1.0 Introduction

This report documents the construction and initial operations of a Soil Vapor Extraction (SVE) system at the Bella Cleaners dry cleaning operation (Tenant Space 4925) in the Claremont Village Shopping Center located at 4805 to 4933 Evergreen Way in Everett, Washington (the Site; Figure 1 and Figure 2). Previous evaluation of data collected from the Site identified the presence of tetrachloroethene (PCE) and associated breakdown products in soil and soil vapor at the Site. The SVE system was constructed to reduce the potential risk to human health and the environment by reducing the concentrations of PCE and associated breakdown products in soil and soil vapor.

The SVE system was constructed as described in the Soil Vapor Extraction Work Plan (Work Plan) prepared for the Site (Apex, 2017). This report documents the SVE construction (well installations and system construction), initial operation of the SVE system, and remedial progress sampling using sub-slab soil vapor samples.

2.0 Site Background

In August 2014, a Phase I Environmental Site Assessment (ESA) (Apex, 2014a) for Claremont Village Shopping Center conducted by Apex identified an operating dry cleaner (Tenant Space 4925), which was considered a Recognized Environmental Condition (REC). Phase II site assessment completed by Apex in 2014 and 2015 identified the presence of concentrations of PCE and associated breakdown products in soil and soil vapor and the potential for vapor intrusion into the building spaces near the source area. According to the discussion with the current operator of Bella Cleaners in 2020, the cleaner stopped using PCE products in approximately 2017.

In 2018 and 2019, an SVE interim action was implemented for the Site. The SVE system was constructed between March and July 2018, and operated for an initial period of approximately six months from July 2018 to February 2019. After the initial operation period, the system was relocated to a second former cleaner (Tenant Space 4821) at Claremont Village Shopping Center for similar initial operations. The system will be returned to Tenant Space 4925 in 2021 for continued operation.

This section presents a description of the Site, the geology and hydrogeology, and previous environmental assessment completed at the Site.

2.1 Site Location and Description

Bella Cleaners is located in Tenant Space 4925 at Claremont Village Shopping Center, located at 4805 to 4933 Evergreen Way in Everett, Washington (Figure 2). The Site includes Bella Cleaners and adjacent

tenant spaces where sub-slab soil vapor concentrations of PCE and breakdown products have been detected above screening levels. The elevation of the Site is approximately 300 feet above mean sea level (MSL) along the storefronts on the west side. A sub-grade truck loading dock is present in the back of the retail spaces on the east side. The topography slopes steeply upward along the east side of the property.

2.2 Site Geology/Hydrogeology

2.2.1 Site Geology

The Site is situated in the Puget Lowland physiographic province of Washington State (Geologic Map of Washington, 2005). The Puget Lowland is a broad, low-lying trough located between the Cascade Range to the east and the Olympic Mountains to the northwest and the Willapa Hills to the southwest. The landscape largely results from repeated cycles of glacial scour and deposition. The Site is located within an area that has been geologically mapped as Vashon glacial till deposits, characterized as a non-sorted composite consisting of silts, sands, gravels, and boulders which were deposited below the advancing glacier. While till can contain lenses of stratified materials, the locally cemented lodgment drains poorly where weathering is limited by burial. Soils encountered in the explorations were unconsolidated silt, sand, and gravel-based soils that are typical of weathered glacial till deposits.

2.2.2 Site Hydrogeology

During the most recent groundwater monitoring event on January 11, 2019, groundwater was encountered at a depth of approximately 57 feet below ground surface (bgs) at MW-1. Based on topography, the shallow groundwater flow direction is expected to be to the north or the northwest.

2.3 Previous Investigations

Previous investigations at the Site have assessed soil, groundwater, and soil vapor for the presence of PCE and breakdown products associated with dry cleaning solvents. Sampling locations and investigation results for pre-remediation sampling are shown on Figures 2 through 4.

2014 Phase II ESA. A Phase II ESA was completed at the Site in September 2014 (Apex, 2014b) and consisted of:

- One exploration (B-2) near the Site area to a depth of 65 feet bgs for purposes of soil and groundwater sampling. Three soil samples were collected from boring B-2 at depths of 15 feet, 40 feet, and 60 feet bgs. Additionally, one grab groundwater sample was collected from boring B-2 at the depth of first encountered groundwater (approximately 60 feet bgs);
- Two grab soil samples beneath the slab of the Site to characterize conditions near a suspected deviation in the sewer lateral. Samples were collected beneath the building slab at the soil surface (Bella Surface) and at a depth of 36 inches bgs (Bella 36''); and

-
- Two sub-slab vapor samples (Bella Front and Bella Back) in the Site area. Samples were collected in areas where the majority of dry cleaning operations occur.

2015 Tier II Indoor Air Assessment. A Tier II Indoor Air Assessment was completed in September 2015 (Apex, 2015) within Bella Cleaners and adjacent tenant spaces. The Tier II assessment consisted of:

- Three sub-slab vapor samples (SS-LS-1, SS-BC-1, and SS-PM-1) in the Site and adjacent tenant spaces (Papa Murphy's and Teriyaki Zone).

2016 SVE Pilot Test. SVE well installation and an SVE pilot test were completed in April and May 2016 (Apex, 2016) and consisted of:

- Soil samples SVE-1-2 and OB-1-48.5 were collected during well installations for the pilot test. Additionally, one grab groundwater sample (GW-1) was collected from OBS-1 at the depth of first encountered groundwater (approximately 57 feet bgs) at the time of drilling.
- The pilot test and analytical model (Air2D) developed by the U.S. Geological Survey (USGS) estimated the intrinsic air permeability of the geologic formation in the vicinity of well SVE-1 and that an effective radius of influence (ROI) of at least 42 feet is feasible.

The prior investigation results for the Site are discussed below.

Soil. Concentrations of PCE and breakdown products were detected in soil samples, including five detections of PCE ranging from 1 microgram per kilogram ($\mu\text{g}/\text{kg}$) to 63.2 $\mu\text{g}/\text{kg}$. None of the detected concentrations of volatile organic compounds (VOCs) exceeded the applicable Model Toxics Control Act (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Use, except for the PCE concentration in one soil sample (SVE-1-2). Soil results are presented on Table 1 and are shown in Figure 3.

Groundwater. Concentrations of VOCs were not detected above reporting limits in the grab groundwater samples collected from boring B-2 and OBS-1. Groundwater results are presented on Table 2 and are shown in Figure 4.

