LIMITATIONS

This report has been prepared for the exclusive use of Smith-Kem, their authorized agents, and regulatory agencies. It has been prepared following the described methods and information available at the time of the work. No other party should use this report for any purpose other than that originally intended, unless Floyd|Snider agrees in advance to such reliance in writing. The information contained herein should not be utilized for any purpose or project except the one originally intended. Under no circumstances shall this document be altered, updated, or revised without written authorization of Floyd|Snider.

The interpretations and conclusions contained in this report are based in part on site characterization data collected by others. Floyd|Snider cannot assure the accuracy of this information.

Executive Summary

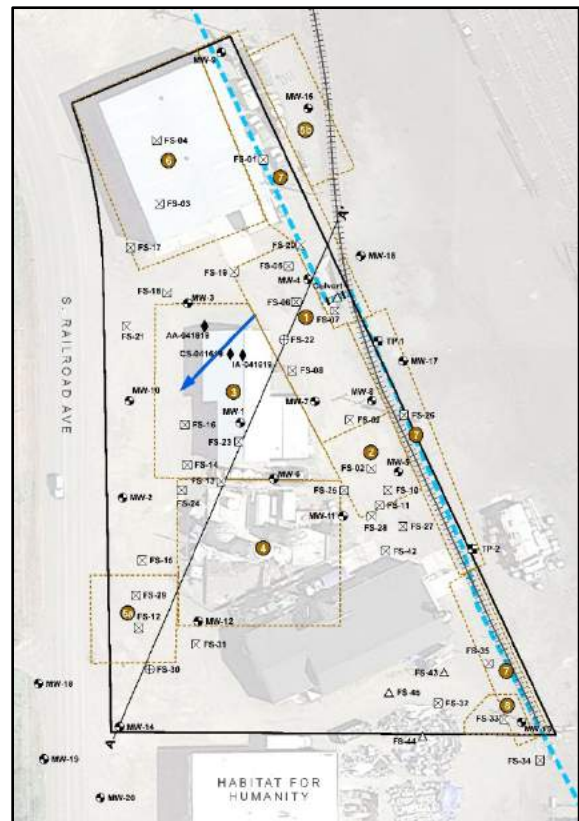

INTRODUCTION

The Smith-Kem property (Property) is located at 200 S. Railroad Avenue in Ellensburg, Washington. Starting in the mid-1920s, Shell Oil Products US (SOPUS; herein referred to as “Shell”) operated a bulk fuel facility on the property and continued operations until the early 1970s. From 1948 until 1972, Shell leased a portion of the Property to James R. and Jean Smith (the Smiths) to conduct their agricultural products business. The Smiths operated under the Shell Chemical Company brand during that time and provided fertilizers, pesticides, and herbicides. The Smiths, and later, Smith-Kem, conducted fertilizer blending and pesticide storage at the Property until 2015. The McGregor Company began leasing the Property in 2015 and runs a fertilizer blending and pesticide storage operation.

In 2008, the Washington State Department of Ecology (Ecology) identified the Property as a Model Toxics Control Act (MTCA) site based on an investigation that found elevated levels of total petroleum hydrocarbons (TPH) in soil and groundwater. Subsequent investigations documented the presence of pesticides, chlorinated herbicides, nitrate, and ammonia in soil or groundwater. Ecology entered into Agreed Order (AO) No. DE 12908 with Shell and Smith-Kem (two of the potentially liable parties for the Site) in 2016. This Remedial Investigation (RI)/Feasibility Study (FS) has been prepared under the 2016 AO.

The RI portion of this report describes soil and groundwater quality at the site, develops the conceptual site model (CSM), and proposes cleanup standards for chemicals of concern (COCs) at the site. This RI establishes the boundary of the “Site,” defined by MTCA as where contamination has come to lie (WAC 173-340-200). The FS portion of this report develops the remedial action objectives (RAOs), provides a comprehensive evaluation of alternative cleanup actions, and identifies a sitewide preferred cleanup action.

Sections 1.0 through 4.0 present hydrogeologic and other information about the Property and describe the investigations used for Site characterization. Sections 5.0 through 7.0 present the results of Site characterization, including identification of COCs, delineation of areas of concern (AOCs), and development of the CSM.

SITE DESCRIPTION

The majority of the Property's surface is covered by buildings or compacted gravel. The topography is relatively flat, with a slope slightly to the south. Soil on the Property consists of unconsolidated gravel and cobbles with varying amounts of sand and silt. Groundwater is typically encountered between 3 and 6 feet below ground surface (bgs) with a hydraulic gradient to the south-southwest and is considered potable per WAC 173-340-720(2).

CONCEPTUAL SITE MODEL

Based on RI sampling and analysis, the two media of concern at the Site are soil and groundwater. Groundwater cleanup standards are protective of human health via drinking water exposure. Soil cleanup standards are protective of groundwater and human and ecological exposure via the direct contact pathway.

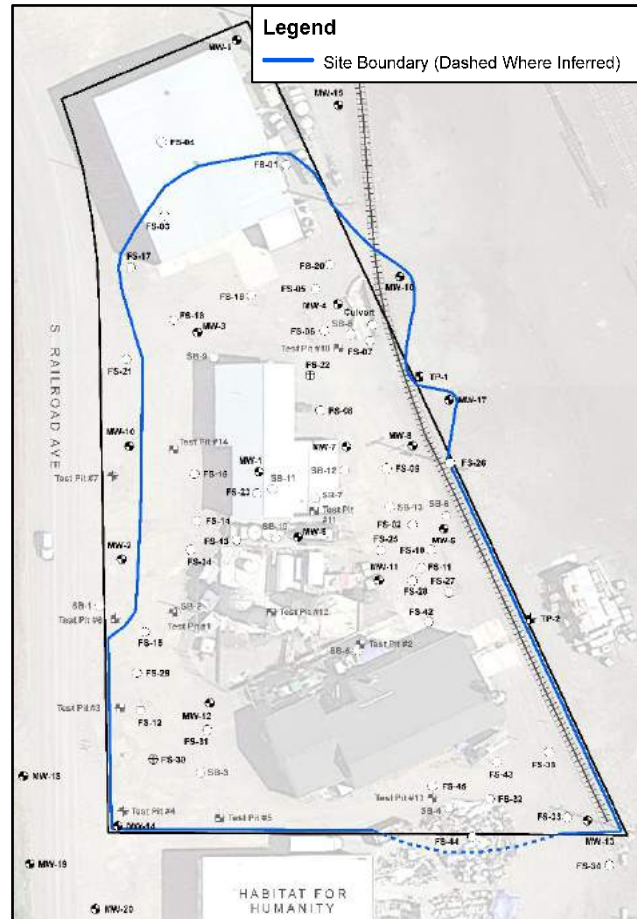

Current and former Site uses, including pesticide and fertilizer handling and storage and the historical transfer and storage of bulk petroleum fuels, resulted in contamination at the Site. Potential sources of contamination include the following:

- Direct releases from equipment washing operations
- Generation of by-products during burning operations
- Direct releases from material storage, use, and handling
- Leaks and spills from equipment, tanks, and machinery
- Leaks and spills during fueling and fuel transfer operations at the Rail Spur or between ASTs and trucks
- Grading of the ground surface to maintain gravel surfaces
- Infiltration of precipitation and overland flow through contaminated soil, causing leaching into groundwater

The RI identified COCs in both media. In groundwater, 12 COCs were identified based on an evaluation of the historical and RI data (nitrate, nitrite, eight pesticides and herbicides, diesel-range TPH, and oil-range TPH). In soil, 10 COCs were identified based on the evaluation of the historical and RI data (aldrin, dieldrin, chlordane, alpha-chlordane, beta-benzene hexachloride, and toxaphene); two active-use pesticides (atrazine and simazine); total diesel- and oil-range TPH; and dioxins/furans.

Based on the nature and extent of COCs, there are six AOCs that contain soil or groundwater contamination. The AOCs are areas historically or currently used for trash burning, loading/offloading, storage, and refueling; and a low spot area that experiences seasonal ponding. Additionally, nitrate contamination is widespread in groundwater across the Property. The Site boundary encompasses all areas where contamination originating from historical and current Site activities (that are greater than the proposed CULs) has come to lie.

The CSM is complete with respect to identification of potentially active contaminant transport and exposure pathways. However, data gaps pertaining to the extent of particular soil contaminants will be filled prior to selection and design of the final remedy and may be achieved with additional sampling prior to submittal of the Engineering Design Report. Cleanup standards for the COCs were used to focus the development and evaluation of remedial alternatives in the FS.

DEVELOPMENT OF CLEANUP ACTION ALTERNATIVES

To support the development of cleanup action alternatives, remediation levels (RELs) have been developed to identify the concentrations at which different cleanup actions are taken. RELs are, by definition, concentrations that exceed cleanup standards and can be used when a combination of cleanup action components are necessary to achieve CULs at a point of compliance. RELs may also be used where soil containment (i.e., under a cap) is part of the cleanup action alternative.

Proposed soil RELs were developed for some organochlorine pesticides and TPH. Proposed soil RELs are levels that will result in achievement of the RAOs using a combination of source removal and soil containment. Groundwater RELs are not proposed at the Site because the proposed soil RELs are intended to be protective of groundwater contamination and, when applied, will allow proposed groundwater CULs to be met long-term at the proposed conditional point of compliance.

A range of remedial technologies were reviewed and considered to address both soil and groundwater contamination at the Site. The technologies that were retained have been aggregated into four cleanup action alternatives, which include combinations of the following:

- Excavation of surface soil with concentrations of soil greater than RELs and CULs and placement of an asphalt cap
- Excavation of soil to direct contact RELs, leaching RELs, and/or soil CULs
- Installation of a geosynthetic clay liner (GCL) to provide a protective barrier to remaining pesticide contamination at concentrations greater than RELs or CULs
- In Situ groundwater treatment consisting of a liquid activated carbon matrix to passively treat groundwater contamination
- Monitored natural attenuation (MNA) and groundwater monitoring
- Implementation of institutional controls (ICs), including restrictions on land use and resource use (i.e., prohibit the use of groundwater within Site boundaries as drinking water)

EVALUATION OF CLEANUP ALTERNATIVES—DISPROPORTIONATE COST ANALYSIS

The MTCA cleanup regulations provide the framework for the disproportionate cost analysis (DCA). The DCA evaluates cleanup action alternatives in order to identify the cleanup remedy that uses permanent solutions to the maximum extent practicable, while also achieving cleanup standards within a reasonable restoration time frame. In making this determination, each cleanup action alternative was assessed using MTCA comparative evaluation criteria as follows:

- Protectiveness (30% of total benefit score)
- Permanence (20% of total benefit score)
- Effectiveness over the long term (20% of total benefit score)
- Management of short-term risks (10% of total benefit score)
- Technical and administrative implementability (10% of total benefit score)
- Consideration of public concerns (10% of total benefit score)
- Cost (compared to total benefit score)

Under the MTCA cleanup regulations, cleanup action alternatives must meet minimum requirements for protectiveness. The final step in evaluating alternatives is identifying the protective alternative that is permanent to the maximum extent practicable. This requires weighing incremental costs and benefits of protective cleanup action alternatives. Costs are considered disproportionate to benefits when the incremental costs of an alternative exceed the incremental benefits compared to alternatives that are lower cost but still protective.

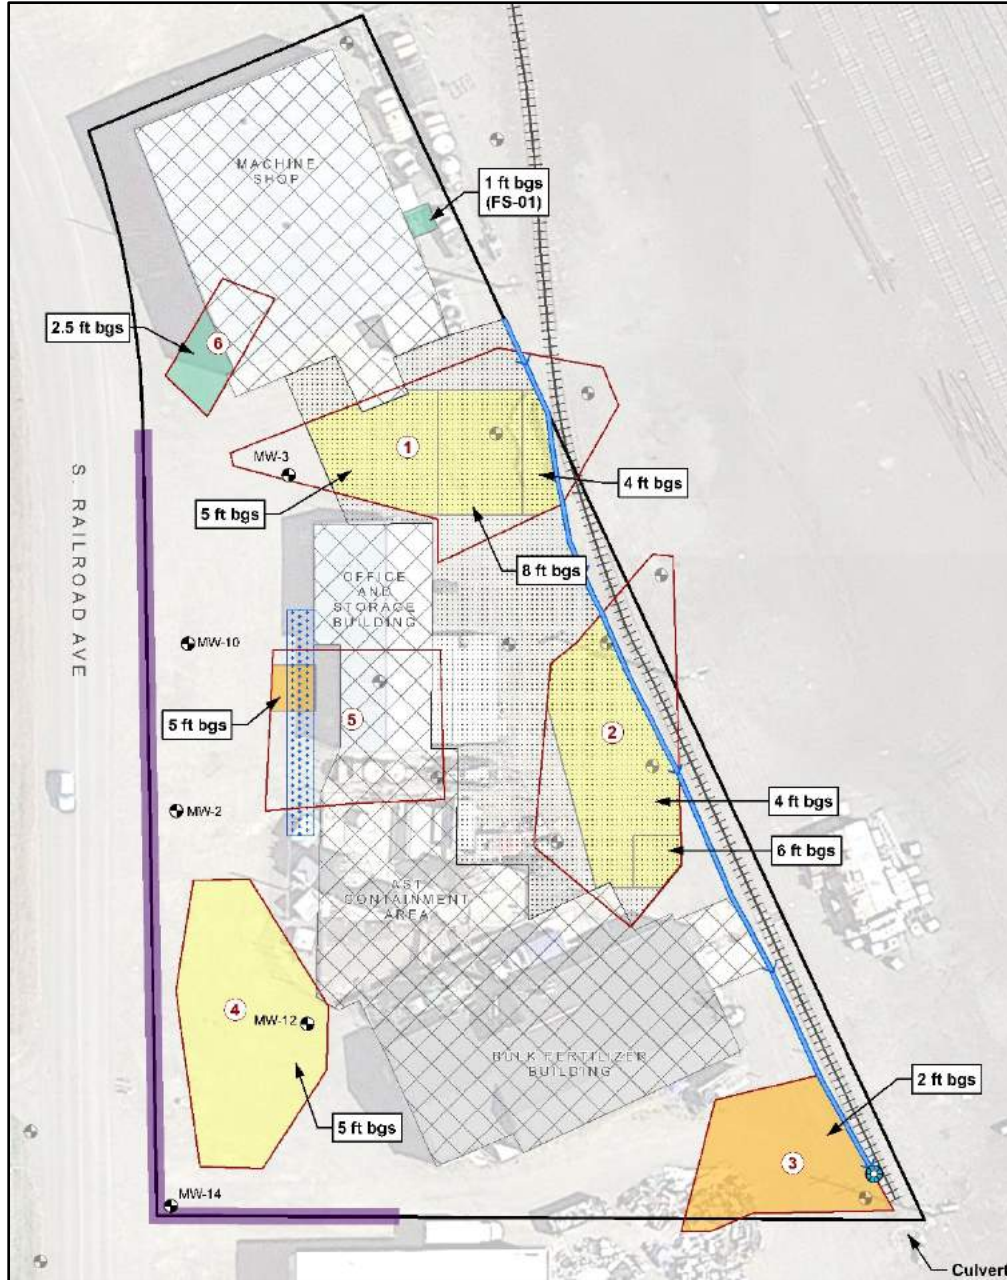

PREFERRED CLEANUP ACTION

The four alternatives were evaluated, and the preferred cleanup action was selected by choosing the alternative with the greatest benefit per unit cost score. Alternative 3 was selected as the Preferred Cleanup Action Alternative as it is permanent to the maximum extent practicable.

The Preferred Cleanup Action Alternative is a comprehensive remedy for the Site that complies with all the applicable remedy selection requirements under MTCA and provides the greatest environmental benefit for the associated cost based on the DCA. This remedy includes the following components:

- Excavation and off-site disposal of soil in all AOCs with COC concentrations greater than RELs or CULs
- Excavation to CULs in AOC 6 and an area around FS-01
- Installation of a GCL and drainage in portions of AOC 1 and AOC 2 for protection of groundwater
- In situ groundwater treatment by injecting liquid activated carbon along the downgradient edge of AOC 5 to immobilize contaminants (pesticides and TPH) in groundwater migrating from beneath the office and storage building
- Capping contaminated soil with COC concentrations greater than the RELs to protect worker direct contact exposure, including pesticide and TPH contamination beneath the office and storage building in AOC 5 and deeper TPH contamination beneath the gravel cap in AOC 4
- ICs to prohibit use of Site groundwater as drinking water and maintenance of the cap
- MNA for groundwater recovery

The Preferred Cleanup Action Alternative for soil and groundwater meets the minimum requirements for selection of a cleanup action under MTCA (WAC 173-340-360(2)(a)) because it is protective of human health and the environment, complies with cleanup standards, complies with applicable state and federal laws, and provides for compliance monitoring. The Preferred Cleanup Action Alternative meets the other MTCA requirements for selection of a cleanup action, including using permanent solutions to the maximum extent practicable, providing for a reasonable restoration time frame, and consideration of public concerns.

1.0 Introduction

This Remedial Investigation (RI) and Feasibility Study (FS) report was prepared per the requirements of Agreed Order (AO) No. DE 12908 (Ecology 2016a) between the Washington State Department of Ecology (Ecology) and the potentially liable parties (PLPs), Shell Oil Products US (SOPUS; herein referred to as “Shell”) and Smith-Kem Ellensburg, Inc. (Smith-Kem). The Smith-Kem property (Property) is located at 200 S. Railroad Avenue in Ellensburg, Washington (Figures 1.1 and 1.2). The site has been listed in Ecology’s Integrated Site Information System (ISIS) under Facility Site ID number 12832256 and Cleanup Site ID number 4257.

Starting in the mid-1920s, Shell operated a bulk fuel facility on the Property and continued operations until the early 1970s. In 1948, Shell leased a portion of the Property to Smith-Kem, a vendor of agricultural products. Shell sold the Property to James R. and Jean Smith (the Smiths) of Ellensburg, Washington, in 1972, and Smith-Kem continued to conduct operations on the Property until March 31, 2015, when the McGregor Company (McGregor) acquired the business and assumed control of the site and several adjacent parcels as an operator. The Smiths sold the Property to Ad Gro on August 5, 1996 (refer to Quit Claim Deed in Appendix A) but McGregor has had effective control of the day-to-day operations on the Property since April 1, 2015.

An investigation in 2007 identified total petroleum hydrocarbons (TPH) in soil and groundwater, which led to subsequent investigations in soil and groundwater that documented elevated levels of pesticides, chlorinated herbicides, and ammonia. Based on the results, Shell and Smith-Kem were named PLPs and entered into the AO on February 29, 2016 (Ecology 2016a). RI field activities were conducted, per the AO and Ecology-approved RI Work Plan (Work Plan; Floyd|Snider 2016), starting in 2016 and were completed in early 2020.

1.1 PURPOSE AND OBJECTIVES OF THIS REPORT

The purpose of this report is to present an RI/FS consistent with the requirements of the Model Toxics Control Act (MTCA) cleanup regulation (Chapter 173-340 of the Washington Administrative Code [WAC]). In particular, this report was written to meet the following objectives:

- Describe soil and groundwater quality at the site using available data
- Evaluate complete exposure pathways to receptors at the site for analytes of interest found in the environmental media listed above
- Identify cleanup levels (CULs) applicable to the site chemicals of concern (COCs) and points of compliance (POCs)
- Prepare a conceptual site model (CSM) that identifies the COCs and areas of concern (AOCs) at the site
- Define remedial action objectives (RAOs) and applicable or relevant and appropriate requirements (ARARs)

- Develop and evaluate remedial action alternatives for comprehensive cleanup appropriate for implementation at the facility
- Select a preferred remedial action for the site that will achieve MTCA compliance under current and anticipated land uses

1.2 DOCUMENT ORGANIZATION

This document is organized as follows:

- **Section 1.0—Introduction:** Provides the purpose and objectives, regulatory overview for the site, and organization of the RI report.
- **Section 2.0—Site Background and Setting:** Provides information on the location, ownership, and historical and current land use at the site, as well as regional and site geology and ecological setting.
- **Section 3.0—Summary of Previous Investigations:** Presents previous soil and groundwater investigations that have been conducted at the site.
- **Section 4.0—Remedial Investigation Activities:** Presents a description of the soil, groundwater, and vapor intrusion (VI) investigations that were conducted as part of the RI, including sampling design, field methods, and analytical methods. Field activities described include soil sampling, air sampling, groundwater sampling, monitoring well installation, and test pit excavations.
- **Section 5.0—Preliminary Conceptual Site Model and Site Screening Levels:** Presents the CSM, identifies preliminary screening levels (SLs), provides a summary of exposure pathways and receptors, and site SLs, and identifies chemicals of potential concern (COPCs).
- **Section 6.0—Nature and Extent of Contamination:** Presents the COCs based on exceedances of developed site-specific CULs and POCs. Presents a description of type, concentration, and extent of contamination for both soil and groundwater.
- **Section 7.0—Final Conceptual Site Model, Areas of Concern, and Recommendations:** Summarizes the findings and conclusions of the RI, presents the final CSM, summary of AOCs, and proposes recommendations for the site.
- **Section 8.0—Feasibility Study:** Presents the RAOs, the POCs, and provides a summary of the remediation levels (RELs) that were developed to identify the concentrations at which different cleanup actions are taken.
- **Section 9.0—Remedial Technology Identification and Screening:** Presents the remedial technologies that were reviewed and considered to address both soil and groundwater contamination at the Site and a summary of the screening that was done to remove technologies from further evaluation.

- **Section 10.0—Identification of Cleanup Action Alternatives:** Provides a summary of the Sitewide cleanup action alternatives that were compiled as alternatives for the cleanup.
- **Section 11.0—Cleanup Action Alternatives Evaluation and Disproportionate Cost Analysis:** Provides a summary of the requirements and criteria that each remedial alternative is evaluated against in accordance with MTCA. Presents the results of the disproportionate cost analysis (DCA) that was conducted to identify the alternative that is permanent to the maximum extent practicable, using DCA evaluation criteria.
- **Section 12.0—Preferred Cleanup Action Recommendation:** Presents the Preferred Cleanup Action Alternative that was selected for the remediation of soil and groundwater at the Site and how this alternative complies with ARARs and RAOs.
- **Section 13.0—References:** Presents the sources cited in the RI/FS report.

The appendices of this document are as follows:

- Appendix A—Historical Records
- Appendix B—Select Site Photographs
- Appendix C—Floyd|Snider Memoranda
- Appendix D—Monitoring Well Logs, Boring Logs, and Groundwater Monitoring Field Forms
- Appendix E—Remedial Investigation Data
- Appendix F—Data Validation Reports
- Appendix G—Chemical Parameters and Backup Calculations
- Appendix H—Evaluation of Nondetect Results and Analytical Sensitivity
- Appendix I—Cost Estimate
- Appendix J—Statement from the McGregor Company on Current Operations

2.0 Site Background and Setting

2.1 PROPERTY LOCATION, DESCRIPTION, AND ZONING

The Property, located at 200 S. Railroad Avenue, is zoned as “heavy industrial” by the City of Ellensburg (City of Ellensburg 2017; Figure 2.1). The Property is approximately 2 acres and is bounded to the north by vacant properties and to the south by various light-industrial and other commercial businesses. To the east is the BNSF Railway (BNSF) rail yard and the Rail Spur that comes onto the eastern portion of the Property. To the west of S. Railroad Avenue is a rural residential property that is zoned as “Residential Suburban.” A detailed description of adjacent properties is provided in Section 2.6.

The Property surface is covered with compacted imported gravel and is relatively flat with an approximate property elevation at 1,500 feet above mean sea level. The general topography of the area slopes slightly toward the south. The nearest bodies of surface water include Mercer Creek, approximately 225 feet to the west of the Property, and Wilson Creek, approximately 125 feet east of the Property.

2.2 SITE DEFINITION, DESCRIPTION OF STUDY AREA, AND SITE SETTING

In this document, the word Property is used to refer to tax parcel 226833 (Figure 2.1). One goal of the RI is to better define the boundary of the “Site,” which under MTCA is defined by where contamination has come to lie (WAC 173-340-200). Until the Site is defined in Section 6.0, per MTCA, “site” is used to describe the study area, which includes the Property and the area surrounding the Property where investigation activities occurred and includes the BNSF rail yard (BNSF property) to the east, the commercial property to the south (owned by Ryan Wales; referred to as the Wales property), the residential property to the west (owned by Stephen Carter; referred to as the Carter property), and the City of Ellensburg right-of-way (ROW) S. Railroad Avenue, to the west.

The surrounding City of Ellensburg, as well as most of Kittitas County, is prime agricultural land. Historically, the main agricultural exports were wheat, timothy hay, alfalfa, corn, peas, and cattle. According to the Washington State University extension office (WSU 2018), current exports in Kittitas County include cattle and a variety of crops, including hay, wheat, and vegetables.

In order to transport surface water to farms for irrigation, irrigation ditches were commonly built throughout the area. Historically, an irrigation ditch (the historical ditch) ran from north to south along the eastern Property line, crossing beneath the Rail Spur. The north end of the ditch originated at Mercer Creek and the south end terminated at a conveyance system that drained into Wilson Creek. The ditch was used to convey water to agricultural properties to the south of the site (refer to Figure 2.2 for the ditch location). The dates the historical ditch was constructed and subsequently abandoned are not known. Smith-Kem never used the ditch as part of site operations.

The Property would periodically flood in the winter as the water level in the irrigation ditch would rise during rain events. Additionally, a Mercer Creek culvert to the north of the Property would clog, occasionally causing localized flooding. When the City of Ellensburg replaced the street crossing of Mercer Creek with a bridge and removed the culvert under the road in 2012, flooding from Mercer Creek stopped entirely.

In the early 1990s, the historical ditch was no longer being used and was dry. Because it was considered a safety hazard to have an open ditch, Smith-Kem backfilled the ditch with clean, local fill soil from a hotel construction project in Ellensburg. Because the site is prone to ponding after rain events, a culvert was left in place near the northeast Property boundary at the low spot where the historical ditch crossed under the Rail Spur to allow infiltration of stormwater, as shown on Figure 2.2 and in Photograph 13 of Appendix B.

A second culvert exists just south of the Property line to the east of the terminus of the Rail Spur. This culvert, which appears to be in line with the historical irrigation ditch, does not drain surface water from the Property, but appears to collect water from an off-Property feeder culvert to the west. This culvert daylights again in an open ditch area to the southeast of the Wales property (Photograph 23; Appendix B).

2.3 PROJECT BACKGROUND AND REGULATORY OVERVIEW

Upon discovery of TPH contamination during an investigation (discussed in Section 3.0), Sage Earth Sciences (Sage) notified Ecology on July 2, 2007, that there had been a release of petroleum at the site (Ecology 2016a). Ecology subsequently reviewed the Sage *Limited Site Characterization Report* (Sage 2007), and on May 29, 2008, Ecology Site Manager Richard Bassett conducted a site visit and met with the current property owner.

Following the site visit, on June 2, 2008, Ecology sent a letter to Smith-Kem and Ad Gro recommending that the Property be entered into Ecology's Voluntary Cleanup Program (VCP) or go under AO to characterize soil and groundwater contamination for TPH and other hazardous substances. On August 13, 2008, a Site Hazard Assessment (SHA) ranking of "3" was assigned to the site by Ecology (Ecology 2008).

The site was entered into Ecology's VCP on June 20, 2012, but was subsequently removed in October 2012 by Smith-Kem (CRA 2014). On November 15, 2012, Ecology received notification from Shell acknowledging its PLP status with regard to the former operation of the bulk terminal (Ecology 2016a).

On March 1, 2013, Ecology notified Smith-Kem and Ad Gro of a determination of their proposed PLP status for the site (Ecology 2013). On October 31, 2014, letters were sent to Smith-Kem, Ad Gro, and Shell notifying them all as PLPs under MTCA. On February 29, 2016, Shell and Smith-Kem entered into AO DE 12908 with Ecology. Although Ad Gro was notified as having potential liability under MTCA, it is not a party to the AO.

The AO scope of work required the PLPs to prepare a Work Plan, conduct an RI, and prepare an RI report and FS report in a manner that complies with the requirements of MTCA. The Work Plan was completed in July 2016, and the first of three phases of the RI began in August 2016.

2.4 HISTORICAL PROPERTY OWNERSHIP, DEVELOPMENT, AND OPERATIONS

The following paragraphs detail the history of ownership, development, and operations conducted on the Property. Figure 2.2 shows the approximate locations of notable historical site features identified from Sanborn Fire Insurance maps (Sanborn maps), historical aerial photos, and previous site investigations. Additional site features summarized below may not be shown on Figure 2.2 due to limited information about precise locations of activities or structures. Appendix A provides historical records, aerials, and Sanborn maps that were reviewed for this section.

Shell operated on the Property as a bulk fuel distributor from approximately 1923 to 1972 as described in Section 2.4.1. From 1948 until 1972, Shell leased a portion of the Property to the Smiths to conduct their agricultural products business. The Smiths operated under the Shell brand during that time and provided fertilizers, pesticides, and herbicides, as described in Section 2.4.2.

2.4.1 Shell Operations and Associated Products

Shell's operations at the Property first started in approximately 1923 (Kittitas County 2015). According to historical property records, general operations consisted of receiving, storing, and distributing bulk fuel products, although exact details concerning unloading, storage, and operational activities are not known.

As of the 1928 Sanborn map, there were an office and warehouse building (which still exists currently); two fire hydrants; two oil pumps; two aboveground storage tanks (ASTs), and aboveground product lines that extended from the Rail Spur to the warehouse building.

According to historical records and discussions with the current Property owner, during its operations, Shell had at least four primary ASTs that ranged in volume from approximately 6,000 gallons up to 25,000 gallons. The ASTs were used for the storage of gasoline and diesel fuels that would come on railcars via the Rail Spur. A former pump house, located south of the office building, pumped fuel from the railcars into the ASTs. According to the Property owner, fuel was also pumped through the aboveground product lines, into holes through the roof of the office building and out to trucks for filling. Trucks would also fill their tanks by pulling up to the ASTs for direct filling.

One 600-gallon underground storage tank was formerly located near the southwestern corner of the office building (the exact location is unknown) and used for the storage of white gas and, later, for zinc chelates. The tank was decommissioned and removed in the late 1970s.

According to Kittitas County historical tax assessor records, Shell sold the Property, including all buildings and land improvements, to the Smiths on November 30, 1972 (Kittitas County 2015). Ad Gro acquired the Property from the Smiths, as documented on a Quit Claim Deed, on August 5, 1996 (Appendix A).

2.4.2 The Smiths and Smith-Kem Operations and Associated Products

The Smiths began operations in 1948, operating on the Property concurrent with Shell. As described in Section 2.4, from 1948 until 1972, Shell leased a portion of the Property to the Smiths to conduct their agricultural products business. The Smiths operated under the Shell brand during that time. Initially, they leased a portion of the office and storage building for their operations and unloaded products on the eastern platform onto trucks for application.

Due to the expense associated with pesticide application and limited gross revenue for the business, only 1 to 2 percent of the Smiths' operations included the application of pesticides and up to 98 percent of business was fertilizers (Erickson 2016). The majority of business was for local farmers in the Ellensburg area.

In addition to fertilizer and pesticide handling operations, municipal waste and brush was reportedly burned periodically over a period of decades at the southeast corner of the Property. Limited information regarding the nature of burning operations, including the exact location and extent of the burn area, is available.

Lignin sulfonate was utilized as a dust suppressant in unpaved areas of the Property starting in the early 2000s. The nontoxic product is derived from lignin, a naturally occurring polymer found in wood. Upon initial application to unpaved surfaces, it can appear dark brown (as seen in Photograph 14 in Appendix B). Due to the differences in timing and operational procedures, fertilizer and pesticides have been separated in the following sections to provide a summary of each.

2.4.2.1 The Smiths and Smith-Kem Fertilizer Use and Operations

The Smiths began fertilizer operations and sales in 1948, providing anhydrous ammonia fertilizer, known as Shell NH₃, to local farmers, as well as farmers in the Columbia Basin (Steward 1998). They leased a platform area on the east side of the warehouse building for their operations, although other areas of the Property were used for operational activities. Most fertilizer was delivered to the Property by long haul truck, but some came in on railcar via the Rail Spur.

During the 1950s, anhydrous ammonia was shipped in on railcars and then transferred to trucks for later application in the agricultural fields. In contrast to pesticides, some blending of fertilizers occurred on-site. Liquid potash, sulfur, zinc, and boron were bought directly from the manufacturer and then blended into fertilizers.

The type of fertilizer used at the Property included liquid nitrogen and a limited supply of Solution 32. After fertilizer product was blended, it was loaded into transfer tanks on the beds of

trucks to be delivered and applied on agricultural fields. The Smiths operated two or three trucks with single tanks and two or three trucks with double tanks (Erickson 2016).

Once Shell's operations ceased in the early 1970s (as described in Section 2.4.1), Smith-Kem repurposed some of the ASTs for the storage of fertilizer products. In the late 1980s, all remaining steel tanks were replaced with tanks made of fiberglass.

In 1987, a significant leak of approximately 7,000 gallons of pressurized anhydrous ammonia occurred when a hose burst from a railcar positioned at the end of the Rail Spur. The leak resulted in local evacuations, but no citations were issued for the release.

As the fertilizer operation expanded in the late 1970s to early 1980s, and to comply with Washington State Department of Agriculture and insurance requirements, a 70-foot by 90-foot concrete secondary containment was constructed around the fertilizer tank farm located north of the current bulk fertilizer building (the AST containment area). During Smith-Kem operations on the Property, up to six ASTs containing fertilizer products (of varying volumes), an 8,000-gallon diesel AST, and a 2,000-gallon gasoline AST, were also located within the AST containment area. The diesel and gasoline ASTs were used for refueling equipment (Erickson 2016). These were installed after or concurrent with the AST containment area installation.

Further development occurred on the Property in 1976 when the 8,000-square-foot tractor service and machine shop building was constructed along the northern Property line. Prior to construction, equipment was stored outside and along the west side of the Property. Also in 1976, Smith-Kem added its first computerized three-wheel rig with long spray booms to apply fertilizer and crop protection products. The high-flotation machines were used for widespread application.

In 1988, the fertilizer business shifted from mostly "wet" application (i.e., anhydrous ammonia) to more "dry" application (i.e., pelletized/granular products). To accommodate the storage and mixing of fertilizers, a 5,000-square-foot building (the "bulk fertilizer building") was built in 1988 south of the AST containment area (Kittitas County 2015). Additionally, a designated paved wash area was constructed on the north side of the bulk fertilizer building to collect rinse water, which was stored in a polyethylene tank. During Smith-Kem's operations, this water was stored and later recycled for reapplication to agricultural fields.

In February 1995, Smith-Kem installed a 21,000-gallon anhydrous ammonia AST at the Property. The tank was used until approximately 2010 and was then removed and sold.

2.4.2.2 The Smiths and Smith-Kem Pesticide and Herbicide Use and Operations

The Smiths' historical pesticide operations did not involve converting raw pesticide products into finished products ready for application nor reformulating products. There are no known adjuvants, solvents, or carriers that were added to pesticides or fertilizer formulations during historical operations. Typically, the only modification to products handled on the Property was the addition of water to dilute the pesticide to a concentration suitable for application. Adjuvants

such as surfactants may have been present in products handled at the site, but those would have been additions made by the manufacturer.

Historically, pesticides were loaded onto trucks to the north of the office and storage building and to the south of the storage area, north of the AST containment area.

From July 1989 until termination of its permit in September 2007, Smith-Kem was registered with the U.S. Environmental Protection Agency (USEPA) as a pesticide-producing establishment. USEPA provided reporting forms from years 2005 through 2007, which indicated that Smith-Kem distributed RT Master II and Roundup to customers. Both products are listed as herbicides in the documentation that USEPA provided to Floyd|Snider (Schulze 2016). Dieldrin, a commonly used insecticide, was used to treat pea crops (Erickson 2016).

Other herbicide products may have been stored and distributed at the Property, in addition to RT Master II and Roundup, including 2,4-dichlorophenoxyacetic acid (2,4-D), Banvel (dicamba) atrazine, and Bladex (cyanazine). Roundup was the main product line distributed to customers. Herbicides were mainly distributed to support Smith-Kem fertilizer operations (Erickson 2016).

In general, it is impossible to recreate an accurate product list of all herbicides and pesticides that could have been used and sold on the Property, given the duration and nature of the operations. Generally, pesticide use over time would have depended on the Ellensburg market, which changed as the agricultural markets evolved, and what pesticides were available in commerce.

2.5 CURRENT PROPERTY OPERATIONS AND DEVELOPMENT

McGregor leases the Property to conduct its agricultural product distribution business.¹ Floyd|Snider requested that McGregor provide a list of products and chemicals used and distributed at the Property, as well as information on current operations. In response, McGregor provided some information on products used on-site. McGregor has stated that the range of products at the location at any time may change based on seasonality of product demand, new products or new formulations available in the market, and demand of customers. The National Pesticide Information Retrieval System database further lists McGregor as having “no federally active products registered by this company.” However, McGregor handles hazardous substances and registered pesticides at the facility. Where appropriate, Floyd|Snider has included first-hand observations of materials and operations information. Floyd|Snider has also included McGregor’s responses to requests for information to inform this section but has not independently verified those responses. Refer to Photographs 1 through 13 in Appendix B for current photographs of operations and features at the site.

McGregor is a distributor and manufacturer of bulk crop nutrition and protection products. McGregor operates 33 facilities throughout the northwest, including its operations at the Property. McGregor blends pre-purchased products for commercial use. Additionally, operations

¹ McGregor is responsible for all current operations at the facility. Terms of McGregor’s lease obligate McGregor to prevent all releases, maintain MTCA compliance, and to indemnify and hold harmless Smith-Kem for all activities, releases, and environmental conditions, post April 1, 2015.

consist of filling agricultural equipment for direct application to crops throughout the Ellensburg area.

McGregor reports that its operations at the Property include handling bulk liquid and dry fertilizer products, as well as handling a full range of crop protection products (which include a broad range of pesticides and herbicides). McGregor has recently provided a specific inventory list to Floyd|Snider (as of October 18, 2021). For the purposes of this RI/FS, Floyd|Snider and Ecology assume that any agricultural chemicals registered for use on crops grown in the Kittitas Valley of Washington may be handled at the Property, but, as noted, specific products currently handled and distributed vary seasonally.

Floyd|Snider field personnel have witnessed specific activities during RI field investigations. For example, in the bulk fertilizer building, bulk fertilizer is stored under cover and on concrete. McGregor uses front loaders to transport the fertilizer to other areas across the Property.

Between the office and storage building and the AST area, large spray equipment is driven onto the concrete pad for refueling and filling of crop care products. When sampling the monitoring well in this area, Floyd|Snider field personnel have observed blue, soapy liquid pooled in the bottom of the well monument, which McGregor identified as a marking dye, which some equipment uses to identify where field applications of agricultural products have been made. The product is a common agricultural product derived of a proprietary blend of blue dye and coupling agents and is labeled as nontoxic.

Semitrucks are unloaded into the bulk fertilizer building on the east side of the building using a conveyer system and then direct loaded into machinery on the north side of the building using an overhead transfer system.

Floyd|Snider has limited knowledge of the products currently stored in the ASTs within the containment area; however, based on observations of field personnel, at least one AST contains diesel fuel.

In response to requests for information to further inform this section of the RI/FS, McGregor provided in an email information about its operations as of October 2021 (Appendix J). To the extent that Ecology has further questions or concerns about McGregor's operations, Floyd|Snider would direct Ecology to contact McGregor. Smith-Kem and Floyd|Snider have not independently verified these statements, operations, or practices. McGregor's position is that it does not contribute to any contamination at the Smith-Kem facility.

McGregor has stated that it has discontinued the use of lignin sulfonate as a dust suppressant.

At the northern portion of the Property, McGregor stores its large equipment in and around the machine shop. The machine shop is also used for indoor storage of packaged fertilizer and other products. A small lunch area and restroom are connected to the southeastern corner of the machine shop.

The original office and storage building is located in the central portion of the Property. The office is used for administrative and business operations, while the remainder of the building is used to store packaged liquid and dry agricultural products (including pesticides). One bulk pesticide product is stored (inside containment) in this building.

2.6 ADJACENT PROPERTIES

Figure 2.1 presents the current owners and operators for the properties surrounding the Property. Appendix A provides historical aerial photos and documentation for the adjacent properties described in this section.

To the west of the Property is a 7.6-acre suburban residential property (207 S. Railroad Avenue) owned by Carter since 1979. The Carter property is largely undeveloped fields with one residential structure built in 1920. This property is separated from the Property by S. Railroad Avenue, a City of Ellensburg two-lane ROW road with no shoulder or sidewalks.

To the east of the Property is the BNSF rail yard (former Northern Pacific Railroad [NPRR]). The Rail Spur is present in the 1928 Sanborn map and presumably was once owned by NPRR or Shell. Historically, the Ellensburg Lumber Company's planing and sawmill and a former feed and seed warehouse were present from approximately the 1920s to the 1970s to the east of the BNSF (former NPRR) rail yard.

Based on review of Sanborn maps from 1928 and 1948, hay, grain, and feed companies, whose operations likely included loading/offloading from hay and grain silos, were located to the north and south along the BNSF (former NPRR) rail yard corridor. Currently, these properties are primarily commercial businesses, occupied by a Fred Meyer, a Goodwill, and a boat dealership and parts store. None of these properties and operations appear to be of concern and are not connected to Smith-Kem; therefore, they are not shown on figures.

The adjacent property to the north has remained vacant since early development on the Property. Properties to the north of this parcel are currently light industrial businesses. The properties to the west of the Property, including the property owned by Stephen Carter across S. Railroad Avenue, are primarily residential.

The land to the south of the Property was developed starting in the 1960s. In the 1964 aerial photograph (Appendix A), a large bermed feature is present on this parcel, although it is unclear what purpose this feature served. The bermed feature is not present in the 1970 aerial photograph; it was replaced by a building. Historical business directories indicate that C & H Transfer Transportation & Fuel, and later, Ellensburg Furniture Transfer Company Warehouse, operated at 204 S. Railroad Avenue, which was presumably located directly south and adjacent to the Property. This address no longer exists and is believed to be combined with current 212 S. Railroad Avenue.

At 212 S. Railroad Avenue (the current street address of the Wales property located directly adjacent and south of the Property), former operators included Ellensburg Refrigeration and

Heating and Consolidated Electrical Distributers. This property is currently occupied by Habitat for Humanity, while Protac Dust Control leases the smaller building at the southeastern corner of the parcel. The property was sold on April 1, 2019, to Ryan Wales.

2.7 PHYSICAL ENVIRONMENT

2.7.1 Site Geology

The site is located in the Kittitas Valley, in the eastern foothills of the Cascade Mountains. The geology in the vicinity of the site is characterized by Quaternary valley-fill deposits of glacial drift, alluvial sediments, and loess up to 1,000 feet thick overlying Columbia River basalt flows and older bedrock.

Soil borings advanced on the Property and in the vicinity have encountered shallow soils consisting of unconsolidated gravel and cobbles with varying amounts of sand and silt (refer to Photographs 15 through 20 in Appendix B for representative photos). These soils were observed from the surface to at least 20 feet below ground surface (bgs), which is the maximum depth that soils were sampled during the RI activities. Figure 2.3 shows cross-section line A-A' in plan view (along with RI sample locations, discussed in Section 4.0), and Figure 2.4 shows A-A' in cross section. Soil boring and test pit logs across the site show lateral and vertical heterogeneity typical of alluvial settings. Silt content generally increases on the northern half of the Property with layers of dark brown silt and some organic matter in shallow soils (i.e., between 0 and 5 feet bgs), which is consistent with this area being part of a floodway or wetland prior to site development. This silt unit is not continuous across the Property; however, varying amounts of silt in sandy and gravelly soils were observed in the top 5 feet of soils across the site. All site soils are considered to have been deposited as recent alluvium in the floodplain of the Yakima River.

2.7.2 Site Hydrogeology

The site is located in the Yakima River basin, with regionally characteristic soils of permeable gravel and cobbles with varying amounts of sand and silt. Discontinuous silt layers were also observed in the soil columns on the site; however, there do not appear to be any continuous aquitards within the top 20 feet of soil at this site. A shallow unconfined aquifer is typically encountered at depths ranging from 3 to 6 feet bgs. The annual average groundwater table is 3.5 feet bgs, with greater depths to water (ranging between 4 and 5 feet bgs) encountered on the BNSF property near the Rail Spur, which is consistent with the elevation of the BNSF property sitting approximately 1 to 1.5 feet higher than the Property. The groundwater table has a shallow horizontal gradient of about 0.002 feet per foot and fluctuates with highs observed during early spring (March) and lows observed during winter (January) and late summer (August).

The groundwater flow direction was established to be generally south-southwest using transducer data and observations of eight quarterly groundwater sampling events that took place between August 2016 and July 2018. A review of other Ecology sites in the Ellensburg area (e.g., Circle K Stores 2701136, Devere & Sons Distributing, and A1 Petroleum & Propane) shows the same southwesterly regional groundwater flow direction.

Transducers were installed in five monitoring wells at the site for 12 months between November 2016 and November 2017. The transducers collected groundwater depth, pressure, and temperature four times a day during this 12-month span to monitor for potential agricultural irrigation influence and seasonal fluctuations in groundwater levels. The transducer data are presented in Figure 2.5. Groundwater levels appear to peak in March prior to the 2017 irrigation season in Kittitas County, which ran between April 14 and October 15 (Kittitas Reclamation District 2017). The transducer data show that the local groundwater table is not significantly affected by agricultural irrigation but does exhibit seasonal fluctuations consistent with snow melt in the spring and dry weather in the summer. Within the Property boundary, the typical minimum depth to water during the wet season is approximately 3 feet bgs.

The groundwater at the site is considered potable per WAC 173-340-720(2). According to Ecology's Environmental Information Management database, there is one domestic well located approximately 0.75 miles to the south of the site, which draws groundwater from the aquifer at a depth of 180 feet. Review of the boring log generated during well installation indicates that there is a clay layer present between 115 and 130 feet bgs. Nearby surface water bodies include Mercer Creek to the west and Wilson Creek to the southeast. These creeks are approximately 450 and 200 feet away from the site, respectively, and eventually discharge into the Yakima River, which is about 0.9 miles southwest of the site. Shallow groundwater at the site is recharged from precipitation via infiltration through the unpaved ground surface.

3.0 Summary of Previous Investigations

Between 2007 and 2015, four investigations were done by Smith-Kem, Shell, and McGregor to assess whether TPH contamination and pesticides were present on the Property. Results indicated that elevated levels of TPH, chlorinated pesticides, chlorinated herbicides, nitrate, and ammonia are present in soil and groundwater, as summarized in the following sections. Sampling locations from all previous investigations are shown on Figure 3.1. All data collected during previous investigations are included in the reports described in the following sections.

3.1 SAGE EARTH SCIENCES, INC.

In 2007, Sage (on behalf of Belsaas & Smith Construction and Smith-Kem) performed a site characterization to assess TPH in soil and groundwater adjacent to the AST area on the Property as a result of an interested purchaser inquiry. Fourteen test pits (Test Pit #1 through Test Pit #14) were excavated on June 11 and July 2, 2007. Samples were collected from 12 of the 14 test pits and analyzed for diesel-, oil-, and gasoline-range TPH. Sage's report, dated July 26, 2007, indicated that soil and groundwater were impacted by diesel at concentrations that exceeded the MTCA Method A criteria. Sage concluded that petroleum-impacted soil appeared to be limited to the vicinity of the ASTs. However, the extent of petroleum-impacted soil was not determined. Sage concluded that petroleum-impacted groundwater appeared to extend from the area of the ASTs to the east and northeast (Sage 2007).

3.2 CONESTOGA-ROVERS & ASSOCIATES

In June 2013, Conestoga-Rovers & Associates (CRA) performed a site investigation on behalf of Shell for the purpose of further assessing soil and groundwater contamination reported by Sage in 2007. Eleven soil borings (SB-1 through SB-11) were advanced in June 2013. Samples were analyzed for diesel-, oil-, and gasoline-range TPH and benzene, toluene, ethylbenzene, and xylenes (BTEX). Select samples were analyzed for naphthalene, carcinogenic polycyclic aromatic hydrocarbons (cPAHs), 1,2-dibromoethane (EDB), 1,2-dichloroethane (EDC), methyl *tert*-butyl ether (MTBE), diisopropyl ether (DIPE), and polychlorinated biphenyls (PCBs).

Concentrations of gasoline-range TPH in soil collected from boring locations SB-6 and SB-11, located in the central and eastern side of the Property, exceeded MTCA Method A criteria.² CRA concluded that the majority of diesel- and heavy-oil impacted soil was located on the eastern side of the Property from the location of the former aboveground piping run to the Rail Spur.

Between September and October 2013, CRA completed an additional investigation focused on the TPH releases. Ten soil borings were advanced (MW-1 through MW-8 and SB-12 and SB-13), and eight of the ten borings were completed as monitoring wells (MW-1 to MW-8) to further

² Although gasoline-range TPH was identified, a review of the chromatograms suggests that detections of gasoline-range TPH was due to weathered diesel-range TPH creating chromatographic overlap in the gasoline-range organics, as described further in *Development of PCULs and Identification of COPCs for Evaluation in the Remedial Investigation Report* (hereafter referred to as the PCUL and COPC Memo; Attachment C.4 of Appendix C).

assess impacts to groundwater. Samples were analyzed for the same analytes as the June 2013 investigation. TPH was detected in groundwater samples collected from the MW-1 and MW-4 in the central and northern portion of the site (CRA 2014).

Sixteen soil samples were analyzed from locations SB-1 through SB-13 and MW-1, MW-5, MW-7, and MW-8. Results were non-detect or in compliance with MTCA Method A criteria, with the exception of one result from MW-5 that exceeded the criterion for gasoline-range TPH and one result from MW-1 that exceeded the criterion for the benzo(a)pyrene toxic equivalent (TEQ).

Groundwater from monitoring wells MW-4 and MW-6 contained concentrations of diesel-range TPH greater than the MTCA Method A criterion during November 2013 and March 2014. Concentrations of diesel-range TPH were less than MTCA Method A criterion in samples collected from all wells in May and August 2014 (CRA 2014). CRA established the groundwater flow to be to the southwest.

3.3 FULCRUM ENVIRONMENTAL AND NTH DEGREE

As reported in the AO, in 2014, Smith-Kem consultants Fulcrum Environmental and Nth Degree collected groundwater samples from the existing network of eight monitoring wells to investigate the presence and distribution of pesticide contamination in groundwater. A report dated August 4, 2014, indicated that groundwater samples from five of the eight wells (i.e., MW-1, MW-4, MW-6, MW-7, and MW-8) showed detections of gamma-benzene hexachloride (BHC; lindane), chlordane, endrin, endosulfan II, endrin aldehyde, and dieldrin (Ecology 2016a).

3.4 LANDAU & ASSOCIATES

In April 2015, groundwater sampling was performed by Landau & Associates on behalf of McGregor to document conditions compared to results of previous investigations and to establish a baseline concurrent with the start of McGregor operations at the Property. The sampling identified the presence of diesel-range TPH, nitrate, 2,4-D, chlordane, dieldrin, and toxaphene at concentrations greater than their MTCA Method A or Method B criteria in samples collected from monitoring wells MW-1, MW-4, MW-6, MW-7, and MW-8. Oil-range TPH, lindane, dinoseb, and dicamba were detected in groundwater but at concentrations less than their MTCA Method B criteria (Landau 2015).

4.0 Remedial Investigation Activities

Floyd|Snider, on behalf of Smith-Kem, performed RI sampling in three phases between August 2016 and June 2018: Phase 1, Phase 2A, and Phase 2B with additional follow-up sampling completed as required by Ecology in 2019 and 2020. RI sampling was completed in accordance with the Agreed Order and WAC 173-340-350(7) describing procedures for conducting an RI. All RI sample locations are shown on Figure 2.3. The phased approach defined initial analytes of interest, identified areas of potential concern (AOPCs), refined data gaps, and allowed time to get permission to access of the BNSF portion of the site, as described in this section. All three phases included sampling of soil and groundwater via sonic drilling. All sample locations were sampled in accordance with the Work Plan (Floyd|Snider 2016), Work Plan Addendum memorandum (Work Plan Addendum; Floyd|Snider 2017), the Proposed Additions to Phase 2B Sampling Scope memorandum (Additions Memorandum; Floyd|Snider 2018), the Proposed Sampling Plan for Vapor Intrusion Assessment (Floyd|Snider 2019a), and the 2019 Work Plan Addendum (Floyd|Snider 2019b). Boring and well logs are provided in Appendix D. All results associated with RI sampling are provided in Appendix E and will be discussed in later sections of this report.

Based on operations, as well as existing environmental site conditions, seven AOPCs were identified in the Work Plan to identify areas where additional sample collection was necessary to resolve data gaps (refer to Figure 2.3). After Phase 1, the AOPCs were refined and one additional AOPC was added in the Work Plan Addendum (Floyd|Snider 2017). Over the three phases of investigation described in the following sections, the sampling approach was refined to facilitate the collection of data suitable to define the nature and extent of contamination at the site.

The AOPCs defined in the Work Plan and Work Plan Addendum that required further evaluation in this RI are listed as follows and shown on Figure 2.3:

- AOPC 1—Culvert Soil Source Area
- AOPC 2—TPH in MW-5/SB-6 Soil
- AOPC 3—Office Building Area
- AOPC 4—AST Area
- AOPC 5a and AOPC 5b—Potential Former Wash Areas
- AOPC 6—Machine Shop Area
- AOPC 7—Former Irrigation Ditch and Culverts
- AOPC 8—Historical Burn Area

4.1 PHASES OF THE REMEDIAL INVESTIGATION ACTIVITIES

The scope of work of the three phases of RI sampling and supplemental work is described in the following sections. Detailed discussion of sample collection and laboratory analysis are presented in Section 4.2 and 4.3.

4.1.1 Identification of Analytes of Interest

Analytes of interest were identified in the Work Plan based on knowledge of former industrial activities at the Property, coupled with environmental data from previous investigations. Analytes of interest included diesel-, oil-, and gasoline-range TPH; BTEX; select cPAHs; metals; pesticides, herbicides, and insecticides; nitrate; nitrite; and ammonia. Site records regarding pesticide and herbicide use were incomplete; as a result, 10 different classes of pesticides, herbicides, and insecticides were considered analytes of interest. Analysis was conducted for more than 100 different pesticides, herbicides, and insecticides during the first year of quarterly groundwater monitoring (Year 1 groundwater monitoring) and during initial soil investigations (Phase 1 sampling).

4.1.2 Phase 1—2016

Phase 1 of the RI sampling took place between August 1 and 5, 2016, and included installation of six new monitoring wells (MW-9 through MW-14), advancement of 16 soil borings (FS-1 through FS-16), and collection of one surface sample (Culvert-1) on the Property. Analysis of soil and groundwater was conducted for the full suite of analytes of interest identified in the Work Plan (Floyd|Snider 2016).

Quarterly groundwater monitoring of all 14 wells began in August 2016, following installation of the new monitoring wells.

4.1.3 Phase 2A—2017

A Work Plan Addendum was developed after Phase 1 to address data gaps both on the Property and off-Property and to reduce the scope of analytical testing based on findings in Phase 1 (Floyd|Snider 2017). Many analytes were never detected during Phase 1 sampling efforts. Therefore, Phase 1 data were sufficient to remove these analytes from further consideration as COPCs, as documented in two Ecology-approved memoranda: *Summary of Year 1 Groundwater Results and Recommendations for Year 2* (hereafter referred to as the Year 1 Groundwater Summary Memorandum) and *Constituents of Potential Concern Elimination for Phase 2* (hereafter referred to as the Soil Elimination Memorandum), included as Attachments C.2 and C.3, respectively. Screened out analytes include metals, with the exception of arsenic; volatile organic compounds (VOCs); organophosphate pesticides; triazine herbicides; phenylurea herbicides; carbamate pesticides; organophosphorus and organosulfur pesticides; organonitrogen pesticides; and glyphosate. Screened out analytes are not considered COPCs for the site; however, for completeness, data for these analytes are included in Appendix E.

The Phase 2A investigation took place between June 6 and 9, 2017, and included advancement of 17 soil borings (FS-17 through FS-25; FS-27 through FS-33; and FS-35), installation of four temporary wells (FS-37 through FS-40), and collection of one surface sample (Surface-1). The four temporary wells were advanced on the Carter property downgradient of the Smith-Kem Property to determine whether elevated levels of nitrate, nitrite, and atrazine in groundwater are leaving the Property. The surface sample, Surface-1, was collected south of the Property, at the southeastern corner of the Wales property, where a culvert daylight in line with the historical irrigation ditch. Additionally, soil borings FS-22 and FS-30 were converted into temporary wells that were sampled at multiple depth intervals (between 4 and 15 feet bgs) to determine whether COPCs are present at stratified depths in the aquifer. Additional soil samples were collected for dioxin/furan analysis to characterize the former burn area. Refer to the Work Plan Addendum for further sampling rationale (Floyd|Snider 2017).

4.1.4 Phase 2B—2018

Phase 2B was a distinct event from Phase 2A due to delays in attaining site access of adjacent properties. This event took place between June 20 and 22, 2018, and included installation of six monitoring wells (MW-15 through MW-20), advancement of three soil borings (FS-26, FS-34, and FS-42), excavation of two test pits (TP1 and TP2), and collection of three surface soil samples (FS-43 through FS-45). The scope of Phase 2B was to further investigate potential contamination off-Property. Three of the monitoring wells (MW-15, MW-16, and MW-17), one soil boring (FS-26) and the two test pits were completed on the BNSF property to the east of the Property to further investigate the historical irrigation ditch and bound the eastern extent of contamination identified in soil and groundwater on the Property during Phase 1 and Phase 2A. Three monitoring wells (MW-18, MW-19, and MW-20) were installed in the City of Ellensburg ROW downgradient and to the south and west of the Property to characterize groundwater conditions downgradient of the Property. A shallow boring (FS-42) was collected to delineate elevated atrazine concentrations in soil found at FS-28. Additionally, one soil boring (FS-34) was completed to the south of the Property, and three surface samples were collected on the Property (FS-43 through FS-45) to further characterize the dioxins/furans in the historical burn area. Soil samples were analyzed for the same reduced list of COPCs as in Phase 2A. Refer to the Work Plan Addendum and the Additions Memorandum for further sampling rationale (Floyd|Snider 2017 and 2018).

4.1.5 Supplemental RI Work—2019 to 2020

Following completion of Phases 1, 2A, and 2B, supplemental work was completed to assess the risk for VI of petroleum compounds into the office building and to further characterize site groundwater with focused sampling for nine organochlorine pesticides. The VI assessment took place on April 16, 2019, and included collection of three air samples collected over 8 hours to replicate potential exposure to workers during normal working hours. The samples included one outdoor ambient air sample collected near the northwest corner of the building, one indoor air sample collected in the center of the office space, and one air sample collected from the crawl space beneath the office. Air samples were analyzed for TPH, BTEX, and naphthalene. The scope

of work is further described in the Proposed Sampling Plan for Vapor Intrusion Assessment (Floyd|Snider 2019a).

The supplemental groundwater sampling that took place on March 25, 2020, was an Ecology-coordinated sampling effort focused on achieving the lowest attainable practical quantitation limits (PQLs) for nine organochlorine pesticides at the Site. All 20 monitoring wells were sampled during this event, and samples were submitted for laboratory analysis by low-level USEPA Method 8081B. Refer to the 2019 Work Plan Addendum for further sampling methodology and rationale (Floyd|Snider 2019b).

4.2 SOIL

The soil investigations were completed in August 2016, June 2017, and June 2018. This section describes general field methods used for surface and subsurface soil sampling and laboratory analytical methods. Soil sample locations are shown on Figure 2.3.

4.2.1 Soil Borings

Borings were advanced from the ground surface to a typical depth of 10 to 15 feet bgs. Soil was collected for logging purposes using 5-foot-long, 6-inch-diameter drill rods with disposable sampling bags. The drill rods were rinsed between boring locations. Soil was logged continuously by a field geologist according to the Unified Soil Classification System (USCS) and field screened to identify intervals potentially contaminated with volatile constituents using a photoionization detector (PID). PID readings and visual observations of contamination, such as staining and sheen, were documented on the boring logs.

Per the Work Plan, soil samples were collected from depth intervals characterized at the time of collection as surface (i.e., 0 or 0.5 to 1 feet bgs, corresponding to a depth just below the compacted imported gravel surface), shallow vadose zone soil (between the surface and observed water table), at the water table, and saturated soil (generally 4 feet and below). Additional samples were collected at some locations based on field indications of potential contamination such as high PID readings, staining, or odor. Samples were collected from the bagged core using disposal plastic or decontaminated stainless-steel spoons and homogenized, or mixed, in a stainless-steel bowl. Following homogenization, the sample material was placed into laboratory-supplied sample vials and jars, labeled, and immediately placed in a cooler maintained at a temperature of approximately 4 degrees Celsius (°C) using crushed ice. The samples were transported to Friedman & Bruya, Inc. (FBI) in Seattle, Washington; Pacific Agricultural Laboratory (PAL) in Sherwood, Oregon; and Analytical Resources, Inc. (ARI) in Tukwila, Washington, under standard chain-of-custody procedures.

4.2.2 Test Pits

Two test pits were dug during the June 2018 Phase 2B event with an excavator using a 2-foot-wide toothed bucket.

The test pits were excavated near the border of the Smith-Kem and BNSF properties. Soil was logged continuously by a field geologist according to the USCS and screened to identify potentially contaminated depth intervals through olfactory or visual observation of staining or sheen. Signs of contamination such as odors, sheens, or staining were noted on field forms. Test pits were approximately 2 to 3 feet wide by 10 feet long and ranged in depth between 4 and 5 feet.

Test pit soil samples were collected by scraping material from the desired depth of the sidewall of the excavation into a clean, disposable container, using a decontaminated stainless-steel spoon. The sample material was placed into laboratory-supplied sample jars, labeled, and immediately placed in a cooler maintained at a temperature of approximately 4 °C using crushed ice. Samples were transported to FBI and PAL under standard chain-of-custody procedures.

4.2.3 Surface Soil

Two grab samples were collected per the Work Plan and Work Plan Addendum (Culvert-1 and Surface-1). The culvert sample was collected with a decontaminated shovel and the surface sample was collected from the ditch using a decontaminated hand-auger. For both samples, the soil was collected from the tooling with a decontaminated stainless-steel spoon with care taken to avoid any soil that made direct contact with the tool. Each sample was then homogenized in a stainless-steel bowl and placed in laboratory-supplied sample jars, labeled, and immediately placed in a cooler maintained at a temperature of approximately 4 °C using crushed ice. Samples were transported to FBI and PAL under standard chain-of-custody procedures.

The surface samples collected in Phase 2B (FS-43 through FS-45) were not originally included in the scope of either the Work Plan or Work Plan Addendum. These samples were added to the scope of Phase 2B in coordination with Ecology to refine the extent of AOPC 8, the historical burn area, in relation to shallow soils potentially impacted by dioxins/furans. Due to the compacted nature of the ground surface on the Property, the soil samples for FS-43, FS-44, and FS-45 were collected by advancing a 6-inch sonic drill rod 1 to 2 feet into the subsurface. During sample collection, field personnel looked for sign of potential burn areas and no signs were observed. Soil was collected in a disposable plastic liner with care taken to reduce disturbance of the soil sample in order to target the interval just below the compacted gravel road-base fill material. Soil was logged by the field geologist according to the USCS and screened (visually and olfactorily) and then sampled and homogenized using disposable plastic spoons to avoid cross-contamination. Soil was placed in laboratory-supplied sample jars, labeled, and immediately placed in a cooler maintained at a temperature of approximately 4 °C using crushed ice. Samples were transported to ARI under standard chain-of-custody procedures.

4.2.4 Analytical Methods

The soil samples collected in August 2016 as described above were analyzed for some or all of the following constituents using the analytical methods summarized below and in accordance with the Work Plan:

- Metals (arsenic, cadmium, chromium, copper, lead, and zinc) by USEPA Method 200.8
- Mercury by USEPA Method 1631E

- Diesel- and oil-range TPH by NWTPH-Dx
- Gasoline-range TPH by NWTPH-Gx
- VOCs by USEPA Method 8260
- cPAHs by USEPA Method 8270D-SIM
- Nitrate/nitrite by Method SM4500NO3F or USEPA Method 300.0
- Ammonia by USEPA Method 350.1
- Semivolatile organic compounds (SVOCs) by USEPA Method 8270
- Multi-residue pesticides profile, which includes the following analyses:
 - Halogenated pesticides by USEPA Method 8081B
 - Organophosphorus pesticides by USEPA Method 8141B
 - Organonitrogen pesticides by USEPA Method 8270D
 - Miscellaneous pesticides by USEPA Method 8321B
- Chlorinated herbicides by USEPA Method 8151
- Glyphosate by USEPA Method 547

The soil samples collected in June 2017 and June 2018 were analyzed for some or all of the following constituents using the analytical methods summarized below and in accordance with the Work Plan Addendum approved by Ecology in April 2017:

- Nitrate/nitrite by USEPA Method 300.0
- Chlorinated herbicides by USEPA Method 8151
- Organochlorine/halogenated pesticides by Modified USEPA 8081B
- Diesel- and oil-range TPH by NWTPH-Dx
- Dioxins/furans by USEPA Method 1613

4.3 GROUNDWATER

The groundwater investigation was completed during quarterly monitoring events starting in August 2016. Additionally, groundwater screening samples were collected from temporary wells during the June 2017 Phase 2A sampling event, and supplemental groundwater samples were collected from all monitoring wells in March 2020. This section describes field methods used for installation of monitoring wells and analytical laboratory methods. Groundwater sampling locations, including monitoring wells and temporary wells, are shown on Figure 2.3. Monitoring well construction details are provided in Table 4.1.

4.3.1 Monitoring Well Installation and Development

Six monitoring wells (MW-9 through MW-14) were installed on the Property in August 2016 to supplement the existing eight monitoring wells (MW-1 through MW-8) previously installed by CRA in 2013. Three of these wells (MW-9, MW-13, and MW-14) were placed on the northeast, southeast, and southwest Property corners, respectively, to monitor upgradient and downgradient groundwater concentrations at the Property boundaries. The other three wells were placed across the Property to monitor the western edge of the Property (MW-10) and the area surrounding the AST area (MW-11 and MW-12).

