STATUS REPORT – 2019
MANHATTAN VILLAGE SHOPPING CENTER AND HARRIS PROPERTIES
NORMANDY PARK, WASHINGTON

Dear Mr. Grant and Mr. Bloch:

PES Environmental, Inc. (PES) has prepared this letter to summarize the remediation system operation and maintenance (O&M) activities, supplemental remedial investigations, and groundwater monitoring and sampling performed in 2019. This letter also includes the design report for expanding the soil vapor extraction system (SVE) and conducting shallow excavation to treat contaminated vadose zone soil. The work was performed at Manhattan Village Shopping Center (MVSC) property located at 17835 First Avenue South (the "MVSC property") and the Harris property located at 17817 – 17825 First Avenue South in Normandy Park, Washington (the "Harris property"), collectively referred to as the "Property." The location and current features of the Property are shown on Figures 1 and 2. The O&M and sampling were conducted in accordance with the Remedial Action Work Plan (RAWP[1]) and the Operations and Maintenance Plan (O&M Plan)[2]. A Sampling and Analysis Plan (SAP) is included as Appendix H to the RAWP.

REMEDIATION SYSTEM O&M

Air Sparging and Soil Vapor Extraction System Description

The air sparging (AS) and SVE system includes 22 SVE wells, 31 AS wells, and a remediation equipment enclosure containing the AS and SVE mechanical equipment and controls (Figure 3).

[1] PES Environmental, Inc. 2016. *Remedial Action Work Plan, Manhattan Village Shopping Center and Harris Properties, VCP NW1873, Normandy Park, Washington*. October.
[2] PES Environmental, Inc. 2016. *Operations and Maintenance Plan, Manhattan Village Shopping Center and Harris Properties, VCP NW1873, Normandy Park, Washington*. December.

The AS/SVE system was started up in October 2016. The SVE system consists of a well manifold, positive displacement blower, inline silencers, moisture knockout, condensate storage and transfer pumps, and discharge stack. The SVE manifold includes a vacuum gauge, and each leg of the manifold includes a balancing valve, sampling port, and flow and vacuum monitoring port. The discharge stack includes a temperature gauge, flow meter, sampling port, and an inline silencer. The AS system consists of a well manifold, positive displacement blower, inline silencers, and a heat exchanger. Each leg of the manifold includes a pressure gauge, flow meter, and balancing valve. The AS blower and heat exchanger include pressure and temperature gauges. The SVE blower, AS blower, and heat exchanger are mounted inside insulated enclosures to dampen the equipment noise.

The AS wells are designed to target the sand and silty sand aquifer directly above the silt and clay layer that has been encountered at depths of 46.5 to 50 feet below ground surface (ft bgs) on the Harris property and 55 to 56 ft bgs on the MVSC property. The SVE wells are installed at two levels within the vadose zone. Shallow screened wells (5 to 20 ft bgs) target the upper vadose zone, and deeper screened wells (20 to 30 ft bgs on Harris property and 20 to 35 ft bgs on MVSC property) target the lower vadose zone. Detailed descriptions of the AS/SVE system, remediation wells, as-built drawings, and O&M procedures are included in the O&M Plan.

Soil Vapor Extraction System O&M

The AS/SVE system was shut-off on December 13, 2018 to evaluate potential for rebound of tetrachlorethene (PCE) concentrations in groundwater and to perform vapor intrusion soil gas sampling in March and June. Due to limited evidence of PCE concentration rebound in groundwater, the AS system was allowed to remain off-line indefinitely. The SVE system was restarted on June 6 following completion of the vapor intrusion sampling work. Performance groundwater monitoring and vapor intrusion soil gas sampling are discussed in later sections of this report.

O&M activities during the reporting period included field inspections, testing, and O&M of SVE components monthly. Specific work included documenting and maintaining the operational status of the SVE equipment, general operating conditions (leaks, breakage, alarms), monitoring and balancing SVE wells (flow rate, vacuum), monitoring field volatile organic compound (VOC) concentrations from SVE wells and the discharge stack, and responding to system alarms. Annual brush cutting on Harris property to maintain access to remediation and monitoring wells was conducted in November 2019.

Performance vapor samples were collected periodically from the SVE discharge stack, and the samples were analyzed by ALS Environmental (an accredited laboratory) for VOCs by United States Environmental Protection Agency (EPA) Method TO-15 to evaluate mass removed and to verify compliance with Puget Sound Clean Air Agency (PSCAA) and Washington State Department of Ecology (Ecology) discharge criteria.

Once restarted in June the SVE system operated with virtually no downtime, except for a 41-day period when auto-dialer did not notify PES that the system remained shut-down following a power outage in late August. Review of conditions during the next routine O&M visit indicated

that the battery backup had failed. PES replaced the batteries and the SVE system operated with minimal issues for the remainder of the reporting period. The remediation system has operated with 75% uptime since start-up in 2016. The majority of downtime is related to planned shutdowns for rebound testing and routine performance groundwater sampling events. The SVE system operating data is summarized in Table 1.

The SVE system operation has been focused on the areas shown in 2018 to contain PCE concentrations in vadose zone soil above the cleanup level (CUL)[3]. These areas include the SVE wells closest to the Four Star Cleaners (SVE-5, -6, -7, -8), the former Manhattan Cleaners and Coin-Op Laundry (Manhattan Cleaners; SVE-10), and the wells behind the QFC building (SVE-11A, -12A). Several other nearby wells have been operating, mainly to provide makeup air to prevent the blower from shutting down on low flow rate alarm. These supplemental wells vary based on flow needs but generally include SVE-2, -3, -15, -16, and -18.

The SVE system operated with a total flow rate of between 542 and 609 standard cubic feet per minute (scfm) and vacuums of 28 to 52 inches of water column (in.w.c.) on the SVE well field. Individual SVE wells operated between approximately 30 to 65 scfm per well, with an average flow of 49 scfm per well.

SVE Sampling. The SVE system effluent stack was sampled twice during the reporting period. The PCE concentrations were 440 micrograms per cubic meter (µg/m^3) in July and 310 µg/m^3 in October. The individual SVE wells were not sampled during the reporting period.

The PCE removal rates averaged 0.016 pounds per day (lb/day) over the operating period. A total of 3.1 pounds of PCE was removed between June 6, 2019 and December 27, 2019, and a total of 120.8 pounds of PCE have been removed throughout the lifetimes of the SVE systems that operated from September 2009 through December 27, 2019. The PCE mass removal rate in 2019 was relatively consistent with 2018. Charts showing SVE effluent PCE concentrations and cumulative PCE mass removal are included as Attachments A1 and A2. Copies of the laboratory analytical reports and data validation memorandum are included in Attachment B.

The SVE system discharge has remained in compliance with the PSCAA exemption limits (e.g., less than 500 lb/year of total VOCs), and is below the Ecology small quantity emission rate of 32.4 lb/year of PCE.

SUPPLEMENTAL INVESTIGATIONS

Supplemental investigations were conducted at the Site in February, March, June, October, and November 2019. In February and March, two monitoring wells were installed in SW 178th Street for the purpose of delineating the groundwater plume near the northern edge of the Harris property. Later in March and in June, two rounds of soil gas samples were collected to evaluate potential for vapor intrusion with SVE system off-line. The work conducted from October and

[3] PES Environmental, Inc. *Status Report – November 2017 through December 2018, Manhattan Village Shopping Center and Harris Properties, Normandy Park, Washington*. July 2.

November 2019 was associated with a passive flux meter (PFM) study. The following summarizes the supplemental assessments that were completed in 2019.

Monitoring Well Installations – February, March, and October 2019

The work included drilling and installing four new monitoring wells (MW-17 through MW-20), well development, disposal of investigation related wastes, and surveying. Other associated work included repairing six monitoring wells which were paved over by the City of Normandy Park (City) and redeveloping monitoring wells near the northern end of the Harris property. The locations for the new monitoring wells and soil gas probes are included on the attached Figure 4.

Drilling. PES oversaw the drilling and installation of monitoring wells MW-17 and MW-18 on February 28 and March 1, 2019; and oversaw drilling and installation of monitoring wells MW-19 and MW-20 on October 16 and 17, 2019 (Figure 4). The wells were drilled and installed by Washington State licensed drillers using a hollow stem auger drilling rig consistent with the Washington State well regulations (WAC 173-160). Holt Services, Inc. was subcontracted for MW-17 and MW-18, and Cascade drilling was subcontracted for MW-19 and MW-20. Drilling locations were cleared for utilities prior to drilling, and the first 7 to 9 ft were advanced with an air knife and vacuum truck.

- MW-17 and MW-18. These wells were installed in SW 178th Street to evaluate shallow soil and groundwater conditions north of the Harris property. MW-17 and MW-18 were drilled to 39.5 ft bgs and 41.5 ft bgs, respectively.

- MW-19 and MW-20. These wells were installed on the Harris Property near the northern property line to serve as monitoring wells in the PFM study. These wells were installed as a deep and shallow pair (MW-19 and MW-20, respectively) with screened intervals that cover the entire perched water bearing zone. MW-19 was drilled to 55.5 ft bgs and MW-20 was drilled to 46 ft bgs.

  These wells were installed approximately 27 feet northwest of DC-8, which has had some of the highest PCE concentrations over the last several years. Ideally the new wells would have been installed in a line between DC-8 and MW-18 (Figure 4), but a diagonal crossing power line and multiple large trees forced the well locations to be moved to the west.

Soil samples were collected using a standard split-spoon sampler. Samples were collected at 5-ft intervals in MW-17 and MW-18 and in the first 25 feet of MW-19. MW-19 and MW-20 were continuously sampled starting at 25 ft and 30 ft, respectively. Each soil sample was screened with a photoionization detector (PID) for the presence of VOCs and observed for lithology. The aggregate portions of saturated samples in MW-19 and MW-20 were further evaluated to estimate relative percentages of fine, medium, and coarse-grained sand. Lithologic observations and PID readings were recorded on field boring log forms (Attachment C). Field grain size distributions are summarized on Table C1.

Soil samples were collected and field preserved using EPA Method 5035 protocols and were placed in laboratory supplied containers, sealed, labeled, and placed in a cooler on ice under chain-of-custody protocols for delivery to Fremont Analytical Laboratory (Fremont), a Washington State accredited analytical laboratory. Samples from each boring were selected for analysis of VOCs by EPA Method 8260.

All drilling and non-dedicated sampling equipment was decontaminated between each drilling location. Soil cuttings and decontamination water were placed into 55-gallon DOT-rated drums and temporarily stored on the Harris property pending disposal.

Well Installation and Development. Depth to groundwater was measured in nearby monitoring wells to provide a reference point for setting the well screen depths.

- MW-17 and MW-18. The wells were completed with 10-ft long screened intervals spanning the seasonal groundwater table. MW-17 was screened from 28 to 38 ft bgs and MW-18 was screened from 30 to 40 ft bgs.

- MW-19 and MW-20. The screened intervals for the monitoring well pair were designed so that the two 5-ft long PFMs could be installed end-to-end within the saturated screened interval. MW-19 was screened from approximately 44 to 54 ft bgs and MW-20 was screened across the seasonal groundwater table from 30 to 45 ft bgs.

The wells were constructed with 2-inch diameter Schedule 40 PVC, 0.020-inch PVC slotted screen and a filter pack. The well annular space above the filter pack was filled with bentonite chips (hydrated), and a bentonite grout seal. The wells were completed with 8-inch diameter heavy duty traffic rated monuments and set in concrete. The wells and concrete surrounds in SW 178th street were painted black to match the surrounding asphalt pavement. Well completion details are summarized in Table D1.

MW-17 and MW-18 were developed on March 5, 2019; and MW-19 and MW-20 were developed on October 24, 2019. The purpose of development was to remove sediment from the well and filter pack and create a hydraulic connection with the perched aquifer. Bailing, surging, and pumping was used to develop the wells. Approximately 44.5 gallons was removed from MW-17, 57 gallons from MW-18, 75 gallons from MW-19, and 80 gallons from MW-20. Development water was placed into 55-gallon DOT-rated drums and temporarily stored on the Harris property pending disposal.

Subsurface Conditions. Soil encountered during the subsurface investigation consisted predominantly of sand, sand with silt, silty sands, sandy silts, and silt with sand, all with variable gravel. Fill material composed of silty sand was encountered in the upper 8 ft bgs, consistent with previous investigations. The fill was underlain by a fine to medium sand, sand with silt, and silty sand to the maximum depth of exploration (55.5 ft bgs). The sand layer contained discontinuous layers of silty sand and silt and became denser below approximately 22 to 25 ft in MW-17 and MW-18 and below approximately 34 ft bgs in MW-19 and MW-20. Coarser sand

and pockets of gravel were also encountered below the denser soil. Other features including gradational grain size variation, bedding, and fining upward sequences, appear to be consistent with previous interpretations of these units as recessional outwash. Heaving conditions were observed in MW-19 and 50 gallons of water was added during drilling to control the heave.

No odors were detected in any of the borings. Field PID readings did not exceed 1.7 part per million by volume (ppmv). Wet soil was generally encountered between 34 to 38 ft bgs in the borings at the time of drilling in MW-17 and MW-18, and between 33 to 37 ft bgs in MW-19 and MW-20.

Soil Analytical Results. Three discrete soil samples each were collected from MW-17 and MW-18, four samples were collected from MW-19, and two samples from MW-20. PCE exceeded the Ecology Model Toxics Control Act (MTCA) Method A CUL (0.050 milligrams per kilogram [mg/kg]) in one sample collected from MW-17 (0.0543 mg/kg at 35 ft bgs) and in two soil samples collected from MW-19 (0.0717 mg/kg at 35 ft bgs, 0.107 mg/kg at 39 ft bgs). PCE was detected below the CUL in MW-18 (30 and 35 ft bgs) and in MW-20 (30 ft bgs), and PCE was below the laboratory practical quantitation limit (PQL) in the remaining samples. These samples were collected from saturated soil and the detected PCE concentrations are assumed to be the associated with the groundwater plume. Soil results are summarized on Table 2. Historical soil data is included in Attachment C4.

Well Monument Repair. The flush-with-grade well monuments for MW-17, MW-18, KMW-3, KMW-6, KMW-7, and KMW-8 were paved over by the City during the spring of 2019. The City identified the well locations on the new pavement so they could be located, dug-out, and repaired. PES was on-site on October 16 and 17, 2019, to oversee the repair of the monuments by Cascade. The existing monuments were jack hammered out, and new traffic rated monuments were installed in their place. The 2-inch PVC well casings were extended upwards, if needed, for proper wellhead construction. A right-of-way (ROW) permit and traffic control plan was acquired from the City prior to the work. Figure 4 shows the locations of the wells.

Monitoring Well Redevelopment. PES redeveloped ten monitoring wells on October 16 and 17, 2019. The work included the six wells which had been paved over and repaired (see above) and four other wells which have been critical for monitoring the PCE plume including DC-7, DC-8, DC-15, and DC-17. The wells were redeveloped using light bailing and surging followed by pumping, up and down the screened interval. The total volume of water removed from each well during the well redevelopment included 40 gallons (MW-17), 35 gallons (MW-18), 65 gallons (KMW-3), 70 gallons (KMW-6), 40 gallons (KMW-7), 55 gallons (KMW-8), 55 gallons (DC-7), 55 gallons (DC 8), 35 gallons (DC 15), and 55 gallons (DC-17).

Surveying. MW-17, MW-18, MW-19, and MW-20 were surveyed on March 3 and October 25, 2019, by Lanktree Surveying, Inc., a licensed Washington State surveyor. The October 25 work also included surveying the post-repair elevations of KMW-3, KMW-6, KMW-7, and KMW-8.

Surveyed locations were relative to the North American Datum of 1983 (NAD 83) and North American Vertical Datum of 1988 (NAVD 88).

Vapor Intrusion Assessment – March and June 2019

A vapor intrusion assessment was conducted at the Property in February, March and June 2019 to evaluate the potential for chlorinated solvent vapors to intrude into the former Manhattan Cleaners suite on the Harris Property and into the existing Four-Star Cleaners on the MVSC property. The work included coordinating with the property owners and tenants for locating acceptable probe installation locations, installing seven temporary soil vapor monitoring probes (SVS-11 through SVS-17), and conducting two rounds of sampling (March and June 2019). Existing soil gas probe SVS-10, near the location of the former PCE dry cleaning machine, was also sampled. Soil gas sampling was performed during a period where the SVE system was temporarily shut down (December 13, 2018 through June 5, 2019). The locations of the soil gas probes are included on the attached Figure 4.

Temporary Soil Vapor Probe Installations. On February 22 and 28, 2019, PES installed seven temporary soil vapor probes on the MVSC and Harris properties. Two temporary soil vapor probes (SVS-11 and SVS-17) were installed on the MVSC property. SVS-11 was installed in the dry cleaner (Four-Star Cleaners) suite near the back door. SVS-17 was installed the alley behind (north) of the Four-Star Cleaners near SVE-6 to evaluate soil gas conditions near existing remediation well SVE-6. The temporary soil vapor probe locations on the MVSC property are shown on Figure 5.

Five temporary soil vapor probes (SVS-12, SVS-13, SVS-14, SVS-15, and SVS-16) were installed in the former Manhattan Cleaners suite on the Harris property (currently occupied by Archie's Restaurant). SVS-14, SVS-15, and SVS-16 were installed on the back (west) wall of the suite, and two probes (SVS-12 and SVS-13) were installed in the center of the kitchen area. The temporary soil vapor probe locations on the Harris property are shown on Figure 6.

The seven probes located inside the buildings (all probes except SVS-17) were installed on February 22, 2019, and were constructed by drilling a hole using a roto-hammer to an approximate depth of 2 feet, placing Teflon tubing and 6-inch long stainless-steel screen in the borehole, installing a Vapor PinTM (with extensions) for sample collection, and sealing the boring with a small threaded end cap. Sand filter pack material was placed around the screen and the upper annulus was sealed with bentonite. The screen depths for these soil vapor probes were at 1.3 ft bgs.