Soil Vapor. Several VOCs, including PCE and trichloroethylene (TCE) were detected in the sub-slab vapor samples collected beneath the Site and adjacent tenant spaces. The detected concentrations of PCE ranged from 1,270 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$) to 22,000 $\mu\text{g}/\text{m}^3$. The detected concentrations of TCE ranged from 4.5 $\mu\text{g}/\text{m}^3$ to 46 $\mu\text{g}/\text{m}^3$. Each of the PCE detections and two TCE detections exceeded the applicable MTCA screening levels. Chloroform was detected in several soil vapor samples at concentrations above the screening levels. Chloroform is a common trihalomethane breakdown product. Chloroform detections are commonly associated with breakdown of disinfection byproducts from water and sewer systems. The only other VOC detected above a screening level was naphthalene in one sample.

The sub-slab soil vapor concentrations indicated some PCE had been released to soil and that there was a potential for vapor intrusion. Historical soil vapor concentrations are presented on Table 3 and are shown in Figure 5.

A portion of the 2014 and 2015 Apex investigations also included a former dry cleaner at tenant space 4821, currently occupied by Wild Birds Unlimited (Figure 2). This investigation and remediation work is being reported separately.

2.4 Short Term TCE Risks

Washington State Department of Ecology (Ecology) published the Toxics Cleanup Program Implementation Memorandum #22 – Vapor Intrusion Investigations and Short-term Trichlorethene Toxicity on October 1, 2019. This document includes default short-term screening levels for TCE in all media that are targeted for preventing TCE exposure for women of childbearing age. The default short term soil vapor TCE screening level is 250 µg/m³. The highest detected concentration of TCE in soil vapor at the Site was 92.3 µg/m³. Short term TCE risks are not expected at the Site.

3.0 Remedial Construction and Sampling

The SVE system was constructed in general accordance with the SVE Work Plan (Apex, 2017). In general, the design is based on the recommendations provided in the U.S. Army Corps of Engineers (USACE) Soil Vapor Extraction Engineering Manual (USACE, 2002). Any deviations from the work plan are described below. Construction of the SVE system included installation of the groundwater monitoring well MW-1 (completed on March 15, 2018) and installation of the SVE system equipment (which was substantially completed in July 2018). Well drilling was completed by Cascade Drilling, Inc. of Woodinville, WA, and system construction activities were performed by Clearcreek Contractors Inc (Clearcreek) of Everett, Washington.

Apex documented the well drilling and installation of the mechanical system components (system piping, vaults, and above-ground equipment). The layout of the system is shown on Figure 6, and a schematic of the SVE system components is shown on Figure 7.

3.1 Preparatory Activities

The following activities were conducted prior to starting work in order to prepare the site and workers for construction activities.

3.1.1 Utility Locating

The Washington Utility Notification Center was notified of the proposed installation activities at least 48 hours prior to beginning construction. In addition, a private utility locator was retained to locate underground utilities and piping at the vapor extraction wells and trenching locations that might not be located through the One-Call system.

3.1.2 Health and Safety

A health and safety plan (HASP) was prepared prior to commencing construction activities. Daily tailgate health and safety meetings were conducted every morning prior to the start of each day's activities.

3.1.3 Interior Sub-Slab Vapor Points Installation

On May 15, 2018, three interior sub-slab soil vapor points (SS-BC-2, SS-BC-3, and SS-BC-4) were installed in the vicinity of the dry cleaning and spot cleaning equipment as well as the waste storage areas to collect baseline pre-remediation data. On August 7, 2020, five additional sub-slab soil vapor points were installed to assess remediation performance. The additional sub-slab sampling points were installed within the tenant space (SS-BC-5 and SS-BC-6), adjacent tenant space in Papa Murphy's (SS-PM-2), and adjacent tenant space in Teryaki Zone (SS-TZ-2 and SS-TZ-3). The sub-slab soil vapor points consisted of the Vapor Pin system (<http://vaporpin.coxcolvin.com/>) and were installed by Apex with roto-hammer equipment. The sub-slab soil vapor point locations are shown on Figure 8.

3.2 SVE System Construction

The SVE system was constructed between March 13 and July 10, 2018. Construction details are summarized below.

3.2.1 System Piping and Trenching

Trenching and SVE piping construction were performed by Clearcreek. The piping layout for the SVE system is shown on Figure 6. Clearcreek first cut the concrete for the SVE well and trenches, then constructed the trenches according the details and specifications in the SVE Work Plan (Apex, 2017).

To the extent practicable, pipe slopes were maintained during installation such that the low point of the piping was at the wellhead. Trenches were excavated to a depth of approximately 2.5 to 3 feet bgs. The excavated soil was used to backfill the trenches, and the backfill was compacted to a firm, non-yielding state using hand-operated compactors. Paved areas that were disturbed during the installation activities were restored with concrete to match the surrounding surface.

Soil vapor extraction well (SVE-1) and observation well (OBS-1), which were installed during a previous SVE pilot test in 2016, were utilized as a part of the SVE system. Within the well vault, the SVE-1 well is

equipped with a flow control valve and monitoring port. The control valve allows for adjusting flow from the well over a continuous range from zero to the maximum flow capable from the well. The monitoring port was installed on the well side of the control valve and may be used for either monitoring vacuum or collecting a vapor sample.

3.2.2 System Blower and Vacuum Assembly

The SVE system is a self-contained system unit that houses the vacuum blower (Rotron EN404), moisture separator, transfer pump, and storage drum. The self-contained system is housed in an insulated skid-mounted shed (approximately four feet by six feet). The two carbon drums and the control panel are located outside of the shed. The system unit was connected to the SVE piping and electrical service in close proximity to the system. The treated discharge from the system exhausts from the top of the a carbon filters outside of the shed through an elevated stack (approximately 20 feet above ground level). The control panel is equipped with alarms and controls.

3.3 Construction Waste Management

Construction waste consisted of asphalt concrete, soil cuttings from the well installations, decontamination water, and personal protective equipment (PPE). The wastes were handled as follows.

- Asphalt concrete removed from the vault and trench areas was segregated and disposed of as solid waste.
- The soil cuttings generated during the SVE system installation was placed in 55-gallon drums, approved by Ecology as contained-in waste and disposed of by Cascade Drilling (under subcontract to Apex). These soils were transported to the Waste Management Wenatchee Landfill, a Subtitle D landfill in Wenatchee, Washington. Approval emails from Ecology and Soil disposal documentations are included in Appendix B.
- The purged water and decontamination water generated during the SVE well installation was placed in 55-gallon drums, approved by City of Everett under the Discharge Permit authorized on March 7, 2018, and disposed into sanitary sewer system by Clearcreek (under subcontract to Apex). Discharge permit and approval emails from City of Everett are included in Appendix B.
- PPE and miscellaneous debris were disposed of as a solid waste.