Six additional monitoring wells were installed off-Property in the Phase 2B event in June 2018 (MW-15 through MW-20). Three were installed downgradient of the Property near the S. Railroad Avenue ROW (MW-18, MW-19, and MW-20), and three were installed upgradient of the Property on BNSF property (MW-15, MW-16, and MW-17) to monitor downgradient and upgradient groundwater conditions, respectively.

4.3.1.1 Field Methods

Monitoring well installation was completed by Holocene Drilling. The boreholes for the wells were drilled using standard sonic drilling techniques. Sonic boreholes were advanced using a 6-inch-diameter inner rod and 8-inch-diameter outer casing.

The monitoring wells were constructed to span the water table with 10-foot-long screens set from either 3 to 13 feet bgs or 5 to 15 feet bgs. Well screen assemblies consist of a 10-foot length of 2-inch-diameter 0.020-inch (20-slot), Schedule 40 polyvinyl chloride (PVC) pipe set in a #10/20 Colorado silica sand filter pack. The sand filter pack was installed by pouring sand into the space between the well casing and outer drill rod as the casing was withdrawn. A weighted tape was used to monitor filter pack placement and depth during installation. The sand filter pack extends 0.5 to 2 feet above the top of the screened interval. A 2-foot-thick seal of hydrated bentonite chips was installed in the annular space immediately above the sand filter pack. The remainder of the annular space was sealed with concrete to the ground surface.

All monitoring wells were secured with flush-to-ground locking steel protective monuments with expansion seals on the well casing to minimize the potential for surface water entering the monument. Well completion details are summarized in Table 4.1 and in the monitoring well logs in Appendix D.

Well development was completed by continuous pumping at a steady rate using a battery-operated submersible whale pump. Well development equipment was decontaminated by pumping an Alconox solution and clean water through the pump. Well development was terminated when turbidity readings stabilized or were less than 50 nephelometric turbidity units (NTU).

A professional survey, including measuring point elevation of the well case, was completed for all sampling locations. Coordinates were surveyed to ± 1 foot accuracy in Washington State Plane

(South) and elevations were surveyed to ± 0.1 foot accuracy for Site features and ± 0.01 foot accuracy at monitoring well measuring points in North American Vertical Datum of 1988.

4.3.2 Monitoring Well Sampling

Beginning in August 2016, groundwater samples were collected from 14 existing and newly installed monitoring wells for eight consecutive quarters. Following the June 2018 Phase 2B event, the six new monitoring wells were sampled. All 20 monitoring wells were sampled again in March 2020. The following section describes the field methods used for sampling.

4.3.2.1 Field Methods

All wells were purged and sampled from the mid-point of the well screen using low-flow procedures to achieve the lowest turbidity practicable, using a peristaltic pump and dedicated polyethylene and silicone tubing. Prior to and during sampling, depth to water was measured to the nearest 0.01 foot using a water level indicator. The monitoring well was purged prior to sampling at a maximum rate of 0.5 liters per minute. During purging, field parameters (i.e., temperature, pH, conductivity, salinity, and turbidity) were recorded at 5-minute intervals using a multi-parameter water quality meter. Once the field measurements for water quality parameters were stable (within 10 percent) for three consecutive readings, the groundwater sample was collected. The last set of field parameters measured during purging will represent field parameters in the groundwater sample. All field measurements were recorded on groundwater sample collection forms, which are included in Appendix D.

After purging the well and labeling the sample bottles, the groundwater samples were collected by directly filling the laboratory-provided bottles from the pump discharge line at the same flow rate that was used for purging. The sample bottles were labeled and immediately placed in a cooler maintained at a temperature of approximately 4 °C using crushed ice. Samples were transported on ice to FBI and PAL under standard chain-of-custody procedures. During the March 2020 sampling event, samples were transported to ALS Environmental (ALS) in Kelso, Washington, under standard chain-of-custody procedures.

4.3.3 Groundwater Screening Sampling

A total of eight temporary screening wells were sampled in June 2017. Six temporary wells were installed on the Property to characterize the vertical extent of contamination in the vicinity of MW-4 and FS-12, which included three screened intervals (at 5 feet bgs, 10 feet bgs, and 15 feet bgs) installed 1 foot apart at boring locations FS-22 and FS-30. The deepest screened well at FS-22 and the mid-screened well at FS-30 were not productive and, therefore, were not sampled. Four more temporary wells (FS-37, FS-38, FS-39, and FS-40) were installed at depths between 4.5 and 14 feet bgs downgradient of the Property on the Carter property to define the extent of atrazine and nitrate concentrations potentially leaving the Property. The results of this vertical investigation are discussed in Section 6.3.

4.3.3.1 Field Methods

The temporary screening wells installed in June 2017 were constructed with 2- or 5-foot screens set at various depths. Screen lengths and depths were determined in the field and set to span across the water table or to target a specific depth interval. A static depth to water measurement was also collected after installation and prior to purging. Sample collection forms for temporary wells are included in Appendix D.

Well screen assemblies consisted of 2-inch-diameter 0.020-inch (20-slot), Schedule 40 PVC pipe set in a #10/20 Colorado silica sand filter pack. The sand filter pack was installed by pouring sand into the space between the well casing and outer drill rod. The on-Property temporary wells were purged and sampled with the drill casing pulled up to just above the well screen to limit the vertical flow of groundwater during sampling. The temporary wells on the Carter property were purged and sampled with the drill rods fully extracted. After sampling, all temporary wells were abandoned the same day by removing the well casing and screen and backfilling the borehole with hydrate bentonite chips.

Groundwater was purged using standard low flow sampling techniques from the temporary PVC casing using a peristaltic pump with disposable polyethylene and silicone tubing. Groundwater screening samples were collected by filling laboratory-provided bottles directly from the pump discharge line once the purge water was visually clear or until the water quality parameters had stabilized. The sample bottles were labeled and immediately placed in a cooler maintained at a temperature of approximately 4 °C using crushed ice. Samples were transported on ice to FBI and PAL under standard chain-of-custody procedures.

4.3.4 Analytical Methods

The groundwater samples were analyzed for some or all of the following constituents by the methods indicated below and in accordance with the Work Plan and Work Plan Addendum:

- Diesel- and oil-range TPH by NWTPH-Dx
- Gasoline-range TPH by NWTPH-Gx
- Total and/or dissolved metals (arsenic, cadmium, chromium, lead, and mercury) by USEPA Methods 200.8
- VOCs by USEPA Method 8260
- Ammonia as total nitrogen by USEPA Method 350.1
- Nitrate and nitrite as nitrogen by USEPA Method 300.0
- Multi-residue pesticides profile, which includes the following analyses:
 - Halogenated pesticides by USEPA 8081B
 - Organophosphorus pesticides by USEPA 8141B
 - Organonitrogen pesticides by USEPA 8270D

- Miscellaneous pesticides by USEPA 8321B
- Chlorinated herbicides by USEPA Method 8151
- Low-level organochlorine pesticides by USEPA 8081B (March 2020 only)

4.3.5 Water Level Elevations

Transducers were installed in five monitoring wells (MW-4, MW-6, MW-9, MW-11, and MW-12) and set to collect four measurements a day—at 6 a.m., noon, 6 p.m., and midnight—for 12 months spanning from November 2016 to November 2017. These measurements were downloaded quarterly and corrected for atmospheric pressure with the barometric data collected from a barometer installed in MW-11. Transducer data are presented in Figure 2.5.

4.4 VAPOR AND INDOOR AIR

An initial VI assessment was completed in September 2018 to assess if VI posed an immediate risk to occupants working in the office building. Floyd|Snider prepared a memorandum to document this initial assessment (included as Attachment C.3). Ecology sent a letter to Floyd|Snider on November 19, 2018, requesting that the VI assessment occur in the next 4 months (i.e., by mid-March 2019) to further evaluate the potential VI risk in the office building (Ecology 2018a). A VI investigation was later completed in April 2019 in response to Ecology's letter. Sampling was completed in accordance with the approved sampling plan for VI (Floyd|Snider 2019a). This section describes general field methods used for collecting indoor air, ambient air, and crawl space air samples and laboratory analytical methods. A summary memorandum detailing the field activities and indoor air results is included as Attachment C.5.

4.4.1 Vapor Sampling—Indoor Air, Ambient Air, and Crawl Space

The office building is approximately 1,500 square feet including an attached storage garage area. The office space and storage garage are separated by an exterior wall and have independent foundations. The storage garage area has a slab-on-grade concrete foundation, and the office building is raised approximately 3 feet above the ground with an accessible crawl space. The storage garage area is on top of and adjacent to petroleum-impacted soils.

To assess VI risk in the office building, vapor samples were collected over an 8-hour period from the office space indoor air, upwind ambient air from outside the office building, and air from the crawl space beneath the office building.

4.4.1.1 Field Methods

Three air samples were collected in 6-liter SUMMA canisters over an 8-hour period during normal working business hours to replicate worker exposure conditions during a full workday at the Property. Weather was considered when scheduling sampling to avoid sampling during a period of extreme atmospheric pressure changes or within 24 hours of a rain event that would have produced 0.5 inches of precipitation or more. No precipitation occurred during the sampling or

the previous day. In addition, a building survey was performed that included taking note of other potential vapor sources, such as cleaning products, air fresheners, copy machines, and cigarette smoke.

The SUMMA canisters were set up with flow regulators to allow continuous collection of air to be sampled over an 8-hour period. One SUMMA canister was placed outside and upwind near the northwest corner of the office building approximately 3 feet above the ground surface in a location protected from the elements (i.e., wind, precipitation) to measure ambient air conditions. Wind direction was to the southeast during the sampling event. The outdoor ambient air SUMMA canister was set up first to allow ambient air sample collection prior to the collection of the other samples, approximately 35 minutes before sampling indoor air. This provides a more accurate assessment of the building's air exchange rate, which is generally in the range of 0.25 to 1.0 hour for outdoor air to enter indoor air. A second SUMMA canister was placed near the center of the office building at 4 feet above the floor level to collect an indoor air sample representative of the breathing zone. A third SUMMA canister was placed in the crawl space beneath the office building near utility conduits entering the office floor and away from perimeter vents. All efforts were made to eliminate other sources of vapor-producing chemicals, such as air fresheners, within the office space prior to sampling. If such items were present, they were noted in the building survey form. The survey forms and photographs are included in Attachment C.5.

4.4.2 Analytical Methods

Air samples were sent to FBI in Seattle, Washington, and analyzed for the following:

- Air-phase petroleum hydrocarbons by Method MA-APH
- BTEX and naphthalene by USEPA Method TO-15

Indoor air results were submitted to Ecology, via email, on May 3, 2019.

4.5 DATA VALIDATION

Laboratory analytical data from PAL, ARI, and ALS were validated by EcoChem. Data validation reports from EcoChem are provided in Appendix F. Laboratory analytical data from FBI were validated in-house. Analytical schedules and professional judgment statements for in-house data validation are provided in Appendix F Tables F.1 and F.2

For Phase 1 data, either full validation (USEPA Stage 4) or summary level validation (USEPA Stage 2B) was performed on all herbicide, pesticide, and glyphosate data as sample delivery groups were received from the laboratories. For all other data resulting from laboratory analysis, a compliance screening (Stage 1) data quality review was performed.

For Phase 2, herbicide and pesticide data received a USEPA Stage 2A validation rather than a USEPA Stage 2B validation. As described in the Work Plan Addendum, validation was reduced to a USEPA Stage 2A validation because the full USEPA Stage 4 validation done for the first sampling round did not identify any systematic errors in compound identification or quantitation using

complex analytical methodologies. The majority of data qualification was based on quality assurance/quality control (QA/QC) elements that would still be evaluated during a USEPA Stage 2A validation. The dioxin/furan sample data received a full USEPA Stage 4 validation.

The analytical data were validated in accordance with the National Functional Guidelines for Superfund Organic Methods Data Review (USEPA 2014a and 2016a) and National Functional Guidelines for Inorganic Superfund Data Review (USEPA 2014b and 2016b). The data quality review included evaluation of sample chain-of-custody procedures, sample preservation and analytical holding times, blank contamination, precision (replicate analyses), accuracy (compound recovery), adherence to the target analyte list, detection limits, and data package completeness. Appendix F provides the analytical schedule and professional judgment statements relating to each sample delivery group. All RI investigation data are determined to be of acceptable quality for use, as qualified, or noted below:

- In the July 5, 2017, EcoChem data validation report, sample MW-04-081016 was noted to have percent difference values outside the control limit for dieldrin, dichlorodiphenyldichloroethylene (DDE), dichlorodiphenyltrichloroethane (DDT), and alpha-chlordane, which indicates a potential high bias. As a result, EcoChem assigned the samples a data qualifier of “J” to indicate the result should be considered an estimate.
- Additionally, this sample was extremely turbid, as documented on the groundwater sampling form (Appendix D). Despite low-flow purging techniques, higher turbidity values of 150 NTU were noted at monitoring well MW-4. High turbidity measurements in groundwater samples, such as those seen in the August 2016 result collected from MW-4, are known to cause high bias in metals results due to the entrainment of soil particles in the sample (Puls and Powell 1992). Highly turbid samples are typically not used to determine COCs or to measure compliance due to their propensity to cause false positives in the results, particularly for chemicals that have a high soil organic carbon partitioning coefficient (K_{oc}) value.

Due to the high biased qualification during data validation and the fact that the sample was highly turbid, Floyd|Snider determined that results from this sample are unrepresentative of site groundwater conditions for arsenic, dieldrin, DDE, DDT and alpha-chlordane. These results are therefore of unacceptable quality for site characterization.

4.6 DEVIATIONS

Deviations from the Work Plan, Work Plan Addendum, Year 1 Groundwater Summary Memorandum, the Additions Memorandum, the 2019 Work Plan Addendum, and Sampling Plan for Vapor Intrusion Assessment are summarized in Table 4.2.

5.0 Preliminary Conceptual Site Model and Site Screening and Cleanup Levels

Section 5.1 describes key elements of the preliminary CSM, and the SLs developed for soil and groundwater. Section 5.2 describes the preliminary CULs developed for soil and groundwater, and Section 5.3 identifies site COPCs.

5.1 PRELIMINARY CONCEPTUAL SITE MODEL, SCREENING LEVELS, AND ANALYTES OF INTEREST

The preliminary CSM is a tool used to identify potentially contaminated media, receptors, and routes of exposure. The preliminary CSM was developed with consideration of current, historical, and potential future uses of the Property. Physical features of the Property and findings from previous environmental investigations were considered; however, the preliminary CSM will be modified as appropriate following the evaluation of site-specific data in the RI to refine the CSM for the Site.

The sections that follow describe the preliminary CSM; identification of analytes that were potentially released at the Property; and development of SLs for each analyte in each of the media of concern.

5.1.1 Media of Concern, Exposure Pathways, and Receptors

The preliminary CSM identifies the media of concern that may be impacted by current and former site activities. The preliminary CSM includes consideration of direct contaminant release mechanisms as well as potentially complete contaminant transport pathways. Groundwater, vadose zone (unsaturated) soil, saturated soil, and indoor air are the media of concern, as illustrated in Figure 5.1.³

VI SLs protective of indoor air are also protective of outdoor air, and soil SLs protective of direct contact are protective of all routes of direct contact exposure (i.e., direct contact, ingestion, and inhalation). Outdoor air is not a medium of concern.

The preliminary CSM also identifies potential receptors (people, plants, and animals) that could be exposed to contamination once in the environment. The preliminary CSM is further described in the sections that follow.

5.1.1.1 Potential Sources of Contamination and Contaminant Transport Pathways

Potential sources of current and historical soil and groundwater contamination may include the following:

- Direct releases from material storage, use, and handling
- Direct releases from equipment washing operations

³ Surface water and sediment are not media of potential concern because the site does not abut surface water and available data indicate groundwater is unlikely to impact surface water.

- Generation of by-products during burning operations
- Leaks and spills from equipment, tanks, and machinery
- Leaks and spills during fueling and fuel transfer operations at the Rail Spur or between ASTs and trucks
- Grading of the ground surface for maintenance and to support changes in operations
- Infiltration of precipitation and overland flow through contaminated soil, causing leaching into groundwater

The majority of the Property is unpaved. Many historical operations may have resulted in releases that occurred decades ago. Leaching of hazardous substances from soil into groundwater is expected, particularly for those chemicals with low to moderate soil K_{oc} values. Leaching from soil to groundwater may represent a continued source of contamination to groundwater, while transport of a contaminant plume in groundwater may have caused soil downgradient of the source area to become impacted as contaminants sorb onto the soil. Thus, empirical demonstrations of groundwater quality and evaluations of paired soil and groundwater data are expected to be a useful tool when evaluating whether the leaching pathway is complete for particular analytes, in accordance with WAC 173-340-747(3)(f).

WAC 173-340-747(9) describes conditions that must be met for an empirical demonstration to show that the soil concentrations present at the site have not caused, and will not cause, the applicable groundwater criteria to be exceeded at the POC for the target medium. To perform an empirical demonstration the following must be true:

- Sufficient time must have elapsed for soil contamination to migrate to groundwater.
- Current and past site characteristics (e.g., depth to groundwater and infiltration) must be representative of future site conditions.

Ecology's Implementation Memorandum No. 15 provides additional guidance on how to perform an empirical demonstration under MTCA (Ecology 2016c). The soil and groundwater data evaluation performed in later sections of this RI/FS were performed in accordance with technical considerations set forth in Ecology's Implementation Memorandum No. 15. Conditions present at the site are appropriate for a qualitative assessment of whether sufficient time has elapsed for contamination to have migrated to the groundwater; that is, the site has highly permeable soils, shallow depth to groundwater, and a long period of time has elapsed since certain contaminant releases of banned pesticides has occurred.

Finally, certain volatile analytes present a potential risk to indoor air if present in high concentrations and if structures are located or built over contaminated areas. However, a VI assessment was completed for the site in 2019. The vapor sampling data obtained in 2019, in conjunction with the conclusion with the previous VI assessments conducted at the site (Attachment C.3), indicate that TPH contamination in soil or groundwater does not pose a VI threat to occupants within the current office building; therefore, VI risk to indoor air is not a pathway of concern. Vapor sampling activities and results are summarized in Attachment C.5.

5.1.2 Screening Level Development

SLs were developed in accordance with the MTCA cleanup regulation (WAC 173-340) and are protective of both human health and ecological receptors for each of the potentially impacted media at the site. SLs were developed using MTCA Method B, which is the “universal method for determining cleanup levels for all media at all sites” per WAC 173-340-700(5)(b). SLs were initially developed for the chemicals of interest identified as part of the Work Plan (Floyd|Snider 2016). SLs for dioxins/furans were developed using the approach outlined in WAC 173-340-708(8)(d)(ii). The dioxin/furan TEQ⁴ for human health and ecological receptors was calculated using the appropriate toxic equivalent factor (TEF) values for humans and mammals in MTCA Table 708-1. Individual congener results and the TEF values used to calculate the dioxin/furan TEQ for each sample are included in Table G.1 in Appendix G.

Additionally, certain SLs were revised in September 2018, because of updates to Ecology guidance for the VI pathway. Throughout this RI, the term SL refers to the updated SLs.

SLs are protective of direct contact and select cross-media exposure scenarios (i.e., cross-media exposures consistent with the contaminant transport pathways identified in Figure 5.1). Cross-media protection pathways require that (1) the contaminant migrates from one medium (or location) to another and that (2) an exposure occurs between a receptor and the medium that is being protected. SLs are inherently conservative because contaminant migration is modeled by simple equilibrium partitioning equations that are not calibrated to site-specific conditions, including natural attenuation and degradation processes that can limit or eliminate contaminant migration and exposure. This ensures the use of analytical methods with appropriate sensitivity to assess risk, regardless of site-specific conditions. SLs are used to identify COPCs prior to a more detailed evaluation to identify COCs based on site-specific conditions.

The sections that follow identify the receptors, potentially applicable exposure pathways, and corresponding regulatory criteria and natural background concentrations considered in the development of SLs for each of the potentially impacted media.

5.1.2.1 Groundwater Screening Levels, Receptors, and Potential Exposure Pathways

Groundwater SLs were initially developed and presented in the Work Plan. Groundwater data were screened against these SLs to identify chemicals tentatively retained as COPCs in the Ecology-approved October 2017 Year 1 Groundwater Summary Memorandum (Attachment C.1). Updated groundwater SLs are described in the text that follows and consider more recent chemical partitioning data and toxicity factors than the SLs developed in the Work Plan.

Groundwater SLs are protective of the following receptors and exposure pathways:

- **Protection of human health via drinking water exposure.** The underlying aquifer is considered potable per WAC 173-340-720(2). Potential receptors include adults and children who drink from wells that supply water from within the aquifer. Protection

⁴ The TEQ expresses the toxicity of a mixture of substances (e.g., cPAHs or dioxins/furans) as a single value.

of this exposure pathway is protective of other receptors (e.g., terrestrial receptors and the environment) and other potential future beneficial uses of the aquifer, including industrial and agricultural use. However, groundwater at or near the Property is not currently being used for drinking water and it is not anticipated that such use will occur in the future (Gray & Osborne 2014). As noted in Section 2.7.2, the nearest downgradient groundwater well is located approximately 0.75 miles away from the Property boundary and is unlikely to be affected by contamination originating at the Property.

- **Protection of human health from exposure to indoor air (due to VI).** Aldrin⁵ and TPH are present in soil or groundwater at the Property; thus, VI from groundwater was considered a potentially active pathway under current or future land use.

Specific criteria considered for each of these exposure pathways are listed below.

- **Groundwater-to-Drinking-Water Exposure Pathway.** Ecology requires that SLs must be at least as stringent as all applicable state and federal laws per WAC 173-340-700(6)(a). The following criteria were considered for purposes of establishing groundwater SLs protective of potable water use:
 - Federal maximum contaminant level (MCL; 40 CFR 141-143)
 - Washington State MCL (WAC 246-290-310)
 - MTCA Method B groundwater criteria (WAC 173-340-720(4)) protective of cancer and noncancer endpoints, or MTCA Method A groundwater criteria (WAC 173-340-720(3)) when MTCA Method B values were not available
- **Groundwater-to-Indoor-Air Exposure Pathway.** The 2019 indoor air VI assessment indicates that there is not a VI risk to occupants in the current office building, the following criteria were considered for purposes of establishing a groundwater SL protective of indoor air exposure for future buildings:
 - *Ecology's Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action*, Table B-1: Indoor Air Cleanup Levels, Groundwater Screening Levels, and Soil Gas Screening Levels (Ecology 2018b)
 - *Ecology's Implementation Memorandum No. 14: Updated Process for Initially Assessing the Potential for Petroleum Vapor Intrusion* (Ecology 2016b)
 - *Ecology's Implementation Memorandum No. 18: Petroleum Vapor Intrusion (PVI): Updated Screening Levels, Cleanup Levels, and Assessing PVI Threats to Future Buildings* (Ecology 2018c)

Prior to selecting the groundwater SL, the groundwater target concentration was calculated. The groundwater target concentration is the most stringent drinking water ARAR (i.e., the state or federal MCL) adjusted for health effects, if available. The most stringent drinking water ARAR was

⁵ Other than TPH, aldrin is the only volatile analyte of interest for which Ecology has developed VI SLs applicable to groundwater.

adjusted to protect human health if the excess cancer risk exceeds 1 in 100,000 (1×10^{-5}) or if the hazard quotient exceeds 1. In these cases, the ARAR was adjusted downward in accordance with WAC 173-340-720(7)(b) to the minimum of the following:

- MTCA Method B noncancer criterion
- MTCA Method B cancer criterion multiplied by a factor of 10

For analytes without an established ARAR, the groundwater target concentration is the minimum MTCA Method B criterion.

The groundwater SL is the most conservative (lowest) criterion between the groundwater target concentration and the VI SL, after considering natural background. Arsenic is the only chemical whose SL was adjusted upward for natural background. The arsenic SL is equivalent to the Washington natural background concentration established in MTCA Method A Table 720-1 (WAC 173-340-900), as allowed by WAC 173-340-720(7)(c). Groundwater SLs are listed in Table 5.1.

Laboratory methods were chosen such that PQLs for each analyte would be low enough to allow evaluation of the results gathered during sampling conducted in accordance with the Work Plan relative to the SLs. This goal was accomplished for most analytes; however, the PQLs were elevated relative to the SL for 10 organochlorine pesticides. To resolve this data gap, Floyd|Snider conducted a groundwater monitoring event in March 2020: all on-Property and off-Property wells were sampled and analyzed for the 10 organochlorine pesticides with previously elevated reporting limits relative to the SLs. More information is provided in Appendix H.

5.1.2.2 Soil Screening Levels, Receptors, and Potential Exposure Pathways

Soil SLs were initially developed in 2016 in the Work Plan. Soil data were initially screened against SLs developed in the Work Plan to identify chemicals tentatively retained as COPCs in the Ecology-approved February 2017 Soil Elimination Memorandum (Attachment C.2). This information was considered when updating soil SLs in 2020 for this RI. Current soil SLs include more recent chemical partitioning data, toxicity, and exposure factors, and are described in the text that follows.

Receptors potentially exposed to soil include human and ecological receptors. Soil SLs are protective of the following receptors and exposure pathways:

- **Protection of human health via direct contact.** Because the Property is located within a few hundred feet of residential and commercial properties, soil SLs were developed to be protective of unrestricted land use exposure scenarios (i.e., direct contact with soil by customers or nearby residents), consistent with WAC 173-340-745(1)(b)(iii). However, the Property is zoned heavy industrial and is located within a city that has adopted a comprehensive plan and adopted zoning regulations under the Growth Management Act. The current and anticipated future use of the Property will be for industrial purposes.

- **Protection of wildlife receptors via direct contact.** Because soil contamination occurs in the upper 15 feet of soil and includes legacy pesticide contamination, a terrestrial ecological evaluation (TEE) was considered.
- **Protection of the highest beneficial use of groundwater via leaching from soil.** Soil SLs must be protective of the highest beneficial use of groundwater, which is assumed to be potable, per WAC 173-340-700(6)(b). For purposes of soil SL development, the groundwater target concentration to be protected is the groundwater SL presented in Table 5.1.
- **Protection of human health from exposure to indoor air (due to VI).** Soil SLs must consider site use and be protective of current buildings and any future buildings via the VI pathway.

Specific criteria considered for each of these exposure pathways are listed below.

- **Direct Contact Exposure Pathway.** Soil SLs for the direct contact pathway were developed using MTCA Method B soil criteria (WAC 173-340-740(3)) protective of cancer and noncancer endpoints. If MTCA Method B criteria were not available, MTCA Method A criteria for unrestricted land use (WAC 173-340-740(2)) were used.
- **Protection of Groundwater via the Leaching Pathway.** The MTCA three-phase partitioning model (WAC Equation 747-1) was used to determine soil concentrations protective of the groundwater (i.e., the groundwater preliminary CUL developed in Section 5.2). This model was used to determine protective concentrations in site soil using the procedure and default input partitioning parameters for saturated soil described in WAC 173-340-747(4). Chemical partitioning data for each analyte are provided in Table G.2. If a groundwater preliminary CUL was not developed or if chemical partitioning data were not available for a particular analyte, SLs for this pathway were not developed.
- **Soil-to-Indoor Air Exposure Pathway.** VI SLs are presented in Ecology's *Implementation Memorandum No. 14: Updated Process for Initially Assessing the Potential for Petroleum Vapor Intrusion* and *Implementation Memorandum No. 18: Petroleum Vapor Intrusion (PVI): Updated Screening Levels, Cleanup Levels, and Assessing PVI Threats to Future Buildings* (Ecology 2016b and Ecology 2018c). These SLs are protective of indoor air for occupants within residential dwellings. Ecology considers these SLs applicable to all sites with petroleum contamination, although the memoranda note that CULs for this pathway may consider current and potential future site conditions and land use consistent with other Ecology VI guidance. In addition, Ecology's *Implementation Memorandum No. 18* includes a process to calculating a site-specific TPH indoor air CUL.

Soil SLs are listed in Table 5.2. The soil SL is the most conservative (lowest) criterion from among the criteria identified above, adjusted to natural background, as appropriate per WAC 173-340-740(5)(c). Accordingly, the arsenic SL was adjusted to the Washington natural background concentration established in MTCA Method A Table 740-1 (WAC 173-340-900).

The saturated soil SLs developed for the leaching pathway were less than reporting limits achieved by the laboratory during the Phase 2 soil sampling event for pentachlorophenol and nine organochlorine pesticides. As described in the Soil Elimination Memorandum (Attachment C.2), elevated reporting limits relative to soil SLs are typically not indicative of an unacceptable risk to potential receptors at the site due to the conservative nature of the equilibrium partitioning calculation. Soil data are not compared to soil SLs for the leaching pathway in this RI.

5.2 PRELIMINARY CLEANUP LEVELS AND POINTS OF COMPLIANCE

Preliminary CULs were developed for the site in an Ecology-led process that took place beginning in February 2020. The process is documented in the PCUL and COPC Memo (Attachment C.4). Groundwater preliminary CULs were developed for any chemical that was either (a) detected in site groundwater or (b) retained for further analysis as a COPC in the Ecology-approved October 2017 Year 1 Groundwater Summary Memorandum (Attachment C.1). Soil preliminary CULs were developed for any chemical that was either (a) detected in site soil or (b) retained for further analysis as a COPC in the Ecology-approved February 2017 Soil Elimination Memorandum (Attachment C.2).

This section also describes the POC where each preliminary CUL applies.

5.2.1 Groundwater

Groundwater cleanup standards are defined as a CUL combined with a POC where the CUL will apply. Preliminary groundwater cleanup standards will ensure that groundwater is protective of human health, ecological receptors, and the environment. The highest beneficial use of groundwater in this evaluation is assumed to be drinking water use (refer to Section 5.1.2.1).

5.2.1.1 Point of Compliance

The standard POC for groundwater is defined in MTCA as “throughout the site from the uppermost level of the saturated zone to the lowest depth potentially affected by the site” per WAC 173-340-720(8)(b). Ecology may approve a conditional POC if it can be demonstrated that it is not practical to meet groundwater CULs at the standard POC within a reasonable restoration time frame using all practicable methods of treatment in the site cleanup per WAC 173-340-720(8)(c) or (d). In this RI, the standard POC will be used to define the nature and extent of contamination. The FS will evaluate whether it is feasible to meet the standard POC for groundwater, or whether a conditional POC is required.

5.2.1.2 Preliminary Cleanup Levels

Preliminary CULs for groundwater are presented in Table 5.1 and were developed in accordance with WAC 173-340-720(4). The preliminary CUL is equivalent to the groundwater SL, or risk-based target CUL, unless this value is less than the PQL. In these cases, the groundwater SL was adjusted

upward to the PQL. This adjustment is consistent with WAC 173-340-720(7)(c), which allows upward adjustment of CULs to the PQL or natural background, whichever is higher.⁶

5.2.2 Soil

Soil cleanup standards are defined as a CUL combined with a point of compliance where the CUL will apply. Preliminary soil cleanup standards will ensure that soil is protective of human health, ecological receptors, and the environment for each of the three potentially active soil exposure pathways identified in the preliminary CSM (Section 5.1.1).

5.2.2.1 Point of Compliance

The standard POC for soil is pathway-dependent, as defined in WAC 173-340-740(6)(b) through (e). The standard POC for each potentially active soil exposure pathway, along with specific application at the Property, is summarized below:

- **Direct Contact.** The standard POC is soil throughout the site from the ground surface to 15 feet bgs for both human health and ecological exposure pathways. This represents a reasonable estimate of the depth of soil that could be excavated and distributed at the soil surface as a result of site development activities and is consistent with MTCA. This POC is protective of incidental ingestion and dermal contact with soil for any site and does not require the presence of pavement or institutional controls to be protective.

Ecology may approve a site-specific POC for the terrestrial ecological exposure pathway per WAC 173-340-7490(4)(a). The site-specific POC should be equivalent to the depth of the biologically active zone. The biologically active zone is defined as the maximum depth that soil invertebrates, burrowing animals, and plants may penetrate into the soil. The depth of the biologically active zone bounds the depth where ecological receptors may be exposed to contamination: contamination in soil below the biologically active zone is not a potential source of exposure to ecological receptors. In other words, if the only contamination present at a site is below the biologically active zone, the ecological exposure pathway is incomplete.

Under WAC 173-340-7490(4)(a), the depth of the biologically active zone is 6 feet bgs. This is equivalent to the conditional POC. This depth is appropriately conservative for a site-specific POC representing the site's biologically active zone based on the following lines of evidence:

- Observed vegetation surrounding the site is predominantly composed of shrubs, grasses, and other relatively shallow-rooted vegetation. Studies have found that for vegetation of this type, more than 50% of root biomass is expected to be present in the top 3 to 4 feet of soil (Sample et al. 2015).

⁶ For clarity, for analytes whose preliminary CUL was adjusted to be equivalent to the PQL, the preliminary CUL prior to adjustment to the PQL is referred to as the risk-based target CUL.

- Soil turnover is low, due to the relative dearth of soil invertebrates at and adjacent to the Property.
- Soil macroinvertebrates, like voles and other burrowing animals, have not been observed at or adjacent to the Property.
- The extremely shallow depth of the vadose zone at the site limits habitability by soil biota and invertebrates, which cannot live in saturated soil due to its lack of oxygen (absence of void space). The maximum depth of the vadose zone is 3.5 feet bgs across the site; periodic seasonal flooding can cause the depth of the vadose zone to rise to 2.5 to 3 feet bgs.

More information describing features of the site and its use that contribute to a relatively shallow biologically active zone are described in Section 6.2.1.1 with respect to the development of proposed CULs for the site.

- **Leaching.** The POC is soil throughout the site. In practice, this means that soil samples collected within the vadose zone are compared to the site-specific preliminary CUL developed for leaching from vadose zone soil, and soil samples collected within saturated soil are compared to the site-specific preliminary CUL developed for leaching from saturated soil.
- **Vapor Intrusion.** The POC is soil throughout the site from the ground surface to the uppermost water table. Generally, for soil on Property, the corresponding depth range for this pathway is from 0 to 3 feet bgs, in accordance with WAC 173-340-740(6)(c).⁷

Because soil POCs are exposure pathway-specific, it is possible to have multiple CULs for soil that apply to different geographic areas of the site or to different depth ranges within the same lateral extent.

5.2.2.2 Preliminary Cleanup Levels

The starting point for development of soil preliminary CULs for each soil pathway is the SL applicable to that pathway. Soil SLs are presented in Table 5.2. SLs are intentionally conservative and are designed to be protective of any site. By contrast, preliminary CULs may consider site-specific conditions that limit current and future exposure to contamination in accordance with WAC 173-340-708(10)(b)(i). At this site, exposure assumptions considered in development of the soil preliminary CUL for the direct contact pathway were not modified from their SLs.

Soil-to-groundwater equilibrium calculations protective of the leaching pathway were performed using the MTCA three-phase model (WAC Equation 747-1). Certain inputs into this equation were modified from the leaching SLs developed for this pathway to account for measurable soil properties that affect contaminant transport. Specifically, the soil fraction of organic carbon (f_{oc}) was modified from the MTCA default value of 0.001 to a site-specific value of 0.011. The site-specific f_{oc} value was calculated by taking the arithmetic mean of select soil samples analyzed for

⁷ Ecology's Implementation Memorandum No. 14 (Ecology 2016b) specifies a POC of 0 to 6 feet bgs; however, at this site, the MTCA POC depth is more appropriate to use due to the shallow depth to groundwater.

total organic carbon, expressed as a fraction. f_{oc} data are presented in Table 3 of the PCUL and COPC Memo (Attachment C.4). All other calculation inputs match those used in the calculation of SLs for this pathway.

The risk-based soil criterion selected for each chemical was the more stringent standard between leaching and the direct contact criteria (protective of human direct contact and terrestrial receptors), which was determined using standard MTCA Method B practices described in Ecology's soil cleanup standards development guidance (Ecology 2005). If groundwater demonstrates compliance for the leaching pathway (i.e., the chemical is not identified as a groundwater COPC in Table 5.3, as described in Section 5.3.1), the soil preliminary CUL was modified to the soil direct contact criterion for that chemical.⁸ This direct contact preliminary CUL was used to determine exceedance information and COPC status.

Preliminary CULs applicable to site soil are presented in Table 5.4.

Soil to Indoor Air Preliminary Screening Levels

The relevant criteria for this pathway are numerically equivalent to the SLs developed and described in Section 5.1.2.2.

5.3 IDENTIFICATION OF CHEMICALS OF POTENTIAL CONCERN

Following development of groundwater and soil preliminary CULs, groundwater and soil data were screened relative to the preliminary CULs to identify COPCs for each medium. COPC status and data used to identify COPCs are described in the sections that follow.

5.3.1 Groundwater

For most analytes, all available groundwater data were used to identify site groundwater COPCs. Chemical-specific dataset considerations are summarized below.

- **Metals and TPH.** Results collected from test pits and temporary wells that were analyzed for metals and TPH were excluded from the groundwater data set used to identify site groundwater COPCs, as described in the PCUL and COPC Memo (Attachment C.4).
- **Organochlorine Pesticides.** For the 10 organochlorine pesticides with elevated groundwater reporting limits in Phase 2 groundwater sampling events, groundwater data collected and analyzed in March 2020 were used to determine COPC status. If the chemical was not detected in any sample analyzed during the March 2020 groundwater monitoring event, the chemical was not retained as a COPC. Otherwise,

⁸ The conditions in WAC 173-340-747(9)(b)(ii) are met: current soil concentrations for these analytes are protective of groundwater and will remain protective of groundwater in the future. The screened-out analytes were generally legacy pesticides, whose manufacture and use has been discontinued for more than 30 years; thus, a sufficient amount of time has elapsed for migration of these pesticides to groundwater to have occurred.

detected results measured during March 2020 were evaluated relative to the preliminary CUL to determine COPC status.

For all other chemicals, if the maximum detected result exceeded the preliminary CUL in any sample, the chemical was retained as a groundwater COPC. Table 5.3 presents the results of groundwater COPC screening and provides information about the frequency of exceedance and maximum detected result for each analyte.

5.3.2 Soil

All available soil data collected after June 1, 2007, were used to identify soil COPCs. Detected results in soil were compared to soil preliminary CULs, which are protective of direct contact exposure and leaching from soil. The VI pathway was evaluated separately, because the only analyte of interest with a soil VI SL is TPH. TPH concentrations in soil exceed the VI SL. However, the VI assessment activities conducted in 2019 determined that TPH impacts in soil do not pose a significant risk to occupants of the current office building (Attachment C.5). Future VI risk will be evaluated as part of the FS remedy design, but preliminary CULs are protective of the pathway. Thus, TPH in soil is not a VI risk to indoor air relative to future land use on the Property and is not retained as a soil COPC for the VI pathway.

If the maximum detected result exceeded the soil preliminary CUL in any sample, the chemical was retained as a soil COPC. Table 5.5 presents the results of soil COPC screening and provides information about the frequency of exceedance and maximum detected result for each analyte.

Although gasoline-range TPH was detected and exceeded the preliminary CUL in a limited number of samples, it was eliminated as a COPC because the laboratory stated that the pattern of peaks in the chromatograms indicate gasoline is not present in any of the samples with gasoline detections. More information is provided in the PCUL and COPC Memo.

5.3.3 Summary of Chemicals of Potential Concern

COPCs in soil and groundwater are summarized in Table 5.6, along with their preliminary CULs. Table 5.6 also lists the pathway basis of each soil preliminary CUL, which is relevant to the POC where the preliminary CUL applies.

6.0 COCs and Nature and Extent of Contamination

This section identifies groundwater and soil COCs using their preliminary cleanup standards. COCs are generally described as COPCs that are present at the site at concentrations and frequencies that represent a risk to human health or the environment. COCs are determined by screening site data against cleanup standards developed for each medium.

Groundwater and soil cleanup standards developed in Section 5.2 are used to identify the “Site,” which, as described in Section 2.2, under MTCA is defined as where contamination has come to lie (WAC 173-340-200). The geographic extent of the Site is described in Section 6.3 for groundwater and Section 6.4 for soil. The cleanup standards are also used to describe the nature and extent of contamination and refine the AOPCs into AOCs in Section 6.4. The Site boundary generally coincides with the Property boundary, with some minor exceedances outside the eastern and southern Property boundary.

6.1 IDENTIFICATION OF GROUNDWATER CHEMICALS OF CONCERN

This section identifies COCs in site groundwater from among the groundwater COPCs by screening site groundwater data against their preliminary CULs.

Table 6.1 presents exceedance information for COPCs detected in site groundwater samples. For each COPC, this table presents the preliminary CUL; information about the number of groundwater results; the maximum detected result; whether detected results exceed the preliminary CUL; and the maximum exceedance factor for each COPC. Exceedance information in this table is based on individual sample results; that is, field samples and field duplicate samples are considered individually, rather than averaged.

The groundwater dataset used to identify COCs is the same as the groundwater dataset used to identify COPCs, with one exception: results for arsenic, dieldrin, DDE, DDT, and alpha-chlordane in sample MW-04-081016 were excluded because these results were determined to be unrepresentative of site groundwater conditions, as described in Section 4.5 relative to elevated turbidity in the sample and data quality issues with particular results. Exclusion of these results is consistent with WAC 173-340-720(9)(a), which establishes that “compliance with groundwater cleanup levels shall be determined by analysis of groundwater samples representative of the groundwater.” Exclusion of these results is consistent with earlier discussion and agreement with Ecology: the PCUL and COPC Memo (Attachment C.4) documents studies and guidance demonstrating that elevated turbidity in a groundwater sample can result in sample bias that causes artificially elevated results that are not representative of groundwater quality for particular chemicals, including metals.

Exclusion of these sample results eliminates arsenic, DDE, DDT, and alpha-chlordane as COCs. Three of these four chemicals were measured at concentrations in compliance with their CULs in all other samples within the relevant groundwater dataset used to identify COCs.

Based on information presented in Table 6.1, alpha-chlordane and dicamba were screened out as groundwater COCs in accordance with WAC 173-340-720(9)(e) and WAC 173-340-720(9)(d)(i)(A) because:

1. they were not detected at concentrations exceeding 2 times the preliminary CUL;
2. fewer than 10% of detected results exceed the preliminary CUL; and
3. the upper one-sided 95% confidence limit on the true mean groundwater concentration is less than the preliminary CUL.

6.1.1 Summary of Groundwater Chemicals of Concern and Proposed Cleanup Standards

Proposed CULs were developed for each chemical that was identified as a COC in Section 6.1. Proposed CULs are numerically equivalent to the groundwater preliminary CUL for each chemical. The standard POC for all groundwater COCs is groundwater throughout the site, to the maximum depth where contamination from the site is present. Compliance is determined for each groundwater monitoring well individually in accordance with WAC 173-340-720(9)(c). Proposed CULs for each COC are summarized in Table 6.2.

**Table 6.2
Summary of Groundwater Chemicals of Concern and Proposed Cleanup Levels (µg/L)**

Analyte	CAS No.	Proposed CUL	CUL Basis	Toxicity Basis ⁽¹⁾
Miscellaneous Substances				
Nitrate	14797-55-8	10,000	MCL	Short-Term/Acute
Nitrite	14797-65-0	1,000	MCL	Short-Term/Acute
Organochlorine Pesticides				
HCH-beta	319-85-7	0.049	MTCA Method B	Carcinogenic
Aldrin	309-00-2	0.0026	MTCA Method B	Carcinogenic
Chlordane	57-74-9	2.0	MCL	Carcinogenic
Dieldrin	60-57-1	0.0055	MTCA Method B	Carcinogenic
Toxaphene	8001-35-2	0.80	MCL adjusted to MTCA Method B	Carcinogenic
Chlorinated Herbicides				
2,4-D	94-75-7	70	MCL	Chronic
MCPA	94-74-6	8.0	MTCA Method B	Short-Term/Acute
Other Chlorinated/Halogenated Pesticides				
Atrazine	1912-24-9	3.0	MCL	Carcinogenic

Analyte	CAS No.	Proposed CUL	CUL Basis	Toxicity Basis ⁽¹⁾
Total Petroleum Hydrocarbons				
Diesel-range TPH	DRO	500 ⁽²⁾	MTCA Method A	Short-Term/Acute
Oil-range TPH	ORO	500 ⁽²⁾	MTCA Method A	Short-Term/Acute

Note:

- 1 In accordance with WAC 173-340-720(9)(c)(v), compliance with proposed CULs will be determined using an upper percentile concentration for CULs based on short-term or acute toxic effects on human health or the environment, and the true mean concentration for CULs based on chronic or carcinogenic threats.
- 2 Ecology has required that diesel-range and oil-range TPH results be summed and compared to a CUL of 500 µg/L. Future assessments of TPH in groundwater (if applicable) will assume the CUL will be summed, per Ecology’s requirement. In the draft CAP, it is anticipated that Ecology can establish the final groundwater CUL to reflect the combined diesel-range and oil-range TPH for the Site.

Key information about each of the groundwater COCs is provided in Table 6.3. Information contained in Table 6.3 includes current and historical commercial uses potentially relevant to on-site releases and environmental partitioning, fate, and transport information. This information can be used to supplement the discussion of nature and extent of contamination contained in Section 6.3.

6.2 IDENTIFICATION OF SOIL CHEMICALS OF CONCERN AND CLEANUP STANDARDS

This section identifies soil COCs and their proposed cleanup standards.

6.2.1 Identification of Chemicals of Concern

This section identifies soil COCs from among the COPCs identified in Section 5.3.2 by screening soil data against CULs protective of the direct contact and leaching pathways. Prior to performing screening analysis to identify COCs, CULs protective of ecological receptors are developed for use in the screening evaluation.

6.2.1.1 Direct Contact

Direct contact criteria protective of ecological receptors form the basis of the preliminary CUL for seven COPCs: lead, zinc, chlordane, total DDX (calculated as the sum of dichlorodiphenyldichloroethane [DDD], DDE, and DDT), alpha-chlordane, total diesel- and oil-range TPH, and dioxins/furans (refer to Table 5.6). Direct contact criteria for the protection of ecological receptors are found in WAC 173-340-900, Table 749-2. Footnotes in that table recognize that these concentrations “are not intended to be protective of terrestrial ecological

receptors at every site” and that “exceedances of the values in this table do not necessarily trigger requirements for cleanup action under this chapter.”

A site-specific evaluation has been performed to determine criteria protective of the direct contact pathway. The direct contact criteria that will be considered when selecting proposed CULs will be the most stringent of either a site-specific criterion protective of ecological receptors or the direct contact criterion protective of human health listed in Table 5.4. With respect to ecological receptors, this evaluation will consider whether existing soil concentrations measured at the site:

- are causing or contributing to a loss of habitat quality; and
- are protective of ecological receptors that may be found at the site, now or in the future.

To evaluate whether existing soil concentrations are diminishing habitat quality, current habitat quality was evaluated. Figures 6.1 and 6.2 were developed to support this discussion in this section. These figures identify areas of the site that meet all WAC Table 749-2 TEE criteria; areas of the site that are highly impacted for either pesticides (Figure 6.1) or dioxins (Figure 6.2); and include representative photos of soil borings and vegetation in each of these areas.

Habitat quality was determined to be poor based on the following lines of evidence:

- The soils are primarily sand and permeable gravel and cobbles, with varying amounts of sand and silt present. There are no continuous aquitards within the top 20 feet of soil at the site. For more information on site geology, refer to Section 2.7.1.
- The top 3 feet of soil at the site is typically covered with a gravelly/sandy road base or gravel surface that is low in organic matter relative to typical surface soil.
- Heavy truck traffic at the site compacts surface soil. Compacted soil has less air for plant use and has reduced concentrations of organic matter relative to uncompacted soil (Hipple ND).
- Recent investigations conducted on-site confirm that below the road base or gravel surface that comprises the site surface, soils are typically silty soil or silty sands with gravel that overlay sand with gravel. Soil observations collected from borings in an area outside of any AOPC, where samples do not exceed concentrations protective of terrestrial receptors (e.g., FS-04, FS-17, MW-9, MW-10, MW-15), do not differ significantly from soil observations in borings where soil results were significantly greater than these concentrations (e.g., FS-05, FS-06, and FS-19 in AOPC 1; or FS-33 in AOPC 8). Photographs of representative soil borings are included in Figures 6.1 and 6.2.
- Compared to organic-rich soil, soil types observed at the site are expected to support a smaller number and diversity of terrestrial species. This expectation is confirmed by observations made during site investigations conducted by Floyd|Snider personnel: worms and other biota have not been observed in soil borings at the site.

Earthworm abundance is presumed to be constrained by (a) the soil types present at the site, (b) the site's hard-packed surface, and (c) the site's shallow groundwater table, which is also subject to periodic seasonal flooding. Soil biota are most likely to be present in the top 0.5 to 1 foot of soil—where organic matter is most plentiful—and are less likely to be present below 2 feet bgs, where much lower f_{oc} values are typically observed (Hendrix et al. 1992, Curry 2004). Given the absence or low levels of organic matter present in surficial soils, earthworm populations are severely constrained and, therefore, not available as a prey species.

- There is effectively no vegetation on the Property or at adjacent properties to the east or south. The only vegetation present is occasional grass clumps (particularly immediately off-Property near the railroad track) and a few invasive/emergent non-native shrubs. Photographs of the site, showing limited vegetation, are included in Appendix B. In particular, photographs of the BNSF property and along the northern Property boundary, where soil COPC concentrations were generally less and protective of terrestrial receptors—show that vegetation in these areas of the site is similar to vegetation observed in site AOPCs, where results often exceed criteria protective of terrestrial receptors.

Even if the road base were not present, conditions contributing to poor habitat quality and a lack of earthworm and plant abundance would persist. The sandy and gravelly soils present at the site are prone to drought and seasonal flooding; truck traffic and other on-site activities would continue to compact the soil causing continued deterioration of habitat quality for plants and soil biota; and the absence of vegetation to contribute to organic matter content would continue to constrain the occurrence of soil biota (Curry 2004).

To evaluate the second objective, that is, whether current soil concentrations are protective of ecological receptors, the contaminant distribution at the site was evaluated using established practices to determine a depth-weighted average concentration relevant to ecological receptors. This assessment relies on two critical observations:

- The number of results exceeding TEE criteria is generally low. For example, zinc, alpha-chlordane, and total DDx exceed preliminary CULs protective of terrestrial receptors in fewer than 10% of samples collected at the site (Table 5.5).
- Contamination is observed to decrease significantly with depth for most chemicals exceeding TEE criteria.

Depth-weighted receptor exposure adjustment calculations were performed for metals (lead and zinc), pesticides (alpha-chlordane, chlordane, and total DDx), and dioxins/furans. Details of this calculation, including the equation and its inputs, are found in Attachment G.1. Results of these calculations are presented in Table 6.4. Calculations are performed first on a site-wide basis, then by sub-setting the data to exclude areas with elevated concentrations of pesticides and dioxins/furans.

Depth-weighted receptor exposure adjustment factors reflect the importance of different soil horizons for soil exposure potential by various ecological receptors. The most important soil horizon for soil uptake by ecological receptors, including earthworms and burrowing mammals, is the 0.5 to 1 foot bgs soil interval (USEPA 2015). Thus, this depth interval is assigned the largest depth-weighted adjustment factor. The next most important soil horizon is the 0 to 0.5 feet bgs soil interval, because most earthworm communities feed on leaf litter and other surficial sources of organic matter (Curry 2004). Surface soil has the next greatest depth-weighted adjustment factor. Below 1 foot bgs, exposure is expected to decrease with increasing depth; adjustment factors mirror this trend. Vegetation observed on and near the site is primarily composed of plants with shallow root systems, like grasses and shrubs. These standard adjustment factors are also appropriate for vegetation that would be expected to occur at the site that would form the basis of an herbivore's diet.

Depth-weighted average results were considered when developing proposed CULs for metals, legacy pesticides, and dioxins/furans along with additional lines of evidence described below for each chemical. This analysis was not performed for total diesel- and oil-range petroleum hydrocarbons.

Lead and Zinc. Sampling results indicate that although there are limited areas where soil samples collected in the 0 to 2 foot bgs soil interval exceed the TEE criteria for lead and zinc (of 220 milligrams per kilogram [mg/kg] and 270 mg/kg, respectively), the depth-weighted average soil concentration in the top 3 feet of soil across the site is well below TEE criteria in WAC Table 749-2 (refer to Table 6.4). These results show that current concentrations of lead and zinc in soil are unlikely to negatively impact soil biota, plants, or wildlife and are, therefore, protective of terrestrial receptors.

The proposed site-specific TEE criterion for zinc is 470 mg/kg and is equivalent to the maximum detected zinc concentration on-site. This criterion is appropriately conservative because despite some samples with concentrations as great as 470 mg/kg, the TEE criterion for lead is not exceeded when site-wide depth-weighted average calculations are performed (refer to Table 6.4). Because current soil concentrations are protective of ecological receptors, the proposed CUL for lead is 250 mg/kg, which is equivalent to the MTCA Method A criterion protective of unrestricted land use.

Total DDX. Sampling results indicate that although there are limited areas where soil samples exceed the TEE criterion, the depth-weighted average soil concentration in the top 3 feet of soil across the site exceeds the TEE criterion by a factor of less than 1.2. Table 6.4 shows that removal of a single sample (i.e., FS-06-0-0.5, collected at FS-06 within the pesticide-impacted area designated on Figure 6.1) will bring the site-wide depth-weighted average soil concentration into compliance with the TEE criterion. This demonstrates that the limited amount of soil that exceeds the TEE criterion in WAC Table 749-2 for total DDX at the site is unlikely to negatively impact soil biota, plants, or wildlife; existing soil concentrations are generally protective of this pathway. The proposed CUL for total DDX is 13 mg/kg, which is equivalent to the concentration measured in sample FS-06-0-0.5.

Chlordane and alpha-Chlordane. Outside of the pesticide-impacted area designated on Figure 6.1, current pesticide soil concentrations are unlikely to negatively impact soil biota, plants, or wildlife and are, therefore, protective of terrestrial receptors. The proposed site-specific TEE criterion for alpha-chlordane is 9 mg/kg, which is equivalent to the maximum detected concentration within the pesticide-impacted area. A site-specific TEE criterion protective of ecological receptors was not explicitly calculated for chlordane but is expected to be equivalent to the alpha-chlordane criterion. The proposed TEE criterion of 9 mg/kg is greater than the most stringent MTCA Method B criterion protective of unrestricted land use for chlordane (2.9 mg/kg). Therefore, the proposed direct contact CUL for both chlordane and alpha-chlordane is 2.9 mg/kg.

The determination that the concentration of 9 mg/kg is protective of ecological receptors for these chemicals is based on the following lines of evidence:

- The direct contact pathway is incomplete for terrestrial receptors.
 - The basis for the WAC Table 749-2 criterion for chlordane is presumably protection of soil biota, which are the most sensitive ecological receptors (WAC Table 749-3).⁹ As previously discussed, site soil cannot support soil biota due to its low organic carbon content, rather than the presence of pesticide contamination.
 - The next most conservative TEE criterion for chlordane listed in WAC Table 749-3 (2.7 mg/kg) is protective of avian and mammalian wildlife. Soil biota or plant life must be present at the site to support avian and mammalian predation. Neither soil biota nor plant life are present at the site, and site use and soil characteristics precludes development of increased vegetation or soil biota populations in the future.
- AOPCs identified for pesticides would be expected to result in a top-down release (e.g., the culvert soil source area, AOPC 1, shown on Figure 6.1). Both alpha-chlordane and chlordane have high K_{oc} values, indicating a preference to sorb to soil (refer to Table G.2), which would be expected to result in concentrations that decrease with depth. That is, results presented in Table 6.4 represent the worst case that receptors would be exposed to because RI sampling focused on collection and analysis of shallow soil samples. Concentrations in the top 3 feet of soil are well characterized and represent the greatest concentrations expected to be present at the site.
- Sampling results indicate that although there are limited areas where alpha-chlordane results exceed the WAC Table 749-2 TEE criterion, the depth-weighted average soil concentration in the top 3 feet of soil across the site is equivalent to the WAC Table 749-2 TEE criterion (refer to Table 6.4). Removal of sample FS-06-0-0.5 reduces the site-wide depth-weighted average soil concentration for alpha-chlordane to less than the TEE criterion in Table 749-2 (1 mg/kg). Residual concentrations of

⁹ The most stringent criterion listed in WAC Table 749-3 for each chemical is protective of the most sensitive ecological receptor. Because WAC Table 749-3 does not contain criteria for alpha-chlordane, the criteria developed for chlordane were used as a surrogate in this evaluation.

alpha-chlordane in soil that exceed the WAC Table 749-2 TEE criterion in a limited number of samples are unlikely to negatively impact soil biota, plants, or wildlife.

- The greatest detected concentrations of pesticides were observed at locations FS-05, FS-06, and FS-19, within the pesticide-impacted area shown on Figure 6.1. Table 6.4 shows that if results at these locations are not considered, the site-wide depth-weighted average soil concentration for chlordane is approximately 1.1 mg/kg. This concentration exceeds the WAC Table 749-2 TEE criterion by a factor of 1.1 and is less than the criterion in WAC Table 749-3 for protection of wildlife.
- Vegetation and soil observations (e.g., limited vegetation, lack of soil biota, and soil type) at these three locations are similar to observations of soil borings and lack of vegetation in the northern portion of the site, where no contamination was observed. Thus, lack of vegetation and soil biota are attributable to factors other than presence of contamination. Representative photographs of these observations are included on Figure 6.1.

Dioxins/Furans. Current dioxin/furan soil concentrations are unlikely to negatively impact soil biota, plants, or wildlife and are, therefore, protective of terrestrial receptors. The proposed site-specific TEE criterion for dioxins/furans is 92 mg/kg, which is equivalent to the maximum detected dioxin/furan concentration. This value is greater than the most stringent MTCA Method B criterion protective of unrestricted land use; therefore, the **proposed direct contact CUL for dioxins is 13 nanograms per kilogram (ng/kg)**. The determination that the concentration of 92 mg/kg is protective of ecological receptors is based on the following lines of evidence:

- The direct contact pathway is incomplete for ecological receptors.
 - The basis for the WAC Table 749-2 criterion for dioxins/furans is presumably protection of wildlife, which are the most sensitive from among the three categories of ecological receptors listed in WAC Table 749-3.¹⁰ Soil biota or plant life must be present at the site to support avian and mammalian predation. Neither soil biota nor plant life are present at the site, and site land use and soil characteristics precludes the presence of vegetation or soil biota populations in the future.
- The only significant dioxin/furan-generating activity was constrained to a small geographic area of the site where trash and vegetation were historically burned. This area is identified as AOPC 8 (Figure 2.3). The extent of the area where dioxin/furan contamination is significantly elevated has been refined based on evaluation of site sampling data, as shown on Figure 6.2.
- Presence of dioxins/furans in soil does not inhibit plant growth. Although dioxin/furan impacts were not observed at locations FS-34 and FS-35, no vegetation or soil biota were observed in these areas. Representative soil photographs are included on Figure 6.2. Maximum dioxin/furan concentrations in these samples were measured at 0.141 and 3.38 ng/kg, respectively (Appendix E); both of these concentrations are less

¹⁰ The most stringent criterion listed in WAC Table 749-3 for each chemical is protective of the most sensitive ecological receptor.

than area background (Table 5.4). Thus, lack of vegetation and soil biota are attributable to factors other than presence of contamination.

- Contamination is constrained to surficial soil, consistent with historical trash burning operations. Among samples with elevated levels of dioxins/furans (that is, locations where one or more samples has a dioxin/furan concentration of 20 ng/kg), the average dioxin/furan concentration in surface samples (collected from 0.5 to 1 feet bgs) is greater than the average concentration in the 1 to 2 feet bgs depth interval (Table 6.4).¹¹ The depth-weighted average sitewide soil concentration for dioxins/furans is approximately 20 ng/kg. This result is believed to be biased high by the sampling schema, which prioritized collection and analysis of dioxin/furan samples in areas suspected to be contaminated by former burning operations.

Table 6.5 presents exceedance information for COPCs in soil relative to the proposed CULs for the direct contact pathway. For each COPC, this table presents relevant direct contact criteria; information about the number of soil results; the maximum detected result; whether detected results exceed direct contact criteria; and the maximum exceedance factor for each COPC. Table 6.5 compares soil data collected from 0 to 15 feet bgs to direct contact CULs to identify soil COCs for the direct contact pathway.

Based on information presented in Table 6.5, zinc and five legacy organochlorine pesticides (beta-BHC, heptachlor, DDD, DDE, and total DDX) were screened out as soil COCs for the direct contact pathway. These analytes were screened out in accordance with WAC 173-340-740(7)(e)(i-ii) and WAC 173-340-740(7)(d)(i)(a) because:

1. the maximum concentration is not greater than 2 times the preliminary CUL; and
2. less than 10% of samples exceed the preliminary CUL; and
3. the upper one-sided 95% confidence limit on the true mean soil concentration is less than the preliminary CUL.

Lead, eight pesticides (i.e., aldrin, chlordane, dieldrin, DDT, toxaphene, atrazine, alpha-chlordane, and simazine), total diesel- and oil-range TPH, and dioxins/furans were retained as soil COCs for the direct contact pathway.

6.2.1.2 Leaching

Table 6.6 presents exceedance information for the leaching pathway. As noted in this table, in addition to elimination of analytes using criteria in WAC 173-340-740(7)(e)(i-ii) and WAC 173-340-740(7)(d)(i)(a), analytes were screened out as soil COCs for the leaching pathway using empirical demonstrations of groundwater quality. Specifically, if a chemical was not retained as

¹¹ Only one sample was analyzed for dioxins/furans in the 2 to 3 feet bgs depth interval. At this location, the shallow (0 to 2 feet bgs) depth interval was not analyzed for dioxins/furans.

a groundwater COC in Table 6.1, then groundwater empirically demonstrates compliance and the leaching pathway was determined to be inactive for that chemical.

Based on the information in Table 6.6, five legacy pesticides are COCs for the leaching pathway: beta-BHC, aldrin, chlordane, dieldrin, and toxaphene.

6.2.2 Proposed Cleanup Standards

This section develops and describes proposed CULs for the site, which are developed for each soil COC identified in Section 6.2.1. For chemicals that were identified as soil COCs for more than one exposure pathway (e.g., the direct contact and leaching pathway), the proposed CUL will be protective of all potential exposures. The proposed cleanup standard is defined as the proposed CUL combined with a point of compliance where it applies.

Proposed CULs for soil COCs are identified in Table 6.7. The proposed CUL protective of the leaching pathway is referred to as the “leaching CUL.” The standard POC for the leaching pathway is 0 feet bgs to the maximum depth where contamination is present. The proposed CUL protective of the direct contact pathway is referred to as the “direct contact CUL.” The standard POC for the direct contact pathway is 0 to 15 feet bgs for protection of human health and ecological receptors. At this site, a site-specific POC of 0 to 6 feet bgs for the protection of ecological receptors via direct contact pathway is proposed.

Table 6.7
Summary of Soil Chemicals of Concern and Proposed Cleanup Levels by Pathway (mg/kg) ⁽¹⁾

Analyte	CAS No.	Direct Contact CUL	Leaching CUL
Metals			
Lead	7439-92-1	250	NA
Organochlorine Pesticides			
HCH-beta (b-BHC)	319-85-7	NA	0.0067
Aldrin	309-00-2	0.059	0.0067
Chlordane	57-74-9	2.9	1.1
Dieldrin	60-57-1	0.063	0.0067
4,4'-DDT / Sum DDT	50-29-3	2.9	NA
Toxaphene	8001-35-2	0.91	0.84
Other Chlorinated/Halogenated Pesticides			
Atrazine	1912-24-9	4.3	NA
alpha-Chlordane	5103-71-9	2.9	NA
Simazine	122-34-9	8.3	NA

Analyte	CAS No.	Direct Contact CUL	Leaching CUL
Total Petroleum Hydrocarbons			
Total diesel- and oil-range TPH	DRO+ORO	460 ⁽²⁾	NA
Dioxins/Furans			
Dioxins/furans	DF_TEQ (U=1/2)	0.000013	NA

Note:

- Proposed CULs were developed for chemicals identified as soil COCs in Tables 6.5 or 6.6. Proposed CULs are pathway specific.
- Direct contact CUL is protective of ecological receptors. For protection of human health, TPH data should be evaluated relative to the MTCA Method A criterion of 2,000 mg/kg, which applies to results for diesel- and oil-range TPH.

Abbreviations:

- CAS Chemical Abstracts Service
- HCH Hexachlorocyclohexane
- NA Not applicable

Key information about each of the soil COCs is provided in Table 6.8. Information contained in Table 6.8 includes environmental partitioning, fate, and transport information; potential on-site sources; and current and historical commercial uses. This information can be used to supplement later discussion in this section, including relative to the nature and extent of contamination contained in Section 6.4.

6.3 NATURE AND EXTENT OF CONTAMINATION: GROUNDWATER

The sections that follow describe the nature and extent of groundwater contamination, which serves to define the “Site” for each of the COCs listed in Section 6.1.

Twelve groundwater COCs (nitrate, nitrite, eight pesticides and herbicides, diesel-range TPH, and oil-range TPH) were identified based on an evaluation of data with respect to the preliminary CULs (Section 6.1.1). Results for each of these COCs are included in Table 6.9.

To facilitate the discussion of the nature and extent of contamination of groundwater COCs, Table 6.9 groups results from permanent and temporary groundwater wells according to groundwater flow direction and the geographic area where each well was installed. Groundwater well groups, from northeast to southeast, are identified as follows:

- Upgradient (MW-9, MW-15, and MW-17)
- Cross-gradient off-Property (MW-16)¹²
- Interior (MW-1, MW-3 through MW-8, MW-11, and MW-12; and temporary wells FS-22 and FS-30)

¹² MW-16 is considered cross-gradient based on the similarity of measured groundwater elevations at locations MW-4 and MW-16 during the June/July 2018 sampling events.

- Downgradient Property boundary (MW-2, MW-10, MW-13, and MW-14)
- Downgradient off-Property (MW-18 through MW-20; and temporary wells FS-37 through FS-40)

Table 6.9 includes both individual results and compliance results at each well. MTCA allows compliance with CULs to be determined using either the upper percentile or the true mean concentration for each well, depending on the toxicity basis of the proposed CUL, as long as no single sample concentration is more than 2 times the proposed CUL and no more than 10% of the measured concentrations exceed the proposed CUL (WAC 173-340-720(9)(e)(i-ii)). Thus, Table 6.9 includes a row identifying the compliance result for each well.

As noted in Table 6.2, the compliance result for each well listed in Table 6.9 is equivalent to the true mean groundwater result for analytes whose CULs are based on chronic or carcinogenic effects and is equivalent to the upper percentile result for analytes whose CULs are based on acute or short-term effects.

