Subject: Additional Soil Assessment and Cleanup Report
Former Alseth Auto Parts Site
618 – 105th Street SW, Everett, Washington 98204

Dear Mr. Hegger:

Noll Environmental, Inc., is pleased to submit this report documenting shallow soil removal and sample collection results from a former auto dismantling business located at the above-referenced site (Figure 1). It is our understanding that 105th Street Associates, LLC, recently purchased this property and plans to redevelop the site with multiple residences. Noll Environmental observed the removal of shallow soil at the site in June and July 2006. Nine soil samples were collected from scraped areas (about 0.3-foot below grade) and three samples were collected from the associated soil stockpile in June 2006. The samples were tested for petroleum hydrocarbons and metals. Six “hot” spots were identified and excavated for offsite disposal, and 13 confirmation samples were collected. At Ecology’s request, 16 additional soil samples were collected from the site in July 2006. Three “hot” spots were identified and excavated for offsite disposal, and 10 confirmation samples were collected. One confirmation sample exceeded the cleanup level for cadmium in soil, but the sample results met the Model Toxics Control Act (MTCA) statistical cleanup level for soil.

Background and Site Description

The property consists of three contiguous 0.43-acre lots (24, 25, and 26) of Olivia Park Division 2 (Snohomish County Tax Assessor parcels 00535300002400 through 00535300002600). A plat plan is included in Attachment 1. A vacant house is located on lot 26 and a metal garage/shop building is located on lot 24 (Figure 2). Snohomish County Tax Assessor records indicate the parcels were owned by Earl Alseth since at least July 1999. The address is 618 – 105th Street SW, Everett, Snohomish County, Washington 98204. The site is located in the SE quarter of the NW quarter of section 24, township 28 north, range 4 east. The site is bounded to the west, south, and east by

RECEIVED

AUG 16 2006

DEPT OF ECOLOGY

residences, and to the north by 105th Street SW (Figure 2). The site topography is flat, with some trees and shrubs.

Marsh Industrial Research (Marsh) of Fircrest, Washington, conducted a site cleanup and soil assessment for Alseth Auto Wrecking between December 2003 and August 2005. Several small structures (old house, office with attached storage, covered tear down area, and transmission rack) and various car bodies and parts were removed from the site by Marsh in 2003 and 2004. An unknown quantity of soil was excavated and stockpiled onsite in April 2004. Two samples (Stock Pile 1 and Stock Pile 2) were collected from the stockpiled soil and analyzed for total petroleum hydrocarbons (TPH) as diesel (TPH-D), TPH as oil (TPH-O), and metals. The samples contained cadmium (4.4 to 6.5 parts per million [ppm]) and lead (390 ppm) exceeding the MTCA Method A cleanup levels (Table 1).

Marsh excavated additional soil and collected eight discrete samples (72-20 A, 70-70 A, 110-120 A, 110-180 A, 40-190 A, 40-220 A, 65-235 A, and 40-263 A; Figure 2) and one soil stockpile sample (Stock Pile 3) in October 2004. Three samples (110-120 A, 40-190 A, and 40-263 A) and the soil stockpile sample contained cadmium (4.3 to 18 ppm) and lead (350 to 970 ppm) at concentrations exceeding MTCA Method A cleanup levels (Table 1). Sample 110-120 A also contained TPH-O (2,750 ppm) at a concentration exceeding the MTCA Method A cleanup level. One additional stockpile sample (Reject Pile) collected in November 2004 contained TPH-O (5,620 ppm), cadmium (12 ppm), and lead (600 ppm) at concentrations exceeding MTCA Method A cleanup levels.

Three shallow groundwater monitoring wells (MW 449, MW 450, and MW 451) were installed at the site by Environmental Services Network NW (ESN) of Lacey, Washington, in November 2004 (Figure 2). The wells were sampled for TPH as gasoline (TPH-G), TPH-D, TPH-O, BTEX (benzene, toluene, ethylbenzene, and total xylenes), and dissolved metals (arsenic, cadmium, chromium, and lead) in early December 2004. A groundwater sample collected from well MW 450 was also analyzed for PAHs (polycyclic aromatic hydrocarbons) and PCBs (polychlorinated biphenyls). All results were below the laboratory method detection limits. Marsh collected four discrete soil samples (By Well 450, 140-50, 180-50, and 60-100) in December 2004 (Figure 2). Two samples (140-50 and 60-100) contained cadmium (4.4 to 11 ppm) and lead (340 to 580 ppm) at concentrations exceeding MTCA Method A cleanup levels (Table 1).

