AOV8, AOV9, AOW1, AOW2, and AUD1, USEPA Method 1613B detected results that were reported as estimated maximum potential concentrations (EMPC) were assigned by the reviewer a "U" qualifier (non-detect) at the reported EMPC value. Results detected below the RL were flagged by ARI with "J EMPC" and were also assigned by the reviewer a "U" qualifier at the reported EMPC value. In reports AON2 and AOW1, the 1,2,3,7,8-PeCDF results for samples CR09a-SSD-COMP and CR19F-SSD were flagged by ARI with "X" in addition to "EMPC," due to polychlorinated diphenyl ether interference. Qualified results are summarized below.

Report	Sample	Component	Laboratory-Reported Result (pg/g)	Result of Record (pg/g)
AON0	CR23-S-3.0	2,3,7,8-TCDF	0.0538 J EMPC	0.0538 U

EMPC = estimated maximum potential concentration.
J = the result is an estimated value.
pg/L = picograms per liter.
U = the result is non-detect.

In reports AON0, AOV8, and AOW2, the USEPA Method 1613B OCDD result for samples CR22-S-3.0 and CR08a-SSD-COMP exceeded the instrument calibration range. The results have been qualified as estimated by the reviewer as follows:

Report	Sample	Component	Laboratory-Reported Result (pg/g)	Result of Record (ug/kg)
AON0	CR22-S-3.0	OCDD	30800	30800 J
AOV8	CR08a-SSD-COMP	OCDD	13700	13700 J
AOW2	CR0b-SSD-COMP	OCDD	22200	22200 J

J = the result is an estimated value.
ug/kg = micrograms per kilogram.

In report AON3, the laboratory flagged USEPA Method 8082A Aroclor 1254 results for sample CR20-S-5.0 due to primary and confirmation column relative percent differences (RPDs) greater than or equal to 40 percent. The laboratory did not detect chromatographic interference. The results were qualified "J", as estimated, by the reviewer. Qualifications are as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON3	CR20-S-5.0	Aroclor 1254	710	710 J
AON3	CR21-S-5.0	Aroclor 1254	73	73 J

J = the result is an estimated value.
ug/kg = micrograms per kilogram.

In report AOT3, the preserved (fixed) total solids result was greater than the total solids result. The preserved total solids value was within 20 percent of the total solids value; thus, no results were qualified.

The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

All TOC analysis dates exceeded the recommended 14-day holding time; however, samples from reports AON1, AON2, AOV8, AOW1, and AOW2 were prepared for analysis within 14 days of sample collection. Samples from report ASF7 were prepared from containers frozen at the time of receipt. No data required qualification.

USEPA Method 8270D and 8270D SIM extractions were conducted one to two days past the 14-day recommended holding times for sediment samples associated with reports AOV9 and AOW2. The reviewer confirmed with ARI that the affected samples were extracted from containers stored at -18°C from the time of login. Sediment sample storage at -18°C

extends USEPA Method 8270D and 8270D-SIM holding time to one year. No qualification was required.

Remaining extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch.

If an analyte was detected in a sample and in the associated method blank, the sample result was qualified if the concentration was less than five times the method blank concentration for USEPA Method 1613B results and less than ten times the method blank concentration for remaining analysis results. Method reporting limits (MRLs) were elevated to the concentration detected in the samples and results were qualified as not detected "U" at the elevated MRL. The reviewer did not qualify remaining results.

Sample results less than five times the MRL were qualified by the reviewer with "J+", as estimated with a positive bias, if sample results were also within ten times a method blank concentration that was below the MRL.

For USEPA Method 1613B results, analytes detected in a sample and in the associated method blank below the MRL but above the EDL were qualified as "U" at the reporting limit. Method blank detections flagged as EMPCs did not result in qualification.

In report AON3, the USEPA Method 1613B method blank had detections for some analytes below the MRL and a detection of OCDD above the MRL. All associated sample results were above the MRL and greater than five times the method blank concentrations; thus, no results were qualified.

In reports AON0, AON1, and AON2, the soil and sediment matrix USEPA Method 1613B method blank (MB-102315) had several detections below the MRL and a detection for OCDD above the MRL. The following results were qualified

Report	Sample	Component	Laboratory-Reported Result (pg/g)	Result of Record (pg/g)
AON0	CR23-S-3.0	2,3,4,6,7,8-HxCDF	0.133 J	0.133 U

J = the result is an estimated value.
pg/g = pictograms per gram.
U = the result is non-detect.

In report AOV8, the sediment matrix USEPA Method 1613B method blank (MB-102615) had detections of some analytes below the MRL and detections of 1,2,3,4,6,7,8-HpCDD and OCDD above the MRL. All associated sample results were either qualified based on EMPC, were non-detect, or were greater than five times the method blank concentration; thus, no results were qualified.

In reports AOV9, AOW1, and AOW2, the sediment matrix USEPA Method 8270D method blank (MB-103015) had a detection of diethylphthalate above the reporting limit, at 21 ug/kg. Associated samples were qualified by the reviewer as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOV9	CR26-SBSD	Diethylphthalate	20	20 U
AOW1	CR19F-SBSD	Diethylphthalate	24	24 U
AOW1	CR19F-SBSD-DUP	Diethylphthalate	38	38 U
AOW1	CR19F-SSD	Diethylphthalate	22	22 U
AOW1	SR18B-SBSD	Diethylphthalate	20	20 U
AOW1	SR18B-SSD	Diethylphthalate	40	40 U
AOW2	CR15C-SSD	Diethylphthalate	21	21 U
AOW2	CR15C-SBSD	Diethylphthalate	26	26 U
AOW2	CR08b-SSD-COMP	Diethylphthalate	36	36 U

J = the result is an estimated value.
U = the result is non-detect.
ug/kg = micrograms per kilogram.

In reports AOV9, AOW1, and AOW2, the sediment matrix USEPA Method 1613B method blank (MB-102615) had a detection of 1,2,3,7,8,9-HxCDF below the MRL and detections of 1,2,3,4,6,7,8-HpCDD and OCDD above the MRL. The following results were qualified:

Report	Sample	Component	Laboratory-Reported Result (pg/g)	Result of Record (pg/g)
AOV9	CR08b-SBSD	1,2,3,7,8,9-HxCDF	0.146 J	0.146 U
AOV9	CR08b-SBSD	OCDD	45.4	45.4 U
AOW1	CR18B-SSD	1,2,3,7,8,9-HxCDF	0.226 J	0.226 U

Report	Sample	Component	Laboratory-Reported Result (pg/g)	Result of Record (pg/g)
AOW2	CR15C-SSD	1,2,3,7,8,9-HxCDF	0.338 J	0.338 U

J = the result is an estimated value.
pg/g = pictograms per gram.
U = the result is non-detect.

In report AOT3, the USEPA Method 8270D sediment matrix method blank (MB-102815) had a detection for phenol below the reporting limit, at 17 ug/kg. The associated sample, CR19D-SSD-CONV, had a phenol detection above the reporting limit, at 93 ug/kg. The reviewer qualified the result as estimated with a positive bias (J+) as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOT3	CR19D-SSD-CONV	Phenol	93	93 J+

J+ = the result is an estimated value with a positive bias.
U = the result is non-detect.
ug/kg = micrograms per kilogram.

All remaining method blanks were non-detect.

Trip Blanks

Trip blanks were not submitted for analysis.

Equipment Rinsate Blanks

Equipment rinsate blanks were not submitted for analysis.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. The laboratory appropriately documented and qualified surrogate outliers. Associated batch quality assurance/quality control for samples with surrogate outliers were within acceptance limits, except where otherwise noted. Sample results associated with surrogate percent recovery exceedances caused by dilutions were not qualified by the reviewer.

In report AON0, the USEPA Method 8270D surrogate p-terphenyl-d14 result was below the lower percent recovery acceptance limit of 28 percent, at 24.9 percent for sample CR23-GW-6.0. The surrogate p-terphenyl-d14 is a base/neutral surrogate, and the remaining base/neutral surrogates for sample CR23-GW-6.0 were within percent recovery acceptance limits. No results were qualified.

In report AON0, the NWTPH-Dx surrogate o-terphenyl result was below the lower percent recovery acceptance limit of 50 percent, at 47.6 percent for sample CR23-GW-6.0. Associated sample results were qualified "J" as estimated by the reviewer as follows:

Report	Sample	Component	Laboratory-Reported Result (mg/L)	Result of Record (mg/L)
AON0	CR23-GW-6.0	Diesel	3.4	3.4 J
AON0	CR23-GW-6.0	Motor Oil	3.2	3.2 J

J = the result is an estimated value.
mg/L = milligrams per liter.

In report AON3, the USEPA Method 8082A surrogate decachlorobiphenyl exceeded the upper percent recovery acceptance limit of 120 percent, at 126 percent due to co-elution with some Aroclors compounds. The exceedance was minor, and the remaining surrogate had acceptable percent recovery; thus, no results were qualified.

All remaining surrogate recoveries were within acceptance limits.

LABELED ANALOG RECOVERY RESULTS

In reports AON0, AON2, AON3, AOV8, AOV9, AOW1, and AOW2, USEPA Method 1613B samples were spiked with carbon-13 (C13) labeled analog standards to quantify the relative response of analytes in each sample. All C13 labeled analog standard recoveries were within acceptance limits.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

Matrix spike/matrix spike duplicate (MS/MSD) results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency. Control limits were not included with most MS/MSD results. The reviewer confirmed that MS/MSDs met percent recovery and RPD acceptance criteria, with the following exceptions:

In reports AON1, sediment matrix USEPA Method 8270D MS/MSD results for 4-methylphenol were above the upper percent recovery acceptance limit, with percent recoveries of 162 percent and 139 percent, respectively. The MS/MSD results for N-nitrosodiphenylamine were below lower percent recovery acceptance limits, at 24.5 percent and 12.2 percent, respectively. The RPD for N-nitrosodiphenylamine exceeded the control limit, at 67 percent. The associated laboratory control sample (LCS) had acceptable percent recoveries for both compounds. The sample used to prepare the MS/MSD was qualified by the reviewer as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON1	CR12-SBSD-15	4-Methylphenol	870	870 J
AON1	CR12-SBSD-15	N-Nitrosodiphenylamine	20 U	20 UJ

J = the result is an estimated value.
ug/kg = micrograms per kilogram.
UJ = the result is non-detect and an estimated value.

In report AON1, sediment matrix USEPA Method 8270D-SIM MS/MSD results for N-nitrosodiphenylamine were below lower percent recovery acceptance limits, at 28.4 percent and 14.5 percent, respectively. The RPD for N-nitrosodiphenylamine exceeded the control limit, at 64.6 percent. The associated LCS had acceptable percent recovery. The sample used to prepare the MS/MSD was qualified as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON1	CR12-SBSD-15	N-Nitrosodiphenylamine	4.9 U	4.9 UJ

ug/kg = micrograms per kilogram.
UJ = the result is non-detect and an estimated value.

In report AON3, the soil matrix USEPA Method 6010C MS result for total chromium was below the lower percent recovery acceptance limit of 75 percent, at -5.4 percent. The associated LCS met percent recovery acceptance limits for total chromium. The associated laboratory duplicate exceeded RPD acceptance limits for total chromium. Associated samples are qualified in the laboratory duplicate section below.

In report AOV8, the sediment matrix USEPA Method 8270D-SIM MS/MSD results for pentachlorophenol and the MS result for 2,4-dimethylphenol were flagged with "E" by ARI due to concentrations exceeding the instrument calibration range. The reviewer confirmed that the same MS/MSD extract was analyzed by both 8270D dual scan and 8270D-SIM. The MS/MSD met percent recovery acceptance limits for pentachlorophenol and 2,4-dimethylphenol by both USEPA Method 8270D and 8270D-SIM, and analytical results for the same samples reported by both methods were consistent; thus, no results were qualified.

All remaining MS/MSD results were within acceptance limits for percent recovery and RPDs.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. Laboratory duplicate results that had concentrations less than five times the reporting limit were not evaluated.

In report AON3, the soil matrix USEPA Method 6010C laboratory duplicate prepared with sample CR20-S-5.0 exceeded the RPD control limit of 20 percent for total chromium, at 119 percent. The associated LCS met percent recovery acceptance limits. The MS prepared with the same sample also exceeded total chromium control limits. The sample used to prepare the laboratory duplicate is likely heterogeneous. Since the matrix of sample CR20-S-5.0 is expected to be similar to the matrix of site soils, both sample results were qualified "J" as estimated by the reviewer as follows:

Report	Sample	Component	Laboratory-Reported Result (mg/kg)	Result of Record (mg/kg)
AON3	CR20-S-5.0	Total Chromium	71	71 J
AON3	CR21-S-5.0	Total Chromium	32	32 J

Report	Sample	Component	Laboratory-Reported Result (mg/kg)	Result of Record (mg/kg)

J = the result is an estimated value.
mg/kg = milligrams per kilogram.

The laboratory duplicates for solid matrix USEPA Method 6010C and 7471A batches prepared on November 2, 2015 were associated with results reported in AOV8, AOV9, AOW1, and AOW2. The laboratory duplicate results were reported only in AOW1 and met RPD control limits.

All remaining laboratory duplicate RPDs were within acceptance limits.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

Laboratory control sample/laboratory control sample duplicates (LCS/LCSD) are spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. Control limits were not included with most LCS/LCSD results. The reviewer confirmed that LCS/LCSDs met percent recovery and RPD acceptance criteria, with the following exceptions:

In reports AON0 and AON3, the soil and sediment matrix USEPA Method 8270D LCS result for 4-chloroaniline was below the lower percent recovery acceptance limit of 11 percent, at 3.8 percent; the result for 3-nitroaniline was below the lower percent recovery acceptance limit of 22 percent, at 5.7 percent; and the LCS result for 3,3'-dichlorobenzidine was 0 percent. All associated sample results were non-detect. Due to the low LCS percent recoveries, the results have been qualified with "R" as rejected by the reviewer as shown in the table below. Qualifications are as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON0	CR07-SSD-COMP	4-Chloroaniline	97 U	97 R
AON0	CR07-SSD-COMP	3-Nitroaniline	97 U	97 R
AON0	CR07-SSD-COMP	3,3'-Dichlorobenzidine	97 U	97 R
AON0	CR23-S-3.0	4-Chloroaniline	93 U	93 R
AON0	CR23-S-3.0	3-Nitroaniline	93 U	93 R
AON0	CR23-S-3.0	3,3'-Dichlorobenzidine	93 U	93 R
AON0	CR22-S-3.0	4-Chloroaniline	190 U	190 R
AON0	CR22-S-3.0	3-Nitroaniline	190 U	190 R
AON0	CR22-S-3.0	3,3'-Dichlorobenzidine	190 U	190 R
AON3	CR20-S-5.0	4-Chloroaniline	1400 U	1400 R
AON3	CR20-S-5.0	3-Nitroaniline	1400 U	1400 R
AON3	CR20-S-5.0	3,3'-Dichlorobenzidine	1400 U	1400 R
AON3	CR21-S-5.0	4-Chloroaniline	460 U	460 R
AON3	CR21-S-5.0	3-Nitroaniline	460 U	460 R
AON3	CR21-S-5.0	3,3'-Dichlorobenzidine	460 U	460 R

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)

ug/kg = micrograms per kilogram.
R = the result is rejected.

In reports AON0 and AON3, the groundwater and surface water matrix USEPA Method 8270D LCSD result for 2,2'-oxybis (1-chloropropane) was below the lower percent recovery acceptance limit of 47 percent, at 44.4 percent. The LCS result was within the percent recovery acceptance limit; thus, no results were qualified. The LCS/LCSD exceeded RPD acceptance limits of 30 percent for phenol, bis(2-chloroethyl)ether, and 2-chlorophenol. Associated samples were non-detect; thus, no results were qualified.

In reports AON1, AOV8, AOV9, AOW1, and AOW2, the USEPA Method 8270D-SIM LCS results for pentachlorophenol were flagged with "E" by ARI due to concentrations exceeding the instrument calibration range. The reviewer confirmed that the same LCS extract was analyzed by both 8270D dual scan and 8270D-SIM. The LCS met percent pentachlorophenol percent recovery acceptance limits for both methods. The pentachlorophenol results reported by both methods for the same samples were consistent; thus, no results were qualified.

All remaining LCS/LCSD results were within acceptance limits for percent recovery and RPD.

FIELD DUPLICATE RESULTS

One field duplicate was submitted for analysis with report AOW1 (CRF19F-SBSD/CRF19F-SBSD-DUP). MFA uses acceptance criteria of 100 percent RPD for results that are less than five times the MRL or 50 percent RPD for results that are greater than five times the MRL. Non-detect data are not used in the evaluation of field duplicate results. All field duplicate analytes were within the acceptance criteria.

CONTINUING CALIBRATION VERIFICATION RESULTS

Continuing calibration verification (CCV) results are used to demonstrate instrument precision and accuracy throughout the sample batch. ARI reported CCV-qualified results. CCV exceedances associated with quality control samples and surrogate results that met percent recovery acceptance limits were not qualified by the reviewer.

In reports AON1 and AON2, the solid matrix USEPA Method 8270D-SIM CCV analyzed on November 5, 2015 exceeded percent drift acceptance limits for pentachlorophenol. All associated results were qualified as estimated by the reviewer with "UJ" for non-detect results and "J" for detected results, as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON1	CR-24-SSD-COMP	Pentachlorophenol	86 Q	86 J

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON1	CR11-SBSD-23	Pentachlorophenol	19 U	19 UJ
AON1	CR12-SBSD-15	Pentachlorophenol	20 U	20 UJ
AON1	CR13-SBSD-11	Pentachlorophenol	20 U	20 UJ
AON1	CR14-SBSD-12	Pentachlorophenol	20 U	20 UJ
AON2	CR09a-SSD-COMP	Pentachlorophenol	19 U	19 UJ
AON2	CR09b-SSD-COMP	Pentachlorophenol	19 U	19 UJ

In reports AON0 and AON3, the solid matrix USEPA Method 8270D CCV analyzed on October 28, 2015 exceeded percent drift acceptance limits for phenol, carbazole, and 3,3'-dichlorobenzidine. Associated sample results have been qualified as estimated by the reviewer with "J," except for 3,3'-dichlorobenzidine results, which were already qualified in the LCS/LCSD section. Results detected below the reporting limit were already flagged by the laboratory as estimated; no additional qualification was required. Qualified results are as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AON0	CR-07-SSD-COMP	Carbazole	24	24 J
AON0	CR23-S-3.0	Phenol	19 U	19 UJ
AON0	CR23-S-3.0	Carbazole	19 U	19 UJ
AON0	CR22-S-3.0	Phenol	38 U	38 UJ
AON0	CR22-S-3.0	Carbazole	38 U	38 UJ
AON3	CR20-S-5.0	Phenol	280 U	280 UJ
AON3	CR20-S-5.0	Carbazole	280 U	280 UJ
AON3	CR21-S-5.0	Phenol	92 U	92 UJ
AON3	CR21-S-5.0	Carbazole	92 U	92 UJ

J = the result is an estimated value.
U = the result is non-detect.
ug/kg = micrograms per kilogram.
UJ = the result is non-detect and an estimated value.

In reports AON0 and AON3, the aqueous matrix USEPA Method 8270D CCV analyzed on October 23, 2015 exceeded percent drift acceptance limits for benzoic acid, hexachlorocyclopentadiene, 2,4-dinitrophenol, 4-nitrophenol, and pentachlorophenol. Associated sample results that were non-detect have been qualified as estimated by the reviewer with "UJ." Sample results reported between one-half of the MRL and the MRL are estimated values and were not additionally qualified by the reviewer. Qualified results are summarized as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/L)	Result of Record (ug/L)
AON0	CR23-GW-6.0	Hexachlorocyclopentadiene	5.0 U	5.0 UJ
AON0	CR23-GW-6.0	2,4-Dinitrophenol	20 U	20 UJ
AON0	CR23-GW-6.0	4-Nitrophenol	10 U	10 UJ

Report	Sample	Component	Laboratory-Reported Result (ug/L)	Result of Record (ug/L)
AON0	CR23-GW-6.0	Pentachlorophenol	10 U	10 UJ
AON0	CR22-GW-9.0	Benzoic acid	20 U	20 UJ
AON0	CR22-GW-9.0	Hexachlorocyclopentadiene	5.0 U	5.0 UJ
AON0	CR22-GW-9.0	2,4-Dinitrophenol	20 U	20 UJ
AON0	CR22-GW-9.0	4-Nitrophenol	10 U	10 UJ
AON0	CR22-GW-9.0	Pentachlorophenol	10 U	10 UJ
AON3	CR21-GW-10	Benzoic acid	20 U	20 UJ
AON3	CR21-GW-10	Hexachlorocyclopentadiene	5.0 U	5.0 UJ
AON3	CR21-GW-10	2,4-Dinitrophenol	20 U	20 UJ
AON3	CR21-GW-10	4-Nitrophenol	10 U	10 UJ
AON3	CR21-GW-10	Pentachlorophenol	10 U	10 UJ
AON3	CR20-GW-5.0	Benzoic acid	20 U	20 UJ
AON3	CR20-GW-5.0	Hexachlorocyclopentadiene	5.0 U	5.0 UJ
AON3	CR20-GW-5.0	2,4-Dinitrophenol	20 U	20 UJ
AON3	CR20-GW-5.0	4-Nitrophenol	10 U	10 UJ
AON3	CR20-GW-5.0	Pentachlorophenol	10 U	10 UJ
AON3	Seep-01	Benzoic acid	20 U	20 UJ
AON3	Seep-01	Hexachlorocyclopentadiene	5.0 U	5.0 UJ
AON3	Seep-01	2,4-Dinitrophenol	20 U	20 UJ
AON3	Seep-01	4-Nitrophenol	10 U	10 UJ
AON3	Seep-01	Pentachlorophenol	10 U	10 UJ

UJ = the result is non-detect and an estimated value.
ug/L = micrograms per liter.

In reports AON0 and AON3, ARI reported in the case narrative that a USEPA Method 8082A CCV exceeded the percent drift acceptance limit for Aroclor 1242. The reviewer confirmed that the CCV was associated with aqueous matrix samples. The CCVs analyzed on the secondary column met percent drift acceptance criteria, and ARI quantified results from the secondary column; thus, no qualification was required.

In reports AOV8 and AOV9, the solid matrix USEPA Method 8270D CCV analyzed on October 30, 2015 exceeded percent drift acceptance limits for 4-methylphenol and benzoic acid. Associated sample results detected below the reporting limit were already flagged by the laboratory as estimated; no additional qualification was required. Remaining qualified results are summarized below. The CCV also exceeded percent drift acceptance limits for some compounds that were not reported, and no action was required by the reviewer for these exceedances. Qualifications are as follows:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOV8	CR17-D-SSD	4-Methylphenol	19 U	19 UJ
AOV8	CR17-D-SBSD	4-Methylphenol	120	120 J
AOV8	CR17-D-SSD	Benzoic Acid	230	230 J

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOV8	CR08A-SBSD	4-Methylphenol	190	190 J
AOV8	CR10-SSD-COMP	4-Methylphenol	160	160 J
AOV8	CR10-SSD-COMP	Benzoic Acid	210	210 J
AOV8	CR08a-SSD-COMP	4-Methylphenol	28	28 J
AOV9	CR08b-SBSD	4-Methylphenol	560	560 J
AOV9	CR08b-SBSD	Benzoic Acid	290	290 J

J = the result is an estimated value.
ug/kg = micrograms per kilogram.
UJ = the result is non-detect and an estimated value.

In reports AOV9, AOW1, and AOW2, the solid matrix USEPA Method 8270D-SIM CCV analyzed on November 5, 2015 exceeded percent drift acceptance limits for pentachlorophenol. Associated sample results that were non-detect have been qualified as estimated by the reviewer with "UJ." Associated sample results detected below the reporting limit were already flagged by the laboratory as estimated; no additional qualification was required. Qualified results are summarized below.

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOV9	CR26-SBSD	Pentachlorophenol	20 U	20 UJ
AOW1	CR19F-SBSD	Pentachlorophenol	20 U	20 UJ
AOW1	CR19F-SBSD-DUP	Pentachlorophenol	20 U	20 UJ
AOW2	CR15C-SSD	Pentachlorophenol	20 U	20 UJ
AOW2	CR15C-SBSD	Pentachlorophenol	20 U	20 UJ

ug/kg = micrograms per kilogram.
UJ = the result is non-detect and an estimated value.

In reports AOW1 and AOW2, the solid matrix USEPA Method 8270D CCV analyzed on November 14, 2015 exceeded percent drift acceptance limits for benzoic acid, diethylphthalate, and pentachlorophenol. Associated sample results detected below the MRL were already flagged by the laboratory as estimated; no additional qualification was required. Diethylphthalate results were already qualified by the reviewer in the method blank section above. Remaining qualified results are summarized below:

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOW1	CR18B-SBSD	Benzoic Acid	210	210 J
AOW1	CR18B-SBSD	Pentachlorophenol	99 U	99 UJ
AOW1	CR18B-SSD	Pentachlorophenol	99 U	99 UJ
AOW2	CR15C-SSD	Benzoic Acid	250	250 J
AOW2	CR15C-SSD	Pentachlorophenol	98 U	98 UJ
AOW2	CR15C-SBSD	Pentachlorophenol	98 U	98 UJ
AOW2	CR08b-SSD-COMP	Benzoic Acid	330	330 J

Report	Sample	Component	Laboratory-Reported Result (ug/kg)	Result of Record (ug/kg)
AOW2	CR08b-SSD-COMP	Pentachlorophenol	96 U	96 UJ

J = the result is an estimated value.
ug/kg = micrograms per kilogram.
UJ = the result is non-detect and an estimated value.

In report AUD1, ARI noted in the cover letter that USEPA Method 8270D CCV results for benzoic acid were above the acceptance limit for percent difference. The non-detect sample result has been qualified with "J" as estimated by the reviewer:

Report	Sample	Component	Laboratory-Reported Result (ug/L)	Result of Record (ug/L)
AUD1	Storm-01	Benzoic Acid	22 U	22 UJ

ug/L = micrograms per liter.
U = the result is non-detect.
UJ = the result is non-detect; RL posted is an estimated value.

The reviewer confirmed with ARI that remaining CCVs not reported by the laboratory were within acceptance limits for percent recovery.

REPORTING LIMITS

ARI evaluated USEPA Methods 6010C, 7470A, 7471A, 8082A, 8270D, and 8270D-SIM results to one-half the MRL. Non-detect results were reported at the MRL. ARI evaluated USEPA Method 1613B results to EDLs. Remaining results, including NWTPH-Dx, were evaluated and reported to MRLs. Results reported between MRL and one-half of the MRL or between the EDL and MRL were qualified by the laboratory with "J" as estimated. Some reporting limits were additionally raised due to matrix interference. NVL evaluated asbestos results to the 1 percent visual estimation detection limit.

Samples requiring dilutions because of high analyte concentrations and/or matrix interferences had elevated EDLs and/or RLs.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies.

In report AON2, sample CR09b-SSD-COMP was incorrectly transcribed by ARI during login as CRO96-SSD-COMP.T The sample name was corrected for the final report; however, USEPA Method 8270D and 8270D-SIM, and 8082A surrogate recovery summary pages in report AON2 display the incorrect sample name.

In report AON3, sample Seep-01 was not recorded on the chain of custody. The sample name, collection date and time, and analyses were provided by MFA after samples were received by ARI. A record of the request is included with the report.

USEPA Method 8270D analysis was added to samples in report AOW1 after samples were received by the laboratory. A record of the added analysis was not included with the final report.

In report AOW1, USEPA Method 8082A analysis was requested but not performed for samples CR18B-SBSD and CR18B-SSD. The results are reported in report ART5.

In report AUD1, total suspended solids analysis requested on the chain of custody was canceled due to insufficient sample volume. No additional action was required.

No additional issues were found.

1 INTRODUCTION

On behalf of the Grays Harbor Historical Seaport Authority (GHHSA), Maul Foster & Alongi, Inc. (MFA) conducted a hazardous building materials assessment at five buildings at the Weyerhaeuser Sawmill/Seaport Landing Site in Aberdeen, Washington (the site). MFA conducted the survey on December 3 through 5, 2019. Site features and building locations are provided in Figure 1-1. The five buildings assessed are:

- Planar building
- Storage shed
- Fuel and chemical storage shed
- Main shipping shed
- Guard shed

The assessment areas are described in the work plan (MFA, 2019) and were limited to the buildings that GHHSA had identified as being part of the site's reuse. The assessment included use of a portable x-ray fluorescence (XRF) device to screen materials for the presence of lead-based paint (LBP); sampling and analysis of suspected asbestos-containing materials (ACM); sampling and analysis of suspected pentachlorophenol (PCP)-containing materials; and visual inspection and tracking of suspected polychlorinated biphenyl (PCB)-containing fixtures, mercury-containing fixtures, and other potentially hazardous materials.

The survey was conducted by certified Asbestos Hazard Emergency Act (AHERA) building inspector Emily Curtis of MFA. Ms. Curtis's AHERA building inspector certificate is provided in Appendix A. Samantha Wolf-Saxon of MFA also assisted in the fieldwork efforts.

1.1 Material Survey Objective

The objective of this survey was to identify building materials and components that may require abatement, special handling, or disposal during future demolition or construction activities.

1.2 Regulatory Framework

This survey was conducted as described in the work plan (MFA, 2019) and consistent with regulatory requirements of AHERA in 40 Code of Federal Regulations (CFR) 763; Washington Administrative Code (WAC) 296-65 pertaining to ACM, and Olympic Region Clean Air Agency rules. Additionally, sampling was conducted to determine if PCP use in the planer/grader building has impacted the building materials slated for demolition. PCP was used in the planer/grader building as a spray-on application for anti-sapstain (PES, 2010).

2 BACKGROUND

2.1 Site Description

The site is located at 500 North Custer Street in Aberdeen, Washington, and is approximately 2 miles upriver from Grays Harbor. The site is bordered on the west by a former boatyard and marine service center, to the east by a log storage yard, to the north by the Chehalis River, and to the south by residential and commercial development. The GHHSA acquired the upland portion of the site on March 29, 2013.

2.2 Site History

Historically, sawmills operated on both the upland and in-water portions of the site, beginning prior to 1900. Weyerhaeuser acquired the property in 1955 and operated several sawmills and associated support facilities through January 2009, when the mill known as the small log sawmill was permanently closed. In 2006, the Big Mill and attached finger pier were closed, and the associated structures were removed between 2006 and 2008. The small log mill continued to operate into early 2009. PCP was applied to milled lumber in spray rooms in the planer/grader building (PES, 2010).

3 FIELD AND ANALYTICAL METHODS

MFA conducted the field sampling and survey on December 3 through 5. The building-material survey was conducted to satisfy federal, state, and local air quality regulations regarding communicating the location, amount, and quality of known ACM and LBP at the site as well as to catalogue other potentially hazardous fixtures to be managed before renovation, construction, or demolition. The scope of work included the following:

- Collection of bulk samples of suspected ACM.
- Use of a portable XRF device to field screen painted surfaces for the presence of lead in surface paint.
- Collection of paint chip samples.
- Collection of bulk samples of suspected PCP-containing materials.
- Submission of suspected ACM bulk samples and paint chip samples to a laboratory accredited by the National Voluntary Laboratory Accreditation Program (NVLAP). Suspected ACM samples were analyzed by polarized light microscopy (PLM).

- Submission of PCP-containing building samples of wood and concrete to Apex Laboratories, LLC.
- Recording the location, quantity, and quality of homogeneous areas identified on the floor of each building as well as the roof of the guard shed and the exteriors of all buildings.

The survey involved visual inspection of the interiors and exteriors of designated buildings.

3.1 Asbestos-Containing Material

MFA's survey of suspected ACM at the site in the designated buildings included bulk sampling of surfacing materials and miscellaneous materials from homogeneous areas, in accordance with AHERA sampling protocol.

Sample locations were chosen by the inspector, based on identification of suspected ACM. See Figures 3-1 through 3-7 for a description of the sampling locations.

Samples were extracted with hand tools and placed into labeled sample bags. For layered building material, the layers were penetrated and incorporated into each sample. Samples were sent to NVL Laboratories, Inc., an NVLAP laboratory, for analysis by U.S. Environmental Protection Agency (USEPA) PLM Method 600/R-93-116.

3.2 Lead-Based Paint

MFA conducted a survey for interior and exterior paint coatings of the designated buildings, including XRF readings of each color and/or layer identified. The portable XRF unit used was a Vanta L analyzer with a reported accuracy range from 0.1 to 5 milligrams of lead per square centimeter. Generally, if a painted surface has a detectable result for lead, it is considered lead-containing. As defined by the USEPA (40 CFR 745), LBP is quantified as paint containing lead concentrations of over 5,000 parts per million (ppm) (greater than 0.5 percent).

For quality assurance, approximately 5 percent of the representative paint chip samples collected by XRF were submitted for analysis. The identification of LBP summarized in this report is based on XRF results and confirmation paint chip samples collected from the buildings. For paint that was observed generally in the same homogeneous areas as paint in testing locations and having color similar to the tested paint, it was assumed that the test result for that color was representative of that untested paint.

Sampling locations were chosen by the inspector, based on identification of painted surfaces and ability to access certain portions of the buildings. See Figures 3-1 through 3-7 for sampling locations.