The compliance result for each chemical at each monitoring well is presented in Table 6.9 and is determined as follows:

1. For legacy pesticides, the compliance result is equivalent to the March 2020 groundwater result if the chemical was not detected at a particular location during RI sampling conducted between 2016 and 2018. For more information, refer to Appendix H.
2. For chemicals with a carcinogenic toxicity basis, including legacy pesticides that were detected at a well during remedial investigation sampling, the compliance result is calculated as the average among all results, including both detect and nondetect results. Only results collected on or after January 1, 2016, are included in the average.
3. For chemicals with a short-term/acute toxicity basis, the compliance result is calculated as (a) the maximum result when all results were nondetect; or (b) the maximum detected result when one or more results were detected. Only results collected on or after January 1, 2016, are considered.

6.3.1 Nitrate and Nitrite

Nitrate and nitrite were detected in groundwater at concentrations greater than their respective proposed CULs at multiple locations across the Property. Current and former fertilizer handling operations are sources of nitrate and nitrite contamination. Although fertilizer can result in nitrite or nitrate contamination, nitrate tends to be the dominant form because most nitrogenous materials (including nitrite, organic nitrogen, and ammonia) convert to nitrate once released in the environment. Nitrate, in turn, is cycled out of the environment via uptake by plants or microbial organisms. Locations where nitrate and nitrite were detected at concentrations that exceed their proposed CULs are shown in Figures 6.3 and 6.4, respectively. Nitrate and nitrite exceedances are clustered in the central portion of the Property, with the greatest detected concentrations measured at wells MW-1 and MW-6 near the office and warehouse buildings. The

greatest detected nitrate concentrations measured at locations MW-1 and MW-6 exceed the proposed CUL by a factor of 16 and 22, respectively. Similarly, the greatest nitrite concentrations measured at wells MW-1 and MW-6 (6,800 and 2,000 µg/L) had exceedance factors of 6.8 and 2.0, respectively.

Generally, nitrate exceedances are more disperse and of greater magnitude than nitrite exceedances. Nitrite exceeds the proposed CUL in groundwater at only four well locations. Each of the four wells where nitrite exceeds the proposed CUL (MW-1, MW-4, MW-6, and MW-7) are classified as interior wells in Table 6.9. By contrast, nitrate results exceed the proposed CUL at 11 monitoring well locations and two temporary wells. Nitrate exceedances decrease in magnitude with increasing distance from MW-1 and MW-6, but still exceed the proposed CUL by a factor greater than 2 at interior wells along the northern Property boundary (MW-4, MW-5, and MW-8) and at well MW-14 along the southern Property boundary. Additionally, nitrate was measured at 12,000 µg/L (exceedance factor of 1.2) at well MW-16, which is cross-gradient to the overall groundwater flow direction.

Results for both nitrate and nitrite are in compliance with the proposed CULs at three upgradient locations (MW-9, MW-15, and MW-17). These data indicate that elevated concentrations of nitrate and nitrite at the Site are associated with current and former operations at the Property. Results for both nitrate and nitrite are in compliance with the proposed CULs at three of the four Property boundary wells (MW-2, MW-10, and MW-13). Nitrate exceeds the proposed CUL at Property boundary well MW-14, but is in compliance at the three adjacent downgradient off-Property wells (MW-18, MW-19, and MW-20). These data are sufficient to bound nitrate and nitrite contamination to within the Property boundary, with the exception of the minor exceedance at MW-16, located on the BNSF property. The magnitude of the exceedance at MW-16 is low enough (exceedance factor less than 2) that active remediation would not be required in this location if groundwater concentrations at interior wells across the Site are brought into compliance, per WAC 173-340-720(9)(e).

Nitrate and Nitrite in Groundwater

Sources

Nitrate and nitrite contamination is a result of current and former fertilizer handling operations. Improved source control is necessary to reduce groundwater concentrations.

Vertical and Lateral Extent

Nitrate and nitrite concentrations are greatest in wells in the central portion of the Property (Figures 6.3 and 6.4). Contamination is confined to the Property boundary, with the exception of a minor nitrate exceedance of the CUL measured on the BNSF property at location MW-16. Concentrations in other upgradient and downgradient wells are less than their CULs (Table 6.9).

Contamination is limited to 15 feet bgs throughout most of the Property. Deeper groundwater contamination may be present near the southwest corner of the Property but does not cause contamination at concentrations of concern in downgradient wells.

Groundwater samples were collected and analyzed for nitrate and nitrite at various depths at six temporary wells (refer to Section 4.3.3). Nitrate results exceeded the proposed CUL at two locations (FS-22 and FS-30). Nitrite results exceeded the proposed CUL only at FS-30. FS-22 is located near MW-4 in the northeastern portion of the Property; FS-30 is located upgradient of MW-14 in the southwestern portion of the Property. At location FS-22, groundwater concentrations were greatest in shallow groundwater. Concentrations in the deeper sample (screened between 9 to 11 feet bgs) were less than half of the concentrations in the shallow sample (screened between 4 to 6 feet bgs). At location FS-30, the opposite was true: concentrations in the deeper sample (screened between 13 to 15 feet bgs) were approximately 2 times greater than the concentrations in the shallow sample (screened between 5 to 7 feet bgs). These results indicate that the nitrate source in the southwestern portion of the Property is potentially older than the nitrate source elsewhere on the Property, because nitrate concentrations would otherwise be expected to decrease with increasing depth. In agricultural areas in Washington, nitrate concentrations in groundwater are related to land use and groundwater recharge: nitrate concentrations typically decrease with increasing depth as a result of increased mixing and transformation processes (DOI 1995).

Results from FS-30 also indicate that in the southwest area of the site, nitrate may be present at levels of concern in groundwater deeper than 15 feet bgs.

Variability in seasonal data was also evaluated. Presuming that current fertilizer handling operations contribute to a portion of the nitrate and nitrite contamination, concentrations are expected to vary seasonally. Box and whisker plots showing data distribution for nitrate, nitrite, and ammonia data are presented in Figure 6.5 to support the discussion of seasonal variability. Figure 6.5 includes charts showing ammonia, nitrate, and nitrite data at MW-1 and MW-6, the nitrate/nitrite source area wells, which are also locations where ammonia data have been collected. Data are normalized relative to nitrate and nitrite CULs. Nitrate concentrations in groundwater at the site do not exhibit a seasonal trend: of the four greatest detected results, two were measured during the dry season¹³ (in May and August of 2017 at well MW-6) and two were measured during the wet season (in November 2017 at wells MW-1 and MW-6). The median groundwater concentration does not vary¹⁴ significantly by season. The median¹⁴ nitrate dry season concentration is 21,000 µg/L, and the median wet season concentration is 23,000 µg/L. By contrast, the median ammonia concentration is slightly greater during the dry season than during the wet season. Conversion of nitrogenous material present in ammonia to nitrate during the late summer and early fall could explain the increasing nitrate and decreasing ammonia results observed between August and November 2016 at MW-6; however, this trend is not observed in MW-1. This variability could be related to McGregor operations on the Property, if nitrogen-based and ammonia-based fertilizers are predominantly handled in different areas of the Property. Without more information from McGregor regarding specific products handled and the nature and location of materials handling operations, it is difficult to

¹³ The dry season is defined as April through September, to correspond with regional agricultural seasons.

¹⁴ The median concentration during each season is equivalent to the middle line of the box and whiskers plot shown in Figure 6.5.

draw conclusions about seasonal trends in nitrate, nitrite, and ammonia concentrations in the subsurface and whether McGregor operations contribute to the variability.

Similarly, nitrite concentrations in groundwater also do not exhibit a clear seasonal trend. Of the four greatest detected results, three were measured during the dry season (in August 2016 and 2017 at well MW-1 and in May 2017 at MW-6). These data appear to be outliers, because the median groundwater concentration is greater during the wet season than during the dry season. Variability in measured nitrite concentrations likely reflects the variability associated with the rate of conversion of ammonium ions to nitrite and nitrate as part of the nitrification associated with the nitrogen cycle. Nitrification occurs quickly in warm weather and more slowly during cold weather and in wet soil. This would be expected to result in peak nitrite concentrations of greater magnitude and shorter duration in the summer and relatively lower concentrations of nitrate that are more stable in the environment during winter months.

6.3.2 Pesticides and Herbicides

Eight pesticides and herbicides (beta-BHC, aldrin, chlordane, dieldrin, toxaphene, 2,4-D, MCPA, and atrazine) were identified as groundwater COCs. Generally, these pesticide and herbicide COCs can be described as either legacy pesticides or active-use pesticides and herbicides. For purposes of discussion throughout this section, beta-BHC, aldrin, chlordane, dieldrin, and toxaphene are considered legacy pesticides; 2,4-D, MCPA, and atrazine are considered active use pesticides.

All eight of the pesticide and herbicide COCs exceed their proposed CULs at well MW-4, which has the greatest detected pesticide concentrations at the site. The remainder of the discussion of the nature and extent of pesticide and herbicide contamination will group discussion of legacy pesticide contamination separate from active-use pesticides and herbicides.

6.3.2.1 Legacy Pesticides

Five legacy pesticides (beta-BHC, aldrin, chlordane, dieldrin, and toxaphene) are COCs for the Site. These pesticides are considered legacy pesticides because their use has been banned by the USEPA (e.g., chlordane and toxaphene in 1983; dieldrin for all uses in 1987).¹⁵ However, these pesticides are stable in the environment and do not break down easily. Partitioning data for each analyte (i.e., K_{oc} values presented in Table 6.3) indicate that these legacy pesticides can range between moderately mobile to immobile in groundwater; thus, impacted groundwater is expected to remain present near the source of release. Of the five legacy pesticides, toxaphene is the least mobile in groundwater (highest range of K_{oc} values) and aldrin is the most mobile (lowest K_{oc} value).

Despite their differences in mobility, dieldrin and toxaphene have the most widespread detected exceedances, as shown on Figures 6.6 and 6.7, respectively. Groundwater results for other legacy

¹⁵ Dieldrin was banned for all uses except termite control in 1974.

pesticides are shown on Figure 6.8; results for these pesticides exceed their proposed CULs only at locations MW-4 and MW-6.

As previously noted, all three legacy pesticides exceed their proposed CULs at well MW-4. MW-4 is considered a significant source area for the Site: measured concentrations of all legacy pesticides are greatest at MW-4. The ground surface slopes toward MW-4, which is a localized depression that collects surface runoff (Photograph 12, Appendix B). Reported historical operations in the vicinity of MW-4 include pesticide storage and filling; thus, contamination may be attributed to former pesticide handling operations in this area. At MW-1, dieldrin and toxaphene exceed their proposed CULs.

At MW-4, the dieldrin compliance result (0.88 µg/L) exceeds the proposed CUL by a factor of 160. Although concentrations drop sharply with distance from MW-4, the compliance results at MW-16 (0.076 µg/L) also exceeds the proposed CUL by a factor of 14. This trend is also observed for toxaphene in these wells: the compliance result in MW-4 (14 µg/L) is significantly greater than the MW-16 compliance result (1.2 µg/L). MW-16 is upgradient/cross-gradient of MW-4. This pattern of contamination represents a halo effect caused by diffusion of contamination from the source at MW-4, rather than migration of the source in the direction of groundwater flow.

A secondary source of pesticide contamination appears to be present at well MW-6, where dieldrin, toxaphene and beta-BHC exceed their proposed CULs at concentrations that are greater than at wells MW-1 and MW-7. MW-6 is directly north of the AST area where pesticides were historically handled while filling trucks and ASTs. With the exception of dieldrin, legacy pesticides were not detected in groundwater at concentrations exceeding their proposed CULs at any other wells in recent (post-2016) groundwater monitoring events. The downgradient extent of beta-BHC, chlordane, and toxaphene contamination is bounded laterally by MW-2, MW-10, and MW-12, which are downgradient of locations MW-1 and MW-6 (where one or more of these pesticides exceed the proposed CULs). Aldrin contamination is constrained to a smaller footprint immediately surrounding MW-4.

Legacy Pesticides in Groundwater

Sources

Legacy pesticide contamination is a result of former pesticide handling operations.

Vertical and Lateral Extent

Five legacy pesticides (beta-BHC, aldrin, chlordane, dieldrin, and toxaphene) are present at concentrations of concern in groundwater. Legacy pesticide contamination is bounded to the central portion of the Property. Legacy pesticides were detected most frequently in three wells (MW-1, MW-4, and MW-6), with the greatest concentrations measured in MW-4.

Dieldrin and toxaphene exceedances are widespread in groundwater. Contamination is bounded along the southwest property line by results at MW-2, MW-18, MW-19, and MW-20.

Only shallow groundwater (i.e., groundwater less than 15 feet bgs) is impacted.

Dieldrin contamination extends across the site to the southwest corner of the Property at MW-14. Contamination along the west and southwestern Property boundary is bounded by wells MW-10 and MW-2 (western boundary) and MW-18, MW-19, and MW-20 (southwestern boundary). Results at these wells are in compliance with the proposed CUL.

Concentrations of legacy pesticides are generally stable or decreasing in source area wells. Time series charts showing aldrin, dieldrin, chlordane, beta-BHC, and toxaphene results and trends in recent (post-2016) data at locations MW-1, MW-4, and MW-6 are included in Figures 6.9a through 6.9e. Because chlordane and dieldrin were detected relatively frequently in recent events, Figures 6.9b and 6.9c for chlordane and dieldrin also include box and whiskers plots showing the distribution of detected concentrations during the wet and dry seasons.

As shown on Figures 6.9b and 6.9c, both chlordane and dieldrin exhibit a slight seasonal trend, with the greatest detected results typically being measured during the dry season. Because these pesticides are no longer in active use and are not used, handled, or stored at the Property, this trend can be explained by dilution; increased precipitation (rainfall and snowmelt) is potentially diluting pesticide concentrations measured in groundwater during the wet season. Although the greatest detected toxaphene concentration was measured during the dry season, the majority of toxaphene detections have occurred during sampling events conducted in the wet season. This indicates that fluctuations in the water table may impact measured toxaphene concentrations in groundwater, possibly as a result of an increase in particulate-bound toxaphene present in shallow soil being drawn into the groundwater sample. Toxaphene is less mobile and, therefore, mostly bound in surface soils.

Groundwater samples were collected at various depths and analyzed for legacy pesticides at six temporary wells. Dieldrin was the only legacy pesticide detected at any temporary well; the only location where dieldrin was detected was FS-22. FS-22 is located near MW-4. Dieldrin concentrations in the shallow (4 to 6 feet bgs) depth sample from FS-22 were almost 5 times greater than those measured in the deeper (9 to 11 feet bgs) depth sample at this location. These data indicate that pesticide concentrations decrease rapidly with depth, supporting the conclusion that existing groundwater wells are sufficient to bound the depth of groundwater contamination at the site for legacy pesticides.

6.3.2.2 Active-Use Pesticides and Herbicides

Active-use pesticides and herbicides were detected more frequently in groundwater than legacy pesticides. However, most active-use pesticides and herbicides are formulated to be less toxic and less persistent than legacy pesticides (refer to Table 6.3). Three active-use pesticides and herbicides (atrazine, 2,4-D, and MCPA) were detected at sufficient frequency and concentration to become COCs. Although these three analytes are referred to as active-use pesticides and herbicides, they have been in commerce for decades. Therefore, there may be overlap between current use of these pesticides and herbicides at the Property.

Atrazine

Of the three active-use pesticide and herbicide soil COCs, atrazine was detected at concentrations exceeding its proposed CUL most frequently, with 13% of results site-wide exceeding the proposed CUL (Table 6.1). Individual atrazine results exceed the proposed CUL at five well locations (MW-1, MW-4, MW-6, MW-7, and MW-12), as shown in Figure 6.10. However, the compliance results based on average atrazine results exceed the proposed CUL at only two of these wells (MW-4 and MW-6). The maximum detected concentrations of atrazine were measured at well MW-4. Results measured at well MW-4 range from 1.9 to 33 µg/L, with an average detected concentration of 14 µg/L. At this location, both the compliance result and the maximum detected result exceed the proposed CUL by a factor greater than 2. The only other well where individual atrazine results exceed the proposed CUL by a factor greater than 2 is MW-6, which had a maximum detected concentration of 7.9 µg/L. Contamination at MW-4 is suspected to be a result of historical pesticide and herbicide handling operations in the vicinity of the historical loading dock at the north end of the office, and contamination at MW-6 may have been caused by either current or historical operations (e.g., tanker truck and AST filling, as previously described with respect to legacy pesticides).

Groundwater samples were collected and analyzed for atrazine at six temporary wells. Atrazine was detected only in temporary wells FS-22 and FS-30 located on the Property. Atrazine concentrations in the temporary wells decrease with depth; measured concentrations in the shallow intervals of FS-22 and FS-30 are significantly greater than concentrations measured in deeper samples. At FS-22, measured concentrations drop from 1.6 µg/L in the shallow interval to 0.44 µg/L in the deeper interval; at FS-30, concentrations drop from 16 µg/L to 1.8 µg/L. Concentrations measured in deep samples at FS-22 and FS-30 (screened at depths from 9 to 11 feet bgs and from 13 to 15 feet bgs, respectively) both meet the proposed CUL. Existing groundwater data at wells throughout the Property are sufficient to bound the vertical extent of atrazine contamination at the site. Only shallow groundwater (i.e., groundwater less than 15 feet bgs) is impacted by atrazine at concentrations of concern.

Active-Use Pesticides and Herbicides in Groundwater

Sources

Active-use pesticide and herbicide contamination is a result of current (and possibly former) pesticide handling operations. Improved source control is expected to reduce groundwater concentrations.

Vertical and Lateral Extent

Active-use pesticide and herbicide contamination is bounded to the central portion of the Property. Atrazine was detected at concentrations exceeding its CUL in only three locations (MW-1, MW-4, and MW-6); MCPA was detected at concentrations exceeding its CUL only at two locations (MW-4 and MW-6); and 2,4-D was detected at concentrations exceeding its CUL only at MW-4.

Only shallow groundwater (i.e., groundwater less than 15 feet bgs) is impacted.

Atrazine results are in compliance with the proposed CUL at location MW-14; however, because atrazine results exceed the SL, downgradient off-Property wells were installed and analyzed for atrazine at locations MW-18, MW-19, and MW-20. Atrazine was not detected at any of these locations. Average atrazine results are in compliance with the proposed CUL at all of the Property boundary wells. These data are sufficient to bound the lateral extent of atrazine contamination at the Site to interior wells MW-4 and MW-6. Charts presented in Figure 6.11 show trends in groundwater data at wells where atrazine was detected at concentrations exceeding the proposed CUL. At each of these wells, atrazine results show a decreasing trend.

Because atrazine degrades once released to the environment, desethyl atrazine, a common atrazine degradant, was analyzed for at select wells (MW-4, MW-6, MW-12, and MW-14). These wells were selected either because they are source area wells (i.e., wells with the greatest measured concentrations of atrazine) or because they are immediately downgradient of source area wells. As such, these wells were expected to have the greatest concentrations of desethyl atrazine. Samples were collected and analyzed for desethyl atrazine to evaluate whether degradation of atrazine would contribute to human health effects that would otherwise not be accounted for. Desethyl atrazine was nondetect at a reporting limit of 0.06 µg/L in all samples (refer to Appendix E).

Figure 6.11 also includes seasonality information for detected atrazine results. Although the median concentrations during the wet and dry seasons are similar, the greatest detected results were measured in November 2016 and 2017 at location MW-4. These results likely represent a “first flush,” whereby heavy rains in the beginning of the wet season wash atrazine on the ground surface into groundwater. Improved source control to reduce spills/leaks of pesticide products containing atrazine, or improved housekeeping practices to clean up spills/leaks of these products, would be expected to reduce atrazine concentrations in groundwater.

2-Methyl-4-chlorophenoxyacetic Acid and 2,4-Dichlorophenoxyacetic Acid

MCPA and 2,4-D have a low magnitude of exceedances site-wide (3% of results or less exceed their proposed CULs; refer to Table 6.1). As shown on Figure 6.12, the greatest detected concentrations of these two pesticides were measured at MW-4. If MW-4 were brought into compliance with the proposed CUL, both chemicals would be screened out as COCs in groundwater because no other results were measured at concentrations greater than 2 times the proposed CUL in any other well.

MCPA was identified as a groundwater COC on the basis of four detected results that exceed the proposed CUL of 8.0 µg/L (Table 6.9). The maximum result was measured at well MW-4, with a detected concentration of 88 µg/L (exceedance factor of 11). As shown in Table 6.9, two other results of 24 and 28 µg/L collected at MW-4 exceed the proposed CUL; each of these results exceeds the proposed CUL by a factor greater than 2. The only other sample with a measured concentration exceeding the proposed CUL was collected at monitoring well MW-6, with a detected concentration of 8.1 µg/L. This result barely exceeds the proposed CUL of 8 µg/L.

2,4-D was retained as a groundwater COC because the maximum result is more than 2 times the proposed CUL. The maximum detected result collected from well MW-4 (260 µg/L) exceeds the proposed CUL by a factor of 3.7 (Table 6.9). Among recent results (collected on or after January 1, 2016) only one sample exceeds the proposed CUL, with a maximum detected result of 210 µg/L (exceedance factor of 3). The average result is in compliance with the proposed CUL at MW-4 and at all other groundwater monitoring locations.

Groundwater samples were collected and analyzed for MCPA and 2,4-D at six temporary wells. MCPA was not detected in any temporary well sample. 2,4-D was detected in samples collected at locations FS-22 and FS-30, but at concentrations more than an order of magnitude less than the proposed CUL. At FS-22, which is proximate to MW-4, concentrations decrease with depth, from 0.15 µg/L in shallow groundwater to nondetect at a reporting limit of 0.08 µg/L in deeper samples. These data indicate that MCPA and 2,4-D contamination is present only in shallow groundwater in the immediate vicinity of MW-4.

6.3.3 Total Petroleum Hydrocarbons

Diesel and oil-range TPH were identified as groundwater COCs on the basis of a limited number of detected results that exceed the proposed CUL of 500 µg/L (Table 6.1). Historically, petroleum fuel (including both diesel- and oil-range TPH) and agricultural products may have flowed toward the low spot surrounding MW-4 during general handling and filling activities in the area. Although less than 2% of oil-range TPH samples exceed the proposed CUL (refer to Table 6.1), the maximum result was detected at a concentration of 1,100 µg/L (exceedance factor of 2.2). As shown on Figure 6.13, oil-range TPH results are in compliance with the proposed CUL at all other wells. All samples collected from temporary wells at locations FS-22 and FS-30 also had oil-range TPH concentrations in compliance with the proposed CUL. These data are sufficient to bound the extent of oil-range TPH contamination both vertically and horizontally to a limited area surrounding MW-4.

Diesel-range TPH results also exceed the proposed CUL at MW-4. The maximum detected result at this location (1,000 µg/L) exceeds the CUL by a factor of 2.0 and was measured in 2014. In samples collected on or after January 1, 2016, the maximum detected result is 750 µg/L (exceedance factor of 1.5). The only other location where groundwater monitoring results exceed the proposed CUL is MW-6. At this location, the maximum diesel-range TPH results is 810 µg/L (exceedance factor of 1.6). Although no individual result or compliance result exceeds the proposed CUL by a factor greater than 2.0, diesel-range TPH was retained as a COC because the 95th percentile result for the dataset as a whole exceeds the proposed CUL.

TPH in Groundwater

Sources

TPH contamination is a result of former fueling, filling, and fuel handling operations.

Vertical and Lateral Extent

TPH concentrations are greatest in MW-4. Diesel-range TPH also exceeds in well MW-6. Concentrations in all other wells are less than their CULs.

Only shallow groundwater (i.e., groundwater less than 15 feet bgs) is impacted.

TPH impacts in groundwater at the site are limited to shallow groundwater (i.e., groundwater less than 15 feet bgs).

Diesel-range and oil-range TPH concentrations in groundwater at the site are less than the SLs recommended in Ecology's Implementation Memorandum No. 14 (Ecology 2016b). Therefore, there is no vapor risk from contaminated groundwater and no further groundwater delineation relative to VI SLs is needed.

6.4 NATURE AND EXTENT OF CONTAMINATION: SOIL

Eleven chemicals were identified as soil COCs based on evaluation of data with respect to the proposed CULs (Section 6.2.1). Soil COCs include lead; six legacy pesticides (aldrin, dieldrin, chlordane, alpha-chlordane, beta-BHC, and toxaphene); two active-use pesticides (atrazine and simazine); total diesel- and oil-range TPH; and dioxins. Results for each of these COCs are included in Table 6.10.

The AOC associated with each soil location is listed in Table 6.10. AOCs are refined from the AOPCs presented in Section 4.0 based on the nature and extent of soil contamination described in the text that follows.

Pesticide contamination is described in Section 6.4.1 (legacy pesticides) and Section 6.4.2 (active-use pesticides); TPH contamination is described in Section 6.4.3; and dioxin/furan contamination is described in Section 6.4.4. Lead exceeds the proposed CUL by a factor greater than 2 times the CUL at only one location (SB-11). It is retained as a COC but is not further described in this section.

Six AOCs were developed based on evaluation of site data in this chapter. AOCs are shown on Figure 6.14 through Figure 6.22 as relevant for particular chemicals. AOCs are briefly described as follows:

- AOC 1: Culvert Source Area
- AOC 2: Rail Spur Loading Area
- AOC 3: Trash Burning Area
- AOC 4: Downgradient Low Spot
- AOC 5: Office and Storage Area
- AOC 6: Machine Shop

6.4.1 Legacy Pesticides

Pesticide data were collected throughout the Property. Four legacy pesticides (aldrin, dieldrin, chlordane, and toxaphene) exceed CULs for the leaching and direct contact pathways; beta-BHC exceeds its proposed CUL for the leaching pathway. Additionally, total DDT and alpha-chlordane exceed their proposed CULs for the direct contact pathway.

Among the seven legacy pesticide COCs, dieldrin and toxaphene are the most widespread contaminants at the site. The nature and extent of these chemicals in soil will be discussed first to develop pesticide AOCs, followed by the nature and extent of contamination for the remaining chemicals, which are generally found within the boundaries of areas where dieldrin and toxaphene contamination is present.

Throughout the discussion in the sections that follow, soil data will be evaluated with respect to proposed CULs to determine whether contamination is bounded. Consistent with WAC 173-340-740(7)(e)(i), soil contamination may be considered bounded for a particular chemical if the measured result in a sample is within 2 times the proposed CUL (that is, the exceedance factor is less than or equal to 2).

6.4.1.1 Dieldrin

Dieldrin exceeds its proposed CUL more frequently than aldrin, chlordane, or toxaphene. This observation is related to dieldrin's greater mobility, as evidenced by its K_{oc} value, which is less than K_{oc} values for either chlordane or toxaphene (refer to Table 6.8).

The nature and extent of dieldrin contamination was evaluated with respect to CULs developed for the leaching and direct contact pathways. The leaching CUL for dieldrin is approximately 10 times less than the direct contact CUL. The leaching CUL is 0.0067 mg/kg, whereas the direct contact CUL is 0.063 mg/kg. Dieldrin is present at concentrations exceeding the leaching CUL in six distinct AOCs on-site, which are shown on Figure 6.14 as AOCs 1 through 6. Figure 6.14 also shows locations where dieldrin was detected at concentrations exceeding the proposed CUL in groundwater to support identification of areas where soil represents a leaching concern to groundwater. Figure 6.15 shows the nature and extent of dieldrin contamination relative to the direct contact CUL.

The greatest detected concentrations of dieldrin in soil were measured within AOC 1 and AOC 2 (Table 6.10). At most locations, dieldrin concentrations are greatest in the uppermost samples

Legacy Pesticides in Soil

Sources

Legacy pesticide contamination is a result of former pesticide handling operations.

Vertical and Lateral Extent

Five legacy pesticides (dieldrin, aldrin, toxaphene, chlordane, and beta-BHC) may be a source to groundwater. The primary areas where leaching is of concern are in the vicinity of MW-4; in the vicinity of former loading and unloading areas near the Rail Spur and office building; and in an area that experiences seasonal ponding near the southwestern Property boundary. Groundwater data along the Property line and in downgradient wells confirm that current legacy pesticide concentrations in soil are protective of off-Property groundwater. Legacy pesticides also exceed direct contact CULs in these areas.

Legacy pesticides also exceed direct contact criteria in isolated areas elsewhere within the Property boundary, including in the southwest corner of the Property and in isolated samples near the Machine Shop.

Throughout the Site, legacy pesticide contamination is generally limited to the top 6 feet of soil.

analyzed, and concentrations decrease significantly with depth. Relative to the direct contact pathway, dieldrin contamination is generally limited to the top 4 feet of soil, as shown on Figure 6.15. However, dieldrin exceeds the direct contact CUL by a factor greater than 2 at depths of 6 or more feet bgs in a limited number of samples within three AOCs: AOC 1, AOC 2, and AOC 5.

Outside of the six AOCs, dieldrin exceedances are low level (less than 2 times the leaching CUL) and spatially isolated. The only location outside of a named AOC where dieldrin exceeds at a concentration greater than 2 times the leaching CUL is Surface-1. Contamination at this location does not need to be remediated based on the following lines of evidence. The location between the southwestern Property boundary and this sample (FS-34) meets the CUL, indicating that (a) this is a localized area of contamination and (b) any contamination between the Property boundary and Surface-1 would be low level and possibly related to off-site activities, a ground surface depression, or the culvert daylighting here. As such, groundwater impacts are not expected. Relative to the direct contact CUL, contamination at Surface-1 is appropriately bounded (exceedance factor of less than 2).

Dieldrin contamination within each of the six AOCs is described below.

AOC 1. The leaching pathway is complete in AOC 1. Within AOC 1 on-Property, dieldrin exceeds the leaching CUL in surface (0 to 1 foot bgs) samples collected from locations FS-05 and FS-06 at concentrations up to 46 mg/kg. FS-05 and FS-06 are located approximately 10 feet from MW-4. Dieldrin contamination is present in groundwater at MW-4, indicating that soil contamination within this AOC is a likely source to groundwater. Dieldrin contamination in AOC 1 extends west as far as FS-18, which is approximately 10 feet from MW-3. The southern extent of AOC 1 is delineated by the nondetect samples at FS-08, which is approximately 20 feet south of FS-22 and 20 feet north of MW-7. Dieldrin was detected at concentrations exceeding the groundwater proposed CUL all three of the aforementioned groundwater sampling locations, which are downgradient of the MW-4 source area.

Dieldrin in groundwater was also measured at concentrations that exceed the proposed CUL off-Property in AOC 1. Collocated soil results in MW-16 exceed the leaching CUL. Contaminated soil at MW-16 is limited to the surface interval (0.5 to 1 foot bgs) and is present at relatively low concentrations compared to adjacent on-Property locations proximate to MW-4 (i.e., FS-05, FS-06, and Culvert). This provides further support that the primary mechanism for groundwater contamination at MW-16 is diffusion, as concluded in Section 6.3.2.1, rather than contaminated soil.

Concentrations in samples collected from FS-05 and FS-06 decrease with depth as shown in Table 6.10: dieldrin concentrations in the 2 to 3 feet bgs samples show a decrease of more than 30-fold from concentrations in the 0.5 to 1 foot bgs samples. Despite the decrease in concentration, dieldrin contamination is not bounded vertically at locations FS-05 or FS-06. The deepest samples analyzed at these locations (from depths of 5 to 6 feet bgs) exceed the leaching and direct contact CULs by a factor greater than 2. Additional samples will be required during remedy design to bound the depth of contamination in this AOC relative to both the direct contact and leaching CULs. The vertical depth of contamination at other locations within AOC 1

is bounded to a depth of 4 feet bgs relative to the direct contact pathway. Relative to the leaching pathway, contamination is expected to extend to depths of 6 to 7 feet bgs throughout much of the AOC.

AOC 2. The leaching pathway is complete in AOC 2. AOC 2 is an area along the southeastern Property boundary near the Rail Spur. Within this AOC, at location FS-27, dieldrin concentrations are greatest in the 3 to 4 feet bgs depth interval and decline in the samples collected in the 4 to 6 feet bgs depth interval. A similar pattern is observed at location FS-28, where dieldrin concentrations in surface soil (0.23 mg/kg at 0.5 to 1 foot bgs) are approximately equivalent to concentrations measured in the 3 to 4 feet bgs depth interval (0.21 mg/kg). Coal fragments are present at an approximate depth of 1.5 feet bgs in boring logs from this area (refer to Appendix D), indicating that the ground surface of the Property was regraded from its historical elevation in the vicinity of FS-27 and FS-28. Elsewhere with AOC 2, contamination is limited to the top 4 feet of soil.

Based on the magnitude of exceedance at FS-27, this location represents the dieldrin saturated soil source area within AOC 2. Dieldrin contamination extends from FS-27 in the direction of groundwater flow. Soil concentrations are expected to be in compliance with the proposed CUL underneath the footprint of the bulk fertilizer building to the southwest of FS-28 and FS-42 based on dieldrin's limited soil mobility.

AOC 3. The leaching pathway is not active in AOC 3. Groundwater in this area (measured at MW-13) is in compliance with the proposed CUL, providing empirical demonstration that dieldrin contamination in shallow soil is not impacting groundwater at levels of concern. Soil samples off-Property to the southeast (FS-34) meet the more stringent leaching CUL and are sufficient to bound contamination along the eastern/southern Property boundary extent. Within AOC 3, dieldrin contamination in shallow soil at locations FS-32 and MW-13 must be addressed relative to the direct contact pathway.

The greatest concentrations of dieldrin in soil were measured at location FS-32. Surface soil (0.5 to 1 foot bgs) had a concentration of 1.6 mg/kg. FS-32 also has the deepest impacts within this AOC: dieldrin exceeds the direct contact CUL at depths of 4 to 5 feet bgs, with a measured concentration of 0.098 mg/kg. Relative to the direct contact pathway, the 4 to 5 feet bgs sample is sufficient to vertically bound contamination: soil in this interval exceeds the direct contact CUL by a factor of less than 2, indicating that dieldrin is unlikely to exceed the direct contact CUL in the 5 to 6 feet bgs sample.

AOC 4. The leaching pathway is complete in AOC 4. Along the western Property boundary, dieldrin was detected at concentrations exceeding the leaching and direct contact CULs at five locations: FS-12, FS-15, FS-29, FS-30, and FS-31. These sample locations are within a localized depression where ponding is frequently observed during wet weather.

Soil contamination is vertically bounded at depths of 3 to 4 feet bgs throughout this AOC. Residual contamination is present at depths of 4 to 5 feet bgs at FS-31. At this location, results exceed the leaching pathway CUL by a factor of less than two. Groundwater wells along the western Property

line and downgradient of the Property boundary (e.g., MW-2, MW-18, MW-19, and MW-20) are sufficient to empirically demonstrate that groundwater contamination does not extend off-site, and soil contamination is bounded to within the Property.

AOC 5. The leaching pathway is complete in AOC 5. Paired results from well MW-1 and nearby soil boring FS-23 indicate that saturated soil underneath the Office and Storage Building may contribute to groundwater contamination at levels of concern. With the exception of FS-23, limited soil data within the building footprint are available in the vicinity of MW-1 and MW-6. However, upgradient soil samples at borings FS-08 and downgradient groundwater samples at MW-10 and MW-2 limit the extent of the area where leaching may be of concern to the area represented by AOC 5 on Figure 6.14. Dieldrin contamination within this AOC exceeds the direct contact and leaching CUL at depths of 5 to 6 feet bgs within AOC 5 (Figure 6.15). Contamination is not vertically bounded at location FS-23, because samples collected in deeper soil intervals were not analyzed for pesticides (Table 6.10).

AOC 6. The leaching pathway is not active in AOC 6. Surface soil (0.5 to 1 foot bgs) samples at two locations near the machine shop (FS-03 and FS-17) exceed dieldrin direct contact CULs. Groundwater wells along the western Property line (e.g., MW-10) are sufficient to empirically demonstrate that groundwater contamination does not extend off-site, and soil contamination is bounded to within the Property. Dieldrin concentrations in the surface sample at FS-21 exceed the direct contact CUL by a factor of less than 2. This result is sufficient to bound the lateral extent of contamination to the southeast; the northern extent of contamination is bounded by FS-04.

Dieldrin was nondetect in the samples from 2.5 to 3.5 feet bgs at locations FS-21, FS-03, and FS-17. These data vertically bound the extent of contamination in this AOC to a depth of 2.5 feet bgs.

6.4.1.2 Aldrin

Once present in the environment, aldrin is converted to dieldrin. This chemical property contributes to the infrequent aldrin detections at the Site and explains why aldrin contamination is present in the same areas as dieldrin. Aldrin exceeds its leaching CUL in AOC 1, AOC 2, AOC 4, and AOC 5 as shown on Figure 6.16. Relative to the direct contact pathway, aldrin exceeds the direct contact CUL only in AOC 1, as shown on Figure 6.17.

The nature and extent of aldrin contamination is described below for each AOC.

AOC 1. The leaching pathway is complete in AOC 1. Sitewide, the greatest detected concentrations of aldrin were measured in surface soil within AOC 1 at locations FS-05 and FS-06. These locations are in close proximity to MW-4, the only location on-site where detected aldrin concentrations exceed the groundwater proposed CUL.

In soil, aldrin exceeds the leaching CUL as far west as FS-19; however, concentrations at FS-19 are on the same order of magnitude as the leaching CUL of 0.0067 mg/kg with a maximum detected concentration of 0.013 mg/kg (exceedance factor of 1.9) and are not expected to

contribute to groundwater exceedances. Indeed, groundwater at location MW-3, less than 20 feet downgradient of FS-19, is in compliance with the proposed CUL. Therefore, FS-19 is used to bound the western extent of aldrin contamination. Results at locations FS-20, Culvert, FS-07, and FS-22 bound the extent of contamination to the north, east, and south.

Within AOC 1, aldrin concentrations decline with increased depth. Aldrin concentrations in the sample collected from 2 to 3 feet bgs at location FS-06 decrease more than 70-fold from 20 mg/kg in the 0.5 to 1 foot bgs sample to 0.24 mg/kg in the 2 to 3 feet bgs sample. The maximum depth of contamination in AOC 1 is expected to be approximately 7 feet bgs based on the sample result in the 5 to 6 feet bgs sample interval at FS-05 and the observed rate of decline in concentration with depth at other sampling locations. The depth of contamination will be further refined during remedy design.

AOC 2. The leaching pathway is not active in AOC 2. Data collected from nearby groundwater well MW-11 provide an empirical demonstration that groundwater is not impacted by aldrin soil contamination within this AOC.

Aldrin was not detected at concentrations exceeding the direct contact CUL within AOC 2. Aldrin exceeds the leaching CUL at three locations within this AOC (FS-27, FS-28, and FS-25; Table 6.10). At FS-25, contamination is limited to the surface soil interval (0.5 to 1 feet bgs) and is present at low concentrations (exceedance factor less than 2). The maximum depth of contamination greater than the leaching CUL within this AOC is 4 feet bgs at location FS-28.

AOC 4. The leaching pathway is not active in AOC 4. Aldrin is in compliance with its proposed groundwater CUL in groundwater wells within AOC 4 (MW-12) and along the western Property line and downgradient of the Property boundary (MW-2, MW-14, MW-18, MW-19, and MW-20). These results are sufficient to empirically demonstrate that soil results that exceed the leaching CUL for aldrin do not impact groundwater.

Aldrin was not detected at concentrations exceeding the direct contact CUL within AOC 4. Aldrin exceeds the leaching CUL at one location within this AOC (FS-29), at relatively low concentrations (0.012 mg/kg; exceedance factor less than 2) in the surface soil interval (0.5 to 1 foot bgs).

AOC 5. The leaching pathway is not active in AOC 5. Nearby groundwater wells MW-1 and MW-6 are sufficient to empirically demonstrate that groundwater is not impacted by soil contamination within this AOC.

Aldrin was not detected at concentrations exceeding the direct contact CUL within AOC 5. Aldrin exceeds the leaching CUL at one location within this AOC (FS-23) in the surface soil interval (0.5 to 1 foot bgs).

6.4.1.3 Toxaphene

Toxaphene exceeds its proposed CULs in the same geographic areas as dieldrin soil exceedances, but the vertical and lateral extent of contamination are typically more constrained as a result of toxaphene's more limited mobility in soil (higher K_{oc} values).

Soil and groundwater data are shown on Figure 6.18 relative to the leaching CUL and proposed groundwater CUL, respectively, to support identification of areas where soil may represent a leaching concern to groundwater. Soil data are shown on Figure 6.19 relative to the direct contact CUL. Toxaphene exceeds the leaching CUL at depths greater than 4 feet bgs only at two locations: at FS-22 in AOC 1 and at FS-27 in AOC 2. At all other locations, toxaphene contamination is vertically bounded at depths of 4 feet bgs or less.

Toxaphene contamination in AOC 6 is low-level (i.e., exceeds the proposed CUL by a factor less than 2) and does not require active remediation. The nature and extent of toxaphene contamination in the remaining AOCs where toxaphene exceeds its proposed CULs described below for each AOC.

AOC 1. The leaching pathway is complete in AOC 1. Within AOC 1, toxaphene exceeds the leaching CUL in surface (0 to 1 foot bgs) samples collected from locations FS-05 and FS-06 at concentrations up to 120 mg/kg. FS-05 and FS-06 are located approximately 10 feet from MW-4. Toxaphene contamination is present in groundwater at MW-4, indicating that soil contamination within this AOC is a likely source to groundwater. Toxaphene exceeds the leaching CUL as far west as FS-19, which is approximately 25 feet from MW-3, and as far south as FS-22. Toxaphene is in compliance with the groundwater proposed CUL at MW-3 and FS-22, which are downgradient of the MW-4 source area. These groundwater results empirically demonstrate that soil exceeding the leaching CUL at FS-19 and FS-22 are not causing groundwater impacts.

Soil samples collected at MW-16 along the eastern boundary of AOC 1 are in compliance with the leaching CUL. However, groundwater results at MW-16 exceed the proposed CUL. This provides further support that the primary mechanism for groundwater contamination at MW-16 is diffusion, as concluded in Section 6.3.2.1, rather than contaminated soil.

Concentrations in samples collected from FS-05 and FS-06 decrease with depth: toxaphene results in the 2 to 3 feet bgs are nondetect at concentrations approximately 10 times less than concentrations measured in surface soil. The maximum depth of contamination within AOC 1 is expected to be 6 feet bgs within the source area (at FS-05 and FS-06) and 4 feet bgs elsewhere throughout the AOC based on measured concentrations in shallow soil at Phase 1 RI sampling locations (e.g., FS-05 and FS-06) and the observed rate of decline in concentration with depth. At other locations in AOC 1 (e.g., FS-19 and FS-22) that are farther from the MW-4 source area, toxaphene is bounded at depths of 4 feet bgs.

AOC 2. The leaching pathway is not active in AOC 2. Within AOC 2, toxaphene concentrations are greatest in the 3 to 4 feet bgs depth interval at locations FS-27 and FS-28. Toxaphene concentrations decline in the samples collected in the 4 to 6 feet bgs depth interval at these

locations. Coal fragments are present at an approximate depth of 1.5 feet bgs in boring logs from this area (refer to Appendix D), indicating that the ground surface of the Property was regraded from its historical elevation in this area. Elsewhere with AOC 2, contamination is limited to the top 4 feet of soil.

Groundwater results at location MW-7 along the northwestern boundary of AOC 2, and proximate to FS-09, exceed the proposed CUL. Groundwater results at other monitoring wells within AOC 2 (i.e., MW-5, MW-8, and MW-11) are in compliance with the proposed CUL. These groundwater results empirically demonstrate that soil exceeding the leaching CUL at FS-02, FS-25, and MW-11 are not causing groundwater impacts. Groundwater results immediately downgradient of FS-27 and FS-28 have not been measured; soil at these two locations is considered a source to groundwater.

The maximum depth of contamination in this AOC is 6 feet bgs in the vicinity of FS-27, based on the observed rate of decline in concentration with depth and the relatively low exceedance factor in the 4 to 5 feet bgs sample (concentration of 1.4 mg/kg with exceedance factor of 1.5). At all other locations in this AOC, toxaphene contamination is vertically bounded at 4 feet bgs.

AOC 3. The leaching pathway is not active in AOC 3. Groundwater in this area (measured at MW-13) is in compliance with the proposed CUL, providing empirical demonstration that toxaphene contamination in shallow soil is not impacting groundwater at levels of concern. Within AOC 3, toxaphene contamination in shallow soil at locations FS-32, FS-33, and FS-35 must be addressed relative to the direct contact pathway.

The greatest concentrations of toxaphene in soil were measured at location FS-32. Surface soil (0.5 to 1 foot bgs) had a concentration of 11 mg/kg (12 times the direct contact CUL of 0.91 mg/kg). Soil samples off-Property to the southeast (FS-34) meet the more stringent leaching CUL and are sufficient to bound contamination along the eastern/southern Property boundary extent.

Toxaphene was not detected in samples from the 2 to 3 feet bgs interval within this AOC, typically with reporting limits less than the direct contact CUL. Toxaphene contamination is limited to shallow (0 to 2 feet bgs) soil in this AOC.

AOC 4. The leaching pathway is not active in AOC 4. Groundwater results within this AOC, along the western Property line, and downgradient of the Property boundary (e.g., FS-30, MW-2, MW-12, MW-14, MW-18, MW-19, and MW-20) empirically demonstrate that soil contamination within this AOC does not impact groundwater at levels of concern. Along the western Property boundary in AOC 4, toxaphene was detected at concentrations exceeding the leaching and direct contact CULs at three locations: FS-12, FS-29, and FS-31. Toxaphene contamination at locations FS-12 and FS-29 must be addressed relative to the direct contact pathway. Soil at location FS-31 exceeds the direct contact CUL by a factor of less than 2 and may remain in place.

The maximum depth of contamination is 2 feet bgs at locations FS-29 and FS-31; contamination extends to 4 feet bgs at location FS-12. Contamination is bounded to the north, south, and east by nondetect results at locations FS-15, FS-30, and MW-12.

AOC 5. The leaching pathway is complete in AOC 5. Toxaphene was detected at concentrations exceeding the leaching CUL in surface soil at FS-23. The maximum depth of contamination at FS-23 is 4 feet bgs; results from the 4 to 5 feet bgs sample are in compliance with the leaching CUL.

Groundwater results from well MW-1, which is approximately 15 feet away from FS-23, indicate that saturated soil underneath the Office and Storage Building may contribute to groundwater contamination. Groundwater results at MW-6 also exceed the proposed CUL for toxaphene, indicating that soil in the vicinity of MW-6 may also exceed the leaching CUL. Few soil samples were collected in the vicinity of MW-1 and MW-6. Upgradient soil samples at boring FS-08 and downgradient soil samples at FS-13, FS-14, and FS-24 limit the extent of the area where leaching may be of concern to a geographic footprint approximately corresponding to the southern half of the Office and Storage Building. Based on results at FS-23 and from other Phase 2 sampling locations across the site, which generally show soil contamination deeper than 4 feet bgs is in compliance with the leaching and direct contact CULs, the maximum depth of toxaphene contamination is expected to be 4 feet bgs.

6.4.1.4 Chlordane and alpha-Chlordane

Chlordane and alpha-chlordane have higher K_{oc} values and are less mobile in soil than dieldrin; this is reflected in the relatively limited extent of chlordane and alpha-chlordane exceedances in soil. Chlordane exceeds its soil proposed CUL by a factor of more than 2 in three of the same geographic areas as dieldrin soil exceedances: within AOC 1 (the MW-4 source area), within AOC 2 (the source area near the Rail Spur at locations FS-27 and FS-28), and within AOC 4 (near the southwest Property boundary at location FS-12). alpha-Chlordane contamination is collocated with chlordane in AOC 1. Chlordane and alpha-chlordane results are both in compliance with proposed CULs in AOC 5 and AOC 6. Chlordane contamination in AOC 3 is low-level (i.e., exceeds the proposed CUL by a factor less than 2) and does not require active remediation.

Soil and groundwater data for chlordane are shown on Figure 6.20 relative to the leaching CUL and proposed groundwater CUL, respectively, to support identification of areas where soil may represent a leaching concern to groundwater. Soil data for chlordane and alpha-chlordane are shown on Figure 6.17 relative to the direct contact CUL.

The nature and extent of chlordane and alpha-chlordane contamination is described below for each AOC.

AOC 1. The leaching pathway is complete in AOC 1. Chlordane concentrations in the surface soil samples collected from FS-05 and FS-06 are 38 and 84 mg/kg. Chlordane concentrations in groundwater samples from nearby groundwater well MW-4 exceed the groundwater proposed CUL.

Chlordane exceeds the leaching CUL as far west as FS-19, which is approximately 20 feet from MW-3, and as far south as FS-22. Chlordane is in compliance with the groundwater proposed CUL at MW-3 and FS-22, which are downgradient of the MW-4 source area. These groundwater results empirically demonstrate that soil exceeding the leaching CUL at FS-19 and FS-22 are not causing groundwater impacts.

Chlordane and alpha-chlordane are in compliance with the direct contact CUL in soil at FS-19 and FS-22. Addressing contamination at FS-05 and FS-06 will resolve exposure concerns with respect to both the leaching and direct contact pathways. The maximum depth of contamination requiring remediation at these locations is expected to be 7 feet bgs based on a sample that exceeds in the 5 to 6 feet bgs interval at FS-05 (2.6 mg/kg; exceedance factor of 2.4) and the observed rate of decline in concentration with depth. At other locations in AOC 1 (e.g., FS-19 and FS-22) that are further from the MW-4 source area, chlordane is bounded at depths of 4 feet bgs.

AOC 2. The leaching pathway is not active in AOC 2. Nearby groundwater wells MW-05 and MW-11 are used to provide an empirical demonstration that groundwater is not impacted by chlordane soil contamination within this AOC. Thus, current concentrations of chlordane in soil in AOC 2 are not of concern for the leaching pathway. Chlordane exceedances of the direct contact CUL (Figure 6.17) must be addressed.

Chlordane exceeds its leaching and direct contact CULs at four locations within this AOC (FS-27, FS-28, FS-02, and FS-09), between the AST containment area and Rail Spur. At these locations, contamination is generally present in the 3 to 4 feet bgs depth interval, consistent with the elevation of surficial soils prior to regrading this area of the Property. The maximum detected concentration of chlordane within this AOC was measured at a concentration of 14 mg/kg, which exceeds the leaching and direct contact CULs (of 1.1 and 2.9 mg/kg) by factors of 13 and 4.8, respectively. Samples from locations along the eastern Property boundary (i.e., FS-26 and FS-10) bound the extent of contamination within the Property boundary. Samples from locations FS-25 and MW-11 bound contamination to the west.

alpha-Chlordane does not exceed its proposed CUL in this AOC.

AOC 4. The leaching pathway is not active in AOC 4. Groundwater wells along the western Property line and downgradient of the Property boundary (i.e., MW-2, MW-14, MW-18, MW-19, and MW-20) are sufficient to empirically demonstrate that groundwater contamination does not extend off-site, and soil contamination is bounded to within the Property.

Chlordane exceeds the leaching and direct contact CUL at two locations within this AOC (FS-29 and FS-12); alpha-chlordane is in compliance with its soil proposed CUL in this AOC. Chlordane contamination is present at concentrations requiring remediation only in the surface soil interval (0.5 to 1 foot bgs) in this AOC; deeper results that exceed the direct contact CUL at FS-12 exceed the CUL by a factor of less than 2. Current concentrations of chlordane in soil in AOC 4 are not of concern for the leaching pathway; however, chlordane exceedances of the direct contact CUL at location FS-29 at depths of 0.5 to 1 foot bgs must be addressed.

6.4.1.5 *beta*-BHC

beta-BHC does not exceed its preliminary CUL for the direct contact pathway; therefore, its proposed CUL is based on the leaching pathway. Soil and groundwater results for beta-BHC are shown on Figure 6.16. beta-BHC results requiring further evaluation are present within AOC 1, AOC 2, and AOC 5. There are two other locations that exceed the proposed CUL (FS-29 and FS-32); but these results are spatially isolated with low magnitudes of exceedance (exceedance factors of less than 2). Contamination is bounded at 4 feet bgs across the site; in most areas, beta-BHC contamination is limited to the top 1 foot of soil.

AOC 1. The leaching pathway is assumed to be complete in AOC 1. Groundwater results for beta-BHC exceed the proposed CUL at MW-4. beta-BHC was not detected in soil sampling locations proximate (within 20 feet) to MW-4. However, because most of these locations were collected during Phase 1 monitoring events, their reporting limits are elevated with respect to the proposed CUL. The typical maximum depth of contamination is 4 feet bgs, based on the typical maximum depth of contamination for other legacy pesticides across the site and the maximum depth of less-mobile pesticides in AOC 1. Contamination may extend as deep as 6 feet bgs near FS-05.

During Phase 2 sampling events, beta-BHC was detected at concentrations exceeding the leaching CUL within AOC 1 at downgradient locations FS-19 and FS-22. Results at these locations, ranging from 0.0084 to 0.011 mg/kg, exceed the proposed CUL of 0.0067 mg/kg by factors of less than 2. Collocated and proximate downgradient groundwater results at locations MW-3 and FS-22 meet the proposed groundwater CUL, indicating that soil at FS-19 and FS-22 is unlikely to be a source to groundwater. It is assumed that soil at FS-05 and FS-06 within the AOC 1 source zone may be contributing to groundwater exceedances at MW-4. That is, the extent of beta-BHC contamination within AOC 1 is expected to be constrained to a much smaller geographic footprint than observed for other legacy pesticides, like dieldrin.

AOC 2. The leaching pathway may be complete in AOC 2. Collocated soil and groundwater data at AOC 2 were evaluated to determine whether soil exceedances contribute to beta-BHC groundwater contamination at the site. As shown on Figure 6.16, the nearest groundwater well is MW-11, which is less than 20 feet downgradient of FS-28. MW-11 is in compliance with the groundwater proposed CUL.

However, there are no wells immediately downgradient of FS-42 and FS-27, where the greatest detected concentrations of beta-BHC were measured. MW-11 is cross-gradient to these soil sampling locations. Therefore, it is assumed that locations FS-42 and FS-27 may cause or contribute to groundwater contamination in the southern portion of AOC 2.

At FS-42 and FS-27, soil from the 3 to 4 feet bgs depth interval was measured at concentrations of 0.017 and 0.052 mg/kg, exceeding the leaching CUL of 0.0067 mg/kg by factors of 2.5 and 7.8, respectively. The depth of contamination at these locations is bounded at 4 feet bgs by the clean sample from the 4 to 5 feet bgs interval at location FS-27. The lateral extent of contamination within AOC 2 is bounded by results at FS-28, which had a maximum result of 0.0068 mg/kg

(exceedance factor of just more than 1.0), and by TP-2, which is in compliance with the proposed CUL.

AOC 5. The leaching pathway may be complete in AOC 5. Groundwater results for beta-BHC exceed the proposed CUL at MW-6. Soil samples were not collected upgradient of MW-6. The two soil sampling locations closest to MW-6 were both nondetect (FS-13 and FS-23; Table 6.10). These two sampling locations are located downgradient of MW-6 (Figure 6.16). It is possible that upgradient soil near MW-6 is contaminated. The geographic extent of any such contamination is expected to be limited to an area within approximately 20 feet of the well, given the relatively low magnitude of exceedance in groundwater (maximum exceedance of 0.085 µg/L, a factor of 2.0 times the proposed CUL of 0.049 µg/L).

6.4.1.6 DDT

DDT is not a groundwater COC; therefore, the proposed CUL for DDT is 2.9 mg/kg, which is equivalent to the proposed CUL developed for the direct contact pathway. DDT results are shown on Figure 6.17. DDT exceeds its proposed CUL at concentrations requiring remedial action (i.e., at concentrations greater than 2 times the proposed CUL) in one sample at one location: FS-33. FS-33 is present within AOC 3.

At this location, DDT was detected at a concentration of 20 mg/kg (exceedance factor of 6.9) in the 2 to 3 feet bgs depth interval. Results in the 4 to 5 feet bgs soil sample at FS-33 are in compliance with the proposed CUL. Adjacent samples to the north/northwest and southeast at locations FS-35, FS-32, and MW-13 meet the proposed CUL in all sampled depth intervals. These results confirm contamination is vertically and laterally bounded.

6.4.1.7 Summary

The greatest detected concentrations of legacy pesticides were measured in AOC 1, near MW-4. Soil in this area is a source of contamination to groundwater. Soil is also contaminated with legacy pesticides at levels of concern elsewhere at the site, particularly in areas where former pesticide loading, handling, and storage occurred.

Data discussed in Sections 6.4.1.1 through 6.1.4.5 with respect to the leaching pathway demonstrate that the leaching CUL overestimates leaching from soil for several chemicals.

For most legacy pesticides (i.e., aldrin, chlordane, beta-BHC, and toxaphene), soil results that exceed the leaching CULs, even at concentrations more than 10 times the proposed CULs, did not necessarily impact groundwater at levels of concern. This illustrates an important concept with respect to the leaching pathway: if a relatively small amount of high-concentration contamination is present, it is unlikely to cause groundwater contamination at levels of concern. That is, both the concentration (magnitude of exceedance) and the volume of impacted soil are important predictors of groundwater impacts. Remediation levels (RELs) for the leaching pathway will be developed for these chemicals in the FS.

6.4.2 Active-Use Pesticides

Pesticide data were collected throughout the Property. Two active-use pesticides (atrazine and simazine) exceed their proposed CUL for the direct contact pathway. Active-use pesticides were detected at concentrations that exceed their proposed CULs at much lower frequency than legacy pesticides (Table 6.5). Atrazine and simazine were detected at concentrations that exceed their proposed CUL at just one location: FS-28 (refer to Table 6.10) The maximum detected concentrations of atrazine and simazine of 710 mg/kg and 110 mg/kg exceed their proposed CULs of 4.3 and 8.3 mg/kg by factors of 165 and 13, respectively, at this location. Results in the sample from the deeper depth interval (collected from 5 to 6 feet bgs) at this location meet the proposed CUL, indicating that contamination is limited to the top 4 feet of soil.

Results at adjacent sampling locations (i.e., FS-11, FS-27, FS-42, and MW-11) also meet the CUL, bounding the extent of contamination to a discrete area within the Property boundary.

6.4.3 Total Petroleum Hydrocarbons

Total diesel- and oil-range TPH was identified as a soil COC. Results that exceed the proposed CUL for total diesel- and oil-range TPH are shown on Figure 6.21. Generally, chromatograms from site TPH samples, at all depths, show results of a highly weathered middle distillate that is absent of quantifiable C8 through C12 hydrocarbons (refer to Appendix E). These chromatograms indicate that TPH contamination at the site is primarily a result of historical operations, rather than more recent releases associated with current operations.

As shown on Figure 6.21, diesel- and oil-range TPH exceedances in soil are clustered in areas where fuel was transferred from railcars and loaded into ASTs or loaded into trucks for refueling, such as at locations FS-10 (within AOC 2) and FS-23 (within AOC 5).

Active-Use Pesticides in Soil

Sources

Active-use pesticide contamination is a result of recent or former pesticide handling operations.

Vertical and Lateral Extent

Contamination is limited to an area of the Property associated with pesticide handling: an area near the Rail Spur in the southeastern portion of the Property.

Contamination is limited to the top 4 feet of soil.

TPH in Soil

Sources

TPH contamination is a result of former fueling, filling, and fuel handling operations. Leaks and drips from vehicles and equipment impact surface soil.

Vertical and Lateral Extent

TPH contamination is present at three areas of the Property associated with former fuel handling and storage: the office and former refueling area; the Rail Spur; and the AST Containment Area. TPH contamination is found in the top 10 feet of soil in these areas.

Additionally, surface soil (0 to 1 feet bgs) exceeds the proposed CUL at two discrete locations in the northeast portion of the site: FS-01 and Culvert.

Additionally, surface soil exceeds the proposed CUL at two discrete locations in the northeast portion of the site: FS-01 and Culvert. The sample at Culvert was collected at a depth of 0 to 0.25 feet bgs; the sample at FS-01 was collected at a depth of 0.5 to 1 foot bgs. A deeper sample was not collected at Culvert, but a sample result from 2 to 3 feet bgs at FS-01 bounds the contamination at FS-01. The only known source of contamination in the vicinity of FS-01 and Culvert is incidental leaks or spills from vehicle equipment used and parked on the Property. Thus, soil contamination in these areas is expected to be limited to the upper 1 to 2 feet of soil.

The nature and extent of TPH contamination is described below for each of the remaining AOCs.

AOC 2. The only results that exceed the proposed CUL for total diesel- and oil-range TPH by a factor greater than 2 within AOC 2 were collected at depths between 7.5 and 10 feet bgs at locations FS-10, FS-27, and MW-5. These depths are below the biologically active zone (Section 5.2.2.1), which is the same as the conditional POC allowable under MTCA for this pathway per WAC 173-340-7490(4)(a). The maximum result in soil deeper than 6 feet bgs in AOC 2 is 3,300 mg/kg. This result is less than 2 times the direct contact criterion developed for protection of human health (2,000 mg/kg for diesel- and oil-range TPH; Table 5.3). Results from soil samples collected in shallower depth intervals at these three locations (FS-10, FS-27, and MW-5) are less than samples collected at depths greater than 7.5 feet bgs, indicating that deep soil contamination is a result of an older release. This release is likely associated with former loading and unloading operations at the Rail Spur.

Shallow soil samples from locations FS-09, MW-11, FS-27, and FS-28 indicate that more recent releases resulted in surficial soil contamination within this AOC. At these locations, soil in the 0.5 to 1 foot bgs sample depth interval exceeds the proposed CUL, with concentrations dropping significantly in the next deepest soil sampling interval. Samples collected from the 1.5 to 4 feet bgs depth interval at these three locations are in compliance with the proposed CUL. Shallow TPH contamination is not present in surficial samples collected at FS-02, FS-10, and FS-11, indicating that surface soil contamination is a result of small release (e.g., leaks and drips from equipment) rather than a significant spill. The maximum depth of TPH contamination requiring remediation in this AOC is 6 feet bgs at FS-28; soil contamination is typically bounded at shallower depths at other locations within AOC 2.

AOC 4. Site-wide, the greatest concentrations of diesel- and oil-range TPH were measured in samples collected from locations MW-12 and Test Pit #1, which are downgradient of the AST containment area and within AOC 4. The maximum TPH result was detected at a concentration of 21,000 mg/kg (exceedance factor of 46) at MW-12 at a depth of 1.5 to 2 feet bgs. Concentrations measured at MW-12 decrease with depth and are in compliance with the proposed CUL at a depth of 7 to 8 feet bgs. At Test Pit #1, samples were collected at depths of 3 and 5 feet bgs; both samples exceed the proposed CUL. Within AOC 4, diesel- and oil-range TPH exceeds the proposed CUL at location FS-31 at a depth of 8 to 9 feet bgs. The sample from the 9 to 10 feet bgs interval is in compliance with the proposed CUL of 460 mg/kg.

Contamination in AOC 4 is present at depths deeper than the biologically active zone for ecological receptors. However, a total diesel- and oil-range TPH concentration measured at a

depth of 8 to 9 feet bgs at FS-31 (7,000 mg/kg), which exceeds the direct contact criterion for protection of human health (2,000 mg/kg for diesel- and oil-range TPH) by a factor greater than 2.¹⁶ Based on results from FS-31 and MW-12, TPH contamination is vertically delineated at a depth of 9 feet bgs in this AOC.

AOC 5. Contamination within AOC 5 is present in both surface soil (i.e., FS-16 and FS-23) and at depths of 6 to 7 feet bgs (i.e., FS-13 and FS-23). Deep samples at FS-16 and shallow samples at FS-23 indicate that two distinct sources of contamination may be present within this AOC. This observation is supported by the pattern of contamination observed in samples from location FS-23. At location FS-23, TPH concentrations are greatest in surface soil and decrease with depth between 0 and 6 feet bgs; the sample collected at a depth of 5 to 6 feet bgs is in compliance with the proposed CUL. The next sample, collected from a depth of 6 to 7 feet bgs (below the biologically active zone), exceeds the proposed CUL by a factor of 10. The concentration measured in this sample (4,600 mg/kg) is similar to the concentration measured in the surface soil sample from this location (4,900 mg/kg). This sample result exceeds the direct contact criterion for protection of human health (2,000 mg/kg for diesel- and oil-range TPH) by a factor greater than 2. The sample collected from a depth of 8 to 9 feet bgs at this location is in compliance with the proposed CUL of 460 mg/kg.

FS-23 is located within the footprint of the Office and Storage Building. Diesel- and oil-range TPH was nondetect or detected at relatively low concentrations in samples collected from locations both upgradient (MW-1 and SB-11) and downgradient (FS-16 and FS-14) of FS-23.

At location FS-23, contamination is vertically bounded by the sample collected from a depth of 8 to 9 feet bgs. This depth interval was not sampled at location FS-13; however, the sample collected at a depth of 13 to 14 feet bgs at location FS-13 is in compliance with the proposed CUL. Relative to the direct contact criterion for protection of human health, the maximum depth of TPH contamination in this AOC is between 10 and 12 feet bgs.

6.4.4 Dioxins/Furans

Dioxin/furan sampling was conducted in the southeastern corner of the Property in an area where historical burning activities were reportedly conducted. Based on current and historical activities at the Property, dioxin/furan contamination associated with AOC 3 is expected to be limited to surface soil. The maximum depth of dioxin/furan contamination is assumed to be 2 feet bgs.

Sample results confirm the presence of dioxin/furan contamination resulting from these activities: surface soil results at locations FS-32, FS-33, FS-43 and FS-44 range from 23.1 to 92.4 ng/kg (Table 6.10). These results exceed the proposed CUL by factors ranging between

¹⁶ Summed result for total diesel- and oil-range TPH is used as a surrogate for this initial evaluation of protection of human health via the direct contact pathway. Individual results for diesel- and oil-range TPH are presented in Appendix E.

1.8 and 7.1, as shown on Figure 6.22. Contamination is bounded to the southeast, north, and northwest by samples collected from locations FS-34, FS-35, and FS-45, respectively.

The greatest dioxin/furan concentration (92.4 ng/kg) was measured in FS-44, which is located in the southwestern corner of AOC 3 along the southern Property boundary. Relative to the proposed CUL, the extent of off-site contamination along the southwestern boundary of AOC 3 is a data gap that must be filled prior to selection and design of the final remedy. This may be achieved with additional sampling prior to submittal of the Engineering Design Report (EDR).

