Appendix C – Differential Pressure Data

Appendix D – Analytical Data and Validation Reports

1.0 INTRODUCTION

Dalton, Olmsted, and Fuglevand, Inc. (DOF), has prepared this Data Gaps Data Report (Report) for the Taylor Way and Alexander Avenue Fill Area (TWAAFA) Site (Site)on behalf of Glenn Springs Holdings, Inc. (Occidental Chemical), General Metals of Tacoma (GMT), and Clean Earth Inc. (Clean Earth) formerly known as Stericycle Environmental Solutions, Inc. and Burlington Environmental (Burlington). These parties (collectively the "AO Parties") are performing activities at the TWAAFA Site under Agreed Order Number (AO) DE 14260 (effective December 4, 2020) with the Washington State Department of Ecology (Ecology). The Port of Tacoma (Port) is also a PLP to the TWAAFA Site, identified in the Enforcement Order Number DE 19410 (issued December 4, 2020) by Ecology.

The PLPs prepared this Report to summarize the data gaps investigation work completed at the TWAAFA Site in accordance with the AO and EO. Figure 1 shows the general vicinity of the TWAAFA Site and Figure 2 shows the location of the property parcels that comprise the TWAAFA Site.

1.1 Purpose

The purpose of this report is to summarize results of recent field investigations performed at the TWAAFA Site originally proposed to fill in data gaps identified in the Final Data Gaps Work Plan (Work Plan) (DOF, 2020) consistent with the deliverable referred to as the "Soil and Groundwater Data Report" identified in the Work Plan and the AO. The Soil and Groundwater Data Report was retitled to the Data Gaps Data Report because it also includes results of soil vapor sampling conducted under the Work Plan and in response to Ecology comments on initial TWAAFA data gaps reporting deliverables.

The investigations proposed in the Work Plan included sampling and analysis of soil, groundwater, and soil vapor planned to address either informational data gaps or contaminant confirmational data gaps to better understand the nature and extent of contamination at the TWAAFA Site. Table 1 summarizes the data gaps investigation tasks and the remaining tasks to be addressed at the TWAAFA Site prior to preparation and submission of a Remedial Investigation/Feasibility Study Report (RI/FS), as identified in the Work Plan and required under the AO. The status of each task is included, identifying remaining work to be completed prior to the RI/FS.

1.2 Background

Initial data gaps work performed at the TWAAFA Site was documented in 2021 and 2022 and provided to Ecology as part of:

- March 2021 – *Aboveground Site Conditions Memorandum* (DOF, 2021a);
- September 2021 – *TWAAFA Existing Groundwater Monitoring Network Evaluation and Recommendations Addendum* (DOF, 2021b);
- December 2021 – *Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations* (DOF, 2021c);
- April 2022 – *Revised Groundwater Monitoring Plan* (DOF,2022a);
- May 2022 – *First Quarter 2022 Groundwater Data Analysis Report* (DOF, 2022b); and
- August 2022 – *Second Quarter 2022 Groundwater Data Analysis Report* (DOF, 2022c).

This Report documents the results of the following required data gaps tasks:

- Soil sampling on Burlington Former Parcel A, 1205 Alexander Avenue, and 1300 Taylor Way.
- Shallow groundwater sampling at temporary borings on 1205 Alexander Avenue and 1300 Taylor Way.
- Additional characterization of the deep aquifer at greater depths than historically sampled.
- Abandonment of three wells on 1205 Alexander Avenue, and 1300 Taylor Way.
- Assessment of potential for vapor intrusion at concentrations of concern using groundwater data collected as part of data gaps efforts.
- Assessment of potential for vapor intrusion under existing conditions.

The remaining data gaps to address under the Work Plan include:

- Four quarters of groundwater elevation measurements, mapping, and sampling (currently in progress during calendar year 2022). This includes split sampling to further assess organic material bias in diesel range organics sample analyses that may be occurring at the TWAAFA Site.
- Preparation of a TWAAFA Site Indoor Air Assessment Protocol to be used at the TWAAFA Site as future Site development is planned and completed.