The temporary probe in the alley (SVS-17) was installed on February 28, 2019, by ESN Drilling (a Washington State licensed driller) using a direct push drill rig. The boring was hand-cleared to a depth of 3 ft, advanced to 5 ft bgs, followed by installation of a 6-inch long stainless-steel screen, sand filter pack, bentonite seal, and 6-inch diameter traffic rated well monument set in concrete. The screen depth for SVS-17 was 4.5 to 5 ft bgs.

Soil Vapor Sampling. Soil vapor samples were collected on March 11 and June 3, 2019. All of the soil vapor probes were sampled in March, however, the sample from SVS-12 was not analyzed due to a failed flow controller. All soil vapor probes except SVS-16 were sampled in June. SVS-16 was not sampled due to its monitoring port being clogged with floor wax.

During sampling, PES installed a plastic shroud that is sealed and weighted at the ground surface. To test for potential leaks, PES performed a "shut-in test" in the above-ground laboratory-provided sampling equipment (flow controller, pressure gauge, sampling manifold, fittings), and confirmed that the sampling equipment did not lose more than one-inch of mercury (Hg) vacuum per minute using a syringe or peristaltic pump.

Prior to collecting each subslab soil vapor sample, approximately three tubing pore volumes was purged from the monitoring point at a rate below 200 milliliters per minute (ml/min) using either a peristaltic pump or syringe. PES leak-tested the probe assembly using an inert tracer gas (ultra-high purity helium) and a field helium gas meter. The helium was maintained at a concentration of approximately 20 percent within the shroud. If helium was detected during purging at a concentration greater than 10 percent of the shroud concentration, the vapor probe was resealed, and the leak test repeated.

Samples were collected at 200 ml per minute into laboratory provided, batch certified one-liter summa cannisters. The canister valve was closed while the canister remained under negative pressure, and the samples were submitted for VOC analysis by EPA Method TO-15 to Pace Analytical (a Washington State-accredited laboratory). The 24-hour barometric pressure preceding and during the March and June soil vapor sampling events is provided in Attachment E.

Soil Vapor Sampling Results. For the purposes of this discussion, only PCE and its daughter breakdown products, trichloroethene (TCE), cis-1,2-dichloroethene (cDCE), trans-1,2-dichloroethene (tDCE), and vinyl chloride are included. PCE, TCE, and vinyl chloride results have been compared to their modified MTCA Method B commercial remediation screening levels (SLs)[4] of 1,067 micrograms per cubic meter ($\mu g/m^3$), 36.7 $\mu g/m^3$, and 31.7 $\mu g/m^3$, respectively. Ecology has not assigned SLs for cDCE nor tDCE.

- Subslab soil vapor samples (SVS-10 through SVS-16). PCE was detected above the PQL in each of the subslab samples, but only exceeded the SL in SVS-13 in June (1,500 $\mu g/m^3$). SVS-13 is located near the middle of former Manhattan Cleaners suite. TCE was detected below the SL in the samples from SVS-10 (March) and SVS-11 (June), and cDCE was detected in SVS-11 (June). Neither vinyl chloride nor tDCE were detected in any of the subslab soil vapor samples.

[4] Commercial remediation screening levels (SLs) for PCE, TCE, and vinyl chloride have been calculated using Equation 750-2 (Washington Administrative Code 173-340-750). Per Ecology's *Frequently Asked Questions (FAQs) Regarding Vapor Intrusion (VI) and Ecology's Draft VI Guidance Implementation Memorandum No. 21* (November 1, 2018), an exposure frequency (EF) factor of 0.3 was used (instead of 1.0) to reflect a commercial exposure of 52 weeks at 50 hours per week. Ecology has not assigned vapor intrusion SLs to cDCE or tDCE.

- Soil vapor samples from SVS-17. PCE and TCE exceeded their SLs in March and June, and vinyl chloride exceeded the SL in March. cDCE and tDCE were detected in both the March and June samples. The March and June concentrations of PCE were 26,900 and 104,000 µg/m^3, and TCE were 319 and 3,290 µg/m^3, respectively. The March vinyl chloride concentration was 44.7 µg/m^3. cDCE and tDCE were also detected in both samples. The March and June concentrations of cDCE were 1,230 and 8,600 µg/m^3, and tDCE were 43.4 and 519 µg/m^3, respectively.

Table 3 summarizes the subslab soil vapor sample results for the March and June 2019 sampling events.

Passive Flux Meter Study - October and November 2019

The purpose of the PFM study was to evaluate PCE mass flux and groundwater velocity (or Darcy velocity) across the majority of the shallow perched water bearing zone along the conceptual barrier wall alignment. Mass flux is the contaminant mass moving across a unit area of the aquifer. These data collected from the PFM study will be used to develop design elements and potential costs for evaluating the feasibility of implementing of a permeable reactive barrier (PRB) to cut-off the PCE plume and thereby improve natural attenuation of PCE concentrations downgradient from the PRB.

The PFM study measured the Darcy velocities and PCE mass flux and identified PCE transport zones in the monitoring well pair MW-19/MW-20 located along the northern Harris property line. PFMs are activated carbon filled sock-like devices that can be installed in two-inch diameter monitoring wells and are sold by EnviroFlux of Gainesville, Florida. The activated carbon in the PFMs is pre-loaded with four tracers, each having a known sorption coefficient (Kd). Once installed, the PFMs are left in a groundwater monitoring well for several weeks; during which time, the tracers are depleted at a rate proportional to the groundwater velocity. Simultaneously, the activated carbon sorbs the migrating PCE from passing groundwater. After the prescribed period of deployment, PFMs are retrieved, and discrete interval samples of activated carbon are placed in jars and sent to EnviroFlux for laboratory analysis. The residual mass of tracers in each sample are used to estimate groundwater velocity and the mass of PCE in each sample is used to estimate a PCE concentration in the passing groundwater. Multiplying the groundwater velocity by PCE concentration results in a mass flux of PCE (mg) passing through a unit area of aquifer (square meter[m^2]) per unit time (day).

PFM Installation and Development. PES installed the PFMs in MW-19 and MW-20 on November 7, 2019. Two 5-ft long PFMs were deployed in series in the saturated screened interval of each well. PFM-1 and PFM-2 were installed in MW-19 and PFM-3 and PFM-4 were installed in MW-20. In MW-19, PFM-1 was placed from approximately 49 ft to 54 ft bgs and PFM-2 was placed from approximately 44 ft to 49 ft bgs. In MW-20, PFM-3 was placed from approximately 40 ft to 45 ft bgs and PFM-4 was placed from approximately 34 ft to 40 ft bgs. Each PFM includes 4 discrete 1-ft long sampling zones which allows 8 intervals to be tested in each well (16 total samples).

PFM Extraction and Sampling. The PFMs remained in the wells for approximately 2.5 weeks and were retrieved by PES on November 25, 2019. The carbon was sampled in accordance with EnviroFlux instructions, and the samples were submitted to EnviroFlux for laboratory analysis. Samples were collected in approximate 1-foot increments throughout the screen intervals and preserved in glassware provided by EnviroFlux. The sample IDs are identified by the approximate screened interval depths as deployed in the monitoring wells. The samples were analyzed for PCE and Darcy groundwater velocity. Note that the PFM media extended slightly beyond the well screen intervals and into the blank casing. The small portions of the PFM media in the blank casing were not sampled.

PFM Study Results. The results of the PFM study provided by EnviroFlux are included in Attachment F. The calculated Darcy groundwater velocities and PCE flux for each sample interval are tabulated in Tables F1 and F2 and shown graphically on Charts F1 and F2. The average PCE mass flux and discharge rates for each monitoring well are listed in Tables F3, F4, and F5 and their associated charts.

The Darcy groundwater velocities ranged from 5.9 to 20.8 centimeters per day (cm/day) (average velocity of 13.2 cm/day) in the deep well MW-19 and 3.7 to 15.4 cm/day (average velocity of 8.3 cm/day) in the shallow well MW-20. The data suggests that Darcy velocities are slightly higher in deeper groundwater and overall vary by a factor nearly 6 across the perched saturated zone.

The PFM study found that the highest PCE mass flux zone appears to be between approximately 36 and 38 ft bgs where the average mass flux was approximately 0.054 $mg/m^2/day$. The highest mass flux zone was approximately 1 to 3 feet below the groundwater table during the test period. This highest rate of flux was roughly only two times the average mass flux through the shallower screened MW-20 (0.024 milligrams $mg/m^2/day$). The average mass flux in the deeper screened MW-19, however, was 0.002 $mg/m^2/day$, or less than 5 percent of the maximum mass flux and less than 10 percent of the average mass flux in MW-20. These data indicate that PCE mass flux is greatest in shallow groundwater.

As described above, the PFM data is used to estimate the PCE concentration in groundwater. This can be calculated from the data in Attachment F by dividing the flux by the Darcy velocity. In doing so, the average PCE concentration in MW-19 was estimated at 0.02 micrograms per liter (µg/L) and at 0.36 µg/L in MW-20. This pattern is consistent with historical groundwater monitoring results from other areas of the Site which have indicated decreasing PCE concentrations with depth (see historical results for monitoring well pairs MW-9A/MW-9B and MW-10A/MW-10B in Table D3).

It should be noted that the PFM study was conducted near the seasonal low groundwater time of year and therefore, the PCE mass flux during seasonal high groundwater (e.g., winter and late spring) was not specifically evaluated. However, based on long term groundwater monitoring results and consistency of data, we believe that PCE mass flux is occurring year-round in shallow groundwater. Overall, the PFM test results indicate that preferred PCE mass flux zone is in shallow groundwater and decreases with depth.

PERFORMANCE GROUNDWATER MONITORING AND SAMPLING

Four rounds of groundwater performance monitoring and sampling were conducted during the reporting period. The scope included water level monitoring in select shallow and deep wells, and sampling shallow wells per the RAWP.

- March 2019 performance sampling of two new monitoring wells MW-17 and MW-18.
- May 2019 performance sampling consisted of 3 monitoring wells including MW-10, MW-11 and DC-17 to monitor for potential rebound following shut-down of the air sparging system in December 2018;
- October 2019 performance sampling consisted of 15 monitoring wells including MW-2, MW-7, MW-9, MW-10, MW-17, MW-18, MW-19, MW-20, DC-7, DC-8, DC-15, DC-17, KMW-3, KMW-7, and KMW-8.
- December 2019 performance sampling consisted of resampling of monitoring wells MW-19 and MW-20 to confirm the non-detect results in October.

Groundwater Level Monitoring

Groundwater levels were measured from sampled wells prior to sample collection during each sampling event on March 6, 2019, May 21, 2019, October 24 through 29, 2019, and December 4, 2019. The sampling event in October was the only event where groundwater levels were measured in all monitoring wells. Depth to water was measured from the surveyed top of casing (TOC) to the nearest 0.01 foot using an electronic water level probe.

Groundwater Sampling

Groundwater samples were collected using low-flow sampling techniques. For each sampling event, a bladder pump with a dedicated bladder was lowered into each well. Groundwater was purged prior to sample collection until parameters stabilized. Field parameters measured during sampling consisted of temperature, pH, specific conductance, dissolved oxygen (DO), and oxidation reduction potential (ORP). The pump intake was set at approximately two to three feet below the static water level, generally consistent with previous sampling events. For wells with completed submerged screened intervals, the pump intake was typically set within approximately one to two feet below the top of the screen. For the sampling events in May and October, well MW-10 was sampled instead of DC-10A because DC-10A did not have a sufficient volume of water in order to collect a sample. Samples were collected into preserved 40-ml VOA sampling containers and submitted to Pace Analytical in Mt. Juliet, TN (a Washington State accredited laboratory) for analysis of VOCs by EPA Method 8260C.

Quality Assurance/Quality Control

Equipment blank, trip blank, and field duplicate samples were collected in accordance with the 2016 SAP. Equipment blank and field duplicate samples are to be collected at a rate of approximately one per twenty samples, and a trip blank is to be submitted with each cooler. Equipment blank and field blank samples were collected and analyzed at the appropriate frequency during the reporting period. One trip blank was analyzed per cooler, except in March 2019. Duplicate samples collected during the reporting period were from DC-17 (May) and DC-7 (October).

Water Level Monitoring Results

Water level measurements and groundwater elevations for the four sampling events in 2019 are summarized in Table 3, and field parameter measurements are summarized in Table 4. Groundwater levels were only measured once in all wells during 2019; however, based on previous data, groundwater elevations in the shallow wells on the Property vary seasonally, with the lowest levels in fall and highest levels in spring to early summer. Groundwater elevations in October 2019 ranged from 252.75 to 271.84 feet above NAVD 88.

The groundwater gradients in October remained generally consistent with historical results, with a north-northwest directional component on the Property and a more northerly component across SW 178th Street. The gradient across the Property (0.005 ft/ft) is approximately an order of magnitude lower than the gradient to the north of the Property (0.03 ft/ft). The on-Property gradient is estimated from MW-12 to DC-7, and the off-Property gradient is estimated from MW-7 to MW-9. The 2019 groundwater elevations and elevation contours are shown on Figure 7. Monitoring well details are included as Attachment D1, and a complete summary of historical groundwater elevations is included as Attachment D2.

Groundwater Analytical Results

The laboratory analytical results from the March, May, October, and December 2019 sampling events for PCE are summarized on Table 5 and shown on Figure 7. A complete summary of historical PCE concentrations in groundwater monitoring wells is included as Attachment D3.

The results from the March 2019 sampling event (2 wells) are summarized as follows:

- PCE was above Ecology's Model Toxics Control Act (MTCA) Method A cleanup level (CUL; 5 µg/L) in MW-17 and MW-18 at concentrations of 6.82 and 11.4 µg/L, respectively.

The results from the May 2019 sampling event (3 wells) are summarized as follows:

- PCE was below the CUL in two wells (MW-10 and MW-11); and
- PCE was above the CUL in DC-17 at a concentration of 8.62 µg/L.

The results from the October 2019 sampling event (15 wells) are summarized as follows:

- PCE was below the laboratory PQL in three wells including MW-9, MW-19, and MW-20;
- PCE was below the CUL in five wells including MW-2, MW-10, MW-17, KMW-3, and KMW-7; and
- PCE remained above the CUL in seven wells including MW-7, MW-18, DC-7, DC-8, DC-15, DC-17, and KMW-8 at concentrations between 5.72 and 17.1 µg/L.

The results from the December 2019 sampling event (2 wells) are summarized as follows:

- PCE was below the PQL in MW-19 and MW-20, which was consistent with the findings from the October 2019 results.

Discussion of Groundwater Monitoring Results

By the October 2019 sampling event, PCE had been below the CUL for at least five consecutive sampling events in all wells within the AS zone of influence (ZOI). The groundwater data tables and historical time trend plots (Attachment G) indicate the following:

- Rebound monitoring. Rebound monitoring in conducted in May showed relatively stable PCE concentrations following shut-down of the AS/SVE system for 5 months. The wells closest to the AS ZOI (MW-10 and MW-11) increased slightly but remained below the CUL. DC-17, further downgradient, barely changed and remained above the CUL. The next monitoring event in October showed that PCE in MW-10 continued to stay below the CUL and showed that DC-17 had decreased to its lowest ever concentration (5.72 µg/L). Note that MW-10 had been substituted for DC-10A which did not have enough groundwater in the screen for sampling during either event;
- MW-17. PCE in this new well was slightly above the CUL in March (6.82 µg/L) and below the CUL in October (2.85 $\mu g/m^3$) in its first two monitoring events. These results suggest that MW-17 may be near the edge of the plume;
- MW-18. PCE in this new well was consistent in March and October at 11.4 and 11.3 µg/L, respectively. MW-18 is located approximately 58 feet north of DC-8 (15.0 µg/L in October) and 265 feet south of MW-7 (7.13 µg/L), and the results suggest that MW-18 is in a flow path between DC-8 and MW-7;
- MW-19. PCE in this new well was below the PQL in October and in December and are consistent with historical results from other deep screened wells at the Site;
- MW-20. PCE in this new well was below the PQL in October and December and the results were unexpected considering that this well is only 27 feet northwest of DC-8.

The results, however, are consistent with the calculated PCE concentrations in the PFM study (Attachment F) which estimated PCE concentrations to be between approximately 0.04 and 0.7 µg/L in the eight samples collected along the 10 ft screened interval;

- MVSC property and southern half of Harris property. PCE concentrations in the MVSC property and in the southern half of Harris property remained below the CUL;

- Northern half of Harris property and in SW 178th Street. PCE concentrations remained above the CUL in DC-7, DC-8, DC-15, and KMW-8 and were slightly higher in October 2019 compared to October 2018. As noted above, PCE is also above the CUL in new well MW-18;

- MW-7. PCE concentrations in downgradient well MW-7 on the Dunn Lumber property continued an overall decreasing trend although the PCE concentration in October 2019 was slightly higher than the historical low concentration in October 2018; and

- MW-9. PCE has never been detected above the laboratory MRL in the furthest downgradient monitoring well MW-9.

Laboratory Data Validation

The laboratory analytical reports for the groundwater monitoring and sampling events were validated in accordance with the EPA guidelines for organic data review[5]. All of the data was judged to be acceptable for their intended use. Copies of the laboratory analytical reports and data validation memoranda are included in Attachment B.

RESIDUALS MANAGEMENT AND DISPOSAL

Residuals accumulated during the reporting period included SVE system condensate, groundwater sampling purge and decontamination water, and supplemental investigation derived soil. SVE system condensate is managed within the operating SVE system until sufficient volume can be generated for disposal and a waste profile sample is collected shortly prior to disposal. Groundwater sampling purge water, decontamination water, and supplemental investigation soil cuttings were placed in 55-gallon drums and temporarily stored adjacent to the remediation system enclosure. Waste profile samples were collected at the end of each sampling event. Copies of laboratory reports containing waste profile data are included in Attachment B, and copies of disposal documentation are included in Attachment H.