One additional sample was collected and analyzed for dioxins/furans: a sample from the 2 to 3 feet bgs depth interval was collected from FS-19, located near the machine shop. This sample was collected to determine whether use of lignosulfonate as a dust suppressant is associated with dioxin/furan contamination in deeper soil elsewhere at the site. This sample exceeds the proposed CUL, but by a factor less than 2. This concentration is low enough that the area does not require active remediation for dioxins/furans. Thus, active remediation will be constrained to AOC 3, after completion of additional sampling to bound the extent of off-Property contamination associated with this AOC.

7.0 Conceptual Site Model, Areas of Concern, and Recommendations

This section presents the Characterization Stage CSM (herein referred to as the “CSM”) for the Site, including identification of media of concern, contaminant migration and exposure pathways, and receptors. The CSM is illustrated in Figure 7.1 to accompany the discussion in this section.

Based on the nature and extent of COCs described in Section 6.0, AOCs were identified that will be evaluated as part of the FS. The AOCs are summarized on Figure 7.2. The Site boundary is shown on Figure 7.3. This Site boundary includes all locations where contamination greater than the proposed CULs and originating from the activities associated with the Site has come to lie.

7.1 CONCEPTUAL SITE MODEL

Soil and groundwater-are the two media of concern at the Site. Potentially active pathways and receptors are summarized below, along with the compliance basis for proposed cleanup standards developed to protect site receptors.

Groundwater. VI is not an active pathway at the Site: current groundwater concentrations are protective of current and future industrial worker and commercial exposure via VI throughout the Site without the need for remedial action (refer to Attachment C.5). Groundwater proposed CULs were developed to be protective of human health via drinking water exposure. Groundwater proposed CULs must be met at the standard POC; that is, at all wells throughout the site to the maximum depth where contamination is present. Groundwater contamination is present at the Site at a maximum depth of 15 feet bgs for all groundwater COCs except for nitrate. Nitrate may exceed the proposed CUL at depths deeper than 15 feet bgs in the southwest Property boundary (i.e., MW-12, FS-30, and MW-14). Groundwater COCs and proposed cleanup standards are summarized in Table 7.1.

**Table 7.1
Groundwater Chemicals of Concern, Proposed Cleanup Standards, and AOCs**

Chemical	Proposed CUL (µg/L)	Compliance Basis ⁽¹⁾	Point of Compliance	AOCs Where Contamination is Present
Miscellaneous Substances				
Nitrate	10,000	Upper Percentile	0–15+ feet bgs	Sitewide
Nitrite	1,000	Upper Percentile	0–15 feet bgs	AOC 1, AOC 5
Legacy Pesticides				
Aldrin	0.0026	True Mean	0–15 feet bgs	AOC 1
beta-BHC	0.049	True Mean	0–15 feet bgs	AOC 1, AOC 5
Chlordane	0.6	True Mean	0–15 feet bgs	AOC 1
Dieldrin	0.06	True Mean	0–15 feet bgs	Widespread within the Site
Toxaphene	0.8	True Mean	0–15 feet bgs	AOC 1, AOC 5

Chemical	Proposed CUL (µg/L)	Compliance Basis ⁽¹⁾	Point of Compliance	AOCs Where Contamination is Present
Active Use Pesticides				
2,4-D	70	True Mean	0–15 feet bgs	AOC 1
Atrazine	3	True Mean	0–15 feet bgs	Widespread within the Property
MCPA	8	Upper Percentile	0–15 feet bgs	AOC 1, AOC 5
Total Petroleum Hydrocarbons				
Diesel-range TPH	500 ⁽²⁾	Upper Percentile	0–15 feet bgs	AOC 1, AOC 5
Oil-range TPH	500 ⁽²⁾	Upper Percentile	0–15 feet bgs	AOC 1

Note:

- 1 Compliance with proposed CULs will be determined using either an upper percentile concentration or the true mean concentration, in accordance with WAC 173-340-720(9)(c) and (e).
- 2 Ecology has required that diesel-range and oil-range TPH results be summed and compared to a CUL of 500 µg/L. Future assessments of TPH in groundwater (if applicable) will assume the CUL will be summed, per Ecology’s requirement. In the draft CAP, it is anticipated that Ecology can establish the final groundwater CUL to reflect the combined diesel-range and oil-range TPH for the Site.

Soil. Soil cleanup standards were developed to be protective of both the highest beneficial use of groundwater and of human and ecological exposure via the direct contact pathway. The vapor sampling data obtained in 2019 indicate that TPH soil concentrations in AOC 5, under the Office and Storage Building, do not pose a significant risk to building occupants and the VI pathway is not active. Thus, soil vapor does not require active mitigation.

Land use at the Site is currently industrial and will remain industrial based on City of Ellensburg zoning and growth plans. At this Site, Ecology determined that CULs must be protective of unrestricted land use, as documented in the PCUL and COPC Memo. Industrial land use does not need to be maintained to ensure current and future protection of human health and ecological receptors, and institutional controls limiting future land use to industrial are not required if the proposed CULs are met. Soil proposed CULs based on exposure via the direct contact pathway must be met throughout the standard MTCA POC of 0 to 15 feet bgs if the basis of the proposed CUL is protection of human health. If the pathway basis is protection of ecological receptors, a site-specific POC of 0 to 6 feet bgs is proposed, based on the depth of the biologically active zone. If the maximum depth where contamination occurs is shallower than these maximum depth thresholds, the POC is the maximum depth where contamination occurs. Finally, for soil proposed CULs based on protection of groundwater via the leaching pathway, the POC is throughout site soil, to the maximum depth where contamination occurs.

Soil COCs and proposed cleanup standards are summarized in Table 7.2. Because legacy pesticides are generally of concern in soil relative to the leaching pathway, data for each of the six legacy pesticides are used to delineate specific areas that could either be an ongoing source to groundwater or risk to human health via the direct contact pathway, using empirical demonstrations of groundwater quality as appropriate for each chemical and AOC.

The POC indicated in Table 7.2 was identified based on the maximum depth of Site contamination as described in Section 6.4.

**Table 7.2
Soil Chemicals of Concern, Proposed Cleanup Standards, and AOCs**

Chemical	Proposed CUL (mg/kg)	Pathway/Basis	Point of Compliance ⁽¹⁾
Metals			
Lead	250	Direct Contact/ MTCA Method A	AOC 4: 0–2 feet bgs ⁽²⁾
Legacy Pesticides			
Aldrin	0.0067	Leaching/WAC Eq. 747-1	AOC 1: 0–7 feet bgs ⁽³⁾
	0.059	Direct Contact/ MTCA Method B	AOC 2: 0–4 feet bgs AOC 5: 0–2 feet bgs
beta-BHC	0.0067	Leaching/WAC Eq. 747-1	AOC 1: 0–6 feet bgs AOC 2: 0–5 feet bgs
Chlordane	1.1	Leaching/WAC Eq. 747-1	AOC 1: 0–7 feet bgs
	2.9	Direct Contact/ MTCA Method B	AOC 2: 0–4 feet bgs AOC 4: 0–1 feet bgs
alpha-Chlordane	2.9	Direct Contact/ MTCA Method B	AOC 1: 0–2 feet bgs
Dieldrin	0.0067	Leaching/WAC Eq. 747-1	AOC 1, 2, 5: 0–7 feet bgs ⁽³⁾ AOC 4: 0–5 feet bgs
	0.063	Direct Contact/ MTCA Method B	AOC 3: 0–6 feet bgs AOC 6: 0–2.5 feet bgs
Total DDT	2.9	Direct Contact/ MTCA Method B	AOC 3: 0–4 feet bgs
Toxaphene	0.84	Leaching/WAC Eq. 747-1	AOC 1 and 2: 0–6 feet bgs AOC 5: 0–4 feet bgs ⁽³⁾
	0.91	Direct Contact/ MTCA Method B	AOC 3: 0–2 feet bgs AOC 4: 0–4 feet bgs
Active-Use Pesticides			
Atrazine	4.3	Direct Contact/ MTCA Method B	AOC 2: 0–4 feet bgs
Simazine	8.3	Direct Contact/ MTCA Method B	AOC 2: 0–4 feet bgs
Total Petroleum Hydrocarbons ⁽⁴⁾			
Total Diesel-and Oil-Range TPH	460 / 2,000	Direct Contact/TEE and MTCA Method A	AOC 2: 0–6 feet bgs AOC 4: 0–9 feet bgs ⁽⁵⁾ AOC 5: 0–12 feet bgs ⁽⁵⁾ FS-01: 0-1 feet bgs

Chemical	Proposed CUL (mg/kg)	Pathway/Basis	Point of Compliance ⁽¹⁾
Dioxins/Furans			
Dioxins/Furans	0.000013	Direct Contact/ MTCA Method B	AOC 3: 0–2 feet bgs

Notes:

- 1 This table lists the maximum depth of contamination requiring remediation for each chemical based on discussion in Section 6.4. The standard POC for the direct contact pathway is 0–15 feet bgs; the standard POC for the leaching pathway is throughout the soil column. If deeper contamination is encountered during remedial activities, the POC depth will be expanded as appropriate.
- 2 Lead exceeds the soil proposed CUL in two samples from two locations (FS-08 and MW-12) at a maximum depth of 2 feet bgs. Deeper samples at each location bound the depth of contamination. The Ecology-approved data gaps memorandum (Attachment C.6) concludes that lead contamination is bounded at a depth of 2 feet bgs based on detected results collected site-wide.
- 3 Maximum depth of contamination will be confirmed as necessary during remedial design.
- 4 The proposed CULs for TPH are protective of the direct contact and leaching pathways. The POC for the TEE criterion of 460 mg/kg is 0 to 6 feet bgs. The POC for the MTCA Method A criterion of 2,000 mg/kg is 0 to 15 feet bgs. The proposed CULs for the petroleum VI pathway are equivalent to the preliminary CUL of 250 mg/kg. VI will be assessed in the FS to determine whether remediation is required to address the VI pathway.
- 5 TPH contamination exceeding the MTCA Method A criterion (direct contact criterion for protection of human health) by a factor greater than 2 is present in soil deeper than 6 feet bgs. The depth of contamination in this AOC reflects the standard MTCA POC for protection of human health.

7.1.1 Summary of Contaminant Sources and Transport Pathways

Soil and groundwater contaminants at the Site are caused by current and former Site uses, including pesticide and fertilizer handling and storage and the historical transfer and storage of bulk petroleum fuels. Sources of current and historical soil and groundwater contamination include the following:

- Direct releases from equipment washing operations
- Generation of by-products during burning operations
- Direct releases from material storage, use, and handling
- Leaks and spills from equipment, tanks, and machinery
- Leaks and spills during fueling and fuel transfer operations to/from the Rail Spur and to/from ASTs or trucks
- Grading of the ground surface to support changes in operations
- Infiltration of precipitation and overland flow through contaminated soil, causing leaching into groundwater

7.1.2 Summary of Areas of Concern

Based on the nature and extent of groundwater and soil COCs, described in Sections 6.3 and 6.4, respectively, the boundaries for each AOPC retained for consideration in Section 6.4 were

updated to form AOCs that will be evaluated as part of the FS. The AOCs are illustrated on Figure 7.2.

The AOC descriptions below include details about the associated soil and groundwater contamination within each AOC. Insets for each AOC show historical and current locations that were used to define the extent of the AOC. All AOCs will be evaluated in the FS during the development and analysis of comprehensive site remedial actions.

Additionally, certain chemicals may be present at the Site outside of defined AOCs as a result of incidental releases during McGregor operations. These chemicals including total diesel- and oil-range TPH in soil; nitrate and nitrite in groundwater; and atrazine in groundwater.

AOC 1 (Culvert Source Area)

AOC 1 represents a historical source area surrounding MW-4, which is lower than the surrounding area and culminates at the culvert. The extent of the AOC encompasses the greatest concentrations of legacy pesticides and oil-range TPH in groundwater at MW-4.

AOC 1 is also associated with active-use pesticides and diesel- and oil-range TPH that are detected at elevated concentrations in groundwater. Soil boring locations FS-05 and FS-06, within AOC 1, contain the greatest concentrations of legacy pesticides in soil exceeding the proposed CULs. In addition, AOC 1 is extended to the west to include soil boring FS-18, which exceeds proposed CULs for legacy pesticides for the leaching pathway.

In groundwater, COCs present at concentrations exceeding their proposed CULs in AOC 1 include nitrate, nitrite, all legacy pesticides (beta-BHC, aldrin, chlordane, dieldrin, and toxaphene), all active use pesticides (2,4-D, MCPA, atrazine), and diesel- and oil-range TPH.

Soil COCs present at concentrations exceeding their proposed CULs in AOC 1 are legacy pesticides (aldrin, beta-BHC, chlordane, alpha-chlordane, dieldrin, and toxaphene); total diesel- and oil-range TPH; and dioxins/furans. Within AOC 1, the maximum depth for pesticides with concentrations exceeding the CULs in soil is approximately 7 feet bgs; pesticides are not detected at depths greater than 6 feet bgs, but clean bounding samples are not available for all chemicals at locations near the source zone (i.e., FS-05 and FS-06). TPH contamination is limited to surface soil, and dioxin/furan contamination is present at low levels (less than 2 times the proposed CUL).

AOC 2 (Rail Spur Loading Area)

AOC 2 encompasses the area adjacent to the Rail Spur where miscellaneous chemicals were historically transferred from railcars to the ASTs and overhead loading racks. AOC 2 also represents an area of track-out of dry fertilizer from concrete onto gravel. The COCs present at concentrations exceeding the proposed CULs in AOC 2 are encountered primarily in soil and include legacy pesticides (aldrin, beta-BHC, chlordane, dieldrin, and toxaphene), as well as active use pesticides atrazine and simazine. Within AOC 2, the greatest concentrations for pesticides are encountered at depths between 3 and 4 feet bgs with a maximum exceedance depth of 6 feet bgs.

Nitrate and dieldrin exceed their proposed groundwater CULs within this AOC.

AOC 3 (Trash Burning Area)

AOC 3 encompasses an area where trash was historically burned. There are no groundwater impacts associated with AOC 3. Dioxins/furans and three legacy pesticides (dieldrin, DDT, and toxaphene) exceed their soil proposed CULs at concentrations by a factor greater than 2 within AOC 3. Chlordane and beta-BHC are also present at concentrations greater than their proposed soil CULs, but with lower-magnitude exceedances. Dioxin/furan contamination associated with AOC 3 is bounded at a depth of 2 feet bgs; pesticide contamination is bounded at a depth of 3 feet bgs.

Pesticide contamination is bounded within the Property boundary. A data gap remains with respect to the extent of dioxin/furan contamination along the southwestern corner of AOC 3 along the southern Property boundary.

AOC 4 (Downgradient Low Spot)

AOC 4 represents a low spot area that experiences seasonal ponding. It is downgradient of the former anhydrous ammonia tank, which was in use from 1995 to 2010. The extent of AOC 4 includes soil contaminated with diesel- and oil-range TPH outside and downgradient of the AST area at locations Test Pit #1, MW-12 and FS-31.

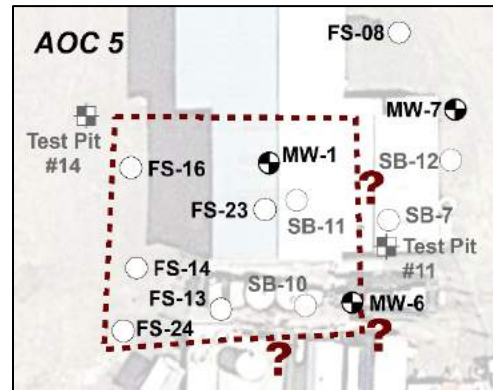

Lead and four legacy pesticides (beta-BHC, chlordane, dieldrin, and toxaphene) exceed their proposed CULs in this AOC. Lead contamination is present at 2 feet bgs. Legacy pesticide contamination is bounded at a maximum depth of approximately 6 feet bgs. TPH contamination is bounded at 9 feet bgs.

Three chemicals (nitrate, dieldrin, and atrazine) exceed their groundwater proposed CULs within AOC 4 or in well MW-14, which is immediately downgradient.

AOC 5 (Office and Storage Area)

AOC 5 represents the area surrounding the office and former historical refueling area. This area was historically used for petroleum product offloading and storage. Agricultural chemicals were also reportedly offloaded and stored in this area after operations were fully converted from fuel terminal operations.

Soil COCs in this AOC are legacy pesticides (aldrin, dieldrin, and toxaphene) and total diesel- and oil- range TPH. Pesticide contamination is present at a maximum depth of approximately 6 feet bgs and is expected to be bounded at depths of 7 feet bgs. TPH contamination is present at depths of 6 to 7 feet bgs; clean bounding samples are not available at all locations until 12 feet bgs.

Groundwater contamination is present in AOC 5 wells MW-1 and MW-6. The greatest detected nitrate concentrations at the Site were measured at these two wells; nitrite also exceeds its proposed CUL at these locations. Three legacy pesticides (beta-BHC, dieldrin, and toxaphene) exceed their CULs in MW-1 and MW-6. Additionally, two active use pesticides (2,4-D and atrazine) and diesel-range TPH exceed their proposed CULs at MW-6.

AOC 6 (Machine Shop)

AOC 6 is located in the northern portion of the Property near the machine shop. There are no groundwater impacts associated with AOC 6. Surface soil is contaminated for two legacy pesticides (dieldrin and toxaphene) in this AOC, likely as a result of incidental spills during historical operations. Contamination is bounded at depths of 2.5 feet bgs.

7.2 RECOMMENDATIONS

The following bulleted items describe data gaps that will be addressed further in the FS as needed with regard to the nature and extent of contamination and fate and transport.

- There is not a VI risk to occupants in the current office building; however, VI risk to future potential buildings will be assessed in alternative cleanup actions presented in the FS.
- Results from temporary well FS-30 indicate that in the southwest area of the Site, nitrate may be present in groundwater deeper than 15 feet bgs, although the specific depth of impacted groundwater is not well constrained. Future activities to address this data gap may include evaluation of source control measures (such as paving) to address ongoing fertilizer input and monitoring to assess the impact on groundwater.
- The leaching pathway for dieldrin is partially delineated along the downgradient boundary of AOC 2/upgradient boundary of AOC 5. Soil exceeds the leaching CUL within these AOCs, with limited soil samples between them proximate to wells MW-6 and MW-7. Dieldrin exceeds its groundwater proposed CUL in both of these wells. This will be considered during FS development when evaluating remedial alternatives for the Site. Soil in this area is considered a potential source to groundwater unless additional data collected during remedial design bounds the extent of soil contamination in the vicinity of these wells.
- The leaching pathway for dieldrin is partially delineated along the downgradient boundary of AOC 1 by FS-22. Soil exceeds the leaching CUL at this location. The nearest downgradient monitoring well is MW-1 within AOC 5. Dieldrin exceeds its groundwater proposed CUL in MW-1. This will be considered during FS development when evaluating remedial alternatives for the Site. Soil in this area is considered a potential source to groundwater unless additional data collected during remedial design bounds the extent of soil contamination in the vicinity of MW-1.
- The extent of off-site dioxin/furan contamination along the southwestern boundary of AOC 3 is a data gap that must be filled prior to design of the final remedy. This will be achieved with additional sampling as part of pre-design data collection prior to submittal of the EDR, as further described in Section 12.1.1.1.
- The FS will include source control recommendations to be coupled with site remediation to address nitrate and nitrite contamination in groundwater and prevent contamination from incidental TPH or active-use pesticide releases.

8.0 Feasibility Study

This FS has been developed in accordance with MTCA WAC 173-340-350(8) and includes an evaluation of cleanup action alternatives for contaminated soil and groundwater at the Site. The purpose of the FS is to evaluate cleanup actions that are protective of human health and the environment through elimination, reduction, or control of risks posed through potential exposure and migration pathways present at the Site in compliance with MTCA and its implementing regulations. Based on this evaluation, a sitewide preferred cleanup action is recommended to Ecology for consideration.

8.1 REMEDIAL ACTION OBJECTIVES

Remedial action objectives (RAOs) for the Site were developed to specifically identify goals that should be accomplished to meet the minimum requirements of the MTCA cleanup regulations (WAC 173-340). RAOs define the objectives that must also be met by the remedy to ensure substantive compliance with ARARs. RAOs for the Site include the following:

- Remediate soil and groundwater to protect human and ecological receptors from exposure to Site contamination that exceeds applicable CULs.
 - Remove unacceptable human health risk resulting from direct contact with contaminated soil or groundwater.
 - Remove unacceptable potential human health risk from consumption of drinking water.
 - Remove unacceptable future potential human health risk from indoor VI of TPH contamination.
- Comply with local, state, and federal laws (ARARs; WAC 173-340-710) and site-specific cleanup standards (as described in Sections 6.1 and 6.2).
- Provide for compliance monitoring to evaluate the effectiveness of the preferred cleanup action and to determine that the cleanup standards are met.
- Remediate contaminants in a method that does not interfere with or restrict proposed future use plans to operate the Site as an industrial parcel.

8.2 POINTS OF COMPLIANCE

Per WAC 173-340-200, the POC is “the point or points on a site where CULs established in accordance with WAC 173-340-720 through 173-340-760 shall be attained” and includes standard POCs and conditional points of compliance (CPOCs). POCs are established for each impacted medium at the Site, as described in the following sections.

8.2.1 Groundwater

Under MTCA (WAC 173-340-720(8)(b)), the standard POC for groundwater is defined as “throughout the site from the uppermost level of the saturated zone extending vertically to the

lowest most depth which could potentially be affected by the site,” which implies that groundwater will meet CULs throughout the Site within a reasonable restoration time frame. Therefore, the standard POC for groundwater is throughout the Site.

Per MTCA (WAC 173-340-720(8)), where it can be demonstrated that it is not practicable to meet the CULs throughout the Site within a reasonable restoration time frame using all practicable methods of treatment, Ecology may approve a CPOC that is as close as practicable to the source area, and typically not extending past the property boundary. The use of a CPOC may be proposed as part of a cleanup action alternative based on whether the alternative can meet CULs Sitewide within a reasonable restoration time frame.

8.2.2 Soil

The standard POCs for soil are based on three pathways of exposure:

- **Direct contact.** The standard POC for all direct contact pathways (irrespective of the receptor) is the top 15 feet of soil per WAC 173-340-740(6)(d) for human health risk assessment and WAC 173-340-7490(4)(b) for ecological risk assessment. This POC is protective of incidental ingestion and dermal contact with soil and does not require the presence of a cap or institutional controls (ICs) to be protective.
- **Leaching to groundwater.** The standard POC for the leaching pathway is soil throughout the Site per WAC 173-340-740(6)(b). This is a cross-media pathway for Sitewide soil that is a potential source of contamination to groundwater.
- **Soil vapor.** The standard POC is from the surface to the uppermost groundwater table, per WAC 173-340-740(6)(c).

For ecological risk assessment, MTCA allows the use of a CPOC for sites with ICs to prevent excavation of deeper soil per WAC 173-340-7490(4)(a). The CPOC can be set at the soil biologically active zone for the direct contact pathway protective of ecological receptors, which is assumed to extend to a depth of 6 feet bgs. If ICs are proposed as part of the remedy for the Site, a CPOC may be used for the protection of ecological receptors via the direct contact pathway.

8.2.3 Air

The POC for ambient and indoor air is Sitewide; however, VI from subsurface contaminants will occur only in enclosed spaces and structures. An initial VI assessment was completed in 2019 to assess whether VI posed an immediate risk to occupants of the office building on-site (refer to Section 4.4). The assessment memorandum, included as Attachment C.3, concluded that VI was not a risk to building occupants. Therefore, further VI assessment was not considered as part of this FS for existing buildings. VI assessment for future structures is discussed in Section 12.1.5 as part of proposed ICs for the Site.

8.3 AREAS OF CONCERN

AOCs were developed based on the nature and extent of soil COCs. Refer to Section 7.1.2 for details about each AOC and the determination for the AOC boundaries. A summary of the COCs in soil and groundwater and depth of contamination for each AOC is presented in this section along with a description of physical features that will affect the remedy or design, and additional pre-design data needs that may affect the boundary extent in certain AOCs. COCs in groundwater exist outside the described AOCs, as described in Section 6.3. In addition, dieldrin and nitrate in groundwater extend past the property boundary at the southwest corner of the Site. Exceedances of groundwater and long-term monitoring will be addressed as part of each alternative. The AOCs and relevant site features are shown on Figure 8.1. For the specific sample locations within each AOC, refer to Figure 7.2.

AOC 1: AOC 1 contains multiple pesticides, TPH, and dioxins/furans in soil at concentrations greater than CULs to a maximum known depth of 7 feet bgs and multiple pesticides, TPH, and nitrate/nitrite in groundwater at concentrations greater than CULs. AOC 1 is along the eastern property edge and extends onto the BNSF property to include MW-16. Remedial actions in this AOC will need to include a buffer from the active BNSF rail line. Elevated concentrations of pesticides are present along the north edge of AOC 1, and additional data collection is needed to better define this boundary prior to design of the final remedy.

AOC 2: AOC 2 contains multiple pesticides in soil at concentrations greater than CULs to a maximum known depth of 7 feet bgs and dieldrin and nitrate in groundwater at concentrations greater than CULs. High concentrations of dieldrin at FS-09 (north side) and FS-27 (south side) are not fully bounded in soil. The containment area (west) and bulk fertilizer building (south) near AOC 2 define these boundaries. AOC 2 is also along the eastern property edge and extends onto the BNSF property. Remedial actions in this AOC would need to include a buffer from the active BNSF rail line.

AOC 3: Multiple pesticides and dioxins/furans are present in AOC 3 in soil to a maximum known depth of 5 feet bgs. There are no groundwater impacts in AOC 3. Additional data collection is needed to better define the lateral extent of off-site dioxin/furan contamination along the southwestern boundary of AOC 3 prior to design of the final remedy. AOC 3 is along the southeastern edge of the property, and remedial actions in this AOC would need to include a buffer from the active BNSF rail line and access to the adjoining property for data collection and cleanup.

AOC 4: AOC 4 contains multiple pesticides and TPH in soil at concentrations greater than CULs to a maximum known depth of 5 feet bgs for pesticides and 9 feet bgs for TPH. Dieldrin and nitrate/nitrite in groundwater are greater than CULs in AOC 4. Elevated concentrations of dieldrin are present along the western edge of AOC 4, and additional data collection is needed to better define this boundary of AOC 4 prior to design of the final remedy. The containment area and bulk fertilizer building define the eastern boundary of AOC 4.

AOC 5: AOC 5 contains multiple pesticides and TPH in soil at concentrations greater than CULs to a maximum known depth of 7 feet bgs for pesticides and TPH (TPH may extend as deep as 12 feet bgs). In groundwater, multiple pesticides, TPH, and nitrates/nitrites are present at concentrations greater than CULs. Elevated concentrations of dieldrin are present in FS-16 in the northwest corner of AOC 5, and additional data collection is needed to better define this boundary prior to design of the final remedy. AOC 5 contains part of the office and storage building, a concrete pad for truck loading and unloading, and the northern edge of the containment area. The office and storage building is an older structure that has underlying contamination that will be considered during the evaluation of cleanup alternatives. The containment area is the southern boundary of AOC 5.

AOC 6: This AOC is characterized by shallow dieldrin and toxaphene in soil at concentrations greater than the CULs to a maximum depth of 2.5 feet bgs. Groundwater contamination is not present in this AOC. The eastern portion of AOC 6 extends beneath the machine shop, and underlying shallow soil contamination will need to be considered during the evaluation of cleanup action alternatives.

Additional data described in the bullets in Section 7.2 will be collected as part of a pre-design investigation prior to submittal of the EDR, as further described in Section 12.1.1.

8.4 REMEDIATION LEVELS

This section discusses the use of RELs at the Site. In accordance with WAC 173 340-200, a REL “means a concentration of a hazardous substance in soil, air, water, or sediment above which a particular cleanup action component will be required as part of a cleanup action at a site.” RELs are, by definition, concentrations that exceed cleanup standards and can be used when a combination of cleanup action components are necessary to achieve CULs at a POC. RELs may also be used where soil containment (i.e., under a cap) is part of the cleanup action alternative. A summary of COCs and proposed CULs for the Site is included in Section 6.0. Cleanup actions that use RELs to meet the cleanup standards at a CPOC are also considered to comply with the cleanup standards.

RELs have been developed to identify the concentrations at which different cleanup actions are taken. Multiple cleanup technologies will be necessary in developing cleanup alternatives due to the widespread and varied nature of contamination across the Site. In addition, inaccessible areas of contamination beneath buildings and the containment area and ongoing sources of contamination from continued operational use will need to be addressed. A summary of the Sitewide nature and extent of contamination is presented in Section 7.0.

RELs are proposed only for some COCs in soil. COCs not discussed in the following sections will use their respective proposed CUL to determine the appropriate cleanup action.

Sitewide TPH soil data relative to the proposed RELs and CULs are shown on Figure 8.2, along with the approximate extent of the TPH groundwater plumes. Figures 8.3 through 8.5 provide Sitewide pesticide soil data and groundwater contamination extent at different depth intervals

relative to the proposed RELs and CULs. Figures 8.6 through 8.11 provide pesticide soil data for each AOC relative to the proposed RELs and CULs.

8.4.1 Soil Remediation Levels

Proposed soil RELs are levels that will result in achievement of the RAOs using a combination of source removal and soil containment. Where appropriate, a low-permeability cap would eliminate the direct contact pathway for workers and the leaching pathway of vadose zone soil to groundwater via stormwater infiltration. A low-permeability cap would also control ongoing sources of COCs from current and future industrial operations. Current operational sources of COCs are described in Section 7.1. The long-term goal is to achieve compliance with the proposed CULs in groundwater that are protective of human health via drinking water exposure, as measured at the proposed CPOC. Proposed soil CULs and RELs for Site COCs are presented in Table 8.1. All soil criteria are presented in Table 5.2.

**Table 8.1
Soil Chemicals of Concern Proposed Cleanup Levels and Remediation Levels**

Analyte	CAS No.	Proposed CUL (Leaching)	Proposed CUL (Direct Contact)	Proposed REL (Leaching)	Proposed REL (Direct Contact)
Metals (mg/kg)

Notes:

- 1 Based on MTCA Method A.
- 2 Based on WAC Equation 747-1.
- 3 Based on MTCA Method B.
- 4 Based on TEE. POC for the terrestrial ecological exposure pathway is the biologically active zone, defined within the Site as 0 to 6 feet bgs. Refer to Section 5.2.2.1.

During engineering design, a Long-Term Compliance Monitoring Plan (LTCMP) will be developed that meets the requirements of WAC 173-340-410. In this plan, cleanup action requirements will be evaluated where soil RELs are used. Performance and confirmation monitoring will be developed during engineering design.

8.4.1.1 Total Petroleum Hydrocarbons

The proposed TPH RELs are based on conservative residual saturation values. A residual saturation value is defined as the concentration at which the petroleum product is not mobile in groundwater. Selection of residual saturation values as RELs is consistent with WAC 173-340-747(3)(g), which states that soil concentrations left on-site must not result in the accumulation of light non-aqueous phase liquid in groundwater. A TPH REL based on residual saturation values is appropriate to use where groundwater exceedances are not of concern and the direct contact pathway has been addressed by other technologies.

Table 15-14 of Ecology’s Concise Explanatory Statement for the Amendments to the Model Toxics Control Act Cleanup Regulation (Ecology 2001) identifies residual saturation values for different petroleum products relevant to a variety of soil types.

The sum of total diesel- and oil-range TPH concentrations greater than the combined CUL is present in AOCs 1, 2, 4 and 5. AOCs 2 and 5 include predominately weathered diesel-range TPH, and AOCs 1 and 4 include primarily weathered oil-range TPH. Separate RELs were developed for diesel range-TPH and oil-range TPH to evaluate the collocation of these constituents with diesel- and oil-range TPH groundwater exceedances. The Site geology is characterized as layers of silty sand to silty gravel within the top 5 feet underlain by well-graded sand and gravel, as described in Section 2.7.1. Therefore, the residual saturation values for coarse sand and gravel in Table 15 14 (Ecology 2001) were conservatively chosen to be most appropriate for the Site based

on geology and hydrogeology: 3,879 mg/kg for middle distillates (i.e., diesel fuel) and 8,727 mg/kg for fuel oils.

These values are consistent with studies from the Alaska Department of Environmental Conservation (ADEC). In 2006, ADEC published recommendations from a joint working group that included ADEC, USEPA, and a number of federal stakeholders in Alaska regarding the formation of free product as a function of soil type and petroleum product (ASCWG 2006). The studies proposed residual saturation values of 2,200 mg/kg for middle distillate and 4,800 mg/kg for residual range in coarse gravel, and 6,500 mg/kg for middle distillate and 15,000 mg/kg for residual range in coarse sand (no values were proposed for coarse sand/gravel).

For conservatism, the RELs selected for use at the Site are less than those identified in Table 15 14 (Ecology 2001) and by ADEC. RELs proposed for the Site are 3,800 mg/kg for diesel range TPH and 8,700 mg/kg for oil-range TPH. The distribution of diesel-range TPH and oil-range TPH in soil at concentrations greater than the REL according to depth is shown on Figure 8.2.

8.4.1.2 Pesticides

Two different RELs were developed for pesticides: a REL protective of soil leaching to groundwater and a REL protective of commercial workers exposed via direct contact. The rationale for each of these RELs is described as follows.

Protection of Soil Leaching to Groundwater REL

A REL to protect the soil to groundwater (leaching) pathway was developed using an empirical demonstration by reviewing Site soil and groundwater data to determine at which concentration COCs in soil will not cause an exceedance of the established groundwater proposed CULs. This approach to develop empirical demonstration-based RELs is consistent with WAC 173-340-747(3)(f).

Soil sample locations within an approximately 20-foot radius of groundwater wells were considered collocated for purposes of performing the empirical demonstration.¹⁷ Collocated data for aldrin, beta-BHC, and chlordane indicated that these COCs were present in soil at concentrations greater than 50 times the leaching proposed CUL and leach to groundwater at levels that cause groundwater to exceed CULs (FS-05/FS-06 to MW-4). Elsewhere at the Site, collocated data for these COCs at concentrations between 1 and 5 times the soil proposed CUL did not cause exceedances in groundwater. However, there were no relevant soil data with lesser exceedances collocated with groundwater results that could be used to determine a threshold between 5 and 50 times the leaching proposed CUL that represents soil concentrations sufficient to cause groundwater contamination.

Toxaphene soil data indicate that leaching contributes to groundwater contamination when soil results are greater than 20 times the leaching proposed CUL (FS-23 to MW-1, FS-05/FS-06 to

¹⁷ Soil data collected at distances of up to 30 feet upgradient of groundwater wells were considered collocated when closer soil samples were not available.

MW-4, and FS-09 to MW-7). This threshold does not apply at all locations. For example, there were no exceedances of the toxaphene groundwater proposed CUL at MW-11 where collocated soil data are 60 to 80 times the CUL at nearby FS-27 and FS-28.

Dieldrin soil data also indicate that leaching contributes to groundwater contamination when soil concentrations are greater than 20 times the proposed CUL (nine clustered locations across the Site). Soil data collocated with MW-17 and MW-15, which meet groundwater CULs for dieldrin, exceed dieldrin leaching proposed CULs by exceedance factors ranging between 2 and 10. These data empirically demonstrate that soil concentrations 10 times greater than the leaching proposed CUL do not contaminate groundwater via the leaching pathway.

Based on analysis of Site data, a leaching REL of 20 times the leaching proposed CUL is proposed for pesticides to protect the soil to groundwater (leaching) pathway.

Protection of Commercial Worker Direct Contact REL

Proposed CULs may consider site-specific conditions that limit current and future exposure to contamination in accordance with WAC 173-340-708(10)(b)(i). At this site, exposure assumptions considered in development of the soil preliminary CUL for the direct contact pathway were not modified from their SLs. Therefore, RELs for commercial worker direct contact were developed using MTCA equations for direct contact CULs (WAC Equations 740-1 and 740-2) with considerations of site-specific exposure factors. Table 8.2 lists the exposure factors used in Equations 740-1 and 740-2.

**Table 8.2
Exposure Factors Used to Calculate Direct Contact RELs**

Criteria	Used Value	Basis
Reference dose	Refer to Appendix G	MTCA Default Value
Average body weight	70 kilograms	Commercial Exposure
Hazard quotient	1 (unitless)	MTCA Default Value
Averaging time	20 years	Commercial Exposure
Soil ingestion rate	150 milligrams per day	Commercial Exposure
Gastrointestinal absorption factor	1 (0.6) ⁽¹⁾ (unitless)	MTCA Default Value
Exposure frequency	0.40 (unitless)	Commercial Exposure
Exposure duration	20 years	Commercial Exposure

Note:

- 1 A factor of 0.6 was used for dioxins/furans.

8.4.1.3 Dioxins/Furans

As described in Section 6.2, current dioxin/furan soil concentrations are unlikely to negatively impact soil biota, plants, or wildlife and are, therefore, protective of terrestrial receptors. The proposed REL for dioxins/furans is 94 ng/kg, which is based on protecting worker direct contact. Similar to pesticides, the dioxin/furan REL was calculated using the MTCA equations for direct contact CULs (WAC Equation 740-1 and 740-2) with considerations of site-specific exposure factors. The exposure factors used in Equations 740-1 and 740-2 are listed in Table 8.2.

The extent of dioxin/furan contamination that is located along the southwestern corner of AOC 3 at the southern Property boundary remains a data gap and will be addressed as part of a pre-design investigation, further described in Section 12.1.1. The REL for dioxins/furans may be applied only to contamination within the Property boundary; therefore, dioxin/furan contamination extending past the Property boundary must be addressed to the established CULs.

8.4.2 Groundwater Remediation Levels

Groundwater RELs are not proposed at the Site. Soil RELs described in the preceding sections are intended to be protective of groundwater contamination and, when applied, will allow proposed groundwater CULs to be met long-term at the proposed CPOC. Each COC in groundwater will be included as part of long-term groundwater monitoring for the Site, and compliance will be determined based on compliance with the proposed groundwater CULs at the POC or CPOC, if one is established.

9.0 Remedial Technology Identification and Screening

Remedial technologies were reviewed and considered to address both soil and groundwater contamination at the Site. This section identifies and briefly describes the most common remedial technologies for cleanup of the site-specific COCs for soil (lead, aldrin, beta-BHC, chlordane, dieldrin, total DDT, toxaphene, atrazine, alpha-chlordane, simazine, diesel-range TPH, oil-range TPH, and dioxins/furans) and groundwater (nitrate, nitrite, aldrin, beta-BHC, chlordane, dieldrin, toxaphene, 2,4-D, atrazine, MCPA, diesel-range TPH, and oil-range TPH), and the application and limitations of each technology.

A preliminary technology screening was then completed to eliminate technologies that do not meet RAOs applicable to the Site, are not technically feasible, or do not address the types of contamination present.

9.1 IDENTIFICATION OF REMEDIAL TECHNOLOGIES COMMON TO SOIL AND GROUNDWATER CONTAMINATION

The following technologies may be applicable for remediation of soil and groundwater contamination at the Site and for long-term protection of human and ecological receptors from exposure to contaminated soil and groundwater.

9.1.1 No Action

No action indicates that no active remedial technology would be implemented. No action can provide a reference for comparison of the benefits of other remedial technologies.

9.1.2 Institutional Controls

ICs are physical, legal, and administrative measures that are implemented to minimize or prevent human exposure to contamination by restricting access to the Site. ICs often involve deed restrictions or covenants, site advisories, use restrictions, or consent decrees and would be implemented at the Site to limit or prohibit activities that may interfere with the integrity of any cleanup action or result in exposures to hazardous substances at the Site. ICs are typically implemented in addition to other technologies when those technologies leave COCs on-site at concentrations that could pose a risk to human or ecological receptors. ICs may include documents such as an Operations, Maintenance, and Monitoring Plan (OMMP) that would describe how contamination that remained on-site would be addressed if disturbed in the future.

ICs are applicable to Site soil for protection of terrestrial ecological receptors and are potentially applicable to all Site soil and groundwater COCs.

9.1.3 Monitored Natural Attenuation

Monitored natural attenuation (MNA) involves regular sampling and analysis to monitor the results of one or more naturally occurring physical, chemical, or biological processes that reduce

the mass, toxicity, volume, or concentration of chemicals in site soil or groundwater. These naturally occurring processes may include biodegradation; dispersion; dilution; sorption; volatilization; and chemical stabilization, transformation, or destruction of contaminants. MNA may be implemented as a stand-alone remedial technology or in combination with other remedial technologies.

In soil, natural attenuation would consist mainly of biodegradation of TPH, but it would not be an effective treatment for pesticides and herbicides. MNA is applicable to all groundwater contamination at the Site.

9.1.4 Engineering Controls

Engineering controls are physical measures constructed to block exposure pathways and reduce or eliminate contaminant exposure to ecological and human receptors. Engineering controls focus on controlling or preventing access to the contamination and do not remove or destroy contaminated material. Engineering controls can be used as permanent measures or as temporary measures to prevent exposure to the contamination until a permanent cleanup is implemented.

Any technology designed to block exposure to contaminated material can be considered an engineering control measure. Soil engineering controls include placement of an indicator layer on top of contaminated soil, stabilization of erosion areas, or the use of engineered equipment or access controls (e.g., fencing) to prevent or limit contact with contaminated soil. Installation of a surface cap such as pavement is also an engineering control that blocks exposure to contaminated soil and minimizes infiltration of stormwater through soil that causes leaching to groundwater. Surface capping is discussed separately from other engineering controls in Section 9.1.5.

Engineering controls require maintenance in perpetuity to ensure proper function and prevent exposures. They are typically implemented with ICs and other more permanent technologies. The engineering controls technology is applicable to all Site soil and groundwater COCs.

9.1.5 Surface Capping

Surface capping is a containment remedy that places a physical barrier over contaminated soil to control surface water infiltration, human and ecological exposure via direct contact, and soil erosion. Surface caps can be constructed with pervious material such as gravel or clean fill; impervious material such as asphalt, concrete, or geosynthetic clay liner (GCL); or a combination of those materials. They are engineered to meet the conditions of a site such as permeability requirements, erosion potential, and site use. Existing building slab footprints or paved surfaces can also act as a capped surface if they meet the engineer cap requirements for the site. Stormwater conveyance systems or other types of drainage system may need to be installed in combination with capping if the cap is designed to minimize infiltration or if capping modifies existing grades and associated drainage. Surface capping requires maintenance to preserve

integrity and is typically implemented with ICs that require cap maintenance and define procedures for soil and groundwater management when the cap is penetrated.

The surface capping technology is applicable to all Site soil COCs and is potentially applicable to all Site groundwater COCs.

9.1.6 Enhanced Bioremediation

Bioremediation of groundwater involves the process of using microorganisms in situ to degrade COCs to less- or non-toxic constituents. Microorganisms, nutrients, or oxygen are injected into groundwater to accelerate the natural biodegradation process and aid in the decomposition of COCs. Typical enhancements include oxygen, nitrates, or solid-phase peroxide products. Bioremediation amendments, such as a slow-oxygen-release compound, can be effective in treating residual contamination over a long time (up to 12 months) following implementation. Bioremediation amendments are typically applied to groundwater via a permanent well or temporary injection points. Bioremediation of groundwater is typically effective only once the source of the contamination is removed and is often used in combination with other remedial technologies.

Bioremediation of soil involves the process of using microorganisms in situ or ex situ to degrade COCs to less- or non-toxic constituents. Microorganisms, nutrients, or oxygen are injected into soil to accelerate the natural biodegradation process and aid in the decomposition of COCs. Typical enhancements include oxygen, nitrates, or solid-phase peroxide products. Bioventing involves adding oxygen to vadose zone soil to aid microorganisms already present in breaking down COCs. Bioventing is effective in the vadose zone for degrading TPH and organic vapors but is not effective at treating saturated soil. Mixing of microorganisms, nutrients, or oxygen with contaminated soil can also be accomplished with excavated soil in landfarms. Following degradation of COCs, the landfarmed soil can be replaced on-site.

Bioremediation is applicable to treat TPH, nitrate, nitrite and, to a lesser extent, organic pesticides in Site soil and groundwater.

9.1.7 Chemical Oxidation and Reduction

Chemical oxidation involves injecting oxidizing agents, such as ozone, hydrogen peroxide, or permanganate, into the subsurface to rapidly destroy organic chemicals. Injection can be applied in both vadose and saturated zones but is most effective in treating chemicals in the saturated zone. Applicability of chemical oxidation is dependent on aquifer characteristics, soil types, and the homogeneity of the subsurface, because injected solutions tend to follow preferential pathways through heterogeneous soil. Volumes of injected agent and rate of chemical injection are dependent on the subsurface conditions at the Site. Injection points may be installed as permanent injection wells or may be injected via temporary borings. The effectiveness of injections is quite dependent on-site conditions, which typically are heterogeneous, making it difficult to obtain an even and effective distribution of the oxidant. Further, a high soil oxidant

demand (i.e., high soil organic content that consumes the added oxidant) or other oxidizer sink may significantly reduce the effectiveness of chemical oxidants.

Chemical oxidation is applicable to treat all Site COCs in soil and groundwater.

9.1.8 Thermal Treatment

Thermal treatment (which is commonly applied via electrical resistance heating or thermal conduction) is a process that quickly and evenly heats contaminated waste to volatilize chemicals with low boiling points (e.g., TPH). Vapors are then recovered and typically treated using activated carbon or thermal oxidation. Thermal treatment can be applied as an in situ or ex situ process.

In situ thermal remediation involves passing electrical current or direct heat through zones of contaminated soil and groundwater. With electrical resistance heating, a current is delivered to the subsurface through a series of closely spaced electrodes. Resistance to the flow of electricity between electrodes via the natural resistance of the soil matrix generates heat in the subsurface. Soil consisting of silt can be heated as effectively as sandier zones due to the superior electrical resistance properties of silt or clay. If heated close to the boiling point of water, the heating process volatilizes chemical droplets embedded in soil into a vapor phase. The contaminated vapors, along with steam produced by the boiling of groundwater, are removed from the subsurface through a vapor recovery network for condensation and treatment.

Ex situ thermal treatment requires excavation and placement of the subsurface soil into a treatment cell or combustion chamber. The material is then heated through electrical resistance or application of direct heat to the temperature necessary to volatilize targeted solid and aqueous contaminants into the vapor phase. Ex situ thermal treatment generally allows a shorter and more efficient heating process than in situ thermal treatment because of the ability to homogenize the material inside the treatment cell; however, it requires additional costs in soil excavation and handling.

Thermal treatment is applicable to treat all COCs in soil and groundwater except lead.

9.2 IDENTIFICATION OF REMEDIAL TECHNOLOGIES FOR SOIL

The following technologies may be applicable for remediation of soil contamination at the Site and for long-term protection of human and ecological receptors from exposure to contaminated soil. Soil COCs consist of lead, aldrin, beta-BHC, chlordane, alpha-chlordane, dieldrin, total DDT, toxaphene, atrazine, simazine, diesel-range TPH, oil-range TPH, and dioxins/furans.

9.2.1 Excavation and Landfill Disposal

Excavation of contaminated soil using standard construction equipment is a common method to achieve remediation goals. For off-site disposal, excavated contaminated soil is transported by either truck or rail to an appropriate licensed landfill. The extent of soil removal is defined by remedial design sampling or confirmation soil sampling of the excavated surface prior to backfill,

compaction, and site restoration. Selection of backfill material and site restoration is dependent on site-specific considerations and is typically designed to meet future use of the site. In some circumstances, backfilled material may act as a capped surface if contamination remains deeper than the bottom depth of the excavation. Excavation may require relocation of mobile structures or shoring to maintain sidewall stability. Dewatering or drawdown of the groundwater table may also be required if excavation is to occur below the groundwater table. Excavation depths will vary depending on the depth of contamination, presence of subsurface utilities, and site use.

Excavation is applicable to treat all Site COCs in soil.

9.2.2 Solidification and Stabilization

Solidification and stabilization physically bind or chemically immobilize/stabilize the contamination within the soil matrix, thereby reducing or eliminating contaminant mobility. With solidification, the contaminants are either enclosed or bound within the soil matrix via a binding agent such as cement grout. Stabilization involves adding and mixing a chemical compound with the contaminated soil to make the COC immobile through a chemical reaction that forms a new compound that is less toxic than the parent COC, or through adsorption processes.

Soil mixing with an auger is a remediation technique that can be used to implement solidification or stabilization by mixing amended soil in overlapping soil columns. The soil columns are formed by advancing a large-diameter auger into the subsurface, in combination with a series of mixing shafts. As the mixing shafts are advanced into the soil, grout or slurry containing a reactant that destroys or stabilizes the COC (for example, zero-valent iron [ZVI]) is pumped through the hollow stem of the shaft and injected into the soil. This process generates a large amount of spoils that are difficult to handle and can also leave wedges of untreated soil in the spaces between the installed soil columns.

Solidification or stabilization can also be accomplished in conjunction with excavation by mixing the binding agent into the soil at the base of excavation. This method can be advantageous if deeper excavation is riskier or more expensive due to structural stability.

The solidification and stabilization technologies are applicable to treat all Site COCs in soil.

9.2.3 Soil Vapor Extraction

Soil vapor extraction (SVE) is a process that extracts soil vapor from unsaturated soil pore spaces in the vadose zone by applying a vacuum to the subsurface. Vacuum is applied by a blower connected to extraction wells screened within the unsaturated area of contamination. The controlled flow of air removes accumulated volatile vapors from the unsaturated zone, which causes additional volatilization of chemicals in the soil to the vapor phase. Soil vapor extracted from the subsurface is processed through a treatment system, typically including filters for particulate removal, condensate removal, and treatment by oxidation or carbon filtration. SVE systems may be enhanced with air sparging or groundwater extraction if contamination extends below the water table.

SVE is applicable to the volatile fraction of the TPH soil contamination located in the vadose zone but is not effective in treating the heavy fraction of TPH (higher end of diesel- and oil-ranges) or other Site COCs.

9.3 IDENTIFICATION OF REMEDIAL TECHNOLOGIES FOR GROUNDWATER

The following technologies may be applicable for remediation of groundwater contamination at the Site and for long-term protection of human and ecological receptors from exposure to contaminated groundwater. Groundwater COCs consist of nitrate, nitrite, aldrin, beta-BHC, chlordane, dieldrin, toxaphene, 2,4-D, atrazine, MCPA, diesel-range TPH, and oil-range TPH.

9.3.1 Remediation of Source Soil Contamination

The source of groundwater contamination on-site comes from the direct leaching of soil contamination or the diffusion of contaminated groundwater in contact with contaminated soil. Therefore, the application of technologies to remove or reduce COC concentrations in soil will also be effective in reducing COC concentrations in groundwater. The effectiveness of groundwater remediation via remediation of soil is determined by the degree of COC concentration reduction in soil and the natural attenuation potential for each COC in groundwater. Source removal typically includes groundwater monitoring following remedy implementation to confirm that the soil source to groundwater has been effectively removed and that groundwater concentrations are less than cleanup standards. Compliance may not occur immediately and may require a short time frame for subsurface conditions to stabilize.

9.3.2 In Situ Groundwater Treatment

There are multiple methods for in situ groundwater treatment, each of which typically involves creating a passive treatment zone in the groundwater column. One method of in situ groundwater treatment is a permeable reactive barrier (PRB) wall that intercepts and treats contaminated groundwater flowing from an upgradient source. Groundwater flows through a treatment wall of reactive material, typically composed of ZVI mixed with sand. Permeable barrier walls, such as PRB walls, are generally constructed in one of two configurations, either as a “funnel and gate” configuration that employs angled wing walls to capture and direct the contaminated groundwater to a central treatment unit or as a linear trench intersecting the plume. Groundwater flows according to its natural gradient through the PRB, where the reactive media within the wall react with the dissolved chemicals in groundwater. The life span and effectiveness of a PRB wall is also dependent on the mass of chemicals passing through the wall. PRB walls do not remediate the source area itself but decrease the contaminant solubility or otherwise immobilize the chemicals migrating from the source area with the groundwater. An alternative in situ groundwater treatment method is to create a passive treatment zone by injecting colloidal liquid activated carbon, such as the trademarked Regenesis PlumeStop™, in a formation within or downgradient of the contaminated plume. PlumeStop can also be amended with ZVI or other chemical-reduction compounds.

In situ groundwater treatment is applicable for remediating all Site COCs in groundwater.

9.3.3 Low-Permeability Barrier Wall

Barrier wall containment technologies are implemented to contain chemicals in place and typically do not involve further source area treatment. Vertical containment barriers are placed in the subsurface to cut off groundwater flow and stop chemical migration. They can be constructed using a variety of materials such as metal sheet piling, high-density polyethylene (HDPE), or a slurry mixture. The slurry wall is constructed of a low-permeability material, typically a soil and bentonite clay mixture, that does not degrade in the environment. Barrier walls are typically constructed vertically from the ground surface to a depth greater than the chemical plume in soil and groundwater, or until the wall encounters a confining layer. Containment remedies are often implemented in combination with permanent pumping remedies to maintain inward gradients within the contained area and provide hydraulic control. Barrier walls and hydraulic control require continued monitoring in perpetuity to confirm the hydraulic gradients are maintained and extensive maintenance on the systems installed to pump groundwater to maintain inward gradients. Pumping system operations would also require treatment and disposal of extracted groundwater that is contaminated.

A low-permeability barrier wall is applicable to all Site COCs in groundwater.

9.3.4 Pump and Treat

Pump and treat involves pumping contaminated groundwater from the subsurface and treating it before it is discharged. Treatment is generally conducted by air stripping for VOCs, filtration via activated carbon for organic compounds, or precipitation or ion exchange for metals. Groundwater pump and treat can reduce chemical concentrations in saturated soil slowly by increasing the diffusion of soil contamination into groundwater. Extraction system design and treatment are dependent on the site characteristics and chemical type. Extraction wells may be screened at different levels or intervals to maximize the system effectiveness; however, restoration time frames for pump and treat systems are often very long because pump and treat cannot significantly accelerate the removal of mass from source areas, which are often large enough to leach chemicals into groundwater for long periods of time.

The pump and treat technology is applicable to all Site COCs in groundwater.

9.3.5 Air Sparging

Air sparging is typically used to treat groundwater contaminated with volatile and certain semivolatile chemicals including the volatile fraction of TPH. Air is injected into the contaminated aquifer through injection wells, where it bubbles upward through channels in the soil column, creating an air stripping effect that moves chemicals in groundwater to the air bubble, which migrates to the vadose zone where it can be recovered and treated. Air sparging is limited by contaminant depths and works best in homogenous sandy soil formations that limit preferential pathways for air flow.

The air sparging technology would not be applicable to most Site COCs in groundwater including the heavier diesel- and oil-range TPH contamination and organochlorine pesticides.

9.4 PRELIMINARY SCREENING OF REMEDIAL TECHNOLOGIES

A preliminary screening of the remedial technologies listed in Sections 9.1 through 9.3 was completed in accordance with WAC 173-340-350(8)(b). The objective of the screening was to remove technologies from further evaluation if they clearly did not meet the minimum requirements of the RAOs or had a disproportionate cost to apply based on the site conditions. The preliminary screening process retains or rejects technologies based on the applicability at the Site given: the COCs and impacted media, effectiveness based on proven success at similar sites, applicability of the technology within the Site physical constraints, and the ability of the technology to achieve RAOs. Table 9.1 evaluates each technology compared to these criteria and indicates if the technology was retained or rejected as a result of the screening process.

Based on this preliminary screening step, the following technologies were rejected from further evaluation for remediation of soil or groundwater:

- No action
- Solidification and stabilization
- Enhanced bioremediation
- Chemical oxidation
- SVE
- Thermal treatment
- Low-permeability barrier wall
- Pump and treat
- Air sparging

The remaining technologies were retained for further consideration as part of the cleanup action alternative evaluation in one or more AOCs:

- ICs
- MNA
- Engineering controls
- Surface capping
- Source removal by excavation and landfill disposal
- In situ groundwater treatment

These technologies may be implemented as stand-alone treatments or in combination with other technologies, as appropriate, depending on subsurface conditions. These retained technologies were evaluated for each AOC and then aggregated into Sitewide alternatives for further evaluation as described in Section 10.0.

10.0 Identification of Cleanup Action Alternatives

The technologies that were retained in Section 9.4 have been aggregated into cleanup action alternatives for soil and groundwater contamination at the Site and compiled into Sitewide alternatives, as described in the following sections.

10.1 CLEANUP ACTION ALTERNATIVES

The alternatives summarized in the following sections were selected to address both soil and groundwater contamination at the Site and are presented in order from least protective to most protective. Alternative 1 is a minimum removal alternative, and Alternative 4 is a full removal alternative to the maximum extent practicable. Consistent with WAC 173-340-350(8)(c)(ii)(B)(II), Alternative 4 does not fully meet the definition of a permanent cleanup action because it is not technically possible to address all contaminated soil beneath all active structures, although it addresses the majority of contaminated soil present. The four alternatives are summarized in Table 10.1 and will be evaluated according to the MTCA DCA procedures described in Section 11.0, to compare the costs and benefits of each of the alternatives, and to identify the alternative that is permanent to the maximum extent practicable. A summary of the alternative costs is shown on Table 10.1.

10.1.1 Alternative 1

Alternative 1 is shown on Figure 10.1 and includes the following elements:

- **Excavation:** Localized shallow pesticide contamination in AOC 6 and surface TPH contamination around FS-01 would be excavated to CULs where asphalt is not installed. Excavation of these two areas would remove approximately 60 cubic yards (CY) of contaminated soil. Prior to asphalt capping described below, the top 1 foot of surface soil would be excavated across much of the Site. The total volume of soil removed in Alternative 1 is 1,810 CY. All excavated soil would be disposed of off-site at a permitted Subtitle D landfill facility. The depth of excavation and amount of soil removal are summarized in Table 10.1.
- **Capping:** After excavation of a certain amount of surface soil necessary for grading (likely a minimum of 1 foot),¹⁸ the area would be replaced with crushed surfacing base course (CSBC) and asphalt surfacing to restore the existing grade, which would cap the remaining contamination on-site. The installation of a new stormwater conveyance and treatment system would be a necessary component of this alternative because stormwater currently infiltrates through the gravel surface. Asphalt would not be required in the northern area of the Site where only localized surface contamination is present and is proposed to be excavated.

¹⁸ Most of the surface soil in the AOCs is contaminated; therefore, a limited amount of contaminated soil removal would occur as part of grading that would be necessary prior to asphalt pavement installation.

The asphalt and drainage evaluation for the Site was completed by PBS Engineering and Environmental Inc. (PBS). Current operations, which involve heavy equipment and frequent turning, were considered by PBS to determine the necessary thickness of pavement and CSBC (refer to the asphalt cross section on Figure 10.1). The addition of pavement and stormwater infrastructure would trigger permit coverage under the Industrial Stormwater General Permit (ISGP) and would likely require stormwater treatment as part of the system design.

Existing structures (i.e., the office and storage building) that have contaminated soil beneath them will also function as a cap. Monitoring the integrity of these structures will be required as part of the ICs.

In addition to shallow excavation and capping, MNA and ICs would be a component of this alternative, as described in Sections 10.2 and 10.3. A CPOC would be established along the downgradient property boundary and long-term groundwater monitoring would be necessary to monitor groundwater recovery and compliance with cleanup standards. Of note, the asphalt surface would require periodic maintenance and eventual replacement over time given the temperature extremes in Ellensburg and load and turning requirements of heavy machinery used on property.

The estimated cost for Alternative 1 is \$2,508,000, as shown in Table 10.1 and Table I.2 of Appendix I.

10.1.2 Alternative 2

Alternative 2 is shown on Figure 10.2 and includes the following elements:

- **Excavation:** Remove soil with COC concentrations greater than commercial worker direct contact RELs for pesticides and dioxins/furans,¹⁹ RELs for TPH, and CULs for other COCs (lead and pesticides without established RELs) and dispose of off-site at a permitted Subtitle D landfill facility. Localized shallow pesticide contamination in surface soil in AOC 6 and surface TPH soil contamination around FS-01 would be excavated to CULs. Alternative 2 would remove a total of 2,610 CY of contaminated soil. The depth of excavation and amount of soil removal in each AOC is summarized in Table 10.1.
- **Geosynthetic Clay Liner:** A GCL would be installed in portions of AOC 1 and AOC 2 and throughout AOC 4 to provide a protective barrier to remaining pesticide contamination at concentrations greater than leaching RELs in areas with the most significant groundwater contamination. The total area of GCL installed will equal approximately 22,300 square feet (SF). The surface layer will be excavated in areas where GCL will be placed outside excavation footprints to an approximate depth of 1.5 feet bgs. The GCL will be extended beyond the area of known contamination and

¹⁹ If pre-design data show that contamination in AOC 3 extends off-property, then excavation off-property will be designed to meet CULs

would provide a secondary benefit of source control in the primary traffic route for current bulk fertilizer loading operations. The GCLs would be constructed with a gentle slope to shed water and direct infiltrated precipitation to respective drainage trenches. One trench would be installed along the east side of the facility to manage flow from the northeast GCL, and a second trench would be installed along the south side of the facility to manage flow from the southwest GCL. Both trenches would have a perforated underdrain within the GCL footprint and would be filled with gravel to convey surface runoff and shallow subsurface flow from above the GCL. Outside of the GCL footprint, the conveyance lines would be solid conveyance pipe to prevent exfiltration of collected surface water to other areas of the Site. Both trenches would drain to a single collection manhole that would be installed near the existing culvert in the southeast corner of the facility to allow sedimentation of solids before infiltration and discharge to an existing swale. The GCL and drainage evaluation was performed by PBS.

- **In Situ Groundwater Treatment:** A liquid activated carbon matrix (such as PlumeStop) would be injected into the subsurface along the downgradient edge of AOC 5 to passively treat groundwater contamination migrating from underneath the office and storage building. The liquid activated carbon is a colloidal substance that coats the surface of soil particles and adsorbs organic contaminants in groundwater to immobilize the contaminants from migrating further.
- **Capping:** Contaminated soil with COC concentrations greater than direct contact RELs will require a cap to protect worker direct contact exposure. The cap will include the office and storage building in AOC 5, which covers TPH- and pesticide-contaminated soil, and the GCL in AOC 4, which covers deeper TPH-contaminated soil. Monitoring the integrity of these structures will be required as part of the ICs.

In addition to excavation, GCL, groundwater treatment, and capping, MNA after excavation of contaminated soils and ICs would be a component of this alternative, as described in Sections 10.2 and 10.3. In addition, a CPOC would be established along the downgradient property boundary and long-term groundwater monitoring would be necessary to monitor groundwater recovery and compliance with cleanup standards. The GCL is presumed to require less maintenance than an asphalt surface because the gravel surface above the GCL is more conducive to ongoing operations.

The estimated cost for Alternative 2 is \$2,087,000, as shown in Table 10.1 and Table I.3 of Appendix I.

10.1.3 Alternative 3

Alternative 3 is shown on Figure 10.3 and includes the following elements:

- **Excavation:** Remove soil with COC concentrations greater than leaching RELs for pesticides, RELs for TPH and dioxins/furans,²⁰ and CULs for other COCs (lead and pesticides without established RELs) and dispose of off-site at a permitted Subtitle D landfill facility. Localized shallow pesticide contamination in surface soil in AOC 6 and surface TPH soil contamination around FS-01 would be excavated to CULs. Alternative 3 would remove a total of 3,070 CY of contaminated soil. The depth of excavation and amount of soil removal in each AOC is summarized in Table 10.1.
- **Geosynthetic Clay Liner:** A GCL would be installed in portions of AOCs 1 and 2 to provide a barrier to remaining pesticide contamination at concentrations greater than leaching CULs in areas with exceedances of groundwater CULs. The surface layer will be excavated in areas where GCL will be placed outside excavation footprints to an approximate depth of 1.5 feet bgs. The total area of GCL installed will equal approximately 15,650 SF. A GCL would not be installed in AOC 4 because pesticide concentrations greater than the empirically based leaching CULs would be removed and pesticide concentrations in groundwater in this area is less than 10 times the CUL, which is expected to meet cleanup standards within a reasonable time frame. The GCL across AOC 1 and AOC 2 would be extended beyond the area of known contamination and would provide a secondary benefit of source control within the primary traffic route for current bulk fertilizer loading operations. The GCL would be constructed with a gentle slope to shed water and direct infiltrated precipitation to respective drainage trenches. One trench would be installed along the east side of the facility to manage flow from the GCL. This trench would have a perforated underdrain within the GCL footprint and would be filled with gravel to convey surface runoff and shallow subsurface flow from above the GCL. Outside of the GCL footprint, the conveyance lines would be solid conveyance pipe to prevent exfiltration of collected surface water to other areas of the Site. The trench would drain to a single collection manhole that would be installed near the existing culvert in the southeast corner of the facility to allow sedimentation of solids before infiltration and discharge to an existing swale. The GCL and drainage evaluation was performed by PBS.
- **In Situ Groundwater Treatment:** A liquid activated carbon matrix (such as PlumeStop) would be injected into the subsurface along the downgradient edge of AOC 5 to passively treat contaminated groundwater migrating from underneath the office and storage building. The liquid activated carbon is a colloidal substance that coats the surface of soil particles and adsorbs organic contaminants in groundwater.
- **Capping:** Contaminated soil with COC concentrations greater than direct contact RELs will require a cap to protect worker direct contact exposure. The cap will include the

²⁰ If pre-design data show that contamination in AOC 3 extends off-property, then excavation off-property will be designed to meet CULs.

office and storage building in AOC 5, which covers TPH- and pesticide-contaminated soil, and the new gravel surface in AOC 4, which covers deeper TPH-contaminated soil. Monitoring the integrity of these structures will be required as part of the ICs.

MNA after excavation of contaminated soils and ICs would be a component of this alternative, as described in Sections 10.2 and 10.3. In addition, a CPOC would be established along the downgradient property boundary and long-term groundwater monitoring would be necessary to monitor groundwater recovery and compliance with cleanup standards.

The estimated cost for Alternative 3 is \$2,107,000, as shown in Table 10.1 and Table I.4 in Appendix I.

10.1.4 Alternative 4

Alternative 4 is shown on Figure 10.4 and includes the following elements:

- **Excavation:** Remove soil with COC concentrations greater than CULs to the maximum extent practical for all COCs and dispose of off-site at a permitted Subtitle D landfill facility. The office and storage building would be demolished to access the area of contamination beneath the building. Deeper areas of excavation would require shoring or soil layback to stabilize the excavation side slopes, and dewatering of the excavation would require treatment and disposal of extracted groundwater. Following remediation, the office and storage building would be restored to resemble existing conditions. Alternative 4 would remove a total of 5,370 CY of contaminated soil. The depth of excavation and amount of soil removal in each AOC is summarized in Table 10.1.
- **Capping:** Existing structures (i.e., the office and storage building) that have contaminated soil beneath them will also function as a cap. Monitoring the integrity of these structures will be required as part of the ICs.