2.0 SUMMARY OF FIELD ACTIVITIES

This section summarizes the details of the field activities noted in Section 1. The field investigations were completed from 2020 through 2022 by DOF on behalf of the AO parties and by several other consultants working on behalf of the Port of Tacoma as described in the following sections.

2.1 Soil Sampling

Borings were completed and soil samples were collected to identify subsurface conditions and define the nature and extent of contamination in select areas of the TWAAFA Site. Soil samples collected are summarized in Tables 2 and 3.

2.1.1 1205 Alexander Avenue and 1300 Taylor Way

CRETE Consulting, Inc. (CRETE) completed an investigation of the two properties located at 1205 Alexander Avenue and 1300 Taylor Way (also known as the “Hylebos Marsh Properties”) between September and December 2019. The scope of investigations was documented in a report submitted to Ecology in March 2020 on behalf of the Port of Tacoma (CRETE, 2020) and consistent with that presented in the Work Plan (DOF, 2020). The scope of work included completion of four direct push borings to investigate the presence and type of fill materials generally in the western area of the TWAAFA Site (Soil Borings TWA-SB1 though TWA-SB4 shown on Figure 3).

Borings were visually logged continuously and completed through the fill or to the water table (whichever was deeper), with field screening via a photoionization detector for volatile organic compounds (VOCs). Soil samples were collected one to two feet above the water table and analyzed for: VOCs, northwest total petroleum hydrocarbon diesel and lube oil (NWTPH-Dx), NWTPH- gasoline (NWTPH-Gx), semi-volatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals

(arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, and manganese). An additional sample was collected from a layer of wood debris observed in SB-3 and analyzed for the same parameters (CRETE, 2020).

A copy of the CRETE report is included in Appendix A. Boring logs are included in Appendix B.

2.1.2 Burlington Parcel A

On Burlington Parcel A, DOF completed a direct push boring (TWA-SB5 shown on Figure 3) in September 2021 in the area of a historical sample that showed VOC contamination in soil. This boring was logged to the top of the silt layer at 14-feet below ground surface (bgs) to investigate the presence and type of fill materials in this area of the TWAAFA Site and determine residual VOC soil concentrations. The soil sample from this boring was collected from approximately 4 to 5-feet in depth and analyzed for VOCs, NWTPH-Dx, NWTPH-Gx, SVOCs, PCBs, and total metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, and manganese). A soil vapor sampling point was installed at this location as described further in Section 2.4.2.

2.1.3 CleanCare Parcel (Deep Aquifer Characterization)

On the CleanCare parcel, a soil sample was collected and analyzed at boring TWA-9D (shown on Figure 3) where multi-depth deeper groundwater sampling was conducted in October 2021. Soil samples were collected from fine-grained units identified at depth (only occurred at TWA-9D) for possible VOC and PCB analysis, pending review of results of shallower groundwater sample VOC results. If VOCs were not detected in groundwater above screening levels, the soil samples were not analyzed. Based on these criteria, the sample from TWA-9D at 43-feet bgs was analyzed for PCBs only.

2.2 Groundwater Multi-Depth Sampling

Multi-depth groundwater sampling was conducted at the Site to evaluate concentrations at various depths and aid in determining screen intervals for new groundwater monitoring wells, in cooperation with Ecology.

Shallow groundwater samples were collected by the Port's consultant, CRETE in September 2019, at the water table at locations TWA-SB1, TWA-SB2, TWA-SB3, and TWA-SB4 on the 1205 Alexander Ave and 1300 Taylor Way parcels owned by the Port (shown on Figure 4). Drilling was conducted via direct push drilling methods and sampling followed the methods outlined in the Work Plan based on review of CRETE's Soil and Groundwater Data Report (CRETE, 2020). Groundwater samples were analyzed for VOCs, NWTPH-Dx, NWTPH-Gx, SVOCs, PCBs, and total metals.