- **Wastewater Disposal.** 850 gallons of SVE system condensate were disposed of as non-hazardous wastewater by Marine Vacuum Service, Inc. on July 8, 2019. A total

[5] *EPA Contract Laboratory Program National Functional Guidelines for Organic Data Review*. OSWER 9240.1-05A-P PB99-963506 EPA540/R-99/008, October.

of 6,700 gallons of wastewater related to the supplemental investigation and groundwater sampling was disposed of as hazardous waste at the Clean Harbors Grassy Mountain facility in Utah June 6 and December 20, 2019.

- **Soil Disposal.** Approximately 6,000 pounds of soil cuttings contaminated with PCE (F002-listed soil) was generated during the supplemental investigations. The soil was disposed as hazardous waste at the Clean Harbors Grassy Mountain facility in Utah on June 6 and December 20, 2019.

SVE SYSTEM EXPANSION AND SOIL EXCAVATION DESIGN

PES prepared a design for expanding the SVE system near the Four Star Cleaners and the former Manhattan Cleaners, and for excavating shallow impacted soil in the unpaved area west of the former Manhattan Cleaners. The purpose of the work is to expedite treatment of vadose zone PCE by targeting depth and locations which exceeded the soil CUL in the 2018 confirmation soil samples near the Four Star Cleaners, the former Manhattan Cleaners, and behind the QFC building. The previous soil sampling results indicate that interim SVE system installed in 2009 SVE has been effective at removing PCE from shallow vadose zone soil (except for in unpaved areas) and less effective at treating deeper soil. The previous results also indicate that the SVE wells behind the QFC building need additional time to treat PCE in soil to below the CUL. The October 2019 design (Attachment I) includes the basis for design, SVE and excavation layouts, details for well and wellhead construction, system manifolds, piping, and trenches.

The SVE expansion design includes six new SVE wells to supplement the existing 22-well SVE system. Three wells will be located near the Four Star Cleaners and three wells will be located near the former Manhattan Cleaners. The proposed SVE wells are screened to target the vadose zone below 10 ft bgs and the wells will operate in tandem with four nearby existing SVE wells including SVE-6, SVE-7, SVE-8, and SVE-10. The existing shallow SVE wells SVE-11A and SVE-12A (see Figure 3) will continue to operate to treat remaining shallow PCE impacted soil (at 5 to 6 ft bgs) west of the QFC building.

The existing SVE blower and condensate management equipment have sufficient capacity to handle the planned expansion. The expanded system is expected to operate at a total flow rate of approximately 500 scfm. The SVE blower is controlled by a variable speed drive and has an operating capacity of between approximately 500 scfm to more than 900 scfm with between 30 and 40 in.w.c. vacuum available at the manifold. The new SVE wells are expected to operate similar to the existing SVE wells that have operated between roughly 20 and 60 scfm with an estimated 40 to 50 ft ZOI.

The 2018 confirmation soil sampling indicated that SVE has had limited effect on treating soil just beneath the unpaved ground surface on behind the former Manhattan Cleaners. Therefore, a shallow excavation will be conducted to remove PCE impacts exceeding the CUL in shallow soil to the west of the former Manhattan Cleaners. Based on prior soil sampling in this area, the excavation is anticipated to be approximately 300 square ft by up to 4 ft deep. Soil samples will be collected prior to excavation to further delineate the extents of PCE exceeding the CUL.

Confirmation soil samples will be collected to document conditions at the bottom and sidewalls of the completed excavation.

PES has met with and had communications with the City. The City will require submittal of a State Environmental Policy Act (SEPA) application and a grading permit to complete the construction. The City has indicated that the application review and public comment period should be expected to take approximately 6 to 8 weeks to complete.

SUMMARY AND CONCLUSIONS

The SVE system was shut down from mid-December 2018 through early June 2019 so that vapor intrusion could be evaluated in areas that are serviced by the SVE system. Two rounds of subslab soil vapor samples were collected from two locations inside the Four Star Cleaners suite, five locations inside the former Manhattan Cleaners suite, and in the asphalt paved alley near existing SVE well SVE-6 (behind Four Star Cleaners). One round of samples was collected in March and the other was collected in early June. PCE exceeded the commercial remediation SL by a factor of 1.5 in a single subslab soil vapor sample (SVS-13 beneath former Manhattan Cleaners). The remainder of the samples were well below SLs. However, the soil gas sample collected near SVE-6 (SVS-17) contained PCE and TCE at up to 100 times higher than the SL.

The SVE system was restarted shortly after the June soil vapor sampling event. Stack sampling indicates that SVE operation continues to remove PCE from vadose zone soil at a low rate. SVE operation also protects against vapor intrusion into occupied commercial indoor spaces and prevents vadose zone soil impacts from re-impacting groundwater. The 2018 confirmation soil sampling results and 2019 soil vapor sampling indicate that the existing SVE operations could be optimized by targeting SVE to depths and locations where PCE impacts remain above the CUL. The results also suggest that excavating shallow PCE contaminated soil in the accessible area behind the former Manhattan Cleaners suite will be more effective for achieving the CUL in shallow soil compared to continued SVE.

Groundwater monitoring results indicate that PCE concentrations on the MVSC property and on the southern half of the Harris property continue to remain below the CUL. Wells within the AS ZOI have been below the CUL for at least 5 consecutive quarters and shutting down the AS system for the first six months of 2019 did not appear to result in significant rebound of PCE concentrations in nearby monitoring wells. Therefore, the AS system has been left off-line indefinitely.

New monitoring wells MW-17 and MW-18 were installed in SW 178th Street to evaluate plume conditions directly south of the Harris property. The wells were sampled in March and October. MW-17 was slightly above the CUL in March and below the CUL in October, and the results indicate that this well may be on the edge of the plume. MW-18 was above the CUL in both sampling events.

On the west side of the Harris property, monitoring data has shown that the AS/SVE system has treated the southwest corner to below the CUL (MW-10, MW-11, DC-10A), and PCE in the

northwest corner is naturally attenuating to very close to the CUL in KMW-3 and has been consistently below the CUL in KMW-7. Because the concentrations are so close to the CUL and overall trending downward, we do not think that additional groundwater remediation on the west side of the Harris property is warranted. PCE should continue to decline over time such that it no longer causes groundwater to exceed the CUL off the property in this area.

On the east side of the Harris property, monitoring data has shown PCE has been below the CUL on the property since 2013 (DC-11, DC-12, DC-13). The only area which exceeds the CUL is the area in SW 178th St near KMW-8 and former DC-14. PCE has been naturally attenuating to very close to the CUL and is expected to continue to decline over time to below the CUL. Additional groundwater remediation on the east side of the Harris property is also not warranted.

PCE in groundwater in the north central portion of the Harris property, however, continues to exceed the CUL in DC-8 and DC-15. New monitoring well MW-18 confirms that the plume extends into SW 178th Street and indicates that the above CUL results in MW-7 on Dunn Lumber property are likely associated with contaminant releases on the Property. Downgradient monitoring well MW-9 continues to bound the plume to the north and has remained below the PQL for more than a decade. Passive remediation technologies are being considered to contain the plume in this area of the Site to prevent PCE concentrations greater than the CUL from migrating off the Harris property.

New deep/shallow monitoring well pair MW-19 and MW-20 were installed on the Harris property near the northern property line to evaluate rates of PCE flux in the area. The wells were installed as close to DC-8 as practical, however PCE in samples collected in October and December were unexpectedly below the CUL. These results, along with the long term below CUL results in DC-2, DC-3, and DC-14 suggest that the plume may not be contiguous across the western half of the Harris property.

PFM testing in MW-19 and MW-20 was commenced in early November prior to receiving the October groundwater monitoring results. The PFM study found that the preferred PCE transport zones were indicated in the upper part of the saturated zone at approximately 36 to 38 ft and decreased with depth. PCE flux in MW-20 and were more than 10 times the flux in the deeper screened well MW-19. These results appear to consistent with historical sampling of other shallow/deep monitoring well pairs. The results of the PFM study will be used to develop design elements and potential costs for evaluating the feasibility of implementing a PRB to cut-off the PCE plume the north-central end of the Harris property, and allow for faster natural attenuation of the PCE concentrations to the north of the property.

PES appreciates the opportunity to conduct these groundwater monitoring activities. If you have any questions regarding this report, or need any additional information, please feel free to contact either of us at (206) 529-3980.

Sincerely,

Notes:

1. Borings drilled from 1998 through 2012 were not surveyed. Locations are estimated from prior consultants' site maps.
2. Investigation borings B-5, B-7, B-9, B-11, B-12, and B-13 were completed as vapor monitoring probes VMP-1 through VMP-6.
3. The temporary SVE system installed in 1999 included nine wells which operated for approximately one year, and were subsequently decommissioned. Six SVE wells were installed in investigation borings B-1 (VES-1), BH-1 (VES6A/6B), BH-15 (VES-5), BH-16 (VES-4), and BH-17 (VES-3). The other three wells (VES-2A/2B and VES-7) were installed in separate locations.
4. The former septic tank on Harris Property was removed in April 2006. Four sidewall and two bottom samples were collected. Bottom sample ST6 represents the only detection in the 6 samples
5. SCS borings B-1, B-2, and B-3 were completed as 1-inch diameter vapor monitoring probes in 1998. Well construction details are not available.
6. Soil gas sampling probes SVS-10 through SVS-16 are installed beneath the building slabs and requires specialized tools for access to the flush grade monuments. SVS-17 is installed in the asphalt behind Four Star Cleaners and includes a standard 6-inch diameter flush grade monument.

U = Not Detected
PCE detections above the SL are shaded
1.3 ft = Depth of sample in feet below ground surface

Notes:
1. The sample from SVS-12 in March 2019 was not analyzed due to leakage in the laboratory supplied sample collection equipment.
2. A sample was not collected from SVS-16 in June 2019 due to floor wax which had blocked the sample port.

Note: The original version of this figure includes color-designated features. A black and white copy of the figure may not accurately represent the information originally presented.

Table 1
SVE System Operation and Maintenance Data
Manhattan Village/Harris Properties
Normandy Park, Washington

Date	Time	Operating Days (days)	System Down Time (days)	Electric Meter (KWH)	Blower				Vacuum		SVE Wells[6]	Stack				PCE Removal Rate[4] (lb/day)	PCE Mass Removed[5] (lbs)	Condensate		Notes
					Speed (hz)	Electric Meter (KWH)	Run Time (hr)	Temp. Out (deg F)	Blower (in. w.c.)	Manifold (in. w.c.)		DP (in. w.c.)	Flow[1] (scfm)	VOC[2] (ppm)	Lab PCE[3] (µg/m^3)			DAT Tank (gal)	Holding Tank (gal)	

Notes:

1. Calculated flow rate based on velocity measurements in feet per minute, converted to cfm based on pipe cross sectional area, and normalized to standard conditions
2. As measured with a photoionization detector (PID) adjusted using 0.57 correction factor for PCE
3. SVE system discharge samples analyzed for VOCs using United States Environmental Protection Agency Method TO-15; see laboratory reports for the complete analytical list.
4. Mass Removal Rate = [flow (scfm) * PCE (µg/m$^{3)}$ * 28.3168 (L/cf) / 1,000 (L/m^3) / 453,592,370 (µg/lb) * 60 (min/hour) * 24 (hour/day)]
5. Cumulative mass removed = average mass removal rates from previous and current O&M visit * period run time.
6. SVE wells operating. The numbers refer to the SVE well number: SVE-1, SVE-2, SVE-3, SVE-4, SVE-5, SVE-6, SVE-7, SVE-8, SVE-9, SVE-10, SVE-11a, SVE-11b, SVE-12a, SVE-12b, SVE-13a, SVE-14, SVE-15, SVE-16, SVE-17, SVE-18, and SVE-19.
7. Operating SVE wells include SVE-2, SVE-3, SVE-5, SVE-6, SVE-7, SVE-8, SVE-10, SVE-11A, SVE-12A, SVE-15, SVE-16, and SVE-18.

KWH = Kilowatt Hours
in. w.c. = inches of water column
scfm = standard cubic feet per minute
deg F = degrees Fahrenheit

NM = not measured
PCE = tetrachloroethene
ppm = parts per million
DAT = diffused aeration tank

VOC = Volatile Organic Compounds
µg/m^3 = micrograms per cubic meter
lb/day = pounds per day
Temp. = Temperature

DP = Differential Pressure
EJ = estimated value

Table 2

Tetrachloroethene in Soil
Monitoring Well Installations
Manhattan Village Shopping Center and Harris Properties
Normandy Park, Washington

Boring ID	Depth (ft bgs)	Date	PCE (mg/kg)
		MTCA Method A Cleanup Level	0.050
MW-17	25	3/1/2019	0.0244 U
MW-17	30	3/1/2019	0.0267 U
MW-17	35	3/1/2019	**0.0543**
MW-18	10	2/28/2019	0.0314 U
MW-18	30	2/28/2019	**0.0288**
MW-18	35	2/28/2019	**0.0358**
MW-19	30.5	10/17/2019	0.0271 U
MW-19	35	10/17/2019	**0.0717**
MW-19	38	10/17/2019	**0.107**
MW-19	44	10/17/2019	0.0268 U
MW-20	30	10/17/2019	0.028 U
MW-20	35	10/17/2019	**0.0299**

NOTES:

1. Depths measured from ground surface.
2. Tetrachloroethene (PCE) concentrations in milligrams per kilogram (mg/kg). Other VOCs, if detected above the laboratory practical quantitation limit (PQL), are listed in Table D4.
3. Soil samples analyzed using USEPA Method 8260C (February, March) and 8260D (October).
4. U = concentration not detected at or above the laboratory PQL.
5. Detected concentrations are shown in **bold.**
6. Concentrations exceeding the PCE MTCA Method A cleanup level of 0.050 mg/kg are **bold and shaded**.

Table 3

Soil Gas Results - March 11 and June 3, 2019
Manhattan Village Shopping Center and Harris Properties

NOTES:

1. All results in µg/m^3 (micrograms per cubic meter).
2. U = not detected at or above the method reporting limit shown.
3. - = not applicable
4. Commercial remediation screening levels (SLs) for tetrachloroethene, trichloroethene, and vinyl chloride have been calculated using Equation 750-2 (Washington Administrative Code 173-340-750). Per Ecology's *Frequently Asked* Questions (FAQs) Regarding *Vapor Intrusion (VI) and Ecology's Guidance Implementation Memorandum No. 21 (November 1, 2018)* , an exposure frequency (EF) factor of 0.3 was used (instead of 1.0) to reflect a commercial exposure of 52 weeks at 50 hours per week. Ecology has not assigned vapor intrusion SLs to cis- and trans-1,2-dichloroethene.
5. Detected concentrations are shown in **bold.**
6. Concentrations exceeding the commercial remediation screening level are **bold and shaded**.
7. Only tetrachloroethene and breakdown daughter products are shown. See lab reports for other detected VOCs unrelated to tetrachloroethene including acetone, carbon disulfide, chloroform, chloromethane, 1,2-dichlorobenzene, 1,1-dichloroethene, 1,4-dioxane, ethanol, ethylbenzene, trichlorfluoromethane, dichlororfluoroethane, hexane, methylene chloride, 2-butanone, isopropyl alcohol, 1-propene, styrene, tetrahydrofuran, toluene, 1,1,1-trichloroethane, 1,2,4-trimethylbenzene, 1,3,5-trimethylbenzene, m,p-xylene, and o-xylene.
8. SVS-10 and SVS-11 were collected beneath the slab in Four Star Cleaners on MVSC Property.
9. SVS-12, SVS-13, SVS-14, SVS-15, and SVS-16 were collected beneath the slab in Archies Restaurant on Harris Property. The sample from SVS-12 was not analyzed in March 2019 due to leakage in the sampling train. SVS-16 was not sampled in June 2019 due to floor wax in sampling probe tip.
10. SVS-17 was collected beneath the aspalt paved alley behind Four Star Cleaners on MVSC Property.

December 2019 Event						
MW-19	12/4/2019	Flush	305.35	43.35-53.35	35.36	269.99
MW-20	12/4/2019	Flush	305.51	29.41-44.41	35.49	270.02

NOTES:

1. '-- = not measured or not applicable.
2. Well monument types: flush grade monuments and above ground (AG) monuments.
3. Depth to water is measured from top of well casing.
4. Elevations are reported relative to North American Vertical Datum of 1988 (NAVD 88).
5. Top of casing (TOC) elevations were surveyed by D.R. Strong Consulting Engineers, Inc. in February and May 2013 and by Lanktree Land Surveying, Inc. in July 2015, March 2019, and October 2019.
6. Screened interval depth is estimated using from surveyed elevations (top of casing elevations, ground surface, and monument rim) and field measurements at the time of drilling.
7. Screened intervals completely submerged are shaded.
8. Water level monitoring October 2019: Most on-property wells were monitored on October 24. Wells which were not initially accessible on October 24 were monitored on October 25, 28, and 29.
9. MW-7, DC-8, KMW-7, and KMW-8: Recorded October depth to water on day of sampling.
10. DC-19: Initial water level was not consistent with historical data and remeasured on October 29.

NOTES:

1. TOC = top of casing.
2. units: pH standard units reported to 0.01.
3. µS/cm = microsiemens per centimeter @ 25 degrees Celsius (°C).
4. Dissolved Oxygen (DO) reported to 0.1 milligrams per liter (mg/L).
5. ORP = oxidation-reduction potential.
6. mV = millivolts.

NOTES:

1. Tetrachloroethene (PCE) concentrations in migrograms per liter (µg/l). Other VOCs, if detected above the laboratory practical quantitation limit (PQL), are listed in Table D3.
2. Groundwater samples analyzed using USEPA Method 8260C.
3. U = concentration not detected at or above the laboratory PQL.
4. J = the identification of the analyte is acceptable; the reported value is an estimate
5. Detected concentrations are shown in **bold.**
6. Concentrations exceeding the cleanup level are **bold and shaded**.
7. Screened interval depth is estimated using from surveyed elevations (top of casing elevations, ground surface, and monument rim) and field measurements at the time of drilling.
8. Pump intake depth and depth to water is measured in feet below the top of casing (TOC).
9. Screened intervals completely submerged are shaded.