Marsh collected a soil stockpile sample (Reject Pile) in May 2005, which contained cadmium (5.1 ppm) and lead (360 ppm) at concentrations exceeding the MTCA Method A cleanup levels (Table 1). Marsh excavated additional soil at the site in early June 2005 and collected eight discrete samples (120-20 B, 40-190 B, 65-180, 62-220, 62-225 Gravel, 50-150, 65-200, and 100-200) and three soil stockpile samples (North Pile, Pile 2, and North Pile). One discrete sample (62-225 Gravel) and two soil stockpile samples (North Pile and Pile 2) contained cadmium (2.8 to 5.8 ppm) at concentrations exceeding

the MTCA Method A cleanup level (Table 1). Samples 120-20 B and 40-190 B represent over-excavation and re-sampling results for previous samples 120-20 A and 40-190 A. Marsh collected 10 discrete samples (20-120 A, 40-120 A, 60-120 A, 30-140 A, 55-140 A, 20-170 A, 40-170 A, 60-170 A, 80-170 A, and 50-190 A) in late June 2005 (Figure 2). All results were below MTCA Method A cleanup levels (Table 1). Marsh coordinated the removal of about 600 cubic yards (886 tons) of impacted soil from the site for disposal at the Rinker Materials disposal facility in Everett, Washington, in June 2005.

Initial Vegetation Removal and Soil Sampling

Noll Environmental conducted a brief site walk on May 31, 2006. Site photos are included in Attachment 1. Noll Environmental was onsite on June 3, 2006, to observe the removal of site vegetation and shallow soil from the south end of the site and the area near the metal garage/shed, note any observed petroleum-stained soil, and collect soil samples from the exposed soil. Harvey's Dozing & Trucking of Snohomish, Washington, was the contract excavator. A small bulldozer was used to clear vegetation from the site and excavate shallow soil from the south portion of the property. Excavated soil was temporarily stockpiled south of the vacant site residence, near the south end of the rock access road (Figure 2). The soil pile was covered with plastic sheeting, pending lab results. Nine soil samples (#1 through #9) and three soil stockpile samples (SS-1 through SS-3) were collected from the site on June 3, 2006 (Figure 2). Soil samples were collected at about 0.3 feet below ground surface using clean stainless steel spoons and bowls. The samples were immediately transferred into clean laboratory supplied sample jars, which were properly labeled and placed into an iced cooler for transport to the laboratory.

Exposed soils consisted of brown gravelly silt with sand and brown clayey silt with gravel, including some debris (broken glass, plastic, metal, and brick fragments) and rootlets, at sample locations #1 and #2. Gray gravelly sand (fill) underlain by brown silt was encountered at sample locations #3 and #4. Brown clayey silt with gravel, yellowish mottling, and roots was encountered at sample location #5. Reddish brown sandy silt with gravel, yellowish mottling, roots, and some debris was encountered at sample locations #6, #7, and #9. Dark gray to black gravelly silt with sand and some debris was encountered at sample location #8. No petroleum staining, sheen, or hydrocarbon-like odor was noted at any of the sampling locations.

Collected soil samples were submitted to CCI Analytical Laboratory (CCI) in Everett, Washington, and analyzed for total petroleum hydrocarbons (TPH) in the diesel range (TPH-D) and oil range (TPH-O) using Northwest Method NWTPH-Dx, and MTCA 5 metals (arsenic, cadmium, chromium, lead, and mercury) using U. S. Environmental Protection Agency (EPA) methods 6010 and 7471 (mercury). TPH-D (67 to 340 ppm) and/or TPH-O (140 to 1,300 ppm) were detected in five discrete samples (#1, #5, #7, #8, and #9) and all three soil stockpile samples (SS-1 through SS-3; Table 1). Metals (9 to

17 ppm arsenic, 0.34 to 16 ppm cadmium, 13 to 54 ppm chromium, 28 to 1,100 ppm lead, and 0.03 to 0.34 ppm mercury) were found in all 12 soil samples. Four samples (#1, #3, #8, and #9) contained cadmium (2.8 to 16 ppm) and lead (330 to 1,100 ppm) at concentrations exceeding the MTCA Method A cleanup level (2 and 250 ppm, respectively). All three soil stockpile samples contained cadmium (4.0 to 5.0 ppm) at concentrations exceeding the MTCA Method A cleanup level, and sample SS-1 contained lead (270 ppm) at a concentration exceeding the MTCA Method A cleanup level. Sample #8 was also tested for Toxicity Characteristics Leaching Procedure (TCLP) lead by EPA Method 1311/6010, and contained 0.56 ppm TCLP lead (see lab reports, Attachment 2).