XRF readings were recorded on the field sampling data sheets (FSDSs) as positive or non-detect. Paint chip samples were placed in labeled sample bags and sent to NVL Laboratories, Inc., for analysis by USEPA Method 3051/7000B.

3.3 Pentachlorophenol

MFA's survey of PCP-impacted building material at the site focused on two areas in the planar/grader building where anecdotal information inferred that spray-on applications of PCP may have been performed. Three samples of wood and three samples of concrete building materials were collected in two areas, for a total of six samples. Sample locations were recorded on Figure 3-1 and photographs of the sample locations are provided on the FSDSs. Building material samples were placed in labeled sample bags and sent to Apex Laboratories, LLC, for analysis by USEPA Method 8270D.

3.4 Mercury, Polychlorinated Biphenyls, and Other Materials

MFA conducted a visual survey to identify fixtures that may contain mercury or PCBs. MFA also noted the presence of other potentially hazardous materials, such as containers with residual hazardous chemicals. Items were tracked on the FSDSs provided in Appendix B and are summarized in Table 3-1.

4 ASSESSMENT RESULTS

4.1 Asbestos-Containing Material

Sample locations are provided in Figures 3-1 through 3-7, and sample results are summarized in Table 4-1. Laboratory reports are provided in Appendix C. Asbestos testing was completed for GHHSA at the site by KD&S Environmental, Inc., in 2016 and 2017 (Appendix D). Testing results detected asbestos in samples collected from roofing materials of the planar building, storage shed, chemical storage shed, and main shipping shed. This roofing material will require abatement and appropriate handling during demolition activities.

All 31 samples collected by MFA as a part of this assessment and analyzed were non-detect. Some unsampled materials such as fire hoses and coated sinks were assumed to contain asbestos (see Table 4-1).

4.2 Lead

XRF measurement locations and paint chip sample locations are provided in Figures 3-1 through 3-7. Paint chip sample results are summarized in Table 4-2, and laboratory reports are provided in Appendix C.

Lead was detected in painted surfaces in the planer building, main shipping shed, fuel and chemical storage building, chemical shed, and guard shed; however, the detectable levels of lead were below the USEPA regulated definition of LBP. None of the surfaces assessed in the buildings included in this assessment had lead content above the USEPA regulated definition for LBP. For the purposes of renovation or reuse, painted surfaces with detectable levels of lead below the USEPA regulated

definition of LBP are considered lead-containing, and abatement or in-place management of these materials should follow the USEPA's Renovation, Repair, and Painting Rule.

4.3 Pentachlorophenol

The use of PCP at the site for wood-treating applications necessitates designation of the building debris waste generated in the vicinity of the application as listed waste F032. PCP samples were collected in the area of application from wood and concrete building materials. PCP was not detected in five of the six samples. 4,960 micrograms per kilogram (ug/kg) of PCP was measured in a sample of the wood wall and ceiling of the spray room (sample 1-1-PCP-3). (See lab report in Appendix C).

The Resource Conservation and Recovery Act (RCRA) regulations impose land disposal restrictions on certain hazardous chemicals, including PCP, and defines concentrations that result in hazardous waste generation designation (40 CFR 268). WAC 173-303-040 defines "dangerous wastes" as those solid wastes designated in WAC 173-303-070 through 173-303-100 as dangerous, or extremely hazardous or mixed waste. As used in this chapter, the term "dangerous waste" refers to the full universe of wastes regulated by this chapter. The abbreviation "DW" will refer only to that part of the regulated universe that is not extremely hazardous waste. (See also "extremely hazardous waste," "hazardous waste," and "mixed waste" definitions.)

In an effort to be more protective, the definition of "dangerous waste" includes more wastes than RCRA hazardous wastes.

The Washington State Department of Ecology (Ecology) has a step-by-step guide for determining if a waste is a "dangerous waste."

After consulting the Ecology guidance and RCRA requirements, MFA has determined that while the PCP detections in building material at the site constitute a listed waste (F032), it is neither a hazardous waste under RCRA nor a state dangerous waste. Special handling and disposal will still be required of the wooden spray room walls and ceiling. MFA recommends talking to the GHHSA contractor who will complete the abatement and demolition of the buildings to understand what landfill may be accepting the demolition debris waste. In addition to Ecology requirements, the proposed landfill may have special waste acceptance procedures that may have to be met prior to transfer to and disposal at that facility. Based on MFA's discussions with Ecology, it is possible that the PCP-impacted wood could either be segregated and disposed of at a landfill that will accept the waste, or that the PCP-impacted wood could be washed to remove the PCP and disposed of with the rest of the general building demolition debris. The washwater would require capture and proper disposal, and confirmation sampling of the washed wood would be required prior to disposal.

4.4 Mercury, Polychlorinated Biphenyls, and Other Materials

Mercury-containing fixtures, PCB-containing fixtures, and other hazardous materials were tracked and recorded on the FSDSs provided in Appendix B. A summary of the observations is provided in Table 3-1.

5 SUMMARY AND RECOMMENDATIONS

Based on our observations and the results of the material testing, MFA concludes the following:

- There are lead-containing coatings throughout the interiors and exteriors of the designated buildings.
- Roofing materials on the planar building, storage shed, chemical storage shed, and main shipping shed contain asbestos.
- Many potentially hazardous-materials-containing fixtures are present throughout the designated buildings.
- Unknown and unlabeled chemicals are present throughout the buildings.
- PCP-impacted wood debris in the planar building will require special coordination, handling, and disposal during abatement and demolition activities.

5.1 Recommendations

This report should be made available to contractors during bidding on abatement, construction, or demolition work to be conducted on these buildings. Prior to any disturbance activities at the site, identified hazardous materials should be abated by a licensed abatement contractor or safely managed in place consistent with a written operations and maintenance plan.

GHHSA should inform contractors that, during the renovation and demolition activities, other hazardous materials or conditions may be discovered that may warrant additional remediations and/or corrective actions.

LIMITATIONS

The services undertaken in completing this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, or the use of segregated portions of this report.

MFA. 2019. Upland remedial investigation work plan, Weyerhaeuser Sawmill Aberdeen/Seaport Landing, Facility Site ID 1126, Cleanup Site ID 4987, Agreed Order ID 11225. Prepared for Grays Harbor Historical Seaport Authority. Maul Foster & Alongi, Inc. December 31.

PES. 2010. Level I environmental site assessment, Weyerhaeuser NR Company, Aberdeen Sawmill, 500 N Custer Street, Aberdeen, WA. PES Environmental, Inc., Seattle, Washington. August 13.

TABLES

Table 3-1
Hazardous Building Materials Survey Summary
Grays Harbor Historical Seaport Authority
Aberdeen, Washington

Regulated Material	Material Description	Location	Estimated Quantity if Detected	Comment
Asbestos	Fire hoses	Planer building and main shipping shed	32	
	Coated sink	Planer building and main shipping shed	2	
Lead-containing paint	Green paint on staircases	Planer building	400 sq. ft.	
	Bright yellow paint on steel and wood	Planer building	450 sq. ft.	
	White paint on wood posts	Planer building	150 sq. ft.	
	Light green paint on wood and metal	Planer building	360 sq. ft.	
	Yellow paint on posts	Main shipping shed	1,300 sq. ft.	
	Shiny light green paint on upstairs office cabinets	Main shipping shed	160 sq. ft.	
	Bright red paint on fire valves	Main shipping shed	100 sq. ft.	
	Light green paint on steel beams	Main shipping shed	800 sq. ft.	
	White paint on exterior wood siding	Main shipping shed	5,000 sq. ft.	
	Green paint on exterior concrete pillar	Fuel and chemical storage building	150 sq. ft.	
	Light yellow paint on exterior metal beams	Chemical shed	665 sq. ft.	
	Light blue/gray paint on exterior	Guard shed	700 sq. ft.	
	Off-white paint on exterior	Guard shed	700 sq. ft.	

Table 3-1
Hazardous Building Materials Survey Summary
Grays Harbor Historical Seaport Authority
Aberdeen, Washington

Regulated Material	Material Description	Location	Estimated Quantity if Detected	Comment
PCB-containing, mercury-containing, and other hazardous materials	Lightbulbs/ballasts and fixtures	Planer building, main shipping shed, chemical shed, and guard shed	390	Not all lightbulbs/ballasts included a fixture.
	Electrical panels/boxes	Planer building, fuel and chemical storage building, and chemical shed	7	
	Diesel engine fire pump control box	Planer building	1	
	Miscellaneous motors / compressors / pumps / batteries / boilers / engines	Planer building and main shipping shed	2 motors, 5 compressors, 2 batteries, 1 steam boiler, 4 engines	
	Propane tanks	Planer building and main shipping shed	4	
	CO_2 tanks	Main shipping shed	2	
	Miscellaneous appliances	Planer building	2 refrigerator/freezers	
	Riser rooms/sprinkler systems	Planer building, main shipping shed, fuel and chemical storage building, and chemical shed	8	
	Fire extinguishers	Main shipping shed	41	
	Miscellaneous tanks, drums, and buckets	Planer building, main shipping shed, fuel and chemical storage building, and guard shed	6 tanks, 53 drums, 110 5-gallon buckets	Various gas cans, aerosol cans, paints, and chemical maintenance supplies were not quantified but are present throughout all of the buildings.

NOTES:
ACM = asbestos-containing material.
CO_2 = carbon dioxide.
PCB = polychlorinated biphenyl.
sq. ft. = square feet.

Table 4-1
Summary of Asbestos Sample Results
Grays Harbor Historical Seaport Authority
Aberdeen, Washington

Sample Name	Sample Date	Material Description	Location	Lab Description	Bulk Asbestos	Condition if Detected	Estimated Quantity if Detected
Planer Building							
1-1-MISC-1	12/04/2019	Gray base cove with tan mastic	Upstairs office	Light gray rubbery material	ND	--	--
				Pale yellow soft mastic with debris	ND		
				Gold soft adhesive	ND		
1-2-MISC-2	12/04/2019	Gray speckled sheet vinyl flooring with gray mastic	Upstairs office	Gray sheet vinyl with thin clear adhesive surface	ND	--	--
				Light gray fibrous backing with soft mastic and trace crumbly material (on wood)	ND		
1-3-MISC-3	12/04/2019	Drywall	Upstairs office and break room	Off-white compacted powdery material with paint	ND	--	--
				Off-white compacted powdery material with white paper	ND		
				Trace off-white chalky material with paper	ND		
1-4-MISC-4	12/04/2019	Brown base cove with brown mastic	Upstairs break room	Dark brown rubbery material with debris	ND	--	--
				Brown brittle mastic	ND		
1-5-MISC-5	12/04/2019	Tan/brown sheet vinyl flooring with yellow mastic	Upstairs break room	Tan sheet vinyl	ND	--	--
				Light tan fibrous backing with mastic and trace wood flakes	ND		
1-6-MISC-6	12/04/2019	Light gray ceramic tile with gray mortar	Tile floor of bathroom near spray room	Off-white ceramic tile	ND	--	--
				Beige soft mastic	ND		
				Light gray sandy/brittle material	ND		
				Off-white compressed powdery material with trace debris	ND		
				Off-white brittle material	ND		
Main Shipping Shed							
2-1-MISC-1	12/04/2019	Gray base cove with tan mastic	Men/woman's bathroom on the west side	Light gray rubbery material	ND	--	--
				Cream soft mastic with debris	ND		
2-2-MISC-2	12/04/2019	White/gray speckled sheet vinyl flooring with gray mastic	Men/woman's bathroom on the west side	Off-white sheet vinyl with adhesive surface	ND	--	--
				Light tan fibrous backing with mastic	ND		
2-3-MISC-3	12/04/2019	White vinyl wall covering with yellow mastic	Men/woman's bathroom on the west side	Brown flat hard compressed fibrous material with off-white surface and trace paint	ND	--	--
				Tan brittle mastic with trace debris	ND		
2-4-MISC-4	12/04/2019	12x12 stipple pattern acoustic ceiling tile with brown glue dot	West side upstairs sales office	Off-white compressed fibrous material with white textured paint	ND	--	--
				Tan brittle mastic with trace thin compacted powdery material with white paint	ND		
2-5-MISC-5	12/04/2019	12x12 textured acoustic ceiling tile	West side top floor office	Tan wooden compressed fibrous material with off-white textured coating	ND	--	--

Summary of Asbestos Sample Results
Grays Harbor Historical Seaport Authority
Aberdeen, Washington

Sample Name	Sample Date	Material Description	Location	Lab Description	Bulk Asbestos	Condition if Detected	Estimated Quantity if Detected
2-6-MISC-6	12/04/2019	Gray/blue speckled sheet vinyl flooring with tan mastic	Storage rooms on SW side behind bathroom, office room at the top of the stairs, and back bike storage area	Multicolored sheet vinyl	ND	--	--
				Light gray fibrous backing with mastic and gray paint	ND		
2-7-MISC-7	12/04/2019	Dark gray base cove with tan mastic	SW storage rooms behind bathrooms and back bike storage area	Gray rubbery material with trace white paint	ND	--	--
				Yellow soft mastic with paint and trace debris	ND		
2-8-MISC-8	12/04/2019	Drywall	SW storage rooms behind bathrooms and back bike storage area	White bumpy compacted powdery material with layered paint	ND	--	--
				White compacted powdery material with white paper	ND		
				Beige thin fibrous material	ND		
				Off-white chalky material with paper	ND		
2-9-MISC-9	12/04/2019	Light gray base cove with white /gray mastic	West side upstairs sales office	Gray rubbery material	ND	--	--
				Off-white soft mastic	ND		
				White bumpy compacted powdery material with paint	ND		
				White bumpy compacted powdery material with paint	ND		
				Off-white fibrous material with white paint	ND		
				Tan fibrous material	ND		
2-10-MISC-10	12/04/2019	Drywall	West side upstairs sales office	Off-white compacted powdery material with blue paint and clear cellophane tape	ND	--	--
				Off-white thin fibrous material	ND		
				White chalky material with paper	ND		
2-11-MISC-11	12/04/2019	Gray/green speckled sheet vinyl flooring with tan mastic	West side top floor office	Off-white sheet vinyl with multicolored dots	ND	--	--
				Light gray fibrous backing with yellow mastic	ND		
2-12-MISC-12	12/04/2019	Gray base cove with tan mastic	West side top floor office	Gray rubbery material	ND	--	--
				Off-white soft mastic	ND		
				Brown brittle mastic	ND		
2-13-MISC-13	12/04/2019	Cream vinyl wall covering with yellow/brown mastic	West side back storage/kitchen area	Brown flat hard compressed fibrous material with cream surface	ND	--	--
				Tan brittle mastic	ND		
2-14-MISC-14	12/04/2019	Drywall	NE wood boat storage buildout and upstairs	Off-white thin fibrous material with white paint	ND	--	--
				White chalky material with paper	ND		
2-15-MISC-15	12/04/2019	Gray base cove with gray/white mastic	East side upstairs locker room	Tan rubbery material	ND	--	--
				Off-white soft mastic	ND		
				Brown compressed fibrous material with white paint	ND

Summary of Asbestos Sample Results
Grays Harbor Historical Seaport Authority
Aberdeen, Washington

Sample Name	Sample Date	Material Description	Location	Lab Description	Bulk Asbestos	Condition if Detected	Estimated Quantity if Detected
2-16-MISC-16	12/04/2019	Tan sheet vinyl flooring with tan/yellow mastic	East side upstairs locker room	Off-white sheet vinyl	ND	--	--
				Light tan fibrous backing with mastic	ND		
2-17-MISC-17	12/04/2019	White fibrous wall covering with yellow/tan mastic	East side upstairs locker room	Off-white brittle mastic	ND	--	--
				Brown wooden hard compressed fibrous material with white paint	ND		
				Yellow brittle mastic	ND		
2-18-MISC-18	12/04/2019	Dark brown base cove with white mastic	East side upstairs men's bathroom	Brown rubbery material	ND	--	--
				Off-white soft mastic with debris	ND		
2-19-MISC-19	12/04/2019	White fibrous wall covering with white mastic	East side upstairs men's bathroom	Brown wooden hard compressed fibrous material with cream paint	ND	--	--
				Off-white soft mastic	ND		
2-20-MISC-20	12/04/2019	Dark brown base cove with tan/yellow mastic	East side upstairs office	Black rubbery material with trace debris	ND	--	--
				Brown brittle mastic	ND		
				White compacted powdery material with paint	ND		
Guard Shed							
3-1-MISC-1	12/04/2019	Dark brown base cove with dark brown mastic	Guard shed interior	Black rubbery material with trace debris	ND	--	--
				Dark brown brittle mastic	ND		
3-2-MISC-2	12/04/2019	Dark gray speckled sheet vinyl flooring with tan mastic	Near entrance	Gray sheet vinyl	ND	--	--
				Tan fibrous backing with mastic and trace chalky material	ND		
3-3-MISC-3	12/04/2019	Dark gray square patterned sheet vinyl flooring with tan mastic	Guard shed interior	Gray sheet vinyl	ND	--	--
				Tan fibrous backing with mastic	ND		
3-4-MISC-4	12/04/2019	Drywall	Guard shed interior	White compacted powdery material with paint	ND	--	--
				Beige thin fibrous material	ND		
				White chalky material with paper	ND		
3-5-ROOF-5	12/04/2019	Black asphaltic roofing material	Roof	Black brittle asphaltic material	ND	--	--

NOTES:
Samples were analyzed consistent with polarized light microscopy U.S. Environmental Protection Agency Method 600/R-93-116.
-- = not applicable.
ND = not detected.
sq. ft. = square feet.

Table 4-2
Summary of Paint Chip Results
Grays Harbor Historical Seaport Authority
Aberdeen, Washington

Sample Name	Sample Date	Material Description	Location	Lead Result (wt %)
1-13-PB-13	12/04/2019	Bright yellow paint	Steel and wood posts in Planer building	0.16
2-1-PB-1	12/04/2019	Bright yellow paint	Posts throughout Shipping Shed	0.021
3-2-PB-2	12/04/2019	Off-white paint	Exterior wood siding on Guard Shed	< 0.0046

NOTES:

Samples were analyzed consistent with U.S. Environmental Protection Agency Method 3050B/7000B.

< = less than reporting limit. Reporting limit represents lowest amount of analyte that laboratory can confidently detect in sample and is not a regulatory level.

wt % = percent by weight.

LABORATORY ANALYTICAL REPORTS

December 17, 2019

Kyle Roslund
Maul Foster & Alongi, Inc.
109 E 13th St.
Vancouver, WA 98660

RE: Bulk Asbestos Fiber Analysis; NVL Batch # 1925820.00

Client Project: 1044.02.15
Location: WA

Dear Mr. Roslund,

Enclosed please find test results for the 31 sample(s) submitted to our laboratory for analysis on 12/9/2019.

Examination of these samples was conducted for the presence of identifiable asbestos fibers using polarized light microscopy (PLM) with dispersion staining in accordance with both **EPA 600/M4-82-020**, Interim Method for the Determination of Asbestos in Bulk Insulation Samples and **EPA 600/R-93/116** Method for the Determination of Asbestos in Bulk Building Materials.

For samples containing more than one separable layer of materials, the report will include findings for each layer (labeled Layer 1 and Layer 2, etc. for each individual layer). The asbestos concentration in the sample is determined by calibrated visual estimation.

For those samples with asbestos concentrations between 1 and 10 percent based on visual estimation, the EPA recommends a procedure known as point counting (NESHAPS, 40 CFR Part 61). Point counting is a statistically more accurate means of quantification for samples with low concentrations of asbestos.

The detection limit for the calibrated visual estimation is <1%, 400 point counts is 0.25% and 1000 point counts is 0.1%

Samples are archived for two weeks following analysis. Samples that are not retrieved by the client are discarded after two weeks.

Thank you for using our laboratory services. Please do not hesitate to call if there is anything further we can assist you with.

Sincerely,

Matt Macfarlane, Asbestos Lab Supervisor

Note: If samples are not homogeneous, then subsamples of the components were analyzed separately. All bulk samples are analyzed using both EPA 600/R-93/116 and 600/M4-82-020 Methods with the following measurement uncertainties for the reported % Asbestos (1%=0-3%, 5%=1-9%, 10%=5-15%, 20%=10-30%, 50%=40-60%). This report relates only to the items tested. If sample was not collected by NVL personnel, then the accuracy of the results is limited by the methodology and acuity of the sample collector. This report shall not be reproduced except in full, without written approval of NVL Laboratories, Inc. It shall not be used to claim product endorsement by NVLAP or any other agency of the US Government

Note: If samples are not homogeneous, then subsamples of the components were analyzed separately. All bulk samples are analyzed using both EPA 600/R-93/116 and 600/M4-82-020 Methods with the following measurement uncertainties for the reported % Asbestos (1%=0-3%, 5%=1-9%, 10%=5-15%, 20%=10-30%, 50%=40-60%). This report relates only to the items tested. If sample was not collected by NVL personnel, then the accuracy of the results is limited by the methodology and acuity of the sample collector. This report shall not be reproduced except in full, without written approval of NVL Laboratories, Inc. It shall not be used to claim product endorsement by NVLAP or any other agency of the US Government

Matt Macfarlane, Asbestos Lab Supervisor

Note: If samples are not homogeneous, then subsamples of the components were analyzed separately. All bulk samples are analyzed using both EPA 600/R-93/116 and 600/M4-82-020 Methods with the following measurement uncertainties for the reported % Asbestos (1%=0-3%, 5%=1-9%, 10%=5-15%, 20%=10-30%, 50%=40-60%). This report relates only to the items tested. If sample was not collected by NVL personnel, then the accuracy of the results is limited by the methodology and acuity of the sample collector. This report shall not be reproduced except in full, without written approval of NVL Laboratories, Inc. It shall not be used to claim product endorsement by NVLAP or any other agency of the US Government

RE: Metals Analysis; NVL Batch # 1925826.00

Dear Mr. Roslund,

Enclosed please find the test results for samples submitted to our laboratory for analysis. Preparation of these samples was conducted following protocol outlined in EPA Method SW 846 -3051 unless stated otherwise. Analysis of these samples was performed using analytical instruments in accordance with U.S. EPA, NIOSH, OSHA and other ASTM methods.

For matrix materials submitted as paint, dust wipe, soil or TCLP samples, analysis for the presence of total metals is conducted using published U.S. EPA Methods. Paint and soil results are usually expressed in mg/Kg which is equivalent to parts per million (ppm). Lead (Pb) in paint is usually expressed in mg/Kg (ppm) , Percent (%) or mg/cm^2 by area. Dust wipe sample results are usually expressed in ug/wipe and ug/ft^2. TCLP samples are reported in mg/L (ppm). For air filter samples, analyses are conducted using NIOSH and OSHA Methods. Results are expressed in ug/filter and ug/m^3. Other matrix materials are analyzed accordingly using published methods or specified by client. The reported test results pertain only to items tested and are not blank corrected.

For recent regulation updates pertaining to current regulatory levels or permissible exposure levels, please call your local regulatory agencies for more details.

This report is considered highly confidential and will not be released without your approval. Samples are archived for two weeks following analysis. Samples that are not retrieved by the client are discarded after two weeks.

Thank you for using our laboratory services. if you need further assistance please feel free to call us at 206-547-0100 or 1-888-NVLLABS.

Sincerely,

Yasuyuki Hida, Laboratory Analyst

RE: A9L0180 - Seaport Tidelands - 1044.02.15

Thank you for using Apex Laboratories. We greatly appreciate your business and strive to provide the highest quality services to the environmental industry.

Enclosed are the results of analyses for work order A9L0180, which was received by the laboratory on 12/5/2019 at 12:55:00PM.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: pnerenberg@apex-labs.com, or by phone at 503-718-2323.

Please note: All samples will be disposed of within 30 days of sample receipt, unless prior arrangements have been made.

ANALYTICAL SAMPLE RESULTS

Semivolatile Organic Compounds by EPA 8270D

Analyte	Sample Result	Detection Limit	Reporting Limit	Units	Dilution	Date Analyzed	Method Ref.	Notes
1-1-PCP-4 (A9L0180-04)				**Matrix: Solid**		**Batch: 9120926**		
1-Methylnaphthalene	ND	774	1540	ug/kg	40	12/16/19 14:08	EPA 8270D	
2-Methylnaphthalene	ND	774	1540	ug/kg	40	12/16/19 14:08	EPA 8270D	
Naphthalene	ND	774	1540	ug/kg	40	12/16/19 14:08	EPA 8270D	
Phenanthrene	ND	386	774	ug/kg	40	12/16/19 14:08	EPA 8270D	
Pyrene	ND	386	774	ug/kg	40	12/16/19 14:08	EPA 8270D	
Carbazole	ND	580	1160	ug/kg	40	12/16/19 14:08	EPA 8270D	
Dibenzofuran	ND	386	774	ug/kg	40	12/16/19 14:08	EPA 8270D	
4-Chloro-3-methylphenol	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
2-Chlorophenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,4-Dichlorophenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,4-Dimethylphenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,4-Dinitrophenol	ND	9650	19300	ug/kg	40	12/16/19 14:08	EPA 8270D	
4,6-Dinitro-2-methylphenol	ND	9650	19300	ug/kg	40	12/16/19 14:08	EPA 8270D	
2-Methylphenol	ND	965	1930	ug/kg	40	12/16/19 14:08	EPA 8270D	
3+4-Methylphenol(s)	ND	965	1930	ug/kg	40	12/16/19 14:08	EPA 8270D	
2-Nitrophenol	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
4-Nitrophenol	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
Pentachlorophenol (PCP)	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
Phenol	ND	774	1540	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,3,4,6-Tetrachlorophenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,3,5,6-Tetrachlorophenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,4,5-Trichlorophenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
2,4,6-Trichlorophenol	ND	1930	3860	ug/kg	40	12/16/19 14:08	EPA 8270D	
Bis(2-ethylhexyl)phthalate	**68300**	5800	11600	ug/kg	40	12/16/19 14:08	EPA 8270D	
Butyl benzyl phthalate	ND	11600	11600	ug/kg	40	12/16/19 14:08	EPA 8270D	R-02
Diethylphthalate	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
Dimethylphthalate	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
Di-n-butylphthalate	ND	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	
Di-n-octyl phthalate	**4430**	3860	7740	ug/kg	40	12/16/19 14:08	EPA 8270D	**J**
N-Nitrosodimethylamine	ND	965	1930	ug/kg	40	12/16/19 14:08	EPA 8270D	
N-Nitroso-di-n-propylamine	ND	965	1930	ug/kg	40	12/16/19 14:08	EPA 8270D	
N-Nitrosodiphenylamine	ND	965	1930	ug/kg	40	12/16/19 14:08	EPA 8270D	
Bis(2-Chloroethoxy) methane	ND	965	1930	ug/kg	40	12/16/19 14:08	EPA 8270D

QUALIFIER DEFINITIONS

Client Sample and Quality Control (QC) Sample Qualifier Definitions:

Apex Laboratories

B-02	Analyte detected in an associated blank at a level between one-half the MRL and the MRL. (See Notes and Conventions below.)
J	Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
Q-04	Spike recovery and/or RPD is outside control limits due to a non-homogeneous sample matrix.
Q-17	RPD between original and duplicate sample is outside of established control limits.
Q-18	Matrix Spike results for this extraction batch are not reported due to the high dilution necessary for analysis of the source sample.
Q-29	Recovery for Lab Control Spike (LCS) is above the upper control limit. Data may be biased high.
Q-30	Recovery for Lab Control Spike (LCS) is below the lower control limit. Data may be biased low.
Q-31	Estimated Results. Recovery of Continuing Calibration Verification sample below lower control limit for this analyte. Results are likely biased low.
Q-41	Estimated Results. Recovery of Continuing Calibration Verification sample above upper control limit for this analyte. Results are likely biased high.
Q-42	Matrix Spike and/or Duplicate analysis was performed on this sample. % Recovery or RPD for this analyte is outside laboratory control limits. (Refer to the QC Section of Analytical Report.)
Q-52	Due to erratic or low blank spike recoveries, results for this analyte are considered Estimated Values.
R-02	The Reporting Limit for this analyte has been raised to account for interference from coeluting organic compounds present in the sample.
R-04	Reporting levels elevated due to preparation and/or analytical dilution necessary for analysis.
S-01	Surrogate recovery for this sample is not available due to sample dilution required from high analyte concentration and/or matrix interference.
S-05	Surrogate recovery is estimated due to sample dilution required for high analyte concentration and/or matrix interference.

Maul Foster & Alongi, INC.	Project: **Seaport Tidelands**	
2001 NW 19th Ave, STE 200	Project Number: **1044.02.15**	**Report ID:**
Portland, OR 97209	Project Manager: **Kyle Roslund**	**A9L0180 - 12 19 19 1112**

REPORTING NOTES AND CONVENTIONS:

Abbreviations:

DET Analyte DETECTED at or above the detection or reporting limit.

ND Analyte NOT DETECTED at or above the detection or reporting limit.

NR Result Not Reported

RPD Relative Percent Difference. RPDs for Matrix Spikes and Matrix Spike Duplicates are based on concentration, not recovery.

Detection Limits: Limit of Detection (LOD)

Limits of Detection (LODs) are normally set at a level of one half the validated Limit of Quantitation (LOQ).
If no value is listed ('-----'), then the data has not been evaluated below the Reporting Limit.

Reporting Limits: Limit of Quantitation (LOQ)

Validated Limits of Quantitation (LOQs) are reported as the Reporting Limits for all analyses where the LOQ, MRL, PQL or CRL are requested. The LOQ represents a level at or above the low point of the calibration curve, that has been validated according to Apex Laboratories' comprehensive LOQ policies and procedures.

Reporting Conventions:

Basis: Results for soil samples are generally reported on a 100% dry weight basis.
The Result Basis is listed following the units as " dry", " wet", or " " (blank) designation.

" dry" Sample results and Reporting Limits are reported on a dry weight basis. (i.e. "ug/kg dry")
See Percent Solids section for details of dry weight analysis.

" wet" Sample results and Reporting Limits for this analysis are normally dry weight corrected, but have not been modified in this case.

" " Results without 'wet' or 'dry' designation are not normally dry weight corrected. These results are considered 'As Received'.

QC Source:

In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) may be analyzed to demonstrate accuracy and precision of the extraction batch.

Non-Client Batch QC Samples (Duplicates and Matrix Spike/Duplicates) may not be included in this report. Please request a Full QC report if this data is required.

Miscellaneous Notes:

" --- " QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.

" *** " Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Blanks:

Standard practice is to evaluate the results from Blank QC Samples down to a level equal to ½ the Reporting Limit (RL).
-For Blank hits falling between ½ the RL and the RL (J flagged hits), the associated sample and QC data will receive a 'B-02' qualifier.
-For Blank hits above the RL, the associated sample and QC data will receive a 'B' qualifier, per Apex Laboratories' Blank Policy.
For further details, please request a copy of this document.

EPA ID: OR01039

Maul Foster & Alongi, INC.	Project: **Seaport Tidelands**	
2001 NW 19th Ave, STE 200	Project Number: **1044.02.15**	**Report ID:**
Portland, OR 97209	Project Manager: **Kyle Roslund**	**A9L0180 - 12 19 19 1112**

REPORTING NOTES AND CONVENTIONS (Cont.):

Blanks (Cont.):

Sample results flagged with a 'B' or 'B-02' qualifier are potentially biased high if the sample results are less than ten times the level found in the blank for inorganic analyses, or less than five times the level found in the blank for organic analyses.

'B' and 'B-02' qualifications are only applied to sample results detected above the Reporting Level.

Preparation Notes:

Mixed Matrix Samples:

Water Samples:

Water samples containing significant amounts of sediment are decanted or separated prior to extraction, and only the water portion analyzed, unless otherwise directed by the client.

Soil and Sediment Samples:

Soil and Sediment samples containing significant amounts of water are decanted prior to extraction, and only the solid portion analyzed, unless otherwise directed by the client.

Sampling and Preservation Notes:

Certain regulatory programs, such as National Pollutant Discharge Elimination System (NPDES), require that activities such as sample filtration (for dissolved metals, orthophosphate, hexavalent chromium, etc.) and testing of short hold analytes (pH, Dissolved Oxygen, etc.) be performed in the field (on-site) within a short time window. In addition, sample matrix spikes are required for some analyses, and sufficient volume must be provided, and billable site specific QC requested, if this is required. All regulatory permits should be reviewed to ensure that these requirements are being met.

Data users should be aware of which regulations pertain to the samples they submit for testing. If related sample collection activities are not approved for a particular regulatory program, results should be considered estimates. Apex Laboratories will qualify these analytes according to the most stringent requirements, however results for samples that are for non-regulatory purposes may be acceptable.

Samples that have been filtered and preserved at Apex Laboratories per client request are listed in the preparation section of the report with the date and time of filtration listed.

Apex Laboratories maintains detailed records on sample receipt, including client label verification, cooler temperature, sample preservation, hold time compliance and field filtration. Data is qualified as necessary, and the lack of qualification indicates compliance with required parameters.

LABORATORY ACCREDITATION INFORMATION

TNI Certification ID: OR100062 (Primary Accreditation) - EPA ID: OR01039

All methods and analytes reported from work performed at Apex Laboratories are included on Apex Laboratories' ORELAP Scope of Certification, with the exception of any analyte(s) listed below:

Apex Laboratories

Matrix	Analysis	TNI_ID	Analyte	TNI_ID	Accreditation

All reported analytes are included in Apex Laboratories' current ORELAP scope.