MNA after excavation of contaminated soils and ICs would be a component of this alternative, as described in Sections 10.2 and 10.3. In addition, a CPOC would be established along the downgradient property boundary and long-term groundwater monitoring would be necessary to monitor groundwater recovery and compliance with cleanup standards.

The estimated cost for Alternative 4 is \$3,173,000, as shown in Table 10.1 and Table I.5 of Appendix I.

10.2 MONITORED NATURAL ATTENUATION AND GROUNDWATER MONITORING

The technologies proposed for each alternative address soil contamination and will facilitate the recovery of groundwater contamination by removing the source of contamination or by capping contamination to block the infiltration of stormwater, which leads to groundwater leaching. Nitrate and nitrite are widespread contaminants in groundwater but are not COCs in soil; therefore, the proposed technologies will serve to remove source material and block infiltration

of stormwater in areas with the greatest concentrations of these COCs in groundwater. MNA for groundwater is a component of each alternative after excavation of contaminated soils, and natural attenuation processes would be assumed for long-term groundwater recovery. Therefore, post-remedy groundwater monitoring would be part of each alternative after remedy implementation to confirm that natural attenuation is occurring and downward concentration trends are apparent after remedy implementation. Specific details for long-term groundwater monitoring will be included in a Groundwater Monitoring Plan (GMP). The GMP will describe required post-construction groundwater monitoring and adaptive management to ensure the long-term protectiveness of the selected remedy and will be part of a LTCMP for the Site, which will be prepared as part of engineering design.

10.3 INSTITUTIONAL CONTROLS

ICs are legal and administrative controls intended to restrict human activities such that exposure to contaminants can be prevented or reduced. ICs will be included for the selected remedy for the Site. Specific ICs for the Site would include restrictions on land use, resource use (i.e., prohibit the use of groundwater within Site boundaries as drinking water), and provisions for maintaining the cap as a barrier to subsurface soil contamination, if warranted.

A Soil Management Plan (SMP) would be prepared as part of the ICs to identify where contaminated soil remains on-site. Any activities that would be proposed within these restricted areas would require compliance with the SMP, which would outline health and safety protocols along with soil handling and management procedures. The SMP will also provide details for routine inspection and maintenance of remedial elements (such as the cap, the drainage system, and monitoring wells) and will be part of the LTCMP for the Site. Lastly, contingency actions, as described in Section 12.3, would also be included in the LTCMP should conditions or site-use change in the future.

11.0 Cleanup Action Alternatives Evaluation and Disproportionate Cost Analysis

In this section, the cleanup action alternatives developed for the Site are evaluated against the MTCA requirements for a cleanup remedy per WAC 173-340-360.

11.1 CLEANUP ACTION ALTERNATIVE EVALUATION

This section provides a summary of the requirements and criteria that each remedial alternative is evaluated against in accordance with MTCA. Each of the proposed cleanup action alternatives is screened relative to mandatory “MTCA Threshold Requirements” and “Other MTCA Requirements” for evaluation. A DCA is conducted to identify the alternative that is “permanent to the maximum extent practicable,” using DCA evaluation criteria. Based on these evaluations, a Preferred Cleanup Action Alternative is selected for recommendation to Ecology.

11.1.1 Model Toxics Control Act Threshold Requirements

WAC 173-340-360(2) states that when multiple cleanup action components are implemented for a single site, the overall cleanup action components shall also meet the minimum requirements of WAC 173-340-360(2)(a):

- **Protect Human Health and the Environment.** Protection of human health and the environment shall be achieved through implementation of the selected cleanup action.
- **Comply with Cleanup Standards.** Cleanup standards, as defined by MTCA, include CULs for hazardous substances present at the site; the location, or POC, where the CULs must be met; and any regulatory requirements that may apply to the site due to the type of action being implemented and/or the location of the site.
- **Comply with Applicable State and Federal Laws.** WAC 173-340-710 states that cleanup standards shall comply with applicable state and federal laws. Section 12.5 identifies the ARARs for the preferred alternative for this Site.
- **Provide for Compliance Monitoring.** MTCA requires that all cleanup action alternatives provide for compliance monitoring as described in WAC 173-340-410. Compliance monitoring includes protection monitoring during remedial implementation to monitor short-term risks and confirm protection of human health and the environment during construction activities. Performance monitoring will assess short-term remedy effectiveness and confirm compliance with the CULs immediately following remedy implementation. Confirmation monitoring will evaluate long-term effectiveness of the cleanup action following attainment of the cleanup standards.

Cleanup alternatives that meet the threshold requirements must also fulfill other MTCA requirements described in WAC 173-340-360(2)(b). These additional requirements include the following:

- **Use Permanent Solutions to the Maximum Extent Practicable.** The use of permanent solutions to the maximum extent practicable for a cleanup action is analyzed according to the procedure described in WAC 173-340-360(3). Preference is given to

alternatives that implement permanent solutions, defined in MTCA as actions that can meet cleanup standards “without further action being required at the site being cleaned up or any other site involved with the cleanup action, other than the approved disposal of any residue from the treatment of hazardous substances” (WAC 173-340-200). Under WAC 173-340-360(2)(h), a DCA is required for a cleanup action that uses RELs.

- **Provide for a Reasonable Restoration Time Frame.** A cleanup action shall provide for a reasonable restoration time frame. The factors to be considered when determining the reasonable restoration time frame are listed in WAC 173-340-360(4)(b) and include, but are not limited to, the potential risks posed by the site, the practicability of achieving a shorter restoration time frame, and the current and expected future use of the site.
- **Consideration of Public Concerns.** Public involvement must be initiated according to the requirements set forth in WAC 173-340-600. Ecology’s decision on alternative selection will be presented for public comment in the draft CAP.

11.2 EVALUATION OF THRESHOLD REQUIREMENTS

All of the proposed Sitewide cleanup action alternatives meet the MTCA Threshold Requirements as described below:

- **Protection of Human Health and the Environment.** The proposed alternatives provide varying degrees of protection of human health and the environment through methods of contaminated mass removal by excavation or passive in situ groundwater treatment. All of the proposed alternatives are capable of achieving the proposed CULs for protection of groundwater as drinking water, as measured at the CPOC.
- **Comply with Cleanup Standards.** Cleanup standards for soil are expected to be met by all alternatives through the proposed active remediation methods or by implementing engineering controls and ICs to prevent exposure. Groundwater CULs are anticipated to be met at the CPOC by all alternatives over the predicted restoration time frame.
- **Comply with Applicable State and Federal Laws.** All alternatives address and comply with all relevant and applicable state and federal laws relevant to this project, as described in Section 12.5.
- **Provide for Compliance Monitoring.** All alternatives would include compliance monitoring throughout the cleanup area per WAC 173-340-410. For any alternative selected as the preferred cleanup action, a GMP would be prepared as part of the LTCMP and would include long-term groundwater monitoring to be conducted following completion of cleanup activities to evaluate compliance with proposed CULs at the CPOC.

11.3 EVALUATION OF RESTORATION TIME FRAME

Site-specific groundwater conditions may be taken into consideration under WAC 173-340-360(4)(b) when considering the definition of a reasonable restoration time frame and whether it is practicable to achieve a shorter restoration time frame. Two of the COCs in groundwater, dieldrin and nitrate, are present at high magnitudes across a large portion of the Site and extend off-Property in the southwest corner. The maximum compliance result of dieldrin in groundwater was 0.88 µg/L at MW-4 during the March 2020 sampling event, which is 160 times the proposed groundwater CUL of 0.0055 µg/L based on potable groundwater consumption. Nitrate, which is a COC only in groundwater, had a maximum compliance result of 220,000 µg/L at MW-6 in the central portion of the Site, which is 22 times the proposed CUL of 10,000 µg/L. It is not practicable to achieve CULs for these COC within a restoration time frame shorter than 5 years. Each of the alternatives include some amount of source removal and capping to block the leaching pathway; therefore, the predicted restoration time frames for groundwater between 5 to 25 years are all reasonable. The predicted restoration time frames are based on best professional judgment and experience with similar sites, technologies, and COCs. The restoration time frame for groundwater to meet proposed cleanup standards at the CPOC for each alternative is as follows:

- Alternative 1: 20 to 25 years
- Alternative 2: 15 years
- Alternative 3: 10 years
- Alternative 4: 5 years

11.4 DISPROPORTIONATE COST ANALYSIS

The MTCA DCA is used to evaluate whether a cleanup action uses permanent solutions to the maximum extent practicable, as determined by the level of attainment of a specific criterion defined within WAC 173-340-360(3)(f). The relative benefits and costs associated with each alternative are compared using seven evaluation criteria. As stated in MTCA, the cost of an individual alternative is determined disproportionate “if the incremental costs of the alternative over that of a lower cost alternative exceed the incremental degree of benefits achieved by the alternative over that of the other lower cost alternative” (WAC 173-340-360(3)(e)(i)).

Evaluation of disproportionate cost compares each alternative against the most permanent alternative presented and attainment of MTCA criteria, which factors into the overall permanence of each alternative. Alternative 4 is the most permanent alternative presented; however, it is not technically possible to implement and is not considered in the FS per WAC 173-340-350(8)(c)(ii)(B)(II). It is not technically feasible to remove certain structures (machine shop, AST containment area, bulk fertilizer building, and BNSF rail line) under current and reasonable future site operations without significant disruption to site use. Therefore, Alternative 3 is the most permanent alternative that the evaluation of disproportionate cost is compared against. This can be a qualitative or quantitative analysis, and when multiple alternatives possess equivalent benefits, the lower-cost alternative will be selected. The seven criteria defined in MTCA (WAC 173-340-360(f)) include protectiveness, permanence, effectiveness over the long-

term, management of short-term risks, technical and administrative implementability, considerations of public concerns, and cost:

- **Protectiveness.** Overall protectiveness of human health and the environment, including the degree to which existing risks are reduced, the time required to reduce these risks, and the overall improvement in environmental quality.
- **Permanence.** The degree to which the alternative permanently reduces the toxicity, mobility, or volume of hazardous substances.
- **Cost.** The cost to implement the alternative, consisting of construction, net present value of any long-term costs, and agency oversight costs that are recoverable.
- **Effectiveness over the Long-Term.** Long-term effectiveness consists of the degree of certainty that the alternative will be successful, the reliability of the alternative during the time when hazardous substances are expected to remain on-site at concentrations greater than CULs, the magnitude of the residual risk with the alternatives in place, and the effectiveness of controls in place to control risk while contaminants remain on-site.
- **Management of Short-Term Risks.** Short-term risks consist of the risk to human health and the environment associated with the alternative during construction and implementation and the effectiveness of measures taken to control those risks.
- **Technical and Administrative Implementability.** The ability of the alternative to be implemented is based on whether the alternative is technically possible and meets administrative and regulatory requirements, and if all necessary services, supplies, and facilities are readily available.
- **Consideration of Public Concerns.** These considerations involve whether the community has concerns regarding the alternative and, if so, to what extent the alternative addresses those concerns.

As part of the DCA, each alternative was ranked and assigned a numerical score for each DCA criterion except cost on a scale of 1 to 10, where a score of 10 represents the greatest benefit and a score of 1 represents the least benefit. Each numerical score was then multiplied by a weighting value, and the scores were summed to determine the total alternative benefit score. The weighting values used in this FS are as follows:

- Protectiveness: 30%
- Permanence: 20%
- Effectiveness over the long-term: 20%
- Management of short-term risks: 10%
- Technical and administrative implementability: 10%
- Consideration of public concerns: 10%

The alternatives are evaluated relative to their ability to comply with the criteria listed above and are compared to both each other and the criteria. Because some alternatives provide a similar

degree of compliance with a given criterion, the associated evaluation statements may be the same or similar. Estimated costs for each alternative are summarized in Table 11.1 and presented in detail in Appendix I. The following sections provide a summary of each of the DCA criteria and discuss the rationale for why each alternative was scored in relation to the other alternatives. DCA criteria aspects that were considered equal for all alternatives did not influence the scoring distribution and are not discussed in the following sections. A full description of all aspects evaluated under each criterion for the alternatives is included in Table 11.2.

11.4.1 Protectiveness

Protectiveness was evaluated based on the degree to which existing risks were reduced, time required to reduce risks and attain cleanup standards, risks resulting from alternative implementation, and improvement in overall environmental quality. Alternative 4 is considered the most protective remedy because it would remove the most soil contamination from the Site, has the shortest restoration time frame for groundwater (5 years), and has the greatest overall improvement in environmental quality. Alternative 4 was scored a 9. Alternative 3 includes the second greatest volume of soil removal, but significantly less than Alternative 4, and includes a GCL-capped area and in situ groundwater treatment. Alternative 3 was scored an 8. Alternative 2 includes a smaller volume of soil removal than Alternative 3, but a larger GCL capping footprint and the same volume of in situ groundwater treatment injection. Alternative 2 was scored a 6. Alternative 1 was scored a 3 because it has a much smaller volume of contaminated soil removal, an asphalt cap across most of the Site, and longer restoration time frame than the other alternatives.

11.4.2 Permanence

Permanence was evaluated based on the degree of reduction of contaminant toxicity, mobility, volume, adequacy of destruction of hazardous substances, reduction or elimination of release sources, degree of irreversibility, and risk of treatment residuals. Alternative 4 is the most permanent alternative and was scored the highest at a 9 because it removes almost all contaminated soil greater than CULs. The limited amount of residual soil contamination remaining in place post-remedy is isolated beneath existing structures. Alternative 3 was scored an 8 because the alternative removes all accessible soil that is at risk of leaching contaminants to groundwater and soil that is a direct contact risk to commercial/industrial workers. This alternative relies on a physical cap and ICs to maintain protection against remaining contamination on-site. Alternative 2 was scored a 5 because it removes a smaller volume of contaminated soil than Alternative 3 and relies on a larger GCL cap footprint with ICs. Alternative 1 was scored the lowest with a 2 because it relies solely on a cap and ICs to protect workers from direct contact with contaminated soil. Asphalt maintenance, repair, and likely eventual replacement over time make Alternative 1 a less permanent solution.

11.4.3 Effectiveness over the Long-Term

Long-term effectiveness was evaluated based on the degree of certainty of success, reliability while contaminants remain on-site, magnitude of residual risk, and effectiveness of controls to manage residual risk. Alternative 4 was scored a 9 because it removes almost all contaminated soil with COC concentrations greater than CULs and only limited shallow surface soil

contamination would remain beneath existing structures. Therefore, it has the greatest degree of certainty for success to achieve groundwater CULs in the shortest restoration time frame. Alternative 3 was scored an 8 because it leaves contaminated soil with COC concentrations greater than CULs but less than RELs in place. Alternative 3 also includes a GCL-capped area and in situ groundwater treatment, which are proven technologies, so this alternative still receives a high score. Alternative 2 was scored a 5 because this alternative leaves more contaminated volume than Alternative 3, including soil with pesticide concentrations greater than leaching-based RELs, and, therefore, is less effective with a longer restoration time frame. Alternative 2 also includes a larger GCL footprint than Alternative 3. Alternative 1 was scored a 2 because it relies solely on capping contaminated soil, which will require ICs to be maintained in perpetuity and more long-term operations, maintenance, and monitoring, and has the longest groundwater restoration time frame. Based on current operations that involve heavy equipment and traffic, the long-term asphalt maintenance would be a large component of Alternative 1 and the long-term effectiveness reduced over time due to wear and tear.

11.4.4 Management of Short-Term Risk

Short-term risk management was evaluated based on the risk to human health and the environment created by implementing the remedy and the effectiveness of controls to manage the short-term risk. Alternative 1 was scored a 7 because it involves the smallest volume of contaminated soil handling but requires installation of deeper stormwater conveyance structures and a significant area of asphalt paving. Alternatives 2 and 3 were scored a 7 and 6, respectively, because they both require significantly more contaminated material handling than Alternative 1 and Alternative 3 removes more soil than Alternative 2. Alternative 4 was scored a 4 because it includes the largest scope of contaminated material removal, will likely require a significantly larger scope of dewatering and groundwater treatment, will require shoring or sloping to maintain excavation stabilization, and includes demolition of the office and storage building, which increases the risk of encountering hazardous material. Handling contaminated material would require appropriate personal protective equipment and training to appropriately manage this risk.

11.4.5 Technical and Administrative Implementability

Technical and administrative feasibility was evaluated based on technical possibility; availability of facilities, services, and material; administrative and regulatory requirements; project scale and complexity; monitoring requirements; access requirements; and integration with existing and future operations. All alternatives utilize common technologies that can be safely implemented by local contractors and, therefore, were all scored relatively high. Alternatives 2 and 3 were both scored an 8 because the scope of excavation for both alternatives would not require complex shoring or dewatering methods. Alternative 1 was scored a 6 because the asphalt installation would require installing several deeper manhole and stormwater treatment structures that would require more planning. Additionally, an asphalt surface will require more frequent maintenance than a gravel surface due to the current operations and heavy equipment traffic moving across the Site. Collected stormwater would have to be managed (including treatment) under a stormwater permit, which would involve routine operations, maintenance, monitoring, and reporting. Alternative 4 was scored the lowest with a 4 because it includes the most

contaminated soil handling and demolition of the storage and office building, which would involve permitting and coordination of alternative office space for the current tenant.

11.4.6 Consideration of Public Concerns

Public concerns will be reviewed following the public comment period and will be addressed as part of the final cleanup action alternative selection and design. It is anticipated that the public would have minimal concern with cleanup of the Site.

11.4.7 Cost

Costs were estimated for each alternative and include costs for construction; long-term operations, maintenance, and monitoring; permitting; and agency oversight costs. In addition, all costs include sales tax and a 20% design contingency. Estimated costs for each alternative are summarized in Table 11.1 and presented in detail in Appendix I. The costs for each alternative are as follows:

- Alternative 1: \$2,508,000
- Alternative 2: \$2,099,000
- Alternative 3: \$2,137,000
- Alternative 4: \$3,209,000

11.5 IDENTIFICATION OF PREFERRED CLEANUP ACTION ALTERNATIVE

The preferred cleanup action was selected by choosing the alternative with the greatest benefit per unit cost score. This score is calculated by dividing the total weighted benefit score by the estimated alternative cost (standardized by dividing by \$2.5 million) for that alternative. Based on the alternative evaluation presented in the previous sections and in Tables 11.1 and 11.2, the total benefit per unit of cost achieved are as follows:

- Alternative 1: 3.69
- Alternative 2: 7.15
- Alternative 3: 9.01
- Alternative 4: 6.08

These results indicate Alternative 3 as the option that is permanent to the maximum extent practicable and, therefore, is selected as the Preferred Cleanup Action Alternative. Section 12.0 describes the Preferred Cleanup Action Alternative in greater detail.

12.0 Preferred Cleanup Action Recommendation

The Preferred Cleanup Action Alternative for the remediation of soil and groundwater at the Site, which is proposed by Smith-Kem to Ecology for selection and implementation at the Site, is described in greater detail in the following sections. This section describes how the Preferred Cleanup Action Alternative complies with MTCA, Site RAOs and associated ARARs for the least cost per degree of benefit and provides the greatest level of environmental benefit and permanence per dollar spent, making it the most permanent remedy to the maximum extent practicable.

12.1 PREFERRED CLEANUP ACTION ALTERNATIVE DESCRIPTION

Alternative 3 is selected as the Preferred Cleanup Action Alternative for the Site and is shown on Figure 12.1. This remedy includes the following components:

- Excavation and off-site disposal of soil in all AOCs with COC concentrations greater than:
 - Leaching-based RELs for pesticides
 - RELs for TPH and dioxins/furans²¹
 - CULs for lead and pesticides without an established REL
- Excavation to CULs in AOC 6 and an area around FS-01
- Installation of a GCL and drainage in portions of AOC 1 and AOC 2 for protection of groundwater
- In situ groundwater treatment by injecting liquid activated carbon along the downgradient edge of AOC 5 to immobilize contaminants (pesticides and TPH) in groundwater migrating from beneath the office and storage building
- Capping contaminated soil with COC concentrations greater than the RELs to protect worker direct contact exposure, including pesticide and TPH contamination beneath the office and storage building in AOC 5 and deeper TPH contamination beneath the gravel cap in AOC 4
- ICs to prohibit use of Site groundwater as drinking water and maintenance of the cap
- MNA for groundwater recovery, after excavation of contaminated soils, and long-term groundwater monitoring to confirm that natural attenuation is occurring

The Preferred Cleanup Action Alternative is a comprehensive remedy for the Site that complies with all the applicable remedy selection requirements under MTCA. This alternative provides the

²¹ If pre-design data show that contamination in AOC 3 extends off-property, then excavation off-property will be designed to meet CULs.

greatest environmental benefit for the associated cost based on the DCA presented in Section 11.0 and Tables 11.1 and 11.2.

12.1.1 Soil Excavation with Off-Site Disposal

Contaminated soil will be removed from all of the AOCs and an area around FS-01, as shown on Figure 12.1, using standard excavation means and methods. Excavated soil will be transported off-site to a permitted Subtitle D landfill for disposal. Excavated areas will be backfilled with clean imported fill and restored with a gravel surface. Prior to final surfacing, a GCL will be installed beneath AOC 1 and AOC 2, as described in Section 12.1.2. Removal of contaminated soil to proposed CULs or RELs is anticipated to bring groundwater into compliance with proposed CULs at the proposed CPOC within the predicted restoration time frame of 10 years.

Specific details regarding excavation in each of the AOCs is described below. Actual excavation limits may differ from the depths or lateral dimensions specified to remove soils with COC concentrations greater than applicable CULs or RELs, as determined by future compliance sampling. In addition, the scope of the Preferred Cleanup Action Alternative is based on the data presented in this RI/FS. There are several areas that will include additional data collection as part of pre-remedial design, as indicated in italicized text below.

- **AOC 1:** Soil will be excavated in three zones to remove pesticides, TPH, and dioxins/furans to the applicable RELs or CULs. The western zone will be excavated to 5 feet bgs, the center zone will be excavated to 8 feet bgs, and the eastern zone will be excavated to 4 feet bgs. Dewatering and shoring or lay back of side slopes may be necessary to complete the excavation. The total estimated volume of soil removal from AOC 1 is 850 CY. *Additional pre-design data collection will likely be required to define the northern AOC 1 boundary between AOC 1 and the machine shop.*
- **AOC 2:** Soil from this area will be excavated from two zones to remove pesticides at concentrations greater than the applicable RELs or CULs. A small footprint in the southern portion of AOC 2 will be excavated to 6 feet bgs, and the remaining area will be excavated to 4 feet bgs. Approximately 530 CY of soil will be removed in total. Dewatering and shoring are not anticipated to be necessary to complete the excavation. *Additional pre-design data collection will likely be required to define the northern and southern edges of AOC 2.*
- **AOC 3:** Soil will be excavated to remove pesticides and dioxins/furans at concentrations greater than the applicable RELs or CULs to a depth of 2 feet bgs. The total estimated volume of soil removal from AOC 3 is 220 CY. Dewatering and shoring are not anticipated to be necessary to complete the excavation. *Additional pre-design data collection will likely be required to define the southwestern edge of AOC 3 where shallow dioxins/furans have not been fully delineated.*
- **AOC 4:** Excavation in AOC 4 will remove soil with pesticides, TPH, and lead at concentrations greater than the applicable RELs and CULs to a depth of 5 feet bgs corresponding to a total estimated volume of 860 CY of soil removed. Dewatering and

shoring are not anticipated to be necessary to complete the excavation. *Additional pre-design data collection will likely be required to define the western AOC 4 boundary.*

- **AOC 5:** Excavation in AOC 5 will remove TPH and pesticides at concentrations greater than the applicable RELs and CULs to a depth of 5 feet bgs. The total estimated volume of soil removal from AOC 5 is 60 CY. Dewatering and shoring are not anticipated to be necessary to complete the excavation.
- **AOC 6:** Surface exceedances of pesticide CULs will be removed from AOC 6 to a depth a 2.5 feet bgs. The total estimated volume of soil removal from AOC 6 is 50 CY. Dewatering and shoring are not anticipated to be necessary to complete the excavation.
- **FS-01:** Approximately 10 CY of surface soil will be excavated around the boring location FS-01 to remove TPH at concentrations greater than the CUL.

The additional data collection described in this section will be used to support design and will be collected as part of a pre-remedial design phase after the CAP is issued by Ecology and prior to the EDR. A Pre-Design Investigation Work Plan will be submitted to Ecology for approval prior to implementation and the pre-design investigation results will be documented in the EDR.

12.1.2 Geosynthetic Clay Liner

A GCL would be installed in portions of and around AOC 1 and AOC 2 (15,600 SF) to provide additional protection of groundwater in this area with the greatest concentrations of COCs in groundwater. The intent of the GCL is to minimize infiltration into groundwater, which will control plume migration and would provide an added protection of source control in high-traffic, ongoing bulk fertilizer operational areas. The GCL would be extended beyond the area of known contamination as an added protective measure. The surface layer will be excavated in areas where GCL will be placed outside excavation footprints to an approximate depth of 1.5 feet bgs. The GCL will be installed with multiple layers of gravel and geosynthetic material to provide structure and security against accidental breaches. A cross-section of the GCL installation is shown on Figure 12.1. Composite gravel and liner recommendations were developed based on experience with similar projects and conversations with GCL manufacturers.

Prior to installing the GCL, a 4-inch layer of sand would be placed and compacted to provide a level base. The GCL would be installed over the sand in the footprint shown on Figure 12.1. The GCL can be purchased as premade rolled mats, which can be efficiently unrolled over the area and hydrated to expand into place. The GCL will be covered with 4 inches of CSBC, a 10-ounce high-visibility (orange-colored) geosynthetic fabric, and second 4-inch layer of CSBC to provide structural integrity to the GCL. A 6-ounce high-visibility indicator layer will be placed over the CSBC and is intended as a visual cue to warn operators before more critical underlying fabrics are damaged. The final and top/surface layer will consist of a minimum of 4 inches of CSBC to restore the surface grade elevation. Periodic repairs to the gravel surface will be necessary as part of the long-term operations, maintenance, and monitoring; specific inspection and maintenance requirements will be included in the SMP.

The GCL will be constructed with a gentle slope to direct infiltrated water to a drainage trench along the eastern property boundary. This trench would have a perforated underdrain within the GCL footprint and would be filled with gravel to convey surface runoff and shallow subsurface flow from above the GCL. Outside of the GCL footprint, the conveyance lines would be solid conveyance pipe to prevent exfiltration of collected surface water to other areas of the Site.

Collected infiltrated water would be conveyed to a single collection manhole in the southeastern corner of the facility to provide pretreatment of water by encouraging sedimentation. Following pre-treatment, water will infiltrate into a swale that will be created at the existing riprap area in the southeastern corner of the Site. Overflow water may go toward an existing culvert at the adjacent property line.

12.1.3 In Situ Groundwater Treatment

In situ groundwater treatment will be conducted along the downgradient western edge of AOC 5 to address TPH and pesticides at concentrations greater than respective CULs in groundwater migrating from beneath the office and storage building. A proprietary mixture of liquid activated carbon, such as PlumeStop, will be injected under low pressure into the subsurface using a direct push drill rig to provide even distribution within the target groundwater treatment zone (which is expected to be 5 to 15 feet bgs). The colloidal matrix will coat soil particles to increase the adsorption of groundwater contaminants and act as a passive treatment zone to immobilize contaminants and passively treat groundwater as it flows downgradient.

12.1.4 Groundwater Monitoring and Proposed Conditional Point of Compliance

MNA for groundwater is a component of the Preferred Cleanup Action Alternative after the removal of the soil source contamination. As part of MNA, post-remedy groundwater monitoring will be required after remedy implementation throughout the groundwater plumes to document that natural attenuation is occurring and to evaluate groundwater concentration trends. The GMP will describe long-term post-construction groundwater monitoring and adaptive management to ensure the long-term protectiveness of the selected Sitewide remedy. In addition, a monitoring well network will be established as part of the GMP that will include locations for performance monitoring for the components of the Sitewide remedy (e.g., excavation, in situ groundwater treatment, and MNA). Selected monitoring wells located in source areas (i.e., MW-4) would be replaced post-remedy to evaluate remedy performance. Additional wells may be installed for performance and confirmation monitoring, as warranted based on post-remedy conditions. Groundwater compliance Sitewide will be determined based on a comparison of groundwater data to proposed CULs at the proposed CPOC.

A CPOC is recommended for this Site because of widespread pesticide and nitrate/nitrite contamination across the Site; multiple COCs in groundwater exceed their respective CULs in groundwater by an order of magnitude or more and are not technically feasible to naturally attenuate within a reasonable restoration time frame. Therefore, compliance with the groundwater CULs at the standard POC (groundwater throughout the Site) is not technically feasible within a reasonable restoration time frame. The maximum compliance result of dieltrin

in groundwater was 0.88 µg/L at MW-04, which is 160 times the proposed groundwater CUL of 0.0055 µg/L. Nitrate, which is a COC only in groundwater had a maximum compliance result of 220,000 µg/L at MW-06, which is more than 20 times the proposed CUL of 10,000 µg/L. These CULs are based on protection of groundwater as drinking water; the use of groundwater as drinking water will be prohibited on the Property by the proposed ICs.

Consistent with WAC 173-340-720(8)(c), the proposed CPOC for groundwater is as close as practical to the source of contamination, along the western edge of the Property (refer to Figure 12.1). Compliance at the CPOC would be measured by direct sampling of groundwater in monitoring wells that are along this boundary. Existing monitoring wells MW-2, MW-3, MW-10, MW-12, and MW-14 provide the basis for the proposed CPOC. Additional monitoring wells may be added to the monitoring well network, as needed, to demonstrate compliance. The post-cleanup action monitoring well network will be defined in the GMP, which will be prepared as part of the LTCMP.

12.1.5 Institutional Controls

ICs, in the form of an Environmental Covenant, will be required for the Property and will require a deed restriction that restricts future uses of the Property. ICs will prohibit the use of groundwater as drinking water at the Property. ICs will also require implementation of an Ecology-approved SMP specifying soil management procedures for future subsurface work in areas where contamination at concentrations greater than CULs is present. The SMP, which will be prepared as part of the LTCMP, will define specific source areas and depths where soil contamination that remains in place at concentrations greater than proposed CULs would limit land use. Any activities that would be proposed within these restricted areas will require compliance with the SMP, which will outline health and safety protocols along with soil handling and management procedures and notification requirements. The SMP will include measures for routine inspection and maintenance of remedial elements such as the GCL and monitoring wells. These procedures will be applicable to any future development or maintenance that involves ground-disturbing activities. The SMP will also outline procedures if existing structures are removed in the future that may have potential subsurface contamination at concentrations greater than CULs (refer to Section 12.3 for potential contingency actions). Where an environmental covenant is required, and in consultation with AdGro, Ecology will prepare the Environmental Covenant consistent with WAC 173-340-440 and RCW 64.70.

12.2 COMPLIANCE MONITORING REQUIREMENTS

Compliance monitoring to ensure the protectiveness of the Preferred Cleanup Action Alternative will be implemented in accordance with WAC 173-340-410, Compliance Monitoring Requirements. Detailed monitoring elements for construction will be described in a Construction Compliance Monitoring Plan (CCMP), which will be prepared as part of remedial design. The CCMP will include a Healthy and Safety Plan, Sampling and Analysis Plan, and Quality Assurance Project Plan for monitoring and sample collection during remedy implementation. The CCMP will be included as an appendix to the EDR, which will describe the approach and criteria for the engineering design of soil and groundwater cleanup actions at the Site. A post-remedy LTCMP

will describe required long-term operations, maintenance, and monitoring after remedy implementation to ensure the long-term protectiveness of the remedy and will include a GMP, SMP, and an updated Healthy and Safety Plan.

The objectives of compliance monitoring as stated in WAC 173-340-410 are the following:

- **Protection Monitoring** is used to confirm that human health and the environment are adequately protected during construction of the cleanup action and post-construction monitoring. Protection monitoring requirements will be described in Site-specific Health and Safety Plan(s) that address worker activities during remedy construction and post-construction monitoring.
- **Performance Monitoring** is used to confirm that the cleanup action has attained cleanup standards and other performance standards. Performance monitoring will be conducted throughout each phase of remedy construction to document that remedial goals are being achieved.
- **Confirmation Monitoring** is used to confirm the long-term effectiveness of the cleanup action after completion of the preferred cleanup action. Confirmation monitoring will include long-term monitoring to document that CULs continue to be attained.

12.3 CONTINGENCY ACTIONS

Contingency actions may be required if additional risk reduction measures are needed after remedy implementation. Specific details regarding contingency actions will be outlined in the EDR, and contingency action triggers will be updated, as needed, after remedy implementation in the LTCMP. The contingency measures for the Site are anticipated to include the following:

- Source control efforts to control potential ongoing nitrate and nitrite contributions to groundwater associated with current fertilizer handling operations. There are not data that quantify the ongoing contribution from current operations; therefore, it will be important to assess the potential for ongoing contributions post-remedy. Following installation of the GCL, surface water that infiltrates to the GCL will be conveyed to a collection manhole at the southeastern property line. Water that is conveyed to this manhole can be sampled to determine if an ongoing nitrate/nitrite source exists. If it is determined that fertilizer handling on-site is an ongoing source of nitrate/nitrite in groundwater and post-remedy groundwater concentrations of nitrate/nitrite are not adequately improving, as measured at the proposed CPOC, then a contingency source control evaluation will be done to propose additional best management practices for the Site.
- Pesticide and TPH contamination is present in soil beneath the office and storage building. If future Property development includes removal of this building, then excavation may be necessary to remove contaminated soil beneath this structure. Specific details regarding this contingency will be included in the SMP.

- The southern boundary of AOC 5 and the western boundary of AOC 2 have not been fully delineated due to the presence of the containment area. If future Property development includes removal of the containment area, then additional investigation may be necessary to determine if contamination is present beneath this structure, which could warrant excavation. Investigation and evaluation details regarding this contingency will be included in the SMP.

12.4 COMPLIANCE WITH MTCA

The Preferred Cleanup Action Alternative for soil and groundwater meets the minimum requirements for selection of a cleanup action under MTCA (WAC 173-340-360(2)(a)) because it is protective of human health and the environment, complies with cleanup standards, complies with applicable state and federal laws, and provides for compliance monitoring. The Preferred Cleanup Action Alternative meets the other MTCA requirements for selection of a cleanup action, including using permanent solutions to the maximum extent practicable, providing for a reasonable restoration time frame, and consideration of public concerns. Exposure pathways will be addressed through contaminant removal and disposal in a landfill, capping, and MNA. ICs will be developed to restrict groundwater usage as drinking water and to manage contamination that would remain in place at concentrations greater than proposed CULs.

12.5 COMPLIANCE WITH ARARS

Compliance with ARARs is a minimum requirement for cleanup actions. ARARs are often categorized as location-specific, action-specific, or chemical-specific, as described below and summarized in Table 12.1.

- **Location-Specific ARARs** are requirements that are applicable to the specific area where the site is located and can restrict the performance of activities, including cleanup actions, solely because they occur in specific locations.
- **Action-Specific ARARs** are requirements that are applicable to certain types of activities that occur or technologies that are used during the implementation of cleanup actions. Waste disposal regulations are an example of an action-specific ARAR.
- **Chemical-Specific ARARs** are applicable to the types of contaminants present at the site. The cleanup of contaminated media at the site must meet the proposed CULs developed under MTCA; these CULs are considered chemical-specific ARARs.

The Preferred Cleanup Action Alternative complies with all applicable ARARs. Location-specific ARARs will be met through compliance with all applicable state and federal regulations based on the physical location of the Site. Action-specific ARARs will be met through implementation of construction activities in compliance with all applicable construction-related requirements such as disposal for excavated soil. Chemical-specific ARARs will be met through compliance with proposed CULs and RELs.

Implementation of the Preferred Cleanup Action Alternative would typically trigger a suite of environmental permits; however, cleanup actions conducted under a Consent Decree or AO with Ecology are exempt from the state and local ARAR procedural requirements, such as permitting and approval requirements. Cleanup actions must, however, demonstrate compliance with the substantive requirements of those ARARs (WAC 173-340-710(9)). This exemption applies to procedural permitting requirements under the Washington State Water Pollution Control Act, the Solid Waste Management Act, and local laws requiring permitting such as City of Ellensburg regulations. Cleanup actions are not exempt from procedural requirements of federal ARARs.

12.6 COMPLIANCE WITH SITE RAOS

The Preferred Cleanup Action Alternative will comply with all RAOs through the combination of selected remedial technologies. Excavation and capping of contaminated soil with COC concentrations greater than respective RELs or CULs will minimize leaching and direct contact risk, which will significantly reduce the source of COCs to groundwater. In situ groundwater treatment will reduce dissolved-phase mass and improve groundwater quality. Contaminated soil with COC concentrations greater than the proposed CULs and RELs that remain on-site that could pose a risk to the direct contact and leaching pathways will be controlled through ICs and a cap (GCL, concrete pads, or buildings).

12.7 PROPERTY OWNERSHIP AND ACCESS

The Property is currently owned by Ad Gro and the Property has been leased to McGregor since 2015. As described in Section 2.5, McGregor uses the Property to conduct its agricultural product distribution business and they are responsible for all current operations at the facility. Cleanup action implementation will need to be closely coordinated with McGregor (or the current tenant if McGregor terminates their lease) to minimize disruption to their operations.

The Preferred Cleanup Action Alternative would involve pre-design sample collection to define the southern boundary of AOC 3 and, depending on the results, potential excavation on the southern adjacent property owned by Ryan Wales (and currently occupied by Habitat for Humanity). An access agreement would need to be obtained from the property owner prior to any work on that property.

In addition, there is a BNSF rail spur located along the eastern Property boundary. Cleanup along the rail spur will either require offset to accommodate a standard buffer from the rail for protection, or a permit will need to be obtained from BNSF to conduct cleanup actions immediately adjacent to the rail.

12.8 TYPES AND AMOUNTS OF HAZARDOUS SUBSTANCES TO REMAIN IN PLACE

Some soil contamination at concentrations greater than proposed CULs will remain in place on-site following remedy implementation. The following is a conservative estimate of the contaminated soil volume (untreated) that would remain in place after implementation of the preferred alternative. This estimate does not account for the discontinuous nature of the

contamination and, therefore, the total volume of contaminated soil that is estimated to remain in place is likely less than predicted.

- **AOC 1:** Approximately 600 CY of contaminated soil with COC concentrations (pesticides) greater than CULs would remain in place beneath a cap.
- **AOC 2:** Approximately 350 CY of contaminated soil with COC concentrations (pesticides) greater than CULs would remain in place beneath a cap.
- **AOC 3:** Approximately 320 CY of contaminated soil with COC concentrations (pesticides) greater than CULs would remain in place.
- **AOC 4:** Approximately 210 CY of contaminated soil with COC concentrations (TPH and pesticides) greater than CULs/RELS would remain in place.
- **AOC 5:** Approximately 1,210 CY of contaminated soil with COC concentrations (TPH and pesticides) greater than CULs/RELS would remain in place. The majority of this contaminated soil mass is beneath the office and storage building.
- **AOC 6:** Approximately 45 CY of contaminated soil with dieldrin concentrations greater than CULs would remain in place.

The risk associated with contamination remaining on-site will be managed by ICs that will restrict groundwater usage and will require long-term operations, maintenance, monitoring, and soil management. Contaminated soil remaining in place is not considered an issue to meeting the restoration time frame because the Preferred Cleanup Action Alternative focuses on removal of the greatest contaminant mass areas and uses RELs based on an empirical evaluation of soil leaching to groundwater at the Site. Based on this information, the residual contamination that would be left in place is not anticipated to result in conditions that would prohibit achievement of the proposed CULs at the CPOC within the specified restoration time frame.

12.9 RESTORATION TIME FRAME

RELs, and to an extent CULs, for soil COCs are expected to be met following completion of soil excavation, which is expected to take approximately 2 months from the start of construction. ICs and an SMP will be implemented to manage future exposures. The restoration time frame for groundwater at the CPOC is expected to be 10 years from completion of construction.

12.10 ESTIMATED REMEDY COST SUMMARY

Estimated costs for the Preferred Cleanup Action Alternative are presented in Appendix I. The costs associated with remedy implementation consist of capital construction costs, long-term operations, maintenance, and monitoring costs following remedy completion, and agency oversight that will include periodic reviews of the constructed remedy. The estimated costs for construction of the Preferred Cleanup Action Alternative are as follows:

- Agency oversight, engineering design/reporting, planning, and permitting costs associated with remedy implementation are estimated to be \$275,000.

- Construction capital costs that include sales tax, construction and engineering oversight, and monitoring well decommissioning and installation are estimated to be approximately \$1.3 million.
- Long-term groundwater monitoring costs were estimated based on semiannual monitoring for 2 years after remedy implementation, then annual monitoring thereafter for a period of 8 years. The estimated groundwater monitoring costs, including well installation and decommissioning, with estimated costs of \$200,000.
- Cap inspection and maintenance costs were estimated for a period of 10 years and estimated to be \$15,000.

The total project cost for the Preferred Cleanup Action Alternative, which includes a 20% contingency cost, is estimated to be \$2,137,000.

Notes:

- Not measured.
- 1 All wells were installed with 2-inch schedule 40 PVC, 0.010 or 0.020 slotted screens, and silica sand pack.
- 2 Elevation reported in feet NAVD 88.
- 3 The highest reported water levels for MW-1 through MW-14 were observed during the May 2017 quarterly monitoring event, and in March 2020 for MW-15 through MW-20.
- 4 The lowest reported water levels for MW-1 through MW-14 were observed during August 2017, and in July 2018 for MW-15 through MW-20.

**Table 4.2
Remedial Investigation Work Deviations Table**

Floyd Snider Document	Proposed Action	Deviation
Remedial Investigation Work Plan (2016)	The schedule in section 9 indicates Phase 2 occurring in Fall 2016.	Due to delayed receipt of analytical data and property access, Phase 2 was split into two mobilizations. The first mobilization (Phase 2a) occurred in June 2017. Phase 2b was planned for October 2017, but was not completed until June 2018 as a result of access limitations.
	Per the Sampling Analysis Plan/Quality Assurance Project Plan (SAP/QAPP), analyze soil for nitrate/nitrite by Method SM-4500 NO3F.	Nitrate/nitrite in soil were analyzed by Method SM-4500 NO3F in the August 2016 event (Phase 1). In the June 2017 event (Phase 2A), the primary lab subcontracted the nitrate/nitrite analyses to Fremont Analytical, Inc., which does not run this method (they run nitrate/nitrite by USEPA Method 300.0). According to the laboratory chemist, Method SM-4500 and USEPA Method 300.0 are essentially equivalent to each other. Both methods are conducted using ion chromatography and have the same preparation and analysis.
	Per the SAP/QAPP, analyze groundwater for nitrate/nitrite by USEPA Method 353.2.	Nitrate/nitrite in groundwater were analyzed by USEPA Method 353.2 in the November 2016 quarterly event. In the August 2016, February 2017, and May 2017 quarterly groundwater events, the lab analyzed the samples by USEPA Method 300.0. According to the lab chemist, the original USEPA Method 353.2 that was stated in the Remedial Investigation Work Plan (Work Plan) is a colorimetry titration method and has a greater likelihood of false positives than USEPA Method 300.0, which uses ion chromatography and is a superior method that produces more accurate results.
	Per Table 6.1, install three soil boring/temporary wells (TMW-1 through TMW-3) on BNSF property to determine potential impacts off site.	At the time of drilling, access to the BNSF property had not been granted and sampling was not conducted. (Note: In the Work Plan Addendum, Floyd Snider proposed that these three soil boring/temporary wells would become permanent monitoring wells [see below].)
Remedial Investigation Work Plan Addendum (2017)	Per Table 5, during the May 2017 quarterly event, analyze upgradient monitoring well MW-9 (a relatively clean well) and an impacted well (likely MW-4) for dissolved organic carbon (DOC) to determine the background concentration of DOC compared to the DOC in a contaminated well for further consideration during the feasibility study.	This sampling was not conducted in the May 2017 quarterly event but was conducted in the August 2017 quarterly event.
	Per Table 5, collect groundwater samples from select wells at the site and analyze for major cations and anions as well as redox couples during the next quarterly groundwater sampling event (i.e., during the May 2017 quarterly event).	This sampling was not conducted in the May 2017 quarterly event but was conducted in the August 2017 quarterly event.
	Per Table 5, FS-36 is a provisional temporary well downgradient (on Stephen Carter's property) that will be sampled pending detections of nitrate in FS-37, FS-38, FS-39, or FS-40 using a field kit.	FS-36 was not sampled despite detections of nitrate at low levels between 1 and 3 milligrams per liter (mg/L) at FS-37, FS-38, and FS-40. Field staff determined that elevated turbidity of the groundwater samples was causing unreliable field kit results, and that FS-36 could be sampled during Phase 2b if the laboratory results indicated elevated nitrate was present further downgradient.
	Per Table 5, analyze downgradient, off-site locations (i.e., on Stephen Carter's property) for atrazine and nitrate to determine extent of groundwater contamination.	The laboratory inadvertently analyzed all samples for the full range of pesticides/herbicides, rather than just atrazine. Nitrate was less than the screening level (SL), atrazine was non-detect, and the other pesticides/herbicides were all non-detect, except for two low-level detects (less than the SL) for prometon, an organonitrogen pesticide.
	Per Table 5, install three permanent monitoring wells (MW-15 through MW-17), one soil boring (FS-26), and two trenches (Trenches 1 and 2) on BNSF property to determine potential impacts off site.	At the time of drilling, access to the BNSF property had not been granted and sampling was not conducted. As stated above, these wells were converted to permanent monitoring wells (rather than temporary wells, as approved in the Work Plan) and MW-16 was moved closer to the Smith-Kem Property line.
	Per Table 5, install one soil boring (FS-34) on southern property (Habitat for Humanity) to determine potential impacts off site.	At the time of drilling, access to the Habitat for Humanity property had not been granted and sampling was not conducted.
	Per Table 5, install two temporary groundwater monitoring wells (FS-22 near MW-4 and FS-30 near MW-14) and sample at discrete intervals of approximately 5 feet, 10 feet, and 15 feet below ground surface to determine if chemicals of potential concern (COPCs) are present in stratified depths in the aquifer.	At FS-22, groundwater samples were collected from 4–6 feet below ground surface (bgs) and 9–11 feet bgs. The temporary well installed from 13–15 feet bgs was not productive due to very silty lithology and a sample was not collected from this deeper depth. At FS-30, groundwater samples were collected from 5–7 feet bgs and 13–15 feet bgs. The temporary well installed from 9–11 feet bgs was not productive due to very silty lithology and a sample was not collected from this middle depth.

**Table 4.2
Remedial Investigation Work Deviations Table**

Floyd Snider Document	Proposed Action	Deviation
Remedial Investigation Work Plan Addendum (2017) (cont.)	Per Table 5, advance a soil boring west of FS-13 (FS-24) to delineate the extent of total petroleum hydrocarbon (TPH) contamination. Analyze the samples for the limited COPC list (organochlorine pesticides, chlorinated herbicides, atrazine, simazine, nitrate/nitrite, TPH-Oil, and TPH-Diesel).	The samples collected from this boring were analyzed for pesticides/herbicides and nitrate/nitrite; samples were not analyzed for TPH because there were no field indications of the presence of petroleum (i.e., borings were free from odor and sheen, and photoionization detector (PID) readings did not indicate presence of volatile organic compounds).
	A boring is proposed east of the rail spur on BNSF property (FS-26) to delineate any potential offsite contamination of TPH, pesticides, and/or herbicides.	The boring location FS-26 was relocated to the west of the proposed location to be in-line with the approximate location of the historical ditch. Moving this boring relocated it from BNSF property onto Smith-Kem Property. No field indication of TPH was observed, so a soil sample was not collected for analysis of TPH.
Year 1 Summary Groundwater Sampling Plan Memorandum (2017)	Per Table 4, desethyl atrazine is proposed as an additional analysis for select wells in Year 2 groundwater monitoring to assist in development of the Conceptual Site Model (CSM).	Desethyl atrazine was only analyzed during one event. The results were non-detect, so continued analysis was not deemed to be necessary for CSM development.
	Per Table 5, the third quarter of quarterly groundwater monitoring occurs between February and April 2018.	In coordination with the Washington State Department of Ecology (Ecology), the third quarter was postponed until June 2018 to coincide with Phase 2B field work.
Proposed Additions to Phase 2B Sampling Scope at the Smith-Kem Site Memorandum (2018)	Collect up to four additional soil samples for dioxin/furan analysis with a step-out pattern in order to analyze soil samples with a tiered approach (i.e., analyze the first two samples, assess the results and analyze the step-outs, if necessary).	Three additional soil samples were collected for dioxin/furan analysis to the west of the historical burn area (FS-43, FS-44, and FS-45). All three samples were analyzed instead of utilizing the tiered approach. Further step-outs were limited due to inability to gain approval for site access further south of the Smith-Kem Property.
	Sample the new monitoring wells downgradient of the Smith-Kem Property for atrazine and nitrate during two consecutive groundwater sampling events following the Phase 2B investigation.	Only one sampling event was completed following the Phase 2B investigation. In coordination with Ecology, continued groundwater monitoring was postponed until after review of the Remedial Investigation Report.
Proposed Sampling Plan for Vapor Intrusion Assessment at the Smith-Kem Site Memorandum (2019)	All efforts will be made to eliminate other sources of vapor-producing chemicals, such as air fresheners, within the office space prior to sampling.	The SUMMA canister placed in the office building to sample indoor air was unknowingly set up immediately adjacent to a copier/printer, which may contribute to naphthalene concentrations in the workspace.
Smith-Kem Site Remedial Investigation 2019 Work Plan Addendum (2019)	Ecology personnel will be present on-Site and will perform sample collection for split samples collected from all 20 monitoring wells to be analyzed by Analytical Resources, Inc. (laboratory).	Ecology did not have a representative on site, nor did they collect split samples due to the COVID-19 pandemic and limitations on in-person gatherings.
	Groundwater samples from all wells will be analyzed for nine organochlorine pesticides by low-level USEPA Method 8081B.	HCH-beta was also analyzed along with the nine other organochlorine pesticides.
	ALS Environmental (ALS) provided method detection and reporting limits for each of the nine organochlorine pesticides attainable by the low-level USEPA Method 8081B.	The expected method detection limits and reporting limits listed in Table 2 were elevated by 2 times for aldrin, lindane, and heptachlor in the laboratory report from ALS.

**Table 5.1
Groundwater Screening and Preliminary Cleanup Levels (µg/L)**

Chemical ⁽¹⁾	CAS No.	Relevant Criteria ⁽²⁾				Screening Level (Risk-Based Criteria) ⁽⁸⁾	Adjustment Factor ⁽³⁾	Preliminary CUL ⁽¹⁰⁾
		Drinking Water		Vapor Intrusion			PQL ⁽⁹⁾	
		Groundwater MTCA Method B/A ⁽⁴⁾	Minimum State and Federal MCL ⁽⁵⁾	Groundwater Target Concentration ⁽⁶⁾	Vapor Intrusion Criteria ⁽⁷⁾			
Total Petroleum Hydrocarbons (TPH)								
Gasoline-Range TPH	GRO	800				800	100	800
Diesel	--	500				500	130	500
Diesel-Range TPH	DRO	500			30,000	500	50	500
Oil-Range TPH	ORO	500				500	250	500

Notes:

- Blank cells are intentional.
- 1 Only chemicals requiring development of GW preliminary CULs are retained in this table. GW preliminary CULs were developed for any chemical that was either (a) detected in GW, or (b) retained as a potential COPC in the Ecology-approved Year 1 Groundwater Summary Memorandum (Attachment C.1). For more information, refer to the PCUL and COPC Memo (Attachment C.4).
- 2 GW criteria protective of drinking water use and vapor intrusion were considered. All criteria are rounded to two significant digits.
- 3 Adjustment factors allowable under WAC 173-340-720(7)(c) include the PQL and natural background.
- 4 The MTCA Method B/A criterion for each chemical is the most stringent criterion from among standard MTCA Method B cancer and non-cancer groundwater criteria (WAC 173-340-720(4)). MTCA Method A groundwater criteria listed in WAC Table 720-1 were considered for TPH compounds, as no other TPH criteria were developed.
- 5 The most stringent criterion for each chemical between state and federal MCLs (WAC 246-290-310 and 40 CFR 141-143, respectively).
- 6 The GW target concentration is the most stringent state and federal MCL criterion, after adjusting for health effects. The most stringent MCL is sufficiently protective and does not require adjustment to protect human health if the excess cancer risk does not exceed 1 in 100,000 (1 x 10⁻⁵) and the hazard quotient does not exceed one (1). If the most stringent MCL is not sufficiently protective, it was adjusted downward in accordance with WAC 173-340-720(7)(b) to the minimum of (a) MTCA Method B noncancer criterion and (b) MTCA Method B cancer criterion multiplied by a factor of 10. If an MCL was not established for a particular chemical, the groundwater target concentration is the MTCA Method B/A criterion.
- 7 Vapor intrusion criteria are from Ecology's 2018 document *Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action* and subsequent implementation memoranda.
- 8 The screening level (i.e., risk-based target CUL) is equivalent to the minimum of the groundwater target concentration and vapor intrusion criterion for each chemical. If no relevant groundwater criteria exist, a screening level is not established.
- 9 PQLs are site-specific and based on the method reporting limit information from two laboratories: PAL and ALS Environmental. If it appeared there would be no upward adjustment from the risk-based criterion for a particular chemical, the PAL method reporting limit was selected as the PQL. PQLs are not listed for chemicals that were not analyzed on or after January 1, 2016. PQLs are rounded to two significant digits.
- 10 The preliminary CUL is the GW screening level adjusted upward to the PQL or natural background, whichever is greater, consistent with WAC 173-340-720(7)(c).
- 11 The Washington natural background concentration for arsenic is 5 µg/L, as established in MTCA Method A Table 720-1 (WAC 173-340-900).
- 12 Criteria developed for chromium(III) were considered when determining the relevant criteria for chromium. There is no reason to suspect the presence of chromium(VI) on-site.
- 13 Xylenes are typically analyzed and reported by laboratories as m,p-xylene and o-xylene; these values are summed and reported as total xylenes. When evaluating relevant criteria for xylenes, the criterion developed for total xylenes was selected as the relevant criterion.
- 14 Criteria were not developed for endosulfan I or endosulfan II in CLARC. Criteria developed for endosulfan (CAS no. 115-29-7) were used as a surrogate.
- 15 Criteria were not developed for chlordane-alpha in CLARC; criteria developed for chlordane (CAS no. 12789-03-6) were used as a surrogate.

Notes:

- Blank cells are intentional.
- Dioxin criteria are rounded to three significant figures; all other criteria are rounded to two significant figures.
- Not applicable.
- 1 Only chemicals requiring development of soil preliminary CULs are retained in this table. Soil preliminary CULs were developed for any chemical that was either (a) detected in soil, or (b) retained as a potential COPC in the Soil Elimination Memorandum (Attachment C.2). For more information, refer to the PCUL and COPC Memo (Attachment C.4).
- 2 MTCA Method A criteria for unrestricted land use (WAC Table 740-1) are included in this table and are selected as the risk-based criterion for a particular chemical when no other criteria are available.
- 3 Standard MTCA Method B equations were used to calculate concentrations protective of HH using Equation 720-1 for noncancer health effects and Equation 720-2 for cancer health effects.
- 4 Criteria for the protection of terrestrial ecological receptors at a site with unrestricted land use sourced from WAC 173-340-900, Table 749-2.
- 5 Criteria protective of preliminary CULs for GW were calculated using the variable three-phase equilibrium partitioning model according to WAC 173-340-747(5)(b)(i) using Equation 747-1. Default MTCA input parameters were used, with the exception of f_{oc} . A site-specific f_{oc} of 1.1% (0.011) was used in the calculation.
- 6 Risk-based criteria in this column are based on unrestricted land use and are protective of HH and the environment (MTCA Method A table values); HH from direct contact (MTCA Method B standard formula values); terrestrial receptors (Simple Site with Unrestricted Land Use); and the soil-to-GW pathway (WAC Equation 747-1).
- 7 Criteria developed for total chromium and for chromium(III) were considered when determining the relevant criteria for chromium. There is no reason to suspect the presence of chromium(VI) on-site.
- 8 Xylenes are typically analyzed and reported by laboratories as m,p-xylene and o-xylene; these values are summed and reported as total xylenes. When evaluating relevant criteria for xylenes, the criterion developed for total xylenes was selected as the relevant criterion.
- 9 Criteria were not developed for endosulfan I or endosulfan II in CLARC. Criteria developed for endosulfan (CAS no. 115-29-7) were used as a surrogate.
- 10 Criteria were not developed for chlordane-alpha in CLARC; criteria developed for chlordane (CAS no. 12789-03-6) were used as a surrogate.

Oil-Range TPH	ORO	500	24,000 (1,100)	2.1%	2.2	250	350	NA	Yes	Maximum result > preliminary CUL

Notes:

GW preliminary CULs, results, and exceedance factors are rounded to two significant figures.

RED/BOLD Chemical identified as a COPC.

RED/BOLD RL exceeds GW preliminary CUL.

1 Only chemicals with GW preliminary CULs are included in this table.

2 GW preliminary CULs were developed in Table 5.1.

3 The value in plain text (i.e., not in bold italics) includes all GW results, including data from test pits and temporary well screens at soil boring locations, which are typically used for field screening purposes. These data should not be considered representative of site conditions for determining compliance with CULs as a result of greater sample turbidity. Nearby GW well data exist and can be used to characterize GW quality in the vicinity of test pit/soil boring GW samples. In areas without a nearby well, GW samples collected from collocated soil borings indicate that historical data collected from test pits are not representative of GW quality.

4 RLs presented in this table represent the range of RLs in the 2017–2018 Phase 2b and Phase 2 Groundwater Sampling events among nondetect results. If a chemical was not analyzed during these events, the range of RLs presented in this table represent the minimum and maximum RL from prior events. If a chemical was not analyzed on or after January 1, 2016, RLs are not provided.

5 RLs presented in this table represent the maximum RL in the March 2020 GW sampling event.

6 A chemical is retained as a groundwater COPC if its maximum detected result exceeds the preliminary CUL. For TPH and metals, only results from wells are considered when comparing data to the preliminary CUL. If the chemical was not detected at concentrations exceeding the preliminary CUL, RLs are compared to the preliminary CUL to determine COPC status. RLs measured during the March 2020 event are used for this screening evaluation, when available.

Notes:

- Blank cells are intentional.
- Dioxin/furan criteria are rounded to three significant figures; all other criteria are rounded to two significant figures.
- Not applicable.
- The preliminary CUL for this chemical was adjusted to the PQL.
- 1 This table includes all chemicals for which a soil screening level was established in Table 5.2.
- 2 MTCA Method A criteria for unrestricted land use (WAC Table 740-1) are included in this table and are selected as the risk-based criterion for a particular chemical when no other criteria are available.
- 3 Standard MTCA Method B equations were used to calculate concentrations protective of HH using Equation 720-1 for noncancer health effects and Equation 720-2 for cancer health effects.
- 4 Criteria for the protection of terrestrial ecological receptors at a site with unrestricted land use sourced from WAC 173-340-900, Table 749-2.
- 5 Criteria protective of GW preliminary CULs were calculated using the variable three-phase equilibrium partitioning model according to WAC 173-340-747(5)(b)(i) using Equation 747-1. Default MTCA input parameters were used, with the exception of f_{oc} . A site-specific f_{oc} of 1.1% (0.011) was used in the calculation.
- 6 Risk-based criteria in this column are based on unrestricted land use and are protective of HH and the environment (MTCA Method A table values); HH from direct contact (MTCA Method B standard formula values); terrestrial receptors (Simple Site with Unrestricted Land Use); and the soil-to-GW pathway (WAC Equation 747-1).
- 7 Preliminary CULs are adjusted for the PQL or natural or area background as appropriate per WAC 173-340-740(5)(c).
- 8 Ecology-approved site-specific PQLs were developed in the PCUL and COPC Memo (Attachment C.4). PQLs were not achieved in all samples for all chemicals, due to site-specific matrix and other interferences.
- 9 Background values were sourced as follows:
 - * State-wide natural background for arsenic from WAC Table 740-1.
 - * Natural background for dioxins/furans from Ecology's 2010 Technical Memorandum #8 *Natural Background for Dioxins/Furans in WA Soils*.
 - * Area background for other metals are the geometric mean of the agricultural field results, as printed in Table 2-3 of Ecology's 1999 *Screening Survey for Metals and Dioxins in Fertilizer Products and Soils in Washington State*.
- 10 The leaching component of the soil preliminary CUL is equivalent to the soil to protect GW concentration calculated using the three-phase partitioning equation for saturated soil, after adjusting to the greater of the PQL or natural background.
- 11 The direct contact component of the soil preliminary CUL is equivalent to the most stringent direct contact criterion for protection of HH and ecological receptors, after adjusting to the greater of the PQL or natural background.
- 12 GW COPCs were identified in Table 5.3.
- 13 If GW empirically demonstrates compliance (i.e., the chemical is not retained as a GW COPC), the soil preliminary CUL is equivalent to the direct contact component of the preliminary CUL. If the chemical was retained as a COPC in GW, the soil preliminary CUL is equivalent to the lesser of the leaching and direct contact components of the preliminary CUL.
- 14 Criteria developed for total chromium and for chromium(III) were considered when determining the relevant criteria for chromium. There is no reason to suspect the presence of chromium(VI) on-site.
- 15 Xylenes are typically analyzed and reported by laboratories as m,p-xylene and o-xylene; these values are summed and reported as total xylenes. When evaluating relevant criteria for xylenes, the criterion developed for total xylenes was selected as the relevant criterion.
- 16 Criteria were not developed for endosulfan I or endosulfan II in CLARC. Criteria developed for endosulfan (CAS no. 115-29-7) were used as a surrogate.
- 17 Criteria were not developed for chlordane-alpha in CLARC; criteria developed for chlordane (CAS no. 12789-03-6) were used as a surrogate.

**Table 5.5
Screening Evaluation to Identify Soil Chemicals of Potential Concern (mg/kg)**

Chemical ⁽¹⁾	CAS No.	Soil Preliminary CUL ⁽²⁾	Information Considered in COPC Identification				Is it a Soil COPC? ⁽⁵⁾	Rationale
			Maximum Detection in Soil ⁽³⁾	Percent of Detected Results That Exceed	Maximum Detected Exceedance Factor	Minimum Phase 2 Reporting Limit ⁽⁴⁾		
Other Pesticide/Herbicides								
Endosulfan sulfate	1031-07-8	480	1.1	None	None	0.0067	0.0067	No No exceedances
Total Petroleum Hydrocarbons (TPH)								
Gasoline-range TPH	GRO	30	1,200	6.9%	40	2	5	No Eliminated in Attachment C.2: gasoline detections are chromatographic overlap with weathered diesel.
Total diesel- and oil-range TPH	DRO+ORO	460	21,000	25%	46	250	250	Yes Maximum result > preliminary CUL
Dioxins/Furans								
Dioxins/Furans ⁽⁷⁾	DF_TEQ (U=1/2)	0.0000100	0.0000924	78%	9.24	NA	NA	Yes Maximum result > preliminary CUL

Notes:

Blank cells are intentional.

Dioxin/furan criteria, exceedance factors, and results are rounded to three significant figures; all other criteria, exceedance factors, and results are rounded to two significant figures.

RED/BOLD Chemical identified as a COPC.

1 This table includes all chemicals for which a soil preliminary CUL was established in Table 5.4.

2 Soil preliminary CULs were developed in Table 5.4 and are protective of GW (MTCA Equation 747-1 with site-specific f_{oc}); human health via direct contact (standard MTCA Method B and MTCA Method A criteria for unrestricted land use); terrestrial ecological receptors via direct contact (WAC Table 749-2); and vapor intrusion (Ecology vapor intrusion guidance and implementation memoranda).

3 The soil dataset includes results of all soil samples collected since June 1, 2007.

4 Reporting limits presented in this table represent the range of reporting limits among nondetect results in the 2017–2018 Phase 2 Soil Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.

5 A chemical is retained as a soil COPC if its maximum detected result exceeds the preliminary CUL, unless otherwise documented in the PCUL and COPC Memo (Attachment C.4) and summarized here. If the chemical was not detected at concentrations exceeding the preliminary CUL, reporting limits are compared to the preliminary CUL to determine COPC status.

6 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDD, DDE, DDT; 4,4' isomer results are summed to calculate the total DDx result.

7 The dioxin/furan result is equivalent to the total dioxin/furan TEQ summed using toxic equivalent factor values in WAC Table 708-1 and 1/2 of the reported result for nondetect results in each sample.

Dioxins/Furans			
Dioxins/Furans	--	0.0000100	TEE adjusted to the PQL

Notes:

- Dioxin/furan criterion is rounded to three significant figures; all other criteria are rounded to two significant figures.
- Not applicable.
- 1 Groundwater preliminary CULs were developed in Table 5.1. Preliminary CULs are protective of HH and the environment (MTCA Method A table values); HH via drinking water (state and federal MCLs; MTCA Method B standard formula values); and vapor intrusion (Ecology guidance and implementation memoranda).
- 2 Soil preliminary CULs were developed in Table 5.4. Preliminary CULs are protective of HH and the environment (MTCA Method A table values); HH from direct contact (MTCA Method B standard formula values); terrestrial receptors (Simple Site with Unrestricted Land Use); and the soil-to-groundwater pathway.
- 3 Chemical was retained as a COPC in groundwater, but there is no three-phase leaching pathway criterion for this chemical in soil. For TPH compounds, MTCA Method A CULs in soil are protective of groundwater but were not selected as the preliminary CUL because the TEE criterion is more conservative.

Notes:

Blank cells are intentional.

RED/BOLD Chemical identified as a COC.

RED/BOLD Reporting limit exceeds risk-based GW criteria.

1 Only chemicals identified as GW COPCs in Table 5.3 are included in this table.

2 GW criteria protective of drinking water use and vapor intrusion were considered when developing preliminary CULs. Development of GW preliminary CULs is presented in Table 5.1.

3 Analytical results, reporting limits, and calculated values (e.g., 95th percentile values) are reported to two significant figures.

4 The GW dataset used to identify COCs is the same as the groundwater dataset used to identify COPCs, with one exception. Results for arsenic, dieldrin, DDE, DDT and chlordane-alpha in sample MW-04-081016 (collected 8/10/2016) were excluded because these results were determined to be unrepresentative of site GW conditions, as described in Section 4.5.