Based on the initial sampling results, Harvey's Dozing & Trucking returned to the site on June 13, 2006, to excavate additional soil, and 13 confirmation soil samples were collected. Four previous sample locations (#1, #3, #8, and #9) were over-excavated and re-sampled because the original samples exceeded cadmium and lead cleanup levels. In addition, four previous Marsh sample locations (40-263 A, 140-50, 60-100, and 62-225 Gravel) were over-excavated and re-sampled because the original samples exceeded cadmium and lead cleanup levels, and no documentation was found in the July 2005 Marsh report to indicate whether or not these areas had ever been excavated and re-tested.

A small bulldozer was used to excavate soil to about 1-foot below grade in six areas of the property (Figure 2). Excavated soil was added to the existing stockpile located near the south end of the rock access road, or was stockpiled separately north of the metal garage/shed and near the south property line. The soil piles were covered with plastic sheeting, pending lab results. Thirteen samples (#10 through #22) were collected from the excavated areas on June 13, 2006 (Figure 2). Each excavated area measured about 20 feet by 20 feet. A minimum of two samples were collected from each excavated area. The samples were collected at about 1-foot below ground surface using a clean shovel, which was washed with an alconox solution and rinsed with tap water between each sampling location. The samples were immediately transferred into clean laboratory supplied sample jars, which were properly labeled and placed into an iced cooler for transport to the laboratory.

Exposed soils consisted of brown to olive brown sandy silt with gravel and some rootlets at all sample locations except #18, #19, and #22, where gray sandy silt and silty gravel was encountered. Dark brown to black topsoil was mixed in with the sandy silt at sample locations #11, #13, and #15. Scattered wood, charcoal, and some debris (glass and metal) were encountered at sample locations #11 and #16. Some scattered petroleum staining and soil discoloration was noted at sampling locations #16 and #17.

Collected soil samples were submitted to CCI for analyses. Based on previous sampling results, samples were only tested for cadmium and lead. Cadmium (0.36 to 1.5 ppm) was detected in three samples (#13, #15, and #20). Lead (5.4 to 240 ppm) was detected in samples #10 through #13, #15, and #20 through #22. All results were below MTCA

Method A cleanup levels. Lab reports are included in Attachment 2. All three soil stockpiles (366.41 tons, or about 245 cubic yards) were removed from the site for disposal at the Waste Management transfer station in Seattle, Washington, on June 22 and 23, 2006. The soil was disposed of at the Columbia Ridge Landfill in Arlington, Oregon. Soil disposal documents are included in Attachment 3.

Additional Soil Sampling Results

After reviewing a draft report of findings, Ecology requested additional soil samples from the northeast, east, and south portions of the property. Noll Environmental returned to the site on July 8, 2006, and collected 16 additional samples (#23 through #38) from the exposed soil (Figure 2). Samples were collected at about 0.3 feet below ground surface using a clean shovel and clean stainless steel spoons and bowls. The shovel was decontaminated between sampling locations using a soap water wash and tap water rinse. Collected samples were immediately transferred into clean laboratory supplied sample jars, which were properly labeled and placed into an iced cooler for transport to the laboratory.

Exposed soils consisted mainly of brown to olive brown silt with minor gravel, some roots and orange oxidation, and little or no debris. Some plastic, brick fragments, and broken glass were noted at sample locations #26 and #33. Gray silty gravel with sand, minor roots, and little or no debris was found at sample locations #25, #27, and #29. Some minor glass, metal, and plastic debris was noted at sample locations #27 and #29. Tan to brown silt with gravel, common roots, and no debris was encountered at sample locations #30 and #31. Dark brown to brown organic-rich silt with common roots and some debris (glass and plastic) was found at sample locations #34 and #35. Dark gray to gray silt with some roots and minor metal debris was encountered at sample locations #36 and #37. No sheen or hydrocarbon-like odor was noted at any of the sampling locations.

Collected soil samples were submitted to CCI and analyzed for cadmium and lead (EPA Method 6010), per Ecology's request. Two samples consisting of gray silt (#36 and #37) were also analyzed for TPH-D and TPH-O by Method NWTPH-Dx. Cadmium (0.6 to 9.4 ppm) was detected in nine samples (#27, #29, #31, #32, and #34 through #38; Table 1). Lead (16 to 1,300 ppm) was detected in all samples except #23. TPH-D (39 and 120 ppm) and TPH-O (210 and 660 ppm) were detected in samples #36 and #37, but at concentrations below the MTCA Method A cleanup level (2,000 ppm). The lab report is included in Attachment 2.