Secondary Accreditations

Apex Laboratories also maintains reciprocal accreditation with non-TNI states (Washington DOE), as well as other state specific accreditations not listed here.

Subcontract Laboratory Accreditations

Subcontracted data falls outside of Apex Laboratories' Scope of Accreditation.
Please see the Subcontract Laboratory report for full details, or contact your Project Manager for more information.

Field Testing Parameters

Results for Field Tested data are provded by the client or sampler, and fall outside of Apex Laboratories' Scope of Accreditation.

SECTION 1.0 SCOPE OF WORK

On July 25, 2016 Moraya Wilson (BI/PD-NES-01-27-16-01) and Kathleen Wilson (BI/PD-NES-01-27-16-04) accredited asbestos and hazardous materials inspectors for KD&S Environmental, conducted an asbestos containing materials survey of the property known as:

GRAYS HARBOR SEAPORT
BUILDINGS 7 AND 8
500 N CUSTER
ABERDEEN, WA 98520

The following suspect materials were investigated:

- **Asbestos Containing Material**

Field inspection, data collection, and report generation were based on the following Scope of Work:

1. Perform a visual inspection of the subject property to identify and inventory all accessible suspect asbestos containing materials.
2. Bulk sampling and analysis of identified suspect asbestos containing materials.
3. Provide quantity estimates of asbestos containing materials.
4. Provide a written report including sample descriptions, sample locations, and sample location drawing.

The survey was intended to identify any possible asbestos containing materials (ACM) which may be disturbed during demolition, remodeling or maintenance activities per 40 CFR 61 Subpart M and to maintain compliance with WAC 296-62-07721 and current applicable **Olympic Region Clean Air Agency** (**ORCAA**) Regulations. KD&S Environmental has made a best effort attempt to identify materials, which may be disturbed. In addition, the asbestos survey meets the "Good Faith" asbestos inspection requirements. It should be noted that "Good Faith" surveys are limited in scope and that those materials which required destructive means to access or sample (interstitial spaces) is not included in this report.

Suspect asbestos containing materials within the structure were identified and classified as either a surfacing material, thermal system insulation, or miscellaneous materials. Surfacing materials are those, which are either, spray applied or troweled-on for acoustical, decorative, or fireproofing purposes. Thermal system insulation (TSI) is insulation used to inhibit heat transfer or to prevent condensation on pipes, boilers, tanks, ducts and various other components. Miscellaneous materials include all other materials not included in the above categories such as floor tile, ceiling tile, roofing felt, cementitious materials, wallboard systems and products such as caulking, mastics and putties 65 Miscellaneous and surfacing samples were collected and submitted for laboratory analysis.

Limitations of the Assessment

This targeted assessment was limited to the referenced buildings and did not include areas beyond the "foot print" of the buildings. The conclusions within this report are professional opinions base solely upon visual site observations and interpretation of analytical data as described in this report. Typical construction techniques can render portions of the building inaccessible. As a result, additional ACBM may be present in inaccessible areas (i.e. within wall and ceiling cavities). Suspect ACBM within inaccessible areas should be presumed to contain asbestos until characterized.
The opinions presented herein apply to the site conditions existing at the time of the investigation and interpretation of current asbestos regulations. Recommendations provided may not apply to future conditions that exist at the above mention site.

Survey Methodology

The supporting documentation provided within survey report includes material summary table and the appendices that included site photographs, lab analytical reports, chain of custody forms, staff certification.

SECTION 2.0 ASBESTOS-CONTAINING MATERIALS (ACM) SUMMARY

Bulk samples collected by KD&S Environmental were submitted for sample analysis in accordance with method EPA-600/R-93/116: "Method for the Determination of Asbestos in Bulk Building Materials". Seattle Asbestos performed analysis of suspect asbestos materials. The following suspect materials were found to contain asbestos in quantities equal to or greater than one percent (1%).

**All square footages provided are approximations and any drawings are not to scale. Contractors are advised to verify the measurements on their own prior to bidding the work.*

SECTION 3.0 ASSESSMENT AND RECOMMENDATIONS

ASSESSMENT

The asbestos containing materials identified in the subject property fall into the Miscellaneous Category.

RECOMMENDATIONS

All identified asbestos containing material is regulated material and must be abated prior to any demolition or remodeling activity which may disturb these materials at the subject property. A Washington State Certified Asbestos Contractor must conduct abatement of asbestos containing materials.

NARRATIVE

AT PRESENT THIS SITE (500 N. CUSTER) BELONGS THE GRAYS HARBOR HISTORICAL SEAPORT. THE PROPERTY ORIGINALLY WAS OWNED BY WEYERHAEUSER AND WAS AN ACTIVE PLANER MILL. WEYERHAEUSER CLOSED OPERATIONS HELD AN AUCTION IN 2006 AND THE LARGE MACHINES WERE DISMANTLED. THE MACHINES WERE MOVED OFFSITE.

IN 2008 A BARGAIN SALE WAS COMPLETED WITH GRAYS HARBOR HISTORICAL SEAPORT TOOK POSSESSION.

BUILDING 7

BUILDINGS 7 IS A LARGE POLE BARN TYPE CONSTRUCTION. LARGE PIECES OF EQUIPMENT WAS PARKED IN THIS AREA.

BUILDING 8

THIS BUILDING INCLUDED THE PLANER, CONTROL ROOM, WAREHOUSING OF MATERIALS AND LUNCH ROOM.

SECTION 4.0 STATEMENT OF COMPLIANCE

In accordance with W.A.C. 296-62-07721 and current applicable ORCCA Regulations, KD& S Environmental Consulting performed an Asbestos Inspection of**:**

GRAYS HARBOR SEAPORT
BUILDINGS 7 AND 8
500 N CUSTER
ABERDEEN, WA 98520

Abatement of asbestos-containing materials must be conducted by a Washington State Certified Asbestos Abatement Contractor. Should employees or contract personnel encounter any suspect asbestos-containing materials it is their responsibility to:

1. Contact a representative of the owner.
2. Consult the inspection report to determine whether or not the suspect material contains asbestos.
3. Ensure that all employees and contractors are informed and advised of the location and type of materials that contain asbestos.

The following asbestos-containing materials were identified at the subject property:

BUILDING 7

Sample #	Location	% ACM Category	Description of Material	Friable/ Non-Friable	Total SF
R-1	MIDDLE OF ROOF	MISCELLANEOUS SILVER COAT 2% CHRYSOTILE	HOT MOP W/SILVER COAT ON WOOD	FRIABLE

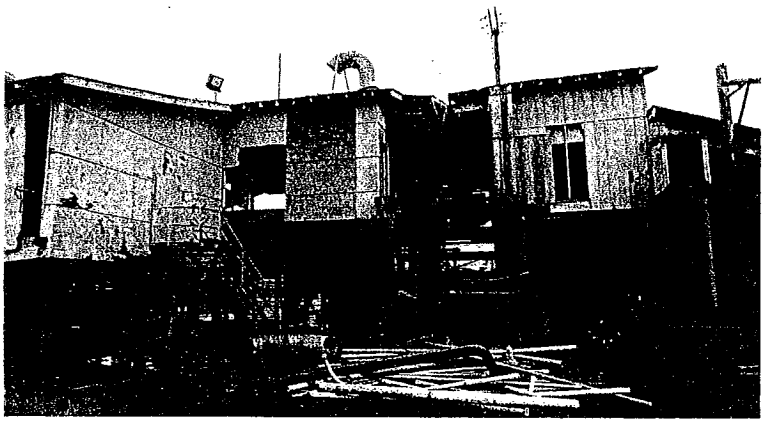
APPENDIX F	CERTIFICATIONS



SECTION 1.0 SCOPE OF WORK

On March 2, 2017 Dean Wilson (BI/PD-NES-01-17-17-02) an accredited asbestos and hazardous materials inspectors for KD&S Environmental, conducted an asbestos containing materials survey of the property known as:

OLD MILL BUILDING
500 NORTH CUSTER STREET
ABERDEEN, WA 98520

The following suspect materials were investigated:

- **Asbestos Containing Material**

Field inspection, data collection, and report generation were based on the following Scope of Work:

1. Perform a visual inspection of the subject property to identify and inventory all accessible suspect asbestos containing materials.
2. Bulk sampling and analysis of identified suspect asbestos containing materials.
3. Provide quantity estimates of asbestos containing materials.
4. Provide a written report including sample descriptions, sample locations, and sample location drawing.

The survey was intended to identify any possible asbestos containing materials (ACM) which may be disturbed during demolition, remodeling or maintenance activities per 40 CFR 61 Subpart M and to maintain compliance with WAC 296-62-07721 and current applicable **Olympic Region Clean Air Agency (ORCAA)** Regulations. KD&S Environmental has made a best effort attempt to identify materials, which may be disturbed. In addition, the asbestos survey meets the "Good Faith" asbestos inspection requirements. It should be noted that "Good Faith" surveys are limited in scope and that those materials which required destructive means to access or sample (interstitial spaces) is not included in this report.

Suspect asbestos containing materials within the structure were identified and classified as either a surfacing material, thermal system insulation, or miscellaneous materials. Surfacing materials are those, which are either, spray applied or troweled-on for acoustical, decorative, or fireproofing purposes. Thermal system insulation (TSI) is insulation used to inhibit heat transfer or to prevent condensation on pipes, boilers, tanks, ducts and various other components. Miscellaneous materials include all other materials not included in the above categories such as floor tile, ceiling tile, roofing felt, cementitious materials, wallboard systems and products such as caulking, mastics and putties. 2 Miscellaneous samples were collected and submitted for laboratory analysis.

Limitations of the Assessment

This targeted assessment was limited to the referenced buildings and did not include areas beyond the "foot print" of the buildings. The conclusions within this report are professional opinions base solely upon visual site observations and interpretation of analytical data as described in this report. Typical construction techniques can render portions of the building inaccessible. As a result, additional ACBM may be present in inaccessible areas (i.e. within wall and ceiling cavities). Suspect ACBM within inaccessible areas should be presumed to contain asbestos until characterized.
The opinions presented herein apply to the site conditions existing at the time of the investigation and interpretation of current asbestos regulations. Recommendations provided may not apply to future conditions that exist at the above mention site.

Survey Methodology

The supporting documentation provided within survey report includes material summary table and the appendices that included site photographs, lab analytical reports, chain of custody forms, staff certification.

SECTION 2.0 ASBESTOS-CONTAINING MATERIALS (ACM) SUMMARY

Bulk samples collected by KD&S Environmental were submitted for sample analysis in accordance with method EPA-600/R-93/116: "Method for the Determination of Asbestos in Bulk Building Materials". Seattle Asbestos performed analysis of suspect asbestos materials. The following suspect materials were found to contain asbestos in quantities equal to or greater than one percent (1%).

TOTAL ASBESTOS

OLD MILL BUILDING
500 NORTH CUSTER STREET
ABERDEEN, WA 98520

ALL POTENTIAL ACM ARE NON-DETECT

**All square footages provided are approximations and any drawings are not to scale. Contractors are advised to verify the measurements on their own prior to bidding the work.*

SECTION 3.0 ASSESSMENT AND RECOMMENDATIONS

ASSESSMENT

Samples taken were non-detect for asbestos. This demolition may proceed with the permitting process without the hindrance of abatement.

RECOMMENDATIONS

All identified asbestos containing material is regulated material and must be abated prior to any demolition or remodeling activity which may disturb these materials at the subject property. A Washington State Certified Asbestos Contractor must conduct abatement of asbestos containing materials.

NARRATIVE

THIS IS AN ABANDONED STRUCTURE AT THE OLD WEYERHAEUSER MILL THAT IS NOW BEING UTILIZED BY THE GRAYS HARBOR SEAPORT AUTHORITY. THE SEAPORT IS PLANNING ON DEMOLISHING THIS SECTION OF THE BUILDING. THE WOOD AND METAL STRUCTURE IS DOWN TO BARE BONES. THERE IS A SMALL OFFICE THAT HAS SHEET VINYL FLOORING AND SOME SHEETROCK. BOTH SAMPLES TESTED NEGATIVE FOR ASBESTOS. THERE WERE NO OTHER SUSPECT MATERIALS TO BE SAMPLED AT THIS FACILITY. A T-CLP SAMPLES WAS ALSO TAKEN TO DETERMINE IF THE DEMOLISHED MATERIALS COULD BE TAKEN AS GENERAL CONSTRUCTION DEBRIS. ANALYSIS SHOWS THAT THE T-CLP SAMPLE WAS LESS THAN THE EPA THRESHOLD OF 5% THEREFORE THE MATERIALS CAN BE DISPOSED OF AS GENERAL CONSTRUCTION DEBRIS.

SECTION 4.0 STATEMENT OF COMPLIANCE

In accordance with W.A.C. 296-62-07721 and current applicable ORCCA Regulations, KD& S Environmental Consulting performed an Asbestos Inspection of:

OLD MILL BUILDING
500 NORTH CUSTER STREET
ABERDEEN, WA 98520

Abatement of asbestos-containing materials must be conducted by a Washington State Certified Asbestos Abatement Contractor. Should employees or contract personnel encounter any suspect asbestos-containing materials it is their responsibility to:

1. Contact a representative of the owner.
2. Consult the inspection report to determine whether or not the suspect material contains asbestos.
3. Ensure that all employees and contractors are informed and advised of the location and type of materials that contain asbestos.

The following asbestos-containing materials were identified at the subject property:

ALL POTENTIAL ACM ARE NON-DETECT

**All square footages provided are approximations and any drawings are not to scale. Contractors are advised to verify the measurements on their own prior to bidding the work.*

I Hereby Attest:

The inspection report has been made available to me. I will inform all subcontractors of the location and types of materials containing asbestos. I am authorized to sign on behalf of my company.

365-230-330
Work practice standards.

(1) Standards for renovation activities. Renovations must be performed by certified firms using certified renovators as directed under WAC 365-230-370. The responsibilities of certified firms are set forth under WAC 365-230-360 and the responsibilities of certified renovators are set forth under WAC 365-230-380.

(a) Occupant protection. Firms must post signs clearly defining the work area and warning occupants and other persons not involved in renovation activities to remain outside of the work area. To the extent practicable, these signs must be in the primary language of the occupants. These signs must be posted before beginning the renovation and must remain in place and readable until the renovation and the postrenovation cleaning verification have been completed. If warning signs have been posted in accordance with 24 C.F.R. 35.1345 (b)(2) or 29 C.F.R. 1926.62(m), additional signs are not required by this section.

(b) Containing the work area. Before beginning the renovation, the firm must isolate the work area so that no dust or debris leaves the work area while the renovation is being performed. In addition, the firm must maintain the integrity of the containment by ensuring that any plastic or other impermeable materials are not torn or displaced, and taking any other steps necessary to ensure that no dust or debris leaves the work area while the renovation is being performed. The firm must also ensure that containment is installed in such a manner that it does not interfere with occupant and worker egress in an emergency.

(i) Interior renovations. The firm must:

(A) Remove all objects from the work area, including furniture, rugs, and window coverings, or cover them with plastic sheeting or other impermeable material with all seams and edges taped or otherwise sealed.

(B) Close and cover all ducts opening in the work area with taped-down plastic sheeting or other impermeable material.

(C) Close windows and doors in the work area. Doors must be covered with plastic sheeting or other impermeable material. Doors used as an entrance to the work area must be covered with plastic sheeting or other impermeable material in a manner that allows workers to pass through while confining dust and debris to the work area.

(D) Cover the floor surface, including installed carpet, with taped-down plastic sheeting or other impermeable material in the work area six feet beyond the perimeter of surfaces undergoing renovation or a sufficient distance to contain the dust, whichever is greater. Floor containment measures may stop at the edge of the vertical barrier when using a vertical containment system consisting of impermeable barriers that extend from the floor to the ceiling and are tightly sealed at joints with the floor, ceiling, and walls.

(E) Use precautions to ensure that all personnel, tools, and other items, including the exteriors of containers of waste, are free of dust and debris before leaving the work area.

(ii) Exterior renovations. The firm must:

(A) Close all doors and windows within twenty feet of the renovation. On multistory buildings, close all doors and windows within twenty feet of the renovation on the same floor as the renovation, and close all doors and windows on all floors below that are the same horizontal distance from the renovation.

(B) Ensure that doors within the work area that will be used while the job is being performed are covered with plastic sheeting or other impermeable material in a manner that allows workers to pass through while confining dust and debris to the work area.

(C) Cover the ground with plastic sheeting or other disposable impermeable material extending ten feet beyond the perimeter of surfaces undergoing renovation or a sufficient distance to collect falling paint debris, whichever is greater, unless the property line prevents ten feet of such ground covering. Ground containment measures may stop at the edge of the vertical barrier when using a vertical containment system.

(D) If the renovation will affect surfaces within ten feet of the property line, the renovation firm must erect vertical containment or equivalent extra precautions in containing the work area to ensure that dust and debris from the renovation does not contaminate adjacent buildings or migrate to adjacent properties. Vertical containment or equivalent extra precautions in containing the work area may also be necessary in other situations in order to prevent contamination of other buildings, other areas of the property, or adjacent buildings or properties.

(c) Prohibited and restricted practices. The work practices listed below are prohibited or restricted during a renovation as follows:

(i) Open-flame burning or torching of painted surfaces is prohibited.

(ii) The use of machines designed to remove paint or other surface coatings through high speed operation such as sanding, grinding, power planing, needle gun, abrasive blasting, or sandblasting, is prohibited unless such machines have shrouds or containment systems and are equipped with a HEPA vacuum attachment to collect dust and debris at the point of generation. Machines must be operated so that no visible dust or release of air occurs outside the shroud or containment system.

(iii) Operating a heat gun on painted surfaces is permitted only at temperatures below 1,100 degrees Fahrenheit.

(d) Waste from renovations.

(i) Waste from renovation activities must be contained to prevent releases of dust and debris before the waste is removed from the work area for storage or disposal. If a chute is used to remove waste from the work area, it must be covered.

(ii) At the conclusion of each work day and at the conclusion of the renovation, waste that has been collected from renovation activities must be stored under containment, in an enclosure, or behind a barrier that prevents release of dust and debris out of the work area and prevents access to dust and debris.

(iii) When the firm transports waste from renovation activities, the firm must contain the waste to prevent release of dust and debris.

(e) Cleaning the work area. After the renovation has been completed, the firm must clean the work area until no dust, debris or residue remains.

(i) Interior and exterior renovations. The firm must:

(A) Collect all paint chips and debris and, without dispersing any of it, seal this material in a heavy-duty bag.

(B) Remove the protective sheeting. Mist the sheeting before folding it, fold the dirty side inward, and either tape shut to seal or seal in heavy-duty bags. Sheeting used to isolate contaminated rooms from noncontaminated rooms must remain in place until after the cleaning and removal of other sheeting. Dispose of the sheeting as waste

(ii) Additional cleaning for interior renovations. The firm must clean all objects and surfaces in the work area and within two feet of the work area in the following manner, cleaning from higher to lower:

(A) Walls. Clean walls starting at the ceiling and working down to the floor by either vacuuming with a HEPA vacuum or wiping with a damp cloth.

(B) Remaining surfaces. Thoroughly vacuum all remaining surfaces and objects in the work area, including furniture and fixtures, with a HEPA vacuum. The HEPA vacuum must be equipped with a beater bar when vacuuming carpets and rugs.

(C) Wipe all remaining surfaces and objects in the work area, except for carpeted or upholstered surfaces, with a damp cloth. Mop uncarpeted floors thoroughly, using a mopping method that keeps the wash water separate from the rinse water, such as the two-bucket mopping method, or using a wet mopping system.

(2) Standards for postrenovation cleaning verification.

(a) Interiors.

(i) A certified renovator must perform a visual inspection to determine whether dust, debris, or residue is still present. If dust, debris, or residue is present, these conditions must be removed by recleaning and another visual inspection must be performed.

(ii) After a successful visual inspection, a certified renovator must:

(A) Verify that each windowsill in the work area has been adequately cleaned, using the following procedure:

(I) Wipe the windowsill with a wet disposable cleaning cloth that is damp to the touch. If the cloth matches or is lighter than the cleaning verification card, the windowsill has been adequately cleaned.

(II) If the cloth does not match and is darker than the cleaning verification card, reclean the windowsill as directed in this section, then either use a new cloth or fold the used cloth in such a way that an unused surface is exposed, and wipe the surface again. If the cloth matches or is lighter than the cleaning verification card, that windowsill has been adequately cleaned.

(III) If the cloth does not match and is darker than the cleaning verification card, wait for one hour or until the surface has dried completely, whichever is longer.

(IV) After waiting for the windowsill to dry, wipe the windowsill with a dry disposable cleaning cloth. After this wipe, the windowsill has been adequately cleaned.

(B) Wipe uncarpeted floors and countertops within the work area with a wet disposable cleaning cloth. Floors must be wiped using an application device with a long handle and a head to which the cloth is attached. The cloth must remain damp at all times while it is being used to wipe the surface for postrenovation cleaning verification. If the surface within the work area is greater than forty square feet, the surface within the work area must be divided into roughly equal sections that are each less than forty square feet. Wipe each such section separately with a new wet disposable cleaning cloth. If the cloth used to wipe each section of the surface within the work area matches the cleaning verification card, the surface has been adequately cleaned.

(I) If the cloth used to wipe a particular surface section does not match the cleaning verification card, reclean that section of the surface as directed in this section, then use a new wet disposable cleaning cloth to wipe that section again. If the cloth matches the cleaning verification card, that section of the surface has been adequately cleaned.

(II) If the cloth used to wipe a particular surface section does not match the cleaning verification card after the surface has been recleaned, wait for one hour or until the entire surface within the work area has dried completely, whichever is longer.

(III) After waiting for the entire surface within the work area to dry, wipe each section of the surface that has not yet achieved postrenovation cleaning verification with a dry disposable cleaning cloth. After this wipe, that section of the surface has been adequately cleaned.

(iii) When the work area passes the postrenovation cleaning verification, remove the warning signs.

(b) Exteriors. A certified renovator must perform a visual inspection to determine whether dust, debris or residue is still present on surfaces in and below the work area, including windowsills and the ground. If dust, debris or residue is present, these conditions must be eliminated and another visual inspection must be performed. When the area passes the visual inspection, remove the warning signs.

(3) Optional dust clearance testing. Cleaning verification need not be performed if the contract between the renovation firm and the person contracting for the renovation or another federal, state, territorial, tribal or local law requires dust wipe sampling.

(a) The renovation firm to perform dust clearance sampling at the conclusion of a renovation covered by this section.

(b) The dust clearance samples are required to be collected by a certified inspector, risk assessor, or dust sampling technician.

(c) The renovation firm is required to reclean the work area until the dust clearance sample results are below the clearance standards in WAC 365-230-020 or any applicable local standard.

(4) Activities conducted after postrenovation cleaning verification. Activities that do not disturb paint such as applying paint to walls that have already been prepared, are not regulated by this subpart if they are conducted after postrenovation cleaning verification has been performed.

[Statutory Authority: RCW 70.103.030. WSR 14-03-104, § 365-230-330, filed 1/20/14, effective 2/20/14. Subject: Preliminary Geotechnical Report
Grays Harbor Historical Seaport – Seaport Landing Site
500 N Custer Street
Aberdeen, Washington

Dear Ms. Bednarik:

In accordance with your request and written authorization, Zipper Geo Associates, LLC (ZGA) has completed a Preliminary Geotechnical Report for the Grays Harbor Historical Seaport located in Aberdeen, Washington. Our work was completed in general accordance with our proposal dated September 10, 2019. Authorization to proceed with our work was provided by Grays Harbor Historical Seaport through signature of our proposal on November 4, 2019. We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report, or if we may be of further service, please contact us.

PRELIMINARY GEOTECHNICAL REPORT
GRAYS HARBOR HISTORICAL SEAPORT – SEAPORT LANDING SITE
500 N CUSTER STREET
ABERDEEN, WASHINGTON
ZGA Project No. 2279.00
February 10, 2020

1.0 INTRODUCTION

The Grays Harbor Historical Seaport Authority (GHHSA) and the City of Aberdeen, Washington (the City) are leading an effort to redevelop Aberdeen's South Waterfront. The South Waterfront consists of approximately 60 acres of waterfront property located along the south shoreline of the Chehalis River in Aberdeen, Washington. The South Waterfront includes three separate sites; the City Wetland site, the Pakonen Boatyard site, and the Seaport Landing site. The Seaport Landing site, owned by the GHHSA is the focus of this report.

Historically, the Seaport Landing site (the Site) has been utilized for production of various lumber products dating back to the late 1800s. Based on our review of various documents available from the Washington State Department of Ecology (DOE), previous use at the site has resulted in various areas of environmental contamination that will require cleanup prior to redevelopment. Further characterization of regulated environmental contaminants at the Site is currently being performed by Maul Foster & Alongi, Inc. (MFA).

Work required to remediate contaminated areas at Site may involve excavation and dredging to remove contaminated soils. Additionally, redevelopment at the site may also include restoration of Shannon Slough, which borders the site to the east. Ultimately, site development may include new buildings. The purpose of this report is to provide preliminary geotechnical recommendations related to the following aspects of site redevelopment:

- Remedial excavation work to remove contaminated soils
- Restoration of Shannon Slough
- Future site development

This report is an instrument of service and the conclusions presented herein are in respect to the specific site and stated project understanding as described above. In the event that the scope of the project changes from our current understanding, the conclusions in this report may require modification. This report has been prepared with generally accepted geotechnical consulting practice for the exclusive use of Grays Harbor Historical Seaport organization and its agents, for specific application to the subject project site and stated purpose.

2.0 SITE DESCRIPTION

The Seaport Landing site consists of several parcels of land owned by GHHSA totaling approximately 23.6 acres (the Upland portion). The Site also includes about 14.5 acres of tidelands subleased by GHHSA from the Weyerhaeuser Timber Company (the Tidelands). Weyerhaeuser leases the tidelands from the

Washington State Department of Natural Resources. The Site is bordered to the north by the Chehalis River; to the south by developed commercial and residential properties; to the east by Shannon Slough and developed industrial property beyond; and to the west by the Pakonen Boatyard site, a former boat dock and marine services center. The Upland portion of the Site is currently developed with 14 main buildings and numerous outbuildings totaling approximately 148,000 square feet of building space. Outside of the building areas, the ground surface is generally covered with asphalt concrete pavement. The west end of the Tidelands area is currently developed with a pile-supported wharf structure and limited, small existing buildings. Within the Tidelands area, areas east of the wharf structure extending to Shannon Slough generally consist of tidal flats that were previously filled during historic uses of the site.

Topographically, the Upland portion of the site is generally flat to gently sloping and occurs at an elevation generally ranging from about 10 to 14 feet (NAVD 88 Datum). Two distinct topographical areas occur within the Tidelands area east of the Wharf area, the Pocket Beach and previously filled tidelands. The Pocket Beach area consists of a roughly 100 foot (east-west) by 200 foot (north-south) area directly east of the Wharf area. The Pocket Beach is a relatively flat, tidally influenced, low lying area flanked by steep slopes along the east, west, and south sides. The Pocket Beach area generally slopes gently downward to the Chehalis River from a high elevation of about 9 feet down to about elevation 6 feet. The steep slopes flanking the Pocket Beach have a total relief of about 4 to 5 feet. East of the Pocket Beach, the ground surface is generally level extending north to the banks of the Chehalis River.

Based on our review of a Bathymetry and Topographic figure presented in a 2019 MFA report, the channel bank of the Chehalis River north of the Site slopes downward from a high elevation of about 13 feet down to -33 feet. Slopes of the channel bank range from about 6 to 23 degrees. The steepest portion of the channel bank occurs both along the tidally influenced shoreline and with open water north of the Pocket Beach area between about elevation -8 to -32.

Shannon Slough traverses from south to north along the east side of the Site generally paralleling the east property boundary of the Site. Shannon Slough discharges to the Chehalis River. Based on our review of the 2019 MFA figure referenced above, the channel banks of Shannon Slough are inclined at about 16 to 18 degrees.

The surface water elevation of the Chehalis River in the vicinity of the Site is tidally influenced by Grays Harbor and the Pacific Ocean. The Pocket Beach and other beach areas within the Tidelands area are fully submerged during high tide (MFA, 2019). Based on our review of survey data provided by MFA, the estimated ordinary high water is at about elevation 9 feet (NAVD 88 Datum).

3.0 SUBSURFACE CONDITIONS

3.1 General

Our understanding of subsurface soil and groundwater conditions at the site is based on subsurface explorations completed at the site as part of our current services, review of information completed by others at the Site, review of published geologic mapping, and review of previous explorations completed by others at nearby sites. Specifically, the following sources were referenced in describing our understanding of subsurface soil and groundwater conditions at the Site:

- Soils and Foundations Investigation, Sanitary Sewer Systems Improvements for South Aberdeen prepared by Roger Lowe Associates (RLA, 1977)
- Army Corps of Engineers Report on the Chehalis River at South Aberdeen and Cosmopolis (ACOE, 1979)
- Subsurface Exploration and Geotechnical Engineering, Proposed Retail Store, Aberdeen, Washington prepared by RZA AGRA, Inc. (RZA, 1992)
- Excerpts from Army Corps of Engineers Chehalis River Foundation Exploration (ACOE, 1993)
- Geotechnical Baseline Report, SR520 Pontoon Construction Design-Build Project prepared by Landau Associates (Landau, 2009)
- Geotechnical Engineering Recommendations, SR 520 Pontoon Casting Facility, Aberdeen, Washington prepared by Shannon & Wilson, Inc. (S&W, 2011)
- Seaport Landing Site, Targeted Brownfields Assessment, Aberdeen, Washington prepared by Ecology and Environmental (EAE, 2018)
- In-Water Remedial Investigation Work Plan, Weyerhaeuser Sawmill Aberdeen/Seaport Landing Site prepared by Maul Foster and Alongi (MFA, 2019)

3.2 Geology of the Chehalis River Flood Plain

The project Site is located within the Chehalis River flood plain. Geologic conditions within the Chehalis River flood plain consist primarily of recent alluvial sediments overlain by older Pliocene-age glacial recessional outwash deposits. During recent glaciation periods, sea level was lowered about 300 feet resulting in the Chehalis River cutting deep canyons in Pliocene sediments. As the glaciers receded, sea level rose up the canyon as far as present day Montesano. The sea level rise resulted in deposition of Chehalis River alluvial sediments which filled the deep canyons (ACOE, 1979).

Early in the process of alluvial filling, relatively thin transitional alluvial stream and river deposits of sand, silt, and gravel were deposited over the glacial outwash sediments. As sea levels continued to rise, marsh sediments consisting of silt and sand with lenses of abundant organic materials began to accumulate over the transitional deposits. Additional rise in sea levels resulted in the area became submerged with deeper water resulting in still water deposits of highly plastic silts and clays with organic silts and zones of woody debris (ACOE, 1979) (Landau, 2009).

The Pliocene recessional outwash deposits which underlie the recent alluvial deposits consist primarily of competent, medium dense to very dense sandy gravel to gravelly sand. The thickness of these Pliocene deposits at the site is unknown. The Pliocene deposits are underlain by siltstone bedrock.

3.3 Site Specific Soil Conditions

To characterize subsurface soil conditions at the Site, we completed 9 geotechnical test borings at the Site. The locations of our test borings are shown on the attached Figure 1, Site and Exploration Plan. The explorations were completed to a depth of about 26 feet below the existing ground surface (BGS). A discussion of methods used to complete the borings as well as detailed boring logs are provided in Appendix A.

In addition to completing test borings, we reviewed information presented in reports completed by others. Specific reports we reviewed are summarized in Section 3.1 above. The following sections present our interpretation of the geologic sequence at the Site based on our test borings and information completed by others. In addition, an conceptual geologic cross section of the site is provided in Figure 2.

3.3.1 Fill

Prior to development, the site generally consisted of tidelands. As development progressed, the tidelands were filled. In the early stages of site development, mill structures were constructed overwater on piers that extended several hundred feet from the original Chehalis River shoreline. As development progressed, land beneath the piers was filled bringing the site to current grades (EAE, 2018). The listed references in Section 3.1 generally describe the fill materials as lumber, planks, sawdust, refuse, earth, and rock. MFA (2019) describes, in detail, shoreline modifications and historical fill events, and the reader is referred to MFA (2019) for a detailed description of those events.

Soils interpreted to be fill were encountered in all of our explorations completed at the Site directly below the ground surface. The thickest fill deposits were found in borings completed in the upland portion of the site including RAU2-GA3, RAU3-GA1, RAU3-GA2, RAU7-GA1, and RAU7-GA2. A generalized summary of the composition and thickness of soils interpreted to be fill in these borings is provided below.

- **RAU3-GA1 & RAU2-GA3:** Encountered 9- to 18-inches of asphalt concrete pavement over 4- to 5-feet of gravelly, silty sand, over woody debris extending to estimated depths of about 17 to 20 feet below the exiting ground surface.

- **RAU3-GA2:** Encountered 6 inches of asphalt concrete pavement over sand and gravel with a variable silt content extending to an estimated depth of about 15 feet below the existing ground surface.

- **RAU2-GA1 & RAU2-GA2 (Pocket Beach):** Encountered 3 feet of sawdust fill in RAU2-GA1 and 9 feet of sawdust and woody debris fill in RAU2-GA2.

- **RAU7-GA1 & RAU7-GA2:** Encountered 6 to 14 inches of asphalt concrete pavement underlain by sand and gravel fill with a variable silt content extending to about 17 feet below the existing ground surface. Woody debris was encountered near the interpreted bottom of fill in boring RAU7-GA2.