5 Reporting limits presented in this table represent the range of reporting limits for nondetect results in the 2017–2018 Phase 2b and Phase 2 Groundwater Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit for nondetect results from all other events.

6 A chemical is eliminated as a COC if the following criteria from WAC 173-340-720(9)(e) and WAC 173-340-720(9)(d)(i)(a) are met:

* The maximum result is no more than 2 times the preliminary CUL;

* Less than 10% of samples exceed the preliminary CUL; and

* The 95th percentile result is in compliance with the preliminary CUL.

7 Preliminary CUL developed for arsenic is applicable to the total fraction. Dissolved fraction results are available in Appendix E but are not compared to the proposed CUL.

8 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDE and total DDT.

9 Silica gel-treated results are included in Appendix E but are not compared to criteria developed for TPH.

Table 6.3
Summary of Key Properties of Groundwater Chemicals of Concern

Chemical ⁽¹⁾	CAS No.	Description	Typical Use in Commerce	Dates of Use	Potential Site Sources	Groundwater Mobility ⁽²⁾		Behavior in Environment
						K _{oc} Range	Classification	
Miscellaneous Substances								
Nitrate	14797-55-8	Component of Fertilizer	Crop fertilization.	1950s to present.	Current and former fertilizer handling.	NA	Highly soluble and mobile.	Nitrogen cycle, denitrification, and uptake by plants are important processes.
Nitrite	14797-65-0							
Organochlorine Pesticides								
HCH-beta	319-85-7	Legacy Pesticide	Insecticide; one of the major components of Lindane.	Banned in 1976.	Former pesticide handling.	2,140	Limited water solubility. High mobility.	Expected to bioaccumulate. Aerobic degradation via reaction with hydroxyl radicals. Biodegrades slowly.
Aldrin	309-00-2		Insecticide against termites and ants, whitegrubs, and other soil-dwelling pests.	Banned in 1974 except to control termites; banned completely in 1987.		400–28,000	Not soluble in water. Moderate to no mobility.	Converted to dieldrin.
Chlordane	57-74-9		Pesticide for crops, lawns, and gardens; underground termite treatment; fumigating agent.	From 1948 until gradually phased out beginning in 1978; banned for all uses in 1988.		20,000–76,000	Not soluble. No mobility.	Persistent and unlikely to biodegrade.
Dieldrin	60-57-1		Insecticide against termites and ants, whitegrubs, and other soil-dwelling pests.	Banned in 1974 except to control termites; banned completely in 1987.		1,957–23,310	Limited water solubility. Little to no mobility.	Persistent; degrades slowly.
Toxaphene	8001-35-2		Insecticide used on field crops and to control pests on livestock and poultry.	Widely used in the 1970s; banned in 1983 except for emergency use. Banned completely in 1990.		210,000–1,000,000	Limited water solubility. No mobility.	Persistent. Degrades via reductive dechlorination anaerobically; does not degrade in aerobic conditions.
Chlorinated Herbicides								
2,4-D	94-75-7	Active-Use Herbicide	Common component of systemic herbicides used to control broadleaf weeds.	Commercially available beginning in 1945. Oldest and most widely used phenoxy herbicide.	Current and former herbicide handling.	20–136	Soluble. High mobility.	Biodegrades readily.
MCPA	94-74-6		Herbicide used to control broadleaf weeds.	Developed in the late 1940s and currently commonly used in the Pacific Northwest.		50–62	Soluble. High mobility.	Biodegrades readily.
Other Chlorinated/Halogenated Pesticides								
Atrazine	1912-24-9	Active-Use Herbicide	Herbicide used to control pre- and post-emergence broadleaf weeds.	Invented in 1958; currently one of the most commonly used herbicides in the United States.	Current and former herbicide handling.	54–1,164	Somewhat soluble. High to moderate mobility.	Biodegrades readily in soil; persistent in groundwater. Degradation products are desethyl atrazine, hydroxy atrazine, deisopropyl atrazine, and didealkyl atrazine.
Total Petroleum Hydrocarbons (TPH)								
Diesel-Range TPH	--	Common Fuel	Feedstock for fuels and manufacturing, or as a heat source.	In use throughout the Property's entire history of industrial operations.	Refueling activities and ASTs.	NA	Limited solubility to insoluble in groundwater. Little to no mobility.	Lighter end components are present in trace amounts but are readily biodegraded and dispersed. Heavier components are more persistent.
Oil-Range TPH	--	Common Fuel	Feedstock for fuels and manufacturing, or as a heat source.	In use throughout the Property's entire history of industrial operations.	Refueling activities and ASTs.	NA	Limited solubility to insoluble in groundwater. Little to no mobility.	Lighter end components are present in trace amounts but are readily biodegraded and dispersed. Heavier components are more persistent.

Notes:

Dioxin/furan results and depth-weighted average concentrations are rounded to three significant figures; other results and depth-weighted average concentrations are rounded to two significant figures.

-- No samples in this depth interval for this location group.

RED/BOLD Depth-weighted average result exceeds TEE criterion

1 TEE criteria for unrestricted land use at a simple site from WAC Table 749-2, prior to adjustment to the greater of the PQL or natural background. The Ecology-approved dioxin/furan PQL for the site is 10 ng/kg.

2 The pesticide-impacted area is shown on Figure 6.1. Three locations were sampled within this area: FS-05, FS-06, and FS-19.

3 The dioxin/furan-impacted area is shown on Figure 6.2. Four locations were sampled within this area: FS-32, FS-33, FS-43, and FS-44.

Abbreviations:

Notes:

- Dioxin/furan criteria, exceedance factors, and results are rounded to three significant figures; all other criteria, exceedance factors, and results are rounded to two significant figures.
- Not applicable: GW preliminary CUL not required for this chemical. Refer to Table 5.1.
- RED/BOLD** Chemical identified as a COC for the direct contact pathway.
- Site-specific criteria for the protection of terrestrial ecological receptors developed in Section 6.2.1.1.
- 1 Only chemicals identified as soil COPCs in Table 5.5 are included in this table.
- 2 This table includes criteria protective of the direct contact pathway. If any direct contact proposed CUL is less than the PQL or natural background, the direct contact criterion that would become the soil proposed CUL if groundwater demonstrates compliance is adjusted upward as appropriate per WAC 173-340-740(5)(c).
- 3 The soil dataset includes results of all soil samples collected since June 1, 2007, from depths of 0 to 15 feet bgs.
- 4 Standard MTCA Method B equations were used to calculate concentrations protective of HH using Equation 720-1 for noncancer health effects and Equation 720-2 for cancer health effects. If MTCA Method B criteria were not available, MTCA Method A criteria for unrestricted land use (WAC Table 740-1) are included.
- 5 Site-specific criteria for the protection of terrestrial ecological receptors were developed in Section 6.2.1.1. If a site-specific criterion was not developed, the value presented in this column is equivalent to the value listed in WAC 173-340-900, Table 749-2.
- 6 Groundwater COCs are identified in Table 6.1.
- 7 Risk-based criteria in this column are based on unrestricted land use and are protective of HH and the environment (MTCA Method A table values); HH from direct contact (MTCA Method B standard formula values); and terrestrial receptors (Simple Site with Unrestricted Land Use). Criteria protective of GW via the leaching pathway are considered separately in Table 6.6.
- 8 Calculated 95th percentile values include detect and nondetect results.
- 9 Reporting limits presented in this table represent the range of reporting limits among nondetect results in the 2017-2018 Phase 2 Soil Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.
- 10 A chemical is eliminated as a soil COC for the direct contact pathway if the following criteria from WAC 173-340-740(9)(e) and WAC 173-340-720(7)(d)(i)(a) are met:
 - * The maximum result is no more than 2 times the direct contact CUL;
 - * Less than 10% of samples exceed the direct contact CUL; and
 - * The 95 percentile result is in compliance with the direct contact CUL.
- 11 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDD, DDE, DDT; 4,4' isomer results are summed to calculate the total DDx result.
- 12 Summed result for total diesel- and oil-range TPH is used as a surrogate for this initial evaluation of protection of HH via the direct contact pathway; as indicated in Table 5.4, the MTCA Method A criterion of 2,000 mg/kg applies to results for diesel- and oil-range TPH. Individual results for diesel- and oil-range TPH are presented in Appendix E.
- 13 The dioxin/furan result is equivalent to the total dioxin/furan TEQ summed using toxic equivalent factor values in WAC Table 708-1 and 1/2 of the reported result for nondetect results in each sample.

Total DDx ⁽¹⁰⁾	T_DDx (U=0)	mg/kg	Not a GW COPC	--	NA	151	62	1.9	NA	25	None	FS-33	2–3	0.0067	0.0067	No	GW demonstrates compliance.
Toxaphene	8001-35-2	mg/kg	0.84	Yes	0.84	150	36	53	18%	120	140	FS-06	0–0.5	0.32	1.3	Yes	Maximum result > soil proposed CUL
Other Chlorinated/Halogenated Pesticides																	
Atrazine	1912-24-9	mg/kg	No Partitioning Data	--	NA	151	62	0.13	NA	710	None	FS-28	3–4	0.0067	0.0067	No	No partitioning data.
Chlordane-alpha	5103-71-9	mg/kg	1.1	No	NA	89	18	1.3	NA	9.9	None	FS-06	0–0.5	0.0067	0.0067	No	GW demonstrates compliance.
Simazine	122-34-9	mg/kg	No Partitioning Data	--	NA	151	40	0.12	NA	110	None	FS-28	3–4	0.0067	0.0067	No	GW demonstrates compliance.
Total Petroleum Hydrocarbons (TPH)																	
Total diesel- and oil-range TPH	DRO+ORO	mg/kg	No Partitioning Data	--	NA	145	52	3,060	NA	21,000	None	MW-12	1.5–2	250	250	No	No partitioning data.
Dioxins/furans																	
Dioxins/furans ⁽¹¹⁾	DF_TEQ (U=1/2)	ng/kg	Not a GW COPC	--	NA	9	9	77.0	NA	92.4	None	FS-44	0.5–1	NA	NA	No	GW demonstrates compliance.

Notes:

Dioxin/furan criteria, exceedance factors, and results are rounded to three significant figures; all other criteria, exceedance factors, and results are rounded to two significant figures.

-- Not applicable: either GW preliminary CUL not required for this chemical or development of soil preliminary CUL does not require calculation of concentration protective of GW. Refer to Tables 5.1 and 5.2.

RED/BOLD Chemical identified as a COC for the leaching pathway.

1 Only chemicals identified as soil COPCs in Table 5.5 are included in this table.

2 This table includes soil criteria protective of GW (also referred to as leaching criteria). If any leaching CUL is less than the PQL or natural background, the leaching CUL is adjusted upward per WAC 173-340-740(5)(c).

3 The soil dataset includes results of all soil samples collected since June 1, 2007. Dioxins/furans results are rounded to three significant figures; all other results are rounded to two significant figures.

4 Leaching criteria were calculated using the three-phase equation (WAC Equation 747-1). Refer to Table 5.4.

5 GW COCs are identified in Table 6.1.

6 If GW empirically demonstrates compliance (i.e., a chemical is not retained as a GW COC in Table 6.1), the leaching pathway is not active and calculated criteria protective of this pathway are not applicable to the site.

7 Calculated 95th percentile values include detect and nondetect results.

8 Reporting limits presented in this table represent the range of reporting limits among nondetect results in the 2017–2018 Phase 2 Soil Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.

9 A chemical is eliminated as a soil COC for the leaching pathway if groundwater demonstrates compliance (i.e., chemical is not a COC in groundwater) or if the following criteria from WAC 173-340-740(9)(e) and WAC 173-340 are met:

- * The maximum result is no more than 2 times the leaching CUL;
- * Less than 10% of samples exceed the leaching CUL; and
- * The 95th percentile result is in compliance with the leaching CUL.

10 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDD, DDE, DDT; 4,4' isomer results are summed to calculate the total DDx result.

11 The dioxin/furan result is equivalent to the total dioxin/furan TEQ summed using toxic equivalent factor values in WAC Table 708-1 and 1/2 of the reported result for nondetect results in each sample.

Abbreviations:

bgs Below ground surface	DDT Dichlorodiphenyltrichloroethane
BHC Benzene hexachloride	GW Groundwater
CAS Chemical Abstracts Service	HCH Hexachlorocyclohexane
COC Chemical of concern	mg/kg Milligrams per kilogram
COPC Chemical of potential concern	NA Not applicable
CUL Cleanup level	PQL Practical quantitation limit
DDD Dichlorodiphenyldichloroethane	Total DDx Calculated as the sum of DDD, DDE, and DDT
DDE Dichlorodiphenyldichloroethylene	WAC Washington Administrative Code

Table 6.8
Summary of Key Properties of Soil Chemicals of Concern

Chemical	CAS No.	Description	Typical Use in Commerce	Dates of Use	Potential Site Sources	Soil Mobility		Behavior in Environment
						K _{oc} Range	Classification	
Metals								
Lead	7439-92-1	Metal	Formerly used in paint and as an anti-knock agent in gasoline; currently used in batteries.	Banned in paint for consumer use in 1978 and as gasoline additive for most uses in 1996.	Lead paint or lead in building materials.	NA	Moderate to limited mobility.	Often inert; may be converted to other forms such as PbSO ₄ , Pb ₃ (PO ₄) ₂ , PbS, and PbO.
Organochlorine Pesticides								
Aldrin	309-00-2	Legacy Pesticide	Pesticide against termites, corn rootworm, grasshoppers, and other soil-dwelling pests.	Banned in 1974 except to control termites; banned completely in 1987.	Former pesticide handling.	400–28,000	Moderate to no mobility.	Converted to dieldrin.
HCH-beta (b-BHC)	319-85-7		Insecticide; one of the major components of Lindane.	Banned in 1976.		2,140	Little mobility.	Expected to bioaccumulate. Aerobic degradation via reaction with hydroxyl radicals. Biodegrades slowly.
Chlordane	57-74-9		Pesticide for crops, lawns, and gardens; underground termite treatment; fumigating agent.	From 1948 until gradually phased out beginning in 1978; banned for all uses in 1988.		20,000–76,000	No mobility.	Persistent and unlikely to biodegrade.
Dieldrin	60-57-1		Insecticide against termites and ants, whitegrubs, and other soil-dwelling pests.	Banned in 1974 except to control termites; banned completely in 1987.		1,957–23,310	Little to no mobility.	Persistent; degrades slowly.
4,4'-DDT / Sum DDT	50-29-3		Insecticide used on field crops.	Most uses banned in 1971 and 1972, except for specific uses to control vector diseases and for controlling body lice.		113,000–350,000	No mobility.	Degrades via reductive dechlorination.
Toxaphene	8001-35-2		Insecticide used on field crops and to control pests on livestock and poultry.	Widely used in the 1970s; banned in 1983 except for emergency use. Banned completely in 1990.		210,000–1,000,000	No mobility.	Persistent. Degrades via reductive dechlorination anaerobically; does not degrade in aerobic conditions.
Other Chlorinated/Halogenated Pesticides								
Atrazine	1912-24-9	Active-Use Pesticide	Herbicide used to control pre- and post-emergence broadleaf weeds.	Invented in 1958; currently one of the most commonly used herbicides in the United States.	Recent or former pesticide handling.	54–1,164	High to moderate mobility.	Biodegrades readily in soil; persistent in groundwater. Degradation products are desethyl atrazine, hydroxy atrazine, deisopropyl atrazine, and didealkyl atrazine.
Chlordane-alpha	5103-71-9	Legacy Pesticide	Major component of chlordane. Pesticide for crops, lawns, and gardens; underground termite treatment; fumigating agent.	From 1948 until gradually phased out beginning in 1978; banned for all uses in 1988.	Former pesticide handling.	20,000–76,000	No mobility.	Persistent and unlikely to biodegrade.
Simazine	122-34-9	Active-Use Pesticide	Herbicide used to control broadleaf weeds, annual grasses, algae, and submerged weeds.	Invented in 1956; currently a commonly used herbicide in cropland. Second most commonly used herbicide in United States cherry orchards.	Recent or former pesticide handling.	78–3,559	High to limited mobility.	Biodegrades as cometabolite in high-organic-content soils.
Total Petroleum Hydrocarbons (TPH)								
Diesel-Range TPH	DRO	Common Fuel	Fuel for trucks, agricultural equipment, and electrical generators.	In use throughout the Site's entire history of industrial operations.	Refueling activities and ASTs.	NA	Moderate to limited mobility.	Lighter end components are readily biodegraded. Heavier components are more persistent.
Oil-Range TPH	ORO		Feedstock for fuels and manufacturing, or as a heat source.	In use throughout the Property's entire history of industrial operations.			Little to no mobility.	Lighter end components are present only in trace amounts but are readily biodegraded. Heavier components are more persistent.

Table 6.8
Summary of Key Properties of Soil Chemicals of Concern

Chemical	CAS No.	Description	Typical Use in Commerce	Dates of Use	Potential Site Sources	Soil Mobility		Behavior in Environment
						K _{oc} Range	Classification	
Dioxins/Furans								
Dioxins/Furans	DF_TEQ (U=1/2)	Reaction Byproduct	Byproduct of certain chemical manufacturing processes and formed during high-temperature combustion reactions.	Natural and anthropogenic contributions possible throughout the Property's entire history of industrial operations.	Historical burning activities.	24,500,000 ⁽³⁾	Little to no mobility.	Persistent and unlikely to biodegrade.

Notes:

- 1 This table includes only analytes that were retained as COCs in Tables 6.5 and 6.6.

Notes:

Result was not used to calculate the compliance result. In the case of sample duplicates, the maximum among detected result and the minimum among nondetect result was used to calculate the average. Additionally, certain results from the sample collected on August 10, 2016, from location MW-4 were excluded as a result of poor data quality following data validation (refer to Section 4.5).

RED/BOLD Result exceeds groundwater proposed CUL.

Italics Nondetect result exceeds groundwater proposed CUL.

1 Chemical groups correspond to the discussion in Section 6.0 relative to the nature and extent of contamination.

2 Only chemicals identified as groundwater COCs in Table 6.1 are included in this table.

3 Proposed CULs were developed for each chemical retained as a COC in Table 6.1 and are numerically equivalent to groundwater preliminary CULs developed in Table 5.1.

4 In accordance with WAC 173-340-720(9)(c)(v), compliance with proposed CULs will be determined using an upper percentile (i.e. maximum) concentration for CULs based on short-term or acute toxic effects on human health or the environment, and the true mean (or average) concentration for CULs based on chronic or carcinogenic threats.

5 The compliance result at each monitoring well is determined as follows:

(1) For legacy pesticides, the compliance result is equivalent to the March 2020 groundwater result if the chemical was not detected at a particular location during remedial investigation sampling. For more information, refer to Appendix H.

(2) For chemicals with a carcinogenic toxicity basis, including legacy pesticides that were detected at a well during remedial investigation sampling, the compliance result is calculated as the average among all results, including both detect and nondetect results. Only results collected on or after January 1, 2016, are included in the average.

(3) For chemicals with a short-term/acute toxicity basis, the compliance result is calculated as (a) the maximum result when all results were nondetect; or (b) the maximum detected result when one or more results were detected. Only results collected on or after January 1, 2016, are considered.

6 Laboratory noted that the sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Abbreviations:

- 2,4-D 2,4-Dichlorophenoxyacetic acid
- bgs Below ground surface
- COC Chemical of concern
- CUL Cleanup level
- HCH Hexachlorocyclohexane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- WAC Washington Administrative Code

Qualifiers:

- J Analyte was detected, concentration is considered to be an estimate.
- JM Analyte was detected, concentration is considered to be an estimate due to a poor chromatographic match to standard.
- JN Analyte was detected, concentration is considered to be an estimate due to a tentative match to standard or library sample.
- JQ Analyte was detected between the method detection limit and reporting limit and is considered to be an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered to be an estimate.

Notes:

Dioxin/furan results are rounded to three significant figures; all other results are rounded to two significant figures.

-- Not applicable; pathway is not active or proposed CUL listed in this table is protective of other pathways.

Result was not used to determine compliance with the proposed CUL. For sample duplicates, the maximum among detected result and the minimum among nondetect results was used to determine compliance.

RED/BOLD Result exceeds applicable soil proposed CUL for either the direct contact or leaching pathway. Soil proposed CULs are summarized by chemical and AOC in Table 7.1.

Italics Nondetect result exceeds groundwater proposed CUL.

1 Only chemicals identified as soil COCs in Table 6.5 or Table 6.6 are included in this table.

2 Proposed cleanup standards were developed for each chemical retained as a soil COC and are summarized in Table 6.7. A proposed cleanup standard is a CUL combined with a point of compliance where the CUL applies. If the leaching pathway is active and the proposed CUL for the leaching pathway is less (more stringent) than the proposed CUL for the direct contact pathway, both proposed CULs are listed in this table. If groundwater data empirically demonstrate that the leaching pathway is not active for a particular AOC, the proposed CUL in that AOC is equivalent to the direct contact CUL.

2a The point of compliance for the direct contact pathway is from 0 to 15 feet bgs. For TPH, whose proposed CUL is based on the TEE pathway, Ecology may approve a site-specific point of compliance equivalent to the depth of the biologically active zone (i.e., from 0 to 6 feet bgs).

2b The point of compliance for the leaching pathway is soil collected at any depth, where groundwater does not empirically demonstrate compliance with the CUL. The leaching pathway is considered potentially active in soil collected outside of a designated AOC for all soil COCs with a leaching CUL listed in this table.

3 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDT.

4 The dioxin/furan result is equivalent to the total dioxin/furan TEQ summed using toxic equivalent factor values in WAC Table 708-1 and 1/2 of the reported result for nondetect results in each sample.

Abbreviations:

- AOC Area of concern
- BHC Benzene hexachloride
- COC Chemical of concern
- CUL Cleanup level
- DDT Dichlorodiphenyltrichloroethane
- Ecology Washington State Department of Ecology
- HCH Hexachlorocyclohexane
- mg/kg Milligrams per kilogram
- ng/kg Nanograms per kilogram
- RI Remedial Investigation
- TEE Terrestrial Ecological Evaluation
- TEQ Toxic equivalent

Qualifiers:

- J Analyte was detected, concentration is considered to be an estimate.
- JM Analyte was detected, concentration is considered to be an estimate due to poor match to chromatographic standard.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered to be an estimate.

**Table 9.1
Soil and Groundwater Technology Screening**

Remedial Technology	Applicable Media	COCs Addressed	General Technology Benefits	General Technology Constraints	Consideration of Site Physical Conditions and RAOs ⁽¹⁾	Retained	Rejected	Rationale for Retaining or Rejecting Technology
No Action	<ul style="list-style-type: none"> Soil Groundwater 	<ul style="list-style-type: none"> None, there is no treatment or removal of COCs associated with this technology. This is included in the technology screening for comparative purposes. 	<ul style="list-style-type: none"> No cost to implement. No long-term monitoring cost. Does not cause substantial impacts to site operations. 	<ul style="list-style-type: none"> Does not reduce or remove chemical concentrations. Does not protect human health and the environment. Does not meet cleanup goals in a reasonable restoration time frame. Technology does not have proven success at sites with similar conditions. 	<ul style="list-style-type: none"> Not limited by site physical conditions. Does not contribute to achievement of RAOs. Does not affect site operations. 		X	No action does not address any of the site COCs or achieve RAOs.
Institutional Controls	<ul style="list-style-type: none"> Soil Groundwater 	<ul style="list-style-type: none"> Applicable to all COCs. 	<ul style="list-style-type: none"> Low cost to implement. Protective of exposure pathways through requirements for maintenance and property restrictions. 	<ul style="list-style-type: none"> Does not reduce or remove chemical concentrations. Limits future site operations and ground-disturbing maintenance through restrictive covenants or administrative measures. As a stand-alone technology, institutional controls are not protective of any soil exposure pathways present at the site. 	<ul style="list-style-type: none"> Not limited by site physical conditions. Contributes to achievement of RAOs when used in combination with other technologies. Can be implemented and maintained with minimal disturbances and ensures that future site maintenance and redevelopment are conducted properly. 	✓		Institutional controls are applicable to all COCs and all media, achieve RAOs when used in combination with other technologies, and can be implemented given site conditions.
Monitored Natural Attenuation	<ul style="list-style-type: none"> Soil Groundwater 	<ul style="list-style-type: none"> Applicable to all COCs to varying degrees. Most effective to treat TPH, nitrate, and nitrate in groundwater. 	<ul style="list-style-type: none"> Low cost to implement. Does not cause impacts to site operations. 	<ul style="list-style-type: none"> Long-term monitoring required until compliance conditions are obtained. Does not control chemical migration. Long restoration time frame to achieve CULs using natural degradation processes. 	<ul style="list-style-type: none"> Not limited by site physical conditions. Contributes to achievement of RAOs when used in combination with other remedial technologies. Natural degradation processes have not been demonstrated at the Site for legacy pesticide COCs. 	✓		Monitored Natural Attenuation would be applicable to achieving RAOs for naturally degrading COCs in groundwater when used in combination with other technologies.
Engineering Controls (excluding surface capping)	<ul style="list-style-type: none"> Soil 	<ul style="list-style-type: none"> Applicable to all COCs. 	<ul style="list-style-type: none"> Typically low cost to implement. Can be protective of direct contact, erosion, and vapor intrusion pathways through physical measures, such as an indicator layer or vapor barrier. 	<ul style="list-style-type: none"> Chemicals remain in place and are not removed or destroyed. Requires maintenance and institutional controls in perpetuity. Pervious ECs, such as an indicator layer, do not protect the soil to groundwater leaching pathway. 	<ul style="list-style-type: none"> Not limited by site physical conditions. Contributes to the achievement of RAOs for soil when used in combination with other technologies. Is not effective to achieve RAOs for groundwater if a permeable engineering control is implemented. 	✓		Engineering controls are applicable to all COCs and all media, achieve RAOs when used in combination with other technologies, and can be implemented given site conditions.
Surface Capping	<ul style="list-style-type: none"> Soil Groundwater (by protection of soil to groundwater pathway) 	<ul style="list-style-type: none"> Applicable to all COCs. 	<ul style="list-style-type: none"> Provides containment of contaminated soil below the ground surface with surface controls or barrier caps. 	<ul style="list-style-type: none"> Chemicals remain in place and are not removed or destroyed. Cap maintenance and institutional controls required in perpetuity. Requires either installation of a stormwater conveyance system and permitting to discharge stormwater in perpetuity or other appropriate drainage controls. 	<ul style="list-style-type: none"> Not limited by site physical conditions. Contributes to achievement of RAOs. 	✓		Surface capping is applicable to all COCs in soil and groundwater, achieves RAOs when used in combination with other technologies, and can be implemented given site conditions.

**Table 9.1
Soil and Groundwater Technology Screening**

Remedial Technology	Applicable Media	COCs Addressed	General Technology Benefits	General Technology Constraints	Consideration of Site Physical Conditions and RAOs ⁽¹⁾	Retained	Rejected	Rationale for Retaining or Rejecting Technology
Source Removal by Excavation and Landfill Disposal	<ul style="list-style-type: none"> Soil Groundwater (by protection of soil to groundwater pathway) 	<ul style="list-style-type: none"> Applicable to all COCs. 	<ul style="list-style-type: none"> Results in immediate removal of all COCs within the excavation area, reducing mass in a short time frame. Removal of soil contamination in areas of impacted groundwater removes the ongoing source of contaminants to groundwater. 	<ul style="list-style-type: none"> Can be expensive to implement because of landfill disposal costs. Deeper excavations, especially near critical infrastructure, may require shoring for stability. Dewatering may be required for excavations extending below the groundwater table, which would require treatment and disposal of groundwater. 	<ul style="list-style-type: none"> Limited by presence of existing buildings. Deeper excavation would need to be sloped or shored. Excavation would not be limited in open areas. Contributes to the achievement of RAOs to the extent that source material is removed. 	✓		Source removal is applicable to all COCs in soil and groundwater, is implementable given site conditions, and achieves RAOs.
Solidification and Stabilization	<ul style="list-style-type: none"> Soil Groundwater (by protection of soil to groundwater pathway) 	<ul style="list-style-type: none"> Applicable to all COCs. 	<ul style="list-style-type: none"> Reduces the mobility of soil contamination through physical or chemical immobilization. Controls contaminant migration and leaching to groundwater. Can reach deep soil contamination by using the auger method without requiring shoring or other soil stabilization measures. 	<ul style="list-style-type: none"> Chemicals remain immobilized in place but not removed. Long-term groundwater compliance monitoring is required to ensure that contaminants are not leaching from the immobilized mass. When applied by the use of an auger, the technology can leave wedges of untreated soil in the spaces between treated soil columns. High up-front cost to mobilize equipment and a large water source. 	<ul style="list-style-type: none"> Limited by the presence of existing buildings or structures. Site contamination is typically shallow and accessible by more permanent and cost-effective remediation technologies. May contribute to the achievement of RAOs to the extent that source material is immobilized. 		✗	Solidification/stabilization is a less permanent technology compared to source removal. The area to be treated is shallow (less than 8 feet below ground surface) and would not require extensive shoring methods to stabilize surrounding soil.
Enhanced Bioremediation	<ul style="list-style-type: none"> Soil Groundwater 	<ul style="list-style-type: none"> Applicable to remediation of TPH, nitrate, nitrite, and pesticides. Not effective in treating lead and dioxins/furans. 	<ul style="list-style-type: none"> Typically low cost to implement. Bioremediation amendment can be injected adjacent to inaccessible areas (e.g., buildings) to treat downgradient soil and groundwater. Can be used in combination with a source control technology to treat residual groundwater contamination. 	<ul style="list-style-type: none"> May require several rounds of injections of microorganisms, nutrients, or oxygen. Does not treat inorganics. Different methods of bioremediation application are required for vadose and saturated zone soils. Effectiveness is limited based on soil geology and nutrient composition. 	<ul style="list-style-type: none"> Not limited by existing structures. High concentrations of nitrate and nitrite in soil and groundwater limit the effectiveness of bioremediation to break down less readily available COCs such as pesticides. May contribute to the achievement of RAOs when used in combination with other technologies. 		✗	Enhanced bioremediation would not be as effective at treating all site COCs compared to other in situ technologies considered.

**Table 9.1
Soil and Groundwater Technology Screening**

Remedial Technology	Applicable Media	COCs Addressed	General Technology Benefits	General Technology Constraints	Consideration of Site Physical Conditions and RAOs ⁽¹⁾	Retained	Rejected	Rationale for Retaining or Rejecting Technology
Chemical Oxidation	<ul style="list-style-type: none"> • Soil • Groundwater 	<ul style="list-style-type: none"> • Applicable to TPH, nitrate, nitrite, and pesticide contamination. • Not applicable to lead and dioxin/furan contamination. 	<ul style="list-style-type: none"> • Chemical oxidation can be injected adjacent to inaccessible areas (e.g., buildings) to treat downgradient soil and groundwater. • Can be used in combination with a source control technology to treat residual groundwater contamination. 	<ul style="list-style-type: none"> • Effectiveness limited by subsurface conditions and site heterogeneity because injected solutions can follow preferential pathways. • Requires multiple rounds of injection. • Oxidants used may require additional health and safety measures. Some oxidants are corrosive to underground utilities. • Not effective in treating vadose zone soils. 	<ul style="list-style-type: none"> • Not limited by existing structures. • Site geology is typically heterogenic, gravelly soil, which is favorable for in situ remediation injection. • High concentrations of nitrate and nitrite in soil and groundwater limit the effectiveness of chemical oxidation to break down less readily available COCs such as pesticides. • May contribute to achievement of RAOs when used in combination with other remedial technologies. 		X	The composition of COCs in groundwater, particularly the high nitrate concentrations, would limit the effectiveness of chemical oxidation to treat other COCs.
Soil Vapor Extraction	<ul style="list-style-type: none"> • Soil 	<ul style="list-style-type: none"> • Applicable to the volatile fraction of TPH contamination. • Not applicable to other COCs. 	<ul style="list-style-type: none"> • Can be implemented adjacent to or beneath existing structures and with limited disturbance to surface activities. • System can be easily turned on and off to optimize performance and cost. 	<ul style="list-style-type: none"> • Limited to treatment of vadose zone soil and volatile contaminants. • Requires surface capping to prevent short-circuiting. • Relatively expensive to install and maintain. • Does not address groundwater contamination for site COCs. 	<ul style="list-style-type: none"> • No current vapor intrusion risk to existing buildings. • Does not address contamination for COCs other than TPH and is not effective in treating saturated zone soils. 		X	Soil vapor intrusion is not a current risk at the site that needs to be addressed. Technology has limited effectiveness for site COCs.
Thermal Treatment	<ul style="list-style-type: none"> • Soil • Groundwater 	<ul style="list-style-type: none"> • Applicable to TPH, pesticide, and dioxin/furan contamination. • Not applicable to nitrate, nitrite, and lead. 	<ul style="list-style-type: none"> • Can be implemented at greater depths than other technologies. • No long-term maintenance required. • Area of effect for treatment can extend beneath inaccessible areas to a certain extent. 	<ul style="list-style-type: none"> • High cost associated with implementation, including site preparation and utility relocation. • Requires large loads of on-site power. • Requires substantial surface infrastructure for operation. • Treating shallow contamination requires a cap to maintain high temperatures in the soil. 	<ul style="list-style-type: none"> • The majority of contamination on site is less than 5 feet below ground surface and would require much higher energy input or constructed cap to effectively heat and degrade COCs. • Thermal treatment would require equipment to remain on-site for the duration of the treatment time, which would likely disturb current operations. 		X	Thermal treatment is not as effective as other technologies to achieve RAOs and would not be cost-effective to treat the small source area of contamination.
In Situ Groundwater Treatment	<ul style="list-style-type: none"> • Groundwater 	<ul style="list-style-type: none"> • Applicable to TPH, pesticide, nitrate, and nitrite contamination. • Not applicable to dioxins/furans and lead. 	<ul style="list-style-type: none"> • Passively treats contaminated groundwater as it passes through the treatment zone. • Can be straightforward to implement, except at significant depths. • Is relatively feasible to implement at shallow depths and does not cause significant disruption to site operations. 	<ul style="list-style-type: none"> • A passive treatment zone must be maintained indefinitely if the source of groundwater contamination is not removed or immobilized. • Depending on the contaminant concentrations in groundwater, the passive treatment zone media may require replacement once the reaction capacity of the material is reached or, in the case of a permeable reactive barrier, the wall pores become clogged. 	<ul style="list-style-type: none"> • Site geology is typically heterogenic, gravelly soil, which is favorable for in situ remediation injection. • May contribute to achievement of RAOs when used in combination with other remedial technologies. 	✓		In situ groundwater treatment is applicable to the COCs present in groundwater, is implementable given site conditions, and achieves RAOs.

**Table 9.1
Soil and Groundwater Technology Screening**

Remedial Technology	Applicable Media	COCs Addressed	General Technology Benefits	General Technology Constraints	Consideration of Site Physical Conditions and RAOs ⁽¹⁾	Retained	Rejected	Rationale for Retaining or Rejecting Technology
Low-Permeability Barrier Wall	<ul style="list-style-type: none"> Groundwater 	<ul style="list-style-type: none"> Applicable to all COCs. 	<ul style="list-style-type: none"> Intercepts and treats contaminated groundwater. 	<ul style="list-style-type: none"> Is relatively costly to implement. May impact future site operations and require relocation of existing utilities. Requires hydraulic control (pumping) inside the barrier wall to maintain an inward gradient of groundwater in perpetuity. 	<ul style="list-style-type: none"> Could cause future impacts to operations. Would not achieve RAOs for contamination within the property boundary. There is not an underlying silt layer to confine the barrier wall. 		X	The site conditions limit the effectiveness of a low-permeability barrier wall to contribute toward the achievement of RAOs.
Pump and Treat	<ul style="list-style-type: none"> Groundwater 	<ul style="list-style-type: none"> Applicable to all site COCs. 	<ul style="list-style-type: none"> Removes dissolved-phase chemicals and adsorbed particles from groundwater. 	<ul style="list-style-type: none"> Does not treat soil source contamination. High groundwater pumping rates may be required resulting in high volumes of groundwater for treatment and disposal. Significant cost associated with treatment and discharge of treated waste stream. Long-term operation and maintenance required for extraction system in perpetuity. 	<ul style="list-style-type: none"> Does not contribute to the achievement of RAOs for the soil pathway and would not be effective as a stand-alone technology to achieve RAOs. Pump and treat operations would cause ongoing impacts to future site use. 		X	Groundwater contamination can be effectively treated with source contamination removal and source control. Adding pump and treat remediation would add marginal benefit compared to the cost and long-term operation and maintenance.
Air Sparging	<ul style="list-style-type: none"> Groundwater 	<ul style="list-style-type: none"> Not applicable to site COCs. 	<ul style="list-style-type: none"> Removes volatile contaminants from groundwater including volatile organic compounds and TPH. 	<ul style="list-style-type: none"> Is not effective at treating heavier-range TPH contaminants. High up-front costs to install air sparging and soil vapor extraction system. Typically requires long-term operation and maintenance. 	<ul style="list-style-type: none"> TPH contamination is diesel- to oil-range constituents. Would cause some disruption to operations. Does not contribute to achievement of RAOs when used in combination with other remedial technologies. 		X	Air sparging would not contribute to achieving RAOs.

Note:

1 RAOs refer to those discussed in Section 9.0.

Abbreviations:

- COC Contaminant of concern
- CUL Cleanup level
- RAO Remedial Action Objective
- TPH Total petroleum hydrocarbons

Alternative	Alternative 1 Capping Soil	Alternative 2 Soil Excavation to Meet Direct Contact RELs, Capping, and In Situ Groundwater Treatment	Alternative 3 Soil Excavation to Meet Leaching and Direct Contact RELs, Capping, and In Situ Groundwater Treatment	Alternative 4 ⁽¹⁾ Soil Excavation to Meet CULs
Alternative Description	Alternative 1 includes: (1) shallow 1-foot surface excavation in all AOCs. (2) installation of asphalt cap with stormwater conveyance. (3) excavation to CULs in AOC 6 and around FS-01. (4) Institutional controls.	Alternative 2 includes: (1) Excavation to direct-contact RELs in AOCs 1, 2, 3, 4, and 5. (2) Installation of GCL cap over AOCs 1, 2, and 4 with drainage conveyance. (3) Excavation to CULs in AOC 6 and around FS-01. (4) Injection of in situ groundwater treatment. (5) Institutional controls.	Alternative 3 includes: (1) Excavation to leaching, residual saturation, and direct contact RELs in AOCs 1, 2, 3, 4, and 5. (2) Installation of GCL cap over AOCs 1 and 2 with drainage conveyance. (3) Excavation to CULs in AOC 6 and around FS-01. (4) Injection of in situ groundwater treatment. (5) Institutional controls.	Alternative 4 includes: (1) Excavation to CULs in all AOCs. (2) Demolition and replacement of the office and storage building to access subsurface contamination. (3) Other buildings/structures as a cap. (4) Institutional controls.

Table 11.1
Disproportionate Cost Analysis Summary

Notes:

- 1 Alternative 4 is the most permanent alternative to the maximum extent practicable. Consistent with WAC 173-340-350(8)(c)(ii)(B)(II), Alternative 4 does not fully meet the definition of a permanent cleanup action because it is not technically feasible to address all contaminated soil beneath all active structures, although it addresses the majority of contaminated soil present.
- 2 Scores for Consideration of Public Concerns were assumed to be equal for all alternatives.
- 3 Specific cost estimate information is provided in Appendix I.
- 4 Benefit per Unit Cost Ratio calculated by dividing the Total Weighted Benefit Score by the Estimated Total Alternative Cost (standardized by divided by \$2.5 million). Higher value indicates the most benefit per unit cost.

<p>Overall Protectiveness</p> <ul style="list-style-type: none"> Degree to which existing risks to human health and the environment are reduced Time required to reduce risks and attain cleanup standards On-site and off-site risks resulting from alternative implementation Improvement in overall environmental quality <p>Protectiveness Benefit Scoring by Alternative</p>  <table border="1" data-bbox="341 866 683 1169"> <caption>Protectiveness Benefit Scoring by Alternative</caption> <thead> <tr> <th>Alternative</th> <th>Score</th> </tr> </thead> <tbody> <tr> <td>Alt 1</td> <td>3</td> </tr> <tr> <td>Alt 2</td> <td>6</td> </tr> <tr> <td>Alt 3</td> <td>8</td> </tr> <tr> <td>Alt 4</td> <td>9</td> </tr> </tbody> </table>	Alternative	Score	Alt 1	3	Alt 2	6	Alt 3	8	Alt 4	9	<ul style="list-style-type: none"> Risks associated with contaminated soil in the AOCs would be permanently reduced a moderate degree by capping with asphalt and existing structures. The cap would provide a reduction in risk associated with groundwater by preventing surface water from infiltrating and leaching contaminants from vadose zone soil. Risks associated with contaminated soil and groundwater greater than CULs remaining on-site beneath the cap would be effectively reduced by ICs, which prohibit groundwater use as drinking water, require the property to remain for industrial use only, and require contingency measures if any existing structures with subsurface contaminated soil were demolished during future redevelopment. The time frame to reduce risks associated with soil would be immediately following remedy implementation. The time frame for achievement of groundwater CULs sitewide is anticipated to be 20 to 25 years. On-site risks during construction would be managed by proper H&S protocols and site security. There are no other added on-site risks. The off-site risks associated with contaminated material transport and disposal are negligible and would be managed using licensed operators and permitted disposal facilities. Alternative 1 achieves the lowest improvement in overall environmental quality because it permanently removes the least mass of contamination. This alternative has the longest anticipated restoration time frame for groundwater compared to other alternatives, which remove more contaminated soil mass. 	<ul style="list-style-type: none"> Risks associated with contaminated soil in the AOCs would be permanently reduced to a high degree by excavation, capping, and in situ groundwater treatment, but less than Alternatives 3 and 4, which remove more contaminated soil mass. Removing and capping contaminated soil would provide a reduction in risk associated with groundwater. Risks associated with contaminated soil and groundwater greater than CULs remaining on-site would be effectively reduced by ICs, which prohibit groundwater use as drinking water, require the property to remain for industrial use only, and require contingency measures if any existing structures with subsurface contaminated soil were demolished during future redevelopment. The time frame to reduce risks associated with soil would be immediately following remedy implementation. The time frame for achievement of groundwater CULs sitewide is anticipated to be 15 years. On-site risks during construction would be managed by proper H&S protocols and site security. There are no other added on-site risks. The off-site risks associated with contaminated material transport and disposal are negligible and would be managed using licensed operators and permitted disposal facilities. Alternative 2 achieves the third highest improvement in overall environmental quality because it permanently removes the third greatest mass of contamination. This alternative has a longer anticipated restoration time frame for groundwater compared to Alternatives 3 and 4, which remove more contaminated soil mass. 	<ul style="list-style-type: none"> Risks associated with contaminated soil in the AOCs would be permanently reduced to a high degree by excavation, capping, and in situ groundwater treatment, but less than Alternative 4, which removes more contaminated soil mass. Removing and capping contaminated soil would provide a reduction in risk associated with groundwater. Risks associated with contaminated soil and groundwater greater than CULs remaining on-site would be effectively reduced by ICs, which prohibit groundwater use as drinking water, require the property to remain for industrial use only, and require contingency measures if any existing structures with subsurface contaminated soil were demolished during future redevelopment. The time frame to reduce risks associated with soil would be immediately following remedy implementation. The time frame for achievement of groundwater CULs sitewide is anticipated to be 10 years. On-site risks during construction would be managed by proper H&S protocols and site security. There are no other added on-site risks. The off-site risks associated with contaminated material transport and disposal are negligible and would be managed using licensed operators and permitted disposal facilities. Alternative 3 achieves the second highest improvement in overall environmental quality because it permanently removes the second greatest mass of contamination. This alternative has a shorter anticipated restoration time frame for groundwater compared to Alternatives 1 and 2, which remove less contaminated soil mass. 	<ul style="list-style-type: none"> Risks associated with contaminated soil in the AOCs would be permanently reduced to a high degree by excavation. Excavation of contaminated soil would provide a reduction in risk associated with groundwater. Risks associated with contaminated soil and groundwater greater than CULs remaining on-site would be effectively reduced by ICs, which prohibit groundwater use as drinking water, require the property to remain for industrial use only, and require contingency measures if any existing structures with subsurface contaminated soil were demolished during future redevelopment. The time frame to reduce risks associated with soil would be immediately following remedy implementation. The time frame for achievement of groundwater CULs sitewide is anticipated to be 5 years. On-site risks during construction would be managed by proper H&S protocols and site security. There are no other added on-site risks. The off-site risks associated with contaminated material transport and disposal are negligible and would be managed using licensed operators and permitted disposal facilities. Alternative 4 achieves the highest improvement in overall environmental quality because it permanently removes the greatest mass of contamination. This alternative has a shorter anticipated restoration time frame for groundwater compared to other alternatives due to significant source removal.

Table 12.1
Applicable or Relevant and Appropriate Requirements for the Preferred Cleanup Action Alternative

Standard, Requirement, or Limitation ⁽¹⁾	Description
Location-Specific ARARs ⁽²⁾	
City of Ellensburg Critical Areas Regulations (EMC Chapter 15.620 [Wetlands] and EMC Chapter 15.650 [Fish and Wildlife Habitat Conservation Areas])	These chapters establish regulations pertaining to development within or adjacent to designated critical areas. The subject property is located approximately 125 feet west of Wilson Creek, 220 feet east of Mercer Creek, and 125 feet north of a freshwater forested/shrub wetland. The City of Ellensburg regulates all development activities within 300 feet of stream and wetland resources.
Native American Graves Protection and Repatriation Act (25 USC 3001 through 3013; 43 CFR 10) Washington’s Indian Graves and Records Law (RCW 27.44)	These statutes prohibit the destruction or removal of Native American cultural items and require written notification of inadvertent discovery to the appropriate agencies and Native American tribe. These programs are applicable to the remedial action if cultural items are found. The activities must cease in the area of the discovery; a reasonable effort must be made to protect the items discovered; and notice must be provided.
Archaeological Resources Protection Act (16 USC 470aa et seq.; 43 CFR 7)	This program sets forth requirements that are triggered when archaeological resources are discovered. These requirements only apply if archaeological items are discovered during implementation of the selected remedy.
National Historic Preservation Act (16 USC 470 et seq.; 36 CFR parts 60, 63, and 800)	This program sets forth a national policy of historic preservation and provides a process that must be followed to ensure that impacts of actions on archaeological, historic, and other cultural resources are protected.
Action-Specific ARARs ⁽³⁾	
State Environmental Policy Act (RCW 43.21C, WAC 197-11)	Establishes the state's policy for protection and preservation of the natural environment. Applies to cleanup actions conducted under MTCA; Ecology will be the lead agency for this effort.
Resource Conservation and Recovery Act (42 USC 6921-6949a; 40 CFR Part 268, Subtitles C and D)	Establishes requirements for the identification, handling, and disposal of hazardous and non-hazardous waste.
Dangerous Waste Regulations (RCW 70.105; WAC 173-303)	Establishes regulations that are the state equivalent of RCRA requirements for determining whether a solid waste is a state dangerous waste. This regulation also provides requirements for the management of dangerous wastes.
Solid Waste Disposal Act (42 USC Sec. 6901-6992; 40 CFR 257-258) Federal Land Disposal Requirements (40 CFR 268)	Protects health and the environment and promotes conservation of valuable material and energy resources. The Solid Waste Disposal Act establishes a framework for regulation of solid waste disposal. Federal land disposal requirements promulgated under the authority of the Solid Waste Disposal Act set minimum safety requirements for landfills including limitations on storage and land disposal for hazardous substances.
Department of Transportation Hazardous Materials Regulations (49 CFR 172)	Regulates the safe and secure transportation of hazardous materials, including documentation and handling requirements for shipping.
Washington Minimum Functional Standards for Solid Waste Handling (WAC 173-304)	Sets minimum functional standards for the proper handling of all solid waste materials originating from residences, commercial, agricultural, and industrial operations, as well as other sources.
Washington Solid Waste Handling Standards (RCW 70.95 and WAC 173-350)	Establishes minimum standards for handling and disposal of solid waste. Solid waste includes wastes that are likely to be generated as a result of site remediation, including contaminated soils, construction and demolition wastes, and garbage.
Washington Water Pollution Control Law (RCW 90.48; WAC 173-216, WAC 173-220) National Pollution Discharge Elimination System (CWA Part 402)	Washington has been delegated authority to issue NPDES permits. CWA Section 301, 302, and 303 require states to adopt water quality standards and implement a NPDES permitting process. The Washington Water Pollution Control Law and regulations address this requirement.
City of Ellensburg Noise Ordinance (EMC Chapter 5.60)	Project construction shall comply with the noise limitations set forth in City of Ellensburg’s noise ordinance.
Noise Control Act of 1974 (RCW 70.107, WAC 173-60)	Establishes maximum noise levels on a state level; the local noise ordinance regulations prevail given that they are more restrictive than the regulations set forth for the state.
Washington State Underground Injection Control Program (WAC 173-218)	Washington is authorized under CWA Sections 144 through 147 to administer a statewide Underground Injection Control program to protect groundwater by regulating the discharge of fluid from injection wells including temporary injection points.
City of Ellensburg Site Development Permit (EMC 15.250.020)	City of Ellensburg Site Development Permits authorize the following activities: paving, grading, clearing, filling, tree removal, on-site utility installation, stormwater facility installation [...]. All excavation, paving, and utility and stormwater facility installation work will require substantive compliance with the Site Development Permit requirements and any supporting technical memorandums (e.g., City of Ellensburg Storm Standards for design and installation of stormwater facilities).
Federal, State, and Local Air Quality Protection Programs State Implementation of Ambient Air Quality Standards NWAPA Ambient and Emission Standards Regional Standards for Fugitive Dust Emissions Toxic Air Pollutants	Regulations promulgated under the federal Clean Air Act (42 USC 7401) and the Washington State Clean Air Act (RCW 70.94) govern the release of airborne contaminants from point and non-point sources. State and local air pollution control authorities such as the Ecology Central Regional Office and City of Ellensburg have also set forth regulations for implementing these air quality requirements. These requirements may be applicable to the Site for the purposes of demolition or dust control.

Table 12.1
Applicable or Relevant and Appropriate Requirements for the Preferred Cleanup Action Alternative

Standard, Requirement, or Limitation ⁽¹⁾	Description
Chemical-Specific ARARs ⁽⁴⁾	
Model Toxics Control Act (WAC 173-340)	Establishes Washington administrative processes and standards to identify, investigate, and clean up facilities where hazardous substances are located.
Drinking Water Standards—State MCLs (WAC 246-290-310)	Establishes standards for contaminant levels in drinking water for water system purveyors.
Water Quality Standards for Groundwaters of the State of Washington (WAC 173-200)	Implements the Water Pollution Control Act and the Water Resources Act of 1971 (90.54 RCW).

Notes:

- 1 Projects conducted under an Agreed Order are exempt from the procedural requirements of most state and local permits (RCW 70.105D.090); however, the remedial actions must still comply with the substantive requirements of the exempt permits.
- 2 Location-specific ARARs are requirements that are applicable to the specific area where the Site is located, and can restrict the performance of activities, including cleanup actions, solely because they occur in specific locations.
- 3 Action-specific ARARs are requirements that are applicable to certain types of activities that occur or technologies that are used during the implementation of cleanup actions.
- 4 Chemical-specific ARARs are applicable to the types of contaminants present at the Site. The cleanup of contaminated media at the Site must meet the CULs developed under MTCA; these CULs are considered chemical-specific ARARs.

Analyte

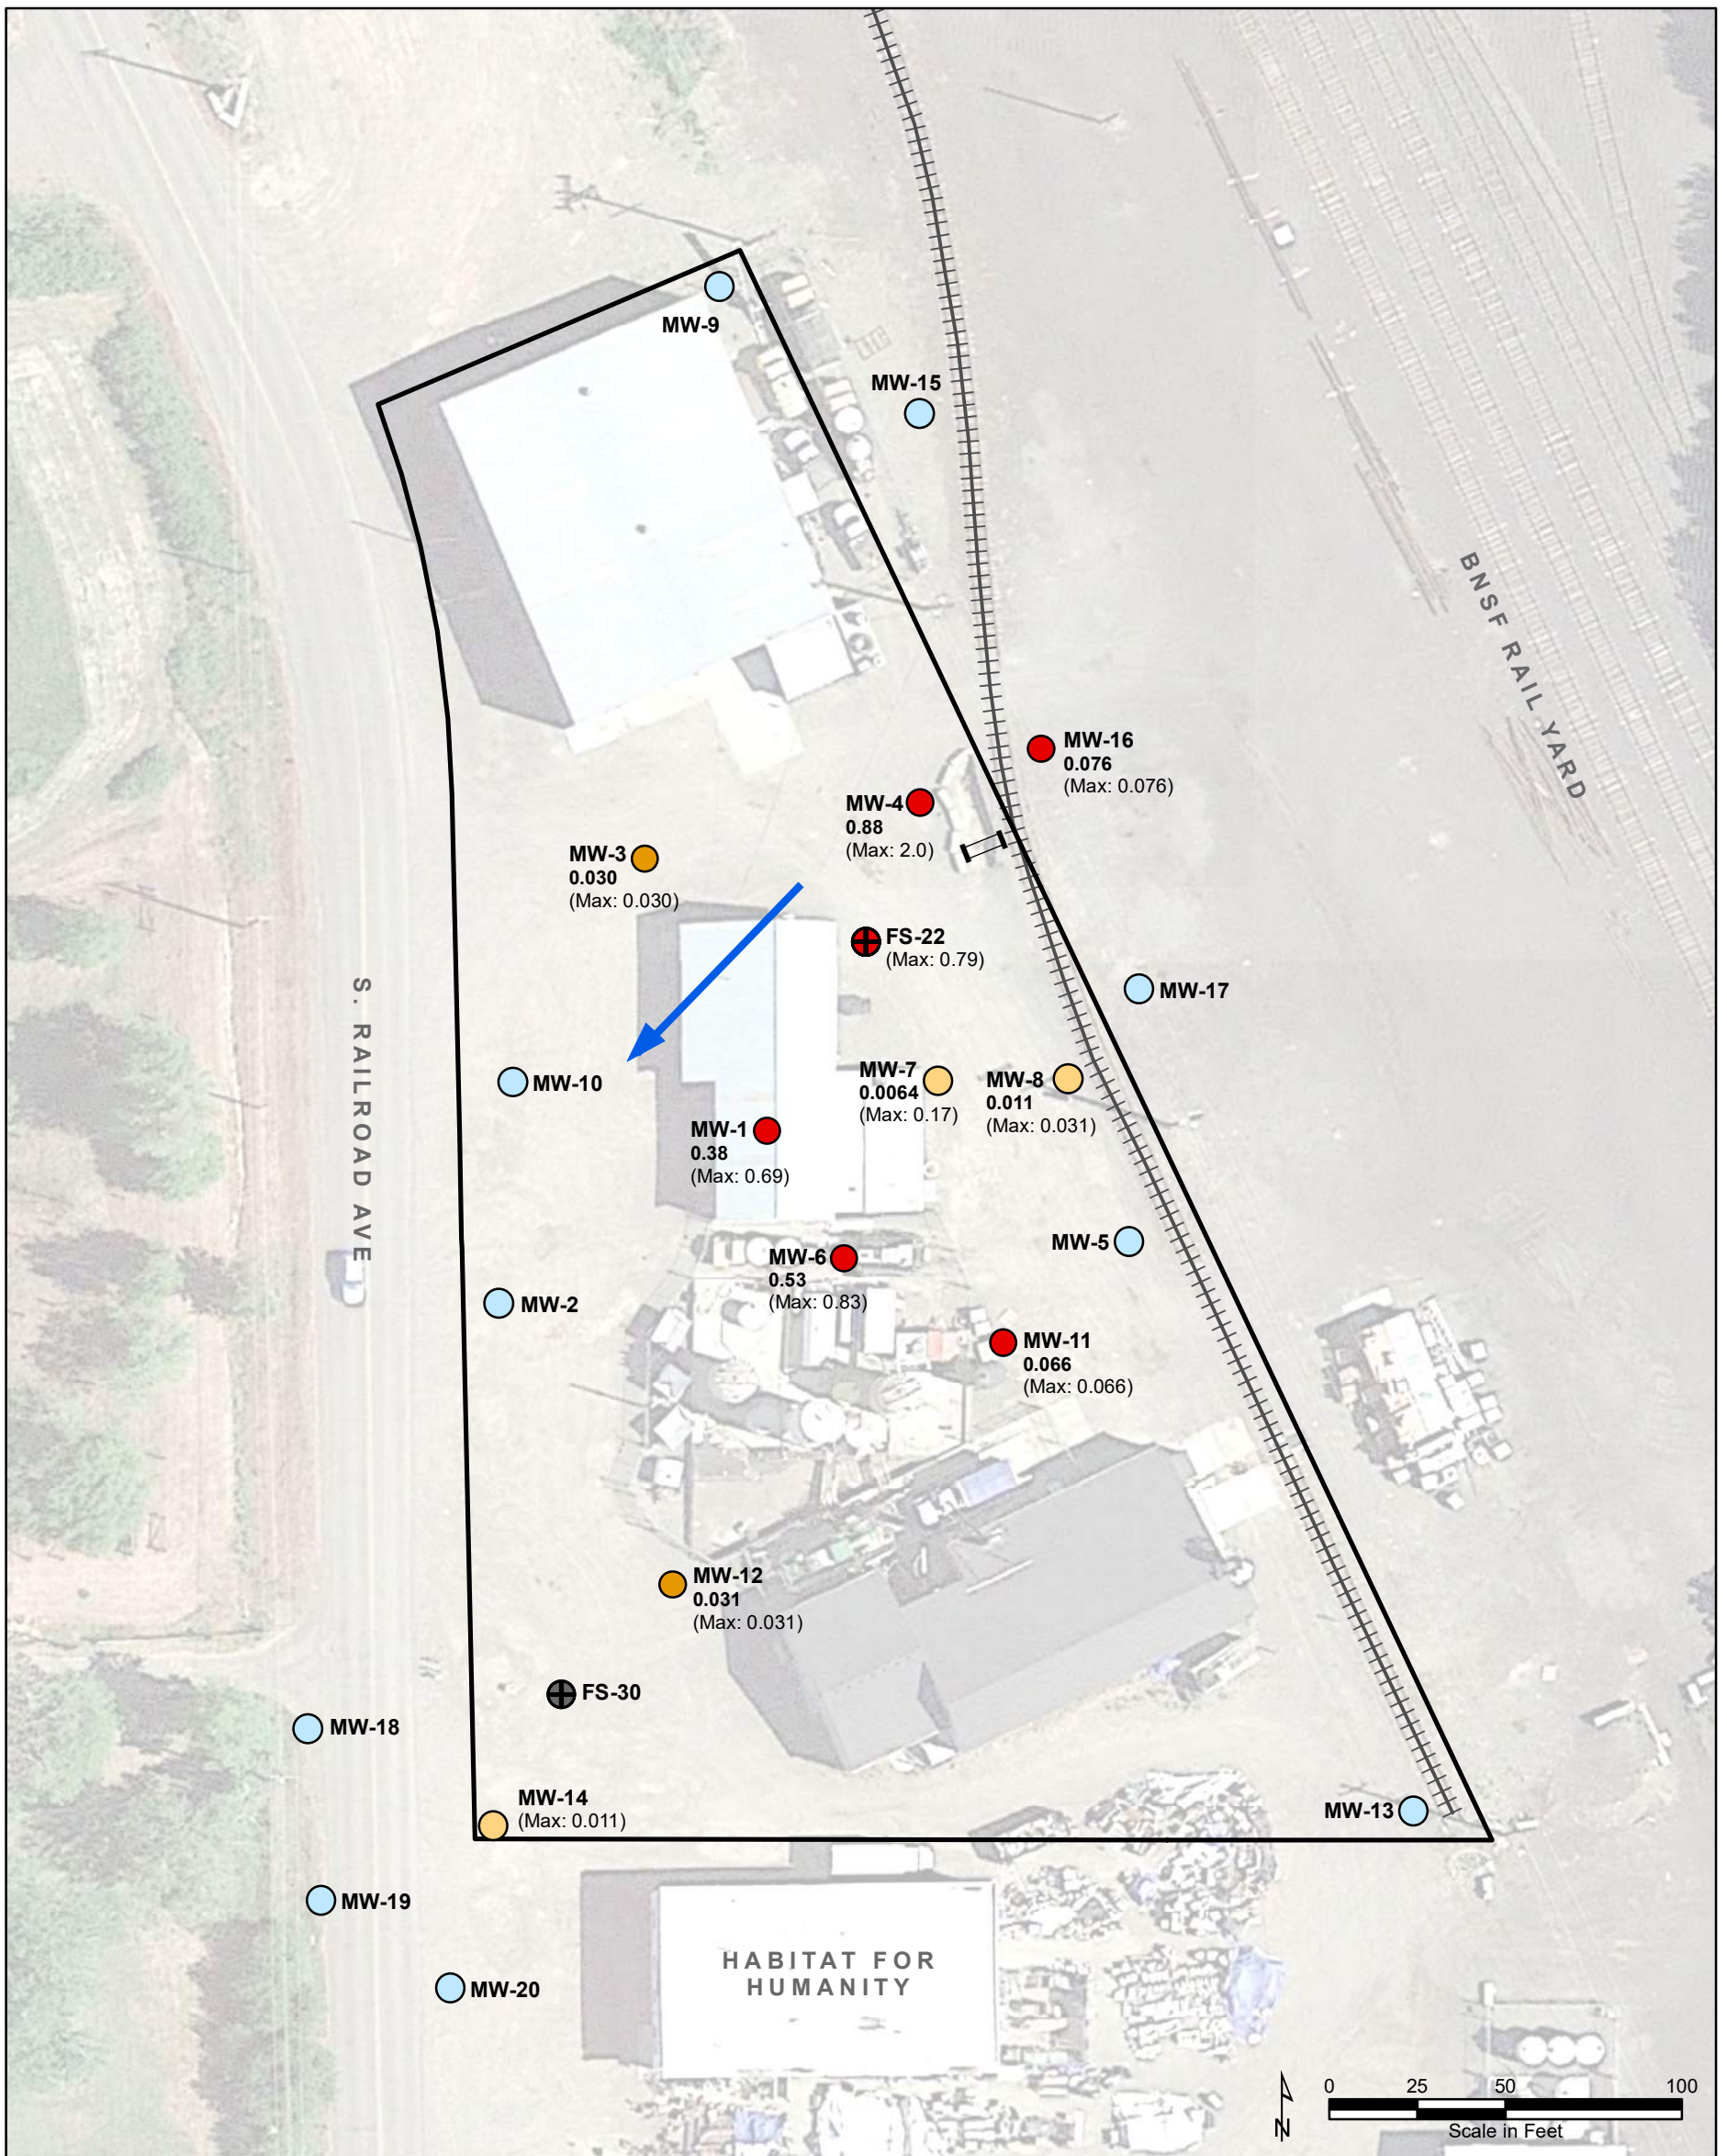

- Ammonia (total as nitrogen)
- Total Nitrate/Nitrite
- Nitrate
- Nitrite

Nitrate Proposed CUL: 10,000 µg/L
Nitrite Proposed CUL: 1,000 µg/L

Notes:

1. Exceedance factors are calculated by dividing the result by their proposed CULs.
2. Ammonia and total nitrate/nitrite do not have a proposed CUL. Ammonia may be considered potential source of nitrate, and nitrate is more commonly found in the environment than nitrite. Thus, the exceedance factor is calculated by dividing results for these analytes by the proposed CUL for nitrate.
3. Box and whiskers plots include all detected results measured at the site.

