Laboratory Analytical Reports

1.0 INTRODUCTION

This report presents the results of groundwater monitoring conducted by Golder Associates Inc. (Golder) at the Bear Creek Village Shopping Center during the month of September 2021.

1.1 Site Description

The site is currently developed as a shopping center known as the Bear Creek Village Shopping Center, located at 17100 - 17262 Redmond Way, in Redmond, King County, Washington (site). Figure 1 depicts the location of the site on a United States Geological Survey (USGS) topographic map. The existing shopping center development was constructed in phases in approximately 1969, 1977, and 1985. Before the existing shopping center, the site was agricultural land with several houses, outbuildings, and a small warehouse complex along the northern side. The shopping center includes two core building complexes, one stand-alone multi-tenant retail-strip building, and three pad buildings (Taco Time, Jiffy Lube [previously Q-Lube], and O'Reilly Auto Parts [previously Schuck's]). Paved parking areas and limited landscaped areas comprise the remaining area. A dry cleaning establishment known as Bear Creek Cleaners formerly operated on the site. Bear Creek Cleaners was located at the southeastern portion of the site and is the focus of this groundwater monitoring program. A brief background on the history of Bear Creek Cleaners and the resulting remedial investigations is provided in previous monitoring reports (Golder 2020a).

1.2 Purpose and Scope

The purpose of this groundwater monitoring was to determine groundwater quality with respect to the presence of halogenated volatile organic compounds (HVOCs) as a result of the former Bear Creek Cleaners operations, and to obtain groundwater elevation data to determine the groundwater flow direction.

The scope of work for this groundwater monitoring included the following:

- Collection of groundwater samples from two on-site groundwater-monitoring wells (MW-10A, and MW-13) in accordance with the approved Ecology request on January 14, 2020 to temporarily reduce groundwater sampling from six to two monitor wells (Golder 2020b).
- Collection of other data from these wells including groundwater level measurements, pH, conductivity, dissolved oxygen, turbidity, oxidation-reduction potential, and temperature.
- Quality control procedures, including the analysis of a duplicate sample collected from MW-10A, which was identified with the sample number MW-20, and an equipment blank.
- Analysis of the groundwater and quality control samples for the presence of HVOCs using United States Environmental Protection Agency (EPA) Method 8260C.

2.0 SEPTEMBER 2021 GROUNDWATER SAMPLING

2.1 Groundwater Investigation Methods

On September 21, 2021, Golder sampled groundwater from two groundwater monitoring wells (MW-10A and MW-13). The wells were purged and sampled in accordance with EPA low-flow sampling guidelines. Figure 2 depicts the location of all pertinent on-site monitoring wells. The September 2021 analytical results are presented in Table 1. Historical analytical results for groundwater sampling conducted since 1999 are summarized in Table 2. A narrative of historical sampling activities was provided in previous monitoring reports (Golder 2020a). Sampling conditions and data collected during the monitoring event were recorded on the Sample Integrity Data Sheets

(SIDS) contained in Appendix A and summarized in Table 3. The following methods and procedures were used in collecting the groundwater samples:

- Depth to groundwater was measured in all on-site wells (MW-1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-9, MW-10A, MW-13, and MW-14) prior to purging and sampling. Water levels were recorded on the SIDS. Table 4 presents depth to water measurements and elevations. Figure 3 depicts groundwater elevations and contours.
- Dedicated tubing is located in all groundwater-monitoring wells and is replaced as needed. Each well was slowly purged of water at a rate of approximately 250 milliliters (mL) per minute using a peristaltic pump connected to the dedicated tubing.
- Field parameters of temperature, pH, conductivity, turbidity, dissolved oxygen, and oxidation-reduction potential were measured and recorded during purging at approximately 5-minute intervals until parameters were stable, Table 3. All field parameters were recorded on the SIDS (Appendix A).
- Upon completion of purging, groundwater samples were collected by directly capturing groundwater in three 40-mL vials pre-preserved with hydrochloric acid. The 40-mL VOA vials were sealed with septa-lined caps and sealed void of air bubbles. The samples were labeled and placed in a cooler with ice.
- For quality control purposes, a duplicate sample and equipment blank were collected. The duplicate sample was collected from MW-10A, which was identified with the sample label MW-20. The equipment blank was collected after sampling at MW-10A.
- The collected samples were transported to OnSite Environmental Inc. in Redmond, Washington for chemical analysis on the same day as sample collection, following chain-of-custody protocols.

