**RE: CLOSURE REPORT
MJB SOUTH HYDRO FILL AREA
ANACORTES, WASHINGTON
FARALLON PN: 299-002**

Dear Ms. Caldwell:

Farallon Consulting, L.L.C. (Farallon) has prepared this Closure Report on behalf of MJB Properties, L.L.C. (MJB) to summarize the cleanup action completed in April 2013 at the South Hydro Fill Area property owned by MJB adjacent to Fidalgo Bay in Anacortes, Washington (herein referred to as the Property) (Figure 1). The cleanup action was performed in accordance with the letter regarding Soil Management Work Plan, MJB South Hydro Fill Area dated June 20, 2012, prepared by Farallon and approved by the Washington State Department of Ecology (Ecology) (Work Plan).

Previous subsurface investigations conducted by Farallon and others have confirmed the limited release of benzene, tetrachloroethene (PCE), and/or lead in soil at concentrations exceeding the Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A cleanup levels for unrestricted land uses. The releases are related to the presence of fill material placed on the Property during historical dredging activities in Fidalgo Bay and/or historical operations on the Property.

This Closure Report presents the analytical results of confirmation samples collected during cleanup activities to remediate several localized source areas with constituents of concern (COCs) in soil at concentrations the MTCA Method A cleanup levels in accordance with the provisions of Section 430 of Chapter 173-340 of the Washington Administrative Code (WAC 173-340-430). The cleanup activities were conducted during redevelopment of the Property and in compliance with threshold requirements of WAC 173-340-360 to protect human health and the environment, cleanup standards, and applicable state and federal laws. Cleanup activities were conducted in accordance with MTCA as an independent action under the direction of Ecology, and were conducted in a manner that is substantially equivalent to a remedial action conducted by Ecology.

BACKGROUND

The Property comprises approximately 12 acres of land that is undeveloped, with the exception of a boat ramp that was constructed in the central portion of the Property in 2010 (Figure 2). The northern portion of the Property is referred to as the Former Pioneer Mill Area, which historically was operated as a shingle mill. The southern portion of the Property is referred to as the Hydraulic Fill Area, which reportedly was created in 1974 using sediments obtained during the dredging of the navigation channel in Fidalgo Bay. During construction of the boat ramp in 2010, soil containing COCs at concentrations exceeding the regulatory screening level was excavated and disposed of off the Site in accordance with a soil management plan approved by Ecology.

The general Property stratigraphy comprises fill underlain by native clay, which is encountered at depths ranging from 1 to 28 feet below ground surface (bgs) on the west and east portions of the Hydraulic Fill Area, respectively. A shallow groundwater-bearing zone was encountered in the fill horizon at depths ranging from 7.5 to 24 feet bgs on the central and eastern portions of the Hydraulic Fill Area, respectively.

PREVIOUS INVESTIGATION SUMMARY

Multiple subsurface investigations have been conducted at the Property. The laboratory analytical results for soil and groundwater sampling conducted by Farallon and others are summarized in Tables 1 through 11 and on Figures 3 through 9.

A subsurface investigation was conducted in June 1991 by Hart Crowser, Inc. (Hart Crowser), which included advancement and sampling of eight borings (B-1 through B-4 and B-7 through B-10) in the Hydraulic Fill Area (Figure 2). Benzene, PCE, and/or lead were detected at concentrations exceeding MTCA Method A cleanup levels in soil samples collected from borings B-4, B-9, and B-10 (Figures 3 through 5). Analytical results for the soil samples collected from the remaining five borings were reported to be either non-detectable at the laboratory reporting limits or the analytes were present at concentrations below MTCA cleanup levels. No groundwater sampling was conducted during the 1991 investigation.

Based on the results of the 1991 investigation, Ecology identified the potential presence of COPCs, including petroleum products, metals, semi-volatile organic compounds, volatile organic compounds, polychlorinated biphenyls, and dioxins/furans, on the South Hydro Fill Area related to the presence of fill material placed on the South Hydro Fill Area during historical dredging activities in Fidalgo Bay and/or historical operations on the Property.

A subsurface investigation was conducted in 2010 by AMEC to characterize the potential presence of COPCs in soil prior to construction of the boat ramp in the central portion of the South Hydro Fill Area. The 2010 investigation included advancement and sampling of seven test pits. COPCs were present at concentrations exceeding regulatory screening levels in shallow soil in a localized area of the boat ramp. During construction of the boat ramp in 2010, soil containing COPCs at concentrations exceeding the regulatory screening level was excavated and disposed of off the Site in accordance with a soil management plan approved by Ecology.