- >1 Times Proposed CUL
- Meets Proposed CUL

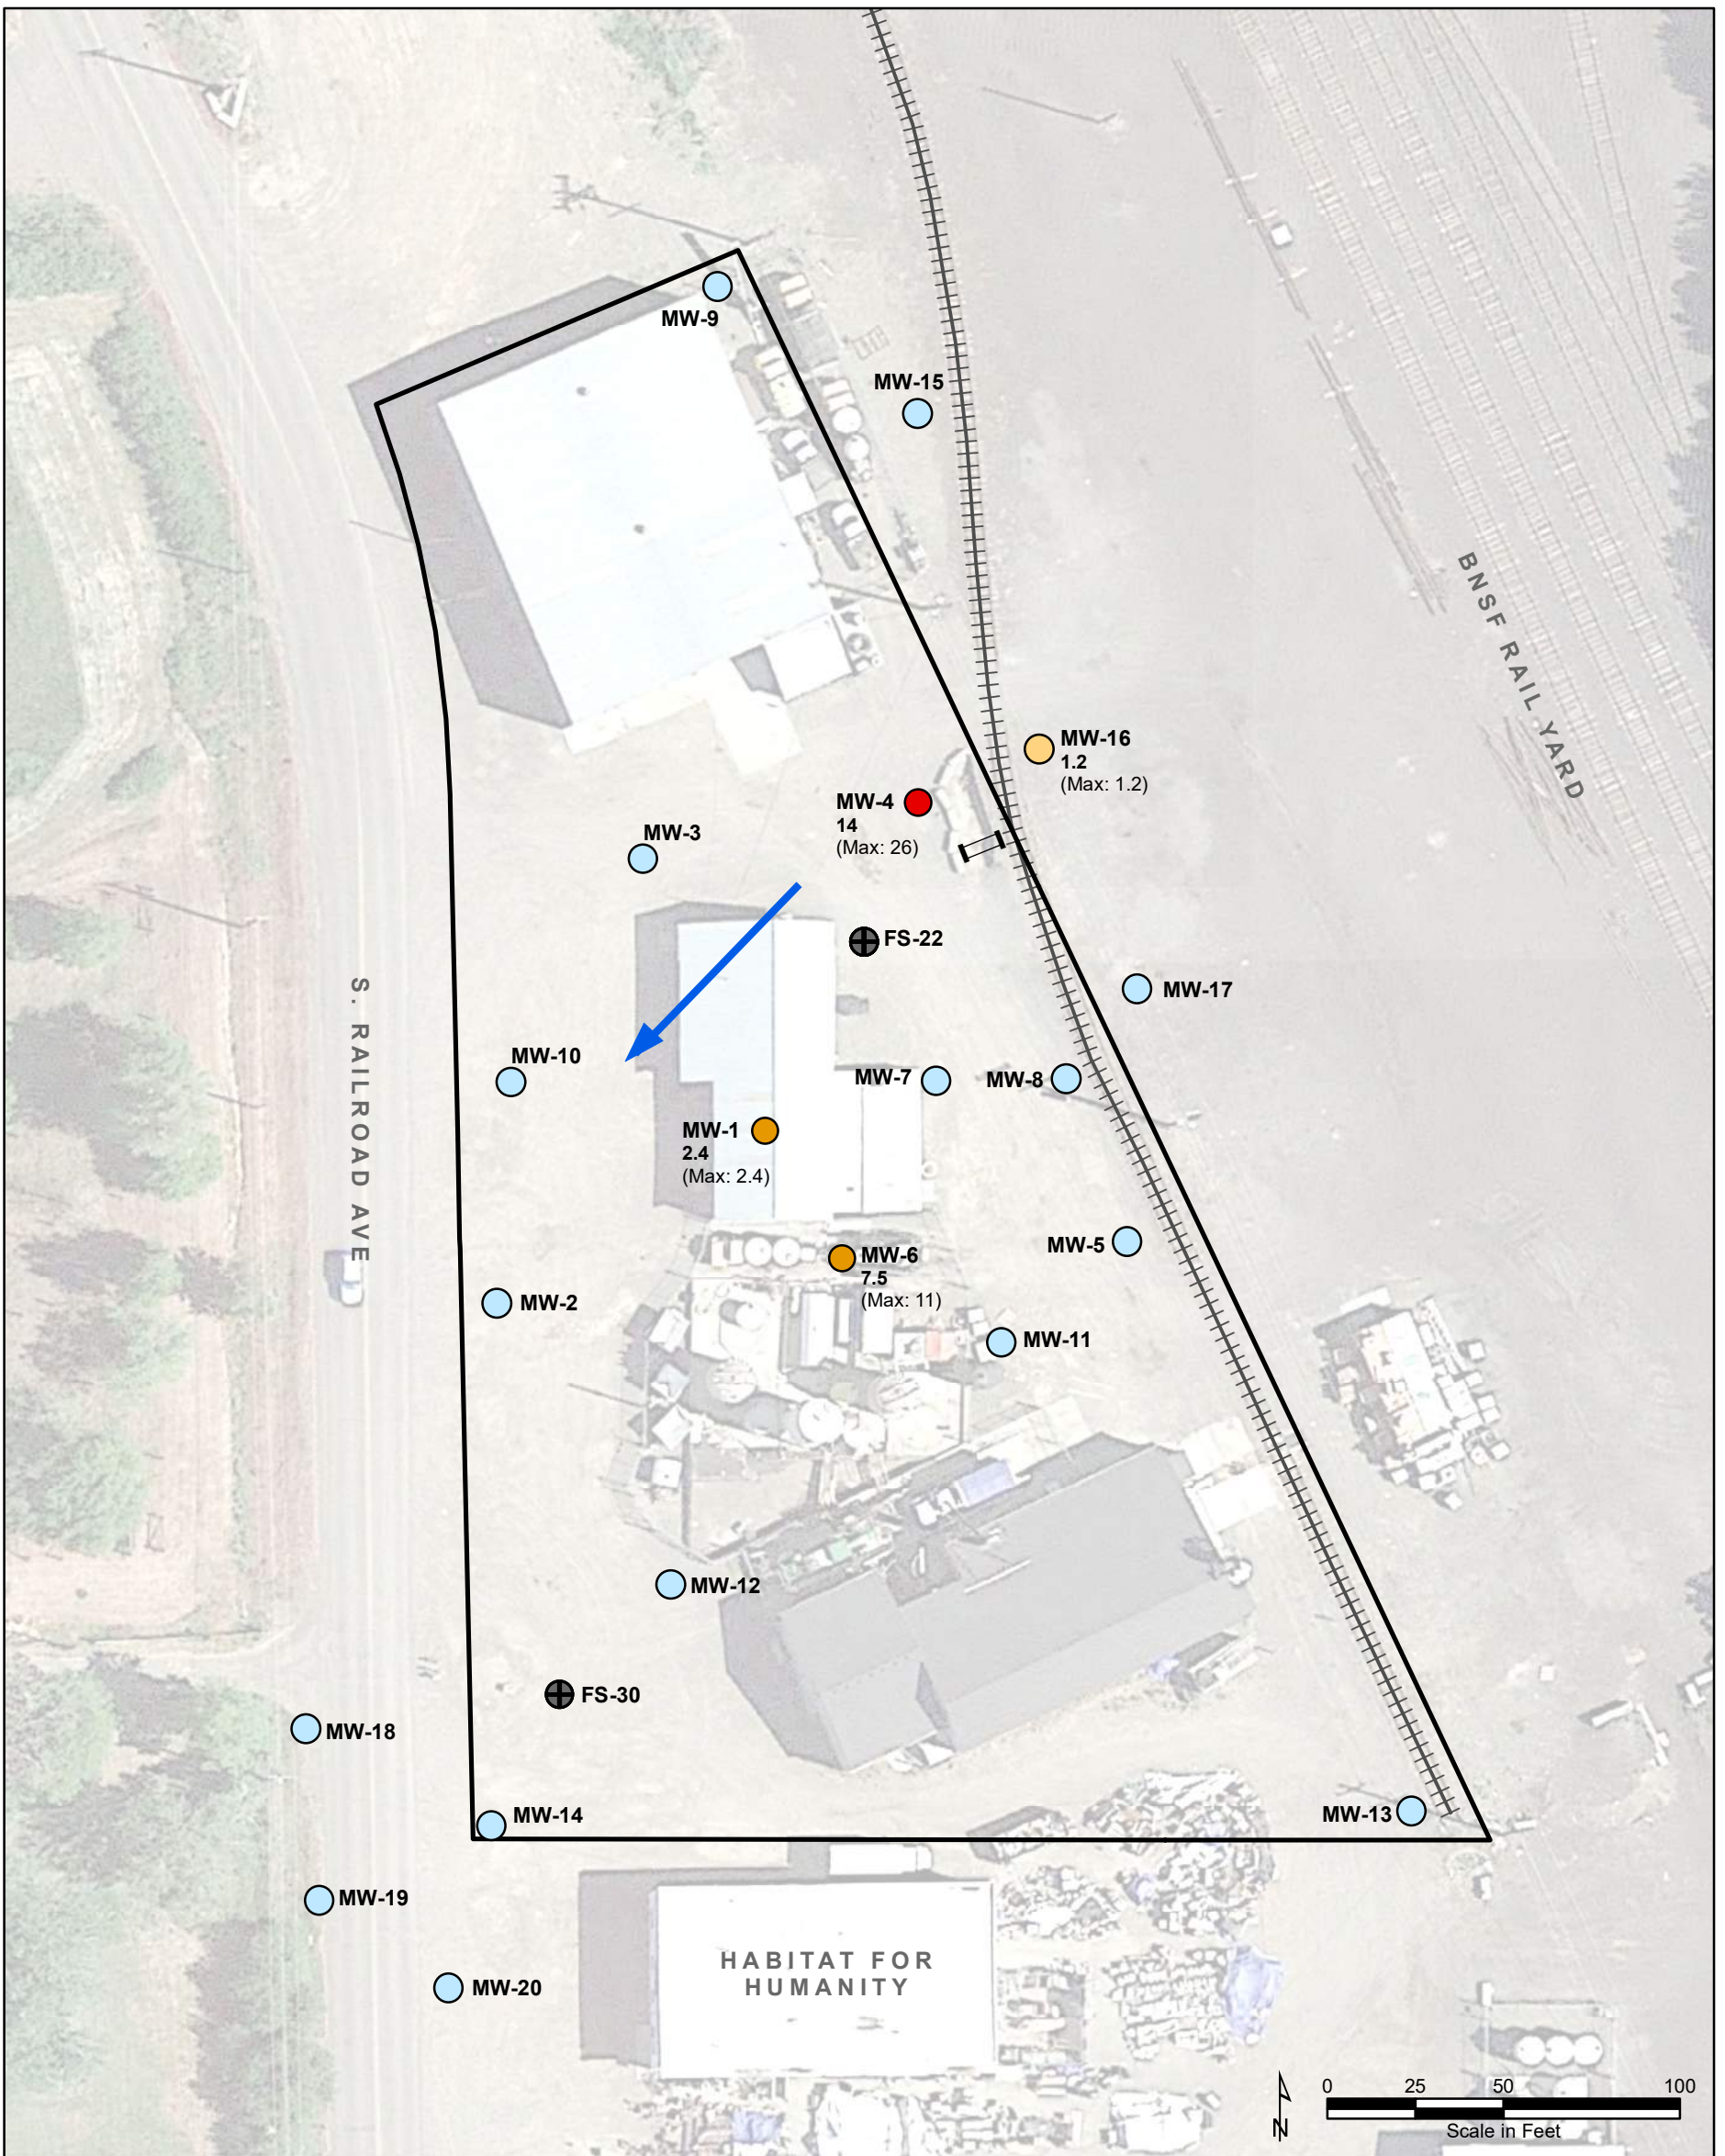

Groundwater Proposed CUL⁽³⁾

2,4-D: 70 µg/L
MCPA: 8.0 µg/L

Notes:

1. Groundwater sampling locations are colored according to the maximum exceedance factor of the compliance result; i.e., the maximum of recent (2016-2020) results for MCPA, and the average of recent results for 2,4-D. If the compliance result exceeds the proposed CUL, it is listed in bold next to the location ID. For more information, see Table 6.9.
2. The maximum detected result for 2,4-D at each location is listed if the maximum result exceeds the proposed CUL. Per WAC 173-340-720(9)(e)(i), no single sample result can be more than two times the proposed CUL.
3. Proposed groundwater CULs are numerically equivalent to the preliminary CULs developed in Table 5.1.
 - Results are reported to two significant figures. Result qualifiers are omitted.
 - Aerial imagery obtained from Google Earth, 2017.

Abbreviations:

2,4-D = 2,4-Dichlorophenoxyacetic acid µg/L = Micrograms per liter
 BNSF = BNSF Railway WAC = Washington Administrative Code
 CUL = Cleanup level
 ft bgs = Feet below ground surface
 MCPA = 2-Methyl-4-chlorophenoxyacetic acid

Alternative 1

Excavate to CULs

Excavate and dispose of soil at off-site landfill. Backfill with clean fill and gravel surface.

- AOC 6
- FS-01

 Protect Existing Structures

Existing buildings, concrete slabs, and concrete within containment area to remain as cap.

Asphalt Cap

Excavate shallow soil and place asphalt cap to restore existing grade. Includes installation of stormwater conveyance system and treatment. Refer to asphalt cross-section for details.

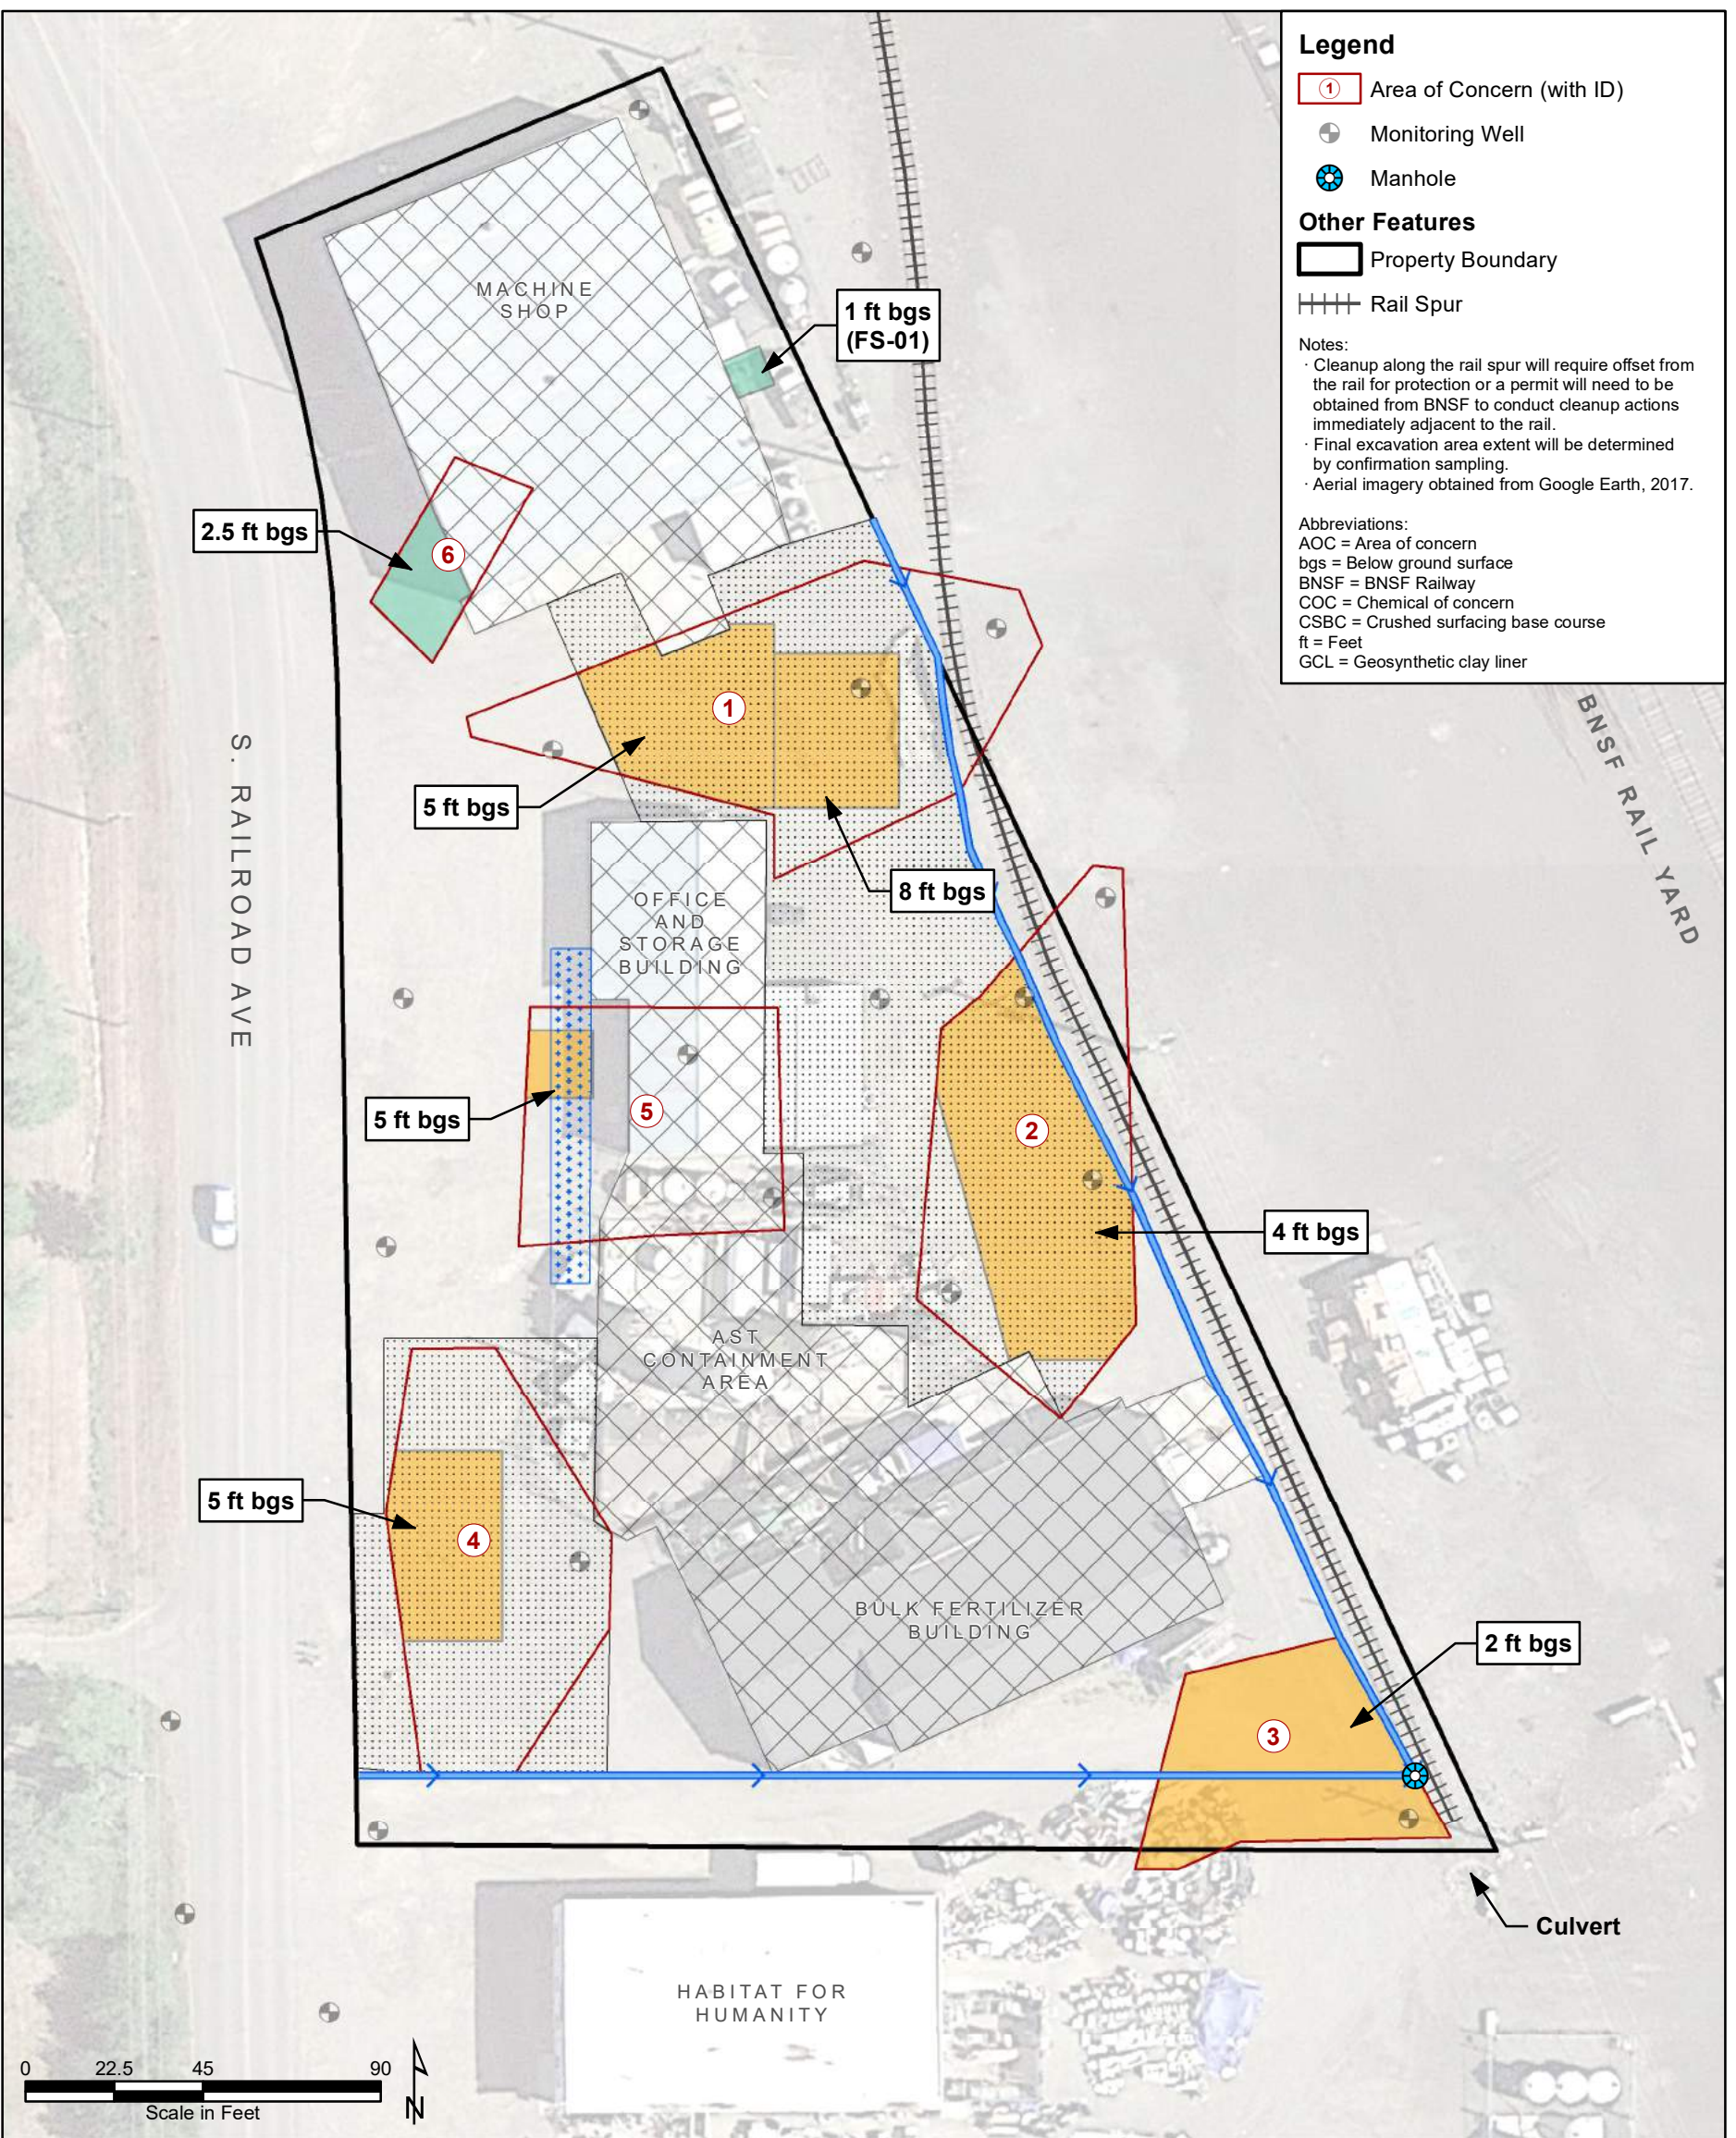

Note: Contaminated surficial soil will be removed as necessary for grading and will be disposed of at an off-site landfill.

- AOC 1 · AOC 4
- AOC 2 · AOC 5
- AOC 3

Asphalt Cross-Section

Note: Asphalt cross-section provided by PBS Engineering and Environmental Inc.

Alternative 2

Excavate to CULs

Excavate and dispose of soil at off-site landfill. Backfill with clean fill and gravel surface.

· AOC 6 · FS-01

Excavate to Direct Contact RELs

Excavate and dispose of soil at off-site landfill. Backfill with clean fill and gravel surface.

Note: If pre-design data show that contamination in AOC 3 extends off-property, then excavation off-property will be designed to meet the CULs.

· AOC 1 · AOC 3 · AOC 6
· AOC 2 · AOC 5

Protect Existing Structures

Existing buildings, concrete slabs, and concrete within containment area to remain as cap.

In Situ Groundwater Treatment

Inject trademarked colloidal activated carbon matrix (PlumeStop™) to create a passive treatment zone.

Geosynthetic Clay Liner

Install GCL as barrier for protection of groundwater from residual soil contamination.

Drainage System

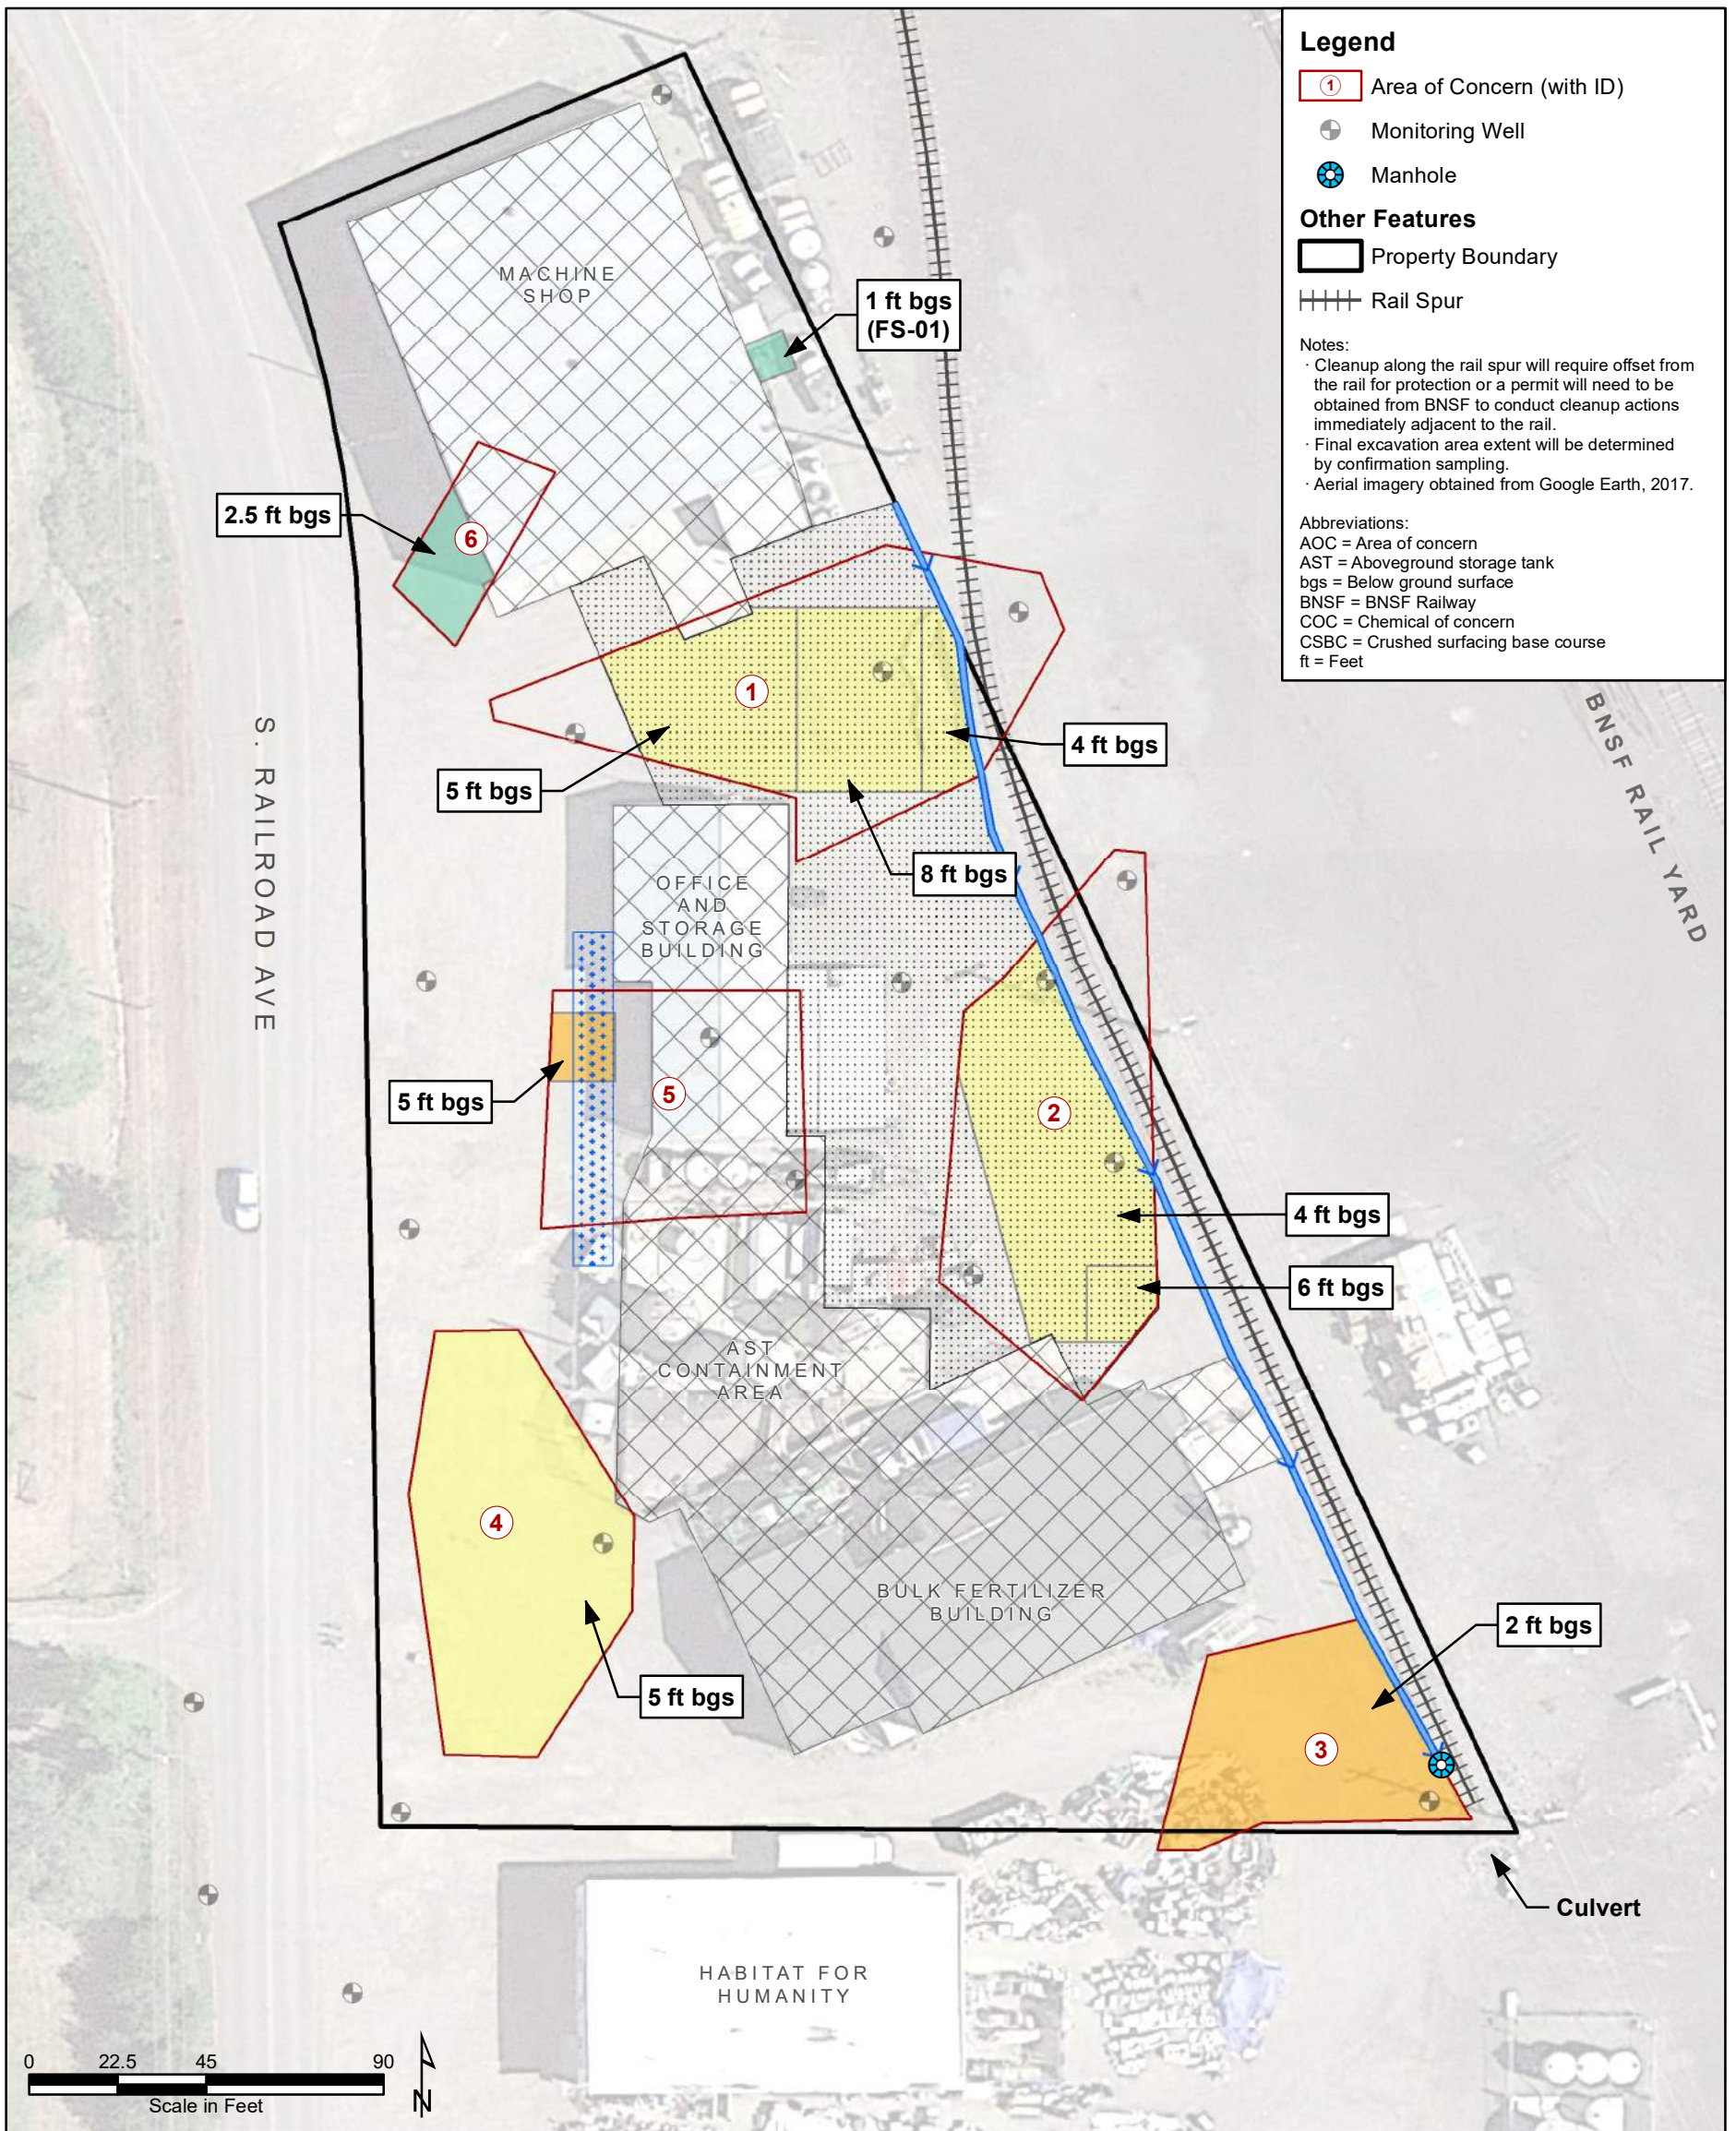

Collect infiltrated precipitation drainage from the GCL and convey to a collection manhole at the southeast corner of the property.

GCL Cross-Section

Not to Scale.

Note: GCL cross-section provided by PBS Engineering and Environmental Inc.

- Rail Spur

Notes:

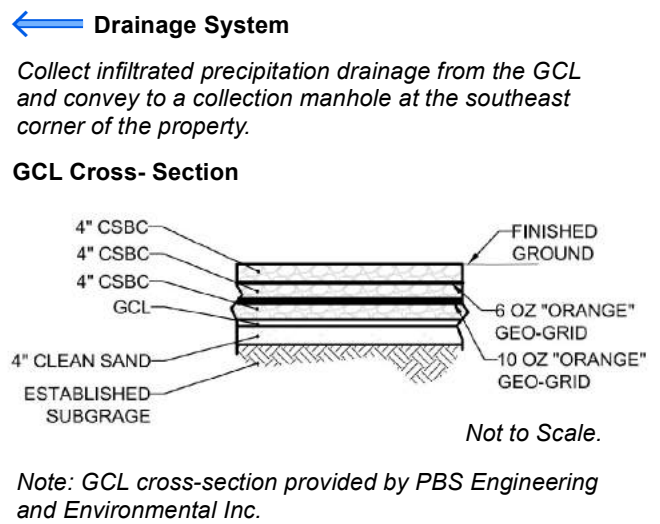

- Cleanup along the rail spur will require offset from the rail for protection or a permit will need to be obtained from BNSF to conduct cleanup actions immediately adjacent to the rail.
- Final excavation area extent will be determined by confirmation sampling.
- Aerial imagery obtained from Google Earth, 2017.

Abbreviations:

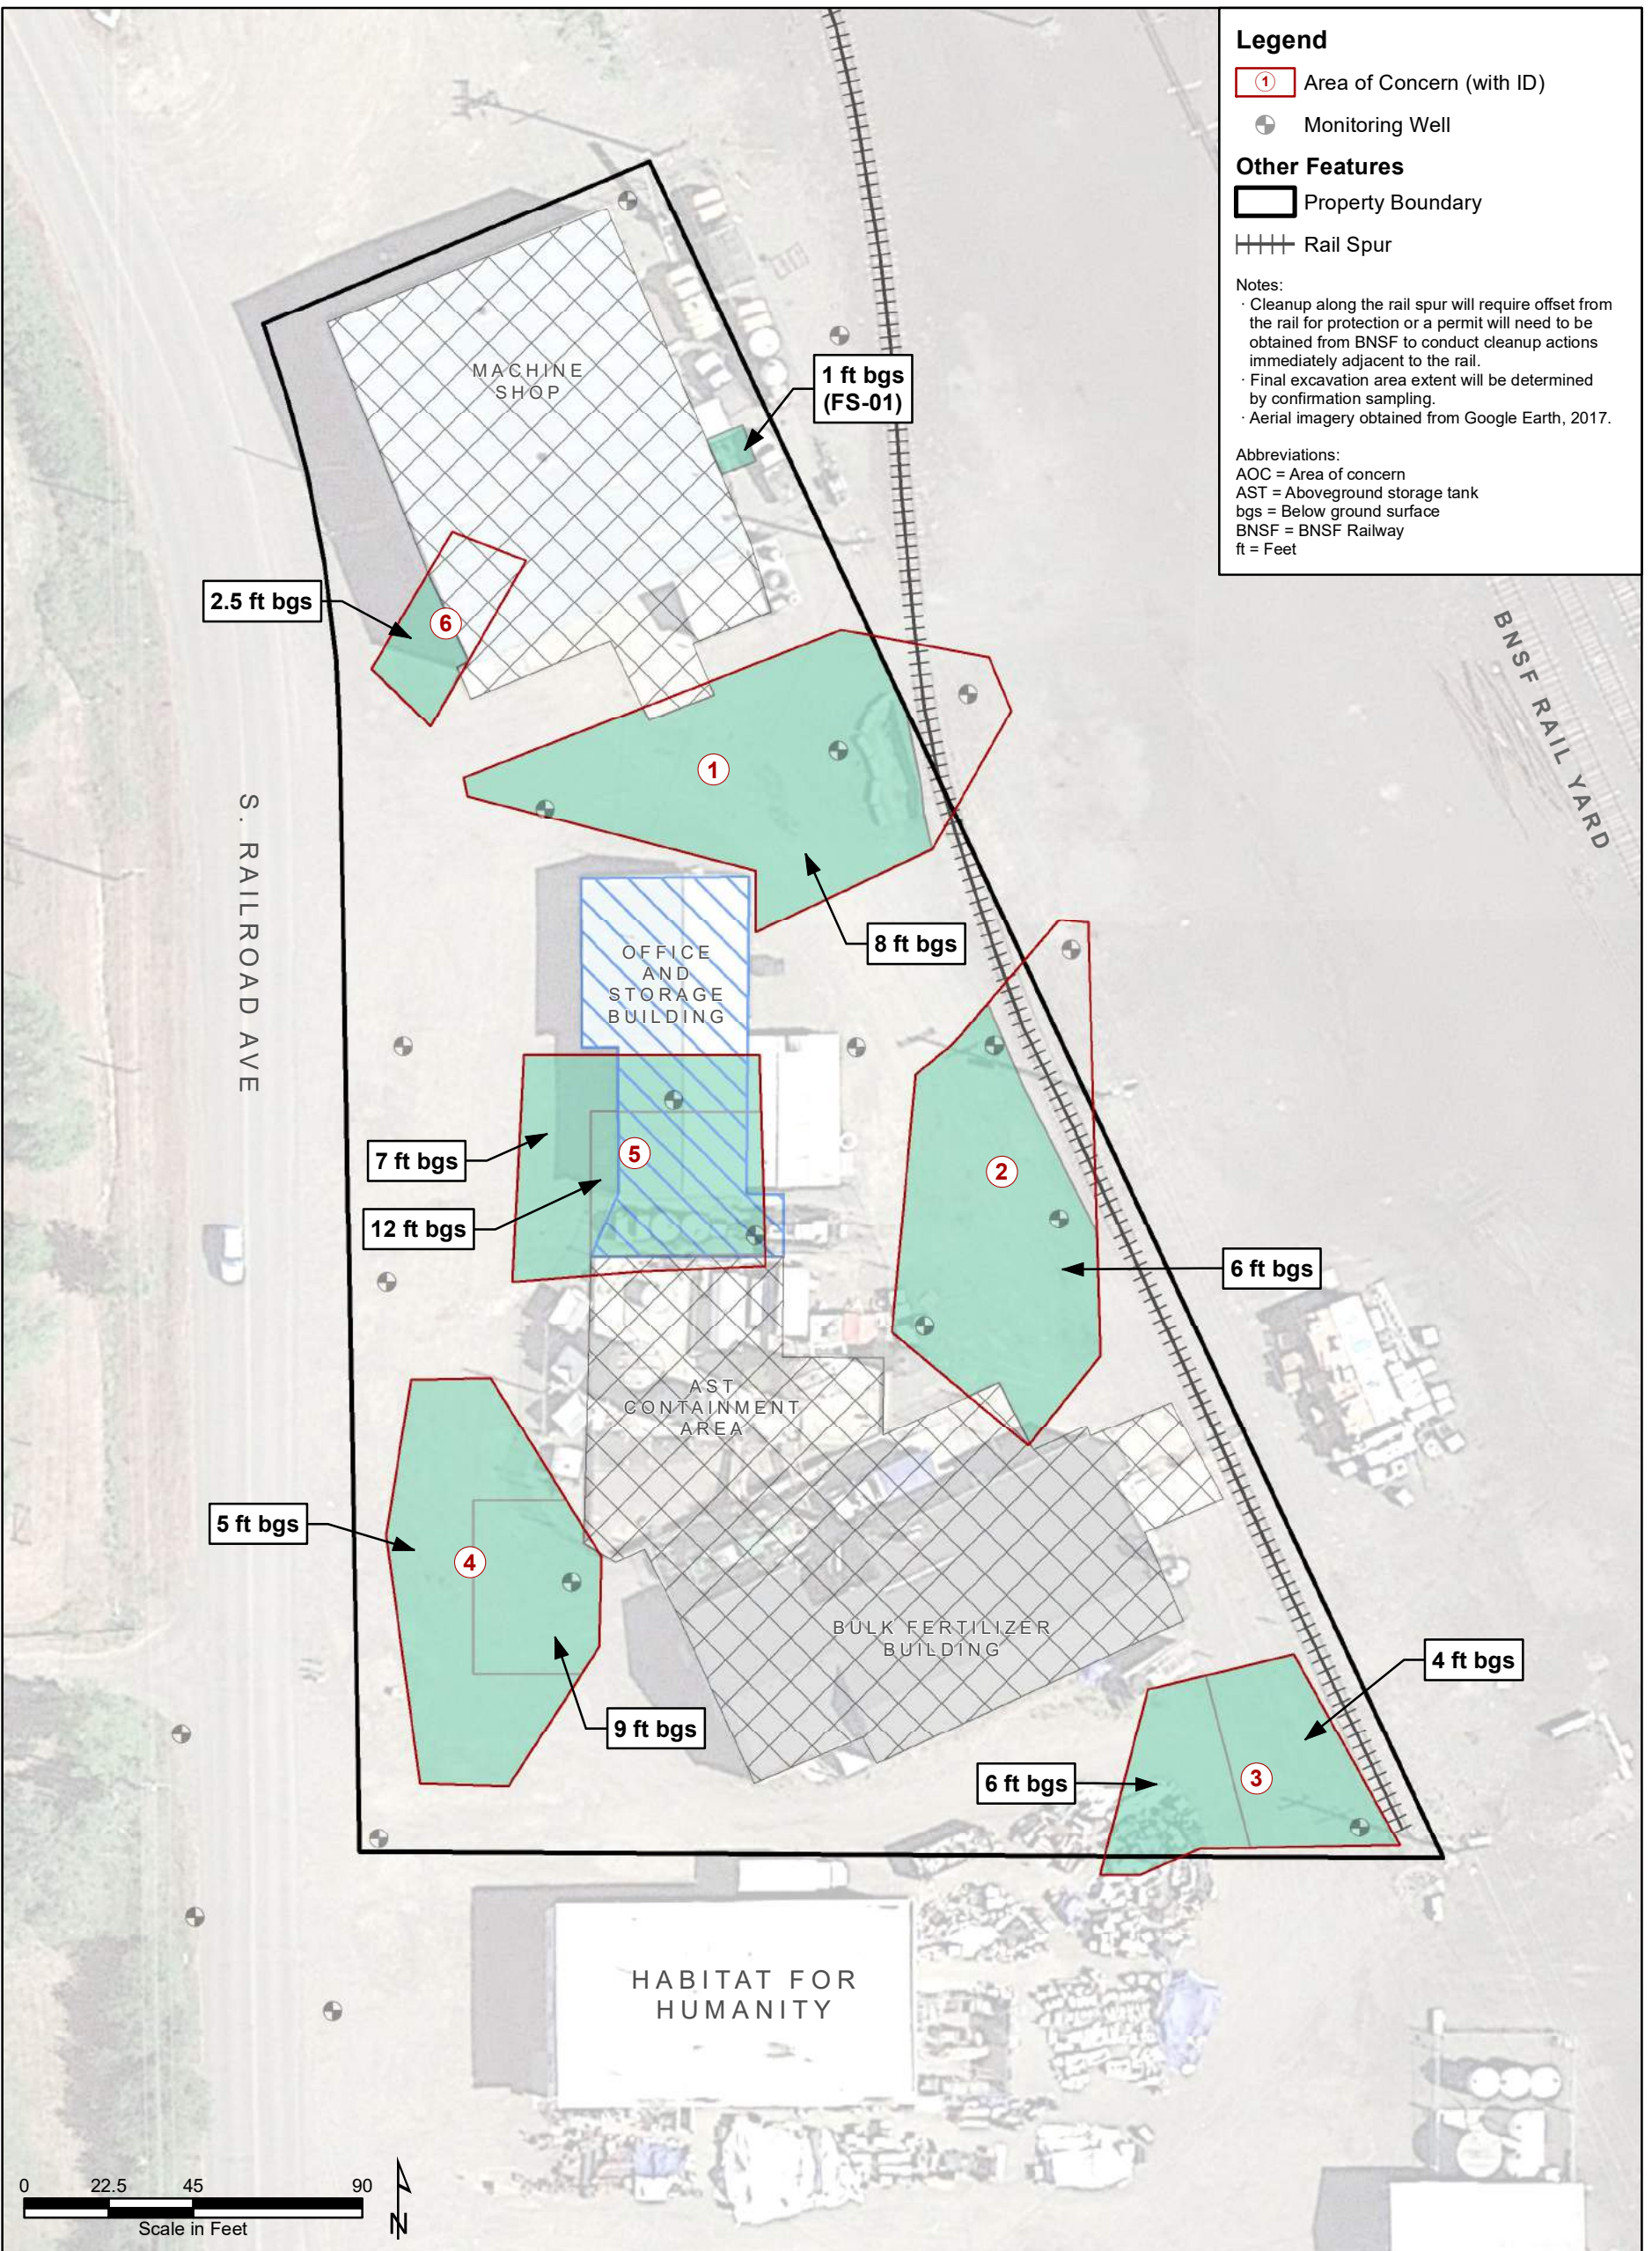

- AOC = Area of concern
- AST = Aboveground storage tank
- bgs = Below ground surface
- CPOC = Conditional point of compliance
- COC = Chemical of concern
- CSBC = Crushed surfacing base course
- CUL = Cleanup level
- CY = Cubic yards
- ft = Feet
- GCL = Geosynthetic clay layer
- REL = Remediation level

Total Volume of Soil Removal (CY)

AOC 1:	850
AOC 2:	530
AOC 3:	220
AOC 4:	860
AOC 5:	60
AOC 6:	50
FS-01:	10
Outside AOCs (GCL Area):	390

Alternative 3

QUIT CLAIM DEED

By [Signature]
AF # 2275 8-7-96

THE GRANTORS, JAMES R. SMITH and JEAN SMITH, husband and wife, for and in consideration of ONE DOLLAR (\$1.00) and other good and valuable consideration, convey and quit claim to AD GRO, L.L.C., a limited liability company, the Grantee, the following described real estate, situated in Kittitas County, State of Washington, together with all after acquired title of the Grantor therein:

All of that portion of the Northeast quarter of the Southwest quarter of Section 2, Township 17 North, Range 18 East, W.M., in the County of Kittitas, State of Washington which is bounded by a line described as follows:

Beginning at the Northwest corner of said quarter of quarter section and running thence South 1°29' East 458 feet; thence South 89°48' East 321 feet to a point on a line parallel to and 200 feet distant, measured at right angles from the center line of the main track of the Northern Pacific Railway Company's railroad; thence North 25°04' West along said line 506.2 feet to the North boundary line of said quarter of quarter section; and thence North 89°48' West 119.4 feet to the point of beginning.

DATED this 5th day of Aug, 1996.

BULK TANK

		#1	#2	
1 - 24,000 gal.	=	2,520.	+ 410.	Column #1=Tank Co
1 - 25,000 gal.	=	2,612.	+ 410.	Column #2=Conc. &
1 - 16,000 gal.	=	1,890.	+ 340.	Tank
1 - 12,000 gal.	=	1,575.	+ 340.	Support
1 - 10,000 gal.	=	1,430.	+ 265.	
1 - 5,000 gal.	=	850.	+ 154.	
1 - 4,000 gal.	=	681.	+ 125.	
<u>87,000 gal.</u>	=	<u>11,558.</u>	+ <u>2,044.</u>	= 13,602

13,602 X 130 F. = 17,680. Dep. 85% = 20% Good = 2,652.

Bulk plants have become obsolete in this area. There are several plants closed in this area and have very little sale value on the market.

The reason for the High depreciation of the bulk storage tank is the super adequate storage of the tanks for the fertilizer business.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Summary of Year 1 Groundwater Results and
Recommendations for Year 2

DRAFT

Memorandum

To: John Mefford and Mary Monahan, Washington State Department of Ecology
From: Allison Geiselbrecht, PhD, and Erin Murray, Floyd|Snider
Date: October 6, 2017
Project No: Smith-Kem
Re: Summary of Year 1 Groundwater Results and Recommendations for Year 2

This memorandum presents a summary of the first year of quarterly groundwater monitoring at the Smith-Kem Ellensburg Site (Site), as well as recommendations for modifications to the constituents of potential concern (COPCs), the monitoring well network, and sampling schedule for Year 2.

As described in the *Smith-Kem Site Remedial Investigation Work Plan* (Work Plan; Floyd|Snider 2016), the data gaps investigation was to be completed in a phased approach, with the intent to collect data in Phase 1 to better inform the approach for Phase 2 sampling. In February 2017, a memorandum was submitted to the Washington State Department of Ecology (Ecology) proposing a reduction in some soil COPCs for Phase 2 of the Remedial Investigation (Floyd|Snider 2017). In late February 2017, Ecology approved the memorandum, which limited Phase 2 investigation soil sampling to those COPCs that were detected at concentrations of potential concern. This memorandum presents a similar rationale for modification to the groundwater sampling plan. By eliminating extraneous COPCs, analytical complexities can be reduced, which, in turn, allows for the elimination of multi-residue methodology for pesticides (and hence, a more standard method), helping reach practical quantification limits (PQLs), reduce costs, and decrease the turnaround time for results.

The COPCs selected for analysis in Phase 1 were based on previous investigations at the Site. COPCs consisted of diesel-range total petroleum hydrocarbons (TPH-D); gasoline-range TPH (TPH-G); benzene, toluene, ethylbenzene, and xylenes (BTEX); organochlorine pesticides; chlorinated herbicides; nitrate; nitrite; and ammonia. However, based on the incomplete record of historical pesticide/fertilizer use, it was not possible to rule out any particular classes of pesticides, herbicides, or insecticides as being COPCs. Therefore, a full suite of organochlorine pesticides, chlorinated herbicides, halogenated pesticides, organophosphate pesticides, organonitrogen pesticides, phenylurea herbicides, carbamate pesticides, and organophosphorus or organosulfur pesticides were analyzed in the first year of quarterly groundwater monitoring in order to cover the full range of pesticides/herbicides that may have been handled on-site.

DATA SUMMARY BY ANALYTE CLASS

Per the Agreed Order (No. DE 12908), the network of 14 monitoring wells were sampled quarterly for 1 year (Ecology 2016). Table 1 provides a summary of detections and the rationale for whether an analyte is proposed for elimination. Table 2 provides the analytical results for all quarterly groundwater samples collected between August 2016 and May 2017. In Phase 2, samples were also collected at two temporary wells on-site at two depths to determine if previously identified COPCs are present within stratified depths within the aquifer. Temporary wells were also installed on the property to the west of the Site to assess atrazine and nitrate contamination off-site. The results of the temporary well sampling are presented in Table 3.

Petroleum Hydrocarbons

As shown in Table 1, TPH-G was not detected during any sampling event and, therefore, is proposed for elimination as an analyte and COPC from future monitoring events. TPH-D and oil-range TPH (TPH-O) are retained, as they were detected in soils and exceeded the most stringent groundwater screening level (SL) in two monitoring wells in at least one event (Figure 1).

Volatile Organic Compounds

There were no BTEX detections or other volatile organic compounds (VOCs) in groundwater samples collected between August 2016 and June 2017 (Tables 1 and 2). Therefore, VOCs will no longer be considered a COPC and are proposed for elimination from future groundwater monitoring events.

Metals

Groundwater was sampled and analyzed for arsenic, cadmium, copper, lead, mercury, and zinc in each sampling event. As shown in Table 1 and Figure 1, in all sampling events there was only one sample that exceeded the most stringent SL for arsenic at MW-4. Due to this one exceedance, Ecology would like monitoring for arsenic to continue (both total and dissolved) at MW-4. Additionally, any new wells installed on-site or on the BNSF property will need to be analyzed for arsenic to determine compliance. Therefore, all other metals, with the exception of arsenic, will no longer be considered COPCs and are proposed for elimination from future groundwater monitoring events.

Nitrate and Nitrite

Nitrate and nitrite have been detected at concentrations greater than SLs with seasonal variations across the Site (Figure 2). Due to these results, and because the Site is an active fertilizer distributor, nitrate and nitrite are being retained as COPCs for future groundwater monitoring.

Ammonia

Ammonia-nitrogen was analyzed for four consecutive quarters in groundwater and does not have a groundwater SL or standard. The existing data are deemed sufficient for conceptual site model (CSM) development; therefore, it is proposed that ammonia will be eliminated from future groundwater monitoring for currently installed wells. For any newly installed monitoring wells on-site or on the BNSF property, groundwater will be analyzed for ammonia to determine compliance.

Organochlorine Pesticides

There were exceedances of a select number of organochlorine pesticides in both soil and groundwater across the Site. Furthermore, there were raised reporting limits for some non-detect analytes in this class (refer to Table 2). Therefore, all the pesticides listed in the Work Plan in this class will be retained as COPCs.

Chlorinated Herbicides

Of the chlorinated herbicides analyzed in groundwater, 2,4-dichlorophenoxyacetic acid (2,4-D) and 2-methyl-4-chlorophenoxyacetic acid (MCPA) concentrations exceeded the SLs during the second or fourth quarter monitoring events, but did not exceed during the first or third quarter of events (Figure 3). Due to this variability in concentrations, the full list of chlorinated herbicides will be retained as COPCs for future groundwater monitoring.

Other Chlorinated/Halogenated Pesticides

As shown in Table 1, of the analytes listed in this category, only atrazine, simazine, and chlordane-alpha exceed their respective SLs. Atrazine and simazine will be retained as COPCs. Because chlordane-alpha is an isomer of chlordane, which is being retained as a COPC (within the organochlorine pesticide class described above), it can be eliminated from future analyses at all wells except for MW-4. Due to chlordane-alpha's toxicity and the potential that this isomer may have different fate and transport characteristics than chlordane, Ecology would like continued monitoring for chlordane-alpha at MW-4.

Other than atrazine and simazine, which will be analyzed at all wells, and chlordane-alpha at MW-4, all other chlorinated/halogenated pesticides can be eliminated as COPCs in future groundwater monitoring.

Additional analyses for future groundwater monitoring will include desethyl atrazine, which is a degradation product of the pesticide atrazine. This additional analysis will be conducted for select monitoring wells with previous exceedances of atrazine. The results will be used in the development of the CSM and remedial alternatives by quantifying the transit time of atrazine in the aquifer.

Remaining Pesticides and Herbicides

For the remaining categories of pesticides and herbicides (i.e., organophosphate pesticides, triazine herbicides, phenylurea herbicides, carbamate pesticides, organophosphorus and organosulfur pesticides, organonitrogen pesticides, and glyphosate), although there were some detections, concentrations were significantly less than the SLs in Table 1. Therefore, all of these classes can be eliminated as COPCs in future groundwater monitoring.

The analytes proposed for elimination (and those that will be retained) are summarized in Table 4.

Table 4
Constituents of Potential Concern in Year 1 and Year 2 of Groundwater Monitoring

Analyte	Year 1	Year 2
TPH-D	Yes	Yes
TPH-G	Yes	No
Volatile Organic Compounds	Yes	No
Metals	Yes	No ¹
Nitrate and Nitrite	Yes	Yes
Ammonia-Nitrogen	Yes	No ²
Organochlorine Pesticides	Yes	Yes
Chlorinated Herbicides	Yes	Yes
Other Chlorinated/Halogenated Pesticides	Yes (full list)	Atrazine/ Simazine only ³
Remaining Pesticides and Herbicides	Yes	No
Desethyl Atrazine	No	Yes (new for Year 2)

Notes:

- 1 Monitoring for arsenic will continue (both total and dissolved) at MW-4.
- 2 Any newly installed monitoring wells on-site or on the BNSF property will be analyzed for ammonia.
- 3 Monitoring for chlordane-alpha will continue at MW-4.

MONITORING NETWORK AND FREQUENCY

Based on the aforementioned discussion of groundwater COPCs and the data presented in Tables 1 through 3, a reduction in the network and frequency of groundwater sampling is appropriate for the next year of monitoring. The monitoring wells on-site that show little-to-no impact or seasonal variation (i.e., MW-2, MW-9, MW-10, and MW-13) are proposed to be sampled semiannually. Seasonal variations of nitrate and nitrite concentrations show peaks in late summer and early fall and lows in winter. Therefore, these quarters (Q1 and Q3) are appropriate sampling times for further documentation of seasonal variations at the minimally impacted wells. Table 5 presents a summary of the proposed wells and monitoring frequency for the second year of groundwater monitoring.

Table 5
Monitoring Network and Frequency

Location	Monitoring Frequency for Year 2
MW-1, MW-3, MW-4, MW-5, MW-6, MW-7, MW-8, MW-11, MW-12, MW-14	Quarterly
MW-2, MW-9, MW-10, MW-13	Semiannually: ^{1, 2} Q1 and Q3
Phase 2b Wells (Off-Property)	To be sampled 1 week after installation. Continued monitoring schedule contingent on initial results.

Notes:

- 1 Q1 of Year 2 Monitoring will occur between August and October 2017; Q3 will occur between February and April 2018.
- 2 If the analytical laboratory is able to achieve lower reporting limits using the new analytical method for pesticides and herbicides and results indicate detections where there were previously non-detect exceedances, these monitoring wells will be monitored quarterly.

Notes:

- Red analyte is retained as a COPC.
- Not applicable
- 1 Both field samples and field duplicates are included in the counts.
- 2 Locations include permanent wells and temporary Geoprobe wells.
- 3 Exceedance factors have been rounded to two significant figures.

Abbreviations:

- BHC Benzene hexachloride
- CAS Chemical Abstracts Service
- COPC Constituent of potential concern
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- EPN *O*-Ethyl *O*-(4-nitrophenyl) phenylphosphonothioate
- ft bgs Feet below ground surface
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPP Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Oil-Range TPH	--	µg/L	500	250 U		250 U	250 U	300 U

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPP Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- ¹ The second number listed is with Silica Gel cleanup.
- ² Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- ¹ The second number listed is with Silica Gel cleanup.
- ² Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- | | |
|--------------------------------------|--|
| CAS Chemical Abstracts Service | DDT Dichlorodiphenyltrichloroethane |
| BHC Benzene hexachloride | µg/L Micrograms per liter |
| D Dichlorophenoxyacetic acid | MCPA 2-Methyl-4-chlorophenoxyacetic acid |
| DB Dichlorophenoxy butyric acid | MCPP Meta-chlorophenylpiperazine |
| DDD Dichlorodiphenyldichloroethane | T Trichlorophenoxyacetic acid |
| DDE Dichlorodiphenyldichloroethylene | |

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detected; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Notes:

- Blanks are intentional.
- Not applicable.
- Red** Detected concentration that exceeds criteria.
- Italics** Non-detect; reporting limit exceeds criteria.
- 1 The second number listed is with Silica Gel cleanup.
- 2 Result listed for comparison only.

Abbreviations:

- CAS Chemical Abstracts Service
- BHC Benzene hexachloride
- D Dichlorophenoxyacetic acid
- DB Dichlorophenoxy butyric acid
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- µg/L Micrograms per liter
- MCPA 2-Methyl-4-chlorophenoxyacetic acid
- MCPD Meta-chlorophenylpiperazine
- T Trichlorophenoxyacetic acid

Qualifiers:

- J Analyte was detected; concentration is considered an estimate.
- JM Analyte was detected, but chromatograph did not match the standard used for quantitation; concentration is considered an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered an estimate.
- U Analyte was not detected at the given reporting limit.
- UJ Analyte was not detected at the given reporting limit, which is considered an estimate.

Floyd | Snider Memoranda

Attachment C.2
Constituents of Potential Concern
Elimination for Phase 2

DRAFT

Memorandum

To: John Mefford and Mary Monahan, Washington State Department of Ecology

Copies:

From: Allison Geiselbrecht and Erin Murray, Floyd|Snider

Date: February 3, 2017

Project No: Smith-Kem

Re: Constituents of Potential Concern Elimination for Phase 2

As described in the Smith-Kem Site Remedial Investigation Work Plan (Work Plan; Floyd|Snider 2016), the data gaps investigation was to be completed in a phased approach, with the intent to collect data in Phase 1 to refine data gaps and inform the approach for Phase 2 sampling. This memorandum presents the rationale for elimination or retention of some constituents of potential concern (COPCs) in soil for the Phase 2 investigation. The full list of COPCs in groundwater will remain unchanged through at least the first four quarters of groundwater sampling.

The COPCs selected for analysis in Phase 1 were based on previous investigations at the Smith-Kem Ellensburg Site (Site) located at 200 South Railroad Avenue in Ellensburg, Washington. COPCs consisted of diesel-range total petroleum hydrocarbons (TPH-D); gasoline-range TPH (TPH-G); benzene, toluene, ethylbenzene, and xylenes (BTEX); organochlorine pesticides; chlorinated herbicides; nitrate/nitrite; and ammonia. However, based on the incomplete record of pesticide/fertilizer use, it was not possible to rule out particular classes of pesticides, herbicides, or insecticides as being COPCs. Therefore, a full suite of organochlorine pesticides, chlorinated herbicides, halogenated pesticides, organophosphate pesticides, organonitrogen pesticides, phenylurea herbicides, carbamate pesticides, and organophosphorus or organosulfur pesticides were analyzed in Phase 1 in order to cover the full range of pesticides/herbicides that may have been handled on-site.

Therefore, in order to adequately and efficiently characterize the Site, Phase 2 sampling will be limited to those COPCs that are actually present on-site at concentrations of potential concern. The process for elimination of COPCs is described below.

PROCESS FOR ELIMINATION OF CONSTITUENTS OF POTENTIAL CONCERN

Table 1a is a frequency of exceedance table for detections for all of the soil COPCs and compares their concentrations against the screening levels (SLs) put forth in Table A.3 of the Work Plan.

Table 1b is a frequency of exceedance table for the non-detects compared against these same SLs.

In most cases, the SLs are based on the soil to protect groundwater pathway, natural background, or the Model Toxics Control Act (MTCA) Method B, which contains a variety of conservative assumptions and has not been tailored to account for site-specific conditions or exposures. The protectiveness of soil screening levels based on the soil to protect groundwater pathway is better evaluated using empirical groundwater data. Therefore, if the analyte exceeds the soil to protect groundwater concentration but is not present in groundwater at concentrations greater than the groundwater screening level, the analyte is considered for elimination in Phase 2 soil testing.

Alternatively, if the COPC has exceedances in both soil and groundwater according to the SLs in Tables 1a and 2, the COPC was retained.

CONSTITUENT OF POTENTIAL CONCERN PROPOSED TO BE ELIMINATED FROM THE ANALYTE LIST IN PHASE 2

Volatile Organic Compounds

As shown in Table 1a, there were only a few exceedances of the SLs for some analytes (which for volatile organic compounds [VOCs] are all based on the protection of groundwater), and there are no exceedances in groundwater for any of these analytes (refer to Table 2).

In addition to the VOCs listed in Table 1a, select samples from MW-11, MW-12, SB-3, and SB-6 were analyzed for the full suite of VOCs. All results were non-detect. For this reason, VOCs are proposed for elimination as COPCs in Phase 2.

Metals

Metals were analyzed in Phase 1 to see if there was a correlation between metals and pesticides and herbicides in soil. Although there were a few limited detections of metals in surface soil across the Site, concentrations do not indicate a connection between metals and pesticide/herbicide concentration and the variability in concentrations is consistent with those seen on an industrial site.

As shown in Table 1a arsenic does not exceed the SL; therefore, it can be eliminated as a COPC in Phase 2. Cadmium, copper, lead, mercury, and zinc all exceed their respective SLs in some detected results (i.e., 2.7, 11, 2.7, 15, and 4.1 percent, respectively). However, because the SLs for these metals are based on the protection of groundwater and there are no exceedances in groundwater (refer to Table 2), and because they are not related to the pesticides on-site, metals should be eliminated as COPCs in Phase 2.

Carcinogenic Polycyclic Aromatic Hydrocarbons

Per the Work Plan, in accordance with MTCA Table 830-1, if there were field indications of TPH in soil or groundwater, a representative sample was to be collected and analyzed for carcinogenic polycyclic aromatic hydrocarbons (cPAHs). Although there were some low-level detections of cPAHs, they were much less than their SLs; therefore, they can be eliminated as COPCs in Phase 2.