Multi-depth deeper groundwater sampling was conducted at seven locations TWA-4D, TWA-5D, TWA-6D, TWA-7D, TWA-8D, TWA-9D, and TWA-10D (shown on Figure 4). The two locations (TWA-5D and TWA-6D) located on the 1205 Alexander Ave and 1300 Taylor Way parcels owned by the Port were conducted by the Port's consultant, CRETE in September 2019. Drilling was conducted via sonic drilling methods and sampling followed the methods outlined in the Work Plan based on review of CRETE's report (CRETE, 2020). The one location (TWA-10D) located on the 1514 Taylor Way parcel owned by the Port was conducted by the Port's consultant, Maul Foster Alongi (MFA) in December 2021. Drilling was conducted via sonic drilling methods and sampling followed the methods outlined in the Work Plan based on review of MFA's field records. The remaining four locations on the Burlington and former CleanCare parcels were conducted by DOF, following the methods outlined in the Work Plan.

Lithology at each boring was logged continuously. Boring logs are included in Appendix B. Silt layers greater than two feet thick, where encountered, were sealed off using conductor casing methods prior to drilling through and sampling deeper zones, as shown in the boring logs. A shallow silt layer was encountered at all borings. A deeper silt unit was only encountered at TWA-9D and TWA-10D from approximately 35 to 45-feet bgs.

Groundwater samples were collected approximately every ten feet and analyzed for VOCs, NWTPH-Dx, NWTPH-Gx, SVOCs, PCBs, and total metals. The shallowest zone at TWA-4D (40 to 42-feet bgs) did not sufficiently produce water for the full analyte suite and therefore only VOCs, NWTPH-Gx, and total metals were analyzed because they require lower sample volumes. The individual sample collection depths are summarized in Table 4 for each location.

2.3 Well Installation and Abandonment

Figure 5 shows the location of the newly installed groundwater monitoring wells installed at the TWAAFA Site from 2019 through 2022. The following subsections describe well installation activities completed at the TWAAFA Site. A revised Groundwater Monitoring Plan (Monitoring Plan), which included construction detail and updated survey information for wells within the TWAAFA Site groundwater monitoring network was submitted to Ecology in April 2022 (DOF, 2022a). The Monitoring Plan contains the standard operating procedures for well installation, well abandonment, low-flow sampling, and water level measurements. Appendix C of the monitoring plan also contains well construction logs for the wells included in the overall groundwater sampling program for the TWAAFA Site.

2.3.1 Well Abandonment

Existing groundwater monitoring wells SB-1, SB-3, and SB-4 on the 1205 Alexander Ave and 1300 Taylor Way property parcels were abandoned by the Port's consultant, CRETE, in November 2019 because they were screened in the silt layer. Well SB-1 was abandoned by overdrilling, removing the well casing and materials, and grouted to the surface. Wells SB-3 and SB-4 were abandoned by filling the well casing with bentonite chips and hydrating the chips. This work is summarized in CRETE's report (CRETE, 2020).

2.3.2 Shallow Well Installation

DOF installed shallow groundwater replacement wells CTMW-11R2 and CTMW-23R in October 2021. These wells were installed above the silt layer, using hollow-stem auger drilling methods, and replaced wells CTMW-11 and CTMW-23 that were abandoned due to nearby construction projects conducted at the Burlington facility.

The Port's consultant, MFA, installed shallow wells TWA-1, TWA-2, and TWA-3 in December 2021 using hollow-stem augers to depths of 10 to 15-feet bgs. A distinct silt layer was encountered in the TWA-2 and TWA-3 borings at an approximate depth of 10-feet; no similar silt layer was encountered in the TWA-1 boring up to a depth of 15-feet.

2.3.3 Deep Well Installation

Deeper groundwater monitoring wells were installed at the TWAAFA Site as part of completion of the multi-depth groundwater sampling investigation described in Section 2.2 using sonic drilling methods. Wells were installed at locations TWA-4D, TWA-5D, TWA-6D, TWA-7D, TWA-8D, TWA-9D, and TWA-10D.

The depths of each well screen were determined in cooperation with Ecology during implementation of the fieldwork based on field observations and expedited sampling results.