An additional subsurface investigation was conducted at the South Hydro Fill Area by Farallon in 2011, which included advancement and sampling of 14 borings (B-11 through B-24) and installation of 3 groundwater monitoring wells (MW-1 through MW-3) (Figure 2). The additional investigation was requested by Ecology to address data gaps identified for the South Hydro Fill Area portion of the Site. Lead was detected at a concentration exceeding the MTCA Method A cleanup level for soil in a single soil sample collected from the fill horizon in boring B-24 on the southwest portion of the Hydraulic Fill Area (Figure 5). Follow-up sampling was conducted at previous Hart Crowser boring locations where benzene, PCE, and/or lead had been detected at concentrations exceeding MTCA Method A cleanup levels. Analytical results for this follow-up sampling had been reported as non-detect at the laboratory practical quantitation limit (Figures 3 through 5). Soil samples collected from the remaining borings were reported either non-detect or below the MTCA cleanup levels for the COPCs (Figures 3 through 5).

Arsenic was detected at a concentration exceeding the MTCA Method A cleanup level for groundwater in samples collected from monitoring wells MW-1 through MW-3 installed in 2011 (Figure 8). Lead was detected at a concentration exceeding the MTCA Method A cleanup level in a groundwater sample collected from monitoring well MW-3 installed proximate to the localized area of shallow soil, with concentrations of lead exceeding the MTCA Method A cleanup level in borings B-11 and B-24 (Figure 5). Arsenic was reported non-detect in each of the soil samples tested on the South Hydro Fill Area during the 2011 investigation, with the exception of one sample collected from a boring on the northern portion of the South Hydro Fill Area. These data indicate that the arsenic detected in groundwater is the result of natural background conditions. The remaining COPCs tested for were reported either non-detect or below their respective MTCA cleanup levels.

Based on the results of the subsurface investigations, the COCs identified for the Property include benzene, PCE, and/or lead within the shallow fill horizon at boring locations B-4, B-9, B-10, and B-24 on the Hydraulic Fill Area.

CLEANUP ACTION APRIL 2013

The cleanup action completed at the Site on April 30, 2013 included excavation and off-site disposal of soil from the confirmed source areas in the fill horizon at prior borings B-4, B-9, B-10, and B-24 on the Hydraulic Fill Area where COPCs were present at concentrations exceeding MTCA Method A cleanup levels. Laboratory analytical results are provided in Attachment A.

EXCAVATION AREAS AND CONFIRMATION SOIL SAMPLING

The analytical results of the soil sampling conducted during the subsurface investigations were used to define the expected distribution of the soil that required disposal off the Property (Figures 3 through 5). The excavations were conducted using a trackhoe excavator provided by MJB. Each excavation comprised an area of approximately 5 by 5 feet, and varied in depth depending on previous analytical results for soil samples collected from each boring. Based on previous analytical results and field observations, clean soil excavated at each location was segregated into temporary stockpiles and reused, if possible, as backfill in the completed

excavations. An appropriate clean backfill material selected by MJB was used to backfill the remainder of each excavation as needed.

The approximate excavation areas completed at borings B-4, B-9, B-10, and B-24 are shown on Figure 9. A confirmation soil sample was collected at the final limits of each excavation and analyzed for the specific COPC previously identified in the subsurface investigation to demonstrate that the cleanup level has been attained. The soil samples were collected according to the revised *Property Investigation Work Plan, MJB South Hydro Fill Area, Anacortes, Washington* dated May 2011, prepared by Farallon. One soil sample was collected from the bottom of each excavation when the maximum excavation depth was reached according to previous analytical results or field observations of potential contamination or when contact of the fill/native soil was made. Soil samples were collected directly from the center of the trackhoe excavator bucket and placed into laboratory-prepared containers. The samples were placed on ice in a cooler under standard chain-of-custody protocols and submitted for laboratory analysis on standard laboratory analytical turnaround time.

Excavation B-4

The excavation at boring B-4 was completed to a total depth of 3.5 feet bgs, and approximately 3.25 cubic yards of soil was excavated and disposed of off the Property as contaminated soil. A confirmation soil sample was collected at 3.5 feet bgs. The confirmation soil sample collected from excavation B-4 was submitted for laboratory analysis for benzene by U.S. Environmental Protection Agency (EPA) Method 8021B.

Excavation B-9

The excavation at boring B-9 was completed to a total depth of 21 feet bgs. Soil excavated between 15 to 21 feet bgs, an approximate volume of 6.5 cubic yards, was excavated and disposed of off the Property as contaminated soil. Soil excavated to a depth of 14 feet bgs had no field evidence of potential contamination, and was stockpiled and reused in combination with imported material to backfill the completed excavation. A confirmation soil sample was collected at 21 feet bgs. The soil sample collected from boring B-9 was submitted for laboratory analysis for benzene by EPA Method 8021B and PCE by EPA Method 8260B.