3.4 Sampling during Construction

Soil and groundwater samples were collected at the Site during SVE construction and shipped to ESC laboratory (now Pace National) for analysis. Laboratory analytical reports are provided in Appendix C. Sampling results are discussed below.

3.4.1 Groundwater Monitoring Well Installation

One groundwater monitoring well (MW-1) was installed east of the Site on March 15, 2018, as shown on Figure 6. The well was installed by Cascade Drilling, Inc. using sonic drilling equipment. As an additional safety precaution, this location was cleared for underground utilities using a vacuum truck with air knife. Soil lithology was logged, and the soil cores were screened for VOCs using a photoionization detector (PID) and for separate-phase oils using a sheen test. Soil lithology and field screening results are shown on the well log included in Appendix A.

The groundwater monitoring well (MW-1) was installed to a total depth of 75 feet bgs and screened approximately 65 to 75 feet bgs. The monitoring well was constructed with two-inch-diameter, Schedule 40 polyvinyl chloride (PVC) casing. The well screen is two-inch Schedule 40 PVC with 0.020-inch slot size. Filter material (10/20 Silica Sand) was installed in the borehole from the bottom of the well extending to one foot above the top of the well screen, and the well was sealed with 3/8-inch hydrated bentonite chips to within one foot of the bottom of the well vault depth. The well was finished with a circular steel vault (18-inch-diameter, 12 inches deep) set in concrete.

3.4.2 Soil Results

During the installation of well MW-1, the encountered soils were field screened continuously throughout the boring. Because there were no field screening indications of contamination during the drilling, soil samples were collected and analyzed from a depth of 10 feet bgs and from the terminus of the boring (75 feet bgs). During the excavation of the SVE trench, soil samples were collected at a depth of three feet bgs within the trench excavation areas.

Four soil samples were collected to assess soil conditions at the east of the Site:

- MW-1 (10') and MW-1 (75') from well MW-1;
- S1 (3') and S2 (3') from the SVE trenching area.

Soil samples were analyzed for chemical analysis of VOCs by Environmental Protection Agency (EPA) Method 8260B. Analytical results show that concentrations of PCE were detected at MW-1 (10'), S1 (3'), and S2 (3'), but were below the MTCA Method A screening level for unrestricted use (50 µg/kg). No other VOCs were detected above method reporting limits (MRLs). The results, in addition to historical soil results, are shown on Table 1. The sample locations are shown on Figure 6.

3.4.3 Groundwater Sampling and Results

Following the installation of the well, Apex developed MW-1 on May 16, 2018 and collected groundwater samples from MW-1 on May 29 and September 10, 2018 and January 22, 2019. The samples were analyzed for VOCs by EPA Method 8260B. No VOCs were detected above MRLs. The results, in addition to historical groundwater results, are shown on Table 2.

4.0 System Monitoring and Initial Operation

The completed SVE system was initially started up on July 11, 2018 and began normal operation. SVE system startup and initial operations are discussed below. Initial operations were completed to evaluate system effectiveness and performance. After the initial operations period between July 11, 2018 and approximately January 7, 2019, the system was relocated to the former cleaner at the location of Tenant Space 4821 for similar initial operations. The system will be returned to the Site in 2021 for continued operation.

4.1 System Startup

At the startup of the SVE system, each of the valves to the SVE well were fully opened and the SVE system was operated for approximately two hours. Following this period, the pressure to the SVE well was monitored using Dwyer® Magnehelic 0- to 100-inch H₂O pressure gauges to determine the vacuum distribution in the piping network of the system. The system continued to run for 24 hours and samples of the pre-treatment vapor and effluent vapor were taken.

4.2 Initial Operations

The system startup pressure measurements were consistent with the design criteria and were balanced at the system well (consistently running about six to seven inches of water vacuum on the SVE system). Routine maintenance of the SVE system equipment includes inspection of the system and operating parameters (vacuum pressures and flow rates), maintenance of the blower motor in accordance with the manufacturer's recommendations, and removal of any water that collected in the moisture separator.

4.3 Monitoring and Performance

The system monitoring program used to assess the effectiveness of the system is outlined in the table below.

Remedial Action Component(s)	Location	Monitoring	Frequency
SVE System	SVE-1, OBS-1, and MW-1; Before and after carbon treatment	PID, vacuum, and flow monitoring	Daily for three days after system startup; Weekly for three weeks, then monthly for five months.
	Before and after carbon treatment	Vapor analytical sampling (Method TO-15)	One day after constant operation, then monthly for approximately six months.

Additionally, in February 2019, vacuum communication testing between the SVE system and sub-slab vapor points BC-1 to BC-4 was conducted. The monitoring results indicated there was not communication between the SVE system and sub-slab vapor points.

4.3.1 Vapor Sample Results

Vapor samples were collected from influent air before carbon treatment (samples labeled as "Influent") and discharge air after carbon treatment (samples labeled as "Effluent"). Samples were submitted to the analytical laboratory (ESC Lab Sciences, now Pace National) and analyzed for VOCs using EPA Method TO-15. Vapor analytical results are presented in Table 4, and the laboratory analytical reports are provided in Appendix C. The analytical results show an average PCE concentration of 50 µg/m³ before carbon treatment and non-detect after carbon treatment for the SVE system. The system flow rate is about 148 cubic feet per minute (cfm). The startup concentration equates to an annual removal rate of approximately 0.25 pounds per year.

4.3.2 SVE System Assessment

The flow and pressure data collected from SVE-1 and OBS-1 near the Site area were used in an analytical model (Air2D) developed by the USGS to assess the ROI around well SVE-1. In accordance with the USACE design guidance (USACE, 2002), the ROI is defined as the distance at which the soil vapor velocity in the pore space is at least 0.001 centimeters per second (cm/sec). Results of SVE system monitoring are presented in Table 5. The results of the Air2D model are included in Appendix D. Based on the results of the Air2D model, the calculated ROI around well SVE-1 at the full-scale SVE system is 66.7 feet, which is larger than the designed ROI (42 feet). The results indicate that the full-scale SVE system would provide enough coverage of the target treatment area (including beneath the Site building). The calculated ROI around SVE-1 is shown on Figure 6.

5.0 Operations Monitoring

The SVE system operated at the Site from July 11, 2018 to approximately January 7, 2019. SVE operation and effectiveness monitoring data were collected during this period. Note that the system was turned off for approximately one week prior to sub-slab sampling in January to allow the Site to return to static conditions before soil vapor monitoring. Note that on January 25, 2019, after the sampling event, the system was restarted for the final SVE monitoring event.

Concentrations of PCE in the vapor stream decreased significantly during the initial operation of the SVE system. Based on comparison of the influent concentration at startup (July 11, 2018) and the final influent concentration sample results (January 22, 2019), concentrations of PCE in the vapor stream from the SVE system were reduced by approximately 70 percent over the six-month operation period. At the time of shutdown, the system continued to remove detectable concentrations of PCE and breakdown products.