All groundwater and quality control samples were analyzed for the presence of HVOCS using EPA Method 8260C. The quality control goal for the project analytical data is to achieve a control limit of +/- 20 percent relative percent difference (RPD) between an original and its duplicate sample for an individual well. For the September 2021 Event, the duplicate (MW-10A and MW-20) was collected at the same time from well MW-10A. Results for the duplicate are included in Table 2 as bracketed results associated with MW-10A. Figure 4 depicts the detected HVOCS concentrations for the wells sampled in September 2021. Figures 5 and 6 depict the detected concentrations of HVOCS for each well over time.

2.2 Water Level Measurements and Groundwater Flow Direction

Static groundwater levels were measured in all on-site monitoring wells (including those that are not sampled for HVOCS) on September 21, 2021 for the September 2021 groundwater sampling event. The groundwater levels measured that day (as well as during historical sampling) are summarized in Table 4. Groundwater elevations on the site are generally at their highest levels during the wetter winter/spring months and lower during the drier summer/fall months. The September 2021 sampling event groundwater levels were similar to previous summer/fall events and the seasonal trend remained consistent with previous events.

The groundwater elevation contour map for September 21, 2021 data is presented in Figure 3. There is some variability in groundwater flow direction across the site, but the inferred groundwater flow direction is generally west or northwesterly, away from Bear Creek, which suggests that Bear Creek loses water to the aquifer. The groundwater gradient measured on September 21, 2021 is generally consistent with historical monitoring results. Low groundwater elevations are observed in MW-2, MW-3, MW-4, and MW-10A compared with elevation in

surrounding wells. Possible causes for the low groundwater elevations could be from excavations in the area during cleanup actions or storm water pipe installations. MW-2, MW-3, MW-4, and MW-10A values were not used in contouring for Figure 3.

2.3 Groundwater Quality

The groundwater analytical data for PCE, and PCE's HVOCS degradation compounds [trichloroethylene (TCE), 1,3-dichlorobenzene (1,3-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), and vinyl chloride] detected in this round of sampling are summarized in Table 1. Table 2 contains the historical sampling results. Appendix B contains a copy of the laboratory analytical data report and data validation. The HVOCS concentrations detected during this round of sampling are depicted in Figure 4. Groundwater HVOCS concentrations and elevations with respect to time for MW-10/10A and MW-13 are depicted in Figures 5 and 6 for the last 21 years.

PCE or its degradation compounds were detected in both monitoring wells sampled during this period. Both wells are located on the eastern side of the former dry cleaner facility.

2.3.1 Perchloroethylene

PCE was detected in MW-13 at a concentration of 1.4 micrograms per liter ($\mu\text{g}/\text{L}$) during the September 2021 sampling event. The practical quantitation limit, or PQL, is 0.20 $\mu\text{g}/\text{L}$. Figure 7 depicts the PCE detections for the routinely sampled wells since 1999. This figure shows an overall decline of PCE concentrations across the site over time. PCE concentrations did not exceed the Model Toxics Control Act (MTCA) Method A Cleanup Level of 5.0 $\mu\text{g}/\text{L}$ in any wells during the September 2021 sampling event. PCE concentrations have not exceeded the MTCA Method A Cleanup Level of 5.0 $\mu\text{g}/\text{L}$ in any Site monitoring well since the March 2013 sampling event.