ANALYTICAL REPORT

May 30, 2019

PES Environmental, Inc.- WA

Sample Delivery Group:	L1101499
Samples Received:	05/22/2019
Project Number:	1358.001.01.003
Description:	MVSC
Site:	MVSC
Report To:	Karsten Springstead 1215 Fourth Ave., Suite 1350 Seattle, WA 98161

Entire Report Reviewed By: Brian Ford

Brian Ford
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace National is performed per guidance provided in laboratory standard operating procedures: 060302, 060303, and 060304.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

ANALYTICAL REPORT

November 04, 2019

PES Environmental, Inc.- WA

Sample Delivery Group:	L1154255
Samples Received:	10/26/2019
Project Number:	1358.001.02.013
Description:	MVSC
Site:	MVSC
Report To:	Karsten Springstead 1215 Fourth Ave., Suite 1350 Seattle, WA 98161

Entire Report Reviewed By:

Brian Ford

Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J0	J0: The identification of the analyte is acceptable, but the reported concentration is an estimate. The calibration met method criteria.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Brian Ford
Project Manager

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J0	J0: The identification of the analyte is acceptable, but the reported concentration is an estimate. The calibration met method criteria.
J4	The associated batch QC was outside the established quality control range for accuracy.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

MEMORANDUM

TO: Project File **DATE:** November 20, 2019

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center

PROJECT #: 1358.001.02.013

TASK: EIM Data Validation Level EPA2A – May and October 2019 Groundwater Samples

LAB: Pace Sample Delivery Groups (SDGs): L1101499, L1154255, and L1155907

Groundwater samples were collected in May and October 2019 as part of remediation performance monitoring at the Manhattan Village Shopping Centre site in Normandy Park, Washington.

- **May 21, 2019:** Four (4) groundwater samples including one field duplicate, one equipment blank, and one trip blank were collected.
- **October 25 and 28-30, 2019:** Sixteen (16) groundwater samples including one field duplicate, one equipment blank, and two trip blanks were collected.

The samples were delivered to Pace Analytical (Pace) of Mount Juliet, TN for laboratory analysis. Samples were analyzed for volatile organic compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method 8260C.

The quality assurance review of the laboratory data for Pace SDGs L1101499, L1154255, and L1155907 are summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Completeness

All samples were collected and analyzed as requested. No concerns, issues, or anomalies were identified in the laboratory report.

Sample Collection and Preservation

The samples were stored on ice in coolers and delivered in good condition to the laboratory. Sample temperatures at the time of receipt were slightly below EPA's recommended temperature preservation range of less than 6.0 °Centigrade. No data qualifications are warranted.

Holding Times

USEPA Method 8260C:
All samples were analyzed for VOCs within the EPA recommended holding time of 14 days for preserved water samples. All holding time criteria were met.

Initial and Continuing Calibration

Calibration data for this project are not required for this deliverable however Pace's notes indicate the following:

- SDGs L1154255 and L1155907 - *USEPA Method 8260C:* Continuing calibration verification (CCV) issues were noted by Pace for multiple compounds associated with analytical batches in each SDG. These compounds are qualified by the laboratory "J0" to indicate that percent difference CCV is outside of laboratory acceptance criteria. **Associated sample results with laboratory qualified (J0) results are estimated and qualified (J/UJ).**

Method Blank Results

USEPA Method 8260C:
Laboratory method blanks were included with the analytical batches per method requirement. The target analytes (VOCs) were not detected in the method blanks at a concentration at or above the reporting detection limits (RDLs) with the following exceptions:

- SDG L1101499: Hexachloro-1,3-butadiene, naphthalene, and 1,2,3-trichlorobenzene are detected below the RDLs in the method blank (analytical batch WG1286542). No action is taken since these compounds are not detected in the associated samples.

Trip Blank Results

Three trip blanks (Trip Blank, TRIP-102519, and TRIP-103019) were collected and analyzed. The target analytes were not detected in the trip blanks at or above the RDLs.

Equipment Blank Results

Two equipment blanks (EQ-052119 and EQ-102519) associated with groundwater samples collected in May and October of 2019 (Pace SDGs L1101499 and L1154255) were collected and submitted for VOC analysis. The target analytes (VOCs) were not detected in the equipment blanks at concentrations at or above the RDLs.

Field Duplicate Analyses

Field duplicate sample pairs are as follows:

- SDG L1101499: Samples DC-17 and MW-101-052119; and
- SDG L1155907: Samples DC-7 and MW-101-103019.

Field duplicate pairs were submitted and analyzed for VOCs. VOC target analyte results are comparable and within a relative percent difference (RPD) of 30% (± 1x RDL for groundwater results <5X the RDL) for the field duplicates.

Laboratory Duplicate Analyses

USEPA Method 8260C:
Laboratory duplicate analysis were not analyzed. Refer to LCS, LCS/LCSD or field duplicate results for accuracy and precision data.

Surrogate Recoveries

USEPA Method 8260C:
The surrogate percent recovery (%R) results for the samples, method blanks, matrix spike samples, and laboratory control samples are within the laboratory surrogate control limits. No data qualifications were warranted.

Laboratory Control Samples

USEPA Method 8260C:
Laboratory control sample/laboratory control sample duplicates (LCS/LCSD) were analyzed by USEPA Method 8260C. In some cases, only an LCS was analyzed and for precision data refer to field duplicate results. The LCS or LCS/LCSD %R's and RPDs for the target compounds are within the laboratory control criteria for waters with the following discussions:

- SDG L1101499: LCS (WG1286542) vinyl acetate recovery is above laboratory acceptance criteria and laboratory qualified (J4). No action is taken on this basis since vinyl acetate is not detected in the associated samples.

- SDG L1154255: LCS and/or LCSD (WG1373989) 2-chlorotoluene, 4-chlorotoluene 1,2,4-trimethylbenzene recoveries are above laboratory acceptance criteria and laboratory qualified (J4). No action is taken on this basis since these compounds are not detected in the associated samples. Naphthalene RPD exceeds laboratory control limit criteria and laboratory qualified (J3) however no action is taken since both recoveries are within criteria but were recovered wide.

- SDG L1155907: LCS recovery for tert-butylbenzene is slightly below the laboratory acceptance criteria and laboratory qualified (J4). **All associated sample tert-butylbenzene results are estimated and qualified (UJ/J).** Refer to Initial and Continuing Calibration section for additional information.

Matrix Spike/Matrix Spike Duplicates

USEPA Method 8260C:
Matrix spike/matrix spike duplicate (MS/MSD) analyses were not performed. Refer to LCS or LCS/LCSD and field duplicate results for accuracy and precision data.

Other Quality Control Issues

No laboratory quality control issues were identified in the laboratory reports with the following discussion:

- Electronic data deliverables (EDDs) for these SDGs were provided by the laboratory and data validator qualifiers were entered where needed.

Quantitation Limits

Results of the USEPA 8260C VOC analyses were reported based on laboratory RDLs. The RDLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. The RDLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

Data qualifiers are assigned and laboratory report pages with qualifiers are attached. All data, including qualified data, are judged to be acceptable for their intended use.

Volatile Organic Compounds (GC/MS) by Method 8260C

ANALYTICAL REPORT

December 17, 2019

PES Environmental, Inc.- WA

Sample Delivery Group:	L1167629
Samples Received:	12/05/2019
Project Number:	1358.001.02.013
Description:	MVSC
Site:	MVSC-HARRIS
Report To:	Karsten Springstead 1215 Fourth Ave., Suite 1350 Seattle, WA 98161

Entire Report Reviewed By: Brian Ford

Brian Ford
Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J0	J0: The identification of the analyte is acceptable, but the reported concentration is an estimate. The calibration met method criteria.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

MEMORANDUM

TO: Project File **DATE:** April 22, 2020

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center

PROJECT #: 1358.001.02.016

TASK: EIM Data Validation Level EPA2A – December 2019 Groundwater Samples

LAB: Pace Analytical Sample Delivery Group (SDG): L1167629

Two (2) groundwater samples and one trip blank were collected as part of remediation performance monitoring at the Manhattan Village Shopping Centre site in Normandy Park, Washington on December 4, 2019. Laboratory analytical services were provided by Pace Analytical (Pace) of Mount Juliet, Tennessee. Samples were analyzed for volatile organic compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method 8260D.

The quality assurance review of the laboratory data for SDG L1167629 is summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Completeness

All samples were collected and analyzed as requested. No concerns, issues, or anomalies were identified in the laboratory report.

Sample Collection and Preservation

The samples were stored on ice in coolers and delivered in good condition to the laboratory. Sample temperatures at the time of receipt were slightly below EPA's recommended temperature preservation range of less than 6.0 °Centigrade. No data qualifications are warranted.

Holding Times

USEPA Method 8260D:
All samples were analyzed for VOCs within the EPA recommended holding time of 14 days for preserved water. All holding time criteria were met.

Initial and Continuing Calibration

Initial and continuing calibration data for this project are retained by the laboratory and available for review if necessary. Pace indicated within the laboratory report that continuing calibration verification (CCV) criteria for are not met and actions are as for the following:

- CCV compounds outside of criteria are qualified by the laboratory (J0). **The associated sample results with laboratory qualifiers (J0) are estimated (UJ/J) as the associated CCV recoveries are outside of laboratory control limits.**

Method Blank Results

USEPA Method 8260D:
Laboratory method blanks were included with the analytical batch per method requirement. The target analytes (VOCs) were not detected in the method blank at a concentration at or above the reporting detection limits (RLs) with the following exceptions:

- Low levels of carbon disulfide and chloroform (analytical batch W1392962) are detected in the method blank. No action is required since these compounds are not detected in the associated samples.

- A low level of idomethane is detected in the (analytical batch W1395047) in the method blank. No action is required since these compounds are not detected in the associated samples.

Trip Blank Results

A trip blank (TB-120419) was collected and analyzed. The target analytes (VOCs) were not detected in the trip blank at a concentration at or above the reporting detection limits (RLs).

Equipment Blank Results

An equipment blank was not collected.

Field Duplicate Analyses

Field duplicate samples were not collected. Refer to client or non-client laboratory duplicate results for precision data.

Laboratory Duplicate Analyses

USEPA Method 8260D:
Laboratory duplicate analysis was not performed. Refer to laboratory control sample or matrix spike results for additional precision data.

Surrogate Recoveries

USEPA Method 8260D:
The surrogate percent recovery (%R) results for the samples, method blanks, matrix spike samples, and laboratory control samples are within the laboratory surrogate control limits. No data qualifications were warranted.

Laboratory Control Samples

USEPA Method 8260D:
The laboratory control sample and laboratory control sample duplicate (LCS/LCSD) %R's and RPDs are within the laboratory control limits with the following exceptions:

- LCSD (analytical batch WG1392962) hexachloro-1,3-butadiene recovery is slightly below criteria however no action is necessary since the LCS recovery is within criteria.

- LCS/LCSD (analytical batch WG1395047) RPDs for acetone and bromomethane exceed laboratory criteria. No action is taken in these cases since spike recoveries are within criteria but were recovered wide.

- LCS/LCSD (analytical batch WG1395047) iodomethane recoveries are below criteria and RPD exceeds laboratory criteria. **Idomethane results in associated samples are estimated and qualified (UJ).**

- LCS/LCSD (analytical batch WG1395047) chloromethane recoveries are below criteria. **Chloromethane results in associated samples are estimated and qualified (UJ).**

Matrix Spike/Matrix Spike Duplicates

USEPA Method 8260D:
Matrix spike/matrix spike duplicate (MS/MSD) analyses was performed on a non-client sample. MS/MSD %R's and RPDs are within the laboratory control limits.

Other Quality Control Issues

No laboratory quality control issues were identified in the laboratory reports with the following discussion:

- Electronic data deliverables (EDDs) for these SDGs were provided by the laboratory and data validator qualifiers were entered where needed.

Quantitation Limits

The RLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. The RLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

Data qualifiers are assigned and laboratory report pages with qualifiers are attached. All data, including qualified data, are judged to be acceptable for their intended use.

RE: MVSC
Work Order Number: 1903006

March 05, 2019

Attention Matt Dahl:

Fremont Analytical, Inc. received 15 sample(s) on 3/1/2019 for the analyses presented in the following report.

Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260C

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Chelsea Ward
Project Manager

Date: *03/05/2019*

Case Narrative

WO#: **1903006**
Date: **3/5/2019**

CLIENT: PES Environmental, Inc.
Project: MVSC

WorkOrder Narrative:
I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below Reporting Limit
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit
R - High relative percent difference observed

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

RE: MVSC
Work Order Number: 1903081

March 14, 2019

Attention Matt Dahl:

Fremont Analytical, Inc. received 6 sample(s) on 3/6/2019 for the analyses presented in the following report.

Volatile Organic Compounds by EPA Method 8260C

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Chelsea Ward
Project Manager

Case Narrative

WO#: **1903081**
Date: **3/14/2019**

CLIENT: PES Environmental, Inc.
Project: MVSC

I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below Reporting Limit
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit
R - High relative percent difference observed

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

MEMORANDUM

TO: Project File **DATE:** April 2, 2019

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center

PROJECT #: 1358.001.01.009

TASK: EIM Data Validation Level EPA2A – February 28, March 1 and 6, 2019 Groundwater, Water, and Soil Samples

LAB: Fremont Work Order Numbers 1903006 and 1903081

Two (2) groundwater samples, one equipment blank, two waste water profile samples, fourteen (14) soil samples were collected as part of an ongoing remedial actions at the Manhattan Village Shopping Center in Normandy Park, Washington on February 28**,** March 1, and March 6, 2019. Laboratory analytical services were provided by Fremont Analytical (Fremont) of Seattle, Washington. Eight of the fourteen soil samples were placed on hold. Samples were analyzed for volatile organic compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method 8260C. Total solids were assessed using EPA Method 8000D.

The quality assurance review of the laboratory data for Fremont Work Orders 1903006 and 1903081 are summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Completeness

All samples were collected and analyzed as requested. No concerns, issues, or anomalies were identified in the laboratory report with the following discussions:

- Per PES's request the chain of custody date of collection **2**/6/19 and sample identifications MW-18-0**2**0619 and MW-17-0**2**0619 were corrected to read **3**/6/19 (MW-18-0**3**0619 and MW-17-0**3**0619).

Sample Collection and Preservation

The samples were stored on ice in coolers and delivered in good condition to the laboratory. Sample temperatures at the time of receipt were slightly below EPA's recommended temperature preservation range of less than 6.0 °Centigrade. No data qualifications are warranted.

Holding Times

USEPA Method 8260C:
All samples were analyzed for VOCs within the EPA recommended holding time of 14 days for preserved water and soil samples. All holding time criteria were met.

USEPA Method 8000D:
Samples were analyzed within the USEPA recommended holding time of seven days for total solids.

Initial and Continuing Calibration

Calibration data for this project are not required for this deliverable however Fremont's notes indicate the following:

- Work Order 1903006 - *USEPA Method 8260C:* Continuing calibration verification (CCV) issue is noted by Fremont for methyl tert-butyl ether (MTBE), trans-1,3-dichloropropylene, 1,1,2-trichloroethane, and 1,1,2,2-tetrachloroethane associated with analytical batch 23687 (analyzed on March 4, 2019). These results are qualified by the laboratory "Q" to indicate that percent difference CCVs are outside of laboratory acceptance criteria**. All associated compound results with laboratory qualified (Q) results are estimated and qualified (J/UJ).**

Method Blank Results

USEPA Method 8260C:
Laboratory method blanks were included with the analytical batches per method requirement. The target analytes (VOCs) were not detected in the method blanks at a concentration at or above the reporting detection limits (RLs).

Trip Blank Results

Trip blanks were not collected. No action is taken other than to note this.

Equipment Blank Results

An equipment blank (EQ-030619) associated with groundwater samples collected on March 6, 2019 (Fremont Work Order 1903081) was collected and submitted for VOC analysis. The target analytes (VOCs) were not detected in the equipment blank at a concentration at or above the RLs.

Field Duplicate Analyses

Field duplicate samples were not collected. Field duplicates are collected on per 20 samples per the project quality assurance plan. Refer to client or non-client laboratory duplicate results for precision data.

Laboratory Duplicate Analyses

USEPA Method 8260C:
Laboratory duplicate analysis were performed on client soil sample MW-18-10 and on a non-client water sample. Laboratory duplicate relative percent differences (RPDs) are within laboratory control limits. Refer to laboratory control sample or matrix spike results for additional precision data.

USEPA Method 8000D:
Laboratory duplicate sample analyses were performed on client soil sample MW-18-10. The primary/duplicate RPDs for total solids analyses are within the laboratory control limit of 20%.

Surrogate Recoveries

USEPA Method 8260C:
The surrogate percent recovery (%R) results for the samples, method blanks, and laboratory duplicates, matrix spike samples, and laboratory control samples are within the laboratory surrogate control limits. No data qualifications were warranted.

Laboratory Control Samples

USEPA Method 8260C:
The laboratory control sample and laboratory control sample duplicate (LCS/LCSD) %R's and RPDs for analytical batch (23687) associated with soils (Fremont Work Order 1903006) are within the laboratory control limits. Refer to matrix spike results for additional accuracy data.

Matrix Spike/Matrix Spike Duplicates

USEPA Method 8260C:
Matrix spike/matrix spike duplicate (MS/MSD) analyses were performed on a non-client sample associated with groundwater (Fremont Work Order 1903081). Several matrix spike compound recoveries are outside of the laboratory acceptance criteria however no action is taken in these cases since the spike was performed on a non-client sample. Refer to LCS or LCS/LCSD and laboratory duplicate results for accuracy and precision data.

Other Quality Control Issues

No laboratory quality control issues were identified in the laboratory reports with the following discussion:

- Electronic data deliverables (EDDs) for these SDGs were provided by the laboratory and data validator qualifiers were entered where needed.