2.4 Vapor Sampling

Soil vapor sampling was conducted at the TWAAFA Site between August 2021 and July 2022 in accordance with several documents:

- *Soil Vapor Sampling and Analysis Plan, Appendix M of the Work Plan (DOF, 2020)* – This plan described the scope and methods approved for implementation on the former CleanCare and Burlington Parcel A parcels of the Site.
- *Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (DOF, 2021c)* – This plan described the scope and methods approved for implementation on other areas of the TWAAFA Site.

The Port's consultant, MFA, conducted sampling on the former Potter Property parcel; all other sampling was conducted by DOF.

Within buildings, VaporPins® were installed through the foundations. The sample locations were preferentially placed near sumps due to the potential for preferential vapor pathways. VaporPins® consist of a single piece of metal, installed by hand tools, and use a silicon sleeve that forms an air-tight seal between the VaporPins® and the side of the borehole.

Outside building footprints, vapor sampling points were installed using direct-push techniques to drill to 4-feet in depth. The original work plan included installation to 5-feet in depth, but shallow groundwater did not allow for installation to 5-feet bgs. The soil vapor sampling point was then constructed using a 6-inch stainless-steel screen, connected to Teflon tubing that was installed up to the surface to allow for sampling. Filter pack sand was placed from approximately 3 inches below to 3 inches above the stainless-steel screen for a total of 1 foot of sand pack. Hydrated bentonite chips were placed above the sand pack interval to seal the soil vapor sampling point up to the surface. Each soil vapor sampling point was completed with a flush-mount well monument.

The sampling locations were installed at least one day prior to sampling to allow the bentonite chips to become fully hydrated. A GPS unit was used to record the soil vapor sample locations outside the building. Soil vapor sample locations within buildings were measured manually.

Just before either sub-slab vapor or soil vapor point samples were collected, a shroud was placed over the sampling point and a single-use laboratory provided soil gas manifold was connected to the vapor sampling location. An evacuated 1L Summa® canister and the purge line was then connected to a peristaltic pump. Helium gas was applied under the shroud as a leak detection indicator. A helium detector instrument was used to monitor the purge line for helium.

All soil vapor samples were submitted to the laboratory for analysis for the VOCs and Air-Phase Hydrocarbons (APH) as listed in Table 1 of Appendix M of the Work Plan (DOF, 2020). Figure 6 shows the location of the soil vapor samples. Location specific information is described in the following sections.

2.4.1 Former CleanCare Property

DOF collected 11 soil vapor samples from within the footprint of the existing buildings on the CleanCare property buildings between August 31 and September 1, 2021. The soil vapor samples were collected at these locations using sub-slab soil vapor sampling using VaporPins® as described in Section 2.4. Fifteen soil vapor samples were collected using temporary soil vapor sampling points. Methane, oxygen, and carbon dioxide were analyzed in the field using a Landtec GEM 2000 Landfill Gas Monitor during sampling in addition to analytical laboratory testing.

2.4.2 Burlington Parcel A

DOF collected one soil vapor sample on September 1, 2021 from a soil vapor sampling point (TWA-SV-27) documented in the Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (DOF, 2021c). Methane was analyzed in the field during sampling in addition to analytical laboratory testing; the methane concentration did not exceed the 5%.

2.4.3 Burlington Lab Pack Building

DOF collected sub-slab vapor samples on March 1, 2022 from the five specified sub-slab monitoring points installed as part of the Vapor Mitigation System (VMS) present in this building, as described in the Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (DOF, 2021c). Differential pressure was continuously measured between February 23 and March 4, 2022. Differential pressure data is provided in Appendix C and shows the intermittent operation of the VMS during facility work hours. When the system was operating, negative pressures varied to approximately negative 250 pascals (Pa) to negative 550 Pa, as expected. When the system was not operating, the pressure was approximately zero pascals. Methane, oxygen, and carbon dioxide were analyzed in the field during sampling in addition to analytical laboratory testing.