2.3.2 Trichloroethylene

TCE was detected (2.0 $\mu\text{g}/\text{L}$) in MW-13 at a concentration greater than the PQL (0.20 $\mu\text{g}/\text{L}$) during the September 2021 sampling event at a concentration of 5.2 $\mu\text{g}/\text{L}$. Figure 8 depicts the TCE detections for MW-2, MW-3, MW-4, MW-10A, and MW-13 since 1997. TCE concentrations did not exceed the MTCA Method A Cleanup Level of 5.0 $\mu\text{g}/\text{L}$ in MW-10A during the September 2021 sampling event. Figure 8 shows an overall decline of TCE concentrations across the Site over time. MW-13 had a slight increasing TCE trend from 2011 to 2017 but concentrations appear to be decreasing since 2017. Seasonal fluctuations remain common. TCE concentrations have not exceeded the MTCA Method A Cleanup Level of 5.0 $\mu\text{g}/\text{L}$ in any Site monitoring well since the March 2005 sampling event with two exceptions. The two exceptions being TCE was detected during the September 2017 (5.1 $\mu\text{g}/\text{L}$) and September 2021 (5.2 $\mu\text{g}/\text{L}$) monitoring events.

2.3.3 Cis-1,2-Dichlorethene

Cis-1,2-DCE was detected at concentrations greater than the PQL (0.20 $\mu\text{g}/\text{L}$) in MW-10A, and MW-13 at concentrations of 2.4 $\mu\text{g}/\text{L}$, and 1.8 $\mu\text{g}/\text{L}$, respectively. The concentrations of cis-1,2-DCE detected during the September 2021 sampling event were all less than the current MTCA Method B Cleanup Level of 16 $\mu\text{g}/\text{L}$. Cis-1,2-DCE has never been detected at a concentration exceeding the current or historical (80 $\mu\text{g}/\text{L}$) MTCA Method B Cleanup Level in effect in any of the wells.

2.3.4 Vinyl Chloride

Vinyl Chloride was not detected in any of the groundwater samples, or equipment blank sample, collected during the September 2021 event. Figure 9 depicts the vinyl chloride detections for MW-2, MW-3, MW-4, MW-10A, and MW-13 since 1997. This figure shows a general overall site-wide decline of vinyl chloride concentrations with only

one exception, MW-10A. Vinyl Chloride concentrations have not exceeded the MTCA Method A Cleanup Level of 0.2 µg/L in any Site monitoring well since the March 2007 sampling event except at MW-10A.

2.3.5 1,3-Dichlorobenzene

1,3-Dichlorobenzene was not detected in any of the groundwater samples, or equipment blank samples, collected during the September 2021 event. During the September 2007, March 2008, and more recently in the September 2011 event, 1,3-dichlorobenzene was detected at concentrations greater than the PQL (0.20 µg/L) in groundwater samples. The detection of this compound during the 2007, 2008, and 2011 events is attributed to the degradation of the dedicated tubing located in the monitoring wells at that time. The dedicated tubing in all wells was replaced before the September 2008 and March 2012 events and as a result, 1,3-dichlorobenzene was not detected in any of the groundwater samples or equipment blank samples in subsequent sampling events.

3.0 CONCLUSIONS AND RECOMMENDATIONS

3.1 Findings and Conclusions

The findings and conclusions of this Groundwater Monitoring Report are summarized as follows:

- During the September 2021 sampling event, there were no detections of any of the constituents of concern (COCs) exceeding MTCA Method A Cleanup Levels, with only one exception; MW-13 had a detection of TCE exceeding the MTCA Method A Cleanup Level (5.0 µg/L).
- The current results indicate an overall decrease in PCE concentrations has occurred in MW-10A, and MW-13 since March 2007. PCE has not exceeded the MTCA cleanup level in any of the wells since 2012. PCE has not been detected in MW-10A since the March 2007 sampling event.
- The review of the last five years of groundwater monitoring results indicate that the rate of biodegradation of HVOCS appears to have slowed down, i.e. the decrease in concentrations of HVOCS has leveled off to some degree, particularly MW-13.