After the SVE system was turned off, confirmation sub-slab soil vapor samples were collected from three sub-slab vapor locations (SS-BC-2, SS-BC-3, and SS-BC-4) at the Site on January 22, 2019 and April 25, 2019 to evaluate contaminant rebound. Sampling results are shown on Figure 8. PCE and TCE were detected at all sample locations. PCE was detected above MTCA Method B soil vapor screening levels in sample SS-BC-2. TCE was detected above MTCA Method B soil vapor screening levels in samples SS-BC-2 and SS-BC-3.

Two rounds of sub-slab soil vapor samples were collected from eight sub-slab vapor locations at the Site and adjacent tenant spaces on August 14 and 21, 2020 as below:

- One sub-slab vapor location (SS-PM-2) at Papa Murphy's;
- Five sub-slab vapor locations (SS-BC-2, SS-BC-3, SS-BC-4, SS-BC-5 and SS-BC-6) at Site; and
- Two sub-slab vapor locations (SS-TZ-2 and SS-TZ-3) at Teriyaki Zone.

Sampling results are shown on Figure 8. PCE and TCE were detected at all sample locations. PCE was detected above the MTCA Method B soil vapor screening level in all above samples except for SS-TZ-2 and SS-BC-4, which are located on the far east end of the Site and Teriyaki Zone tenant space. TCE was detected above the MTCA Method B soil vapor screening level in all above samples except for SS-TZ-2, SS-TZ-3, SS-PM-2 and SS-BC-4.

6.0 Summary and Conclusions

A summary of the remedial activities and data conclusions are provided below.

- The results of soil samples indicated that concentrations of PCE and associated breakdown products in soil to the east of the tenant space were mostly below the MTCA Method A screening levels for unrestricted use. One sample (SVE-1-2) exhibited a PCE concentration that marginally exceeded the MTCA Method A soil cleanup level of unrestricted land use.
- Some amount of PCE has historically been released to the environment, however PCE and associated breakdown products have not been detected in groundwater.
- The SVE system was constructed according to the SVE Work Plan (Apex, 2017) between March 13 and July 10, 2018. The calculated ROI for the constructed SVE system indicates that the full-scale SVE system is covering the target treatment area (including beneath the Site).
- The SVE system operated for an initial period of approximately six months from July 2018 to January 2019. The SVE system was temporally shut down after six months of operation. Monitoring for the SVE system indicates an annual removal rate of approximately 0.25 pounds per year of PCE.

-
- Sub-slab vapor testing was completed in 2019 and 2020 to evaluate treatment effectiveness after system shutdown. Concentrations of PCE and associated breakdown products in the sub-slab soil vapor samples were reduced compared to the 2018 vapor results before operation of the SVE system. However, the detected concentrations of PCE and/or TCE in the sub-slab soil vapor samples at the Site were detected above MTCA Method B soil vapor screening levels in all samples collected before and after initial operation of the SVE system, except for SS-BC-4 and SS-TZ-2.
 - The initial concentration reductions indicate the SVE system was effective in reducing the PCE concentrations near the source area. Based on the concentration rebound that was observed, additional SVE operation is required for remediation.

6.1 System Modification

Operations data indicated there was not communication between sub-slab intervals and the SVE system. Additionally, significantly decreased concentrations in the SVE vapor stream, paired with the residual concentrations detected after initial operation, suggest that mass could be present above the uppermost portion of the SVE well screen, or that the perimeter foundation is preventing access to the shallow intervals. A modification of the SVE system is proposed in order to increase vapor extraction from shallower intervals near the source area.

The proposed shallow SVE well location and piping layout are conceptually shown on Figure 9. Related construction details are shown on Figure 10. This location was selected to be in relatively close proximity to the higher vapor concentrations while minimizing the potential impact to the operating business. Actual locations of the piping and proposed new shallow SVE well may be modified to avoid utility conflicts and other obstructions.

Shallow SVE Well. The well will consist of a six-inch-diameter SVE point screened from four to nine feet bgs with 0.020-inch slot size. Filter material (10/20 Silica Sand) will be installed in the borehole from the bottom of the well extending to one foot above the top of the well screen, and the well will be sealed with 3/8-inch hydrated bentonite chips to within one foot of the bottom of the well vault depth. The well will be finished with a circular steel vault (18-inch-diameter, 12 inches deep) set in concrete. Piping connecting to the SVE system will be routed in a trench to the nearest wall, then routed vertically to above the drop-down ceiling, across the building exterior, and connected to the mobile SVE system. The pipe penetrations will be sealed with caulk at the floor and the exterior building wall.

The piping in the trench will be sloped toward the well to prevent the accumulation of moisture (such as from condensation) in the piping. Piping will be bedded such that no voids or protrusions might potentially damage the piping. The trench will be backfilled with compacted crushed rock (3/4-inch-minus) to a visibly non-yielding state. The vertical piping from the system to the building wall penetration will be equipped with

a drain "Y" to allow cleanout of any water that may accumulate in the riser. The concrete floor slab will be patched to match the existing surface.

Sub-Slab Vapor Pit Construction. The SSDS will consist of a vertical three-inch diameter schedule 40 PVC pipe installed through a 12-inch diameter opening cored in the concrete floor into the sub-slab layer of aggregate material. The three-inch diameter PVC pipe will be routed vertically from beneath the floor to the building exterior via the same path as the SVE well. Piping will be mounted on the exterior of the existing drywall. Pipe penetrations will be sealed with caulk at the floor and the exterior building wall and include new flashings as needed. The vapor pit will be connected to the SSDS system.

The vapor pit piping will be valved and equipped with a metering method to ensure it is operating properly. This will consist of a visible U-tube manometer placed on the PVC pipe sections inside the tenant space for verification of system operation. Initial vacuum pressures will be recorded at startup at the PVC pipe penetrations from the in-line U-tube manometer.

7.0 Future Plans

The data indicate that the system has likely removed most of the VOC mass from subsurface soils, and that the original mass of source material was relatively small. While the SVE system is capturing the area of subsurface soil vapor (defined as five feet bgs and deeper), sub-slab soil vapor concentrations remain above applicable screening levels across several tenant spaces north and south of the cleaner. Concentrations of PCE in soil have been detected above applicable cleanup levels in shallow soils, above the SVE treatment interval (above five feet bgs) at the exterior area of the former cleaner. Additional SVE from sub-slab and shallow soil intervals (above five feet bgs) will likely be required in the future in order to achieve site closure. Some characterization will be required \ to determine the extent of the required removal in the shallow and sub-slab intervals.