Quantitation Limits

Results of the USEPA 8260 VOC analyses were reported based on laboratory RLs. The RLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. The RLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

Data qualifiers are assigned and laboratory report pages with qualifiers are attached. All data, including qualified data, are judged to be acceptable for their intended use.

Seattle, WA 98161

RE: MVSC
Work Order Number: 1910311

October 23, 2019

Attention Matt Dahl:

Fremont Analytical, Inc. received 16 sample(s) on 10/17/2019 for the analyses presented in the following report.

Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260D

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes
Project Manager

Date: *10/23/2019*

CLIENT: PES Environmental, Inc.
Project: MVSC
Work Order: 1910311

Case Narrative

WO#: **1910311**
Date: **10/23/2019**

CLIENT: PES Environmental, Inc.
Project: MVSC

I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below Reporting Limit
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit
R - High relative percent difference observed

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

Sample Log-In Check List

Client Name:	**PES**	Work Order Number:	**1910311**
Logged by:	**Clare Griggs**	Date Received:	**10/17/2019 6:02:00 PM**

Chain of Custody

1.	Is Chain of Custody complete?	Yes ☑	No ☐	Not Present ☐
2.	How was the sample delivered?	Client		

Log In

3.	Coolers are present?	Yes ☑	No ☐	NA ☐
4.	Shipping container/cooler in good condition?	Yes ☑	No ☐	
5.	Custody Seals present on shipping container/cooler? (Refer to comments for Custody Seals not intact)	Yes ☐	No ☐	Not Required ☑
6.	Was an attempt made to cool the samples?	Yes ☑	No ☐	NA ☐
7.	Were all items received at a temperature of >0°C to 10.0°C *	Yes ☑	No ☐	NA ☐
8.	Sample(s) in proper container(s)?	Yes ☑	No ☐	
9.	Sufficient sample volume for indicated test(s)?	Yes ☑	No ☐	
10.	Are samples properly preserved?	Yes ☑	No ☐	
11.	Was preservative added to bottles?	Yes ☐	No ☑	NA ☐
12.	Is there headspace in the VOA vials?	Yes ☐	No ☐	NA ☑
13.	Did all samples containers arrive in good condition(unbroken)?	Yes ☑	No ☐	
14.	Does paperwork match bottle labels?	Yes ☑	No ☐	
15.	Are matrices correctly identified on Chain of Custody?	Yes ☑	No ☐	
16.	Is it clear what analyses were requested?	Yes ☑	No ☐	
17.	Were all holding times able to be met?	Yes ☑	No ☐	

Special Handling (if applicable)

18.	Was client notified of all discrepancies with this order?	Yes ☐	No ☐	NA ☑

Person Notified: _____ Date: _____

MEMORANDUM

TO: Project File **DATE:** November 1, 2018

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center

PROJECT #: 1358.001.02.012

TASK: EIM Data Validation Level EPA2A – October 2019 Soil Samples

LAB: Fremont Work Order Number 1910311

Fifteen (15) soil samples and one (1) trip blank were collected at the Manhattan Village Shopping Centre site in Normandy Park, Washington on October 16-17, 2019. Nine of the fifteen soil samples were placed on hold. Selected samples associated with Work Order 1910311 were analyzed for the following:

- Volatile organic compounds (VOCs) by United States Environmental Protection Agency (USEPA) Method 8260D; and
- Total Solids by USEPA Method 8000D.

The quality assurance review of the laboratory data associated with Fremont Work Order 1910311 is summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Sample Collection and Preservation

The samples were stored on ice in the cooler and delivered in good condition to the laboratory. Cooler temperature at the time of receipt was measured at 4.3 degrees Centigrade (°C). The cooler and sample temperatures were within EPA's recommended temperature preservation range of less than 6.0 °C. No data qualifications are warranted.

Holding Times

All samples were analyzed for VOCs within the EPA recommended holding time of 14 days (preserved water). All holding time criteria were met.

Initial and Continuing Calibration

Initial and continuing calibration data for this project are retained by the laboratory and available for review if necessary. These data were not provided nor requested for this project. Case narrative notes and qualifiers do not issue any issues with calibration data.

Method Blank Results

A laboratory method blank was included with the analytical batch per method requirement. The target analytes (VOCs) were not detected in the method blank at a concentration at or above the reporting limits (RLs).

Trip Blank Results

A trip blank was collected and submitted for analysis. The target analytes (VOCs) were not detected in the trip blank at a concentration at or above the RLs.

Equipment Blank Results

An equipment blank was not collected.

Field Duplicate Analyses

Field duplicate samples were not collected. Refer to laboratory duplicate data or matrix spike sample results associated with this SDG for precision data.

Laboratory Duplicate Analyses

Laboratory duplicate analysis were performed on client sample MW-19-38. Relative percent differences (RPDs) are within laboratory control limit criteria of 30%.

Surrogate Recoveries

The surrogate percent recovery (%R) results for the samples, trip blank, method blank, laboratory duplicate, matrix spike, and laboratory control samples are within the laboratory surrogate control limits. No data qualifications were warranted.

Laboratory Control Samples

The laboratory control sample (LCS) % Rs are within the laboratory control limits. Refer to matrix spike results for additional accuracy data.

Matrix Spike/Matrix Spike Duplicates

Matrix spike/matrix spike duplicate (MS/MSD) analyses were performed on sample MW-20-30. MS/MSD %Rs and RPDs are within laboratory QC criteria.

Other Quality Control Issues

No laboratory quality control issues were identified in the laboratory reports with the following discussion:

- Electronic data deliverables (EDDs) for these SDGs were provided by the laboratory and data validator qualifiers were entered (as needed) into the EDDs.

Quantitation Limits

Results of the USEPA 8260 VOC analyses were reported based on laboratory RLs. The RLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. The RLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

No data qualifiers are assigned. All data are judged to be acceptable for their intended use.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
	The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

MEMORANDUM

TO: Project File **DATE:** April 2, 2019

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center - Soil Vapor Extraction System Performance Data Review

PROJECT #: 1358.001.01.009

TASK: EIM Data Validation Level EPA2A – March 11, 2019 Soil Gas Samples

LAB: Pace Analytical Sample Delivery Groups (SDGs): L1078104 and L1077796

Eight (8) soil gas samples were collected on March 11, 2019 as part of an ongoing remedial actions at the Manhattan Village Shopping Center in Normandy Park, Washington. One soil gas sample was canceled as described below. The remaining samples were analyzed for 67 VOCs by USEPA Method TO-15 (*Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air*, Second Edition, EPA/625/R-96/010B, January 1999). Laboratory analytical services were provided by Pace Analytical (Pace) of Mt. Juliet, Tennessee. Analytical data are reported under Pace's SDGs L1078104 and L1077796.

The quality assurance review of the laboratory data for Pace SDGs L1078104 and L1077796 are summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Completeness

The samples were collected and analyzed as requested. No concerns, issues, or anomalies were identified in the laboratory report with the following discussion:

- SDG L1077796: A Cooler Receipt Form is included with this SDG, but this form is not included with SDG L1078104. No action is taken other than to note that both SDGs were received in good condition.

- SDG L1078104: PES cancelled the analysis request for sample SVS-12-031119 because the laboratory supplied flow controller leaked during sample collection. The laboratory evaluated the equipment and confirmed that ambient air had leaked into the sample. Sample SVS-12-031119 VOC results are not reported because the results are not representative of sub-slab conditions.

Sample Collection and Preservation

The laboratory supplied Summa canisters (1-Liter) for the air samples. The samples were shipped, delivered by FedEx, and received in good condition by the laboratory. The samples were collected, handled, and delivered in an appropriate manner. Review of the Cooler Receipt Form on SDG L1077796 indicates that signed chain of custody seals were not placed on the exterior of the summa canister shipping box. No action is taken other than to note that the samples were received in good condition. No data qualifications were warranted based upon sampling and preservation techniques.

Holding Times

The analyses for VOCs by Method TO-15 were performed within the 30-day recommended holding time limit for the air samples collected in a Summa canister. Date of analyses are not reported with the results. Refer to the method blank results for date of analysis. No data was qualified based upon holding times.

Initial and Continuing Calibration

Initial and continuing calibration data for this project are retained by the laboratory and available for review if necessary. Case narrative and laboratory notes do not indicate that there are any issues with calibration.

Method Blank Results

Laboratory method blanks were included with the analytical batch per method requirement. The method blank results did not report any compounds at concentrations at or above the reporting detection limit (RDLs).

Trip Blank Results

A trip blank was not required for the VOCs by TO-15 analyses. No qualifications were warranted due to the lack of a trip blank for this method.

Field Duplicate Analyses

No field duplicates were required or collected during this field event.

Laboratory Duplicate/Replicate Analyses

A laboratory replicate was not performed. Refer to the Laboratory Control Sample section for additional information.

Surrogate Recoveries

The surrogate percent recovery (% R) results for the VOCs by TO-15 air samples, method blanks, and laboratory control samples are within the laboratory surrogate control limits of 60 - 140% R. No data qualifications were warranted.

Laboratory Control Samples

Laboratory control sample/laboratory control sample duplicate (LCS/LCSD) were analyzed for the VOCs by TO-15 along with each analytical batch. LCS/LCSD %Rs and relative percent differences (RPDs) are within QC criteria.

Matrix Spike/Matrix Spike Duplicates

A matrix spike/matrix spike duplicate (MS/MSD) is not required for the VOCs by TO-15 method.

Other Quality Control Issues

No other laboratory quality control issues were identified in the laboratory report.

Quantitation Limits

Results of the VOCs by TO-15 analysis are reported based on laboratory RDLs (assuming standard temperature and pressure is equal to 24.45) and reported in units of ppbv and $\mu g/m^3$.

The RDLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. For selected samples the RDLs for tetrachloroethene and cis-1,2-dichloroethene are elevated due to a method-required dilution. The RDLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

No data qualifiers are assigned. All data are judged to be acceptable for their intended use.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Brian Ford

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Subject: Revised COC for L1105041
Attachments: COC_060319-revised.pdf

Brian-

Attached is a revised chain of custody for samples collected 6/3/19 at our MVSC site (project number 1358.001.01.009). Sample ID “SVS-16-060319” should be revised to “SVS-17-060319.” I have also attached our field form with canister and flow regulator ids, and canister start and end pressures.

Please let me know if you have any additional questions.

Best,
Shannon

MEMORANDUM

TO: Project File **DATE:** June 24, 2019

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center - Soil Vapor Extraction System Performance Data Review

PROJECT #: 1358.001.01.009

TASK: EIM Data Validation Level EPA2A – June 3, 2019 Air Samples

LAB: Pace Analytical Sample Delivery Group (SDG): L1105041

Seven (7) soil vapor extraction samples were collected on June 3, 2019 as part of an ongoing remedial actions at the Manhattan Village Shopping Center in Normandy Park, Washington. The samples were analyzed for 68 VOCs by USEPA Method TO-15 (*Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air*, Second Edition, EPA/625/R-96/010B, January 1999). Laboratory analytical services were provided by Pace Analytical (Pace) of Mt. Juliet, Tennessee. Analytical data are reported under Pace SDG L1105041 and the quality assurance review is summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Completeness

The samples were collected and analyzed as requested. No concerns, issues, or anomalies were identified in the laboratory report with the following discussion:

- SDG L1105041: On June 5, 2019 PES revised the chain of custody (via email) to show a sample identification correction. Sample identification SVS-16-060319 was revised by PES to read SVS-17-060319. PES also included field form details with canister flow regulator identifications, canister start and end pressures.

Sample Collection and Preservation

The laboratory supplied Summa canisters (1-Liter) for the air samples. The samples were shipped, delivered by FedEx, and received in good condition by the laboratory. The samples were collected, handled, and delivered in an appropriate manner. No data qualifications were warranted based upon sampling and preservation techniques.

Holding Times

The analyses for VOCs by Method TO-15 were performed within the 30-day recommended holding time limit for the air samples collected in a Summa canister. Date of analyses are not reported with the results. Refer to the method blank results for date of analysis. No data was qualified based upon holding times.

Initial and Continuing Calibration

Initial and continuing calibration data for this project are retained by the laboratory and available for review if necessary. Case narrative and laboratory notes do not indicate that there are any issues with calibration.

Method Blank Results

Laboratory method blanks were included with the analytical batch per method requirement. The method blank results do not report any compounds at concentrations at or above the reporting detection limit (RDLs).

Trip Blank Results

A trip blank was not required for the VOCs by TO-15 analyses. No qualifications were warranted due to the lack of a trip blank for this method.

Field Duplicate Analyses

No field duplicates were required or collected during this field event.

Laboratory Duplicate/Replicate Analyses

A laboratory replicate was not performed. Refer to the Laboratory Control Sample section for additional information.

Surrogate Recoveries

The surrogate percent recovery (% R) results for the VOCs by TO-15 air samples, method blanks, and laboratory control samples are within the laboratory surrogate control limits of 60 - 140% R. No data qualifications were warranted.

Laboratory Control Samples

Laboratory control samples/laboratory control sample duplicates (LCS/LCSDs) were analyzed for the VOCs by TO-15 along with each analytical batch. LCS/LCSD %Rs and relative percent differences (RPDs) are within QC criteria.

Matrix Spike/Matrix Spike Duplicates

A matrix spike/matrix spike duplicate (MS/MSD) is not required for the VOCs by TO-15 method.

Other Quality Control Issues

No other laboratory quality control issues were identified in the laboratory report.

Quantitation Limits

Results of the VOCs by TO-15 analysis are reported based on laboratory RDLs (assuming standard temperature and pressure is equal to 24.45) and reported in units of ppbv and $\mu g/m^3$.

The RDLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. For selected samples (SVS-13-060319 and SVS-17-060319) the RDLs for cis-1,2-dichloroethene, trans-1,2-dichloroethene, tetrachloroethene, and/or trichloroethylene are elevated due to method-required dilutions. The RDLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

No data qualifiers are assigned. All data are judged to be acceptable for their intended use.

LABORATORY REPORT

July 24, 2019

Matt Dahl
PES Environmental
1215 Fourth Avenue, Suite 1350
Seattle, WA 98161

RE: MVSC / 1358.001.01.007

Dear Matt:

Enclosed are the results of the sample submitted to our laboratory on July 10, 2019. For your reference, this analysis has been assigned our service request number P1904055.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

ALS | Environmental

www.alsglobal.com

Client: PES Environmental
Project: MVSC / 1358.001.01.007

Service Request No: P1904055

CASE NARRATIVE

The sample was received intact under chain of custody on July 10, 2019 and was stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the samples at the time of sample receipt.

Volatile Organic Compound Analysis

The sample was analyzed for volatile organic compounds in accordance with EPA Method TO-15 from the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (EPA/625/R-96/010b), January, 1999. This procedure is described in laboratory SOP VOA-TO15. The analytical system was comprised of a gas chromatograph / mass spectrometer (GC/MS) interfaced to a whole-air preconcentrator. This method is included on the laboratory's NELAP and DoD-ELAP scope of accreditation. Any analytes flagged with an X are not included on the NELAP or DoD-ELAP accreditation.

The container was cleaned, prior to sampling, down to the method reporting limit (MRL) reported for this project. For projects requiring DoD QSM 5.1 compliance canisters were cleaned to <1/2 the MRL. Please note, projects which require reporting below the MRL could have results between the MRL and method detection limit (MDL) that are biased high.

The results of analyses are given in the attached laboratory report. All results are intended to be considered in their entirety, and ALS Environmental (ALS) is not responsible for utilization of less than the complete report.

Use of ALS Environmental (ALS)'s Name. Client shall not use ALS's name or trademark in any marketing or reporting materials, press releases or in any other manner ("Materials") whatsoever and shall not attribute to ALS any test result, tolerance or specification derived from ALS's data ("Attribution") without ALS's prior written consent, which may be withheld by ALS for any reason in its sole discretion. To request ALS's consent, Client shall provide copies of the proposed Materials or Attribution and describe in writing Client's proposed use of such Materials or Attribution. If ALS has not provided written approval of the Materials or Attribution within ten (10) days of receipt from Client, Client's request to use ALS's name or trademark in any Materials or Attribution shall be deemed denied. ALS may, in its discretion, reasonably charge Client for its time in reviewing Materials or Attribution requests. Client acknowledges and agrees that the unauthorized use of ALS's name or trademark may cause ALS to incur irreparable harm for which the recovery of money damages will be inadequate. Accordingly, Client acknowledges and agrees that a violation shall justify preliminary injunctive relief. For questions contact the laboratory.

5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☐	☐	☒
	Location of seal(s)? _____ Sealing Lid?	☐	☐	☒
	Were signature and date included?	☐	☐	☒
	Were seals intact?	☐	☐	☒
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

Lab Sample ID	Container Description	Required pH *	Received pH	Adjusted pH	VOA Headspace (Presence/Absence)	Receipt / Preservation Comments
P1904055-001.01	6.0 L Source Can					

Explain any discrepancies: (include lab sample ID numbers): _____

RSK - MEEPP, HCL (pH<2); RSK - CO2, (pH 5-8); Sulfur (pH>4)

LABORATORY REPORT

November 25, 2019

Matt Dahl
PES Environmental
1215 Fourth Avenue, Suite 1350
Seattle, WA 98161

RE: MVSC / 1358.001.02.015

Dear Matt:

Enclosed are the results of the sample submitted to our laboratory on October 30, 2019. For your reference, this analysis has been assigned our service request number P1906575.

All analyses were performed according to our laboratory's NELAP and DoD-ELAP-approved quality assurance program. The test results meet requirements of the current NELAP and DoD-ELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP and DoD-ELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. Results are intended to be considered in their entirety and apply only to the samples analyzed and reported herein.

If you have any questions, please call me at (805) 526-7161.

Respectfully submitted,

ALS | Environmental

By Hayden Akers at 6:49 pm, Nov 25, 2019

For Kate Kaneko
Laboratory Director

2655 Park Center Dr., Suite A
Simi Valley, CA 93065
T: +1 805 526 7161
www.alsglobal.com

Client: PES Environmental
Project: MVSC / 1358.001.02.015

Service Request No: P1906575

CASE NARRATIVE

The sample was received intact under chain of custody on October 30, 2019 and was stored in accordance with the analytical method requirements. Please refer to the sample acceptance check form for additional information. The results reported herein are applicable only to the condition of the sample at the time of sample receipt.