2.4.4 Burlington Stabilization Building

DOF installed four sub-slab VaporPin sampling locations in February 2022 within the footprint of the Stabilization Building as described in the Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (DOF, 2021c). The building includes a direct route for sub-slab vapors to vent to ambient air. Operation of the building includes a 20,000 cubic feet per minute (CFM) blower designed to properly ventilate and collect airborne dust during the mixing process performed inside and passive ventilation is sized such that a vacuum is not induced within the building (DOF, 2021). Ecology no longer recommends use of models as the primary method to screen out vapor intrusion potential, and therefore, site-specific data were collected for the assessment of vapor intrusion potential at the building.

The original plan called for installation of five VaporPin locations, but the proposed location near the center of the building, adjacent to the sump, could not be installed. Concrete adjacent to the sump was more than three feet thick and could not be penetrated with a 36-inch roto-hammer drill bit. The location was repaired following the attempted installation of the VaporPin. Differential pressures were collected from location TWA-SV-30 between February 23 and March 4, 2022 during different operational scenarios to imitate the highest vapor intrusion potential (blower actively operating) in the building under standard building operation. Measured differential pressures are summarized in Appendix C. Measurements across the concrete slab foundation ranged between negative 9.46 Pa and

positive 13.2 Pa for a total fluctuation of 22.7 Pa and do not indicate a significant vapor intrusion potential; therefore, soil vapor samples were not collected.

2.4.5 Burlington Transportation Office and Shop Building

DOF installed one sub-slab sampling point within the footprint of the Transportation Building in February 2022 and two soil vapor sampling points outside the building in April 2022. The Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (DOF, 2021c) originally called for five sampling points inside the building footprint but was revised in coordination with Ecology due to underground utility line obstructions.

The differential pressure measured below the Transportation Building varied over approximately a positive 5 Pa in a single spike, but ranged around positive 2 Pa over a two-day period as shown in Appendix C. These pressure fluctuations represent a generally neutral cross slab vapor pressure.

Due to encountering shallow groundwater conditions in the vicinity of the sampling points, sampling was not performed until July 2022. Methane, oxygen, and carbon dioxide were analyzed in the field during sampling in addition to analytical laboratory testing.

2.4.6 Port of Tacoma Former Potter Property

The Port's consultant, MFA, conducted soil vapor sampling on the Former Potter Property in July 2022, as described in the Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (DOF, 2021c). The soil vapor samples were collected at nine locations using sub-slab soil vapor sampling points installed through the concrete floor slab. The sub-slab vapor samples were collected and analyzed as described in Section 2.4. Differential vapor pressure was measured over an eight-day period. The differential pressure was logged and recorded at TWA-SV-37, and Appendix C shows the DP trends for SV-37. This shows the differential pressures over this eight-day period were slightly negative and only varied by 1 to 2 Pa, as show in Appendix C.

3.0 QUALITY ASSURANCE AND QUALITY CONTROL

Quality controls samples were collected as part of soil, groundwater, and soil vapor data collection at the TWAAFA Site, along with other quality control procedures implemented in executing the data gaps data collection under the Work Plan. Data were validated for each event and data validation memorandum are provided along with laboratory data packages in Appendix D. Validated data have been entered into Ecology's EIM database for the work described in this Report.

The most consistently reported issue noted during data validation of groundwater samples was flagging of diesel- and motor oil-range petroleum hydrocarbons because the sample chromatographic pattern did not resemble the fuel standard used for quantitation. This was reported during validation for the first and second quarter 2022 groundwater sampling events conducted thus far under the Work Plan. TPH samples have been analyzed with and without silica gel throughout the data gaps investigation. DOF discussed results to date with Ecology and plans to collect Extractable Petroleum Hydrocarbons (EPH)/Volatile Petroleum Hydrocarbons (VPH) data during the remaining groundwater monitoring events to aid in evaluating this issue during the RI/FS.

In addition, several groundwater analytical results were rejected based on review during data validation as follows:

- Several individual SVOC results were rejected due to low laboratory control spike recoveries or low surrogate recoveries in some groundwater samples. These data (generally non-detect values) were qualified R as rejected for use.
- One result for PCBs in groundwater was rejected due to low surrogate recoveries (TWA-10-20-25-1210).