- **RAU6-GA1 & RAU6-GA2:** Encountered 2.5 to 3 feet of sand and gravel fill. These borings were completed at what appears to be near the old Chehalis River shoreline as indicated by the relatively thin fills encountered.

3.3.2 Recent Alluvium

Below the fill, all of our borings encountered recent alluvium deposits consisting of very soft to soft organic silt and silt with a variable sand and organic/woody debris content. In some of the borings, the alluvium silts were underlain by very loose sands with a variable silt content near the bottom of the boring. All of our borings were completed at about 26 feet BGS within what we interpret to be recent alluvium deposits.

Four borings completed in 1986 are referenced in ACOE (1993), 86-PA-10, -11, -12, and -13. These borings appear to have been completed in the upland portions of the site, and their estimated locations are shown on the attached Figure 1. The ACOE (1993) borings depict the very soft to soft organic silt transitioning to loose to medium dense silty sand to sandy silt at a depth of about 30 to 35 feet BGS. Boring 86-PA-9 from ACOE (1993) was completed about 1,000 feet southwest of the Site and appears to be the only previous boring that penetrated the recent alluvium and encountered Pliocene recessional outwash deposits. Boring 86-PA-9 indicates the recent alluvium transitions to recessional outwash deposits at about 115 to 120 feet BGS.

Landau Associates completed a Geotechnical Baseline Report in support of the SR520 Pontoon Construction project (Landau, 2009) that contains a large body of soils data and a thorough characterization of soil deposits in the area. The SR520 Pontoon project site is located about 1-¾ miles southwest of the Seaport Landing site. Landau (2009) generally characterizes the recent alluvial deposits as about 30 to 40 feet of highly plastic, very soft to soft silts underlain by about 50 to 60 feet of low plasticity sandy silts and silty sands resulting in an overall recent alluvium thickness of about 80 to 100 feet.

3.3.3 Pliocene Recessional Outwash

Based on information presented in Landau (2009) and ACOE (1993), the recent alluvial deposits at the Site appear to be underlain by Pliocene recessional outwash deposits. Both referenced reports indicate the

recessional outwash deposits generally consist of dense to very dense sand and gravel. As mentioned above, boring 86-PA-9 from ACOE (1993) indicates the recessional outwash unit begins at about 115 to 120 feet below existing site grade, or an elevation of about -105 to -110 feet. Information in Landau (2009) indicates the recessional outwash top exists at about elevation -90 to -110 feet at the SR520 Pontoon Site, relatively similar to what boring 86-PA-9 indicates.

3.4 Groundwater Conditions

As part of our services, we characterized expected groundwater elevations at the site through observation of our borings as well as groundwater data from the references cited in Section 3.1 above. In our borings completed within the Pocket Beach area, we observed groundwater generally at the existing ground surface. In our borings completed within the upland areas of the site, we observed groundwater at depths ranging from about 4 to 6 feet below existing site grade.

References cited in Section 3.1 generally indicated similar groundwater elevations as those encountered in our borings. The references further indicate that groundwater flow direction is towards the northwest, and that groundwater elevations at the Site may be tidally influenced.

S&W (2011) provides a brief description of hydrogeologic conditions at the SR 520 Pontoon site. S&W states the SR 520 site is underlain by at least three aquifers including a shallow perched, upper, and lower aquifer. The perched aquifer consist of a thin zone of saturated soil within fill soils that is perched atop the underlying, low permeability high plasticity alluvial silts. The upper aquifer is describe as a thin saturated zone within with high plasticity alluvial silts, and the lower aquifer is described as within the lower plasticity silty sands to sandy alluvial silts below the higher plasticity alluvial silts and above the Pliocene recessional outwash deposits.

3.5 Soil Physical Properties

Our services included limited laboratory testing on samples obtained from our explorations including moisture content and Atterberg Limits testing. Results of moisture content testing are presented on the boring logs provided in Appendix A. In addition to our laboratory testing, Landau (2009) and S&W (2011) provides a significant body of physical property laboratory testing data on soils similar to those expected at the Site. A majority of the testing was completed as related to Landau (2009). S&W (2011) presented table summaries of Landau's data along with limited testing completed by them. Figures B-1 through B-5 provided in Appendix B present summary graphs of laboratory testing data provided in Landau (2009), S&W (2011), and results from our testing where applicable. Data summarized include Atterberg Limits, liquidity index, moisture content, wet density, and void ratio. The laboratory testing data shown in these figures is limited to those tests completed on samples within the upper 15 to 20 feet BGS and focuses mainly on the high plasticity alluvial silts.

S&W (2011) completed dewatering analysis in support of evaluating the feasibility of temporary and permanent dewatering at the SR 520 Pontoon site. S&W based their analysis on pumping tests within the upper and lower aquifers as well as estimated parameters for other soil layers. A summary of data used in S&W (2011) in order of increasing depth BGS is provided below.

Soil Type	Horiz. Hydraulic Conductivity (ft/day)
Mixed fill	0.3
Wood waste fill	130
Alluvial high plasticity silts	0.03
Alluvial silty sands to sandy silts	6 to 15

Landau (2009) completed various strength tests including unconsolidated undrained (UU), consolidated undrained triaxial (CU), and direct simple shear (DSS) tests. S&W (2011) used data from Landau (2009) to complete an approximate Stress History and Normalized Soil Engineering Parameter (SHANSEP) analysis. Based on the SHANSEP analysis, S&W (2011) reported an estimated relationship between undrained shear strength and effective vertical stress for the very soft to soft, highly plastic alluvial silts as follows:

- $S_U/p' = 0.22\ OCR^{0.8}$,
  where S_U = undrained shear strength, p' = in situ vertical effective stress, and OCR = over-consolidation ratio

S&W estimated OCRs within the very soft to soft, highly plastic alluvial silts ranging from about 1.33 to 4 with an average of about 2.15. However, the SR520 site appears to have a thicker section of fill soils overlying the alluvial silts as compared to the Seaport Landing site. Thicker fill atop the alluvial silts would result in higher OCRs. For purposes of our feasibility-level analysis, we have assumed an OCR of 2.0.

S&W (2011) summarized consolidation tests completed as part of Landau (2009). S&W (2011) reported compression indices ($C_{C\varepsilon}$) within the highly plastic alluvial silts ranging from 0.14 to 0.22 with an average of about 0.20.

For volume estimates of dredged material, the actual volume of dredged material will exceed the in-place neat volume quantity. Typical bulk factors for soils expected at the site range from 20 to 40 percent. Technical guidelines for environmental dredging published by the EPA suggest using a bulking factor of 50 percent for feasibility-level estimates.

Limited grain size analyses on the highly plastic alluvial silts were reported in S&W (2011). S&W (2011) reported results of three grain size analysis tests on the highly plastic alluvial silts. The results indicate a fines content (silt and clay sized particles) of about 92 to 98 percent. Of those three tests, one included a

hydrometer test. The hydrometer test indicated a clay size particle (less than 0.002mm) content of about 16 percent and a silt size particle (0.08mm to 0.002mm) of about 76 percent.

4.0 PRELIMINARY CONCLUSIONS AND RECOMMENDATIONS

4.1 General

Our scope of work included providing preliminary geotechnical conclusions and recommendations for proposed future work at the Site including the following:

- Remedial cleanup work to remove contaminated soils within the Pocket Beach area
- Remedial cleanup work to remove contaminated soils within the upland portions of the Site
- Shannon Slough channel bank restoration
- Future development of the Site

The following sections present our preliminary conclusions and recommendations for the above-listed factions of future work.

4.2 Pocket Beach Remedial Cleanup Work

4.2.1 Understanding of Proposed Work

Based on our conversations with MFA, we understand a “dredge and cap” approach is currently being considered to cleanup environmental contaminants within the Pocket Beach area. The dredge and cap approach would consist of excavation to remove contaminated soils, and then backfilling the excavation to restore the area. Due to the location of work and expected debris, we have assumed that dredging will be performed using mechanical methods versus hydraulic methods. Whether or not the work will be completed as a “dry excavation” using conventional excavation methods operating within dewatered contaminants using sheet pile enclosures or cofferdams has yet to be determined. We understand the maximum anticipated excavation depth is approximately 10 feet below existing site grade. Depending on requirements for contaminate release control, sediment resuspension control, and physical constraints, the work may require temporary sheet pile shoring and dewatering. The following sections present our preliminary geotechnical conclusions and recommendations for expected geotechnical aspects of the work within the Pocket Beach area.

4.2.2 Slope Stability

Many aspects of the work may require slope stability analysis including dredged/excavated slope stability, global stability of sheet pile/cofferdam structures, and stability of dredge spoil stockpiles. Various load cases will also need to be analyzed to address varying water levels due to tidal fluctuations, drained versus undrained conditions, surcharge conditions, and other cases that cannot be identified until design of the remedial work is advanced. However, for preliminary planning purposes and feasibility-level analysis, we

completed slope stability analyses in order to evaluate unsupported dredged/excavated slope stability. We completed our slope stability analyses using the computer program Slide developed by Rocscience. Our analyses focused on the expected worst case scenario for stability using undrained strength parameters. For undrained shear strength, we used the relationship described by in S&W (2011) as discussed in Section 3.5 above.

For unsupported, temporary dredged slopes, we assumed a maximum slope height of 10 feet and a high water elevation of 10 feet (NAVD 88). We further assumed the excavation would be completed without dewatering and would extend below the water surface. The results of our slope stability analysis indicate a 1.34 factor of safety could be achieved by limiting the dredge slope angle to 3H:1V. The Washington State Department of Transportation's (WSDOT) Geotechnical Design Manual (GDM) specifies a minimum safety factor of 1.25 for temporary slope stability.

4.2.3 Temporary Shoring

If the preferred approach to cleanup in the Pocket Beach area consists of dry excavation methods, temporary, water-tight shoring will be required. In order to create water-tight shoring, to limit groundwater inflow into the excavation, and prevent bottom heave of the excavated surface, sheet piles may have to extend a significant depth below the excavation line. For feasibility analysis purposes, we estimate sheet pile cofferdam walls with an exposed maximum height of about 10 feet would need to extend about 25 to 40 feet below the excavation line at the bottom of the walls in order provide groundwater cutoff and prevent bottom heave. For feasibility analysis, Figure 3 provides preliminary lateral earth pressure diagrams for conceptual design of sheet pile walls. Figure 3 assumes shoring would be cantilever sheet pile type and active earth pressures.

4.2.4 Temporary Dewatering

If the preferred approach to cleanup in the Pocket Beach area consists of dry excavation methods, temporary construction dewatering will be required. Preliminary dewatering analysis is beyond the scope of this report. However, information presented in Section 3.5 could be used for feasibility level analysis by a qualified dewatering designer.

Temporarily lowering the groundwater table within shored remedial excavations will lower the groundwater table outside of excavations. Lowering the groundwater table through construction dewatering will generate a risk of dewatering-induced ground settlement. The lateral extents and magnitude of settlement depend on the excavation depth and level of groundwater drawdown required to complete the excavation.

4.3 Upland Remedial Cleanup Work

4.3.1 Understanding of Proposed Work

Work at the Site may include remedial cleanup activities in the upland areas of the site. For purposes of this report, we have assumed that this work would be completed using conventional excavation methods extending to a maximum anticipated depth of 15 feet below existing site grade.

4.3.2 Excavation and Shoring Methods

Based on our review of 1997 report completed by EMCON (Independent Remedial Action Report, Weyerhaeuser Aberdeen Sawmill, Aberdeen, Washington), remedial excavation work in the upland portions of the site has been attempted in the past with limited success due to heavy groundwater inflows and physical constraints such as the proximity of remedial excavations to existing buildings. According to EMCON (1997), a 1991 remedial excavation was planned to extend 14 to 15 feet below existing site grade just west of the grader building. The report indicated dewatering was attempted; however, after pumping 20,000 gallons of water at 650 gallons per minute only a 6 inch drawdown could be achieved. Dewatering efforts were abandoned and an excavation was completed below the groundwater table without dewatering to a depth of 14 feet below grade.

The primary geotechnical constraints with conventional excavation methods to remove contaminated soils in the upland portions of the site are groundwater inflow and excavation sidewall stability. As EMCON experienced in 1991, excavations below the groundwater table at the site will experience high groundwater inflows. Unsupported excavations may experience sidewall caving and soil inflow resulting in excavation quantities potentially significantly larger than neat line planned volumes. Additionally, unsupported excavations could result in the development of undetectable voids below the ground surface that create future problems such as sinkholes. In order to complete remedial excavations under the identified constraints, the following methods were identified for consideration:

- Open excavations with no dewatering or sidewall support
- Dry excavation using sheet pile shoring and dewatering
- Stabilized excavations using ground freezing techniques
- Slurry stabilized excavations

Site soil conditions will play a major role in the feasibility of above-listed method alternatives. Material encountered in remedial excavations will vary, and as such, the feasibility of excavation methods will vary. Soils within remedial excavations are expected to consist entirely of wood waste, loose sand and gravel fill with a variable wood waste content over wood waste, variable combinations of wood waste and sand and gravely fill, and very soft silts. Discussions regarding each method alternative are presented in the following sections.

4.3.2.1 Open Excavations with No Dewatering or Sidewall Support

The performance of open excavations with no dewatering or sidewall support will vary based on soil conditions. The following presents our opinion on open excavation performance by soil type.

- **Wood Waste**: The performance of excavations completed below the groundwater table in material composed largely of wood waste will vary based on the composition of wood waste encountered. Sawdust wood waste will likely run into open excavations creating quantities in excess of neat line volumes. Coarse wood waste consisting of material similar to wood chips may or may not run into open excavations. Nested continuous large woody debris such as logs and waste lumber may remain stable but could be difficult to excavate. Wood waste likely also contains soil within the matrix. The soil within the matrix will likely run into open excavations therefore possibly creating voids below the ground surface and outside excavation limits. Running matrix soils would also result in quantities in excess of neat line volumes.

- **Loose Sand and Gravel Fill with Variable Wood Waste:** Excavations below the groundwater table in loose sand and gravel fill will cave, ravel and run to the extent it will likely not be feasible to extend an excavation more than a few feet below the groundwater table.

If the open excavation method is desirable, we recommend the project team consider completing test excavations at the site to further evaluate feasibility. It should also be noted that individuals entering remedial excavations to collect confirmation samples would not be feasible with this method.

4.3.2.2 Dry Excavations with Sheet Piles and Dewatering

In order to complete "dry excavations" to remove contaminated soil in the upland areas of the Site, sheet pile cutoff walls and dewatering within the excavation would be required. Driving sheet piles within areas where soil materials consist largely of wood waste may not be feasible as the woody debris may obstruct driving the sheet piles. Driving sheet piles in areas where soils consist largely of sand and gravel fill with limited woody debris may be feasible. The depth of sheet piles below the excavation line to create a groundwater cutoff and prevent bottom heave may be significant.

4.3.2.3 Excavations Stabilized by Ground Freezing

Ground freezing can generally be described as excavation stabilization using artificially frozen ground to support soils and limit groundwater inflows. The process of ground freezing consists of drilling and installing a series of closely-spaced pipes and circulating a coolant through these pipes. The refrigerated coolant extracts heat from the ground, converting the soil pore water to ice resulting in an extremely strong, impermeable material.

Ground freezing is expected to be feasible in areas where soils consist largely of sand and gravel fills with limited wood waste and the alluvial silts. The feasibility of ground freezing in areas where soils consist largely of wood waste is unknown. To evaluate feasibility of ground freezing in wood waste, we recommend the project team consult with a ground freezing contractor.

4.3.2.4 Slurry-Supported Excavations

Slurry-support methods may be feasible for excavations to remove contaminated soil within the upland portions of the Site. Using the slurry-support method, an excavation is created to the desired depth. As the work proceeds, the excavation is filled with a dense, highly viscous fluid, the slurry. The slurry maintains stability of the excavation sidewalls. The slurry typically consists of a mixture of bentonite and water or cement, bentonite, and water. Once complete, the excavation is filled with either a soil bentonite mixture or, in the case of cement-bentonite slurry, the slurry is left in place and hardens to a consistency similar to medium stiff to stiff clay (excavatable). With soil-bentonite backfills, the resulting soil backfill is soft and weak. The use of cement-bentonite slurry may be more appropriate for the Site considering possible future development. The use of slurry supported excavations may also provide an additional benefit in limiting the flow of groundwater contaminates off site.

One potential disadvantage of cement-bentonite slurry with regards to the intent of the work (remedial excavation) is set up time. Cement-bentonite slurry typically begins to set up within about 2 to 3 hours. However, the setup time can be extended through the use of additives in the mixture. The work may have facets that are sensitive to time such as confirmatory sampling to ensure contaminant removal. As such, set up time should be considered in evaluating the use of cement-bentonite slurry-supported excavations. A hybrid alternative such as using an initial bentonite slurry to complete the excavation, and then displacing the bentonite slurry with a cement-bentonite slurry could be considered. We recommend additional analysis be completed to evaluate the overall feasibility of slurry-supported excavation methods.

Slurry-supported excavations are expected to be feasible in areas where soils consist largely of sand and gravel fills with limited wood waste and the alluvial silts. Slurry-supported excavations in areas where soils consist largely of wood waste may not be feasible due to the high permeability of the material. To further evaluate feasibility of slurry methods in wood waste, we recommend the project team consult with a geotechnical contractor who specializes in this type of work such as Hayward Baker, Malcolm Drilling or Keller.

4.3.3 Excavation Backfilling

The primary geotechnical concern for backfilling remedial excavations is the ability of the backfill to obtain strength and settlement characteristics capable of supporting future development. However, we expect that the only aspect of future development that will require some level of strength for support is pavements. Any new buildings that are proposed will require pile foundation support as discussed in

Section 4.5.1. Proposed future underground utilities should be aligned outside of remedial excavation areas as the backfill will settle over time and could damage underground utilities that traverse through backfilled remedial excavations.

Remedial excavations that will be completed as dry excavations using either sheet pile shoring or ground freezing should be backfilled with free draining, granular material (such as WSDOT Gravel Borrow) placed in thin lifts and compacted to at least 92 percent of the maximum dry density as determined by the ASTM D1557 test method.

For remedial excavations completed as open excavations with no dewatering or sidewall support, consideration could be given to backfilling with dozed, free draining granular material. However, backfilling with dozed material below the groundwater table will result in a weak fill susceptible to significant future settlement, therefore likely resulting in frequent pavement maintenance and resurfacing. If the frequent maintenance and resurfacing is not desirable, consideration could be given to alternative backfilling methods such as backfilling with controlled density fill placed by tremie methods to displace water. Or alternatively, creating a mixture of soil/cement/bentonite or other additives with groundwater that will solidify over time.

Remedial excavations completed using slurry methods, we recommend using a slurry that will harden in place. The mixture should be designed to provide adequate strength to support pavement subgrades. The strength of the mixture should be limited to that which is excavatable.

Regardless of the method ultimately selected to backfill remedial excavations, the backfill will likely experience some magnitude of future settlement. Specifically, any backfill material used will likely have a density greater than what is currently in place. This added weight will result in consolidation settlement of the soft silts below the newly placed fill over a substantial period of time.

4.3.4 Physical Constraints

Excavations required to remove contaminated soils may be located in close proximity to existing buildings, and therefore potentially destabilizing them. The potential for destabilization depends on how the buildings currently derive vertical support. We have found no indication that the existing buildings are pile-supported, but some could be as the site has a long history of using timber piles to support various things. However, concerns with destabilizing buildings and utilities during past remedial excavations are documented, and therefore the buildings may not be pile supported.

Underpinning building foundations is often used to temporarily support building foundations in close proximity to excavations. Underpinning of building foundations for lightly loaded structures such as those at the Site can typically be achieved using driven, small diameter, steel pipe piles (pin piles) or helical piers. However, the feasibility of either of these methods (pin piles or helical piers) in areas of the Site that are

underlain primarily by wood waste at shallow depths is in question. Specifically, the depth (and therefore capacity) to which pin piles or helical anchors can be installed may be limited by the presence of wood waste. If temporary foundation support is deemed necessary, we recommend the feasibility of using pin piles or helical piers be further evaluated by installing test piles/piers at the site and conducting load testing. However, for preliminary purposes and rough order of magnitude cost estimates, an individual vertical capacity of 2 to 5 kips per pile may be assumed.

4.4 Shannon Slough Restoration

Our scope of services included preliminary evaluation of channel bank slope stability as related to potential future restoration of Shannon Slough. The maximum slope height expected for channel banks along Shannon Slough is about 15 feet, which occurs near the slough confluence with the Chehalis River. Assuming a maximum slope height of 15 feet, our slope stability analysis indicates channel bank slopes on the order of 4H:1V would provide a static factor of safety of about 1.4. Based on our review of topographic contours presented in MFA (2019), the existing channel banks appear to be sloped at about 3H:1V. Our slope stability analysis indicates a safety factor of about 1.1 for existing conditions. Where slope failures would not impact an existing or proposed structure, WSDOT recommends a minimum safety factor of 1.25. During a design seismic event, channel banks inclined at 4H:1V would likely experience deformation. As we do not expect future development in close proximity to the channel banks, we expect that mitigating potential seismic failures of the channel banks will not be considered necessary.

4.5 Future Development

We understand redevelopment at the site is intended to create a mixed-use, working waterfront that incorporates historic elements of Grays Harbor, and provides a homeport for both the Lady Washington and Hawaiian Chieftain tall ships. The highest priorities for development include conversion of the former Maintenance Shop into an educational/interpretive center, and development of a hotel on the site (EAE 2018). We understand the hotel and possibly restaurants or other similar attractions are planned for the western portion of the site.

Soil and groundwater conditions at the site present several geotechnical elements that will require consideration and evaluation during planning and design for future development of the Site. A general summary of identified elements is provided below.

- **Seismic Hazards:** The site is underlain by soils susceptible to liquefaction during a design seismic event. Liquefaction at the site will result in widespread, ground surface settlement. Liquefaction may also result in lateral displacement of the ground towards the Chehalis River (i.e. lateral spreading). Mitigation of liquefaction settlement hazards to buildings can be mitigated by supporting proposed buildings on deep pile foundations. The occurrence of lateral spreading, and the impacts and mitigation of lateral spreading will require additional work that is beyond the scope of this report.

- **Groundwater Conditions**: Groundwater exists at a relatively shallow depth below the existing ground surface at the site. A shallow groundwater table beneath the site will pose difficulties where excavations extended below the groundwater table.

- **Underground Obstructions**: Within the proposed future development areas, the site is underlain by a significant thickness of wood waste. Old timber piles also exist below the ground surface. The presence of wood waste and old timber piles may obstruct future pile foundations and proposed new underground utilities that extend through areas of wood waste and timber piles.

- **New Fill and Consolidation Settlement**: Placing new fill above existing site grades will initiate consolidation settlement. Settlement magnitudes could be significant and carry on for years.

Further discussion regarding the above-identified geotechnical elements is provided in the following section.

4.5.1 Seismic Hazards

Based on references cited in Section 3.1 above, we estimate that recent alluvial soils susceptible to liquefaction exist below the Site at depths ranging from roughly 30 to 120 feet below existing site grade. During an earthquake with adequate ground motions, a portion of the alluvial silts may liquify. The impacts of liquefaction will be widespread settlement of the ground surface and anything supported on the ground surface or in the liquefiable soils. The magnitude of settlement will depend on the strength of the earthquake. For a building code-based seismic design event, the ground surface could experience several inches of settlement.

For building foundations and slabs, liquefaction is typically mitigated by supporting buildings and slabs on pile foundations that extend through the liquefiable soils to more competent soils such as the Pliocene recessional outwash deposits expected below the recent alluvial soils. The risk of liquefaction damage to underground utilities, pavements, and other non-critical facilities is typically not mitigated. However, in some cases, for extremely critical structures such as hospitals, risk mitigation for certain critical infrastructure components may be warranted. Additionally, underground utilities carrying hazardous substances may be sensitive to liquefaction settlement. Where planned underground utilities connect to pile-supported buildings, flexible connections may be required.

The Site is bordered to the north by the Chehalis River. The channel banks of the river essentially create an underwater slope, or free face at the northern boundary of the Site. If liquefaction occurs, the non-liquefiable soils above the liquefiable soils can slide as intact blocks over the lower, liquified deposits resulting in surface displacements proceeding down-slope towards the free face. This lateral surface displacement towards a free face due to liquefaction is commonly referred to as lateral spreading.

Infrastructure located within a lateral spreading zone may experience damage, the magnitude of which is dependent on the magnitude of lateral deformation. Mitigation of lateral spreading impacts can be achieved by the following methods:

- Locating infrastructure outside the zone of lateral spreading.
- Ground improvement to mitigate liquefaction and therefore mitigate lateral spreading
- Isolate the infrastructure from lateral spreading by building structures such as underground retaining walls to support lateral spread zones.
- Design the infrastructure to resist the loads imposed by lateral spreading.

We suspect that lateral spreading at the Site is a hazard that will require consideration during design and planning of future development. However, additional analysis which is beyond the scope of our current services is required to further evaluate lateral spreading and options to mitigate it if necessary.

4.5.2 Construction Dewatering

The groundwater table at the Site is located at a relatively shallow depth below existing site grades. Excavations that extend below the groundwater table for installation of underground utilities or other improvements will experience high groundwater inflows. Dewatering excavations without groundwater cutoff of flow from the upper fill soils may be difficult as the fill materials within proposed development areas are expected to consist largely of wood waste with high permeability. To the extent feasible, we recommend underground utilities and other improvements be located above the groundwater table. If not feasible, other methods such as sheet pile cut off walls or ground freezing as discussed above should be considered.

If dewatering without cutoff is deemed feasible, the project team should be aware of dewatering-induced settlement risk. Lowering the groundwater table through construction dewatering will result in drawdown of the groundwater table outside of the excavation extents. This drawdown will result in ground settlement outside the areas of dewatering. The lateral extents and magnitude of settlement depend on the excavation depth and level of groundwater drawdown required to complete the excavation. For deeper excavations, the impacts could reach hundreds of feet. Mitigation of groundwater drawdown outside of excavation limits is feasible with recharge wells or trenches. However, the success of recharge wells may be variable and will be dependent on several factors.

4.5.3 Underground Obstructions

The presence of wood waste and existing timber piles may obstruct future work such as deep foundation construction (driven piles), ground improvement (liquefaction and lateral spreading mitigation), and other below grade improvements. Design and planning for future development at the site should consider the impacts of underground obstructions.

4.5.4 Consolidation Settlement

New fill placed above existing site grades will result in consolidation of the underlying soft alluvial silts and wood waste fill. Consolidation could result in significant ground settlement over a relatively short period of time followed by continued settlement over a long period of time. One particular example of local consolidation settlement that occurred at the Aberdeen waste water treatment plant is presented in Landau (2009). Landau (2009) reported the following:

> "A report by Shannon and Wilson…..indicates that about 5 ft of fill was placed on the adjacent wastewater treatment plant site during the original plant construction in 1959 and that it caused about 14 to 16 inches of (primary) settlement. The report also indicates that several inches of (secondary) settlement occurred in the 10 to 20 years following the 1959 construction."

The potential impacts of primary and secondary consolidation settlement can be mitigated by using a pre-load fill. Pre-loading consists of initially placing fill to raise a site to design grade, and then placing a thickness of temporary fill (pre-load fill) above design site grades in an effort to "squeeze out" a significant portion of the expected settlement. After the pre-load fill is placed, the site must lie dormant for a period of time, typically on the order of months. The pre-load settlement rate is often accelerated through the installation of vertical drainage elements called wick drains. Without wick drains at the Site, the duration of pre-load could be on the order of years.

5.0 CLOSURE

The conclusions presented in this report are based, in part, on relatively shallow explorations completed by ZGA at the site. For understanding deeper subsurface soil conditions, we relied exclusively on work completed by others. The conclusions in this report should be considered preliminary and conceptual in nature. As the project moves forward and the scope of work is better defined, we recommend additional geotechnical work be completed such as deep subsurface explorations, laboratory testing, and analysis.

This report has been prepared for the exclusive use of the Grays Harbor Historical Seaport. and their agents for specific application to the project discussed and has been prepared in accordance with generally accepted geotechnical engineering practices. No warranties, either express or implied, are intended or made.

APPENDIX A

SUBSURFACE EXPLORATIONS PROCEDURES AND LOGS

Our field exploration for this project included 9 borings advanced on December 4th and 5th, 2019. Approximate exploration locations are shown on the Site and Exploration Plan, Figure 1. Exploration locations were determined using a hand-held GPS device by a staff member of MFA and subsequently provided to ZGA. Exploration locations were also located in the field from existing site features with a fiberglass tape relative to a topographic map of the site, dated November 25th, 2019, prepared by Berglund, Schmidt & Associates. As such, the exploration locations should be considered accurate to the degree implied by the measurement method. The approximate ground surface elevation at each exploration location was determined by interpolating the information provided on the topographic plan. The following sections describe our procedures associated with the exploration. Descriptive logs of the explorations are enclosed in this appendix.

Soil Boring Procedures

Our exploratory borings were advanced with a hollow stem auger, using a track-mounted drill rig operated by an independent drilling firm working under subcontract to our firm. An engineering geologist from our firm continuously observed the borings, logged the subsurface conditions encountered, and obtained representative soil samples. All samples were stored in moisture-tight containers and transported to our laboratory for further visual classification and testing. After each boring was completed, the borehole was backfilled with bentonite and the surface was patched. Drilling equipment was decontaminated between each boring by the drilling contractor.

Throughout the drilling operation, soil samples were obtained at 2.5- to 5-foot depth intervals by means of the Standard Penetration Test (ASTM: D-1586). This testing and sampling procedure consists of driving a standard 2-inch outside diameter steel split spoon sampler 18 inches into the soil with a 140-pound hammer free falling 30 inches. The number of blows required to drive the sampler through each 6-inch interval is recorded, and the total number of blows struck during the final 12 inches is recorded as the Standard Penetration Resistance, or "blow count" (N value). If a total of 50 blows is struck within any 6-inch interval, the driving is stopped and the blow count is recorded as 50 blows for the actual penetration distance. The resulting Standard Penetration Resistance values indicate the relative density of granular soils and the relative consistency of cohesive soils.

The enclosed boring logs describe the vertical sequence of soils and materials encountered in each boring, based primarily upon our field classifications and supported by our subsequent laboratory examination and testing. Where a soil contact was observed to be gradational, our logs indicate the average contact depth. Where a soil type changed between sample intervals, we inferred the contact depth. Our logs also graphically indicate the blow count, sample type, sample number, and approximate depth of each soil sample obtained from the boring, as well as any laboratory tests performed on these soil samples. If any groundwater was encountered in a borehole, the approximate groundwater depth, and date of observation, is depicted on the log. Groundwater depth estimates are typically based on the moisture content of soil samples, the wetted portion of the drilling rods, the water level measured in the borehole after the auger has been extracted, or through the use of an observation well.

The boring logs presented in this appendix are based upon the drilling action, observation of the samples secured, laboratory test results, and field logs. The various types of soils are indicated as well as the depth where the soils or characteristics of the soils changed. It should be noted that these changes may have been gradual, and if the changes occurred between samples intervals, they were inferred.

APPENDIX B
LABORATORY TESTING PROCEDURES AND RESULTS

LABORATORY TESTING PROCEDURES

A series of laboratory tests were performed during the course of the this study to evaluate the index and geotechnical engineering properties of the subsurface soils. Descriptions of the types of tests performed are given below.

Visual Classification

Samples recovered from the exploration locations were visually classified in the field during the exploration program. Representative portions of the samples were carefully packaged in moisture tight containers and transported to our laboratory where the field classifications were verified or modified as required. Visual classification was generally done in accordance with the Unified Soil Classification system. Visual soil classification includes evaluation of color, relative moisture content, soil type based upon grain size, and accessory soil types included in the sample. Soil classifications are presented on the exploration logs in Appendix A.

Moisture Content Determinations

Moisture content determinations were performed on representative samples obtained from the exploration in order to aid in identification and correlation of soil types. The determinations were made in general accordance with the test procedures described in ASTM: D-2216. The results are shown on the exploration logs in Appendix A.

Atterberg Limits

Atterberg limits are used primarily for classification and indexing of cohesive soils. The liquid and plastic limits are two of the five Atterberg limits and are defined as the moisture content of a cohesive soil at arbitrarily established limits for liquid and plastic behavior, respectively. Liquid and plastic limits were established for selected samples in general accordance with ASTM: D-423 and ASTM: D-424, respectively. The results of the Atterberg limits are presented on a plasticity chart in this appendix where the plasticity index (liquid limit minus plastic limit) is related to the liquid limit. The plastic limits and liquid limits are also presented adjacent to appropriate samples on the exploration logs in Appendix A.

GROUNDWATER—SURFACE WATER INTERACTION LETTER

December 12, 2022
Project No. M1044.02.013

Tom Middleton, LHG
Washington State Department of Ecology
PO Box 47775
Olympia, Washington 98504-7775

Re: Seaport Landing Groundwater-Surface Water Interactions

Dear Tom Middleton:

On behalf of Grays Harbor Historical Seaport Authority, Maul Foster & Alongi, Inc. (MFA), has prepared this report evaluating groundwater and surface water interactions at the Seaport Landing property, formerly the Weyerhaeuser Sawmill Aberdeen, located at 500 N Custer Street in Aberdeen, Washington (the Site; see Figure 1-2 of the remedial investigation [RI] report, to which this report is an appendix). The data were collected to support the RI of the Site, required by the Washington State Department of Ecology Agreed Order DE 15953, dated March 28, 2019. This investigation was conducted in order to characterize the flow regime of shallow site groundwater and evaluate interactions between groundwater and tidally influenced surface water at the Site. This report is an Appendix to the *Upland Remedial Investigation Report, Weyerhaeuser Sawmill Aberdeen/Seaport Landing*, (RI report) for the Site.