Volatile Organic Compound Analysis

The sample was analyzed for volatile organic compounds in accordance with EPA Method TO-15 from the Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air, Second Edition (EPA/625/R-96/010b), January, 1999. This procedure is described in laboratory SOP VOA-TO15. The analytical system was comprised of a gas chromatograph / mass spectrometer (GC/MS) interfaced to a whole-air preconcentrator. This method is included on the laboratory's NELAP and DoD-ELAP scope of accreditation. Any analytes flagged with an X are not included on the NELAP or DoD-ELAP accreditation.

The upper control criterion was exceeded for hexachlorobutadiene in the Continuing Calibration Verification (CCV). Since the apparent problem equates to a potential high bias and the field sample analyzed in this sequence did not contain the analyte in question, the data quality is not affected. No corrective action was required.

The sample container has a leaking valve; however, the sample was repressurized and analyzed and the results reported. Results from this sample should be considered estimated and utilized accordingly.

The container was cleaned, prior to sampling, down to the method reporting limit (MRL) reported for this project. For projects requiring DoD QSM 5.1 compliance canisters were cleaned to <1/2 the MRL. Please note, projects which require reporting below the MRL could have results between the MRL and method detection limit (MDL) that are biased high.

The results of analyses are given in the attached laboratory report. All results are intended to be considered in their entirety, and ALS Environmental (ALS) is not responsible for utilization of less than the complete report.

Use of ALS Environmental (ALS)'s Name. Client shall not use ALS's name or trademark in any marketing or reporting materials, press releases or in any other manner ("Materials") whatsoever and shall not attribute to ALS any test result, tolerance or specification derived from ALS's data ("Attribution") without ALS's prior written consent, which may be withheld by ALS for any reason in its sole discretion. To request ALS's consent, Client shall provide copies of the proposed Materials or Attribution and describe in writing Client's proposed use of such Materials or Attribution. If ALS has not provided written approval of the Materials or Attribution within ten (10) days of receipt from Client, Client's request to use ALS's name or trademark in any Materials or Attribution shall be deemed denied. ALS may, in its discretion, reasonably charge Client for its time in reviewing Materials or Attribution requests. Client acknowledges and agrees that the unauthorized use of ALS's name or trademark may cause ALS to incur irreparable harm for which the recovery of money damages will be inadequate. Accordingly, Client acknowledges and agrees that a violation shall justify preliminary injunctive relief. For questions contact the laboratory.

Analyses were performed according to our laboratory's NELAP and DoD-ELAP approved quality assurance program. A complete listing of specific NELAP and DoD-ELAP certified analytes can be found in the certifications section at www.alsglobal.com, or at the accreditation body's website.

Each of the certifications listed above have an explicit Scope of Accreditation that applies to specific matrices/methods/analytes; therefore, please contact the laboratory for information corresponding to a particular certification.

Sample Acceptance Check Form

Client: PES Environmental Work order: P1906575

Project: MVSC / 1358.001.02.015

Sample(s) received on: 10/30/2019 Date opened: 10/30/2019 by: DENISE.POSADA

Note: This form is used for all samples received by ALS. The use of this form for custody seals is strictly meant to indicate presence/absence and not as an indication of compliance or nonconformity. Thermal preservation and pH will only be evaluated either at the request of the client and/or as required by the method/SOP.

		Yes	No	N/A
1	Were **sample containers** properly marked with client sample ID?	☒	☐	☐
2	Did **sample containers** arrive in good condition?	☒	☐	☐
3	Were **chain-of-custody** papers used and filled out?	☒	☐	☐
4	Did **sample container labels** and/or tags agree with custody papers?	☒	☐	☐
5	Was **sample volume** received adequate for analysis?	☒	☐	☐
6	Are samples within specified holding times?	☒	☐	☐
7	Was proper **temperature** (thermal preservation) of cooler at receipt adhered to?	☐	☐	☒
8	Were **custody seals** on outside of cooler/Box/Container?	☐	☐	☒
	Location of seal(s)? _____ Sealing Lid?	☐	☐	☒
	Were signature and date included?	☐	☐	☒
	Were seals intact?	☐	☐	☒
9	Do containers have appropriate **preservation**, according to method/SOP or Client specified information?	☐	☐	☒
	Is there a client indication that the submitted samples are **pH** preserved?	☐	☐	☒
	Were **VOA vials** checked for presence/absence of air bubbles?	☐	☐	☒
	Does the client/method/SOP require that the analyst check the sample pH and if necessary alter it?	☐	☐	☒
10	**Tubes:** Are the tubes capped and intact?	☐	☐	☒
11	**Badges:** Are the badges properly capped and intact?	☐	☐	☒
	Are dual bed badges separated and individually capped and intact?	☐	☐	☒

Lab Sample ID	Container Description	Required pH *	Received pH	Adjusted pH	VOA Headspace (Presence/Absence)	Receipt / Preservation Comments

MEMORANDUM

TO: Project File **DATE:** December 9, 2019

FROM: Jessie Compeau

SUBJECT: Laboratory Data Validation Review

PROJECT: Manhattan Village Shopping Center - Soil Vapor Extraction System Performance Data Review

PROJECT #: 1358.001.02.015

TASK: EIM Data Validation Level EPA2A – July and October Quarterly Air Samples

LAB: ALS Environmental Service Request Numbers: P1904055 and P1906575

One soil vapor extraction sample was collected for the July 8 and the October 28 2019 quarterly sampling events at the Manhattan Village Shopping Center in Normandy Park, Washington. The samples were analyzed for 68 VOCs by USEPA Method TO-15 (*Compendium of Methods for the Determination of Toxic Organic Compounds in Ambient Air*, Second Edition, EPA/625/R-96/010B, January 1999). Laboratory analytical services were provided by ALS Environmental (ALS) (also known as ALS Global (ALS)) of Simi Valley, California. Analytical data are reported under ALS's service request number P1904055 and P1906575.

The quality assurance review of the analytical data is summarized below.

DATA QUALIFICATIONS

Guidelines established by USEPA for a limited data validation review of analytical data were used to validate the data. The comments presented in this memorandum refer to the laboratory's performance in meeting the quality control criteria outlined in the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (USEPA, 2017).

DATA VALIDATION

Completeness

The samples were collected and analyzed as requested. No concerns, issues, or anomalies were identified in the laboratory report.

Sample Collection and Preservation

The laboratory supplied summa cannisters (6-Liter) for the air samples. The samples were shipped, delivered by FedEx, and received in good condition by the laboratory. The samples

were collected, handled, and delivered in an appropriate manner. No data qualifications were warranted based upon sampling and preservation techniques.

Holding Times

The analyses for VOCs by Method TO-15 were performed within the 30-day recommended holding time limit for the air samples collected in a summa cannister. No data was qualified based upon holding times.

Initial and Continuing Calibration

Initial and continuing calibration data for this project are retained by the laboratory and available for review if necessary. Case narrative and laboratory notes do not indicate that there are any issues with calibrations.

Method Blank Results

Laboratory method blanks were included with the analytical batch per method requirement. The method blank results do not report any compounds at concentrations at or above the reporting detection limit (MRLs).

Trip Blank Results

A trip blank was not required for the VOCs by TO-15 analyses. No qualifications were warranted due to the lack of a trip blank for this method.

Field Duplicate Analyses

No field duplicates were required or collected during this field event.

Laboratory Duplicate/Replicate Analyses

A laboratory replicate was performed on the sample (sample SYS-07082019) collected in July of 2019. All target compound RPDs are within laboratory control limit criteria of 25%. Refer to the Laboratory Control Sample section for additional precision information.

Surrogate Recoveries

The surrogate percent recovery (% R) results for the VOCs by TO-15 air samples, method blanks, and laboratory control samples are within the laboratory surrogate control limits of 70 - 130% R. No data qualifications were warranted.

Laboratory Control Samples

Laboratory control samples/laboratory control sample duplicates (LCS/LCSDs) were analyzed for the VOCs by TO-15 along with each analytical batch. LCS/LCSD %Rs and relative percent differences (RPDs) are within QC criteria with the following exception:

- Service Request P1906575: LCSD recovery for methyl tert-butyl ether (MTBE) is marginally below control limit criteria. No action is taken since the LCS recovery for MTBE is within control limit criteria.

Matrix Spike/Matrix Spike Duplicates

A matrix spike/matrix spike duplicate (MS/MSD) is not required for the VOCs by TO-15 method.

Other Quality Control Issues

No other laboratory quality control issues were identified in the laboratory report.

Quantitation Limits

Results of the VOCs by TO-15 analysis are reported based on laboratory MRLs (assuming standard temperature and pressure is equal to 24.45) and reported in units of ppbv and $\mu g/m^3$.

The MRLs indicate the minimum quantity of a target analyte that can be confidently determined by the reference method. For sample SYS-07082019 and sample STACK – 102819 tetrachloroethene MRLs for are elevated due to method-required dilutions. The MRLs were acceptable for the project; therefore, no data qualifications were warranted.

Data Assessment

No data qualifiers are assigned. All data are judged to be acceptable for their intended use.

NOTES:

1. The grain size distribution is summarized from the boring logs.
2. The sand fractions were visually estimated by placing sand in a small vial, water was added, shaken, and allowed to settle.

Notes:
1. Northing and easting in feet relative to the Washington State Plane System North Zone (NAD 83/91)
2. Elevations in feet relative to the North American Vertical Datum (NAVD 88)
3. Monitoring point = top of the PVC well casing
4. All depths shown in feet below ground surface (ft bgs)
5. All wells completed with Schedule 40 PVC with the exception of AS-1 (Schdedule 80 PVC)
6. Drilling methods include hollow stem auger (HSA), direct push (DP), vacuum truck with air knife (AKVAC), and hand augered (HA)
7. '-- = not documented or unknown
8. Surface elevations for the direct push borings represents ground surface adjacent to the boring
9. Screened intervals are documented on boring logs and are typically based on a field measurements relative to ground surface at the time of drilling. Screened intervals relative to top of casing are estimated using well field construction measurements, surveyed top of casing elevations, surveyed ground surface elevations, and in some cases surveyed monument rim elevations. If ground or rim elevations are not surveyed, then top of casing is assumed to be 0.4 ft depth.
10. Monitoring wells MW-1, DC-6, DC-9A, DC-9B are missing or destroyed. The 1999 SCS VES wells have been decommissioned.
11. Temporary well screens consisting of Geoprobe SP22 stainless steel slotted tooling were deployed in direct push borings SB-19 through SB-25 and SB-29.
12. Soil vapor sampling probe screens are constructed of fine metal mesh.

Table D2
Historical Summary of Groundwater Elevations (1999 - 2019)
Manhattan Village Shopping Center and Harris Properties
Normandy Park, Washington

Location	Date	Well Casing Elevation (feet NAVD88)	Depth to Water (feet below well casing)	Water Level Elevation (feet NAVD88)

NOTES:

1. '-- = not measured or not applicable.
2. Well monument types: flush grade monuments and above ground (AG) monuments.
3. Depth to water is measured from top of well casing.
4. Elevations are reported relative to North American Vertical Datum of 1988 (NAVD 88).
5. Top of casing (TOC) elevations were surveyed by D.R. Strong Consulting Engineers, Inc. in February and May 213 and by Lanktree Land Surveying, Inc. in July 215.

NOTES:

1. Tetrachloroethene (PCE) concentrations in migrograms per liter (µg/l).
2. Groundwater samples analyzed using USEPA Method 8260B.
3. U = concentration not detected at or above the laboratory practical quantitation limit (PQL).
4. J = the identification of the analyte is acceptable; the reported value is an estimate
5. Detected concentrations are shown in **bold.**
6. Concentrations exceeding the cleanup level are **bold and shaded**.
7. Other detected VOCs are below their respective cleanup level unless otherwise noted.
8. Shallow monitoring wells are screened at the top of the shallow aquifer, and deep monitoring wells are screened below and deeper within the shallow aquifer.
9. Review of historical results indicate that DC-17 was inadvertently sampled as DC-5 in 2010, 2011 and 2012. This table reports the 2010 - 2012 DC-17 data as DC-5.

Table D4
Historical Summary of Soil Analytical Results (1998 - 2019)
Manhattan Village Shopping Center and Harris Properties
Normandy Park, Washington

Sample ID	Depth (ft bgs)	Date	PCE (mg/kg)	Other VOCs detected (mg/kg)	Comments
MW-18	35	02/28/19	**0.0358**		
MW-19	30.5	10/17/19	0.0271 U		
MW-19	35	10/17/19	**0.0717**		
MW-19	38	10/17/19	**0.107**		

Table D4
Historical Summary of Soil Analytical Results (1998 - 2019)
Manhattan Village Shopping Center and Harris Properties
Normandy Park, Washington

Sample ID	Depth (ft bgs)	Date	PCE (mg/kg)	Other VOCs detected (mg/kg)	Comments
MW-19	44	10/17/19	0.0268 U		
MW-20	30	10/17/19	**0.0280** U		
MW-20	35	10/17/19	**0.0299**		

NOTES:

1. Tetrachloroethene (PCE) concentrations in milligrams per kilogram (mg/kg).
2. Soil samples analyzed using USEPA Methods 8260B and 8021B (1998 through 2000 only).
3. ND and U = concentration not detected at or above the laboratory practical quantitation limit (PQL).
4. Detected concentrations are shown in **bold.**
5. Concentrations exceeding the PCE MTCA Method A cleanup level of 0.050 mg/kg are **bold and shaded**.
6. Other detected VOCs - only those which are above their respective cleanup level are listed.

PES Environmental, Inc.
Engineering & Environmental Services

MEMORANDUM

TO: **Ken Bloch – Keller Rohrback LLP.**
Harry Grant – Fox Rothschild LLP

FROM: **Matt Dahl, P.E.**

DATE: **October 22, 2019**

SUBJECT: **Soil Vapor Extraction System Expansion and Soil Excavation Design**
Manhattan Village Shopping Center and Harris Properties
Normandy Park, Washington

PROJECT NO.: 1358.001.02

PES Environmental, Inc. (PES) has prepared this technical memorandum to present the engineering design for conducting additional cleanup actions at the Manhattan Village Shopping Center (MVSC) property located at 17835 First Avenue South (the "MVSC property") and the Harris property located at 17817 – 17825 First Avenue South in Normandy Park, Washington (the "Harris property"), collectively referred to as the "Property" (Figures 1 and 2). The "Site" as used in this memorandum refers to the locations where contaminants originating from the Property have come to be located. This memorandum has been prepared in accordance with the Washington Model Toxics Control Act (MTCA) Chapter 173-340 of the Washington Administrative Code (WAC).

This design includes the basis and plans for treating tetrachloroethylene (PCE) in soil exceeding the MTCA Method A cleanup level (CUL) of 0.05 milligrams per kilogram (mg/kg) by: (1) expanding the existing soil vapor extraction (SVE) system near the Four Star Cleaners and the former Manhattan Cleaners and Coin-op Laundry (Manhattan Cleaners), and (2) excavating shallow impacted soil in the unpaved area west of the former Manhattan Cleaners. The SVE expansion includes installing six new wells to provide additional SVE coverage. The design includes the SVE and excavation layouts, details for well and wellhead construction, system manifolds, piping, and trenches. The existing 10 horsepower SVE system blower and condensate management equipment has adequate capacity for the expanded SVE system.

The following information is attached to this memorandum:

- Attachment A includes Site figures:
    - Figure 1 – Subject Property Location Map
    - Figure 2 – Site Plan
    - Figure 3 – Existing Remediation Well Locations
    - Figure 4 – Supplemental Investigation - Soil Results April 2018
    - Figure 5 – Soil Gas Sampling Locations on Manhattan Village Property
    - Figure 6 – Soil Gas Sampling Locations on Harris Property
- Attachment B includes the construction drawings:
    - Sheet T-1 – Cover Sheet
    - Sheet G-1 - General Notes
    - Sheet G-2 – Temporary Erosion Control Notes and Details
    - Sheet C-1 – Existing Site Plan
    - Sheet C-2 – SVE Expansion and Excavation Layout
    - Sheet C-3 – SVE Expansion and Excavation Details
    - Sheet C-4 – Well Construction Details
    - Sheet C-5 – Trench and Lateral Sections
    - Sheet C-6 – SVE Manifold Details
- Attachment C includes SVE pipe pressure loss calculations.

The design drawings are schematics, and as such do not show all potential construction conditions. Modifications to this design may occur due to minor interferences and/or structural obstructions encountered during the construction work.

BACKGROUND

There have been multiple rounds of remediation at the Site beginning in 1999. An interim SVE system operated on the MVSC property between October 1999 through July 2000 and was decommissioned shortly after the operating period. Follow-up remedial investigations lead to commissioning a second interim SVE system in 2009 (10-wells, SVE-1 through SVE-10). Confirmation soil sampling performed in 2011 and 2012 indicated that the interim SVE system had removed PCE to below CUL in most areas, although not all locations and depths that had previously exceeded the soil CUL were tested. Groundwater sampling indicated that PCE remained above the groundwater CUL; therefore, the current air sparging and SVE system (Figure 3) was commissioned in October 2016 for the primary purpose of groundwater remediation in areas along the western side of the Property. The SVE system consists of the 10 interim SVE wells, 9 SVE wells screened near the water table to capture the air sparging off-gas,

and 3 shallow-screened SVE wells to remediate vadose zone PCE behind the QFC building (an area that was beyond the influence of the interim SVE system).