DOF communicated with the lab regarding deficiencies when identified to seek review and corrections prior to groundwater sampling events. However, the majority of analytical data were determined to be of good quality and usable.

4.0 RESULTS

This section presents the results of data gaps activities discussed in Section 2.

4.1 Physical Conditions

The completion of additional borings across the Site as part of the data gaps investigation allowed for review of fill area maps and lithologic information presented in the Work Plan (DOF, 2020) that relied on historical information. Generally, fill areas presented in the Work Plan did not change and the various fills were encountered where expected at the Site and presented in the Work Plan. New borings confirmed shallow geologic information presented in the Work Plan and revealed alternating sandy and silty layers to depths of 60-feet bgs across the Site. The additional deeper borings confirmed a deeper silt layer (generally below 35-feet bgs) is present in some areas, but did not appear continuous across the Site.

4.1 Soil Sampling

Soil samples were collected to refine the understanding of the nature and extent of contamination in various areas of the Site as described in Section 2.1. This section summarizes the soil analytical results from sampling between 2019 and 2021 conducted under the Work Plan (DOF, 2020). Sample results previously reported to Ecology are presented in Table 3 (from the CRETE report (CRETE, 2020)). A copy of the full CRETE report, including laboratory results, can be found in Appendix A. Other results are presented in Table 2 and laboratory results are included in Appendix D. Results are compared to screening levels similarly used for historical data screening in the Work Plan (DOF, 2020). Soil sample locations are shown on Figure 3.

4.1.1 Volatile Organic Compounds

VOC concentrations reported in soil samples were below screening levels except for TWA-SB5, where the benzene result (0.33 mg/kg), slightly exceeded the screening level of 0.0274 mg/kg.

4.1.2 Total Petroleum Hydrocarbons (TPH)

TPH-Gasoline (TPH-Gx) was detected in soil at an estimated concentration of 1,600 mg/kg in a sample from TWA-SB5 above the screening level (500 mg/kg). TPH-Diesel (TPH-Dx) and TPH-Motor Oil (TPH-O) in this sample were detected at a total concentration of 1,700 and 2,300 mg/kg, respectively. The TPH-O

concentration was above the screening level for motor oil hydrocarbon range. All other sample results were below screening levels.

4.1.3 Semi-volatile Organic Compounds

Several SVOCs were detected in soil at concentrations less than 80 mg/kg but no SVOCs were detected above their respective screening levels in any of the soil samples collected.

4.1.4 Polychlorinated Biphenyls

PCBs were not detected above the screening level of 1 mg/kg in any soil samples collected.

4.1.5 Inorganics

None of the soil samples collected exceeded screening levels specified in the Work Plan, except for arsenic, which was detected at a concentration of 7.83 mg/kg in a sample of "wood waste" collected at 9 to 10-feet bgs at location TWA-SB3, slightly above the screening level of 7.3 mg/kg.

4.2 Groundwater Sampling

Shallow groundwater samples were collected from several temporary borings (TWA-SB1 through TWA-SB4) on the 1205 Alexander Ave and 1300 Taylor Way parcels from the water table in 2019. Deeper groundwater samples were collected from multiple depths at boring locations TWA-4D through TWA-10D across the Site to evaluate concentrations vertically and aid in selection of screen intervals for new wells.

Groundwater sample results previously reported to Ecology are presented in Table 5 (from the CRETE report (CRETE, 2020)). A copy of the full CRETE report, including laboratory results, can be found in Appendix A. Other results are presented in Table 4 and laboratory results are included in Appendix D. Results are compared to screening levels presented in the Work Plan (DOF, 2020).Groundwater sample locations are shown on Figure 4.

4.2.1 Volatile Organic Compounds

VOCs (including acetone, methylene chloride, bromodichloromethane, chloroform, and toluene) were reported at low concentrations in samples from TWA-SB1, TWA-8D, TWA-9D, and TWA-10D. VOCs did not exceed the screening level in any of the groundwater samples collected.