Nitrate/Nitrite

Nitrate and nitrite would be eliminated based on the process of elimination described above (i.e., their maximum concentrations did not exceed their respective SLs in soil). However, nitrate and nitrite exceeded the SLs in groundwater. Therefore, nitrate and nitrite were retained as COPCs because the Site is an active fertilizer distributor and the information may be useful during the remedial investigation for development of the conceptual site model.

Organochlorine Pesticides

There were significant exceedances of a select group of organochlorine pesticides in both soil and groundwater across the Site. Furthermore, there were raised reporting limits for some non-detect analytes in this class (refer to Table 1a). Therefore, all the pesticides listed in the Work Plan in this class will be retained as COPCs.

Chlorinated Herbicides

Of the chlorinated herbicides analyzed in soil, only pentachlorophenol was found to exceed the SL; however, 2,4-dichlorophenoxyacetic acid (2,4-D) and 2-methyl-4-chlorophenoxyacetic acid (MCPA) concentrations exceeded the SLs in groundwater during the second quarter of monitoring. However, 2,4-D and MCPA were not detected in groundwater at concentrations greater than SLs during the first quarter of groundwater sampling, this shows that there is variability in groundwater at the Site and, therefore, the full list of chlorinated herbicides will be retained as a COPCs for Phase 2.

Other Chlorinated/Halogenated Pesticides

As shown in Table 1a, of the analytes listed in this category, only chlordane-alpha exceeds its respective SL. However, because chlordane-alpha is an isomer of chlordane, which is being retained as a COPC (within the organochlorine pesticide class described above), it can be eliminated for Phase 2. Additionally, there were exceedances in groundwater for atrazine and simazine (refer to Table 2) and, although they were not detected at concentrations greater than the SLs in soil, they will be retained as COPCs in Phase 2 soil testing. Other than atrazine and simazine, all other chlorinated/halogenated pesticides can be eliminated as COPCs in Phase 2.

Remaining Pesticides and Herbicides

For the remaining categories of pesticides and herbicides (organophosphate pesticides, triazine herbicides, phenylurea herbicides, carbamate pesticides, organophosphorus and organosulfur pesticides, organonitrogen pesticides, and glyphosate), although there were some detections, concentrations were much less than the SLs in Table 1a and were rarely found in groundwater. Therefore, all of these classes can be eliminated as COPCs in Phase 2.

Petroleum Hydrocarbons

Although TPH-G was detected and exceeded the SL, the case narrative provided by the laboratory stated that the pattern of peaks in the chromatograms indicate that the presence of gasoline was not seen in any of the samples with gasoline detections. According to the laboratory, any gasoline detection is likely chromatographic overlap with weathered TPH-D or oil-range TPH. Therefore, gasoline can be eliminated as a COPC for Phase 2. TPH-D is retained, as it was found in soil at elevated concentrations.

Constituents of Potential Concern in Phase 1 and Phase 2

Analytes	Phase 1	Phase 2
Volatile organic compounds	Yes	No
Metals	Yes	No
Carcinogenic polycyclic aromatic hydrocarbons	Yes	No
Nitrate/Nitrite	Yes	Yes
Organochlorine Pesticides	Yes	Yes
Chlorinated Herbicides	Yes (full list)	Yes (reduced list)
Other Chlorinated/Halogenated Pesticides	Yes (full list)	Atrazine/Simazine only
Remaining Pesticides and Herbicides	Yes	No
Petroleum Hydrocarbons (TPH-D, TPH-G)	Yes	Yes (TPH-D only)

Table 1a
Frequency of Exceedance of Screening Levels for Soil—Detections

CAS Number	Analyte	Units	Screening Level	Information About Detected Results						Information About Detected Exceedances		Retain as COPC?	Rationale
				Number of Results	Percent of Detected Results	Maximum Detected Value	Location of Maximum Detect	Depth of Maximum Detect (ft bgs)	Date of Maximum Detect	Detected Results that Exceed Screening Level	Exceedance Factor		
Total Petroleum Hydrocarbons (TPH)													
--	Gasoline-Range TPH	mg/kg	30	76	29%	1200	FS-13	6-7	8/4/2016	7%	40	No	Lab case narrative: A pattern of peaks indicating the presence of gasoline was not seen in the samples.
--	Diesel-Range TPH	mg/kg	2,000	77	29%	4,700	FS-13	6-7	8/4/2016	4%	2.35	Yes	
--	Oil-Range TPH	mg/kg	2,000	77	18%	17,000	MW-12	1.5-2	8/1/2016	3%	8.5	Yes	
Additional Pesticides													
1066-51-9	AMPA	mg/kg	--	3	100%	2.6	FS-05	0.5-1	8/3/2016	--	--	No	Not retained; maximum detected value is less than most stringent screening level.
1031-07-8	Endosulfan sulfate	mg/kg	--	70	2.9%	1.1	FS-09	3-4	8/3/2016	--	--	No	Not retained; maximum detected value is less than most stringent screening level.
26225-79-6	Ethofumesate	mg/kg	--	70	--	--	--	--	--	--	--	No	Not retained; not detected.
15299-99-7	Napropamide	mg/kg	--	70	--	--	--	--	--	--	--	No	Not retained; not detected.

Notes:

- 1 Volatile organic compounds (VOCs) shown are those included in the Smith-Kem Site Remedial Investigation Work Plan (Floyd|Snider 2016). Although not listed in this table, the full suite of VOCs was analyzed in select samples. All results were non-detect. Only soil from the Phase 1 Event included.
- No location, sample, depth, or date restrictions.
- Analytes were restricted to the Work Plan COC list.
- Nitrate + Nitrite reported as micrograms per gram (µg/g) by the laboratory, this is equivalent to (mg/kg); unit was updated to match criteria.
- For Gasoline-Range TPH, only one result was between the 30 and 100 criteria (sample MW-12-1.5-2), which did have detected benzene, so the lower criteria is applicable. The remaining four samples exceeded both sets of criteria, but did not have benzene analyzed.
- All pesticide/herbicide data are from preliminary lab reports and have not been validated at this time.
- Exceedance factor is rounded to two significant figures.

Yes Indicates that constituent was retained as a COPC.

Notes:

- Not applicable
- 2,4-DB 4-(2,4-dichlorophenoxy)butyric acid
- 2,4-D 2,4-dichlorophenoxyacetic acid
- 2,4,5-T 2,4,5-Trichlorophenoxyacetic acid
- BHC Benzene hexachloride
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- MCPA 2-methyl-4-chlorophenoxyacetic acid
- mg/kg Milligrams per kilogram
- TEQ Toxic equivalent

15299-99-7	Napropamide	mg/kg	--	70	100%	0.0067	--	--	--

Notes:

- 1 When all values were detected the reporting limit is given for minimum/maximum non-detects.
 Only soil from the Phase 1 Event included.
 No location, sample, depth, or date restrictions.
 Analytes were restricted to the Work Plan constituents of concern list.
 Nitrate + Nitrite reported as micrograms per gram (µg/g) by the laboratory, this is equivalent to mg/kg; unit was updated to match criteria.
 For Gasoline-Range TPH, only one result was between the 30 & 100 criteria (sample MW-12-1.5-2), which did have detected benzene, so the lower criteria is applicable. The remaining four samples exceeded both sets of criteria, but did not have benzene analyzed.
 All pesticide/herbicide data is from preliminary lab reports and has not been validated at this time.
 Exceedance factor is rounded to two significant figures.

Abbreviations:

- Not applicable
- 2,4-DB 4-(2,4-dichlorophenoxy)butyric acid
- 2,4-D 2,4-dichlorophenoxyacetic acid
- 2,4,5-T 2,4,5-Trichlorophenoxyacetic acid
- BHC Benzene hexachloride
- DDD Dichlorodiphenyldichloroethane
- DDE Dichlorodiphenyldichloroethylene
- DDT Dichlorodiphenyltrichloroethane
- MCPA 2-methyl-4-chlorophenoxyacetic acid
- mg/kg Milligrams per kilogram
- TEQ Toxic equivalent

Floyd | Snider Memoranda

Attachment C.3
Initial Vapor Intrusion Assessment

DRAFT

Memorandum

To: John Mefford and Mary Monahan, Washington State Department of Ecology
From: Gabe Cisneros, LG, and Allison Geiselbrecht, PhD, Floyd|Snider
Date: September 17, 2018
Project No: FP-SmithKem
Re: **Initial Vapor Intrusion Assessment**

This memorandum provides an initial assessment on whether vapor intrusion (VI) is a potential risk for occupants in the current office building at the Smith-Kem Ellensburg Site (the Site), located at 200 South Railroad Avenue in Ellensburg, Washington (Figure 1). This memorandum summarizes diesel- and heavy oil-range total petroleum hydrocarbon (TPH-D and TPH-O, respectively) concentrations adjacent to the office building, reviews the soil-gas to indoor air pathway for occupants in the current office building, and uses the Washington State Department of Ecology (Ecology) guidance documents to determine if there is a VI risk to occupants that needs to be addressed immediately.

SOIL DATA SUMMARY

Soil analytical data from locations FS-13 and FS-23, adjacent to the office building, indicate that TPH-D was detected at concentrations ranging between 2,100 milligrams per kilogram (mg/kg) and 4,700 mg/kg. All other locations adjacent to the office building resulted in TPH-D concentrations that were either less than the laboratory reporting limits or less than the screening criteria of 2,000 mg/kg (Figure 1). The shallowest TPH-D detection in soil boring FS-23 indicated a concentration of 4,300 mg/kg at a depth between 0.5 and 1.0 feet below ground surface (bgs). Soil boring FS-23 is approximately 26 feet south of the occupied office portion of the office/storage building, beneath the concrete slab of the storage warehouse. Soil samples collected from MW-1 by Conestoga-Rovers & Associates (CRA) in 2014 were analyzed for TPH-D, which was not detected at 2 or 5 feet bgs, and TPH-O, which was not detected at a concentration greater than 13 mg/kg at 2 and 5 feet bgs.

Additionally, locations MW-12 and FS-31, located to the southwest of the containment and bulk aboveground storage tanks (ASTs), contained TPH-D and TPH-O concentrations exceeding the screening criteria. TPH-D was detected in MW-12 at a concentration of 3,500 mg/kg at 1.5 feet bgs, and oil-range TPH (TPH-O) was detected at concentrations of 17,000 and 11,000 mg/kg at depths between 1.5 to 2 and 5 to 6 feet bgs, respectively. No soil samples collected from soil boring FS-31 contained TPH-D or TPH-O at concentrations greater than the screening criteria

except for TPH-O detected at a concentration of 6,300 mg/kg between 8 and 9 feet bgs. Locations MW-12 and FS-31 are adjacent to the bulk fertilizer storage building and FS-31 is approximately 70 feet north of the Habitat for Humanity building. Soil analytical data from locations MW-14, TP-5, and SB-3, which are downgradient from FS-31 and MW-12 and upgradient from the Habitat for Humanity building, indicate that TPH concentrations were less than the laboratory reporting limits or the screening criteria for TPH-D and TPH-O (Figure 1).

BUILDING USES AND DESCRIPTIONS

The office portion of the office/storage building is approximately 35 feet by 40 feet and is suspended approximately 3 feet above a crawlspace (Figure 1). A storage building is adjacent to the south end of the office building, and from an aerial figure, the two appear to be connected. However, the storage building has a slab-on-grade, concrete floor and a wall with a doorway and stairs that separates the two buildings. Occupancy in the storage building is limited to storage activities (Attachment 1, Photograph 4).

The building adjacent to locations MW-12 and FS-31 is a bulk fertilizer storage warehouse, and occupancy is limited to storage of fertilizer and short-term worker occupancy (Attachment 1). The Habitat for Humanity building is approximately 95 feet by 50 feet and appears to have an elevated floor as well.

ECOLOGY'S INITIAL ASSESSMENT OF POTENTIAL VAPOR INTRUSION

U.S. Environmental Protection Agency's (USEPA's) 2015 technical guidance for addressing petroleum VI states that the lateral inclusion zone and horizontal separation distance must be defined to determine if current buildings are threatened by potential VI (USEPA 2015). Ecology has updated their VI guidance to include lateral inclusion zones and vertical separation distances in their memorandum, *Updated Process for Initially Assessing the Potential for Petroleum Vapor Intrusion* (2016 VI Guidance; Ecology 2016). The 2016 VI Guidance defines the lateral inclusion zone as the area surrounding a contaminant source through which vapor phase contamination might travel and intrude into buildings. If the degree and extent of contamination is well-defined and the dissolved-phase plume is stable or receding, then a horizontal separation distance of 30 feet is appropriate for establishing a lateral inclusion zone. In addition, the following site-specific conditions are noted:

- The degree and extent of TPH contamination in soil and groundwater is well-defined.
- There are no occupied, slab-on-grade buildings within the lateral inclusion zone at the site. The only slab-on-grade buildings above and adjacent to TPH detections are warehouse storage areas. The current office building is within 30 feet of shallow residual TPH-D; however, the office has a crawl space (i.e., not slab-on-grade).
- Soil samples from MW-1 indicate that the extent of TPH-D and TPH-O contamination may not extend northward in soils under the office space.

- Soil analytical data indicate that the Habitat for Humanity building is more than 30 feet away from residual TPH concentrations. Therefore, the initial VI assessment process is complete for occupants of the off-property Habitat for Humanity building.

If occupied buildings are present within the lateral inclusion zone, then the vertical separation distance must be evaluated. The vertical screening distances are defined by 6 feet and 15 feet between contamination and the lowest point of the building floor. For soil, total TPH concentrations must be less than 250 mg/kg for weathered gasoline and diesel in biologically active soil to meet the vertical separation distance of 6 feet.

Formerly, the Model Toxics Control Act (MTCA) specified that for sites with diesel contamination, the vapor pathway must be evaluated when total TPH concentrations in soil are greater than 10,000 mg/kg. This concentration-based criteria was developed in the late 1990s as part of the 2001 MTCA rule revisions. Since that time, additional research and USEPA's 2015 guidance suggest that it may be more appropriate to assess the VI pathway even if the soil TPH concentrations for diesel-range organics are less than 10,000 mg/kg.

The suggested total TPH screening level of 250 mg/kg in Ecology's 2016 VI Guidance, is conservative considering that total TPH includes gasoline-range hydrocarbons in addition to TPH-D and TPH-O concentrations. Gasoline-range TPH is not a constituent of concern at the Site; therefore, a more appropriate screening level for TPH-D and TPH-O is 2,000 mg/kg. This concentration is consistent with the MTCA Method A cleanup level and petroleum-related Ecology guidance documents, such as *Model Remedies for Sites with Petroleum Contaminated Soils*, which states that "most sites that meet the Method A levels will have adequately addressed the vapor intrusion pathway" (Ecology 2017). At this time, Ecology has not approved the proposed screening level.

As defined in Ecology's 2016 VI Guidance, soil boring FS-23 is the only location within 30 feet of an occupied office building with TPH-D concentrations within the vertical separation distance of 6 feet at a concentration that exceeds the screening level of 2,000 mg/kg.

CHROMATOGRAMS

The chromatogram for soil sample FS-23-0.5-1, collected at 0.5 to 1 feet bgs, indicates a highly weathered middle distillate fuel that exhibits a slightly different shape than one would expect from a diesel number 2 fuel, but that is still a middle distillate. The diesel standards that were analyzed with the corresponding soil samples are included in Attachment 2. The laboratory director at Friedman & Bruya, Inc., compared the diesel standard with soil sample FS-23-0.5-1.0 and indicated that the more volatile components, less than equivalent carbon (EC) C12 compounds, are absent or non-quantifiable. Generally, C8 through C12 compounds are present in fresh diesel samples, as shown on the diesel standard chromatogram. Chromatograms from soil borings FS-13 and FS-23, at all depths, show similar results of a highly weathered middle distillate that is absent of quantifiable C8 through C12 hydrocarbons.

Generally, petroleum vapors consist primarily of hydrocarbons that do not exceed C12, and in middle distillates, aliphatic compounds in the C9 to C12 range make up the higher percentage of petroleum vapors. This is consistent with Ecology's 2018 updated VI guidance, which states that for diesel releases, the EC 8–12 aliphatic fraction can make up a significant portion of the petroleum vapors (Ecology 2018).

DISCUSSION

The extent of TPH-D in soil is limited and well-defined. Soil boring FS-23 is the only location within 30 feet of a current occupied, office building with TPH-D concentrations within the vertical separation distance of 6 feet at a concentration exceeding the screening level of 2,000 mg/kg. Soil sample FS-23-0.5-1 is slightly more than twice the screening level. It should be noted that the vertical separation distance is conservative and is based on any size building using residential occupants. The current office building contains a crawl space that is opened to outside ambient air, which helps to reduce possible VI risk.

Ecology and USEPA VI screening levels are conservative and based on residential buildings with the occupants experiencing residential exposure durations and exposure frequencies. The office building is used for commercial occupancy, not residential, and the occupants have lower exposure duration and frequencies than occupants living in a residential dwelling.

Additionally, Ellensburg experiences very cold winters (average low temperatures of 20 degrees Fahrenheit) and hot summers (high temperatures up to 100 degrees Fahrenheit). The office building contains an air-conditioning and heating unit, which provides fresh air and a higher indoor air exchange rate (ER) than the default ER value of 0.25 used in conservative VI models (Attachment 1). Therefore, the higher indoor air ER helps to reduce any potential VI risk.

Furthermore, the chromatograms show a highly weathered middle distillate fuel that is largely absent of the EC 8–12 aliphatic fraction that can make up a significant portion of petroleum vapors that can affect indoor air. Therefore, VI risk is minimal.

CONCLUSION AND NEXT STEPS

Based on these lines of evidence, there is not a VI risk to occupants in the current office building that needs to be evaluated immediately. Therefore, VI will be assessed after submitting the Remedial Investigation report and prior to preparing a Feasibility Study. Results from future VI assessments will be used to determine if proposed remedial options are required to address the VI pathway.

Re: **Development of PCULs and Identification of COPCs for Evaluation in the Remedial Investigation Report**

This memorandum describes the process that took place in spring 2020 to develop preliminary cleanup levels (PCULs) and identify chemicals of potential concern (COPCs) for use in the Remedial Investigation (RI) report. This memorandum will be included as an addendum to the RI to document the process.

1.0 DEVELOPMENT OF PCULS

In spring and summer 2020, under direction from the Washington State Department of Ecology (Ecology), Floyd|Snider assisted the Ecology team with revising the risk-based criteria for the Smith-Kem site that were put forth in the 2019 RI. Modifications included the following: land use assumptions, pathways, receptors, exposure assumptions, site soil characteristics, and practical quantitation limits (PQLs). These risk-based criteria were then compared to laboratory PQLs and adjusted upward, as appropriate, to arrive at the soil and groundwater PCULs to be included in the RI. Specific decisions applicable to groundwater and soil PCUL development are presented in Sections 1.1 and 1.2, respectively.

1.1 Groundwater

Groundwater PCULs were developed for any chemical that either was detected in site groundwater or was retained for further analysis as a COPC in the Ecology-approved October 2017 year 1 groundwater summary memorandum (Floyd|Snider 2017a). Groundwater PCULs, risk-based criteria, and PQLs for each chemical requiring a groundwater PCUL are presented in Table 1.

Groundwater criteria protective of drinking water use and vapor intrusion were considered when developing PCULs. The criteria for protection of drinking water include state and federal

maximum contaminant levels and standard Washington Model Toxics Control Act (MTCA) Method B cancer and non-cancer groundwater criteria, calculated using Equation 720-1 for noncancer health effects and Equation 720-2 for cancer health effects. Additionally, MTCA Method A groundwater criteria were considered for total petroleum hydrocarbons (TPH) compounds, because no other TPH criteria were developed. Because site groundwater is unlikely to reach surface water, surface water criteria were not considered.

The risk-based groundwater criterion selected for each chemical was developed, consistent with standard MTCA Method B practices described in Ecology publication no. 01-09-049 (Ecology 2005a), including human health-based adjustments required by WAC 173-340-720(7)(b). The risk-based groundwater criterion for arsenic was adjusted upward to the natural background concentration.

For all other chemicals, the risk-based criterion was compared to the most sensitive PQL achieved by Pacific Agricultural Laboratory (PAL PQL). If the PAL PQL was less than the risk-based criterion, the risk-based criterion became the groundwater PCUL. If the PAL PQL was greater than the risk-based criterion, the risk-based criterion was adjusted to the Analytical Laboratory Services (ALS) PQL provided to Floyd|Snider in an email dated October 2, 2019. The ALS PQLs represent typical PQLs that ALS can achieve using the specified method and preparation steps; these PQLs may not be achievable in all samples due to site-specific conditions or interferences.

Floyd|Snider conducted a groundwater monitoring event in March 2020—all on-property and off-property wells were sampled. ALS analyzed the samples collected during this event for 10 organochlorine pesticides. Following receipt of validated data for this event, groundwater PCULs were reviewed and adjusted to the greater of either the ALS PQL that was achieved in site groundwater sample analysis or the risk-based cleanup level (CUL). Specifically, the PCUL for beta-benzene hexachloride (BHC) was adjusted from the PQL to the risk-based CUL. Groundwater PCULs for other chemicals did not change following the receipt of ALS data.

The analytical laboratory report and data validation report for the March 2020 groundwater data are included as Attachment 1.

1.2 Soil

Soil PCULs were developed for any chemical that either was detected in site soil or was retained for further analysis as a COPC in the Ecology-approved February 2017 soil elimination memorandum (Floyd|Snider 2017b). Soil PCULs, risk-based criteria, and PQLs for each chemical requiring a soil PCUL are presented in Table 2. The fraction of organic carbon data used in development of soil PCULs are presented in Table 3.

Risk-based criteria are based on unrestricted land use and are protective of human health and the environment (MTCA Method A table values); human health via the direct contact pathway (MTCA Method B standard formula values); terrestrial receptors via the direct contact pathways (Simple Site with Unrestricted Land Use); and the soil-to-groundwater pathway (WAC Equation 747-1).

The soil-to-groundwater (leaching) pathway was considered only for chemicals for which a groundwater PCUL was developed. If the May 2019 version of Ecology's Cleanup Levels and Risk Calculation workbook contained insufficient partitioning data to perform the three-phase model calculation, a value protective of the soil-to-groundwater pathway was not calculated. Default MTCA input parameters for saturated soil were used in this calculation, with the exception of f_{oc} . A site-specific f_{oc} of 1.1 percent was used in the calculation. The groundwater PCULs presented in Table 1 were used as the groundwater target concentrations to be protected.

The risk-based soil criterion selected for each chemical was the more stringent standard between leaching and the direct contact criteria (protective of human direct contact and terrestrial receptors), which was determined using standard MTCA Method B practices described in Ecology publication no. 01-09-071 (Ecology 2005b). Ecology criteria for summed analytes were incorporated as follows:

- A PCUL was developed for Total DDx (that is, total dichlorodiphenyltrichloroethane [DDT] and its derivatives) for the terrestrial ecological exposure (TEE) pathway. The PCULs for total dichlorodiphenyldichloroethane, total dichlorodiphenyldichloroethylene, and total DDT do not consider the TEE pathway criterion; the PCULs for these analytes consider human health and leaching exposure pathways.
- A PCUL was developed for total diesel- and oil-range TPH (i.e., TPH-diesel and TPH-oil) based on the most stringent PCUL for either diesel-range TPH or oil-range TPH. The PCULs previously developed for diesel-range TPH and oil-range TPH were removed.

Risk-based criteria were then adjusted upward to the PAL PQL or to natural background levels.

Because the groundwater PCUL for beta-BHC was updated following the March 2020 groundwater monitoring event, groundwater target concentrations used in the leaching calculation used to derive soil PCULs were also updated.

2.0 IDENTIFICATION OF COPCS

Site data presented in Tables 1 and 2 were used to identify soil and groundwater COPCs in each medium according to the rationale described in this section.

Chemicals identified as candidates to become COPCs were initially determined by Ecology by comparing the maximum detected result in soil and groundwater to their PCULs. If the maximum detected result exceeded the applicable PCUL, it was retained as a COPC. If a chemical was never detected, its reporting limits during the Smith-Kem Phase 2 soil and groundwater monitoring events were compared to the PCUL to identify COPCs. Certain organochlorine pesticides were not detected in groundwater in prior events but had reporting limits greater than the ALS PQLs presented in Table 1. These chemicals were initially retained as pending COPCs in groundwater.

If any pending COPC was not detected in any groundwater monitoring well during the March 2020 groundwater sampling event, that chemical was not retained as a COPC. If a pending COPC

was detected in groundwater, data were evaluated relative to the PCUL to determine COPC status. Following the receipt of validated March 2020 groundwater event data, the COPC status of three chemicals was updated: alpha-BHC and heptachlor epoxide did not become groundwater COPCs; aldrin became a groundwater COPC.

Chemicals that Ecology identified as candidates to become groundwater COPCs are summarized in Table 4, along with their PCULs, exceedance information, and ultimate COPC status. Table 4 contains two categories of chemicals: those retained as COPCs and chemicals not retained as COPCs based on discussion that occurred during meetings on April 1, May 4, and June 8, 2020. Table 5 presents the same information for soil.

Groundwater COPC Considerations. During an April 1, 2020, meeting, Floyd|Snider and Ecology agreed to refine the COPC identification approach for metals and TPH. Rather than using the maximum result ever detected in groundwater (which includes groundwater data from test pits and temporary well screens at soil boring locations), only results from established groundwater monitoring wells were used to identify COPCs. Groundwater data from test pits and soil borings are typically used for field screening purposes. For example, the data can assist with determining where to install a permanent monitoring well. Furthermore, results from groundwater wells are typically more representative of site groundwater quality than results from temporary wells, which are more subject to increased turbidity and other sampling artifacts that can bias results. This sampling artifact bias is particularly common for metals, so Ecology guidance for sampling water supply wells recommends sampling wells for metals only if turbidity is less than 10 nephelometric turbidity units (Ecology 2019). Metals results from proximate downgradient wells are available at both locations where metals data were collected from a soil boring location.

TPH data were collected during two different historical events prior to installation of permanent wells. Groundwater samples collected from test pits in 2007 were analyzed for TPH. These data informed the subsequent collection of groundwater samples from temporary wells installed at soil borings in 2013. In most cases, groundwater data from soil borings indicated that historical TPH data collected from test pits are not representative of groundwater quality. Permanent groundwater wells were installed in areas where field screening samples indicated that TPH may be present in groundwater. At locations where TPH samples from test pits and soil borings are elevated (e.g., detected on the order of 24,000 micrograms per liter), data collected over the course of multiple events from collocated groundwater wells demonstrate that these results meet the definition of an outlier, as described in Ecology statistical guidance (Ecology 1992). Groundwater well data show that diesel- and oil-range TPH are groundwater COPCs, with exceedances in a limited number of wells. Groundwater well data were used to eliminate gasoline-range TPH as a groundwater COPC. This conclusion is supported by chromatographic review: historical samples with detected gasoline-range TPH results have peaks only at the upper end of the gasoline spectrum. This signature overlaps with the light-end of the diesel-range TPH chromatographic spectrum, indicating that diesel-range TPH components were reported as both gasoline-range TPH and diesel-range TPH in these historical samples.

Soil COPC Considerations. During the April 1, 2020, meeting, Floyd|Snider and Ecology agreed to refine the approach to identification of soil COPCs to reflect groundwater COPC status with respect to the leaching pathway. If groundwater demonstrates compliance for the leaching pathway (i.e., the chemical is not a groundwater COPC), the soil PCUL was modified to the soil direct contact criterion for that chemical. This direct contact PCUL was used to determine exceedance information and COPC status.

Gasoline-range TPH (TPH-G) was eliminated as a COPC, although it was detected and exceeded the PCUL in a limited number of samples. In 2017 and 2020, the laboratory evaluated chromatograms for samples with elevated TPH-G results to see if peaks indicative of gasoline were present. The case narrative provided by the laboratory stated that the pattern of peaks in the chromatograms indicate gasoline is not present in any of the samples with gasoline detections: any gasoline detection is likely chromatographic overlap with weathered diesel-range TPH or oil-range TPH. Laboratory reports containing revised case narratives supporting this conclusion are provided as Attachment 2. Both reports include chromatograms. Based on this analysis, Ecology agreed on April 24, 2020, via email that TPH-G is not a COPC.

Finally, Floyd|Snider and Ecology agreed to modify the terrestrial ecological evaluation criterion for chromium to 64 milligrams per kilogram (mg/kg), up from 42 mg/kg. The PCUL of 64 mg/kg is consistent with Technical Addendum Attachment V: WAC 173-340 Table 749-2 Chemical-Specific Technical Support Documents for use at sites where only chromium(III) is present. This is appropriate at the Smith-Kem site, because chromium(VI) is not associated with pesticides or any other current or former industrial uses or practices at the site.

RED/BOLD Chemical identified as a COPC by Floyd|Snider and Ecology.

BOLD Chemical identified as a COPC by Ecology; not retained by Floyd|Snider.

RED/BOLD Reporting limit exceeds risk-based groundwater criteria.

1 GW criteria protective of drinking water use and vapor intrusion were considered when developing preliminary cleanup levels. Criteria for protection of drinking water considered include state and federal MCLs and MTCA Method B cancer and non-cancer groundwater criteria. Additionally, MTCA Method A groundwater criteria were considered for TPH compounds, as no other TPH criteria were developed.

2 All criteria and PQLs are rounded to two significant figures. Analytical results are reported to two significant figures.

3 PQLs provided are typical of the method in the media indicated, but may be elevated in some samples due to matrix interferences and/or may be elevated for some compounds due to spectral or other interferences associated with the analysis. The laboratory will make every effort to obtain PQLs that are less than the applicable soil or groundwater cleanup standard in this table using the indicated method.

4 Washington natural background levels in groundwater were considered, in addition to criteria developed for protection of human health and ecological receptors. When the risk-based criteria were less than natural background values, the natural background value was selected as the relevant criterion.

5 Only chemicals requiring development of GW PCULs are retained in this table. GW PCULs were developed for any chemical that was either (a) detected in GW, or (b) retained as a potential COPC in the Ecology-approved Groundwater Elimination Memorandum (Floyd|Snider 2017a).

6 A designation of "true" indicates that the chemical was retained as a candidate to become a COPC following the October 2017 Year 1 Groundwater Summary Memorandum (Floyd|Snider 2017a).

7 The most stringent ARAR established under applicable state and federal laws is sufficiently protective and does not require adjustment to protect human health if the excess cancer risk does not exceed 1 in 100,000 (1 x 10⁻⁵) and the hazard quotient does not exceed one (1). If the most stringent ARAR is not sufficiently protective, it was adjusted downward in accordance with WAC 173-340-720(7)(b) to the minimum of (a) MTCA Method B noncancer criterion and (b) MTCA Method B cancer criterion multiplied by a factor of 10. The risk-based criteria presented in this column are the GW target concentration, which considers this human health adjustment, if a target value was developed in Ecology's CLARC; the most stringent state and federal MCL; or, if no MCL exists, the lowest MTCA Method B groundwater criteria.

8 During Phase 2, 41 GW samples were collected and analyzed by PAL for organochlorine pesticides. The maximum reporting limit for all Phase 2 samples was in compliance with the Ecology-approved PQL from the Remedial Investigation Work Plan (Floyd|Snider 2016) for all chemicals included in this table, with the exception of toxaphene.

9 ALS method detection and reporting limits were provided to Floyd|Snider in an email dated October 2, 2019. In order to report down to the listed limits, ALS will utilize appropriate extraction and cleanup techniques to maximize recovery and reduce matrix interference. ALS extraction and cleanup techniques for analysis of groundwater samples using USEPA Method 8081B are described as follows:

- If the water sample contains enough solid material (sediment) to interfere with sample extraction, ALS will completely decant the liquid portion of the sample for extraction prior to analysis.
- If extracts are colored, then a carbon cleanup is performed. This procedure is based on Restek Application Note EVAN1197. The extracts to be analyzed are passed through a rinsed solid-phase extraction cartridge packed with carbon using a positive pressure or vacuum manifold. The cartridges are then eluted with DCM:Hexane (1:1), leaving the interferences on the carbon.

The ALS PQLs reported in this table represent typical PQLs the lab can achieve using the specified method and preparation steps; these PQLs may not be achievable in all samples due to site-specific conditions or interferences.

10 Final PQLs are site-specific and based off of the Method Reporting Limit information from three labs: PAL, Manchester Lab, and ALS. If it appeared there would be no upward adjustment from a protective value (either groundwater or soil), the PAL method reporting limit was selected as the final PQL.

11 The value in plain text includes all GW results, including data from test pits and temporary well screens at soil boring locations, which are typically used for field screening purposes. These data should not be considered representative of site conditions for determining compliance with cleanup levels as a result of higher sample turbidity. Nearby GW well data exist and can be used to characterize groundwater quality in the vicinity of test pit/soil boring groundwater samples. In areas without a nearby well, GW samples collected from collocated soil borings indicate that historical data collected from test pits are not representative of GW quality.

12 Reporting limits presented in this table represent the range of reporting limits in the 2017–2018 Phase 2a and Phase 2 Groundwater Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.

13 GW COPCs identified in this table have not yet been approved by Ecology.

14 Xylenes are typically analyzed and reported by laboratories as m,p-Xylene and o-Xylene; these values are summed and reported as Total Xylenes. When evaluating relevant criteria for Xylenes, the criterion developed for Total Xylenes was selected as the relevant criterion.

15 Criteria developed for Total Chromium and for Chromium(III) were considered when determining the relevant criteria for chromium. There is no reason to suspect the presence of Chromium(VI) on-site.

16 Aldrin is the only pesticide with a vapor intrusion screening level. The vapor intrusion screening level for aldrin is 0.32 µg/L, which is less conservative (greater than) than criteria protective of the drinking water exposure pathway.

17 Criteria were not developed for Endosulfan I or Endosulfan II in CLARC. Criteria developed for Endosulfan (CAS 115-29-7) were used as a surrogate.

18 Criteria were not developed for chlordane-alpha in CLARC; criteria developed for Chlordane (CAS 12789-03-6) were used as a surrogate.

19 The screening level protective of the vapor intrusion pathway for TPH is 30,000 µg/L, which is less conservative (greater than) than criteria protective of the drinking water exposure pathway.

Blank cells are intentional.

RED/BOLD Chemical identified as a COPC by Floyd|Snider and Ecology.

BOLD Chemical identified as a COPC by Ecology; not retained by Floyd|Snider.

RED/BOLD Reporting limit exceeds risk-based groundwater criteria.

- GW criteria protective of drinking water use and vapor intrusion were considered when developing preliminary cleanup levels. Criteria for protection of drinking water considered include state and federal MCLs and MTCA Method B cancer and non-cancer groundwater criteria. Additionally, MTCA Method A groundwater criteria were considered for TPH compounds, as no other TPH criteria were developed.
- All criteria and PQLs are rounded to two significant figures. Analytical results are reported to two significant figures.
- PQLs provided are typical of the method in the media indicated, but may be elevated in some samples due to matrix interferences and/or may be elevated for some compounds due to spectral or other interferences associated with the analysis. The laboratory will make every effort to obtain PQLs that are less than the applicable soil or groundwater cleanup standard in this table using the indicated method.
- Washington natural background levels in groundwater were considered, in addition to criteria developed for protection of human health and ecological receptors. When the risk-based criteria were less than natural background values, the natural background value was selected as the relevant criterion.
- Only chemicals requiring development of GW PCULs are retained in this table. GW PCULs were developed for any chemical that was either (a) detected in GW, or (b) retained as a potential COPC in the Ecology-approved Groundwater Elimination Memorandum (Floyd|Snider 2017a).
- A designation of "true" indicates that the chemical was retained as a candidate to become a COPC following the October 2017 Year 1 Groundwater Summary Memorandum (Floyd|Snider 2017a).
- The most stringent ARAR established under applicable state and federal laws is sufficiently protective and does not require adjustment to protect human health if the excess cancer risk does not exceed 1 in 100,000 (1 x 10⁻⁵) and the hazard quotient does not exceed one (1). If the most stringent ARAR is not sufficiently protective, it was adjusted downward in accordance with WAC 173-340-720(7)(b) to the minimum of (a) MTCA Method B noncancer criterion and (b) MTCA Method B cancer criterion multiplied by a factor of 10. The risk-based criteria presented in this column are the GW target concentration, which considers this human health adjustment, if a target value was developed in Ecology's CLARC; the most stringent state and federal MCL; or, if no MCL exists, the lowest MTCA Method B groundwater criteria.
- During Phase 2, 41 GW samples were collected and analyzed by PAL for organochlorine pesticides. The maximum reporting limit for all Phase 2 samples was in compliance with the Ecology-approved PQL from the Remedial Investigation Work Plan (Floyd|Snider 2016) for all chemicals included in this table, with the exception of toxaphene.
- ALS method detection and reporting limits were provided to Floyd|Snider in an email dated October 2, 2019. In order to report down to the listed limits, ALS will utilize appropriate extraction and cleanup techniques to maximize recovery and reduce matrix interference. ALS extraction and cleanup techniques for analysis of groundwater samples using USEPA Method 8081B are described as follows:
 - If the water sample contains enough solid material (sediment) to interfere with sample extraction, ALS will completely decant the liquid portion of the sample for extraction prior to analysis.
 - If extracts are colored, then a carbon cleanup is performed. This procedure is based on Restek Application Note EVAN1197. The extracts to be analyzed are passed through a rinsed solid-phase extraction cartridge packed with carbon using a positive pressure or vacuum manifold. The cartridges are then eluted with DCM:Hexane (1:1), leaving the interferences on the carbon.
 The ALS PQLs reported in this table represent typical PQLs the lab can achieve using the specified method and preparation steps; these PQLs may not be achievable in all samples due to site-specific conditions or
- Final PQLs are site-specific and based off of the Method Reporting Limit information from three labs: PAL, Manchester Lab, and ALS. If it appeared there would be no upward adjustment from a protective value (either groundwater or soil), the PAL method reporting limit was selected as the final PQL.
- The value in plain text includes all GW results, including data from test pits and temporary well screens at soil boring locations, which are typically used for field screening purposes. These data should not be considered representative of site conditions for determining compliance with cleanup levels as a result of higher sample turbidity. Nearby GW well data exist and can be used to characterize groundwater quality in the vicinity of test pit/soil boring groundwater samples. In areas without a nearby well, GW samples collected from collocated soil borings indicate that historical data collected from test pits are not representative of GW quality.
- Reporting limits presented in this table represent the range of reporting limits in the 2017–2018 Phase 2a and Phase 2 Groundwater Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.
- GW COPCs identified in this table have not yet been approved by Ecology.
- Xylenes are typically analyzed and reported by laboratories as m,p-Xylene and o-Xylene; these values are summed and reported as Total Xylenes. When evaluating relevant criteria for Xylenes, the criterion developed for Total Xylenes was selected as the relevant criterion.
- Criteria developed for Total Chromium and for Chromium(III) were considered when determining the relevant criteria for chromium. There is no reason to suspect the presence of Chromium(VI) on-site.
- Aldrin is the only pesticide with a vapor intrusion screening level. The vapor intrusion screening level for aldrin is 0.32 µg/L, which is less conservative (greater than) than criteria protective of the drinking water exposure pathway.
- Criteria were not developed for Endosulfan I or Endosulfan II in CLARC. Criteria developed for Endosulfan (CAS 115-29-7) were used as a surrogate.
- Criteria were not developed for chlordane-alpha in CLARC; criteria developed for Chlordane (CAS 12789-03-6) were used as a surrogate.
- The screening level protective of the vapor intrusion pathway for TPH is 30,000 µg/L, which is less conservative (greater than) than criteria protective of the drinking water exposure pathway.

Notes:

- Blank cells are intentional.
- This draft PCUL sheet is developed from a parent document (Copy of 20-0217SmithKem PCULs dev with Arthur – Soil+GW.xlsx).
- Criteria and results are rounded to two significant figures, with the exception of dioxin criteria and results. Dioxin criteria and results are rounded to three significant figures.
- Not applicable.
- RED/BOLD** Chemical identified as a COPC by Floyd|Snider and Ecology.
- The PCUL for this chemical was adjusted to the PQL.
- Manchester PQL is greater than PAL PQL, but the PAL PQL is sufficient to compare data to the PCUL.
- 1 GW PCULs were developed for any chemical that was either (a) detected in GW, or (b) retained as a potential COPC in the Groundwater Elimination Memorandum (Floyd|Snider 2017a).
- 2 This table lists all chemicals that were analyzed for in site soil or GW. Not all chemicals require PCULs in all site media.
- 3 Chemicals that were not analyzed in soil are not considered potential soil COPCs at the site.
- 4 A designation of "true" indicates that the chemical was retained as a candidate to become a soil COPC in the Ecology-approved February 2017 Soil Elimination Memorandum (Floyd|Snider 2017b).
- 5 MTCA Method A criteria for unrestricted land use (WAC Table 740-1) are included in this table and are selected as the risk-based criterion for a particular chemical when no other criteria are available.
- 6 Standard MTCA Method B equations were used to calculate concentrations protective of human health using Equation 720-1 for noncancer health effects and Equation 720-2 for cancer health effects.
- 7 Criteria for the protection of terrestrial ecological receptors at a site with unrestricted land use sourced from WAC 173-340-900, Table 749-2.
- 8 Criteria protective of PCULs for GW were calculated using the variable three-phase equilibrium partitioning model according to WAC 173-340-747(5)(b)(i) using Equation 747-1. Default MTCA input parameters were used, with the exception of f_{oc} . A site-specific f_{oc} of 1.1% was used in the calculation.
- 9 Risk-based criteria in this column are based on unrestricted land use and are protective of HH and the environment (MTCA Method A table values); HH from direct contact (MTCA Method B standard formula values); terrestrial receptors (Simple Site with Unrestricted Land Use); and the soil-to-GW pathway (WAC Equation 747-1).
- 10 PAL PQLs were presented in the Ecology-approved work plan (Floyd|Snider 2016), with the exception of the PQLs for dioxins. ARI dioxin PQLs were provided in the Ecology-approved work plan addendum (Floyd|Snider 2019). The listed PQLs were not achieved in all samples for all chemicals, due to site-specific matrix and other interferences.
- 11 Manchester PQLs were provided to Floyd|Snider by Arthur Buchan at Ecology in an email dated 2/19/2020. Manchester PQLs were last updated in April 2019. Blanks indicate that PQLs for the relevant analysis method/analyte class were not provided. NA indicates that while Manchester performs analysis for pesticides and herbicides, Manchester PQLs for that particular chemical were not provided. The Manchester PQLs reported in this table represent typical PQLs the lab can achieve; these PQLs may not be achievable in all samples due to site-specific conditions or interferences.
- 12 Final PQLs are site-specific and based off of the method reporting limit information from three labs: PAL, Manchester Lab, and ALS. The PAL method reporting limit was selected as the final PQL.
- 13 Background values were sourced as follows:
 - * State-wide natural background for arsenic from WAC Table 740-1.
 - * Natural background for dioxins/furans from Ecology's 2010 Technical Memorandum #8 *Natural Background for Dioxins/Furans in WA Soils*.
 - * Area background for other metals are the geometric mean of the agricultural field results, as printed in Table 2-3 of Ecology's 1999 *Screening Survey for Metals and Dioxins in Fertilizer Products and Soils in Washington State*.
- 14 PCULs are adjusted for the PQL or natural or area background as appropriate per WAC 173-340-740(5)(c).
- 15 The soil dataset includes results of all soil samples collected since June 1, 2007.
- 16 Reporting limits presented in this table represent the range of reporting limits in the 2017–2018 Phase 2 Soil Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.
- 17 Soil COPCs identified in this table have not yet been approved by Ecology.
- 18 Xylenes are typically analyzed and reported by laboratories as m,p-Xylene and o-Xylene; these values are summed and reported as Total Xylenes. When evaluating relevant criteria for Xylenes, the criterion developed for Total Xylenes was selected as the relevant criterion.
- 19 Criteria developed for Total Chromium and for Chromium(III) were considered when determining the relevant criteria for chromium. There is no reason to suspect the presence of Chromium(VI) on-site.
- 20 Manchester does not perform analysis for total chlordane/technical chlordane. PQLs were provided only for individual components of total chlordane (that is, cis- and trans-chlordane).
- 21 Criteria were not developed for Endosulfan I or Endosulfan II in CLARC. Criteria developed for Endosulfan (CAS 115-29-7) were used as a surrogate.
- 22 PQL for 4,4-DDD is lower than the PQL for 2,4-DDD; used PQL for 2,4-DDD.
- 23 Criteria were not developed for chlordane-alpha in CLARC; criteria developed for Chlordane (CAS 12789-03-6) were used as a surrogate.

RED/BOLD Chemical identified as a COPC by Floyd|Snider and Ecology.

The PCUL for this chemical was adjusted to the PQL.

Manchester PQL is greater than PAL PQL, but the PAL PQL is sufficient to compare data to the PCUL.

- GW PCULs were developed for any chemical that was either (a) detected in GW, or (b) retained as a potential COPC in the Groundwater Elimination Memorandum (Floyd|Snider 2017a).
- This table lists all chemicals that were analyzed for in site soil or GW. Not all chemicals require PCULs in all site media.
- Chemicals that were not analyzed in soil are not considered potential soil COPCs at the site.
- A designation of "true" indicates that the chemical was retained as a candidate to become a soil COPC in the Ecology-approved February 2017 Soil Elimination Memorandum (Floyd|Snider 2017b).
- MTCA Method A criteria for unrestricted land use (WAC Table 740-1) are included in this table and are selected as the risk-based criterion for a particular chemical when no other criteria are available.
- Standard MTCA Method B equations were used to calculate concentrations protective of human health using Equation 720-1 for noncancer health effects and Equation 720-2 for cancer health effects.
- Criteria for the protection of terrestrial ecological receptors at a site with unrestricted land use sourced from WAC 173-340-900, Table 749-2.
- Criteria protective of PCULs for GW were calculated using the variable three-phase equilibrium partitioning model according to WAC 173-340-747(5)(b)(i) using Equation 747-1. Default MTCA input parameters were used, with the exception of f_{oc} of 1.1% was used in the calculation.
- Risk-based criteria in this column are based on unrestricted land use and are protective of HH and the environment (MTCA Method A table values); HH from direct contact (MTCA Method B standard formula values); terrestrial receptors (Simple Site with Unrestricted Land Use); and the soil-to-GW pathway (WAC Equation 747-1).
- PAL PQLs were presented in the Ecology-approved work plan (Floyd|Snider 2016), with the exception of the PQLs for dioxins. ARI dioxin PQLs were provided in the Ecology-approved work plan addendum (Floyd|Snider 2019). The listed PQLs were not achieved in all samples for all chemicals, due to site-specific matrix and other interferences.
- Manchester PQLs were provided to Floyd|Snider by Arthur Buchan at Ecology in an email dated 2/19/2020. Manchester PQLs were last updated in April 2019. Blanks indicate that PQLs for the relevant analysis method/analyte class were not provided. NA indicates that while Manchester performs analysis for pesticides and herbicides, Manchester PQLs for that particular chemical were not provided. The Manchester PQLs reported in this table represent typical PQLs the lab can achieve; these PQLs may not be achievable in all samples due to site-specific conditions or interferences.
- Final PQLs are site-specific and based off of the method reporting limit information from three labs: PAL, Manchester Lab, and ALS. The PAL method reporting limit was selected as the final PQL.
- Background values were sourced as follows:
 - * State-wide natural background for arsenic from WAC Table 740-1.
 - * Natural background for dioxins/furans from Ecology's 2010 Technical Memorandum #8Natural Background for Dioxins/Furans in WA Soils .
 - * Area background for other metals are the geometric mean of the agricultural field results, as printed in Table 2-3 of Ecology's 1999Screening Survey for Metals and Dioxins in Fertilizer Products and Soils in Washington State .
- PCULs are adjusted for the PQL or natural or area background as appropriate per WAC 173-340-740(5)(c).
- The soil dataset includes results of all soil samples collected since June 1, 2007.
- Reporting limits presented in this table represent the range of reporting limits in the 2017–2018 Phase 2 Soil Sampling events. If a chemical was not analyzed during these events, the range of reporting limits presented in this table represent the minimum and maximum reporting limit from all other events.

Notes:

- 1 The majority of submitted samples for TOC analysis were collected from saturated soil, which typically has a lesser f_{oc} than shallow soil.
The site-wide average f_{oc} was adjusted to exclude the foc data from FS-19 from 1 to 5 feet bgs due to contamination present in the sample. Additionally, the f_{oc} data from FS-31 from 9 to 12 feet bgs was not included because the sample is too deep. For the non-detect foc sample from FS-19 from 5 to 7.5 feet bgs, one-half the detection limit was used in the calculation.
The calculated average is a conservative representation of site-wide conditions.
- 2 f_{oc} is calculated by converting the TOC result to a decimal and rounding to two significant figures. It is unitless.

Abbreviations:

- bgs Below ground surface
- f_{oc} Fraction of organic carbon
- TOC Total organic carbon

Qualifier:

- J Analyte was detected and the concentration is considered to be an estimate.
- JQ Analyte was detected between the method detection limit and reporting limit; concentration is considered to be an estimate.
- U Analyte was not detected; concentration given is the reporting limit.

Table 4
Groundwater Constituents of Potential Concern Summary

Chemical	Final PCUL (µg/L)	Maximum Detected Result / (Maximum Detected Well Result) (µg/L) ⁽¹⁾	Percent of Detected Results that Exceed	Groundwater COPC?	Rationale
Chemicals Identified as COPCs and Pending COPCs					
Metals					
Arsenic	5.0	23 / (14)	1.7%	Yes	Max result > PCUL
Miscellaneous Substances					
Nitrate	10,000	210,000	57%	Yes	Max result > PCUL
Nitrite	1,000	6,800	8.2%	Yes	Max result > PCUL
Organochlorine Pesticides					
HCH-alpha (a-BHC)	0.014	0.0044	None	No	No exceedances in March 2020 Event
HCH-beta (b-BHC)	0.0490	0.087	3.2%	Yes	Max result > PCUL
Aldrin	0.0026	0.0059	1.3%	Yes	Max result > PCUL
Heptachlor Epoxide	0.048	0.0056	None	No	No exceedances in March 2020 Event
Chlordane	2.0	22	2.4%	Yes	Max result > PCUL
Dieldrin	0.0055	10	24%	Yes	Max result > PCUL
4,4'-DDE / Sum DDE	0.26	0.76	0.81%	Yes	Max result > PCUL
4,4'-DDT / Sum DDT	0.26	1.5	0.81%	Yes	Max result > PCUL
Toxaphene	0.80	26	8.1%	Yes	Max result > PCUL
Chlorinated Herbicides					
2,4-D	70	260	1.6%	Yes	Max result > PCUL
Dicamba	480	550	1.6%	Yes	Max result > PCUL
MCPA	8.0	88	3.2%	Yes	Max result > PCUL
Other Chlorinated/Halogenated Pesticides					
Atrazine	3.0	33	13%	Yes	Max result > PCUL
Chlordane-alpha	2.0	3.3	0.80%	Yes	Max result > PCUL
Total Petroleum Hydrocarbons (TPH)					
Diesel-Range TPH	500	24,000 / (1,000)	8.2%	Yes	Max result > PCUL
Oil-Range TPH	500	24,000 / (1,100)	2.1%	Yes	Max result > PCUL
Chemicals Not Retained as COPCs					
Volatile Organic Compounds					
Chromium (Total)	100	290 / (17)	None	No	No exceedances in groundwater wells; chemical not associated with pesticides
Lead	15	31 / (10)	None	No	No exceedances in groundwater wells
Miscellaneous Substances					
Nitrate/Nitrite	10,000	210,000	57%	NA	See nitrate and nitrite
Organochlorine Pesticides					
G-BHC (Lindane)	0.20	0.17	NA	No	No exceedances
Total Petroleum Hydrocarbons (TPH)					
Gasoline-Range TPH	800	5,500 / (Not Detected in Wells)	None	No	Eliminated in GW Elimination Memo: gasoline detections are chromatographic overlap with weathered diesel

Notes:

All criteria and PQLs are rounded to two significant figures. Analytical results are reported to two significant figures.

RED/BOLD Chemical identified as a COPC by Floyd|Snider and Ecology.

GW PCUL includes state and federal MCLs, MTCA Method B, and MTCA Method A GW criteria.

¹ The value in plain text includes all GW results, including data from test pits and temporary well screens at soil boring locations, which are typically used for field screening purposes. These data should not be considered representative of site conditions. Nearby proximate GW well data collected over the course of multiple events demonstrates that these results meet the definition of an outlier, as described in Ecology statistical guidance (Ecology 1992). In areas without a nearby well, GW samples collected from collocated soil borings indicate that historical data collected from test pits are not representative of GW quality.

Abbreviations:

- COPC Chemical of Potential Concern
- Ecology Washington State Department of Ecology
- GW Groundwater
- MCL Maximum Contaminant Level
- µg/L Micrograms per liter
- MTCA Model Toxics Control Act
- NA Not analyzed; PAL does not perform analysis for this analyte in the indicated media.
- PCUL Preliminary cleanup level
- RL Reporting limit

**Table 5
Soil Constituents of Potential Concern Summary**

Chemical	PCUL if Groundwater Demonstrates Compliance (mg/kg)	Considers Pathways	Max Detection in Soil (mg/kg)	Detected Results that Exceed	Is it a Soil COPC?	Rationale
Chemicals Identified as COPCs and Pending COPCs						
Groundwater demonstrates compliance for leaching pathway						
Metals						
Lead	220	Direct Contact	990	3.6%	Yes	Max Result > Direct Contact PCUL
Zinc	270	Direct Contact	470	6.7%	Yes	Max Result > Direct Contact PCUL
Organochlorine Pesticides						
Heptachlor	0.22	Direct Contact	0.43	1.3%	Yes	Max Result > Direct Contact PCUL
HCH-alpha (a-BHC)	0.16	Direct Contact	0.017	2.0%	No	No exceedances of direct contact PCUL
4,4'-DDD / Sum DDD	2.4	Direct Contact	3.2	0.66%	Yes	Max Result > Direct Contact PCUL
Other Chemicals						
Organochlorine Pesticides						
HCH-beta (b-BHC)	0.0067	Direct Contact, Leaching	0.052	6.0%	Yes	Max Result > Soil PCUL
Aldrin	0.0067	Direct Contact, Leaching	20	8.6%	Yes	Max result > soil PCUL and Direct Contact PCUL
Chlordane	1.0	Direct Contact, Leaching	84	12%	Yes	Max Result > Soil PCUL
Dieldrin	0.0067	Direct Contact, Leaching	46	46%	Yes	Max Result > Soil PCUL
4,4'-DDE / Sum DDE	0.25	Direct Contact, Leaching	5.4	7.9%	Yes	Max Result > Soil PCUL
4,4'-DDT / Sum DDT	2.9	Direct Contact, Leaching	20	6.0%	Yes	Max Result > Soil PCUL
Total DDx	1.0	Direct Contact ⁽³⁾	25	9.3%	Yes	Max Result > Soil PCUL
Toxaphene	0.84	Direct Contact, Leaching	120	18%	Yes	Max Result > Soil PCUL
Other Chlorinated/Halogenated Pesticides						
Atrazine	4.3	Direct Contact ⁽³⁾	710	0.66%	Yes	Max Result > Soil PCUL
Chlordane-alpha	1.0	Direct Contact, Leaching	9.9	5.6%	Yes	Max Result > Soil PCUL
Simazine	8.3	Direct Contact ⁽³⁾	110	0.66%	Yes	Max Result > Soil PCUL
Total Petroleum Hydrocarbons (TPH)						
Total Diesel- and Oil-Range	460	Direct Contact ⁽³⁾	21,000	25%	Yes	Max Result > Soil PCUL
Dioxins						
Dioxins	0.00000300	Direct Contact ⁽³⁾	0.0000924	78%	Yes	Max Result > Soil PCUL
Chemicals Not Retained as COPCs Despite Having One or More Detected Results that Exceed the PCUL						
Groundwater demonstrates compliance for leaching pathway						
Volatile Organic Compounds						
Benzene	18	Direct Contact	0.037	None	No	No exceedances
Metals						
Cadmium	25	Direct Contact	4.4	None	No	No exceedances
Copper	100	Direct Contact	90	None	No	No exceedances
Organochlorine Pesticides						
G-BHC (Lindane)	0.91	Direct Contact	0.16	None	No	No exceedances
Endrin	0.40	Direct Contact	0.38	None	No	No exceedances
Other Chlorinated/Halogenated Pesticides						
Pentachlorophenol	2.5	Direct Contact	0.12	None	No	No exceedances
Other Chemicals						
Metals						
Chromium (Total)	64	Direct Contact ⁽³⁾	65	1.4%	No	The form of chromium present at the site is chromium(III); chromium(VI) is not associated with pesticides or any other current or former industrial uses or practices at the site. The PCUL of 64 mg/kg is consistent with Technical Addendum Attachment V: WAC 173-340 Table 749-2 Chemical-specific Technical Support Documents for use at sites where only chromium(III) is present. One sample exceeds the PCUL by a factor of approximately 1.0.
Total Petroleum Hydrocarbons (TPH)						
Gasoline-Range TPH	30	Direct Contact ⁽³⁾	1,200	6.9%	No	Eliminated in Soil Elimination Memo: gasoline detections are chromatographic overlap with weathered diesel.

Notes:

Criteria and results are rounded to two significant figures, with the exception of dioxin criteria and results. Dioxin criteria and results are rounded to three significant figures.

RED/BOLD Chemical identified as a COPC by Floyd | Snider and Ecology.

Blue Soil PCUL has been adjusted to the PQL.

Green Soil PCUL includes TEE, human health, and leaching pathway as appropriate for the chemical.

Light Green Soil PCUL includes only direct contact criteria; the leaching pathway is not active.

1 If groundwater is clean (i.e., chemical is not a groundwater COPC), the PCUL presented in this table is the most conservative soil direct contact criterion for that chemical. This "direct contact PCUL" was used to determine exceedance information and COPC status.

2 If a-BHC is not detected in any groundwater well in results from the March 2020 groundwater sampling event, a-BHC will not be considered a COPC in soil. If a-BHC is detected in groundwater, soil and groundwater data will be evaluated to determine soil COPC status.

3 No three-phase leaching pathway criteria.

Abbreviations:

COPC Chemical of Potential Concern
mg/kg Milligrams per kilogram

PCUL Preliminary cleanup level
PQL Practical quantitation limit

TEE Terrestrial Ecological Evaluation

Analytical Report for Service Request No: K2002652

Pamela Osterhout
Floyd Snider
601 Union Street, Suite 600
Seattle, WA 98101

RE: PKG SmithKem Site

Dear Pamela,

Enclosed are the results of the sample(s) submitted to our laboratory March 27, 2020
For your reference, these analyses have been assigned our service request number **K2002652**.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please contact me if you have any questions. My extension is 3376. You may also contact me via email at Mark.Harris@alsglobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Mark Harris
Project Manager

 Organochlorine Pesticides

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
 - i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

- * The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
DOD-QSM 4.2 definition : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
 - i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.

Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/analyte is offered by that state.

Phone (360)577-7222 Fax (360)636-1068
www.alsglobal.com

Client: Floyd Snider
Project: PKG SmithKem Site
Sample Matrix: Water

Service Request: K2002652
Date Received: 03/27/2020

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Twenty one water samples were received for analysis at ALS Environmental on 03/27/2020. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Semivoa GC:

Method 8081B, Ultra Low Level Organochlorine Pesticides by GC/ECD 04/19/2020: The upper control criterion was exceeded for Toxaphene in Duplicate Laboratory Control Sample (LCS) KQ2004497-04: 168, 66-154. Recovery in and RPD between the Laboratory Control Sample (LCS) KQ2004497-03 was acceptable, which indicated the analytical batch was in control. The analyte in question was detected in the associated field samples MW-8-032520, MW-3-032520, MW-12-032620, and MW-14-032620. The error associated with elevated recovery indicated a high bias. The sample data was not significantly affected. No further corrective action was appropriate.

Cooler Receipt and Preservation Form

Client Floyd Snider Service Request K20 02652
 Received: 3/27/20 Opened: 3/27/20 By: km Unloaded: 3/27/20 By: km

1. Samples were received via? **USPS** **Fed Ex** **UPS** **DHL** **PDX** **Courier** **Hand Delivered**
2. Samples were received in: (circle) **Cooler** **Box** **Envelope** **Other** **NA**
3. Were custody seals on coolers? **NA** **Y** **N** If yes, how many and where? 1 Front
 If present, were custody seals intact? **Y** **N** If present, were they signed and dated? **Y** **N**

Temp Blank	Sample 1	Sample 2	Sample 3	Sample 4	IR GUN	Cooler / COC ID	NA	Tracking Number	NA	Filed
4.1	—	—	—	—	29800482WS	107278		391413655923		
5.4	—	—	—	—	"	"		391413679611		

4. Packing material: **Inserts** **Baggies** **Bubble Wrap** **Gel Packs** **Wet Ice** **Dry Ice** **Sleeves**
5. Were custody papers properly filled out (ink, signed, etc.)? **NA** **Y** **N**
6. Were samples received in good condition (temperature, unbroken)? *Indicate in the table below.* **NA** **Y** **N**
 If applicable, tissue samples were received: **Frozen** **Partially Thawed** **Thawed**
7. Were all sample labels complete (i.e analysis, preservation, etc.)? **NA** **Y** **N**
8. Did all sample labels and tags agree with custody papers? *Indicate major discrepancies in the table on page 2.* **Yes** **NA** **Y** **N** *km ka*
9. Were appropriate bottles/containers and volumes received for the tests indicated? **NA** **Y** **N**
10. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* **NA** **Y** **N**
11. Were VOA vials received without headspace? *Indicate in the table below.* **NA** **Y** **N**
12. Was C12/Res negative? **NA** **Y** **N**

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count	Out of	Head-	Broke	pH	Reagent	Volume	Reagent Lot	Initials	Time

Lab Control Sample Summary
Ultra Low Level Organochlorine Pesticides by GC/ECD

Sample Name: **Instrument ID:**
Lab Code: **File ID:**
Analysis Method: 8081B **Analysis Lot:**677293
Prep Method: None

This Lab Control Sample applies to the following analyses.

<u>Sample Name</u>	<u>Lab Code</u>	<u>File ID</u>	<u>Date Analyzed</u>
Performance Evaluation	KQ2005308-01	J:\GC23\data\041820\0418F029.D\	04/19/20 09:26

Analyte	Method	Matrix	Unit Cost	Number of Samples	Subtotal
HCH-alpha	Low-Level USEPA Method 8081B (Extract method 3511)	Groundwater	\$295	22 (includes 20 samples, 1 field duplicate, and 1 MS/MSD)	\$6,490
HCH-beta					
Lindane					
Aldrin					
Heptachlor					
Heptachlor Epoxide					
Chlordane					
Dieldrin					
Hexachlorobenzene					
Toxaphene					

ALS Environmental
Appendix from EXT-3511 Extracting Pest/PCB/PAH in Water
EPA Method 3511

Service Request # K2002652 Work Group # Pest: KR2004462
 PCB: —
 PAH: —

Solvent Lot # 23866D

Extraction Start (time/date/initial): 14:08 3/31/20 JD

Extraction Stop (time/date/initial): 14:38 3/31/20 JD

NaCL Lot# 0000234677

Sulfate Lot # 2019040410

Carbon Clean-up (Ext-Car)(time/date/initial): — Carbon Lot # —
 1:1 DCM/Hexane Lot # —

Sulfuric Acid Clean-up (3665) (time/date/initial): — Acid Lot # —

Other Clean-up (type/time/date/initial) —
 Lot# —

Pipette (5 mL) Lot # — Pipette (2 mL) Lot # —

Pipette (1mL) 08719645

Completed by (time/date/initial): —

Pest Vial: yellow Vial Storage: Sneezy G1-H6

PCB Vial: — Vial Storage: —

PAH Vial: — Vial Storage: —

Archived Extract Storage: None

Additional Comments: —

Bench Sheet Review Check List	
<input checked="" type="checkbox"/>	Hold times met; if no, reason: _____
<input checked="" type="checkbox"/>	Prep date, time, method, department, product code correct
<input checked="" type="checkbox"/>	Spike information and Q.C. correct (insufficient volume or mass recorded if no Q.C.)
<input checked="" type="checkbox"/>	Weights/Volumes and units correct on raw and final bench sheets
<input checked="" type="checkbox"/>	Sample IDs have been checked - bottle numbers appended if required
<input checked="" type="checkbox"/>	Names present for: started by, completed by, relinquished by, and witnessed by
<input checked="" type="checkbox"/>	Extract storage recorded
<input checked="" type="checkbox"/>	Additional prep sheet completely filled out (NA or line out blanks)
<input checked="" type="checkbox"/>	All clean-ups have been noted on additional prep sheet

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

Printed: 4/24/20 20:10

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

Printed: 4/24/20 20:10

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

 Run Type: N/A
 Lab ID: K2002652-010

Instrument: K-GC-23nd TP 04/28/20
 Vial: 13
 Dilution: 1
 Raw Units: ug/L

Target Compounds

Final Conc.Units: ng/L

Parameter Name	RT 1	RT 2	Resp 1	Resp 2	Solution Conc 1	Solution Conc 2	Final Conc 1	Final Conc 2	Primary Conc	Rpt?
Toxaphene {1}	14.75	13.39 c	9181	74581	50.888	71.519	250	360		
Toxaphene {2}	14.81 c	13.48 ^{+0.02}	15772	30648	96.648	38.200	480	190		P
Toxaphene {3}	14.93	13.59 ^{-0.01}	12496	128043	38.429	126.903	190	630		i
Toxaphene {4}	14.99 ^{-0.06}	0.00	13207	0	60.392	0.000	300	0		
Toxaphene {5}	15.34 ^{-0.01}	13.93 c	13780	40808	66.128	72.648	330	360		
Toxaphene {6}	15.53 ^{-0.01}	15.43	5051	11414	50.903	37.511	250	190		

Prep Amount: 200 mL
 Prep Final Amount: 1.00 mL

Dilution: 1
 Basis Factor: 100.00

U: Undetected at or above MDL
 J: Analyte detected above MDL, but below MRL
 B: Hit above MRL also found in Method Blank
 E: Analyte concentration above high point of ICAL
 N: Presumptive evidence of compound

D: Result from dilution
 m: Manual integration performed
 d: Compound manually deleted
 NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
 #: Acceptance criteria not applicable
 ?: Insufficient information to determine acceptance
 e: Result >= MRL, but MRL less than low point of ICAL
 c: check for co-elution

Printed: 4/24/20 20:10