BACKGROUND

The Site is located approximately two miles upriver from Grays Harbor, along the alluvial meander plain of the Chehalis River. The Site includes approximately 23.6-acres of upland property, which is owned by Grays Harbor Historical Seaport Authority, and the adjacent approximately 16.9-acres of tidelands in the Chehalis River, which are leased from the Washington State Department of Natural Resources. The primary surface water body in the vicinity of the Site is the Chehalis River, which flows to the west along the northern portion of the Site. The Chehalis River is tidally connected to Grays Harbor and the Pacific Ocean, resulting in a mixed semidiurnal tidal regime (i.e., two different high and two different low tides per lunar day). The shoreline of the river curves inward near the western end of the Site forming a pocket beach (see Figure 1-2 of the RI report). Shannon Slough flows along the southern and eastern portion of the Site, through a culvert and tide gate prior to entering the Chehalis River at an embayment in the upstream corner of the Site.

Depth to groundwater in the upland areas of the Site is approximately 4 to 5 feet below ground surface. Based on preliminary water level data, groundwater on the western portion of the Site generally flows toward the Chehalis River and may be tidally influenced. Groundwater flow on the eastern portion of the Site is toward Shannon Slough. A 2010 investigation determined that

water originating from seeps in the pocket beach area had a different chemical signature than Chehalis River water, suggesting that the seeps are more consistent with Site groundwater and do not represent bank storage of river water inundated during high tide (Floyd Snider 2010).

PROCEDURES

On December 27, 2019, in accordance with the *Upland RI Work Plan (RIWP)*, VanEssen Instruments CTD-Diver non-vented pressure transducers were installed in ten monitoring wells (five newly installed and five existing wells) across the Property and in a staff gauge on the downstream end of the wharf (Figure 1) (MFA 2019). The pressure transducer network consisted of a north-south transect of six monitoring wells approximately perpendicular to the Chehalis River in the west-center of the Site as well as four monitoring wells along the south and east boundaries of the Site to provide a site-wide indication of groundwater fluctuations. The location RAU4-03 was proposed to be part of the pressure transducer network under the RIWP; however, it was not completed as a monitoring well due to a lack of groundwater in the boring to a depth of approximately 15 feet below ground surface. The next closest boring, RAU4-12, was completed as a monitoring well with a pressure transducer in lieu of RAU4-03.

The pressure transducers operated from December 27, 2019, to May 3, 2021, monitoring the water level elevations, conductivity, and temperature in 15-minute intervals. Water levels were manually collected at three monitoring wells where pressure transducers were not installed (D-05, D-07, and D-09) (Figure 1). Monitoring wells D-01 and D-06 were originally scoped to be included for manual measurement under the RIWP; however, the well monuments were unable to be opened in the field. Locations where transducer data and manual water level measurements were collected are documented in Table 1. Data from the pressure transducers were downloaded in conjunction with the collection of manual water level measurements with an electronic well sounding (water level) probe on December 27, 2019; February 12, 2020; May 26, 2020; July 21, 2020; November 9, 2020; and May 3, 2021. Transducer data were corrected for barometric pressure using data collected from a barometric pressure logger placed on the Site, using Van Essen Instruments Diver-Office software.

DATA EVALUATION

Comparison of Manual and Transducer Water Level Data

The manual water level measurements were compared against the readings from the pressure transducers to verify the accuracy of the continuous monitoring data. Manual water level measurements are provided in Table 2, and hydrographs showing manual and transducer water level elevations are provided in Figures 2a through 2j. Generally, the manual measurements matched closely with the water level elevations recorded by the pressure transducer. Consistent discrepancies between the manual and transducer water levels occurred in three monitoring wells:

- **D-02.** Manual water levels at monitoring well D-02 were consistently approximately 1 foot lower than the water levels measured by the pressure transducer, with the exception of the final manual measurement collected on May 3, 2021, which was within 0.01 feet of the transducer measurement.
- **D-03.** Manual water level measurements at monitoring well D-03 were consistently approximately 0.6 feet higher than the water levels measured by the pressure transducer, with the exception of the final measurement collected on May 3, 2021, which was approximately 0.5 feet lower than the corresponding transducer measurement.
- **RAU3-03.** Manual water level measurements at monitoring well RAU3-03 were consistently lower than the water levels measured by the pressure transducer. Manual water levels ranged from approximately 0.5 to 1 foot lower than the corresponding transducer measurements.

All three wells are located in the uplands within approximately 200 feet of each other and are among the monitoring wells with the highest water level elevations. It is unclear what accounts for the discrepancy between manual and transducer water level measurements at these three wells. MFA considered and eliminated the following potential explanations for the discrepancies:

- MFA evaluated the possibility that small temporal differences between manual and transducer measurements (typically less than 15 minutes) could be associated with true changes in water level elevations as the result of tidal or other fluctuations. This was determined not the be the cause of the discrepancies because the three wells are located relatively far upland, away from the Chehalis River, and no tidal signal or other rapid water level fluctuations were observed at these locations.
- MFA confirmed the parameters used to convert transducer pressure readings to water level elevations were correct, including top of casing elevations and barometric pressure readings from the on-site barometric pressure logger.
- MFA consulted with the instrument manufacturer, Van Essen Instruments, which confirmed that the discrepancies were not the result of systematic instrument error, and that barometric pressure compensation was performed correctly.
- MFA reviewed field data logs and consulted with field staff to evaluate the potential for erroneous or anomalous manual water level measurements. Measurements at D-02, D-03, and RAU3-03 were collected using the same instruments and procedures as other monitoring wells where no discrepancies were observed. No anomalies were observed in the field at these wells that would distinguish them from other monitoring wells on site.

To evaluate the implications of the discrepancy between manual and transducer water level measurements, the groundwater potentiometric surface from July 21, 2020, was generated using both manual measurements and transducer data (Figures 3 and 4), and the surfaces were compared. Variations between the potentiometric surfaces generated using manual and transducer data are limited to the area surrounding D-02, D-03, RAU3-03, and D-09. The potentiometric surface generated by manual water level measurements shows an area of apparent groundwater mounding which peaks around monitoring well D-09 (where water levels were only measured manually), whereas the potentiometric surface generated by transducer data shows an area of mounding around monitoring well D-02. The slope of the hydraulic gradient radiating away from this area of apparent groundwater mounding is steeper in the manual data set. These variations are relatively minor and do not result in different interpretations of groundwater flow directions or the direction of the hydraulic gradient between site groundwater and the Chehalis River. Because no source of error associated with transducer measurements was apparent, and because the discrepancies between manual and transducer measurements do not result in conflicting interpretations of groundwater flow directions, MFA proceeded with evaluation of transducer data from monitoring wells D-02, D-03, and RAU3-03 as described below.

Groundwater Discharge

MFA prepared potentiometric surface maps and hydrographs to evaluate patterns of groundwater flow directions and discharge to surface water.

Transducer data were used to generate potentiometric surfaces for high and low tide conditions during four different periods to evaluate tidal and seasonal variations in groundwater flow (Figures 4 through 11). Transducer data were used rather than manual measurements because transducer data allowed for generation of potentiometric surfaces based on simultaneous data, which avoids inconsistencies associated with tidal fluctuations in water levels and corresponded more closely with the times of highest and lowest tide conditions.

At low tide, the Chehalis River lies approximately nine to twelve feet lower than the groundwater elevation observed in the ten monitoring wells with transducers. Groundwater potentiometric surface contour maps based on the transducer data at low tide show that groundwater flows out from an area of apparent groundwater mounding at the center of the property roughly centered at or near monitoring well D-02. Groundwater north and northeast of this area flows north toward the bank of the Chehalis River. Groundwater west of this area flows west toward the inlet in the Chehalis River west of the wharf. Groundwater east and south of this area flows east toward Shannon Slough, which then discharges to the Chehalis River. Water levels were highest in fall and winter, and lowest in summer (Figures 5, 7, 9, and 11).

At high tide, the elevation of the Chehalis River rises 11 to 12 feet above the low tide elevation with the highest high tide in the fall at 9.67 feet North American Vertical Datum of 1988 (NAVD 88) and the lowest in the spring at 8.25 feet NAVD 88. The hydraulic gradient at the Site is less steep during high tides than low tides, but the groundwater flow pattern remains the same, with groundwater flowing away from area of apparent groundwater mounding to the north, west, and east and discharging to the Chehalis River and Shannon Slough (Figures 4, 6, 8, and 10).

A hydrograph displaying water levels for the Chehalis River and each monitoring well equipped with a transducer is provided in Figure 12. The elevation of the Chehalis River fluctuates from approximately -4 to 10 feet NAVD 88 based on tidal cycles. Groundwater elevations measured at monitoring wells generally range from approximately 8 to 12 feet NAVD 88. Water level elevations are slightly lower at the two monitoring wells closest to the riverbank (i.e., RAU2-08 and RAU4-12). Groundwater elevations range from approximately 6 feet to 9 feet NAVD 88 at RAU2-08 and from approximately 3 feet to 6 feet NAVD 88 at RAU4-12. In general, the hydrograph suggests that groundwater is generally upgradient from the surface water, but there may be temporary reversals of the gradient when tidal fluctuations result in surface water levels that are higher than groundwater levels at the riverbank.

Because tidal fluctuations are present in the Chehalis River, pressure waves generated by the tidal fluctuations propagate upland in groundwater. As a result, groundwater levels fluctuate with tidal cycles to varying degrees and at varying times based on distance from the Chehalis River. These fluctuations in groundwater and surface water levels result in a situation in which individual sets of water level measurements cannot fully characterize groundwater levels. Synoptic measurements, including the transducer measurements used to produce the potentiometric surfaces discussed above, are useful for evaluating groundwater flow at individual points in time, but do not capture the net effect of tidal fluctuations on hydraulic gradients and groundwater flow. To evaluate the mean hydraulic gradient between upland monitoring wells and the Chehalis River, MFA calculated averaged water levels for the Chehalis River and each monitoring well using the Serfes filtering method, which uses a rolling average calculation of 71 consecutive hourly measurements to filter out all diurnal and semidiurnal lunar and solar harmonics from the data set (Serfes 1991).

The Serfes averaged data are plotted in Figures 13a through 13j. This data set confirms that mean groundwater elevations are consistently above the mean surface water elevations at all monitoring wells, with the exception of RAU4-12. At most monitoring wells, the averaged groundwater elevations are approximately 5 to 6 feet above the averaged Chehalis River water elevations throughout the year. Monitoring well RAU2-08 is located approximately 60 feet upland from the Chehalis River, and averaged groundwater levels were approximately 3 feet above averaged Chehalis River water elevations throughout the year (Figure 13e). These data confirm that the net direction of groundwater flow is from the uplands to the Chehalis River,

that groundwater is discharging to surface water throughout the Site, and temporary reversals of the hydraulic gradient at the riverbank are unlikely to result in significant flow of water from the Chehalis River into site groundwater.

Unlike averaged water levels at other monitoring wells, averaged water levels at RAU4-12 were consistently 3 to 6 feet lower than averaged water levels at other monitoring wells on the Site, typically within a few inches of Chehalis River water levels, and, at some times, were slightly lower than Chehalis River water levels (Figure 13h). RAU4-12 is located approximately 65 feet upland of Shannon Slough, adjacent to the tide gate. The tide gate is fitted to the culvert at the outlet of Shannon Slough to prevent backflow of water up Shannon Slough at high tide. When the tide gate is closed, the water level in Shannon Slough is a product of water from upland sources pooling behind the tide gate. Shannon Slough is able to drain back into the Chehalis River when the water level in the river is below the tide gate at 4.35 feet NAVD 88, which occurs approximately half the time. Although no water levels are available for any location in Shannon Slough, the water levels downstream of the tide gate, in the vicinity of RAU4-12, likely closely correspond to the water levels in the Chehalis River. Although this setting is hydraulically complex, the averaged water level data from RAU4-12 indicate that groundwater at this location is in close hydraulic connection with surface water in the adjacent Shannon Slough.

Groundwater-Surface Water Interaction Zone

To evaluate groundwater surface water interactions, MFA identified a 48-hour period during each season and performed a detailed evaluation of data logged by the transducers at each monitoring location, including water level elevations, conductivity, and temperature. These data are presented in Attachment A. Each figure includes both time series plots and box plots of the data from a monitoring well and from the Chehalis River, allowing for direct comparison of conditions in surface water and groundwater over the 48-hour period.

Water Levels

The majority of the monitoring wells do not display an observable tidal signal over any of the 48-hour periods reviewed. Monitoring wells D-02, D-03, D-04E, D-08, RAU3-03, and RAU6-02 show minor changes in water levels over each 48-hour period (typically less than 0.2 foot) that do not correspond with tidal patterns. In contrast, RAU2-08 and RAU2-09, which are the wells closest to the river in the western portion of the Site, clearly reflect a tidal signal with a 0.6-to-2-foot increase in elevation at high tide. The tidal response diminishes with distance from the river, which is typical in groundwater adjacent to tidally influenced surface water bodies. At RAU2-08, the tidal signal closely follows the period and pattern of the Chehalis River tidal signal (see Attachment A of this report, Figures A-6, A-17, A-28, and A-39). At RAU2-09, the tidal signal occurs at half the frequency of the Chehalis River tidal signal, and fluctuations at RAU2-09 appear to correspond with only the higher of the two mixed

semidiurnal high tides that occur in the Chehalis River (see Attachment A, Figures A-7, A-18, A-29, and A-40).

Monitoring well RAU4-12 is adjacent to Shannon Slough, immediately upstream of the confluence of Shannon Slough and the Chehalis River and downstream of the tide gate on Shannon Slough. At RAU4-12, there is a clear tidal signal in the water levels; however, the amplitude of the tidal fluctuations is relatively low, with only approximately 0.3 to 0.5 feet of elevation change observed over each tidal cycle (Figures A-9, A-20, A-31, and A-42). Finally, at monitoring well RAU4-UNK, a small tidal signal, with approximately 0.1 to 0.2 feet of elevation change, is apparent during the December and October periods, but not in April and July (Figures A-10, A-21, A-32, and A-43).

The box plots indicate that water level elevations at most monitoring wells are either above the range of water level elevations observed in the Chehalis River or within the upper quartile of water level elevations observed in the Chehalis River. The only monitoring well where mean water level elevations are within the box representing the second and third quartiles of Chehalis River water levels is RAU4-12, where water level elevations are three to six feet lower than other monitoring wells on the Site (Figures A-9, A-20, A-31, and A-42).

Combined, these water level data indicate that the propagation of the Chehalis River tidal signature into upland groundwater is limited to monitoring wells within approximately 65 feet of the riverbank. This tidal signal is propagated by changes in water pressure rather than advection of surface water into upland groundwater (Serfes 1991), and is not an indication of bank storage of surface water.

Conductivity

Evaluation of conductivity is particularly relevant to the assessment of groundwater-surface water interactions at the Site because the Chehalis River is closely connected to Grays Harbor and the Pacific Ocean, and, as a result, has large fluctuations in conductivity associated with influxes of saline seawater during each tidal cycle. As shown in Figures A-1, A-12, A-23, and A-34, conductivity of the Chehalis River fluctuates between close to 0 microSiemens per centimeter (uS/cm) to almost 35,000 uS/cm, which is a typical value for conductivity in seawater off the coast of Washington state (Tyler et al. 2017). These fluctuations in conductivity correspond with tidal fluctuations, providing a distinct signal associated with Chehalis River water.

As shown in Figures A-1, A-12, A-23, and A-34, most of the monitoring wells on the Site have comparatively low conductivity relative to the range observed in the Chehalis River, typically ranging between 100 and 1,000 uS/cm. Three of the wells stand out with much higher conductivity values relative to conductivity values for most other monitoring wells during all four seasons.

- **RAU2-08** shows elevated conductivity in all four 48-hour periods evaluated, with the lowest conductivity levels in April between approximately 8,000 to 10,000 uS/cm and the highest conductivity measurements in October at approximately 30,000 uS/cm (Figures A-6, A-17, A-28, and A-39).

- **RAU2-09** shows a similar pattern, with elevated conductivity levels during all four seasons. October had the highest conductivity levels of the four 48-hour periods evaluated, with conductivity ranging from approximately 29,700 uS/cm to approximately 29,200 uS/cm. April had the lowest conductivity levels of the four 48-hour periods evaluated, with measurements ranging from approximately 7,000 uS/cm to approximately 7,400 uS/cm (Figures A-7, A-18, A-29, and A-40).

- **RAU4-12** has consistently elevated conductivity levels relative to most monitoring wells on the Site, but lower conductivity levels than RAU2-08 and RAU2-09. Like RAU2-08 and RAU2-09, the lowest conductivity levels at RAU4-12 occurred in April at approximately 6,800 uS/cm. The highest conductivity levels were present at RAU4-12 in December at approximately 8,100 uS/cm (Figures A-9, A-20, A-31, and A-42).

The monitoring wells with comparatively elevated conductivity levels are the three monitoring wells closest to surface water bodies adjoining the Site. RAU2-08 is approximately 60 feet upland of the Chehalis River, RAU2-09 is approximately 60 feet upland of the Chehalis River pocket beach, and RAU4-12 is approximately 65 feet upland of Shannon Slough. These locations suggest that the elevated conductivity in groundwater at these monitoring wells is the result of interaction with adjacent surface water. This is consistent with the fact that the highest conductivity levels measured at RAU2-08 and RAU2-09 are similar to the highest conductivity levels in Chehalis River water, while the highest conductivity levels at RAU4-12 are much lower (approximately 8,000 uS/cm compared to 30,000 uS/cm). No conductivity data are available for the Shannon Slough, but the freshwater discharge from Shannon Slough is expected to dilute the Chehalis River water, resulting in much lower conductivity levels in the vicinity of RAU4-12.

Unlike the Chehalis River, none of the monitoring wells with elevated conductivity levels shows periodic fluctuations in conductivity associated with tidal influxes of saline water from Grays Harbor. This suggests that the elevated conductivity in groundwater adjacent to surface water bodies is more likely the result of ongoing chemical dispersion and diffusion than advection of surface water into upland groundwater.

Temperature

Chehalis River temperatures fluctuate periodically with tidal patterns. In October and December, the Chehalis River is warmer at high tide and colder at low tide. Conversely, in April

and July, the Chehalis River is colder at high tide, warmer at low tide. Overall Chehalis River temperatures are highest in July and lowest in December.

Unlike surface water, there are no periodic fluctuations observed in groundwater temperatures in any monitoring wells at the Site, with the exception of RAU2-08 in the month of April (Figure A-17) and RAU2-09 in the month of July (Figure A-29). Generally, groundwater temperatures are higher than surface water temperatures during October and December, and lower than surface water temperatures in April and July. Groundwater temperatures are consistent and distinct from surface water temperatures, suggesting that the physical advection of surface water into upland groundwater—or mixing of surface water and groundwater—is limited at all upland monitoring wells, including wells adjacent to the Chehalis River and Shannon Slough.

At monitoring well RAU2-08 during the April 48-hour evaluation period, groundwater temperatures are consistently lower than surface water temperatures, but appear to temporarily increase at times that correspond with high tides. At monitoring well RAU2-09 during the July 48-hour evaluation period, groundwater temperatures are consistently approximately 13 degrees Celsius, but rise rapidly to 14.2 degrees Celsius at high tide, which is approximately the same temperature as Chehalis River surface water at high tide. These data indicate that, at these locations adjacent to the Chehalis River, there may be seasonal conditions that facilitate physical mixing of surface water and groundwater for limited portions of the year.

CONCLUSIONS

Groundwater at the Site discharges to surface water. Groundwater in the northern and northwestern portion of the Site discharges directly to the Chehalis River. Groundwater in the southern and southeastern portion of the Site discharges to Shannon Slough, which flows into the Chehalis River at the northeastern corner of the Site.

Multiple lines of evidence indicate that significant interaction between surface water and groundwater are limited to three monitoring wells: RAU2-08, RAU2-09, and RAU4-12. RAU2-08 and RAU2-09 are immediately adjacent to the Chehalis River, while RAU4-12 is immediately adjacent to the Shannon Slough. Water levels in all three of these monitoring wells display periodic tidal fluctuations that reflect patterns observed in the Chehalis River. Conductivity measurements at these three wells are substantially elevated relative to other monitoring wells on the Site and are within the range of conductivity levels observed in the Chehalis River. The available data, including temperature data, indicate that groundwater-surface water interactions at these three monitoring wells are dominated by processes including chemical dispersion and diffusion, and propagation of pressure waves upland from fluctuating hydraulic head in the Chehalis River. The data suggest that physical advection of surface water into upland

groundwater, driven by temporary reversals of the hydraulic gradient, is very limited both spatially and seasonally.

Although the data indicate that there is some interaction between surface water and groundwater at monitoring wells located immediately adjacent to the Chehalis River, the concentrations of contaminants measured at these wells are representative of groundwater and are therefore most appropriately compared to groundwater screening levels. No substantial physical advection of surface water onto the uplands is occurring. Substantial groundwater and surface water mixing only occurs when groundwater discharges to the Chehalis River or Shannon Slough, where the volume of groundwater discharged is a small portion of the total water volume. Even at monitoring wells where there is evidence of groundwater-surface water interactions, surface water screening levels are inappropriate for drawing risk conclusions, because groundwater samples are not representative of surface water conditions.

Sincerely,

Maul Foster & Alongi, Inc.

Data Source
Aerial photograph obtained from Esri ArcGIS Online.

Notes
Manual groundwater level monitoring from wells was conducted from 4:15 p.m. to 5:45 p.m. At this time, the Chehalis River was ebb tide. On July 21, 2020, high tide was 9.2 feet above sea level at 3:24 p.m. and low tide was 2.8 feet above sea level at 8:38 p.m. At 5:00 p.m., Chehalis River was approximately 7 feet above sea level.
ft = feet.
NAVD88 = North American Vertical Datum of 1988.
NS = not sampled.

APPENDIX F

SIMPLIFIED TERRESTRIAL ECOLOGICAL EVALUATION

MEMORANDUM

To:	Tom Middleton, LHG Washington State Department of Ecology	Date:	April 1, 2022
From:	Phil Wiescher, PhD Emily Hess, LHG	Project No.:	M1044.02.013

RE: Final Simplified Terrestrial Ecological Evaluation
Weyerhaeuser Sawmill Aberdeen/Seaport Landing Site
Ecology Cleanup Site ID 4987, Agreed Order ID 11225

On behalf of Grays Harbor Historical Seaport Authority, Maul Foster & Alongi, Inc., has prepared this terrestrial ecological evaluation (TEE) for the upland portions of the Weyerhaeuser Sawmill Aberdeen/Seaport Landing Site (the Site), following the procedures outlined in Washington Administrative Code (WAC) 173-340-7490 through 173-340-7492. The Site is listed on the Washington Department of Ecology's database as Facility Site ID 1126/Cleanup Site ID 4987.

The TEE process is required at all Model Toxics Control Act sites where there has been a release or threatened release of a hazardous substance that may pose a threat to human health or the environment. The TEE procedure is structured with the intent of protecting terrestrial wildlife at industrial and commercial sites and protecting terrestrial plants, soil biota, and terrestrial wildlife at other sites, as provided under WAC 173-340-7490(3)(b). The purpose of this TEE is to present information to evaluate the ecological protectiveness of current and future conditions at the Site (see WAC 173-340-7490(1)(b)).

A TEE form documenting and summarizing the evaluation steps is provided as Attachment A. A simplified TEE exposure analysis procedure was conducted using Table 749-1 (Attachment B). The attached table is a modified version of Table 749-1 that provides the rationale of the scores entered on Attachment B. The attached figure estimates the area of contiguous undeveloped land on the Site.

Based on the evaluation, the Site qualifies for a simplified TEE because current or planned land use makes wildlife exposure unlikely (WAC 173-340-7492[2][a]). The simplified TEE analysis indicates the Site does not have a substantial potential for posing a threat of significant adverse effects to terrestrial ecological receptors and may be removed from further ecological consideration during the remedial investigation and cleanup process. Therefore, as part of the remedial investigation being conducted for the Site as required by Agreed Order ID 11225, soil cleanup level development will not include TEE ecological indicator concentrations.

ATTACHMENTS

Table
Figure
Attachment A – Terrestrial Ecological Evaluation Form
Attachment B – Table 749-1: Simplified Terrestrial Ecological Evaluation-Exposure Analysis Procedure

TABLE

Table
Simplified TEE Scoresheet
Grays Harbor Historical Seaport Authority Site
Aberdeen, Washington

Line Number	Scoring Parameters	Score	Rationale
1	Estimate the area of contiguous (connected) undeveloped land on the site or within 500 feet of any area of the site to the nearest 1/2 acre (1/4 acre if the area is less than 0.5 acre). From the table below, find the number of points corresponding to the area and enter this number in the field to the right. Area (acres) Points 0.25 or less 4 0.5 5 1.0 6 1.5 7 2.0 8 2.5 9 3.0 10 3.5 11 4.0 or more 12	8	The total area of contiguous undeveloped land associated with the site is approximately 1.79 acres (see figure).
2	Is this an industrial or commercial property? If yes, enter a score of 3. If no, enter a score of 1.	3	The site is zoned as industrial.
3	Enter a score in the box to the right for the habitat quality of the site, using the following rating system: High=1, Intermediate=2, Low=3.	3	The site is highly developed. Undeveloped areas of the site are primarily ruderal vegetation and grasses. According to the Critical Areas Report prepared by Grette Associates in 2019, there are no records of rare plants or high quality native ecosystems occurring on or in the vicinity of the property.
4	Is the undeveloped land likely to attract wildlife? If yes, enter a score of 1 in the box to the right. If no, enter a score of 2.	2	Habitat quality at the property is low and is surrounded by active industrial/residential development. There is much suitable habitat for urban wildlife to the east of the site on less developed, previous industrial land and directly north on undeveloped land across the Chehalis River.
5	Are any of the following soil contaminants present: chlorinated dioxins/furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, pentachlorobenzene? If yes, enter a score of 1 in the box to the right. If no, enter a score of 4.	1	Chlorinated dioxins/furans, PCB mixtures, and pentachlorophenol have been detected in soil in the upland portion of the site.
Add the numbers in the boxes on lines 2–5 and enter this number in the box to the right. If this number is larger than the number in the box on line 1, the simplified evaluation may be ended.		9	Simplified evaluation ended. Total score exceeds 8.

NOTES:
Table adapted from Model Toxics Control Act Table 749-1.
PCB = polychlorinated biphenyl.
TEE = terrestrial ecological evaluation.

TERRESTIAL ECOLOGICAL EVALUATION FORM

Voluntary Cleanup Program

Washington State Department of Ecology
Toxics Cleanup Program

TERRESTRIAL ECOLOGICAL EVALUATION FORM

Under the Model Toxics Control Act (MTCA), a terrestrial ecological evaluation is necessary if hazardous substances are released into the soils at a Site. In the event of such a release, you must take one of the following three actions as part of your investigation and cleanup of the Site:

1. Document an exclusion from further evaluation using the criteria in WAC 173-340-7491.
2. Conduct a simplified evaluation as set forth in WAC 173-340-7492.
3. Conduct a site-specific evaluation as set forth in WAC 173-340-7493.

When requesting a written opinion under the Voluntary Cleanup Program (VCP), you must complete this form and submit it to the Department of Ecology (Ecology). The form documents the type and results of your evaluation.

Completion of this form is not sufficient to document your evaluation. You still need to document your analysis and the basis for your conclusion in your cleanup plan or report.

If you have questions about how to conduct a terrestrial ecological evaluation, please contact the Ecology site manager assigned to your Site. For additional guidance, please refer to https://ecology.wa.gov/Regulations-Permits/Guidance-technical-assistance/Terrestrial-ecological-evaluation.

Step 1: IDENTIFY HAZARDOUS WASTE SITE	
Please identify below the hazardous waste site for which you are documenting an evaluation.	
Facility/Site Name: Weyerhaeuser Sawmill Aberdeen/Seaport Landing	
Facility/Site Address: 500 N Custer St, Aberdeen, WA 98520	
Facility/Site No: 1126	VCP Project No.: N/A

Step 2: IDENTIFY EVALUATOR			
Please identify below the person who conducted the evaluation and their contact information.			
Name: Emily Hess, LHG		Title: Project Hydrogeologist	
Organization: Maul Foster & Alongi, Inc.			
Mailing address: 109 E 13th Street			
City: Vancouver		State: WA	Zip code: 98660
Phone: (360) 433-0244	Fax:	E-mail: ehess@maulfoster.com	

Step 3: DOCUMENT EVALUATION TYPE AND RESULTS

A. Exclusion from further evaluation.

1. Does the Site qualify for an exclusion from further evaluation?

☐ Yes *If you answered **"YES,"** then answer **Question 2**.*

☒ No or Unknown *If you answered **"NO" or "UNKNOWN,"** then skip to **Step 3B** of this form.*

2. What is the basis for the exclusion? *Check all that apply. Then skip to **Step 4** of this form.*

Point of Compliance: WAC 173-340-7491(1)(a)

☐ All soil contamination is, or will be,* at least 15 feet below the surface.

☐ All soil contamination is, or will be,* at least 6 feet below the surface (or alternative depth if approved by Ecology), and institutional controls are used to manage remaining contamination.

Barriers to Exposure: WAC 173-340-7491(1)(b)

☐ All contaminated soil, is or will be,* covered by physical barriers (such as buildings or paved roads) that prevent exposure to plants and wildlife, and institutional controls are used to manage remaining contamination.

Undeveloped Land: WAC 173-340-7491(1)(c)

☐ There is less than 0.25 acres of contiguous[#] undeveloped[±] land on or within 500 feet of any area of the Site and any of the following chemicals is present: chlorinated dioxins or furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, heptachlor epoxide, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, or pentachlorobenzene.

☐ For sites not containing any of the chemicals mentioned above, there is less than 1.5 acres of contiguous[#] undeveloped[±] land on or within 500 feet of any area of the Site.

Background Concentrations: WAC 173-340-7491(1)(d)

☐ Concentrations of hazardous substances in soil do not exceed natural background levels as described in WAC 173-340-200 and 173-340-709.

* An exclusion based on future land use must have a completion date for future development that is acceptable to Ecology.

[±] "Undeveloped land" is land that is not covered by building, roads, paved areas, or other barriers that would prevent wildlife from feeding on plants, earthworms, insects, or other food in or on the soil.

[#] "Contiguous" undeveloped land is an area of undeveloped land that is not divided into smaller areas of highways, extensive paving, or similar structures that are likely to reduce the potential use of the overall area by wildlife.

B. Simplified evaluation.

1. Does the Site qualify for a simplified evaluation?

☒ Yes *If you answered **"YES,"** then answer **Question 2** below.*

☐ No or Unknown *If you answered **"NO"** or **"UNKNOWN,"** then skip to **Step 3C** of this form.*

2. Did you conduct a simplified evaluation?

☒ Yes *If you answered **"YES,"** then answer **Question 3** below.*

☐ No *If you answered **"NO,"** then skip to **Step 3C** of this form.*

3. Was further evaluation necessary?

☐ Yes *If you answered **"YES,"** then answer **Question 4** below.*

☒ No *If you answered **"NO,"** then answer **Question 5** below.*

4. If further evaluation was necessary, what did you do?

☐ Used the concentrations listed in Table 749-2 as cleanup levels. *If so, then skip to **Step 4** of this form.*

☐ Conducted a site-specific evaluation. *If so, then skip to **Step 3C** of this form.*

5. If no further evaluation was necessary, what was the reason? *Check all that apply. Then skip to **Step 4** of this form.*

Exposure Analysis: WAC 173-340-7492(2)(a)

☐ Area of soil contamination at the Site is not more than 350 square feet.

☒ Current or planned land use makes wildlife exposure unlikely. Used Table 749-1.

Pathway Analysis: WAC 173-340-7492(2)(b)

☐ No potential exposure pathways from soil contamination to ecological receptors.

Contaminant Analysis: WAC 173-340-7492(2)(c)

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 15 feet at concentrations that exceed the values listed in Table 749-2.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 6 feet (or alternative depth if approved by Ecology) at concentrations that exceed the values listed in Table 749-2, and institutional controls are used to manage remaining contamination.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 15 feet at concentrations likely to be toxic or have the potential to bioaccumulate as determined using Ecology-approved bioassays.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 6 feet (or alternative depth if approved by Ecology) at concentrations likely to be toxic or have the potential to bioaccumulate as determined using Ecology-approved bioassays, and institutional controls are used to manage remaining contamination.

C. Site-specific evaluation. A site-specific evaluation process consists of two parts: (1) formulating the problem, and (2) selecting the methods for addressing the identified problem. Both steps require consultation with and approval by Ecology. *See* WAC 173-340-7493(1)(c).