3.2 Recommendations

Based on the findings and conclusions of the September 2021 groundwater monitoring period, the following recommendations are made:

- The sampling program at the site will continue on the semi-annual sampling schedule (typically March and September) until two consecutive monitoring events below MTCA cleanup levels are achieved at which time the frequency will be increased to quarterly sampling to confirm that results are clean during all seasons of the year. Thus, the next routine semi-annual monitoring event should be scheduled for March 2022.
- The wells sampled during the next groundwater monitoring event should include MW-10A and MW-13 to confirm trends in HVOC concentrations and to support the goal of four consecutive sampling periods with HVOC concentrations that are less than MTCA Method A Cleanup Levels.

4.0 CLOSING

Golder is pleased to continue working with you on the Bear Creek Village Shopping Center project. If you have any questions regarding this report, please feel free to contact Eric Adams at (425) 883-0777.

MTCA Cleanup Levels		5.0 A	5.0 A	0.2 A	16 B¹

Notes:

Analytical results in parentheses represent duplicate samples.

Bold Italic = indicates the analytical result exceeds the MTCA Method A or B Cleanup Level.

<0.20 = indicates sample was not detected above the laboratory analytical detection limit.

A = MTCA Method A Cleanup Level (Model Toxics Control Act Cleanup Regulation - Chapter 173-340 WAC).

B = MTCA Method B formula value (Model Toxics Control Act Cleanup Regulation - Chapter 173-340 WAC and Model

¹ Current (2014) MTCA Method B value. Historical value was 80 µg/L.

* Groundwater elevation resided beneath the well screen. Sample could not be collected.

cis-1,2-DCE = cis-1,2-Dichloroethene

PCE = Perchloroethylene = Tetrachloroethylene

TCE = Trichloroethene

VC = Vinyl Chloride

Table 3: September 2021 Field Parameters

Monitor Well	pH	Conductivity (µS/cm)	Temperature °C	Turbidity NTU	Dissolved Oxygen mg/L	eH rel mV	Purge Rate ml/min	Groundwater Elevation ft amsl
MW-10A	5.9	116.3	15.2	2.4	0.35	171.5	150	29.86
MW-13	5.83	188.3	15.9	1.89	0.68	142.5	175	35.86

Notes:

Groundwater elevation determined using the surveyed elevation (NAVD 88 datum) of the top of each well casing.

Elevations given in feet above mean sea level.

Re: Analytical Data for Project 152539321.200
Laboratory Reference No. 2109-217

Dear Eric:

Enclosed are the analytical results and associated quality control data for samples submitted on September 21, 2021.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DBS".

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 23, 2021
Samples Submitted: September 21, 2021
Laboratory Reference: 2109-217
Project: 152539321.200

Case Narrative

Samples were collected on September 21, 2021 and received by the laboratory on September 21, 2021. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

This report pertains to the samples analyzed in accordance with the chain of custody,
 and is intended only for the use of the individual or company to whom it is addressed.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
 - B - The analyte indicated was also found in the blank sample.
 - C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
 - E - The value reported exceeds the quantitation range and is an estimate.
 - F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
 - H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
 - I - Compound recovery is outside of the control limits.
 - J - The value reported was below the practical quantitation limit. The value is an estimate.
 - K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
 - L - The RPD is outside of the control limits.
 - M - Hydrocarbons in the gasoline range are impacting the diesel range result.
 - M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
 - N - Hydrocarbons in the lube oil range are impacting the diesel range result.
 - N1 - Hydrocarbons in diesel range are impacting lube oil range results.
 - O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
 - P - The RPD of the detected concentrations between the two columns is greater than 40.
 - Q - Surrogate recovery is outside of the control limits.
 - S - Surrogate recovery data is not available due to the necessary dilution of the sample.
 - T - The sample chromatogram is not similar to a typical _____.
 - U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
 - U1 - The practical quantitation limit is elevated due to interferences present in the sample.
 - V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
 - W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
 - X - Sample extract treated with a mercury cleanup procedure.
 - X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
 - Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
 - Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
 - Z -
- ND - Not Detected at PQL
 PQL - Practical Quantitation Limit
 RPD - Relative Percent Difference