Confirmation soil samples were collected in April 2018 (Figure 4) to test locations not evaluated in 2011 and 2012. The results showed that PCE concentrations had declined through operation of the interim and current SVE systems. However, vadose zone soil continued to exceed the CUL in three areas including: (1) west of the QFC building, (2) northeast of the Four Star Cleaners, and (3) west and northwest of the former Manhattan Cleaners. Area 1 is near SVE wells operating since 2016 and appears to need a longer period of SVE to reduce PCE concentrations to below the CUL at a depth of 5 to 6 feet (ft) below ground surface (bgs). In Area 2, PCE exceeds the CUL at 10 ft bgs and deeper. In Area 3, PCE exceeds the CUL at two depth intervals: 2 ft bgs and at 20 ft bgs and deeper. Areas 2 and 3 are near interim SVE wells that have been operating since 2009; it appears that the unpaved ground surface on the Harris property coupled with heterogeneous lithology may have limited the extent of the SVE influence in these areas.

Lithologic samples collected during the April 2018 investigation confirmed the presence of a variable fill material composed predominantly of silty sand and sandy silt with some areas of silt in the upper 3 to 10 ft bgs. The fill is underlain by fine to medium sand with varying degrees of silt. The sand layer contains discontinuous layers of silty sand and silt and becomes denser below approximately 20 to 25 ft bgs. Coarser sand and pockets of gravel have been encountered below 20 to 25 ft bgs. This unit has been interpreted as recessional outwash and includes gradational grain size variation, bedding, and fining upward sequences.

Soil sample results indicate that PCE exceeding the soil CUL extends down to groundwater in Areas 2 and 3. However, groundwater sampling over multiple quarterly events has shown that PCE concentrations in groundwater are below the MTCA Method A CUL of 5 micrograms per liter (µg/L) in these areas. Groundwater elevation fluctuates seasonally by approximately 3 ft and is roughly 3 to 4 ft deeper on MVSC property due to a retaining wall along a shared property line with the Harris property. Groundwater depth is roughly 38 to 41 ft in the alley on the MVSC property, 35.5 to 38.5 ft north of the retaining wall on Harris property, and 36.5 to 39.5 ft near the former Manhattan Cleaners.

Soil gas sampling was performed in March and June 2019 to evaluate the potential for vapor intrusion beneath the Four Star Cleaners, in the alley near the Four Star Cleaners, and beneath the former Manhattan Cleaners. The sampling was conducted while the air sparging and soil vapor extraction systems were off-line for groundwater rebound monitoring. Results indicated that PCE exceeded the modified MTCA Method B screening level for commercial occupancy in one soil gas probe (SVS-17) in the alley behind Four Star Cleaners (Figure 5) and in subslab soil gas probe (SVS-13) beneath the middle of the former Manhattan Cleaners suite (Figure 6).

Groundwater samples were collected in May 2019 to evaluate potential rebound near the downgradient edge of the air sparging zone of influence (ZOI). The results indicated that PCE concentrations remained below the CUL in two wells at the downgradient edge of the air sparging ZOI (MW-10 and MW-11) and remained relatively stable in monitoring well DC-17, which is located approximately 60 ft downgradient (north) of MW-10. The air sparging system

was left off-line to allow for a second round of rebound monitoring later in 2019. The SVE system was restarted in June 2019, and the SVE system coverage was reduced to 13 wells to continue to address three areas where PCE exceeded the CUL in the April 2018 soil samples.

SUMMARY OF ADDITIONAL CLEANUP ACTIONS

SVE System Expansion

A total of six new SVE wells will be installed to supplement the existing 22-well SVE system. Three wells each will be installed near the Four Star Cleaners and near the former Manhattan Cleaners. The purpose of the new wells is to expedite treatment of vadose zone PCE below 10 ft bgs in both areas. The six new SVE wells will operate in tandem with four nearby existing SVE wells including SVE-6, SVE-7, SVE-8, and SVE-10. The existing shallow SVE wells SVE-11A and SVE-12A (see sheet C-1) will also to continue to operate to treat remaining shallow PCE impacted soil (at 5 to 6 ft bgs) west of the QFC building.

The existing SVE blower and condensate management equipment have sufficient capacity to handle the planned expansion. The expanded system is expected to operate at a total flow rate of approximately 500 standard cubic ft per minute (scfm). The existing SVE blower is controlled by a variable speed drive and has an operating capacity of between approximately 500 scfm to more than 900 scfm, with between 30 and 40 inches of water column (in-wc) vacuum available at the manifold. The new SVE wells are expected to operate similar to the existing SVE wells that have operated between roughly 20 and 60 scfm with an estimated 40 to 50 ft ZOI.

The locations of the new SVE wells are shown on Sheets C-2 and C-3. The basis for the new SVE wells is described below:

- SVE-20 and SVE-21. These wells will be installed beneath asphalt pavement in the alley near SVE-6 to address PCE vadose zone impacts observed in SB-13, SB-13B, and SB-14 in April 2018 (Figure 4). The new wells will be screened from 10 to 25 ft bgs and 25 to 37 ft bgs, respectively.

- SVE-22. This well will be installed in an unpaved area between the locations of SVE-7 and SVE-8 to address the deeper PCE vadose zone impacts observed in SB-14 and SB-15. The new well will be screened from 20 to 35 ft bgs.

- SVE-23. This well will be installed in an unpaved area near SVE-10 to address the deeper PCE vadose zone impacts observed in SB-16, SB-26, SB-27, and SB-28. The new well will be screened from 20 to 35 ft bgs.

- SVE-24 and SVE-25: These wells will be installed on a 45 degree angle and extend from an unpaved gravel area to beneath the former Manhattan Cleaners slab to address PCE impacts beneath the building. The vertical depths of the angled well screens will be from 10 to 22.5 ft bgs and 22.5 to 35 ft bgs, respectively. The actual length of each angled well screen will be approximately 17.6 ft, and the screens will be located entirely beneath the slab footprint to reduce the potential for short circuiting to the unpaved area on the west side of the building.

Operation of the expanded SVE system will continue until PCE concentrations become asymptotic. Confirmation soil samples will be collected near the end or following SVE system operation to evaluate the removal of residual soil contamination to below the MTCA Method A soil CUL for PCE of 0.05 mg/kg.

Excavation

Excavation will be conducted to remove PCE impacts exceeding the CUL in shallow soil in an unpaved area west of the former Manhattan Cleaners (see Sheet C-3). PCE impacts are expected to be within the upper 2 to 3 ft bgs, so the excavation is expected to be no deeper than approximately 4 ft bgs. Soil samples will be collected prior to excavation to further delineate the extents of PCE exceeding the CUL. Confirmation soil samples will be collected to document conditions at the bottom and sidewalls of the completed excavation.

SVE SYSTEM EXPANSION AND SHALLOW EXCAVATION DESIGN

SVE System Expansion

The SVE system expansion includes six new SVE wells and lateral piping, upgrading the existing 4-inch diameter piping manifold to 6-inch diameter, and installing a spare lateral pipe for a potential future SVE wells (if needed) near the former Manhattan Cleaners. The new wells are expected to operate with an average flow rate of approximately 40 scfm per well at 10 to 20 in-wc wellhead vacuum. The operating parameters and well spacing are based on providing an anticipated ZOI of approximately 40 ft or more based on performance of the existing SVE wells.

The expanded SVE system is expected to remain exempt from vapor treatment per Puget Sound Clean Air Agency (PSCAA) Regulation I, Article 6, Section 6.03(C)(94) and the Ecology toxic pollutant source control regulations WAC 173-460. The SVE effluent will continue to be discharged directly to the atmosphere, and quarterly stack samples will be collected to confirm regulatory compliance.

Construction drawings including layout, details, and sections are included in Attachment B, and calculation of pressure loss in the longest SVE well run (SVE-25) is included in Attachment C.

Soil Vapor Extraction Wells. The six new wells will be constructed with 4-inch diameter Schedule 40 polyvinyl chloride (PVC) and include a 0.020-inch slot PVC screen. Wellheads will be completed in flush-with-grade traffic rated monuments and lateral piping will be connected to the well casing below the monuments. A threaded end cap will be fitted to the bottom of each well screen, and the screened interval will be backfilled with a 10-20 silica sand filter pack which extends 2 ft above the top of screen. A 1.5- to 2-foot bentonite chip seal will be constructed above the sand and the remaining well annulus will be filled with cement bentonite grout. The 45 degree casings for the two angled wells will be cut-off several feet below ground surface, and vertical rises will be installed. Compression well caps will be installed to seal the top of the SVE well casings. Well construction details are included on Sheet C-4.

Piping, Manifolds, and Trenches. Extracted soil vapors will be conveyed from the wells through lateral pipes, manifold, and header pipes to the existing moisture knockout and blower. Schedule 40 PVC will be used for all pipes. The existing 4-inch header pipe, which serves SVE-4 through SVE-10, will be replaced with a 6-inch header accommodate the additional flow from the six new wells. The 6-inch header has been sized to accommodate flow from SVE-4, SVE-5, and SVE-9 if needed to provide additional makeup air for the positive displacement blower. Layout of SVE piping is shown on Sheets C-2 and C-3, pipe and trench sections are included on Sheet C-5, and manifold details are included on Sheet C-6.

New 2-inch PVC lateral pipes will extend to the six new wells, and a spare lateral will be extended to near the near SVE-25 for potential future use. Each lateral will be connected to the 6-inch header and include a 2-inch PVC ball valve for shut-off and flow control, a PVC labcock valve for sampling and vacuum monitoring, and a brass threaded plug for monitoring flow using a thermal anemometer. The header will be secured to the retaining wall with supports and pipe clamps. Above-ground laterals will be mounted on metal supports as needed to provide slope back towards the SVE wells.

The aboveground laterals for existing wells SVE-4, SVE-5, SVE-7, SVE-8, and SVE-10 will be replaced due to degradation of these PVC pipes over the last 10 years, which has created locations for moisture collection. All pipes will be sloped downward at a minimum of 1 percent towards the SVE wells to prevent moisture buildup in the lines.

Below ground laterals will be installed in trenches and buried a minimum of 18 inches bgs. The trench depths and width will vary by location. The lateral trenches are expected to be up to 3 ft deep to accommodate the 1 percent pipe slope requirement.

Based on historical soil sampling in this area of the Site, the majority of the trench spoils are expected to be non-detect for PCE except for the area within 20 ft of the former Manhattan Cleaners within 20 ft north of the MVSC strip mall. Test pit samples will be collected every 20 to 30 ft along the trench alignment to delineate the presence of PCE. Soil that does not contain PCE will be managed onsite as fill material and spread in a thin layer on the Harris property near the trench or, if suitable, be used as trench backfill. Soil containing PCE above the method reporting limit will be managed as Contained-In waste under approval from Ecology.

Shallow Soil Excavation

Shallow soil will be excavated west of the former Manhattan Cleaners to remove PCE-impacted soil above the CUL to the extent practicable. The PCE impacted soil will be managed as Contained-In waste under approval from Ecology.

Based on prior soil sampling in 2008 and 2018 in this area, the excavation is anticipated to be approximately 300 square ft by up to 4 ft deep. Four test pits will be excavated and sampled prior to excavation to delineate the extent of PCE above the CUL and to help determine the excavation dimensions. The excavation will extend as close to the buildings as practicable so as not to damage the structures. Additional samples may be needed if PCE exceeds the CUL at the outermost test pits.

Confirmation soil samples will be collected from the bottom and sidewalls to document the conditions of the completed excavation. A minimum of one sample will be collected on each sidewall and on the bottom of the excavation.

CONSTRUCTION

Construction tasks include permitting, site preparation, well installation, excavation, trenching and piping, and equipment installation.

Permitting. Anticipated permits include a local grading permit. A pre-application review conference with the City of Normandy Park is required to implement the additional cleanup actions.

Site Preparation. Underground utility locations will be cleared prior to any drilling, trenching, and excavation activities. The proposed locations of the remediation wells and trenches will be marked with white spray paint. At least five days prior to any subsurface work, a One-Call ticket will be submitted to mark the locations of utilities in the public right-of-way. A private locating company will also be contracted to mark the locations of utilities outside of the right-of-way.

Due to presence of buried utilities near the buildings, the drilling locations near the buildings will be cleared using an air knife/vacuum truck rig. Well SVE-22, located in an undeveloped area of Harris property will be cleared with hand tools. Clearing will be performed to a minimum depth of 4 ft bgs. If a planned well location interferes with underground utilities, the well will be relocated a safe distance away, but as close to the original location as possible.

Locations of buried utilities in the plans are approximate; the contractor will be required to pothole and verify the exact location of buried utilities in the trench and excavation area. The contractor shall protect the utilities and repair if damaged.

Test Pit Sampling. Test pit samples will be collected along the trench alignment every 20 to 30 ft to delineate the presence of PCE prior to trenching. Test pit samples will also be collected to delineate the extent of PCE prior to excavation as shown on Sheet C-3. Test pit soil will be screened with a photoionization detector, and depths with the highest concentrations will be analyzed for VOCs by EPA Method 8260, with reporting limits low enough to document the presence or absence of PCE. Selected ion monitoring or low-level analysis may be required if the standard method reporting limits are not low enough. Samples will be analyzed on rush turn-around.

Well Installation. The SVE wells will be installed by a Washington-licensed driller using a limited access rotary sonic drill rig. Continuous samples will be collected for lithology and waste disposal profiling. Discrete soil samples will be collected from the angled wells (SVE-24 and SVE-25) in order to delineate PCE impacts beneath the former Manhattan Cleaners suite. The drilling work will be observed by a field geologist who will log samples, monitor drilling activities, record well construction information, and prepare boring logs and well construction diagrams for each well.

The wells will be completed below grade and temporarily covered with a metal plate until the construction contractor locates the wells and constructs the wellhead completions as shown in the plans. Wells SVE-20 and SVE-22, located in the alley north of Four Star Cleaners, will include an asphalt patch covering over the metal plate.

Trenching and Piping. Trenches will be constructed a minimum of 12 inches wide and excavated to a minimum depth of three inches deeper than the bottom of the lowest installed pipe. The SVE pipes will be buried at least 18 inches deep, covered with a minimum of 8 inches of compacted sand overlain by compacted backfill. The trenches on the MVSC property will be paved to match the existing ground surface. Trenches on the Harris property will be graded and covered with black weed barrier shields and three inches of compacted gravel to match surrounding grades. The trench alignment will be determined in the field to avoid conflict with trees on the Harris property.

Approximately 210 ft of trenching is estimated to generate up to 80 to 90 tons of excavated soil. The actual trench quantities will be determined in the field based on trench alignment.

Above-ground piping will be secured to supports using pipe clamps and sloped at 1 percent minimum towards the SVE wells. Manifold supports shall be mounted to the concrete retaining wall. The SVE lateral penetrations through the retaining wall will be sealed with non-shrink grout.

Excavation. PCE impacted soil will be excavated west of the former Manhattan Cleaners to a depth of up to 4 ft bgs. An approximate 300 square ft area is based on existing soil samples and is expected to generate up to 80 tons of excavated soil. The actual excavation area and volumes will be determined following test pit sampling. Excavations will be backfilled with crushed rock, compacted, and graded to match existing grades.

The contractor will develop an Excavation and Shoring plan to protect the slab-on-grade Harris property buildings during the excavation and backfilling work.

Survey. The new SVE wells will be surveyed by a licensed surveyor. Horizontal coordinates will be surveyed to the Washington State Plane coordinate system, and elevations surveyed to NAVD 88.

Residuals Management

Drill cuttings, excavation spoils, decontamination water, and SVE condensate water generated during system construction, monitoring, and operations and maintenance (O&M) activities will be contained in segregated approved waste containers (55-gallon drums, roll-off containers, etc.). Waste containers will be clearly labeled with a description of contents and the accumulation date. The waste will be sampled, profiled, and properly disposed of at an approved facility.

Decontamination water from drilling is expected to contain PCE and will be managed as a dangerous waste. Decontamination water will be stored in 55-gallon steel drums.

Excavated soil within 20 feet of the buildings is assumed to contain PCE above the laboratory method reporting limit and will be managed as Contained-In waste under approval from Ecology. This includes the entire area excavated behind the Manhattan Cleaners and trenches within 20 feet of buildings on both the Harris and MVSC properties.

A request for a Contained-In determination from Ecology will be submitted prior to beginning the work using; this request will use existing soil data so that excavated soil and drill cuttings containing PCE may be disposed at a Subtitle D landfill.

- The drill cuttings will be stored in 55-gallon steel drums and disposed off-site as Contained-in waste.

- Excavated soil containing PCE will be segregated from non-detect soil, temporarily stored on the property in lined and covered stockpiles (as needed), and loaded into lined trucks for transport and disposal at an approved facility.

    - Excavated soil within 20 feet of the buildings is assumed to contain PCE above the laboratory method reporting limit and will be managed as Contained-In waste under approval from Ecology. This includes the entire area excavated behind the Manhattan Cleaners and trenches within 20 feet of buildings on both the Harris and MVSC properties.

    - Excavated soil from trenches located more than 20 feet from the buildings will be tested prior to excavation to characterize for the presence or absence of PCE above the laboratory method reporting limit. Soil containing PCE above the method reporting limit will be managed as Contained-In waste under approval from Ecology.

- Excavated non-detect soil will remain on the Harris property and be managed as clean fill. The clean fill will be spread in a thin layer on the Harris property near the trench or, if suitable, be used as trench backfill.

OPERATION AND MAINTENANCE

The existing O&M plan will be updated with as-built drawings. Initial operation of the new SVE wells will include multiple rounds of balancing over two to three weeks until conditions stabilize. After stabilization, routine O&M will be conducted on a monthly basis, and preventative maintenance will be performed in accordance with the O&M plan.

REPORTING

The project Health and Safety Plan (HASP) will be updated to incorporate the drilling and construction work. Following completion, as-built drawings will be updated and inserted into the O&M manual. Documentation of construction, startup, and O&M activities will be included in semi-annual progress reports.

LIMITATIONS

The services described in this technical memorandum will be performed consistent with generally accepted professional consulting principles and practices. No other warranty, expressed or implied, is made. These services were performed consistent with our agreement with our client. This technical memorandum is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this technical memorandum apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, or the use of segregated portions of this report.