1. Was there a problem? *See* WAC 173-340-7493(2).

☐ Yes *If you answered **"YES,"** then answer **Question 2** below.*

☐ No *If you answered **"NO,"** then identify the reason here and then skip to **Question 5** below:*

- ☐ No issues were identified during the problem formulation step.
- ☐ While issues were identified, those issues were addressed by the cleanup actions for protecting human health.

2. What did you do to resolve the problem? *See* WAC 173-340-7493(3).

- ☐ Used the concentrations listed in Table 749-3 as cleanup levels. *If so, then skip to **Question 5** below.*
- ☐ Used one or more of the methods listed in WAC 173-340-7493(3) to evaluate and address the identified problem. *If so, then answer **Questions 3 and 4** below.*

3. If you conducted further site-specific evaluations, what methods did you use?
Check all that apply. See WAC 173-340-7493(3).

- ☐ Literature surveys.
- ☐ Soil bioassays.
- ☐ Wildlife exposure model.
- ☐ Biomarkers.
- ☐ Site-specific field studies.
- ☐ Weight of evidence.
- ☐ Other methods approved by Ecology. If so, please specify:

4. What was the result of those evaluations?

- ☐ Confirmed there was no problem.
- ☐ Confirmed there was a problem and established site-specific cleanup levels.

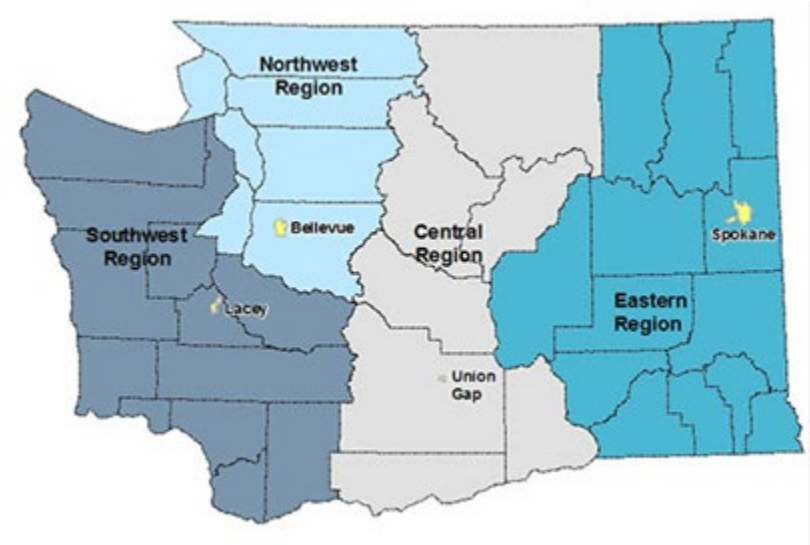
5. Have you already obtained Ecology's approval of both your problem formulation and problem resolution steps?

☐ Yes If so, please identify the Ecology staff who approved those steps:

☐ No

Step 4: SUBMITTAL

Please mail your completed form to the Ecology site manager assigned to your Site. If a site manager has not yet been assigned, please mail your completed form to the Ecology regional office for the County in which your Site is located.



Northwest Region: Attn: VCP Coordinator 3190 160th Ave. SE Bellevue, WA 98008-5452	**Central Region:** Attn: VCP Coordinator 1250 West Alder St. Union Gap, WA 98903-0009
Southwest Region: Attn: VCP Coordinator P.O. Box 47775 Olympia, WA 98504-7775	**Eastern Region:** Attn: VCP Coordinator N. 4601 Monroe Spokane WA 99205-1295

ATTACHMENT B

TABLE 749-1: SIMPLIFIED TERRESTRIAL ECOLOGICAL EVALUATION-EXPOSURE ANALYSIS PROCEDURE

Table 749-1

Simplified Terrestrial Ecological Evaluation-Exposure Analysis Procedure

Estimate the area of contiguous (connected) undeveloped land on the site or within 500 feet of any area of the site to the nearest 1/2 acre (1/4 acre if the area is less than 0.5 acre).	
1) From the table below, find the number of points corresponding to the area and enter this number in the field to the right.	
Area (acres) / Points 0.25 or less / 4 0.5 / 5 1.0 / 6 1.5 / 7 2.0 / 8 2.5 / 9 3.0 / 10 3.5 / 11 4.0 or more / 12	8
2) Is this an industrial or commercial property? If yes, enter a score of 3. If no, enter a score of 1	3
3)[a] Enter a score in the box to the right for the habitat quality of the site, using the following rating system[b]. High=1, Intermediate=2, Low=3	3
4) Is the undeveloped land likely to attract wildlife? If yes, enter a score of 1 in the box to the right. If no, enter a score of 2.[c]	2
5) Are there any of the following soil contaminants present: Chlorinated dioxins/furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, pentachlorobenzene? If yes, enter a score of 1 in the box to the right. If no, enter a score of 4.	1
6) Add the numbers in the boxes on lines 2-5 and enter this number in the box to the right. If this number is larger than the number in the box on line 1, the simplified evaluation may be ended.	9

Notes for Table 749-1

[a] It is expected that this habitat evaluation will be undertaken by an experienced field biologist. If this is not the case, enter a conservative score of (1) for questions 3 and 4.

[b] **Habitat rating system.** Rate the quality of the habitat as high, intermediate or low based on your professional judgment as a field biologist. The following are suggested factors to consider in making this evaluation:

> **Low:** Early successional vegetative stands; vegetation predominantly noxious, nonnative, exotic plant species or weeds. Areas severely disturbed by human activity, including intensively cultivated croplands. Areas isolated from other habitat used by wildlife.

High: Area is ecologically significant for one or more of the following reasons: Late-successional native plant communities present; relatively high species diversity; used by an uncommon or rare species; priority habitat (as defined by the Washington Department of fish and Wildlife); part of a larger area of habitat where size or fragmentation may be important for the retention of some species.

Intermediate: Area does not rate as either high or low.

[c] Indicate "yes" if the area attracts wildlife or is likely to do so. Examples: Birds frequently visit the area to feed; evidence of high use b mammals (tracks, scat, etc.); habitat "island" in an industrial area; unusual features of an area that make it important for feeding animals; heavy use during seasonal migrations.

1 INTRODUCTION

Grette Associates is under contract with Maul Foster Alongi (MFA) to prepare a critical areas report that summarizes the critical areas reconnaissance performed at the Grays Harbor Historical Seaport Authority facility located along the Chehalis River (Figure 1) within the City of Aberdeen.

The purpose of this report is to document all wetlands and fish and wildlife habitat conservation areas (FWHCAs) that are located within the subject property to satisfy the reporting requirements defined in Chapter 14.50 of the City of Aberdeen's Shoreline Master Program (SMP).

Figure 1. Vicinity map

2 FEATURE SUMMARY

Two Grette Associates biologist visited the subject property on September 3, 2019 to conduct an assessment to identify all wetlands and FWHCAs within the subject property.

Grette Associates collected wetland delineation data and delineated three wetland features (Wetland A, B-1, and B-2; Appendix A) that contained all three wetland criteria defined in the U.S. Army Corps of Engineers (USACE) *Federal Wetland Delineation Manual* (1987), and the USACE's *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0)* (2010). Wetlands were rated according to Appendix 2 of the SMP and the

Washington State Department of Ecology's (Ecology) *Washington State Wetland Rating System for Western WA – 2014 Update* (Hruby 2014). Wetland delineation summaries, field datasheets and wetland rating forms are presented in Appendices B, C and D, respectively. A summary of the delineated wetlands is provided in Table 1.

In addition to the wetland delineation, two natural water features (Chehalis River and Shannon Slough) were identified within the subject property. An ordinary high water mark (OHWM) determination using the guidance in Ecology's *Determining OHWM for Shoreline Management Act Compliance in Washington State* (Anderson et al. 2016) was completed for the Chehalis River and Shannon Slough (Table 2).

Table 1. Wetland delineation summary

Feature	Size (Approximate)	Cowardin Class[1]	Hydrology Modifier	HGM Class	Wetland Category	Buffer Width[2]
A	18,500 sq. ft.	REM	Regularly Flooded	Freshwater Tidal Fringe[3]	III	80 ft.
B-1	24,000 sq. ft.	REM	Regularly Flooded	Freshwater Tidal Fringe[3]	III	80 ft.
B-2	23,500 sq. ft.	REM	Regularly Flooded	Riverine	III	80 ft.

[1] Classification based on Cowardin et al. (1979).
[2] Buffers are based on Appendix 2 of the SMP. Per Chapter 15.50.914 of the SMP, any substantial development that provides a disconnect to a wetland feature is considered a buffer interruption.
[3] Per Hruby 2014, freshwater tidal fringe wetlands are rated using the riverine rating form.

Table 2. Natural water feature identification summary

Feature	Water Type[1]	Buffer[2]
Chehalis River	S	0-150 ft.[3]
Shannon Slough	Np	75 ft.

[1] Natural water features were rated according to Chapter 14.50 of the SMP and WAC 222-16-030.
[2] Buffers are based on Appendix 2 of the SMP. Per Chapter 15.50.918 of the SMP, any substantial development that provides a disconnect to a stream is considered a buffer interruption.
[3] Shoreline buffer range from 0-150 feet based on the nature of the proposed land use.

3 BACKGROUND

3.1 Existing Conditions

The subject property is the historic industrial site where the Weyerhaeuser Timber Company operated their Aberdeen sawmill. With the exception of a narrow band of vegetation along portions of the shoreline that is dominated by native and non-native species, the subject property is devoid of vegetation.

Please note that the road crossing associated within Shannon Slough that is located within the subject property has been recently improved and the improvements are not reflected on any aerial images associated with this report. The improvements appear to include narrowing of the access road, culvert replacement, and bank stabilization.

3.2 National Wetlands Inventory

The U.S. Fish and Wildlife Service's National Wetlands Inventory (NWI) was queried to determine if previously-identified wetlands are present within the subject property (USFWS 2019). According to the NWI Interactive Online Mapper, with the exception of

the Chehalis River and Shannon Slough, no aquatic features area mapped in the vicinity of the subject property (Appendix E).

3.3 Sensitive Wildlife and Plants

The Washington Department of Fish and Wildlife's (WDFW) Priority Habitats and Species (PHS) database on-line mapper was queried to determine if state or federally listed fish or wildlife species occur near the subject property (WDFW 2019a). According to the PHS database, no priority habitats or species are mapped by PHS in the upland areas within the subject property (Appendix E).

Additionally, WDFW's SalmonScape on-line mapper was queried to determine what listed SalmonScape species are identified by WDFW to occur within the Chehalis River (WDFW 2019b). According to SalmonScape, the Chehalis River is mapped as providing habitat for numerous listed SalmonScape species (Appendix E).

The Washington Department of Natural Resources' (WDNR) Wetlands of High Conservation Value mapper was queried to determine if the subject parcels occurs in a location reported to contain high quality natural heritage wetland occurrences or occurrences of natural heritage features commonly associated with wetlands (WDNR 2019a). According to WDNR's mapper, there are no records of rare plants or high quality native ecosystems occurring on or in the vicinity of the subject property (Appendix E).

3.4 State Water Classification System

The Washington Department of Natural Resources' (WDNR) Forest Practice Application Mapping Tool on-line mapper was queried to identify the water typing of any streams mapped by WDNR (WDNR 2019b). According to WDNR, the Chehalis River is mapped as *Shorelines of the State* and Shannon Slough is mapped as a non-fish habitat stream (Appendix E).

4 METHODS

4.1 Wetland Determination

The subject property was traversed and data were collected to confirm wetland boundaries. The identified wetlands were delineated according to the procedures described in the USACE's *Federal Wetland Delineation Manual* (1987), and the USACE's *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0)* (2010). Paired data plots and soil test pits were excavated to evaluate wetland and upland conditions. Guidance from the USACE's *Regional Supplement* was used to evaluate the data at each data point.

The boundary of the wetland was established based on changes in vegetation, field indicators of hydric soils, water levels at or below 12 inches, topographic changes, and best professional judgment. Data plots were established in and adjacent to the wetland. The location of the wetland boundaries were recorded with a dGPS device.

Plants were determined to be more or less associated with wetlands based on their wetland indicator (FAC) status. The percent dominance for each plant strata was determined using the 50-20 Rule, which is the recommended method for selecting dominant species from a plant community in instances where quantitative data are

available (USACE 2010). In utilizing this rule, dominants are the most abundant species that individually or collectively accounts for more than 50 percent of the total coverage of vegetation in the stratum plus any other species that, by itself accounts for at least 20 percent of the total.

4.1.1 Hydrophytic Vegetation

The U.S. Fish and Wildlife Service (USFWS) and the NWI have established a rating system that has been applied to commonly occurring plant species on the basis of their frequency of occurrence in wetlands (Table 3). Species indicator status expresses the range in which plants may occur in wetlands and non-wetlands (uplands). Under this system, vegetation is considered hydrophytic when there is an indicator status of facultative (FAC), facultative wetland (FACW) or obligate wetland (OBL) (Table 3). The hydrophytic vegetation criterion for wetland determination is met when ***more than*** 50 percent of the dominant species in the plant community are FAC or wetter. The Corps' *National Wetland Plant List* (Lichvar 2016) was used to determine vegetation indicator status.

Table 3. Definitions for USFWS plant indicator status

Plant Indicator Status Category	Indicator Status Abbreviation	Definition (Estimated Probability of Occurrence)
Obligate Upland	UPL	Occur rarely (<1 percent) in wetlands, and almost always (>99 percent) in uplands
Facultative Upland	FACU	Occur sometimes (1 percent to <33 percent) in wetlands, but occur more often (>67 percent to 99 percent) in uplands
Facultative	FAC	Similar likelihood (33 percent to 67 percent) of occurring in both wetlands and uplands
Facultative Wetland	FACW	Occur usually in wetlands (>67 percent to 99 percent), but also occur in uplands (1 percent to 33 percent)
Obligate Wetland	OBL	Occur almost always (>99 percent) in wetlands, but rarely occur in uplands (<1 percent)
Not Listed	NL	Not listed due to insufficient information to determine status

4.1.2 Wetland Hydrology

Evidence of permanent or periodic inundation (water marks, drift lines, drainage patterns), or soil saturation to the surface for 14 consecutive days or more during the growing season meets the hydrology criterion. Oxidized root channels in the top 12 inches and hydrogen sulfide are primary indicators and water-stained leaves and geomorphic position are secondary indicators of wetland hydrology.

4.1.3 Hydric Soils

Soils that are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper soil horizons are considered hydric soils. Field indicators include histosols, the presence of a histic epipedon, a sulfidic odor, low soil chroma, and gleying. Soil conditions were compared to the Field Indicators of Hydric Soils detailed in the USACE's *Regional Supplement*.

4.2 Ordinary High Water Mark Determination

An OHWM determination using the guidance in Ecology's *Determining OHWM for Shoreline Management Act Compliance in Washington State* (Anderson et al. 2016) was

completed for the portion of the Chehalis River and Shannon Slough within the subject property.

Please note that portions of Shannon Slough upstream of the culvert (Appendix A) were not safely accessible due to site conditions. Therefore, representative elevations were recorded using a dGPS device and utilized to determine wetland boundaries and the OHWM in this area.

5 WETLAND RESULTS

Three wetland features were identified within the subject property (Appendix A).

5.1 Wetlands A and B-1

Wetlands A and B-1 are freshwater tidal wetlands that are situated along the Chehalis River (Appendix A). These features receive daily inundation due to fluctuating river levels that are influenced from tide cycles associated with the Pacific Ocean. While this marine and freshwater interaction is taking place in the Chehalis River, the marine water (saltwater wedge) and/or estuarine environment does not appear to extend up river to the point where the subject property is located. Based on the lack of salt tolerant vegetation observed in Wetlands A and B-1 (see below), the wetlands are classified as freshwater tidal wetlands (Hruby 2014).

5.1.1 Vegetation

Vegetation observed within Wetland A and B-1 predominantly consists of soft rush (*Juncus effusus*), slough sedge (*Carex obnupta*), and Pacific silverweed (*Potentilla pacifica*). According to Hruby (2014), these species generally are not associated with estuarine wetlands. Furthermore, cattail (*Typha latifolia*) was observed in portions of Wetland A which is sensitive to brackish environments (Hruby 2014).

5.1.2 Hydrology

Hydrologic support for Wetlands A and B-1 is primarily provided by daily tidal inundation and shallow groundwater. These wetland features are situated below the OHWM of the Chehalis River within the tidally influenced area along the shoreline.

5.1.3 Hydric Soils

During Grette Associates' soils evaluation a strong hydrogen sulfide odor was observed. Per the USACE's *Regional Supplement* (2010), observing a hydrogen sulfide odor while investigating soils is a primary hydric soils indicator.

5.2 Wetland B-2

Historically, Wetland B-2 was likely a continuation of Wetland B-1 (freshwater tidal wetland); however, during the development of the subject property a road crossing was constructed in Shannon Slough to provide internal access to other portions of the sawmill facilities. The current crossing configuration includes a tidal flap gate that prevents fresh waters from back-flooding up Shannon Slough during tidal exchanges. Given its geomorphic location, Wetland B-2 is classified as a riverine wetland. Wetland B-2 is located along the margins of Shannon Slough and situated in areas that are permanently flooded and/or seasonally flooded by fluctuating water depths within the slough

(Appendix A). Please note that the open water area associated with Shannon Slough is incorporated within Wetland B-2 for mapping purposes.

5.2.1 Vegetation

Vegetation observed within Wetland B-2 largely consists of soft rush and slough sedge.

5.2.2 Hydrology

Hydrologic support for Wetland B-2 is primarily provided by permanent and/or seasonal inundation and shallow groundwater. This feature is located along the edge of Shannon Slough and at the approximate stagnant elevation of the water within the slough.

5.2.3 Hydric Soils

During Grette Associates' site assessment Wetland B-2 was largely inundated by the waters associated with Shannon Slough. As a result, soils were not investigated. Hydric soils are those soils that are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper soil horizons (USACE 2010). Given that this wetland feature is permanently and/or regularly inundated, the soils within Wetland B-2 meet the definition of a hydric soil.

5.3 Wetland Categorization

To determine the categorization of the wetlands based on function, the wetland classification guidelines in Ecology's wetland rating system (Hruby 2014) were used. Based on this guidance, each wetland was given a score for each of three functions: Water Quality, Hydrology, and Habitat (Table 4).

Table 4. Wetland rating and categorization summary

Feature	Cowardin Class[1]	HGM Class	Water Quality	Hydrology	Habitat	Total	Category
Wetland A	REM	Freshwater Tidal Fringe[2]	8	6	4	18	III
Wetland B-1	REM	Freshwater Tidal Fringe	8	6	4	18	III
Wetland B-2	REM	Riverine	8	5	4	17	III

[1] Classification based on Cowardin et al. (1979).
[2] Per Hruby 2014, freshwater tidal fringe wetlands are rated using the riverine rating form.

Per Section 14.50.914 of the SMP, Category III wetlands with low habitat value are subject to an 80-foot wetland buffer. A high land use was assumed when determining wetland buffer widths. Furthermore, per 14.50.914(A) of the SMP, buffers shall not include areas that are disconnected functionally from a wetland; therefore, the substantial improvements function as a buffer interruption and the extent of said buffer ends at the edged on the developed area.

6 FISH AND WILDLIFE HABITAT CONSERVATION AREA RESULTS

Per Section 14.50.917 of the SMP, FWHCAs are typically those areas that support regulated fish and wildlife species or the habitats that play a critical role in sustaining said species. This section is intended to document all FWHCAs that were identified within the subject property.

6.1 Chehalis River

According to WDFW (2019a and 2019b), the Chehalis River provides habitat for numerous salmonid species. Provided below in Table 5 is the list of FWHCAs species that are typically known to occur within the Chehalis River basin.

Table 5. FWHCA species summary

FWHCA Species	State Status	Federal Status
Chinook salmon (*Oncorhynchus tshawytscha*)	Candidate	-
Coho salmon (*O. kisutch*)	Candidate	-
Chum salmon (*O. keta*)	Candidate	-
Steelhead trout (*O. mykiss*)	Candidate	-
Resident Coastal Cutthroat Trout (*O. clarki*)	-	-
Bull trout (*Salvelinus confluentus*)	Candidate	Threatened

In addition to being classified as a FWHCA, the Chehalis River is a *Water of the State*. Therefore, the river is subject to the buffer regulations defined in Section 14.50.430.2 of the SMP. Per said section, the shoreline buffer ranges from 0 feet to 150 feet depending on proposed land use. More specifically, water dependent structures and uses are not subject to a shoreline buffer whereas water-related/water-enjoyment mixed use structures and uses are subject to a 75-foot shoreline buffer and non-water oriented structures and uses are subject to a 150-foot shoreline buffer. Buffer determinations assumed high land use and the *Industrial and Port Development* shoreline environmental designation. Per 14.50.918 of the SMP, buffers shall not include areas that are disconnected functionally from a stream; therefore, the substantial improvements function as a buffer interruption and the extent of said buffer ends at the edged on the developed area.

6.2 Shannon Slough

Based on the queried databases summarized above in Section 3, Shannon Slough is not considered a FWHCA. Furthermore, there is no mapped distribution of any anadromous fish species within the slough and WDNR (2019b) maps Shannon Slough as a non-fish habitat stream. Based on this information, Shannon Slough likely does not provide habitat for fish and is classified as a non-fish habitat natural water feature. Per Section 14.50.918 of the SMP, perennial non-fish habitat natural water features are classified as a Type Np stream and are subject to a 75-foot buffer. Per 14.50.918 of the SMP, buffers shall not include areas that are disconnected functionally from a stream; therefore, the substantial improvements function as a buffer interruption and the extent of said buffer ends at the edged on the developed area.

7 REGULATORY CONSIDERATIONS

Critical areas are regulated by agencies at the local, state, and federal levels. At the local level, wetlands and streams and their associated buffers within 200 feet of *Waters of the State* are regulated under the City of Aberdeen's SMP.

At the state level, wetlands are regulated by the Washington Department of Ecology through the Federal Clean Water Act (Section 401). The requirement for a Water Quality Certification from Ecology for wetland impacts is triggered by an applicant's applying for a federal Clean Water Act Section 404 permit from the USACE. Ecology may also

issue an Administrative Order, allowing them wetland regulatory authority without a federal nexus.

Additionally, WDFW regulates work within state waters to protect fish life under the State's Hydraulic Code (Chapter 77.55 RCW) through the Hydraulic Project Approval (HPA) process.

At the federal level, impacts (specifically dredging or filling) to wetlands are regulated by the Environmental Protection Agency through the USACE. The USACE administers the federal Clean Water Act (Section 404) for projects involving dredging or filling in Waters of the US (lakes, streams, marine waters, and most non-isolated wetlands).

While it is the regulatory agencies that make the final determination regarding jurisdictional status, project proponents can infer jurisdiction using the guidance provided by each agency or local government. This inference can be used to design a project based on the anticipated regulatory constraints within the project area. However, it is the project proponent's responsibility to contact each potential regulating agency and confirm their regulatory status and requirements.

8 DISCLAIMER

The findings and conclusions documented in this report have been prepared for specific application to this proposed project site. They have been developed in a manner consistent with that level of care and skill normally exercised by members of the environmental science profession currently practicing under similar conditions in the area. Our work was also performed in accordance with the terms and conditions set forth in our proposal. The conclusions and recommendations presented in this report are professional opinions based on an interpretation of information currently available to us and are made within the operation scope, budget, and schedule of this project. No warranty, expressed or implied, is made. In addition, changes in government codes, regulations, or laws may occur. Because of such changes, our observations and conclusions applicable to this site may need to be revised wholly or in part.

Wetland boundaries are based on conditions present at the time of the site visit and considered preliminary until the flagged wetland and/or drainage boundaries are validated by the appropriate jurisdictional agencies. Validation of the boundaries by the regulating agencies provide a certification, typically in writing, that the wetland boundaries verified are the boundaries that will be regulated by the agencies until a specific date or until the regulations are modified. Only the regulating agencies can provide this certification.

Since wetlands are dynamic communities affected by both natural and human activities, changes in wetland boundaries may be expected. Because of such changes, our observations and conclusions applicable to this site may need to be revised wholly or in part.

9 BIOLOGIST QUALIFICATIONS

9.1 Chad Wallin

Chad Wallin is a Biologist with extensive training in wetland science and ecology restoration. Chad also has professional experience in stream and fish restoration, marine monitoring, mitigation monitoring, and fish and wildlife assessments.

Chad has earned a Bachelor's of Arts degree in Environmental Studies from the University of Washington along with certificates in ecology restoration and wetland science.

For a list of representative projects, please contact him at Grette Associates.

APPENDIX B: WETLAND SUMMARY

WETLAND A SUMMARY		
Approximate Size (sq. ft.):	18,500	
Cowardin Classification[1]:	REM	
HGM Classification[2]:	Freshwater Tidal	
Wetland Category[3]:	III	
Wetland Buffer Width[4]:	80 ft.	
Sample Plot Total[5]:	2	
Hydrophytic Vegetation Present (Y/N)?	Yes	
Hydric Soil Indicator?	*Hydrogen Sulfide*	
Wetland Hydrology Present?	Yes	

Summary of Findings	
Dominant Vegetation:	Vegetation observed within Wetland A predominantly consists of soft rush, slough sedge, and Pacific silverweed.
Soil Profile:	Hydrologic support for Wetlands A is primarily provided by daily tidal inundation and shallow groundwater. These wetland features are situated below the OHWM of the Chehalis River within the tidally influenced area along the shoreline.
Primary Hydrological Support:	Hydrologic support for Wetlands A is primarily provided by daily tidal inundation and shallow groundwater.

Wetland Data Plot:	**Upland Data Plot:**
	

Notes:
[1] Classification based on Cowardin et al. (1979).
[2] HGM classification based on Brinson, M.M. (1993).
[3] Wetland rating was determined based on the guidelines defined in the local municipal code.
[4] Wetland buffer was determined based on the local municipal code.
[5] Sample plot total includes the collective amount of wetland and upland samples plots examined to define the wetland boundary.

WETLAND B-1 SUMMARY		
Approximate Size (sq. ft.):	24,000	
Cowardin Classification[1]:	REM	
HGM Classification[2]:	Freshwater Tidal	
Wetland Category[3]:	III	
Wetland Buffer Width[4]:	80 ft.	
Sample Plot Total[5]:	2	
Hydrophytic Vegetation Present (Y/N)?	Yes	
Hydric Soil Indicator?	*Hydrogen Sulfide*	
Wetland Hydrology Present?	Yes	

Summary of Findings	
Dominant Vegetation:	Vegetation observed within Wetland B-1 predominantly consists of soft rush, slough sedge, and Pacific silverweed.
Soil Profile:	Hydrologic support for Wetlands B-1 is primarily provided by daily tidal inundation and shallow groundwater. These wetland features are situated below the OHWM of the Chehalis River within the tidally influenced area along the shoreline.
Primary Hydrological Support:	Hydrologic support for Wetlands B-1 is primarily provided by daily tidal inundation and shallow groundwater.

Wetland Data Plot:	**Upland Data Plot:**
	

Notes:
[1] Classification based on Cowardin et al. (1979).
[2] HGM classification based on Brinson, M.M. (1993).
[3] Wetland rating was determined based on the guidelines defined in the local municipal code.
[4] Wetland buffer was determined based on the local municipal code.
[5] Sample plot total includes the collective amount of wetland and upland samples plots examined to define the wetland boundary.

WETLAND B-2 SUMMARY		
Approximate Size (sq. ft.):	23,500	
Cowardin Classification[1]:	REM	
HGM Classification[2]:	Riverine	
Wetland Category[3]:	III	
Wetland Buffer Width[4]:	80 ft.	
Sample Plot Total[5]:	2	
Hydrophytic Vegetation Present (Y/N)?	Yes	
Hydric Soil Indicator?	*Other*	
Wetland Hydrology Present?	Yes	

Summary of Findings	
Dominant Vegetation:	Vegetation observed within Wetland B-2 largely consists of soft rush and slough sedge.
Soil Profile:	During Grette Associates' site assessment Wetlands B-2 was largely inundated by the waters associated with Shannon Slough. As a result, soils were not investigated. Hydric soils are those soils that are saturated, flooded, or ponded long enough during the growing season to develop anaerobic conditions in the upper soil horizons (USACE 2010).
Primary Hydrological Support:	Hydrologic support for Wetlands B-2 is primarily provided by permanent and/or seasonal inundation and shallow groundwater.

Wetland Data Plot:	**Upland Data Plot:**
N/A	N/A

Notes:
[1] Classification based on Cowardin et al. (1979).
[2] HGM classification based on Brinson, M.M. (1993).
[3] Wetland rating was determined based on the guidelines defined in the local municipal code.
[4] Wetland buffer was determined based on the local municipal code.
[5] Sample plot total includes the collective amount of wetland and upland samples plots examined to define the wetland boundary.

Hydroperiods	H 1.2	
Plant cover of **dense** trees, shrubs, and herbaceous plants	S 1.3	
Plant cover of **dense, rigid** trees, shrubs, and herbaceous plants *(can be added to figure above)*	S 4.1	
Boundary of 150 ft buffer (can be added to another figure)	S 2.1, S 5.1	
1 km Polygon: Area that extends 1 km from entire wetland edge - including polygons for accessible habitat and undisturbed habitat	H 2.1, H 2.2, H 2.3	
Screen capture of map of 303(d) listed waters in basin (from Ecology website)	S 3.1, S 3.2	
Screen capture of list of TMDLs for WRIA in which unit is found (from web)	S 3.3	

Wetland name or number A

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

   NO – go to 2 **YES** – the wetland class is **Tidal Fringe** – go to 1.1

   1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

   NO – Saltwater Tidal Fringe (Estuarine) **YES – Freshwater Tidal Fringe**
   *If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

   NO – go to 3 **YES** – The wetland class is **Flats**
   *If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
   ___The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
   ___At least 30% of the open water area is deeper than 6.6 ft (2 m).

   NO – go to 4 **YES –** The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
   ___The wetland is on a slope (*slope can be very gradual*),
   ___The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,
   ___The water leaves the wetland **without being impounded**.

   NO – go to 5 **YES –** The wetland class is **Slope**

   NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
   ___The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
   ___The overbank flooding occurs at least once every 2 years.

Wetland name or number 4

NO – go to 6 **YES** – The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

NO – go to 7 **YES** – The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO – go to 8 **YES** – The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

Wetland name or number A

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		
Depressions cover >$^3/_4$ area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = (2)	2
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		
Trees or shrubs > $^2/_3$ area of the wetland	points = 8	
Trees or shrubs > $^1/_3$ area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > $^2/_3$ area of the wetland	points = (6)	
Herbaceous plants (> 6 in high) > $^1/_3$ area of the wetland	points = 3	6
Trees, shrubs, and ungrazed herbaceous < $^1/_3$ area of the wetland	points = 0	
Total for R 1 — Add the points in the boxes above		8

Rating of Site Potential If score is: ___ **12-16 = H** X **6-11 = M** (M) ___ **0-5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	(Yes) = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	(Yes) = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	(Yes) = 1 No = 0	1
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	(Yes) = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1-R 2.4 Other sources _____	Yes = 1 (No) = 0	Ø
Total for R 2 — Add the points in the boxes above		5

Rating of Landscape Potential If score is: X **3-6 = H** (H) ___ **1 or 2 = M** ___ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 (No) = 0	Ø
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = (1) No = 0	1
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = (2) No = 0	2
Total for R 3 — Add the points in the boxes above		3

Rating of Value If score is: X **2-4 = H** (H) ___ **1 = M** ___ **0 = L** *Record the rating on the first page*

Wetland name or number A

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?

R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).* If the ratio is more than 20 If the ratio is 10-20 If the ratio is 5-<10 If the ratio is 1-<5 If the ratio is < 1	points = 9 points = 6 points = 4 points = 2 points = (1)	1
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).* Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area Plants do not meet above criteria	points = (7) points = 4 points = 0	7
Total for R 4	Add the points in the boxes above	8

Rating of Site Potential If score is: ___ **12-16 = H** X **6-11 = M** ___ **0-5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?

R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 (No) = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	(Yes) = 1 No = 0	1
R 5.3. Is the up-gradient stream or river controlled by dams?	Yes = 0 (No) = 1	1
Total for R 5	Add the points in the boxes above	3

Rating of Landscape Potential If score is: X **3 = H** ___ **1 or 2 = M** ___ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?

R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.* The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds) Surface flooding problems are in a sub-basin farther down-gradient No flooding problems anywhere downstream	points = 2 points = 1 points = (0)	Ø
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 (No) = 0	Ø
Total for R 6	Add the points in the boxes above	Ø

Rating of Value If score is: ___ **2-4 = H** ___ **1 = M** X **0 = L** *Record the rating on the first page*

Wetland name or number A

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

___Aquatic bed	4 structures or more: points = 4
_X_Emergent	3 structures: points = 2
___Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points = 1
___Forested (areas where trees have > 30% cover)	1 structure: points = (0)

If the unit has a Forested class, check if:

___The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

Ø

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

___Permanently flooded or inundated	4 or more types present: points = 3
___Seasonally flooded or inundated	3 types present: points = 2
___Occasionally flooded or inundated	2 types present: points = 1
___Saturated only	1 type present: points = 0
___Permanently flowing stream or river in, or adjacent to, the wetland	
___Seasonally flowing stream in, or adjacent to, the wetland	
___**Lake Fringe wetland**	**2 points**
_X_**Freshwater tidal wetland**	**(2 points)**

2

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft^2.

Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

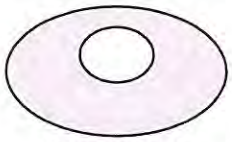
If you counted: > 19 species	points = 2
5 - 19 species	points = (1)
< 5 species	points = 0

1

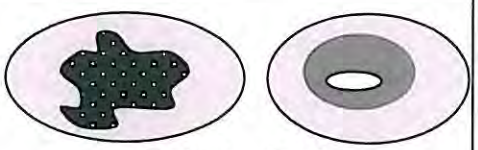
H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points



Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3points

Ø

(3)

Wetland name or number A

3

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* X Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long). ___ Standing snags (dbh > 4 in) within the wetland ___ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ___ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present *(cut shrubs or trees that have not yet weathered where wood is exposed)* X At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated *(structures for egg-laying by amphibians)* X Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 — Add the points in the boxes above	6

Rating of Site Potential If score is: ___ **15-18 = H** ___ **7-14 = M** X **0-6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat functions of the site?	
H 2.1. Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 10-20% % undisturbed habitat ___ + [(% moderate and low intensity land uses)/2] ___ = 10/20 % If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon — points = 3 20-33% of 1 km Polygon — points = 2 10-19% of 1 km Polygon — points = 1 < 10% of 1 km Polygon — points = 0 = River area	1
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 10% % undisturbed habitat ___ + [(% moderate and low intensity land uses)/2] ___ = 10% % Undisturbed habitat > 50% of Polygon — points = 3 Undisturbed habitat 10-50% and in 1-3 patches — points = 2 Undisturbed habitat 10-50% and > 3 patches — points = 1 Undisturbed habitat < 10% of 1 km Polygon — points = 0	1
H 2.3. Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use — points = (-2) ≤ 50% of 1 km Polygon is high intensity — points = 0	-2
Total for H 2 — Add the points in the boxes above	0

Rating of Landscape Potential If score is: ___ **4-6 = H** ___ **1-3 = M** X **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated.* Site meets ANY of the following criteria: — points = 2 — It has 3 or more priority habitats within 100 m (see next page) — It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) — It is mapped as a location for an individual WDFW priority species — It is a Wetland of High Conservation Value as determined by the Department of Natural Resources — It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) within 100 m — points = 1 Site does not meet any of the criteria above — points = 0	1

Rating of Value If score is: ___ **2 = H** X **1 = M** ___ **0 = L** *Record the rating on the first page*

Wetland name or number A

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE:*** *This question is independent of the land use between the wetland unit and the priority habitat.*

— **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

— **Biodiversity Areas and Corridors:** Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

— **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.

— **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

— **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

X **Riparian:** The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

— **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

X **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

— **Nearshore:** Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page).*

— **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

— **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

— **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

— **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number A

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. Circle the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine wetlands Does the wetland meet the following criteria for Estuarine wetlands? — The dominant water regime is tidal, — Vegetated, and — With a salinity greater than 0.5 ppt Yes –Go to **SC 1.1** (No= **Not an estuarine wetland**)	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? Yes = **Category I** No - Go to **SC 1.2**	**Cat. I**
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25) — At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. — The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. Yes = **Category I** No = **Category II**	**Cat. I** **Cat. II**
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? Yes – Go to **SC 2.2** No – Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? Yes = **Category I** (No = **Not a WHCV**) SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf Yes **– Contact WNHP/WDNR and go to SC 2.4** No = **Not a WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? Yes = **Category I** No = **Not a WHCV**	**Cat. I**
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions.*** SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? Yes – Go to **SC 3.3** No – Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? Yes – Go to **SC 3.3** (No = **Is not a bog**) SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? Yes = **Is a Category I bog** No – Go to **SC 3.4** **NOTE:** If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? Yes = **Is a Category I bog** No = **Is not a bog**	**Cat. I**

Wetland name or number A

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.*** — **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. — **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). Yes = **Category I** (No) = **Not a forested wetland for this section**	**Cat. I**
SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? — The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks — The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon *(needs to be measured near the bottom)* Yes – Go to **SC 5.1** (No) = **Not a wetland in a coastal lagoon** SC 5.1. Does the wetland meet all of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). — At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. — The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2) Yes = **Category I** No = **Category II**	**Cat. I** **Cat. II**
SC 6.0. Interdunal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.*** In practical terms that means the following geographic areas: — Long Beach Peninsula: Lands west of SR 103 — Grayland-Westport: Lands west of SR 105 — Ocean Shores-Copalis: Lands west of SR 115 and SR 109 Yes – Go to **SC 6.1** (No) = **not an interdunal wetland for rating** SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)? Yes = **Category I** No – Go to **SC 6.2** SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = **Category II** No – Go to **SC 6.3** SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = **Category III** No = **Category IV**	**Cat I** **Cat. II** **Cat. III** **Cat. IV**
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form	N/A

Wetland name or number B-1

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

   NO – go to 2 **YES** – the wetland class is **Tidal Fringe** – go to 1.1

   1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

   NO – Saltwater Tidal Fringe (Estuarine) **YES – Freshwater Tidal Fringe**
   *If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

   NO – go to 3 **YES** – The wetland class is **Flats**
   *If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
   ___The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
   ___At least 30% of the open water area is deeper than 6.6 ft (2 m).

   NO – go to 4 **YES –** The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
   ___The wetland is on a slope (*slope can be very gradual*),
   ___The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,
   ___The water leaves the wetland **without being impounded**.

   NO – go to 5 **YES –** The wetland class is **Slope**

   NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
   ___The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
   ___The overbank flooding occurs at least once every 2 years.

Wetland name or number B-1

NO – go to 6 **YES** – The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

NO – go to 7 **YES** – The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO – go to 8 **YES** – The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

Wetland name or number B-1

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		
Depressions cover > 3/4 area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = (2)	2
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		
Trees or shrubs > 2/3 area of the wetland	points = 8	
Trees or shrubs > 1/3 area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > 2/3 area of the wetland	points = (6)	
Herbaceous plants (> 6 in high) > 1/3 area of the wetland	points = 3	6
Trees, shrubs, and ungrazed herbaceous < 1/3 area of the wetland	points = 0	
Total for R 1 — Add the points in the boxes above		8

Rating of Site Potential If score is: ___ **12-16 = H** ~~X~~ **6-11 = M** (M) ___ **0-5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	(Yes) = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	(Yes) = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	(Yes) = 1 No = 0	1
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	(Yes) = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1-R 2.4 Other sources _____	Yes = 1 (No) = 0	Ø
Total for R 2 — Add the points in the boxes above		5

Rating of Landscape Potential If score is: ~~X~~ **3-6 = H** (H) ___ **1 or 2 = M** ___ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 (No) = 0	Ø
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	(Yes) = 1 No = 0	1
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	(Yes) = 2 No = 0	2
Total for R 3 — Add the points in the boxes above		3

Rating of Value If score is: ~~X~~ **2-4 = H** (H) ___ **1 = M** ___ **0 = L** *Record the rating on the first page*

Wetland name or number B-1

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?

R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).* If the ratio is more than 20	points = 9	
If the ratio is 10-20	points = 6	
If the ratio is 5-<10	points = 4	
If the ratio is 1-<5	points = 2	1
If the ratio is < 1	points = (1)	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).* Forest or shrub for > $^1/_3$ area OR emergent plants > $^2/_3$ area	points = (7)	
Forest or shrub for > $^1/_{10}$ area OR emergent plants > $^1/_3$ area	points = 4	8
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	9

Rating of Site Potential If score is: ___ **12-16 = H** ___ **6-11 = M** (circled) ___ **0-5 = L** *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?

R 5.1. Is the stream or river adjacent to the wetland downcut?	Yes = 0 (No) = 1	1
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	(Yes) = 1 No = 0	1
R 5.3. Is the up-gradient stream or river controlled by dams?	Yes = 0 (No) = 1	1
Total for R 5	Add the points in the boxes above	3

Rating of Landscape Potential If score is: ___ **3 = H** (circled) ___ **1 or 2 = M** ___ **0 = L** *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?

R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.* The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = (0)	Ø
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 (No) = 0	Ø
Total for R 6	Add the points in the boxes above	Ø

Rating of Value If score is: ___ **2-4 = H** ___ **1 = M** ___ **0 = L** (circled) *Record the rating on the first page*

Wetland name or number B-1

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

___Aquatic bed
__✓__Emergent
___Scrub-shrub (areas where shrubs have > 30% cover)
___Forested (areas where trees have > 30% cover)

4 structures or more: points = 4
3 structures: points = 2
2 structures: points = 1
1 structure: points = (0)

If the unit has a Forested class, check if:

___The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

Ø

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

___Permanently flooded or inundated
___Seasonally flooded or inundated
___Occasionally flooded or inundated
___Saturated only

4 or more types present: points = 3
3 types present: points = 2
2 types present: points = 1
1 type present: points = 0

___Permanently flowing stream or river in, or adjacent to, the wetland
___Seasonally flowing stream in, or adjacent to, the wetland
___**Lake Fringe wetland** **2 points**
__✓__**Freshwater tidal wetland** **(2) points**

2

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft^2.

Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

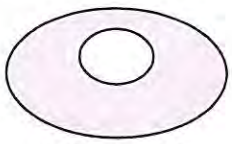
If you counted: > 19 species — points = 2
5 - 19 species — points = (1)
< 5 species — points = 0

1

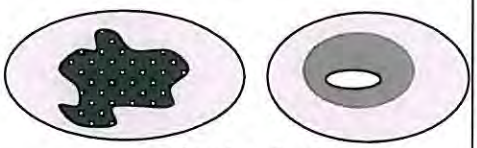
H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = (0) points



Low = 1 point



Moderate = 2 points

Ø

All three diagrams in this row are **HIGH** = 3points

(3)

Wetland name or number B-1

3

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ✓ Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long). ___ Standing snags (dbh > 4 in) within the wetland ___ Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ___ Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present *(cut shrubs or trees that have not yet weathered where wood is exposed)* ✓ At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated *(structures for egg-laying by amphibians)* ✓ Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	3
Total for H 1 Add the points in the boxes above	6

Rating of Site Potential If score is: ___ **15-18 = H** ___ **7-14 = M** ✓ **0-6 = L** *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat functions of the site?	
H 2.1. Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* 15% % undisturbed habitat ___ + [(% moderate and low intensity land uses)/2] ___ = 15 % If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon points = 3 20-33% of 1 km Polygon points = 2 10-19% of 1 km Polygon points = 1 < 10% of 1 km Polygon points = 0	1
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* 10% % undisturbed habitat ___ + [(% moderate and low intensity land uses)/2] ___ = 10% % Undisturbed habitat > 50% of Polygon points = 3 Undisturbed habitat 10-50% and in 1-3 patches points = 2 Undisturbed habitat 10-50% and > 3 patches points = 1 Undisturbed habitat < 10% of 1 km Polygon points = 0	1
H 2.3. Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use points = (- 2) ≤ 50% of 1 km Polygon is high intensity points = 0	-2
Total for H 2 Add the points in the boxes above	0

Rating of Landscape Potential If score is: ___ **4-6 = H** ___ **1-3 = M** ✓ **< 1 = L** *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated.* Site meets ANY of the following criteria: points = 2 — It has 3 or more priority habitats within 100 m (see next page) — It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) — It is mapped as a location for an individual WDFW priority species — It is a Wetland of High Conservation Value as determined by the Department of Natural Resources — It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) within 100 m points = 1 Site does not meet any of the criteria above points = 0	1

Rating of Value If score is: ___ **2 = H** ✓ **1 = M** ___ **0 = L** *Record the rating on the first page*

Wetland name or number B-1

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE:*** *This question is independent of the land use between the wetland unit and the priority habitat.*

— **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

— **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

— **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.

— **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

— **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

✓ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

— **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

✓ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

— **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page).*

— **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

— **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

— **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

— **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number B-1

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. Circle the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine wetlands Does the wetland meet the following criteria for Estuarine wetlands? — The dominant water regime is tidal, — Vegetated, and — With a salinity greater than 0.5 ppt Yes –Go to **SC 1.1** (No= **Not an estuarine wetland**)	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? Yes = **Category I** No - Go to **SC 1.2**	**Cat. I**
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25) — At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. — The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. Yes = **Category I** No = **Category II**	**Cat. I** **Cat. II**
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? Yes – Go to **SC 2.2** No – Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? Yes = **Category I** (No = **Not a WHCV**) SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf Yes **– Contact WNHP/WDNR and go to SC 2.4** No = **Not a WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? Yes = **Category I** No = **Not a WHCV**	**Cat. I**
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions.*** SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? Yes – Go to **SC 3.3** No – Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? Yes – Go to **SC 3.3** (No = **Is not a bog**) SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? Yes = **Is a Category I bog** No – Go to **SC 3.4** **NOTE:** If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? Yes = **Is a Category I bog** No = **Is not a bog**	**Cat. I**

Wetland name or number B-1

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.*** — **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. — **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). Yes = **Category I** (No) = **Not a forested wetland for this section**	**Cat. I**
SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? — The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks — The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon *(needs to be measured near the bottom)* Yes – Go to **SC 5.1** (No) = **Not a wetland in a coastal lagoon** SC 5.1. Does the wetland meet all of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). — At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. — The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2) Yes = **Category I** No = **Category II**	**Cat. I** **Cat. II**
SC 6.0. Interdunal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.*** In practical terms that means the following geographic areas: — Long Beach Peninsula: Lands west of SR 103 — Grayland-Westport: Lands west of SR 105 — Ocean Shores-Copalis: Lands west of SR 115 and SR 109 Yes – Go to **SC 6.1** (No) = **not an interdunal wetland for rating** SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)? Yes = **Category I** No – Go to **SC 6.2** SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = **Category II** No – Go to **SC 6.3** SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = **Category III** No = **Category IV**	**Cat I** **Cat. II** **Cat. III** **Cat. IV**
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form	N/A

Wetland name or number B-2

HGM Classification of Wetlands in Western Washington

For questions 1-7, the criteria described must apply to the entire unit being rated.

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the entire unit usually controlled by tides except during floods?

   NO – go to 2 **YES** – the wetland class is **Tidal Fringe** – go to 1.1

   1.1 Is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)?

   NO – Saltwater Tidal Fringe (Estuarine) **YES – Freshwater Tidal Fringe**
   *If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is an **Estuarine** wetland and is not scored. This method **cannot** be used to score functions for estuarine wetlands.*

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

   NO – go to 3 **YES** – The wetland class is **Flats**
   *If your wetland can be classified as a Flats wetland, use the form for **Depressional** wetlands.*

3. Does the entire wetland unit **meet all** of the following criteria?
   ___The vegetated part of the wetland is on the shores of a body of permanent open water (without any plants on the surface at any time of the year) at least 20 ac (8 ha) in size;
   ___At least 30% of the open water area is deeper than 6.6 ft (2 m).

   NO – go to 4 **YES –** The wetland class is **Lake Fringe** (Lacustrine Fringe)

4. Does the entire wetland unit **meet all** of the following criteria?
   ___The wetland is on a slope (*slope can be very gradual*),
   ___The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks,
   ___The water leaves the wetland **without being impounded**.

   NO – go to 5 **YES –** The wetland class is **Slope**

   NOTE: Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks (depressions are usually <3 ft diameter and less than 1 ft deep).

5. Does the entire wetland unit **meet all** of the following criteria?
   X The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river,
   X The overbank flooding occurs at least once every 2 years.

Wetland name or number B2

NO – go to 6 **YES** – The wetland class is **Riverine**

NOTE: The Riverine unit can contain depressions that are filled with water when the river is not flooding

6. Is the entire wetland unit in a topographic depression in which water ponds, or is saturated to the surface, at some time during the year? *This means that any outlet, if present, is higher than the interior of the wetland.*

NO – go to 7 **YES** – The wetland class is **Depressional**

7. Is the entire wetland unit located in a very flat area with no obvious depression and no overbank flooding? The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

NO – go to 8 **YES** – The wetland class is **Depressional**

8. Your wetland unit seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a Depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within the wetland unit being scored.

NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the HGM class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM classes within the wetland unit being rated	HGM class to use in rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake Fringe	Lake Fringe
Depressional + Riverine along stream within boundary of depression	Depressional
Depressional + Lake Fringe	Depressional
Riverine + Lake Fringe	Riverine
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE

If you are still unable to determine which of the above criteria apply to your wetland, or if you have ***more than 2 HGM classes*** *within a wetland boundary, classify the wetland as Depressional for the rating.*

Wetland name or number B-2

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Water Quality Functions - Indicators that the site functions to improve water quality

R 1.0. Does the site have the potential to improve water quality?		
R 1.1. Area of surface depressions within the Riverine wetland that can trap sediments during a flooding event:		
Depressions cover > 3/4 area of wetland	points = 8	
Depressions cover > ½ area of wetland	points = 4	
Depressions present but cover < ½ area of wetland	points = 2	Ø
No depressions present	points = 0	
R 1.2. Structure of plants in the wetland (areas with >90% cover at person height, **not** Cowardin classes)		
Trees or shrubs > 2/3 area of the wetland	points = 8	
Trees or shrubs > 1/3 area of the wetland	points = 6	
Herbaceous plants (> 6 in high) > 2/3 area of the wetland	points = 6	6
Herbaceous plants (> 6 in high) > 1/3 area of the wetland	points = 3	
Trees, shrubs, and ungrazed herbaceous < 1/3 area of the wetland	points = 0	
Total for R 1 — Add the points in the boxes above		6

Rating of Site Potential If score is: ___ **12-16 = H** ___ **6-11 = M** ___ **0-5 = L** *Record the rating on the first page*

R 2.0. Does the landscape have the potential to support the water quality function of the site?		
R 2.1. Is the wetland within an incorporated city or within its UGA?	Yes = 2 No = 0	2
R 2.2. Does the contributing basin to the wetland include a UGA or incorporated area?	Yes = 1 No = 0	1
R 2.3. Does at least 10% of the contributing basin contain tilled fields, pastures, or forests that have been clearcut within the last 5 years?	Yes = 1 No = 0	Ø
R 2.4. Is > 10% of the area within 150 ft of the wetland in land uses that generate pollutants?	Yes = 1 No = 0	1
R 2.5. Are there other sources of pollutants coming into the wetland that are not listed in questions R 2.1-R 2.4 Other sources _____	Yes = 1 No = 0	Ø
Total for R 2 — Add the points in the boxes above		4

Rating of Landscape Potential If score is: ___ **3-6 = H** ___ **1 or 2 = M** ___ **0 = L** *Record the rating on the first page*

R 3.0. Is the water quality improvement provided by the site valuable to society?		
R 3.1. Is the wetland along a stream or river that is on the 303(d) list or on a tributary that drains to one within 1 mi?	Yes = 1 No = 0	Ø
R 3.2. Is the wetland along a stream or river that has TMDL limits for nutrients, toxics, or pathogens?	Yes = 1 No = 0	1
R 3.3. Has the site been identified in a watershed or local plan as important for maintaining water quality? (*answer YES if there is a TMDL for the drainage in which the unit is found*)	Yes = 2 No = 0	2
Total for R 3 — Add the points in the boxes above		3

Rating of Value If score is: ___ **2-4 = H** ___ **1 = M** ___ **0 = L** *Record the rating on the first page*

Wetland name or number B-2

RIVERINE AND FRESHWATER TIDAL FRINGE WETLANDS

Hydrologic Functions - Indicators that site functions to reduce flooding and stream erosion

R 4.0. Does the site have the potential to reduce flooding and erosion?

R 4.1. Characteristics of the overbank storage the wetland provides: *Estimate the average width of the wetland perpendicular to the direction of the flow and the width of the stream or river channel (distance between banks). Calculate the ratio: (average width of wetland)/(average width of stream between banks).* If the ratio is more than 20	points = 9	
If the ratio is 10-20	points = 6	
If the ratio is 5-<10	points = 4	
If the ratio is 1-<5	points = (2)	2
If the ratio is < 1	points = 1	
R 4.2. Characteristics of plants that slow down water velocities during floods: *Treat large woody debris as forest or shrub. Choose the points appropriate for the best description (polygons need to have >90% cover at person height. These are NOT Cowardin classes).* Forest or shrub for > 1/3 area OR emergent plants > 2/3 area	points = (7)	
Forest or shrub for > 1/10 area OR emergent plants > 1/3 area	points = 4	7
Plants do not meet above criteria	points = 0	
Total for R 4	Add the points in the boxes above	9

Rating of Site Potential If score is: ___ 12-16 = H ___ X 6-11 = (M) ___ 0-5 = L *Record the rating on the first page*

R 5.0. Does the landscape have the potential to support the hydrologic functions of the site?

R 5.1. Is the stream or river adjacent to the wetland downcut? Ditch like feature	(Yes) = 0 No = 1	Ø
R 5.2. Does the up-gradient watershed include a UGA or incorporated area?	(Yes) = 1 No = 0	1
R 5.3. Is the up-gradient stream or river controlled by dams? Controlled structure upstream	(Yes) = 0 No = 1	Ø
Total for R 5	Add the points in the boxes above	1

Rating of Landscape Potential If score is: ___ 3 = H ___ X 1 or 2 = (M) ___ 0 = L *Record the rating on the first page*

R 6.0. Are the hydrologic functions provided by the site valuable to society?

R 6.1. Distance to the nearest areas downstream that have flooding problems? *Choose the description that best fits the site.* The sub-basin immediately down-gradient of the wetland has flooding problems that result in damage to human or natural resources (e.g., houses or salmon redds)	points = 2	
Surface flooding problems are in a sub-basin farther down-gradient	points = 1	
No flooding problems anywhere downstream	points = (0)	Ø
R 6.2. Has the site been identified as important for flood storage or flood conveyance in a regional flood control plan?	Yes = 2 (No) = 0	Ø
Total for R 6	Add the points in the boxes above	Ø

Rating of Value If score is: ___ 2-4 = H ___ 1 = M ___ X 0 = (L) *Record the rating on the first page*

Wetland name or number B-2

These questions apply to wetlands of all HGM classes.

HABITAT FUNCTIONS - Indicators that site functions to provide important habitat

H 1.0. Does the site have the potential to provide habitat?

H 1.1. Structure of plant community: *Indicators are Cowardin classes and strata within the Forested class.* Check the Cowardin plant classes in the wetland. *Up to 10 patches may be combined for each class to meet the threshold of ¼ ac or more than 10% of the unit if it is smaller than 2.5 ac. Add the number of structures checked.*

___Aquatic bed	4 structures or more: points = 4
_X_Emergent	3 structures: points = 2
___Scrub-shrub (areas where shrubs have > 30% cover)	2 structures: points = 1
___Forested (areas where trees have > 30% cover)	1 structure: points = (0)

If the unit has a Forested class, check if:

___The Forested class has 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the Forested polygon

Ø

H 1.2. Hydroperiods

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ ac to count (*see text for descriptions of hydroperiods*).

_X_Permanently flooded or inundated	4 or more types present: points = 3
_X_Seasonally flooded or inundated	3 types present: points = 2
___Occasionally flooded or inundated	2 types present: points = (1)
___Saturated only	1 type present: points = 0
___Permanently flowing stream or river in, or adjacent to, the wetland	
___Seasonally flowing stream in, or adjacent to, the wetland	
___**Lake Fringe wetland**	**2 points**
___**Freshwater tidal wetland**	**2 points**

1

H 1.3. Richness of plant species

Count the number of plant species in the wetland that cover at least 10 ft^2.

Different patches of the same species can be combined to meet the size threshold and you do not have to name the species. ***Do not include Eurasian milfoil, reed canarygrass, purple loosestrife, Canadian thistle***

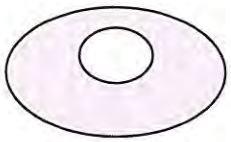
If you counted: > 19 species	points = 2
5 - 19 species	points = (1)
< 5 species	points = 0

1

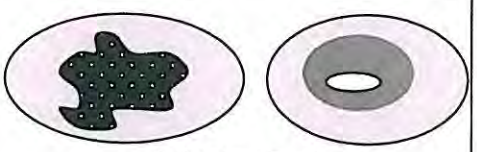
H 1.4. Interspersion of habitats

Decide from the diagrams below whether interspersion among Cowardin plants classes (described in H 1.1), or the classes and unvegetated areas (can include open water or mudflats) is high, moderate, low, or none. *If you have four or more plant classes or three classes and open water, the rating is always high.*

None = 0 points

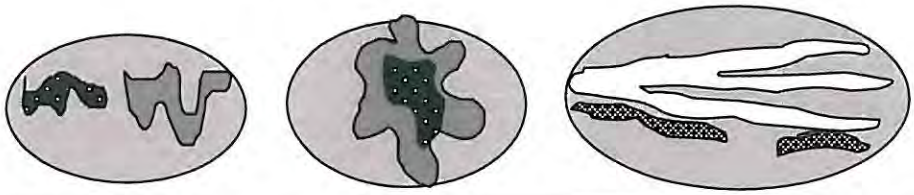


Low = 1 point



Moderate = 2 points

All three diagrams in this row are **HIGH** = 3points



Ø

2

Wetland name or number B-2

2

H 1.5. Special habitat features: Check the habitat features that are present in the wetland. *The number of checks is the number of points.* ____Large, downed, woody debris within the wetland (> 4 in diameter and 6 ft long). ____Standing snags (dbh > 4 in) within the wetland ____Undercut banks are present for at least 6.6 ft (2 m) **and/or** overhanging plants extends at least 3.3 ft (1 m) over a stream (or ditch) in, or contiguous with the wetland, for at least 33 ft (10 m) ____Stable steep banks of fine material that might be used by beaver or muskrat for denning (> 30 degree slope) OR signs of recent beaver activity are present *(cut shrubs or trees that have not yet weathered where wood is exposed)* __X__At least ¼ ac of thin-stemmed persistent plants or woody branches are present in areas that are permanently or seasonally inundated *(structures for egg-laying by amphibians)* __X__Invasive plants cover less than 25% of the wetland area in every stratum of plants (*see H 1.1 for list of strata*)	2
Total for H 1 — Add the points in the boxes above	4

Rating of Site Potential If score is:___**15-18 = H** ___**7-14 = M** __X__**0-6 = L** (L) *Record the rating on the first page*

H 2.0. Does the landscape have the potential to support the habitat functions of the site?	
H 2.1. Accessible habitat (include *only habitat that directly abuts wetland unit*). *Calculate:* ±15% % undisturbed habitat___ + [(% moderate and low intensity land uses)/2]__/__ = ±15% % If total accessible habitat is: > 1/3 (33.3%) of 1 km Polygon — points = 3 20-33% of 1 km Polygon — points = 2 10-19% of 1 km Polygon — points = (1) < 10% of 1 km Polygon — points = 0	1
H 2.2. Undisturbed habitat in 1 km Polygon around the wetland. *Calculate:* ±10 % undisturbed habitat___ + [(% moderate and low intensity land uses)/2]__/__ = 10 % Undisturbed habitat > 50% of Polygon — points = 3 Undisturbed habitat 10-50% and in 1-3 patches — points = 2 Undisturbed habitat 10-50% and > 3 patches — points = (1) Undisturbed habitat < 10% of 1 km Polygon — points = 0	1
H 2.3. Land use intensity in 1 km Polygon: If > 50% of 1 km Polygon is high intensity land use — points = (- 2) ≤ 50% of 1 km Polygon is high intensity — points = 0	-2
Total for H 2 — Add the points in the boxes above	0

Rating of Landscape Potential If score is:___**4-6 = H** ___**1-3 = M** __X__**< 1 = L** (L) *Record the rating on the first page*

H 3.0. Is the habitat provided by the site valuable to society?	
H 3.1. Does the site provide habitat for species valued in laws, regulations, or policies? *Choose only the highest score that applies to the wetland being rated.* Site meets ANY of the following criteria: — points = 2 — It has 3 or more priority habitats within 100 m (see next page) — It provides habitat for Threatened or Endangered species (any plant or animal on the state or federal lists) — It is mapped as a location for an individual WDFW priority species — It is a Wetland of High Conservation Value as determined by the Department of Natural Resources — It has been categorized as an important habitat site in a local or regional comprehensive plan, in a Shoreline Master Plan, or in a watershed plan Site has 1 or 2 priority habitats (listed on next page) within 100 m — points = (1) Site does not meet any of the criteria above — points = 0	1

Rating of Value If score is:___**2 = H** __X__**1 = M** ___**0 = L** (M) *Record the rating on the first page*

Wetland name or number _____

WDFW Priority Habitats

Priority habitats listed by WDFW (see complete descriptions of WDFW priority habitats, and the counties in which they can be found, in: Washington Department of Fish and Wildlife. 2008. Priority Habitat and Species List. Olympia, Washington. 177 pp. http://wdfw.wa.gov/publications/00165/wdfw00165.pdf or access the list from here: http://wdfw.wa.gov/conservation/phs/list/)

Count how many of the following priority habitats are within 330 ft (100 m) of the wetland unit: ***NOTE:*** *This question is independent of the land use between the wetland unit and the priority habitat.*

— **Aspen Stands:** Pure or mixed stands of aspen greater than 1 ac (0.4 ha).

— **Biodiversity Areas and Corridors**: Areas of habitat that are relatively important to various species of native fish and wildlife (*full descriptions in WDFW PHS report*).

— **Herbaceous Balds:** Variable size patches of grass and forbs on shallow soils over bedrock.

— **Old-growth/Mature forests:** Old-growth west of Cascade crest – Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) > 32 in (81 cm) dbh or > 200 years of age. Mature forests – Stands with average diameters exceeding 21 in (53 cm) dbh; crown cover may be less than 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80-200 years old west of the Cascade crest.

— **Oregon White Oak:** Woodland stands of pure oak or oak/conifer associations where canopy coverage of the oak component is important (*full descriptions in WDFW PHS report p. 158 – see web link above*).

I **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other.

— **Westside Prairies:** Herbaceous, non-forested plant communities that can either take the form of a dry prairie or a wet prairie (*full descriptions in WDFW PHS report p. 161 – see web link above*).

✓ **Instream:** The combination of physical, biological, and chemical processes and conditions that interact to provide functional life history requirements for instream fish and wildlife resources.

— **Nearshore**: Relatively undisturbed nearshore habitats. These include Coastal Nearshore, Open Coast Nearshore, and Puget Sound Nearshore. (*full descriptions of habitats and the definition of relatively undisturbed are in WDFW report – see web link on previous page).*

— **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages under the earth in soils, rock, ice, or other geological formations and is large enough to contain a human.

— **Cliffs:** Greater than 25 ft (7.6 m) high and occurring below 5000 ft elevation.

— **Talus:** Homogenous areas of rock rubble ranging in average size 0.5 - 6.5 ft (0.15 - 2.0 m), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs.

— **Snags and Logs:** Trees are considered snags if they are dead or dying and exhibit sufficient decay characteristics to enable cavity excavation/use by wildlife. Priority snags have a diameter at breast height of > 20 in (51 cm) in western Washington and are > 6.5 ft (2 m) in height. Priority logs are > 12 in (30 cm) in diameter at the largest end, and > 20 ft (6 m) long.

Note: All vegetated wetlands are by definition a priority habitat but are not included in this list because they are addressed elsewhere.