4.2.2 Total Petroleum Hydrocarbons

TPH were measured as TPH-Dx, and TPH-O (aka TPH-Lube Oil). TPH-D and TPH-O were reported above their respective screening levels of 500 ug/L each, but these results were also flagged as not matching the hydrocarbon standard used to quantify those samples.

Aliquots of these same samples were treated using silica-gel methods to remove biogenic hydrocarbons and analyzed for the same TPH hydrocarbon ranges. The results of samples using silica-gel were nearly all below reporting limits and all of the results were below their respective screening levels.

4.2.3 Semi-volatile Organic Compounds

SVOCs were sporadically detected above the reporting limit in some groundwater samples including grab samples from TWA-SB2, TWA-SB3, TWA-SB4, TWA-4D, TWA-5D, TWA-7D, and TWA-10D. None of the groundwater samples were reported above their respective screening levels.

4.2.4 Polychlorinated Biphenyls

PCBs were only detected in groundwater from TWA-8D, specifically Aroclor 1260 at a concentration of 0.019 µg/L, exceeding the screening level of 0.00607 µg/L.

4.2.5 Inorganics

Total metals were reported in groundwater above their respective screening levels including arsenic, chromium, copper, lead, manganese, mercury, nickel, and zinc at locations sampled both in shallow and deeper groundwater. Dissolved metals were also analyzed for some samples where turbidity was elevated during sampling. Results indicated metals concentrations were variable across the Site and with groundwater depth.

4.3 Vapor Sampling

Soil vapor data collected between 2021 and 2022 are tabulated and compared to the Ecology sub-slab soil vapor screening levels provided in Table 1 of the Work Plan (DOF, 2020). Results are summarized in Tables 6, 7, and 8. In addition, recent groundwater data collected as part of the data gaps efforts was compared to groundwater screening values provided in Ecology's Cleanup Levels and Risk Calculation (CLARC) tables (Ecology, 2022) to assess the potential for vapor intrusion as identified in the Work Plan (DOF, 2020). These results are presented in Tables 9 and 10. Soil vapor sample locations are shown on Figure 6.

4.3.1 Former CleanCare Property

Chlorinated VOCs were detected in soil vapor samples above Ecology's Models Toxic Control Act (MTCA) Method C screening levels at TWA-SV-2 and SV-3, TWA-SV-10 through TWA-SV-12, and TWA-SV-19, TWA-SV-24, and TWA-SV-25. Similarly, benzene, toluene, ethylbenzene, and xylenes (BTEX) compounds and naphthalene were detected in soil vapor samples above screening levels collected from TWA-SV-1 through TWA-SV- 4, TWA-SV-11 through TWA-SV-14, TWA-SV-22, and TWA-SV-25.

The highest chlorinated VOC concentrations in soil vapor were reported at TWA-SV-10 with tetrachloroethene detected at 760,000 micrograms per cubic meter (µg/m^3). The highest BTEX concentrations were reported at TWA-SV-25 with benzene detected at 45,000 µg/m^3 and toluene detected at 120,000 µg/m^3.

Air-Phase hydrocarbons (APHs) were detected in multiple soil vapor samples with concentrations as high as 7,300,00 µg/m^3 (TWA-SV-25). Multiple samples exceeded the MTCA Method B sub-slab cleaning level and generally coincided with locations where VOCs were also elevated.

The highest concentration soil vapor samples were typically collected at soil vapor points rather than from sub-slab VaporPins™ installed in building slabs.

4.3.2 Burlington Parcel A

Benzene was the only VOC detected (5,400 µg/m^3) above the MTCA Method C screening level (110 µg/m^3) in the soil vapor sample collected on Parcel A (TWA-SV-27). APHs were reported above the Method C screening level (1,500 µg/m^3) as high as 1,2000,000 µg/m^3 in the same sample. There is no building currently located in this area of the Site.

4.3.3 Burlington Lab Pack Building

No constituents were detected in soil vapor samples above screening levels at the five locations sampled beneath the Lab Pack Building.