Apex recommends that the next phase of the interim action consist of:

- Installing and monitoring additional soil vapor monitoring points to determine the full extent of the area where Method B screening levels are exceeded;
- Characterizing shallow soils in the area east of the former cleaner that are located above the current treatment interval;
- Modifying the SVE system to include the capability to extract vapors from shallow (less than five feet bgs) and sub-slab intervals. Operate for nine months.
- Prepare an annual report with a final cleanup decision recommendation.

The objective of the next phase of the interim action is to establish that the SVE can remove vapors from shallow and sub-slab intervals of the Site. These results will provide the needed data to establish a final cleanup action plan for review and approval by Ecology.

Notes:

1. µg/kg = Micrograms per kilogram (ppb).
2. mg/kg = Milligrams per kilogram (ppm).
3. Bold values are detected above laboratory reporting limits.
4. < = Non detect, concentration less than the laboratory reporting limit
5. Screening levels from Department of Ecology's Cleanup Levels and Risk Calculation (CLARC) Master Table for Method A screening. Updated January 2020.
6. Shaded values exceed the Method A soil cleanup levels for unrestricted land use.
7. -- = Not measured or value not available.
8. J = Estimated values.
9. UJ = The not detected value is estimated at the reporting limit.

Boring Logs and Well Construction Documentation

Sample Descriptions

Classification of soils in this report is based on visual field and laboratory observations which include density/consistency, moisture condition, and grain size, and should not be construed to imply field nor laboratory testing unless presented herein. Visual-manual classification methods of ASTM D 2488 were used as an identification guide.

Soil descriptions consist of the following:

MAJOR CONSTITUENT with additional remarks; color, moisture, minor constituents, density/consistency.

Density/Consistency

Soil density/consistency in borings is related primarily to the Standard Penetration Resistance. Soil density/consistency in test pits and push probe explorations is estimated based on visual observation and is presented parenthetically on test pit and push probe exploration logs.

SAND and GRAVEL <u>Density</u>	Standard Penetration Resistance in Blows/Foot	SILT or CLAY <u>Density</u>	Standard Penetration Resistance in Blows/Foot	Approximate Shear Strength in TSF
Very loose	0 - 4	Very soft	0 - 2	<0.125
Loose	4 - 10	Soft	2 - 4	0.125 - 0.25
Medium dense	10 - 30	Medium stiff	4 - 8	0.25 - 0.5
Dense	30 - 50	Stiff	8 - 15	0.5 - 1.0
Very dense	>50	Very Stiff	15 - 30	1.0 - 2.0
		Hard	>30	>2.0

Moisture

		Minor Constituents	<u>Estimated Percentage</u>
Dry	Little perceptible moisture.	Not identified in description	0 - 5
SI. Moist	Some perceptible moisture, probably below optimum.	Slightly (clayey, silty, etc.)	5 - 12
Moist	Probably near optimum moisture content.	Clayey, silty, sandy, gravelly	12 - 30
Wet	Much perceptible moisture, probably above optimum.	Very (clayey, silty, etc.)	30 - 50

Sampling Symbols

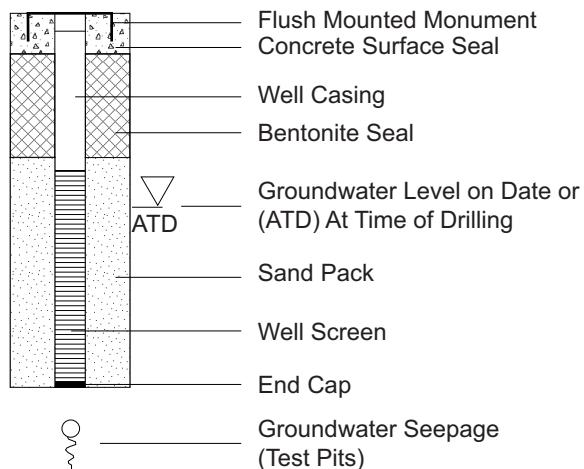

BORING AND PUSH-PROBE SYMBOLS

Re: Contained-in Determination for Contaminated Soils from Claremont Village Shopping Center in Everett, Washington (Ecology FS ID: 3183)

Reference: 1. Letter Report from J. Xu, Apex Companies to B. Maeng, Ecology, dated April 17, 2018
2. Email from J. Xu to B. Maeng, Ecology on April 23, 2018
3. Email from J. Xu to B. Maeng, Ecology on April 24, 2018

Dear Mr. Bills:

The Washington State Department of Ecology (Ecology) received a contained-in determination request from your environmental consultant, Apex Companies for seven (7) 55-gallon drums of contaminated soils generated during installation of SVE wells and monitoring well (SVE-2, OBS-2 and MW-1) at the Claremont Village Shopping Center located at 4925 Evergreen Way in Everett, Washington (Reference 1).

Analytical data and supplemental information for the contaminated soils were submitted to Ecology (References 1 and 2) to determine if these soils contaminated with listed dangerous waste constituents (F002) may be exempt from management as dangerous wastes per the “Contained-In Policy¹”. Ecology understands that these contaminated soils do not designate under federal characteristics (WAC 173-303-090) or State-only criteria (WAC 173-303-100).

Based on the information received and reviewed, Ecology has determined that these soils are contaminated with F002 listed dangerous waste constituents at concentrations that do not warrant management as dangerous wastes, and Ecology will not require disposal of these soils as listed dangerous wastes at a RCRA permitted dangerous waste treatment, storage and disposal (TSD) facility, provided that all of the following conditions are implemented. This contained-in determination applies only to the contaminated soils, and does not pertain to contaminated water or any mixture of contaminated soils and drilling fluids.