Wetland name or number B2

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Wetland Type *Check off any criteria that apply to the wetland. Circle the category when the appropriate criteria are met.*	**Category**
SC 1.0. Estuarine wetlands Does the wetland meet the following criteria for Estuarine wetlands? — The dominant water regime is tidal, — Vegetated, and — With a salinity greater than 0.5 ppt Yes –Go to **SC 1.1** (No) = **Not an estuarine wetland**	
SC 1.1. Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? Yes = **Category I** No - Go to **SC 1.2**	**Cat. I**
SC 1.2. Is the wetland unit at least 1 ac in size and meets at least two of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. (If non-native species are *Spartina*, see page 25) — At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. — The wetland has at least two of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands. Yes = **Category I** No = **Category II**	**Cat. I** **Cat. II**
SC 2.0. Wetlands of High Conservation Value (WHCV) SC 2.1. Has the WA Department of Natural Resources updated their website to include the list of Wetlands of High Conservation Value? Yes – Go to **SC 2.2** No – Go to **SC 2.3** SC 2.2. Is the wetland listed on the WDNR database as a Wetland of High Conservation Value? Yes = **Category I** (No) = **Not a WHCV** SC 2.3. Is the wetland in a Section/Township/Range that contains a Natural Heritage wetland? http://www1.dnr.wa.gov/nhp/refdesk/datasearch/wnhpwetlands.pdf Yes – **Contact WNHP/WDNR and go to SC 2.4** No = **Not a WHCV** SC 2.4. Has WDNR identified the wetland within the S/T/R as a Wetland of High Conservation Value and listed it on their website? Yes = **Category I** No = **Not a WHCV**	**Cat. I**
SC 3.0. Bogs Does the wetland (or any part of the unit) meet both the criteria for soils and vegetation in bogs? *Use the key below.* ***If you answer YES you will still need to rate the wetland based on its functions.*** SC 3.1. Does an area within the wetland unit have organic soil horizons, either peats or mucks, that compose 16 in or more of the first 32 in of the soil profile? Yes – Go to **SC 3.3** No – Go to **SC 3.2** SC 3.2. Does an area within the wetland unit have organic soils, either peats or mucks, that are less than 16 in deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on top of a lake or pond? Yes – Go to **SC 3.3** (No) = **Is not a bog** SC 3.3. Does an area with peats or mucks have more than 70% cover of mosses at ground level, AND at least a 30% cover of plant species listed in Table 4? Yes = **Is a Category I bog** No – Go to **SC 3.4** **NOTE:** If you are uncertain about the extent of mosses in the understory, you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16 in deep. If the pH is less than 5.0 and the plant species in Table 4 are present, the wetland is a bog. SC 3.4. Is an area with peats or mucks forested (> 30% cover) with Sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Engelmann spruce, or western white pine, AND any of the species (or combination of species) listed in Table 4 provide more than 30% of the cover under the canopy? Yes = **Is a Category I bog** No = **Is not a bog**	**Cat. I**

Wetland name or number B-2

SC 4.0. Forested Wetlands Does the wetland have at least 1 contiguous acre of forest that meets one of these criteria for the WA Department of Fish and Wildlife's forests as priority habitats? ***If you answer YES you will still need to rate the wetland based on its functions.*** — **Old-growth forests** (west of Cascade crest): Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/ac (20 trees/ha) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 in (81 cm) or more. — **Mature forests** (west of the Cascade Crest): Stands where the largest trees are 80- 200 years old OR the species that make up the canopy have an average diameter (dbh) exceeding 21 in (53 cm). Yes = **Category I** (No) = **Not a forested wetland for this section**	**Cat. I**
SC 5.0. Wetlands in Coastal Lagoons Does the wetland meet all of the following criteria of a wetland in a coastal lagoon? — The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks — The lagoon in which the wetland is located contains ponded water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon *(needs to be measured near the bottom)* Yes – Go to **SC 5.1** (No) = **Not a wetland in a coastal lagoon** SC 5.1. Does the wetland meet all of the following three conditions? — The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of aggressive, opportunistic plant species (see list of species on p. 100). — At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. — The wetland is larger than $^{1}/_{10}$ ac (4350 ft^2) Yes = **Category I** No = **Category II**	**Cat. I** **Cat. II**
SC 6.0. Interdunal Wetlands Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ***If you answer yes you will still need to rate the wetland based on its habitat functions.*** In practical terms that means the following geographic areas: — Long Beach Peninsula: Lands west of SR 103 — Grayland-Westport: Lands west of SR 105 — Ocean Shores-Copalis: Lands west of SR 115 and SR 109 Yes – Go to **SC 6.1** (No) = **not an interdunal wetland for rating** SC 6.1. Is the wetland 1 ac or larger and scores an 8 or 9 for the habitat functions on the form (rates H,H,H or H,H,M for the three aspects of function)? Yes = **Category I** No – Go to **SC 6.2** SC 6.2. Is the wetland 1 ac or larger, or is it in a mosaic of wetlands that is 1 ac or larger? Yes = **Category II** No – Go to **SC 6.3** SC 6.3. Is the unit between 0.1 and 1 ac, or is it in a mosaic of wetlands that is between 0.1 and 1 ac? Yes = **Category III** No = **Category IV**	**Cat I** **Cat. II** **Cat. III** **Cat. IV**
Category of wetland based on Special Characteristics If you answered No for all types, enter "Not Applicable" on Summary Form	N/A

Notes	Source Date	Mgmt Recommendations				

DISCLAIMER. This report includes information that the Washington Department of Fish and Wildlife (WDFW) maintains in a central computer database. It is not an attempt to provide you with an official agency response as to the impacts of your project on fish and wildlife. This information only documents the location of fish and wildlife resources to the best of our knowledge. It is not a complete inventory and it is important to note that fish and wildlife resources may occur in areas not currently known to WDFW biologists, or in areas for which comprehensive surveys have not been conducted. Site specific surveys are frequently necesssary to rule out the presence of priority resources. Locations of fish and wildlife resources are subject to vraition caused by disturbance, changes in season and weather, and other factors. WDFW does not recommend using reports more than six months old.

BORING LOGS

Maul Foster & Alongi, Inc.

Geologic Borehole Log/Well Construction

Project Number	Well Number	Sheet
1044.02.13	**RAU1-01**	**1 of 1**

Project Name	**Upland RI -- Grays Harbor Historical Seaport Authority**	TOC Elevation (feet)	
Project Location	**500 N Custer Street, Aberdeen, Washington**	Surface Elevation (feet)	
Start/End Date	**12/2/2019 to 12/2/2019**	Northing	
Driller/Equipment	**Holt Services Inc./Geoprobe 7822DT**	Easting	
Geologist/Engineer	**E. Hess**	Hole Depth	**10.0-feet**
Sample Method	**Macro-core**	Outer Hole Diam	**2.25-inch**

Depth (feet, BGS)	Well Details	Sample Data: Interval	Percent Recovery	Collection Method	Number	Name (Type)	Blows/6"	Lithologic Column	Soil Description
1			**60**	**GP**					*0 to 1.8 feet: SILTY SAND (SM); 20% fines; 50% sand; 30% gravel; grass at surface; black with faint petroleum hydrocarbon-like odor at 1.1 to 1.2 feet and 1.4 to 1.8 feet.*
2						**PID = 0 ppm**			
3						**PID = 0 ppm RAU1-01-SO-2.4**			*1.8 to 3.0 feet: SANDY SILT (ML); bluish gray; 60% fines; 40% sand, fine to medium; moist.*
4									*3.0 to 5.0 feet: No recovery.*
5									
6			**50**	**GW GP**					*5.0 to 6.5 feet: SANDY SILT (ML); bluish gray; 60% fines; 40% sand, fine to coarse; trace gravel; wet.*
7						**PID = 0 ppm**			*6.5 to 7.0 feet: SILTY GRAVEL (GM); gray; 30% fines; 20% sand; 50% gravel, subangular; moist.*
8						**RAU1-01-GW-7.5**			*7.0 to 7.5 feet: SANDY GRAVEL with SILT (GW-GM); dark gray; 10% fines; 30% sand; 60% gravel; wet. Wood in shoe at base of borehole.*
9									*7.5 to 10.0 feet: No recovery.*
10									

Total Depth = 10.0 feet bgs.

Borehole Completion Details:
0 to 10.0 feet: 2.25-inch borehole.
0 to 10.0 feet: Bentonite chips hydrated with potable water.

NOTES: *1) bgs = below ground surface. 2) GP = geoprobe. 3) ppm = parts per million. 4) PID = Photo-ionization detector. 5) Temporary polyvinyl chloride screen from 5.0 to 10.0 feet bgs, indicated by dashed graphic in the interval column. 6) GW = groundwater sample. 7) Depths are approximate and relative to feet bgs.*

▽ ***Water level measurement is 5.0 feet bgs, observed in macrocore during drilling.***

▼ ***Water level 4.29 feet bgs, measured after temporary well installation.***

Geologist/Engineer	**M. Pollock**	Hole Depth	**15.0-feet**
Sample Method	**Macro-core**	Outer Hole Diam	**2.25-inch**

Depth (feet, BGS)	Well Details	Sample Data: Interval	Percent Recovery	Collection Method	Number	Name (Type)	Blows/6"	Lithologic Column	Soil Description
1			**60**	**GP**					0 to 1.0 feet: ASPHALT.
									1.0 to 1.8 feet: GRAVEL with SILT (GW-GM); gray; 10% fines; 10% sand, fine to medium; 80% gravel, fine to medium; moist.
2									1.8 to 2.8 feet: SILTY SAND (SM); brownish gray; 20% fines; 80% sand, medium to coarse; trace gravel; moist.
3						**RAU4-12-SO-2.4**			2.8 to 3.0 feet: SILTY SAND (SM); brown; 30% fines; 60% sand, medium to coarse; 10% gravel, fine; trace wood; moist.
4									3.0 to 5.0 feet: No recovery.
5			**75**	**GP**					5.0 to 8.8 feet: SILTY SAND (SM); brown; 30% fines; 60% sand, medium to coarse; 10% gravel, fine; trace wood; moist.
6									
7									
8									
9									8.8 to 10.0 feet: No recovery.
10			**100**	**GP**					10.0 to 12.5 feet: SILTY SAND (SM); brown; 30% fines; 60% sand, medium to coarse; 10% gravel, fine; trace wood; moist.
11									
12									
13									12.5 to 15.0 feet: SILT (ML); gray; 95% fines, low plasticity; 5% sand, fine; trace rootlets; moist.
14									
15									Total Depth = 15.0 feet bgs.

<u>Borehole Completion Details:</u>
0 to 15.0 feet bgs: 2.25-inch borehole.
0 to 1.0 feet bgs: Concrete.
1.0 to 2.7 feet bgs: Bentonite chips hydrated with potable water.
2.7 to 15.0 feet bgs: 10x20 silica filter pack sand.

<u>Monitoring Well Completion Details:</u>
0.3 to 4.3 feet bgs: Flush mount monument. 2-inch diameter, PVC schedule 40, flush threaded, riser pipe.
4.3 to 14.45 feet bgs: 2-inch diameter, PVC schedule 40, 0.010-inch machine slotted, pre-pack well screen.
14.45 to 14.7 feet bgs: 2-inch diameter, PVC, schedule 40, flush threaded, end cap.

Washington Well Identification BME558

NOTES: 1) bgs = below ground surface. 2) GP = geoprobe. 3) PVC = polyvinyl chloride. 4) Depths are approximate and relative to feet bgs.

Appendix A. Geophysical Survey Methods

Introduction

Pacific Geophysics conducted a geophysical survey at the Aberdeen Seaport property formerly owned by Weyerhaeuser and operated as a lumber mill. The survey was conducted to detect underground storage tanks (USTs), other metallic objects or anomalous areas, and utility corridors across the majority of the property. An additional goal was to clear several proposed borehole locations of underground obstructions across the site.

A magnetometer, hand-held metal detectors and ground penetrating radar (GPR) were used for the survey.

This report includes descriptions of the site and scope of work, methodology and results of the geophysical survey.

Site Description

The magnetic survey was conducted across the areas shown in Figure 1. The west and southwest asphalt lots (West), the south asphalt lot (South), and the asphalt areas around and east of the east building (East) now used as a truss-manufacturing facility. From personal communication with the manager of the truss-making facility, an auto wrecking/salvage facility occupied part of the site in the past.

Many metallic surface objects were seen across the site, including chain-link fences, piled building debris, a vehicle scale, poles, bollards, catch basins, and vaults. These features, including the buildings, interfered with the magnetic survey. Buried metallic objects of interest located near or under these objects may have been missed because of the magnetic noise produced by the surface objects.

No surface evidence of USTs, like fill ports and vent pipes, was seen in the areas covered with the magnetometer. During the clearance of one of the boreholes, a UST vent pipe and fuel pump piping were seen by the guard shack.

Scope of Work

The project included the following scopes:

- To detect possible underground storage tanks (USTs) and other metallic objects including underground infrastructure,
- To detect anomalous fill areas containing ferrous metal,
- To detect utility corridors,
- To clear several proposed borehole locations of buried obstructions for drilling.

Jeff Mann and Nikos Tzetos of Pacific Geophysics conducted the survey for Ms. Emily Hess of MFA in October 2019. This report was written by Nikos Tzetos, reviewed by Jeff Mann and emailed to Ms. Hess on November 11, 2019.

Geophysical Equipment and Survey Procedures

General Procedures:

A magnetometer is the first instrument used to investigate a site for subsurface ferrous metallic objects because it enables the operator to rapidly scan the subsurface. Data are collected across an accurately measured survey grid established on the site. For this particular survey, the magnetometer was coupled to a Juniper Systems Geode 2 sub-meter-accuracy GPS unit.

Upon completing the data acquisition phase of the survey, contour maps of the earth's local magnetic field are produced. Small, handheld metal detectors are then used to more thoroughly investigate the magnetic anomalies detected with the magnetometer. These instruments are excellent at detecting and characterizing buried metal objects; however, they do not record data, and are not adequate to survey large areas.

Ground Penetrating Radar (GPR) is usually the last method used to investigate a site for buried metallic objects. The shape of radar reflections produced by buried objects may assist in the interpretation of magnetic anomalies. GPR is the only instrument capable of detecting disturbed-soil zones caused by excavations or UST pits.

Magnetic Survey:

At this site, a Geometrics G858 Portable Cesium Magnetometer was used to acquire the magnetic data. Magnetic data positions were accurately located with the Geode GPS. Traverses were made along survey lines spaced approximately every 5 feet; however, data were collected wherever the operator walked, for example, around piles of building material and small buildings. All data shown in the following figures are shown in the UTM coordinate system in feet.

Colored contour maps showing the earth's local magnetic field at the time of the survey were created and printed in the field. Data were contoured and examined using a contour interval of 250 nT (nanoTesla). Magnetic anomalies higher in amplitude than the normal local magnetic background are shown in red, and are usually found over areas where ferrous objects are located below the sensor, carried at a height of about 3 feet. The objects may be surface objects such as manholes or other surface features, or buried objects of interest, such as USTs, drums, pipes and debris. Magnetic anomalies at or below the amplitude of the local magnetic field are shown in blue, and are caused by ferrous objects located above the sensor. Buildings, fences, metal posts, and cars, usually produce magnetic lows. Depending on their size and orientation, large buried objects may produce both positive (red) and negative (blue) anomalies.

Surface objects can produce significant magnetic interference that can conceal buried objects of interest. The metallic objects that produced significant magnetic interference at this site are noted above in the Site Description.

Hand-held instruments:

An Aquatronics A6 Tracer and a Schonstedt GA92XTd magnetic gradiometer were used to locate and investigate the anomalies detected by the magnetometer. These

instruments can pinpoint the peaks and troughs of the anomalies, and in many cases determine if an object is linear (pipe or utility) or three-dimensional (UST).

The transmitter unit of a Radio Detection RD8000 PDL pipe and cable detector may be used to electrically charge an accessible metal pipe or utility. The charged object can then be “traced” using the receiver unit. The receiver can also detect some metallic features indirectly, using the system’s “radio” function.

Ground Penetrating Radar:

Following the hand-held instrument survey, a GSSI SIR-2000 GPR system coupled to radar antennas of various frequencies may be used to investigate suspicious magnetic anomalies. Radar data collected across the anomalies may give clues to the size and shape of the buried metallic objects producing them. A GSSI 400-MHz antenna was used in this survey.

The collection of radar data is very time consuming; therefore, GPR is not a cost-effective method to blindly scan a site for buried metallic objects; however, it is one of the only methods capable of detecting non-metallic features, including PVC and clay pipes, septic tanks, drywells and trenches and excavations. GPR was used at this site to detect disturbed-soil zones and to clear boreholes.

Additional information regarding these instruments, methods, surveys and limitations with references can be found in the Appendix.

Results

West Areas (Figure 2):
Magnetic data produced with this survey are shown as filled and colored contours, contoured at an interval of 500 nT (nanoTesla).

Several magnetic anomalies were investigated. Most are interpreted to be caused by non-three-dimensional, or small 3D objects. Several pipes and concrete pads were detected. Anomaly A is caused by a concrete vault.

Two prominent groups of anomalies can be seen in Figure 2:

Anomalies labeled B are possibly caused by remnants of a building. Several pipes were detected within this footprint and are shown in the figure.

Anomalies labeled C were readily detected with the Schonstedt but did not with the Tracer, which is an unusual occurrence. It is possible that non-contiguous metallic debris (small, individual pieces of ferrous metal) is causing them. GPR traverses were made across the anomalies and an area with varying degrees of disturbance was detected.

At the time of the survey, a large puddle limited access to the southeast corner of this area, labeled on Figure 2 a puddle extent.

A conductive pipe was detected south of the swales. It extends from a vault to the east, up to the western property line (Figure 2). Several pipes trending mostly WSW-

ENE were detected in the area north of the swales. A known drain pipe between catch basins was detected and is shown in the figure. Also shown are pipes of unknown function between the concrete pads in the north of this survey area.

South Area (Figure 3):
This area appeared to be fairly clean. Most anomalies are interpreted to be caused by surface metal, pipes, concrete pads, or small objects. Anomalies marked D1 appear to be caused by ferrous debris. The characteristics of this zone are similar to anomalies C above. Only the Schonstedt and magnetometer responded to the ferrous metal comprising the zone. No response from the Tracer was detected across this anomaly. The anomaly extends farther to the east.

East Area, Lower Portion (Figure 4):
No anomalies caused by buried 3D objects were detected in this area. Anomalies D1 discussed above continue into D2. Anomalies D and E are interpreted to be caused by buried metallic debris.

Anomalies F, G, and H could only be detected with the Schonstedt hand-held magnetometer indicating they are caused by ferrous debris. No distinct objects or soil disturbances were seen in radar profiles. These anomalies are not caused by USTs. A metallic pipe, possibly a drain to the slough, was detected in this area (please see Figure 4).

Anomalies I are caused by surface objects and/or the building.

Several pipes are shown in Figures 3 and 4. They were detected during the borehole clearance process. A known storm pipe was detected between catch basins; it extends to the east toward the slough but it could not be determined if it drains in the slough. Other pipes trending in the same WSW-ENE direction were detected and are shown in the figures. One may be a water line. Two are extending toward the slough. It is unknown whether they exit the property at the slough.

East Area, Upper Portion (Figure 5):
A large metal structure on a concrete pad caused anomaly J. Two sets of large bollards/lumber stops caused a very large negative anomaly (K). Zones containing ferrous debris with the same characteristics as anomalies C, D1, D2, and E were detected in the south corner of this area (L) and at the south end of anomaly K. Several other anomalies were investigated and are caused by pipes and surface objects.

Borehole Clearance:
Fifty two proposed borehole locations were cleared using GPR and hand-held instruments across the entire property.

During the clearance of RAU5-01, a UST vent pipe and fuel pump piping were seen by the guard shack. The pipes were traced a few feet toward the west, to an asphalt patch located under a covered bulletin board. No metallic object was detected under the patch. This may be the former location of a fuel UST. A possible tank excavation was detected, whose edges coincided with a patch seen on the surface (asterisk, Figure 1).

Figure 6 is an overlay of the resulting magnetic maps on a base photo from Google Earth.

Conclusion

No USTs were detected with the magnetic survey across three areas at the former lumber mill. Most anomalies detected with the survey were caused by surface objects, piping and concrete pads.

Seven large areas containing ferrous debris were detected.

Fifty two borehole locations were cleared with hand-held detectors and GPR.

Limitations

The conclusions presented in this report were based upon widely accepted geophysical principles, methods and equipment. This survey was conducted with limited knowledge of the site, the site history and the subsurface conditions.

The goal of near-surface geophysics is to provide a rapid means of characterizing the subsurface using non-intrusive methods. Conclusions based upon these methods are generally reliable; however, due to the inherent ambiguity of the methods, no single interpretation of the data can be made. As an example, rocks and roots produce radar reflections that may appear the same as pipes and tanks.

Under reasonable site conditions, geophysical surveys are good at detecting changes in the subsurface caused by manmade objects or changes in subsurface conditions, but they are poor at identifying those objects or subsurface conditions.

Objects of interest are not always detectable due to surface and subsurface conditions. The deeper an object is buried, the more difficult it is to detect, and the less accurately it can be located.

The only way to see an object is to physically expose it.

Appendix A. Geophysical Survey Methods

Magnetometer Surveys

Small disturbances in the Earth's local magnetic field are called "magnetic anomalies". These may be caused by naturally occurring features such as metallic mineral ore bodies, or from manmade features such as metal buildings, vehicles, fences, and underground storage tanks. The magnetometer only detects changes produced by ferrous objects. Aluminum and brass are non-ferrous metals and cannot be detected using a magnetometer.

A magnetometer is an electronic instrument designed to detect small changes in the Earth's local magnetic field. Over the years different technologies have been used in magnetometers. The Geometrics G-858 Portable Cesium Magnetometer used to collect magnetic data for Pacific Geophysics uses one of the most recent methods to detect magnetic anomalies. A detailed discussion describing the method this unit uses is available at Geometrics.com.

This magnetometer enables the operator to collect data rapidly and continuously rather than the older instruments that collected data at discreet points only. The G-858 is carried by hand across the site. The sensor is carried at waist level. Typically individual data points collected at normal walking speed are about 6" apart along survey lines usually 5 feet apart, depending on the dimensions of the target objects.

It is critical to know the exact location of each data point so that if an anomaly is detected it can be accurately plotted on a magnetic contour map. At most small sites, data are collected along straight, parallel survey lines set up on the site before the data collection stage begins. For very large, complex sites, the G-858 can be connected to a Global Positioning System (GPS) antenna which allows the operator to collect accurately-located data without establishing a survey grid. With GPS, data are collected and positioned wherever the operator walks. A limitation using GPS is that the GPS antenna must have line of sight with the GPS satellites. Data can be mislocated if the GPS antenna is under trees or near tall buildings.

Data are stored in the unit's memory for later downloading and processing. A magnetic contour map of the data is plotted in the field. Geographical features are plotted on the map. Magnetic anomalies appearing to be caused by objects of interest are then investigated on the site using several small hand-held metal detectors. If an object appears to be a possible object of interest, it may be investigated with GPR.

Magnetic contour maps may be printed in color in order to highlight anomalies caused by ferrous objects located under the magnetic sensor. Usually, ferrous objects situated below the sensor produce magnetic "highs" and anomalies located above the sensor produce magnetic "lows". Magnetic highs are of interest to the operator since most objects of interest are located underground.

Depending on the orientation, shape and mass of a metallic object, a high/low pair of magnetic anomalies may be present. In the northern hemisphere the magnetic low is located north of the object and the magnetic high toward the south. The object producing the anomaly is located part way between the high and the low anomalies.

Magnetometer surveys have limitations. Magnetometers only detect objects made of ferrous (iron-containing) metal. Large ferrous objects (buildings, cars, fences, etc.) within several feet of the magnetometer create interference that may hide the anomaly produced by a nearby object of interest.

Ground Penetrating Radar

A Geophysical Survey Systems, Inc. (GSSI) SIR-2000 GPR system coupled to GSSI antennas of various central frequencies is used to obtain the radar data for our surveys.

GPR antennas both transmit and receive electromagnetic energy. EM energy is transmitted into the material the antenna passes over. A portion of that energy is reflected back to the antenna and amplified. Reflections are displayed in real-time in a continuous cross section. Reflections are produced where there is a sufficient electrical contrast between two materials. Changes in the electrical properties (namely the dielectric constant) that produce radar reflections are caused by changes in the moisture content, porosity, mineralogy, and texture of the material. Metallic objects of interest exhibit a strong electrical contrast with the surrounding material and thus produce relatively strong reflections. Non-metallic objects of interest (septic tanks, cesspools, dry wells, and PVC and clay tile pipes) are not always good reflectors.

Radar data are ambiguous. It can be difficult to distinguish the reflection produced by an object of interest from the reflection caused by some natural feature. Rocks or tree roots have reflections that appear similar to reflections from pipes. In concrete investigations reflections produced by metal rebar look exactly like those from electrical conduit or post-tension cables. Objects with too small an electrical contrast may produce no reflections at all and may be missed. Target objects buried below objects with contrasting properties that also produce reflections may be missed (e.g. USTs below roots, concrete pieces, pipes or rocks). If an object of interest like a UST is buried below the depth of penetration of the radar signal, it will be missed.

In addition to interpreting ambiguous data, radar has several limitations that cannot be controlled by the operator. The radar signal is severely attenuated by electrically conductive material, including wet, clay-rich soil and reinforced concrete. The quality of the data is affected by the surface conditions over which the antenna is pulled. Ideally the antenna should rest firmly on a smooth surface. Rough terrain and tall grass reduce the quality of radar data.

It is the job of an experienced interpreter to examine the GPR profiles and deduce if reflections are from objects of interest. A GPR interpreter cannot see underground, but can only interpret reflections based on experience.

The only way to truly identify an object is to excavate.

Hand-held Metal detectors

Two small, non-recording metal detectors are used to locate suspect magnetic anomalies detected using the G-858 Magnetometer in order to determine the likely cause of the anomaly. First, the magnetic contour map and a Schonstedt Magnetic Gradiometer are used to locate the center of the magnetic anomalies.

Once the anomaly is located an Aqua-Tronics Tracer is used to determine if the object producing the anomaly is a possible object of interest. Most anomalies are at least in part produced by features observed on the ground surface.

Schonstedt Magnetic Gradiometer: This magnetometer has two magnetic sensors separated vertically by 10". The magnetic field surrounding a ferrous object is strongest near the object and decreases rapidly as the distance increases. If the magnitude measured by the sensor located in the tip of the Schonstedt is very high, and the magnetic field measured by the sensor located farther up the shaft of the Schonstedt is low, there is a large vertical magnetic gradient and the instrument responds with a loud whistle indicating the object is near the surface. If there is a small difference in the magnitudes measured by the two sensors, the object is deeper. The instrument responds with a softer tone. A discussion of this instrument is available at Schonstedt.com.

Aqua-Tronics A-6 Tracer: The Aqua-Tronics A-6 Tracer uses a different method of detecting metallic objects. This instrument measures the electrical conductivity of a metal object. It is capable of detecting any electrically conductive metal, including non-ferrous aluminum and brass. The Tracer is capable of detecting three-dimensional objects as well as pipes.

The Tracer consists of a transmitter coil and a receiver coil. In the absence of any electrically conductive material in the vicinity of the Tracer, the electromagnetic field around each coil is balanced.

Basically the electromagnetic field produced by the transmitter induces an electric current into the area surrounding the instrument. Nearby conductive objects distort the EM field. The balance between the two coils is disturbed and the instrument produces an audible tone and meter indication.

Radio Detection RD8000 PDL pipe and cable detector: This instrument may be used to detect buried, conductive pipes and utilities. It consists of a transmitter and a receiver and can be used in two configurations.

The transmitter may be used to directly apply a small electrical current to exposed, electrically conductive pipes and utilities. The RD receiver is then able to "trace" the underground portion of the pipe or utility, under some conditions for several hundred feet. The transmitter can also induce an electrical current into buried pipes and utilities where direct contact is not available.

The receiver can also be used alone. It has the capability to locate pipes and utilities by detecting the very small electrical currents induced into the features by nearby AM/FM radio stations.

The receiver also has an AC power function that may be used to detect underground power lines.

Work Order Case Narrative

Sample receipt

Samples as listed on the preceding page were received December 6, 2019 under ARI work order 19L0091. For details regarding sample receipt, please refer to the Cooler Receipt Form.

Sulfide - Method SM4500

The samples were prepared and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

The method blank was clean at the reporting limits.

The LCS percent recoveries were within control limits.

The matrix spike percent recoveries were within QC limits.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

Work Order Case Narrative

Sample receipt

Samples as listed on the preceding page were received December 10, 2019 under ARI work order 19L0152. For details regarding sample receipt, please refer to the Cooler Receipt Form.

Sulfide - Method SM4500

The samples were prepared and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

The method blank was clean at the reporting limits.

The LCS has low percent recovery. The LCS was re-read to verify with data reported as is. Possible low bias. No remaining volume for a reanalysis. No further corrective action was taken.

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Notes and Definitions

*	Flagged value is not within established control limits.
D	The reported value is from a dilution
U	This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
[2C]	Indicates this result was quantified on the second column on a dual column analysis.

Certificate of Analysis

Project Name:	**Water Sampling**	Workorder:	**3078114**
Purchase Order:		Workorder ID:	**A9L0191**

Dear Mr. Nerenberg:

Enclosed are the analytical results for samples received by the laboratory on Tuesday, December 31, 2019.

The ALS Environmental laboratory in Middletown, Pennsylvania is a National Environmental Laboratory Accreditation Program (NELAP) accredited laboratory and as such, certifies that all applicable test results meet the requirements of NELAP.

If you have any questions regarding this certificate of analysis, please contact Ms. Shannon Butler (Project Coordinator) at (717) 944-5541.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program and any applicable state requirements. The test results meet requirements of the current NELAP standards or state requirements, where applicable. For a specific list of accredited analytes, refer to the certifications section of the ALS website at www.alsglobal.com/en/Our-Services/Life-Sciences/Environmental/Downloads.

This laboratory report may not be reproduced, except in full, without the written approval of ALS Environmental.

ALS Spring City: 10 Riverside Drive, Spring City, PA 19475 610-948-4903

This page is included as part of the Analytical Report and must be retained as a permanent record thereof.

SAMPLE SUMMARY

Workorder: 3078114 A9L0191

Notes

-- Samples collected by ALS personnel are done so in accordance with the procedures set forth in the ALS Field Sampling Plan (20 - Field Services Sampling Plan).
-- All Waste Water analyses comply with methodology requirements of 40 CFR Part 136.
-- All Drinking Water analyses comply with methodology requirements of 40 CFR Part 141.
-- Unless otherwise noted, all quantitative results for soils are reported on a dry weight basis.
-- The Chain of Custody document is included as part of this report.
-- All Library Search analytes should be regarded as tentative identifications based on the presumptive evidence of the mass spectra. Concentrations reported are estimated values.
-- Parameters identified as "analyze immediately" require analysis within 15 minutes of collection. Any "analyze immediately" parameters not listed under the header "Field Parameters" are preformed in the laboratory and are therefore analyzed out of hold time.
-- Method references listed on this report beginning with the prefix “S” followed by a method number (such as S2310B-97) refer to methods from “Standard Methods for the Examination of Water and Wastewater”.
-- For microbiological analyses, the "Prepared" value is the date/time into the incubator and the "Analyzed" value is the date/time out the incubator.
-- An Analysis-Prep Method Cross Reference Table is included after Analytical Results & Qualifiers section in this report.

Standard Acronyms/Flags

J	Indicates an estimated value between the Method Detection Limit (MDL) and the Practical Quantitation Limit (PQL) for the analyte
U	Indicates that the analyte was Not Detected (ND)
N	Indicates presumptive evidence of the presence of a compound
MDL	Method Detection Limit
PQL	Practical Quantitation Limit
RDL	Reporting Detection Limit
ND	Not Detected - indicates that the analyte was Not Detected at the RDL
Cntr	Analysis was performed using this container
RegLmt	Regulatory Limit
LCS	Laboratory Control Sample
MS	Matrix Spike
MSD	Matrix Spike Duplicate
DUP	Sample Duplicate
%Rec	Percent Recovery
RPD	Relative Percent Difference
LOD	DoD Limit of Detection
LOQ	DoD Limit of Quantitation
DL	DoD Detection Limit
I	Indicates reported value is greater than or equal to the Method Detection Limit (MDL) but less than the Report Detection Limit (RDL)
(S)	Surrogate Compound
NC	Not Calculated
*	Result outside of QC limits

The recovery of the Matrix Spike (MS) associated to this analyte was outside of the control limits. The LCS was within established control limits.
The failed recovery of the MS may be due to sample matrix interferences.

1. Were airbills / tracking numbers present and recorded?	NONE	(YES)	NO
Tracking number: 1ZX472OR1590437654			
2. Are Custody Seals on shipping containers intact?	(NONE)	YES	NO
3. Are Custody Seals on sample containers intact?	(NONE)	YES	NO
4. Is there a COC (Chain-of-Custody) present?		(YES)	NO
5. Are the COC and bottle labels complete, legible and in agreement?		(YES)	NO
5a. Does the COC contain sample locations?		(YES)	NO
5b. Does the COC contain date and time of sample collection for all samples?		(YES)	NO
5c. Does the COC contain sample collectors name? collected by client		YES	(NO)
5d. Does the COC note the type(s) of preservation for all bottles?		(YES)	NO
5e. Does the COC note the number of bottles submitted for each sample?		(YES)	NO
5f. Does the COC note the type of sample, composite or grab? not provided		YES	(NO)
5g. Does the COC note the matrix of the sample(s)?		(YES)	NO
6. Are all aqueous samples requiring preservation preserved correctly?	N/A	(YES)	NO
7. Were all samples placed in the proper containers for the requested analyses, with sufficient volume?		(YES)	NO
8. Are all samples within holding times for the requested analyses?		(YES)	NO
9. Were all sample containers received intact and headspace free when required? (not broken, leaking, frozen, etc.)		(YES)	NO
10. Did we receive trip blanks (applies only for methods EPA 504, EPA 524.2 and 1631E (LL Hg)?	(N/A)	YES	NO
11. Were the samples received on ice?		(YES)	NO
12. Were sample temperatures measured at 0.0-6.0°C		(YES)	NO
13. Are the samples DW matrix ? If YES, fill out Reportable Drinking Water questions below		YES	(NO)
13a. Are the samples required for SDWA compliance reporting?	(N/A)	YES	NO
13b. Did the client provide a SDWA PWS ID#?	(N/A)	YES	NO
13c. Are all aqueous unpreserved SDWA samples pH 5-9?	(N/A)	YES	NO
13d. Did the client provide the SDWA sample location ID/Description?	(N/A)	YES	NO
13e. Did the client provide the SDWA sample type (D, E, R, C, P, S)?	(N/A)	YES	NO

RE: A9L0097 - Seaport Upland - 1044.02.13

Thank you for using Apex Laboratories. We greatly appreciate your business and strive to provide the highest quality services to the environmental industry.

Enclosed are the results of analyses for work order A9L0097, which was received by the laboratory on 12/4/2019 at 9:39:00AM.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: pnerenberg@apex-labs.com, or by phone at 503-718-2323.

Please note: All samples will be disposed of within 30 days of sample receipt, unless prior arrangements have been made.

ANALYTICAL CASE NARRATIVE

Work Order: A9L0097

Amended Report Revision 1: This report supersedes all previous reports.

Gasoline by NWTPH-Gx: Missing Result

The original report was missing a result for Gasoline by NWTPH-Gx for client sample "RAU1-12-GW-7.0" (A9L0097-39RE1).
The result is now included.