GENERAL NOTES:

1. LOCATIONS AND DESCRIPTIONS OF UTILITIES SHOWN ON THE DRAWINGS ARE APPROXIMATE AND ARE COMPILED FROM AVAILABLE RECORDS AND/OR LIMITED FIELD SURVEYS.
2. FIELD LOCATE AND POTHOLE TO VERIFY EXACT LOCATIONS OF EXISTING UTILITIES TO DETERMINE THE EXTENT OF PROTECTION REQUIRED AND/OR CHANGES THAT MAY BE REQUIRED PRIOR TO SUBSURFACE WORK. USE CARE WHEN EXCAVATING OR DRILLING NEAR UTILITIES, AND REPAIR ANY DAMAGED AT CONTRACTORS EXPENSE.
3. UTILITY LOCATES: CALL MINIMUM 5 DAYS AND MAXIMUM 10 DAYS BEFORE EXCAVATION AND DRILLING (1-800-424-5555).
4. COMPLY WITH ALL APPLICABLE LOCAL, STATE, AND FEDERAL REQUIREMENTS TO PERFORM WORK.
5. OBTAIN ALL PERMITS, INSURANCES, AND LICENSES TO PERFORM WORK.
6. CONSTRUCTION WORK AREA SHALL BE SECURED AGAINST UNAUTHORIZED ENTRY. MAINTAIN PEDESTRIAN ACCESS TO ALL BUILDING ENTRANCES AND EXITS, AND POST TEMPORARY SIGNAGE FOR DIRECTING PEDESTRIAN AND VEHICLE TRAFFIC AROUND THE CONSTRUCTION AREA.
7. ALL STREETS AND PARKING AREAS ADJACENT TO THE PROJECT SHALL BE KEPT CLEAN OF ALL MATERIAL DEPOSITS RESULTING FROM THE CONTRACTORS OPERATIONS.
8. PROTECT ALL EXISTING STRUCTURES, EXISTING WELLS, AND OTHER EXISTING SITE FEATURES, AND REPAIR ANY DAMAGED AS A RESULT OF THE WORK AT THE CONTRACTORS EXPENSE.
9. DEVELOP AN EXCAVATION AND SHORING PLAN TO PROTECT EXISTING STRUCTURES.
10. UPON COMPLETION OF WORK, RESTORE AREA TO ORIGINAL CONDITION.
11. TOPOGRAPHIC CONTOURS ARE BASED ON SPOT ELEVATION SURVEYS AT MONITORING WELLS. DATUM NAVD 88.

CONSTRUCTION NOTES:

1. VERIFY ALL FIELD CONDITIONS AND DIMENSIONS PRIOR TO WORK.
2. CUT ASPHALT, CONCRETE, AND CURBS IN A STRAIGHT LINE PRIOR TO REMOVAL FOR TRENCHING OR DRILLING. FIELD LOCATE TRENCHES TO AVOID CONFLICTS WITH TREES.
3. EXCAVATE TRENCHES MINIMUM OF 3 INCHES DEEPER THAN BOTTOM OF LOWEST PIPE. COVER ALL PIPES WITH AT LEAST 8 INCHES OF COMPACTED SAND. MINIMUM BURIAL DEPTHS: 18 INCHES FOR REMEDIATION PIPES. MULTIPLE PIPES: MAINTAIN 1-INCH MINIMUM OF SAND AROUND ALL PIPES.
4. BACKFILL TRENCHES WITH CLEAN SAND AND BACKFILL EXCAVATION WITH CRUSHED ROCK. MAXIMUM LOOSE LIFT OF 8 INCHES BEFORE COMPACTION. COMPACT ABOVE PIPE ZONE TO AT LEAST 95% OF MAXIMUM DENSITY AND WITHIN +/- 3% OF OPTIMUM MOISTURE (ASTM D-1557).
5. INSTALL TRACEABLE WARNING TAPE IN ALL TRENCHES AT LEAST 6-INCHES ABOVE HIGHEST PIPE.
6. MATCH SURFACE MATERIALS AND THICKNESS TO SURROUNDING UNLESS NOTED. PRIOR TO ASPHALTING, APPLY TACK COAT TO SURFACES. UPON COMPLETION, APPLY SEAL COAT AND RESTRIPE.
7. SVE PIPE AND FITTINGS TO BE SCHEDULE 40 PVC. CONTROL BALL VALVES TO BE SPEARS 2000 COMPACT -FKM.
8. SUPPORT ALL ABOVE GROUND PIPES WITH UNISTRUT AND SECURE WITH PIPE CLAMPS. 5 FT MAXIMUM SPACING BETWEEN SUPPORTS.
9. PRESSURE TEST ALL PIPING TO A MINIMUM OF 50 PSI PRIOR TO BACKFILLING AND/OR USE.
10. SECURE EXCAVATION AND STOCKPILE AREAS WITH TEMPORARY FENCE. COVER TRENCHES IN DRIVE AREAS WITH STEEL PLATES OVERNIGHT AND SECURE TRENCHES IN OTHER AREAS WITH TEMPORARY FENCE.

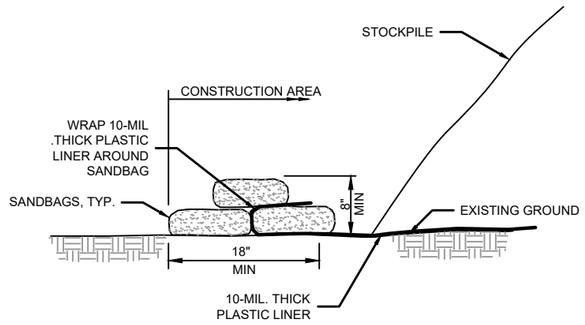
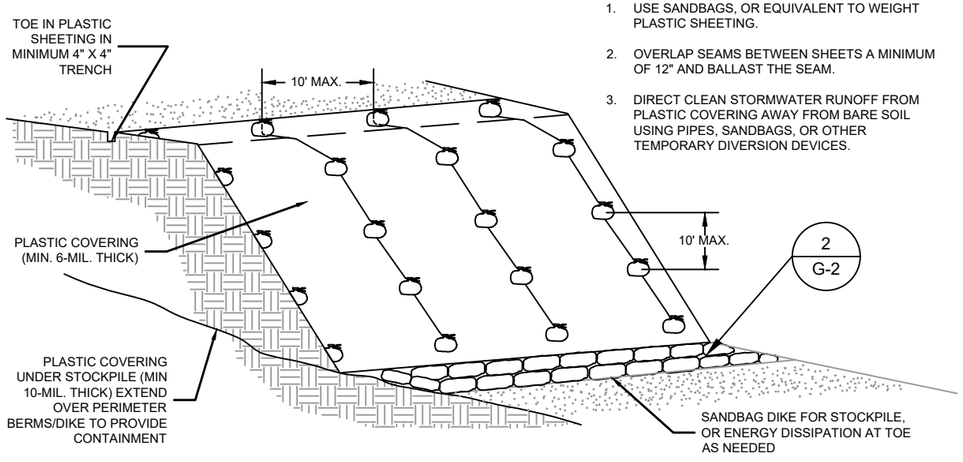
DETAIL 1 G-2 N.T.S. TYP. INLET PROTECTION



DETAIL 2 G-2 N.T.S. TYP. DIKE

DETAIL NOTES:
1. USE SANDBAGS, OR EQUIVALENT TO WEIGHT PLASTIC SHEETING.
2. OVERLAP SEAMS BETWEEN SHEETS A MINIMUM OF 12" AND BALLAST THE SEAM.
3. DIRECT CLEAN STORMWATER RUNOFF FROM PLASTIC COVERING AWAY FROM BARE SOIL USING PIPES, SANDBAGS, OR OTHER TEMPORARY DIVERSION DEVICES.



DETAIL 3 G-2 N.T.S. STOCKPILES

TEMPORARY EROSION/SEDIMENTATION CONTROL (TESC) NOTES

1. THE IMPLEMENTATION OF THE TESC PLANS AND THE CONSTRUCTION, MAINTENANCE, REPLACEMENT AND UPGRADING OF THE TESC FACILITIES IS THE RESPONSIBILITY OF THE CONTRACTOR UNTIL ALL CONSTRUCTION IS APPROVED.
2. THE TESC FACILITIES SHOWN ON THIS PLAN MUST BE IMPLEMENTED IN CONJUNCTION WITH ALL CONSTRUCTION ACTIVITIES, AND IN SUCH A MANNER AS TO ENSURE THAT SEDIMENT LADEN WATER DOES NOT ENTER THE NATURAL OR PUBLIC DRAINAGE SYSTEM, ADJACENT PROPERTIES OR VIOLATE APPLICABLE STANDARDS.
3. THE TESC FACILITIES SHOWN ON THIS PLAN ARE THE MINIMUM REQUIREMENTS FOR ANTICIPATED SITE CONDITIONS. DURING THE CONSTRUCTION PERIOD, UPGRADE THESE TESC FACILITIES (E.G. ADDITIONAL SUMPS, ADDITION OF DITCHES AND SILT FENCES, ETC.) AS NEEDED TO MAINTAIN SITE CONDITIONS.
4. PROVIDE AND MAINTAIN TEMPORARY SEDIMENTATION COLLECTION FACILITIES TO ENSURE THAT SEDIMENT-LADEN WATER DOES NOT ENTER THE NATURAL OR PUBLIC DRAINAGE SYSTEM. AS CONSTRUCTION PROGRESSES AND UNEXPECTED (SEASONAL) CONDITIONS OCCUR, MORE SILTATION WATER QUALITY FACILITIES MAY BE REQUIRED TO ENSURE COMPLETE SILTATION CONTROL OF THE PROJECT. THEREFORE, DURING THE COURSE OF CONSTRUCTION, ADDRESS ANY NEW CONDITIONS THAT MAY BE CREATED BY HIS ACTIVITIES AND TO PROVIDE ADDITIONAL FACILITIES AND BMP'S THAT MAY BE NEEDED TO PROTECT ADJACENT PROPERTIES.
5. INSPECT THE TESC FACILITIES DAILY AND MAINTAINED AS NECESSARY OR AS DIRECTED BY THE ENGINEER TO ENSURE THEIR CONTINUED FUNCTIONING AND EFFECTIVENESS.
6. IF SEDIMENT IS TRANSPORTED ONTO ANY ROADWAY SURFACE, CLEAN THOROUGHLY AT THE END OF EACH DAY OR SOONER IF DEEMED NECESSARY BY THE ENGINEER. REMOVE SEDIMENT FROM ROADS BY SWEEPING AND TRANSPORT TO A CONTROLLED SEDIMENT DISPOSAL AREA. STREET WASHING SHALL BE ALLOWED ONLY AFTER SEDIMENT IS REMOVED, AS REQUIRED BY THE ENGINEER.
7. IMMEDIATELY STABILIZE ANY AREAS OF EXPOSED SOILS, THAT WILL NOT BE DISTURBED FOR TWO DAYS DURING THE WET SEASON (OCTOBER 1 TO APRIL 30) OR SEVEN DAYS DURING THE DRY SEASON (MAY 1 TO SEPTEMBER 30) WITH PLASTIC COVERING.
8. DO NOT ALLOW MORE THAN ONE FOOT OF SEDIMENT TO ACCUMULATE WITHIN A CATCH BASIN. CLEAN ALL CATCH BASINS AND CONVEYANCE LINES PRIOR TO PAVING. DO NOT FLUSH SEDIMENT LADEN WATER INTO THE DOWNSTREAM SYSTEM.
9. REFER TO THE KING COUNTY SURFACE WATER DESIGN MANUAL, APPENDIX D, BEST MANAGEMENT PRACTICES IN THE STORMWATER MANAGEMENT MANUAL FOR WESTERN WASHINGTON CONSTRUCTION, VOLUME II, AND ALL OTHER APPLICABLE REGULATIONS TO ACCOMPLISH CONTROL OF POTENTIALLY HAZARDOUS POLLUTANTS AND SEDIMENTS.
10. PASS ALL DRAINAGE WATER FROM DISTURBED AREAS THROUGH A SEDIMENT TRAP OR OTHER APPROPRIATE SEDIMENT REMOVAL BMPS BEFORE COLLECTING THE WATER FOR TREATMENT. DO NOT ALLOW UNTREATED WATER THAT HAS CONTACTED EXPOSED CONTAMINATED SITE SOIL TO LEAVE THE SITE. ESTABLISH SEDIMENT CONTROLS INTENDED TO TRAP SEDIMENT ON SITE BEFORE OTHER LAND DISTURBING ACTIVITIES TAKE PLACE.
11. DO NOT TRACK SITE SOIL OFF THE SITE BY ANY CONSTRUCTION TRAFFIC. MAINTAIN AN INSPECTION ACTIVITY TO QUICKLY IDENTIFY ANY POTENTIAL MATERIAL TRACKED OFF THE SITE. IN THE EVENT THAT SITE SOIL IS TRACKED ONTO SURROUNDING ROADWAYS, CLEAN THOROUGHLY IMMEDIATELY UPON DISCOVERY INCLUDING BUT NOT LIMITED TO ADJACENT DITCHES/DRAINAGES THAT MAY HAVE BECOME CONTAMINATED BY THE ACTIVITY. COMPLETE THIS WORK TO THE SATISFACTION OF THE OWNER AND AT NO ADDITIONAL COST TO THE CONTRACT (CONTRACTOR WILL BE RESPONSIBLE FOR ANY FINES IMPOSED AS A RESULT OF SOIL TRACKED OFF SITE). REMOVE ANY SPILLED SOIL FROM THE ROAD BY A METHOD TO BE APPROVED BY OWNER. PLACE COLLECTED SOILS IN THE SOIL STOCKPILING AREA FOR DISPOSAL. WASH STREETS AFTER SOIL IS REMOVED AS REQUIRED BY THE OWNER.
12. TREAT WATER THAT IS COLLECTED FROM SITE DEWATERING OPERATIONS OR COLLECTED SURFACE WATER THAT HAS COME IN CONTACT WITH ANY CONTAMINATED SURFACE PRIOR TO DISCHARGE.
13. MINIMIZE EROSION FROM SLOPES. DESIGN AND CONSTRUCT CUT AND FILL SLOPES IN A MANNER THAT WILL MINIMIZE EROSION. DIVERT STORMWATER RUN-ON AWAY FROM SLOPES AND UNDISTURBED AREAS.
14. PREVENT ON-SITE EROSION BY STABILIZING ALL EXPOSED AND UNWORKED SOILS, INCLUDING STOCKPILES. COVER STOCKPILES IF RAIN EVENTS ARE POSSIBLE, DURING PRECIPITATION EVENTS, AND DURING NON-WORKING HOURS. STABILIZE SOIL STOCKPILES FROM EROSION. PROTECT WITH SEDIMENT TRAPPING MEASURES AND LOCATE AWAY FROM STORM DRAIN INLETS, WATERWAYS, AND DRAINAGE CHANNELS. NON-STOCKPILED SOILS, SHALL BE COVERED FROM OCTOBER 1 TO APRIL 30, NO SOILS SHALL REMAIN EXPOSED AND UNWORKED FOR MORE THAN TWO DAYS. FOR NON-STOCKPILED SOILS, FROM MAY 1 TO SEPTEMBER 30, NO SOILS SHALL REMAIN EXPOSED FOR MORE THAN SEVEN DAYS. STABILIZE SOILS AT THE END OF THE SHIFT. BEFORE THE COMPLETION OF THE PROJECT, PERMANENTLY STABILIZE ALL EXPOSED SOILS THAT HAVE BEEN DISTURBED DURING CONSTRUCTION.
15. LOAD EXCAVATED SOIL INTO LINED TRUCKS OR INTO LINED AND COVERED SOIL BINS. IF SOIL BINS ARE USED, TIGHTEN THE CENTER STRAP SUPPORT ON THE SOIL BIN AND SECURELY SET THE COVER TARP WITH BUNGEE CORDS. FOR SOIL BINS TO BE STORED MORE THAN ONE DAY DURING THE WET SEASON (OCTOBER 1 TO APRIL 30) INSTALL A SECOND TARP WITH BUNGEE CORDS TO PREVENT RAINWATER INFILTRATION. MAINTAIN TARPS UNTIL SOIL BINS ARE HAULED OFFSITE.

NOTES:

1. REPLACE 4-INCH HEADER PIPE WITH 6-INCH HEADER AT THE 8-INCH TEE. SECURE THE NEW HEADER PIPE TO THE RETAINING WALL. TIE-IN LATERALS FOR SVE-4 THROUGH SVE-10 AND SVE-20 THROUGH SVE-25.
2. INSTALL NEW ABOVE GROUND LATERAL TO SVE-22 AND REPLACE THE EXISTING 2-INCH ABOVE GROUND LATERALS TO SVE-4 THROUGH SVE-8. SLOPE LATERALS AT 1% TOWARDS THE WELLS. SECURE LATERALS TO UNISTRUT PIPE SUPPORTS AS NEEDED TO MAINTAIN SLOPE.
3. DECOMMISSION ABOVE GROUND AND BURIED LATERAL TO SVE-10. REPLACE WITH NEW LATERAL IN COMMON TRENCH WITH SVE-23, SVE-24, AND SVE-25.
4. CONSTRUCT NEW LATERAL TRENCH FOR SVE-10, SVE-23, SVE-24, AND SVE-25. FIELD LOCATE TO AVOID CONFLICT WITH TREES.
5. MANAGE EXCAVATED SOIL WITHIN APPROXIMATELY 20 FT OF THE BUILDINGS AS ECOLOGY APPROVED CONTAINED-IN WASTE. ASSUME SPOILS GENERATED FROM OUTSIDE OF THESE AREAS IS CLEAN FILL AND MAY BE THIN SPREAD ON THE GROUND INSIDE THE FENCED AREA PENDING SAMPLE CONFIRMATION. ENGINEER APPROVAL REQUIRED FOR USE AS TRENCH BACKFILL.
6. SHALLOW SOIL EXCAVATION AREA. EXCAVATE AND SAMPLE 4 TEST PITS TO DETERMINE THE EXCAVATION DIMENSIONS. ASSUME 300 SQUARE FT BY 4-FT DEEP.