Excavation B-10

The excavation at boring B-10 was completed to a total depth of 12 feet bgs. Soil excavated from 7.5 to 12 feet bgs, an approximate volume of 2.31 cubic yards, was excavated and disposed of off the Property as contaminated soil. Soil excavated to a depth of 7.5 feet bgs had no field evidence of potential contamination, and was stockpiled and reused in combination with imported material to backfill the completed excavation. A confirmation soil sample was collected at 12 feet bgs. The soil sample collected from excavation B-10 was submitted for laboratory analysis for total lead by EPA Method 6000/7000 Series.

Excavation B-24

The excavation at boring B-24 was completed to a total depth of 8 feet bgs. Soil excavated between 1.5 to 8 feet bgs, an approximate volume of 6.0 cubic yards, was stockpiled for disposal off Property as contaminated soil. Soil excavated from the ground surface to 1.5 feet bgs had no field evidence of potential contamination, and was stockpiled and reused in combination with imported material to backfill the completed excavation. A confirmation soil sample was collected at 8 feet bgs. The soil samples collected from excavation B-24 was submitted for laboratory analysis for total lead by EPA Method 6000/7000 Series.

WASTE DISPOSAL

Approximately 26 tons of contaminated soil was excavated and transported off the Property to Republic Services Subtitle D Landfill in Roosevelt, Washington as directed by MJB. The waste disposal documentation from Republic Services is included in Attachment B.

ANALYTICAL RESULTS

The analytical results for the confirmation soil samples collected from excavations B-4, B-9, B-10, and B-24 are presented on Table 11. The four confirmation soil samples were reported non-detect at the laboratory PQL for the COCs tested. A composite soil sample collected from the stockpile for excavations B-10 and B-24 was submitted for laboratory analysis of toxicity characteristic leaching procedure (TCLP) lead for disposal purposes. The TCLP lead sample was reported non-detect at the laboratory PQL.

CONCLUSIONS AND REQUEST FOR NO FURTHER ACTION DETERMINATION

Excavation remediation activities and confirmation soil sampling were completed at prior boring locations B-4, B-9, B-10, and B-24 in accordance with the approved Work Plan. Approximately 18 cubic yards of soil was excavated and transported off the Property to a Subtitle D landfill for disposal as contaminated soil. The analytical results of confirmation soil samples collected at the limit of each excavation confirm that the cleanup levels were attained at the standard point of compliance for soil. The excavation remediation activities were successful in removing identified source areas for COCs on the Property. Based on the results of the cleanup action, MJB requests a Property-Specific No Further Action determination for the upland portion of the South Hydro Fill Area.

MTCA Method A Cleanup Levels for Soil⁶					2,000	2,000	100/30⁷	0.03	7	6	9	

NOTES:

Results in **bold** denote concentrations above applicable cleanup levels.

Results highlighted in yellow denote that sample results exceed applicable Washington State Model Toxics Control Act Cleanup Regulation Method A cleanup levels for Soil.

< denotes analyte not detected at or above the laboratory reporting limit listed.

— denotes sample was not analyzed.

¹Depth in feet below ground surface.

²Soil samples from Borings B-1 through B-10 were analyzed by the Hart Crowser *FAST* Laboratory. Soil samples from Borings B-11 through B-24 were analyzed by OnSite Environmental Inc.

³Soil samples from borings B-11 through B-24 analyzed by Northwest Method NWTPH-DX.

⁴Soil samples from borings B-11 through B-24 analyzed by Northwest Method NWTPH-GX.

⁵Soil samples from borings B-11 through B-24 analyzed by U.S. Environmental Protection Agency Method 8260B.

⁶Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as amended November 2007.

⁷Cleanup level when benzene is present.

DRO = total petroleum hydrocarbons (TPH) as diesel-range organics

Farallon = Farallon Consulting, L.L.C.

ORO = TPH as oil-range organics

GRO = TPH as gasoline-range organics

N = compound identification tentative; concentration estimated

NA = analytical results not available

NOTES:
< denotes analyte not detected at or above the reporting limit listed.

¹Depth in feet below ground surface.

²The analytical laboratory methodology for Excavation and Test Pit samples is unknown. Samples collected from borings B-11 through B-24 were analyzed by U.S. Environmental Protection Agency Method 8270D/SIM.

³Analytical results shown are limited to samples with concentrations detected above the associated laboratory practical quantitation limits.

⁴Total carcinogenic polycyclic aromatic hydrocarbons derived using the total toxicity equivalency method in Section 708(8) of Chapter 173-340 of the Washington Administrative Code.

⁵Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised November 2007.