¹ Washington State Department of Ecology Contained-in Policy, dated February 19, 1993

You or your consultant, Apex Companies shall:

- Ensure that no standing water is present within the drums/containers holding the contaminated soils. All water must be removed to the maximum extent possible from the drums/containers and managed as F002 dangerous wastes or as otherwise allowed under Chapter 173-303 WAC. Adding bentonite or similar materials to absorb standing F002 listed waste contaminated water in the containers is not allowed. Mixtures of bentonite or similar materials and the listed waste contaminated water must be managed as F002 listed dangerous wastes;
- Directly deliver the soils to a solid waste landfill permitted under WAC 173-351 inside Washington State. If you plan to deliver the contaminated soils to a landfill outside Washington State, you must submit Ecology written approval for the contaminated soil disposal from the receiving State hazardous waste program and the out of state landfill, before the soils are delivered to the out of state landfill;
- Dispose of the contaminated soils at the solid waste landfill by May 31, 2018. The contaminated soils must be managed as dangerous wastes after May 31, 2018;
- Provide copies of all signed solid waste landfill receipts or a certificate of disposal issued by the receiving landfill for these contaminated soils to Ecology, attention of Byung Maeng, by June 30, 2018. This is an important verification step for you and your consultant to follow in order for this Ecology decision to be valid;
- Do not consolidate these contaminated soils with other soils that do not pertain to this contained in determination;
- Notify Ecology before disposal of the soils if the amount exceeds the approved amount in this letter. Ecology needs to make sure that the additional soil qualifies for this contained-in determination;
- Ensure that the transporter is properly trained to handle hazardous waste so that the transporter manages the contained-in determination soils during transport in a manner that is protective of human health and the environment;
- Take measures to prevent unauthorized contact with these soils at all times. During transport, take adequate measures to prevent spills or dispersion due to wind erosion. If you load the contaminated soils directly onto the truck bed, the truck must be lined with plastic;
- Provide instructions to the landfill operator that these soils are not to be used for daily, intermediate, or final cover;
- Provide copies of all soil analytical data to the landfill operator, upon request; and
- Do not send these contaminated soils to any incinerator, thermal desorption unit or recycling facility unless that facility is a RCRA Subtitle C permitted dangerous waste TSD facility.

Mr. K.C. Bills
April 25, 2018
Page 3 of 3

Ecology issued this determination based on the information provided and reviewed to date. This Ecology determination will be rescinded if Ecology finds that the information submitted by the property owner or its environmental consultant does not accurately represent the site conditions and is materially false or misleading, or if the Ecology requirements listed above are not followed.

This written decision only applies to the seven (7) 55-gallon drums of soils described above, and does not apply to any other area or other media. Any data used for this contained-in determination is intended for use in determining the proper disposal of the soils according to the Washington State Dangerous Waste Regulations (Chapter 173-303 WAC) and the Ecology Contained-in Policy. This letter is not an Ecology approval for dangerous waste designation or disposal of contaminated soils that may be generated or already excavated from other areas in this property.

This letter is not a No Further Action (NFA) letter and not written approval for any cleanup action plan you may have submitted. Instead, this letter only addresses the procedures for disposal of the contaminated soils according to the Washington State Dangerous Waste Regulations (Chapter 173-303 WAC). Regulatory decisions regarding the cleanup action, applicable soil and groundwater cleanup levels and any other cleanup issues must comply with the requirements under the Ecology Model Toxics Control Act (Chapter 173-340 WAC). Local agencies may have the authority to impose additional requirements on this waste stream.

If you fail to comply with the terms of this letter, Ecology may issue an administrative order and/or penalty as provided by the Revised Code of Washington, Sections 70.105.080 and/or .095 (Hazardous Waste Management Act).

If you have any questions concerning this letter, please contact me at (425) 649-7253 or bmae461@ecy.wa.gov.

Sincerely,

Byung Maeng, PE

Re: Contained-in Determination for Contaminated Soils from the Claremont Village Shopping Center in Everett, Washington

Reference: 1. Letter Report from J. Xu, Apex Companies to B. Maeng, Ecology, dated October 30, 2019
2. Email from J. Xu, Apex Companies to B. Maeng, Ecology on November 18, 2019

Dear Kevin Deis:

The Washington State Department of Ecology (Ecology) received a contained-in determination request from your environmental consultant, Apex Companies for four (4) 55-gallon drums of contaminated soils excavated from a former dry cleaners site (Tenant Space #4821) in the Claremont Village Shopping Center located at 4925 Evergreen Way, in Everett, Washington (Reference 1).

Analytical data and supplemental information for the contaminated soils were submitted to Ecology (References 1 and 2) to determine if these soils contaminated with listed dangerous waste constituents (F002) may be exempt from management as dangerous wastes per the “Contained-In Policy¹”. Ecology understands that these contaminated soils do not designate under federal characteristics (WAC 173-303-090) or State-only criteria (WAC 173-303-100).

Based on the information received and reviewed, Ecology has determined that these soils are contaminated with F002 listed dangerous waste constituents at concentrations that do not warrant management as dangerous wastes, and Ecology will not require disposal of these soils as listed dangerous wastes at a RCRA permitted dangerous waste treatment, storage and disposal (TSD) facility, provided that all of the following conditions are implemented. This contained-in determination applies only to the contaminated soils, and does not pertain to contaminated water or any mixture of contaminated soils and drilling fluids.

You or your consultant shall:

¹ Washington State Department of Ecology Contained-in Policy, dated February 19, 1993

- Ensure that no standing water is present within the drums/containers holding the contaminated soils. All water must be removed to the maximum extent possible from the drums/containers, and managed as F002 dangerous wastes or as otherwise allowed under Chapter 173-303 WAC. Adding bentonite or similar materials to absorb standing F002 listed waste contaminated water in the containers is not allowed. Mixtures of bentonite or similar materials and the listed waste contaminated water must be managed as F002 listed dangerous wastes;
- Directly deliver the soils to a solid waste landfill permitted under WAC 173-351 inside Washington State. If you plan to deliver the contaminated soils to a landfill outside Washington State, you must submit Ecology written approval for the contaminated soil disposal from the receiving State hazardous waste program and the out of state landfill, before the soils are delivered to the out of state landfill;
- Dispose of the contaminated soils at the solid waste landfill by December 31, 2019. This contained-in determination letter is no longer valid after December 31, 2019, and the contaminated soils must be managed as dangerous wastes;
- If you load the contaminated soils directly onto the truck bed or the contaminated soils are transported in roll-off bins, the truck or the roll-off bins must be lined with plastic and properly covered to prevent leaks, spills or dispersion due to wind erosion;
- Provide copies of all signed solid waste landfill receipts or a certificate of disposal issued by the receiving landfill for these contaminated soils to Ecology, attention of Byung Maeng, by January 31, 2020. This is an important verification step for you and your consultant to follow in order for this Ecology decision to be valid;
- Do not consolidate these contaminated soils with other soils that do not pertain to this contained in determination;
- Notify Ecology before disposal of the soils if the amount exceeds the approved amount in this letter. Ecology needs to make sure that the additional soil qualifies for this contained-in determination;
- Ensure that the transporter is properly trained to handle hazardous waste so that the transporter manages the contained-in determination soils during transport in a manner that is protective of human health and the environment;
- Take measures to prevent unauthorized contact with these soils at all times;
- Provide instructions to the landfill operator that these soils are not to be used for daily, intermediate, or final cover;
- Provide copies of all soil analytical data to the landfill operator, upon request; and

Kevin Deis
November 19, 2019
Page 3

- Do not send these contaminated soils to any incinerator, thermal desorption unit or recycling facility unless that facility is a RCRA Subtitle C permitted dangerous waste TSD facility.