The cadmium and/or lead concentrations exceeded the MTCA residential soil cleanup level at sample locations #25 and #27 (between the house and garage/shop), #32 (along the west side of the east metal fence), and #35 and #37 (southern portion of the site). These three areas were marked, and additional soil was excavated to about 2 feet below grade on July 24, 2006 (Figure 2). Excavated soil (388.51 tons, or about 260 cubic yards)

was loaded into trucks and transported offsite to the Waste Management transfer station in Seattle, Washington, on July 26, 2006, for disposal at the Columbia Ridge Landfill in Arlington, Oregon. Soil disposal documents are included in Attachment 3.

Ten soil samples (#39 through #48) were collected from the excavated areas on July 26, 2006 (Figure 2). The northern excavation (sample locations #25 and #27) measured about 15 feet by 55 feet. The central excavation (sample location #32) measured about 15 feet by 48 feet. The southern excavation (sample locations #35 and #37) measured about 48 feet by 60 feet. Three samples (#39, #40, and #41) were collected from the northern excavation, three samples (#42, #43, and #44) were collected from the central excavation, and four samples (#45 through #48) were collected from the southern excavation. The samples were collected from the sidewalls of the excavations at about 1-foot below grade using clean stainless steel spoons and bowls. The samples were immediately transferred into clean laboratory supplied sample jars, which were properly labeled and placed into an iced cooler for transport to the laboratory.

Exposed soils consisted of tan to olive brown silt and sandy silt with roots and little to no debris at sample locations #40 through #43, and olive gray gravelly silt with orange mottling and minor roots at sampling locations #45 through #47. Dark gray sandy silt with a slight hydrocarbon-like odor was noted at sample location #39, dark gray to dark brown silt with some roots and minor debris (glass) was found at sample location #44, and dark brown to brown organic-rich silt with abundant roots was encountered at sample location #48. Site photos showing the excavated areas are included in Attachment 1.

Collected soil samples were submitted to CCI for analyses. All samples were tested for cadmium and lead (EPA Method 6010). Two samples consisting of dark gray silt (#39 and #44) were also analyzed for TPH-D and TPH-O by Method NWTPH-Dx. Cadmium (0.87 and 3.2 ppm) and lead (150 and 240 ppm) were detected in samples #39 and #42 (Table 1). Sample #39 also contained 290 ppm TPH-O. All other results were below the laboratory method detection limits.

The cadmium result (3.2 ppm) for sample #42, located at the north edge of the central excavation (west of the east metal fence), exceeded the MTCA Method A cleanup level for soil (2 ppm). This sample was collected from a small volume of residual soil (less than 2 cubic yards) located adjacent to the west side of the east metal fence. Noll Environmental collected a total of 48 soil samples from the site. Nine samples exceeded the cadmium or lead cleanup levels for residential soil. Eight of those sample locations were subsequently excavated and removed from the site for proper disposal. One soil sample location (#42) out of 39 soil samples (about 2.5%) exceeds the cleanup level for cadmium, but by less than two times the cleanup level (3.2 ppm, cleanup level is 2 ppm). These results meet the statistical soil cleanup level requirements set forth under MTCA [WAC 173-340-740 (7)(e)].

Summary and Conclusions

A former auto wrecking/parts yard (Alseth Auto Parts) located at 618 – 105th Street SW in Everett, Snohomish County, Washington, operated from sometime prior to 1999 until 2003. The property consists of about 1.3 acres (three contiguous 0.43-acre lots) in the SE quarter of the NW quarter of section 24, township 28 north, range 4 east. Marsh Industrial Research conducted a site cleanup and assessment between December 2003 and June 2005. Several small structures (old house, office with attached storage, covered tear down area, and transmission rack) and various car bodies and auto parts were removed from the site. An unknown quantity of soil was excavated and stockpiled onsite in April 2004. Two soil stockpile samples contained cadmium (4.4 to 6.5 ppm) and lead (390 ppm) exceeding MTCA Method A cleanup levels.

Marsh excavated additional soil and collected eight samples and one stockpile sample in October 2004. Three samples and the stockpile sample contained cadmium (4.3 to 18 ppm) and lead (350 to 970 ppm) at concentrations exceeding MTCA Method A cleanup levels. One sample also contained TPH-O (2,750 ppm) at a concentration exceeding the MTCA Method A cleanup level. One additional stockpile sample collected in November 2004 contained TPH-O (5,620 ppm), cadmium (12 ppm), and lead (600 ppm) at concentrations exceeding MTCA Method A cleanup levels.