⁶Washington State Department of Ecology Cleanup Levels and Risk Calculations under MTCA Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway, <https://fortress.wa.gov/ecy/clarc/Reporting/ChemicalQuery.aspx>

⁷Washington State Department of Ecology Cleanup Levels and Risk Calculations under MTCA Standard Method C Formula Values for Soil (Industrial Land Use) - Direct Contact (Ingestion Only) and Leaching Pathway, <https://fortress.wa.gov/ecy/clarc/Reporting/ChemicalQuery.aspx>

cPAHs = carcinogenic polycyclic aromatic hydrocarbons

NA = analytical results not available

TEC = toxic equivalent concentration

NOTES:

Results in **bold** denote concentrations above preliminary screening level.

< denotes analyte not detected at or above the laboratory reporting limit listed.

— denotes sample not analyzed.

¹Depth in feet below ground surface.

²Soil samples from Borings B-1 through B-10 were analyzed by the Hart Crowser FAST Laboratory. The analytical laboratory methodology for the excavation and test pit soil samples is unknown. Soil samples from boring B-11 through B-24 were analyzed by U.S. Environmental Protection Agency Method 6010B/7471A.

³Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as amended November 2007.

⁴Washington State Department of Ecology Cleanup levels and Risk Calculations under MTCA, Standard Method B Formula Values for Soil (Unrestricted Land Use) - Direct Contact (Ingestion Only). Carcinogen values used where established.

⁵Calculated using fixed parameter three-phase partitioning model Washington Administrative Code (WAC) 173-340-747(4).

⁶Concentrations based on simplified ecological terrestrial evaluation in WAC 173-340-7492; concentrations listed in Table 749-2 (unrestricted land use values).

⁷The screening level of some metals is adjusted for regional background concentrations within Skagit/Whatcom Counties or western Washington as reported by the Washington State Department of Ecology (1994a).

Farallon = Farallon Consulting, L.L.C.

NA = analytical results not available

NE = not established

ng/kg = nanograms per kilogram

³Per MTCA (WAC 173-340-708[8][D]), 7 chlorinated dibenzo-p-dioxins (CDDs) and 10 chlorinated dibenzofuran cogeners (CDFs) were tested to enable calculation of a toxicity equivalency quotient (TEQ) concentration of 2,3,7,8-tetrachlorodibenzo-p-dioxin. The reference chemical was 2,3,7,8-tetrachlorodibenzo-p-dioxin because it is the most toxic and best studied of the 210 CDDs and CDFs. Toxicity Equivalent Quotient based on Vanden Berg et al. 2006. *The 2005 World Health Organization Re-evaluation of Human and Mammalian Toxic Equivalency Factors For Dioxins/ and Dioxin-like compounds.*

TEQ = Toxicity Equivalency Quotient

⁴Concentration based on simplified terrestrial ecological evaluation in WAC 173-340-7492 concentrations listed in Table 749-2 (unrestricted land use values).

Re: Analytical Data for Project 299-002
Laboratory Reference No. 1304-222

Dear Riley:

Enclosed are the analytical results and associated quality control data for samples submitted on April 30, 2013.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB" followed by a cursive surname.

David Baumeister
Project Manager

Enclosures

Date of Report: May 7, 2013
Samples Submitted: April 30, 2013
Laboratory Reference: 1304-222
Project: 299-002

Case Narrative

Samples were collected on April 30, 2013 and received by the laboratory on April 30, 2013. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Benzene EPA 8021B and PCE by EPA 8260C Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

TCLP Lead EPA 1311/6010C Analysis

For sample B24/B10 TCLP-Pb, a composite was made from the three jars.

Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
 - B - The analyte indicated was also found in the blank sample.
 - C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
 - E - The value reported exceeds the quantitation range and is an estimate.
 - F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
 - H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
 - I - Compound recovery is outside of the control limits.
 - J - The value reported was below the practical quantitation limit. The value is an estimate.
 - K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
 - L - The RPD is outside of the control limits.
 - M - Hydrocarbons in the gasoline range are impacting the diesel range result.
 - M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
 - N - Hydrocarbons in the lube oil range are impacting the diesel range result.
 - N1 - Hydrocarbons in diesel range are impacting lube oil range results.
 - O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
 - P - The RPD of the detected concentrations between the two columns is greater than 40.
 - Q - Surrogate recovery is outside of the control limits.
 - S - Surrogate recovery data is not available due to the necessary dilution of the sample.
 - T - The sample chromatogram is not similar to a typical _____.
 - U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
 - U1 - The practical quantitation limit is elevated due to interferences present in the sample.
 - V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
 - W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
 - X - Sample extract treated with a mercury cleanup procedure.
 - X1 - Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.
 - Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
 - Z -
- ND - Not Detected at PQL
 PQL - Practical Quantitation Limit
 RPD - Relative Percent Difference