Ecology issued this determination based on the information provided and reviewed to date. Ecology will rescind this approval if the information submitted by the property owner or its environmental consultant does not accurately represent the site conditions or is materially false or misleading, or if the Ecology requirements listed above are not followed.

This written decision only applies to four (4) 55-gallon drums of soils described above, and does not apply to any other area or other media. Any data used for this contained-in determination is intended for use in determining the proper disposal of the soils according to the Washington State Dangerous Waste Regulations (Chapter 173-303 WAC) and the Ecology Contained-in Policy. This letter is not an Ecology approval for dangerous waste designation or disposal of contaminated soils that may be generated or already excavated from other areas in this property. Local agencies may have the authority to impose additional requirements on this waste stream.

This letter is not a No Further Action (NFA) letter and not written approval for any cleanup action plan you may have submitted. Regulatory decisions regarding the cleanup action, applicable soil and groundwater cleanup levels and any other cleanup issues must comply with the requirements under the Ecology Model Toxics Control Act (Chapter 173-340 WAC).

If you fail to comply with the terms of this letter, Ecology may issue an administrative order and/or penalty as provided by the Revised Code of Washington, Sections 70.105.080 and/or .095 (Hazardous Waste Management Act).

If you have any questions concerning this letter, please contact me at (425) 649-7253 or bmae461@ecy.wa.gov.

Sincerely,

Byung Maeng, PE

Seattle, WA 98101

Subject: Discharge Authorization Extension to No. MD -8-2017
Claremont Village Shopping Center
Expires: December 31, 2018

Dear Ms. Xu

Apex Companies is hereby authorized to discharge site related water from your work for Claremont Village Shopping Center. Discharge related to the collection of groundwater samples will be allowed for the project duration. The discharge will be allowed upon the City's receipt of the signed acceptance of this letter and with the proper notification to the City that the work will proceed. There shall be no water sources included in the discharges other than what is authorized.

This authorization is based on the information you provided; we understand that this is sampling of the ground water and will generate minimal amounts of discharge. Discharge will be allowed based on compliance with the conditions of this authorization.

The point of discharge will be within the city's sewer collection system as directed by your city representative.

You will be billed separately for the amount discharged to the city sewers based on the monthly or total flow. As this project will have small amounts of discharge and not on a frequent schedule sewer billings will be either a once a year or quarterly depending on the amounts discharged and will include our current sewer rate (currently \$7.739 per 100 cubic feet) AND the industrial surcharge of \$0.19 per thousand gallons of flow.

This Discharge Authorization is issued with the following conditions:

- 1) You must comply with the general use and discharge requirements of the Industrial Pretreatment Ordinance #3070-08 as amended (attached), as well as any applicable Federal and State regulations.
- 2) The City solely reserves the right to modify, suspend, or terminate this authorization at any time once issued.
- 3) Your City representative and point of contact for discharge is Brian Doolan at 425-257-8828 or bdoolan@everettwa.gov. You need to notify Brian prior to discharge and when your project is completed. You must also report monthly flows to Brian.

- 4) The point of discharge shall be as directed by the City's project representative, and limited to a typical flow of 50 gallons per minute or less.
- 5) Peak flow up to 100 gpm will be allowed, but only by prior notification to the City representative and if the duration is specified and accepted.
- 6) Discharge will enter the city's combined sewer system; the discharge may be limited and not allowed during intense rainfall.
- 7) All flow shall be routed through a system to remove any free floatables and settleable solids, or be free of floatable and settleable solids. Apex Companies will monitor and prevent that there are no floatable and settleable solids in discharge and shall use an onsite storage tank to first pump any dewatering or construction water into, for pre-settlement needs related to high sediment or turbidity prior to discharge to the City's sewers. The City will inspect the tank and volume prior to discharge. Contact Brian Doolan for inspection of the tank. Notify Brian at least two working days prior to your discharge request.
- 8) At any time the City can direct the point of discharge to an alternative location that best suits the City.
- 9) Discharge operations shall comply with the City's Noise Ordinance.
- 10) Apex Companies is solely responsible for spills of any kind related to the discharge operations, including reporting to Department of Ecology, clean-up, and any repairs or restoration, and costs for City to oversee and respond. The City must be notified immediately of any spill.
- 11) City of Everett personnel may take samples of the effluent for analysis and may inspect your site to verify compliance at any time.
- 12) Maximum rate of flow shall not cause capacity problems in the receiving sewer or at any point downstream of the discharge; the City may modify the flow rate at any time.
- 13) The water shall be sampled at least once for the following constituents during the period of discharge. The discharge is subject to these limits:

As	0.5	mg/L
Cd	0.24	"
Cr	5.0	"
Cu	3.0	"
Pb	1.9	"
Hg	0.1	"
Ni	2.83	"
Ag	0.49	"
Zn	4.0	"
CN-	0.65	"
Nonpolar FOG	200	"

Sample results can be submitted either prior or post discharge, but must be submitted to verify discharge limits.

Should lab samples indicate higher than allowed discharge limits, by signing and returning this discharge authorization Apex Companies agrees to pay the over-limits premiums.

All discharge data from the site shall be reported. The total amount of flow to the sanitary sewer shall be reported at the completion of the discharge along with the data required. Please send reports to the following:

Gene Bennett
Industrial Waste Inspector
City of Everett
3200 Cedar Street
Everett, WA 98201
425-257-8240

Brian Doolan
M & O Supervisor
City of Everett
3200 Cedar Street
Everett WA 98201

- 14) The City reserves the right to bill Apex Companies fees for city work beyond our normal site monitoring for sewer related regulatory compliance or for overseeing this discharge authorization.
- 15) Apex Companies shall provide a 24-hour contact number prior to any discharge; Apex Companies agrees to shutdown of the discharge immediately (within 30 minutes) if the City deems it necessary for any reason. Please provide the phone number to the City representative.
- 16) Apex Companies must install a meter to monitor the flow rate of discharge and report the monthly volumes to Brian Doolan. Brian also must inspect and approve the meter installation prior to discharge. Apex Companies will not exceed 50 gallons per minute, unless per Condition No. 5, and must keep a log for the discharge volumes noted. The log and amount of flow must be submitted to Brian Doolan at the end of the project.

Please contact me at 257-8967 (or msadler@everettwa.gov) if you have any questions.

Sincerely,

Mark Sadler, PE
Maintenance Superintendent

Hi Brian,

We have tested one water drum onsite. I attached the lab analytical results to this email for your approval. The results are below the discharge limits listed in the discharge permit. Please let us know if you have any questions. Thanks!