Three site groundwater monitoring wells were sampled for TPH-G, TPH-D, TPH-O, BTEX, and dissolved metals (arsenic, cadmium, chromium, and lead) in December 2004. One groundwater sample was also analyzed for PAHs and PCBs. All results were below laboratory method detection limits. Marsh collected four additional soil samples in December 2004. Two samples contained cadmium (4.4 to 11 ppm) and lead (340 to 580 ppm) at concentrations exceeding MTCA Method A cleanup levels. Marsh excavated additional site soil in early June 2005 and collected eight soil samples and three stockpile samples. One sample and two stockpile samples contained cadmium (2.8 to 5.8 ppm) at concentrations exceeding the MTCA Method A cleanup level. Marsh collected 10 additional soil samples in late June 2005. All results were below MTCA Method A cleanup levels. About 600 cubic yards (886 tons) of impacted soil were removed for disposal at Rinker Materials in Everett, Washington, in June 2005.

Noll Environmental observed vegetation removal and shallow soil excavation from the south end of the site and the area near the metal garage/shed in June 2006. Excavated soil was temporarily stockpiled onsite. Nine samples and three stockpile samples were collected and analyzed for TPH-D, TPH-O, and MTCA 5 metals (arsenic, cadmium, chromium, lead, and mercury). Four samples (#1, #3, #8, and #9) contained cadmium (2.8 to 16 ppm) and lead (330 to 1,100 ppm) at concentrations exceeding the MTCA Method A cleanup level. All three stockpile samples contained cadmium (4.0 to 5.0 ppm) at concentrations exceeding the MTCA Method A cleanup level, and one stockpile sample contained lead (270 ppm) at a concentration exceeding the MTCA cleanup level.

Additional soil was excavated from 6 areas of the site in June 2006. Sample locations #1, #3, #8, and #9 were over-excavated and re-sampled due to cadmium and lead concentrations, and Marsh sample locations 40-263 A, 140-50, 60-100, and 62-225 Gravel were over-excavated and sampled because there was no documentation that these areas had ever been excavated and re-tested. Thirteen soil samples were collected from the excavated areas and analyzed for cadmium and lead. All results were below MTCA Method A cleanup levels. Stockpiled soil (366.41 tons [245 cubic yards]) was removed for offsite disposal at a licensed landfill in June 2006.

At Ecology's request, 16 additional soil samples were collected from the northeast, east, and south portions of the site in July 2006 and tested for cadmium and lead. Two samples containing gray silt were also tested for TPH-D and TPH-O. Cadmium and/or lead concentrations exceeding the MTCA Method A cleanup level were detected in five samples, located between the house and garage/shop (#25 and #27), along the west side of the east metal fence (#32), and in the southern portion of the site (#35 and #37). These three areas were marked, and additional soil was excavated to about 2 feet below grade in July 2006. Excavated soil (388.51 tons [260 cubic yards]) was transported offsite for disposal at a licensed landfill.

Ten confirmation samples were collected from the excavated areas in July 2006 and tested for cadmium and lead. Two samples consisting of dark gray silt were also analyzed for TPH-D and TPH-O. The cadmium result (3.2 ppm) for sample #42 exceeded the MTCA Method A cleanup level for soil (2 ppm). This sample was collected from a small volume of residual soil (less than 2 cubic yards) located adjacent to the west side of the east metal fence. Noll Environmental collected a total of 39 soil samples from the site in June and July 2006 that were below MTCA Method A cleanup levels, and Marsh Industrial Research collected a total of 24 soil samples from the site in 2004 and 2005 that were below MTCA Method A cleanup levels. Therefore, less than 10% of the remaining site samples (one of 64, or 1.56%) exceed the MTCA Method A cleanup level for cadmium in soil, and the cadmium concentration at sample location #42 (3.2 ppm) does not exceed the cleanup level (2 ppm) by more than two times. These results meet the statistical soil cleanup level requirements set forth under MTCA [WAC 173-340-740 (7)(e)]. A total of about 1,100 cubic yards (1,641 tons) of contaminated soil were removed from the site in 2005 and 2006 for offsite disposal at permitted facilities. All known impacted soil, with the exception of sample location #42, have been removed from the site.

Statement of Limitations

This report has been prepared for the sole use of 105th Street Associates, LLC, for the above-referenced address. This report is not intended for use by others, except for lending institutions as directed by 105th Street Associates, LLC, and the information contained herein is not applicable to other sites.