Best,
Jie

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Sample Narrative:

OS: Lowest possible dilution due to sample matrix.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].	¹ Cp
MDL	Method Detection Limit.	² Tc
MDL (dry)	Method Detection Limit.	³ Ss
RDL	Reported Detection Limit.	⁴ Cn
RDL (dry)	Reported Detection Limit.	⁵ Sr
Rec.	Recovery.	⁶ Qc
RPD	Relative Percent Difference.	⁷ GI
SDG	Sample Delivery Group.	⁸ AI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁹ SC
U	Not detected at the Reporting Limit (or MDL where applicable).	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

J	The identification of the analyte is acceptable; the reported value is an estimate.
JO	JO: Calibration verification outside of acceptance limits. Result is estimated.

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

* Accreditation is only applicable to the test methods specified on each scope of accreditation held by ESC Lab Sciences.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].	¹ Cp
MDL	Method Detection Limit.	² Tc
MDL (dry)	Method Detection Limit.	³ Ss
RDL	Reported Detection Limit.	⁴ Cn
RDL (dry)	Reported Detection Limit.	⁵ Sr
Rec.	Recovery.	⁶ Qc
RPD	Relative Percent Difference.	⁷ GI
SDG	Sample Delivery Group.	⁸ AI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁹ SC
U	Not detected at the Reporting Limit (or MDL where applicable).	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits.
J3	The associated batch QC was outside the established quality control range for precision.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
V	The sample concentration is too high to evaluate accurate spike recoveries.

Hey Brian,

You will receive this cooler analyzed for VOCs 10-day TAT tomorrow, can you please revise the sample IDs as following:

"LOC-1 (3)" to "S1 (3)"
"LOC-2 (3)" to "S2 (3)"
"LOC-3 (3)" to "S3 (3)"
"LOC-4 (3)" to "S4 (3)"

Thanks!
Jie

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ Gl
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ Al
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

* Accreditation is only applicable to the test methods specified on each scope of accreditation held by ESC Lab Sciences.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All radiochemical sample results for solids are reported on a dry weight basis with the exception of tritium, carbon-14 and radon, unless wet weight was requested by the client. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
RDL	Reported Detection Limit.	² Tc
Rec.	Recovery.	³ Ss
RPD	Relative Percent Difference.	⁴ Cn
SDG	Sample Delivery Group.	⁵ Sr
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁶ Qc
U	Not detected at the Reporting Limit (or MDL where applicable).	⁷ Gl
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁸ Al
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	⁹ Sc
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.	

ESC Lab Sciences is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

* Not all certifications held by the laboratory are applicable to the results reported in the attached report.

* Accreditation is only applicable to the test methods specified on each scope of accreditation held by ESC Lab Sciences.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
	The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
RDL	Reported Detection Limit.	² Tc
Rec.	Recovery.	³ Ss
RPD	Relative Percent Difference.	⁴ Cn
SDG	Sample Delivery Group.	⁵ Sr
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁶ Qc
U	Not detected at the Reporting Limit (or MDL where applicable).	⁷ Gl
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁸ Al
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	⁹ Sc
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.	

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ SC
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ SC
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
RDL	Reported Detection Limit.	² Tc
Rec.	Recovery.	³ Ss
RPD	Relative Percent Difference.	⁴ Cn
SDG	Sample Delivery Group.	⁵ Sr
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁶ Qc
U	Not detected at the Reporting Limit (or MDL where applicable).	⁷ Gl
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁸ Al
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	⁹ Sc
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ AI
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ SC
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier Description

The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
The remainder of this page intentionally left blank, there are no qualifiers applied to this SDG.	

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.	¹ Cp
ND	Not detected at the Reporting Limit (or MDL where applicable).	² Tc
RDL	Reported Detection Limit.	³ Ss
Rec.	Recovery.	⁴ Cn
RPD	Relative Percent Difference.	⁵ Sr
SDG	Sample Delivery Group.	⁶ Qc
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁷ GI
U	Not detected at the Reporting Limit (or MDL where applicable).	⁸ Al
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	⁹ Sc
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

Hi Brian,

The sample ID "SS-BN-2" should be ""SS-HN-2". Can you please help provide an update report?

Thanks,
Jie

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.

- * Not all certifications held by the laboratory are applicable to the results reported in the attached report.
- * Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

VOLUMETRIC FLOW SIGN CONVENTION :

NEGATIVE HORIZONTAL FLOW => FLOW TOWARDS WELL

POSITIVE HORIZONTAL FLOW => FLOW AWAY FROM WELL

NEGATIVE VERTICAL FLOW => FLOW UPWARDS

POSITIVE VERTICAL FLOW => FLOW DOWNWARDS

MID-DEPTH OF WELL FROM SURFACE = -685.800 cm

RADIUS OF FILTER-SOIL INTERFACE = 5.081 cm

PRESSURE IN WELL = 0.977 atm

VOLUMETRIC FLOW THROUGH WELL = -0.7164E+05 cm³/sec

MASS FLOW THROUGH WELL = -82.401 g/sec

+VE REPRESENTS INJECTION

-VE REPRESENTS WITHDRAWAL

SUMMARY OF UNITS USED IN SIMULATION

LENGTH UNIT SYSTEM : cm

VOLUME UNIT SYSTEM : cm³

TIME UNIT SYSTEM : sec

PRESSURE UNIT SYSTEM : atm

TEMPERATURE UNIT SYSTEM : degC

MASS UNIT SYSTEM : g

PERMEABILITY UNIT SYSTEM : cm²

PROJECT : CLAREMONT SVE

=====

SCOPE : RESULTS OF FULL-SCALE PERMEABILITY TESTS

TEST DATE : 07/30/2018

WELL NUMBER : SVE-1

1. MODEL INPUT SUMMARY

MODEL DOMAIN : THICKNESS = 1219.200 cm
: ESTIMATED PERMEABILITY = 0.100E-06 cm²

: ESTIMATED ANISOTROPY RATIO = 1.00

WELL DEPTH (HANTUSH d) : TOP OF SCREEN = 152.40 cm

WELL DEPTH (HANTUSH l) : BOTTOM OF SCREEN = 1219.20 cm

WELL RADIUS : EFFECTIVE RADIUS = 5.08 cm

AIR FLOW DIRECTION : VAPOR EXTRACTION

2. MODEL OUTPUT SUMMARY

AIR TEMP	SOIL TEMP	ATMOS. PRESS.	SYSTEM PRESS.	FLOW METER	SCALE READING	PREVAIL. FLOW	ACTUAL FLOW
degC	degC	atm	atm	TYPE	--	cm ³ /sec	cm ³ /sec

25.00	15.00	1.000	0.983	NONE	--	--	70014.800