4.3.4 Burlington Transportation Office and Shop Building

APHs were reported above the Method B screening level at 2,000 µg/m^3 (TWA-SV-33). No other constituents were detected in soil vapor samples above screening levels at the three locations sampled beneath and adjacent to the Transportation Office and Shop Building.

4.3.5 Port of Tacoma Former Potter Property

Chlorinated VOCs (chloroform, tetrachloroethene, and trichloroethene) were sporadically detected in soil vapor samples collected from TWA-SV-36, TWA-SV-41, and TWA-SV-43 at the former Potter Property. The highest soil vapor concentrations of tetrachloroethene and trichloroethene (8,200 µg/m^3 and 100 µg/m^3, respectively) were collected from the sub-slab location TWA-SV-41 in the Shop Building. Although above the screening level, these chlorinated VOC concentrations were lower than those detected at some locations on the former CleanCare property.

APHs were detected above their respective screening levels in sub-slab soil vapor samples collected at TWA-SV-35, TWA-SV-36, TWA-SV-41, and TWA-SV-43.

4.3.6 Recent Groundwater Results

The results of recent shallow groundwater sampling from the first and second quarter 2022 are summarized in Tables 9 and 10, respectively. VOCs were detected above the MTCA Method C groundwater screening levels protective of vapor intrusion in samples collected from only three wells, all on the former CleanCare parcel:

- CCW-1A (trichloroethene),
- CCW-2A/2B (1,4-dichlorobenzene, benzene, chlorobenzene, tetrachloroethene, trichloroethene, and vinyl chloride), and
- CCW-5B (benzene).

Additional screening will be performed using the third and fourth quarter 2022 groundwater sampling results.

5.0 CONCLUSIONS AND NEXT STEPS

As discussed in Section 1, this Report summarizes results of several of the data gaps investigation tasks required in preparation for completion of the RI/FS for the TWAAFA Site. The remaining tasks to be completed under the Work Plan include:

- Reporting of the third quarter 2022 groundwater monitoring event. Sampling occurred in August 2022. This report will be submitted to Ecology in November 2022.
- Completion and reporting of the fourth quarter 2022 groundwater monitoring event. Sampling is anticipated to be completed in early December with results reported to Ecology during the first quarter of 2023.

- Preparation of a TWAAFA Site Indoor Air Assessment Protocol to be used at the Site as future Site development is planned and completed. This protocol is expected to be completed in cooperation with Ecology based on results of the vapor investigations documented in this Report and the remaining screening of third and fourth quarter groundwater sampling results.

The data collected under the Work Plan are intended to satisfy data gaps and facilitate completion of the RI/FS, as identified in the Work Plan and AO. DOF recently received comments from Ecology on the first and second quarter 2022 groundwater monitoring reports which will be addressed in cooperation with Ecology ahead of preparing the RI/FS.

TABLES

TABLE 1
DATA GAPS STATUS SUMMARY
Taylor Way and Alexander Avenue Fill Area Site
Tacoma, Washington

Data Gaps Task	Scope	Notes	Task Completed?	Reporting
Informational Data Gaps				
Aboveground Site Conditions Documentation				
Mapping of aboveground structures	Mapping of above ground structures, paved areas, unpaved areas of infiltration, stormwater flow patterns and control features, and general topography.	Reporting completed in March and December 2021	Yes	March 2021 Aboveground Site Conditions memorandum and December 2021 Soil Vapor Intrusion Status and Recommendations memorandum
Current Well Usability				
Field evaluation of wells	Field evaluation of existing wells on the TWAAFA Site to determine which wells remain in good condition, which remain but require rehabilitation, and which should be recommended for abandonment (or have already been abandoned).	Reporting completed September 2021	Yes	September 2021 Existing Groundwater Monitoring Network Evaluation and Recommendations Memo
Current Groundwater Flow Patterns - Addition of several new wells and incorporation of wells across the full TWAAFA Site to facilitate review of new patterns and/or confirm previous groundwater flow assumptions for the site.				
Groundwater elevation measurement and mapping	Groundwater elevations measurement and mapping as part of future groundwater monitoring events and related data reporting. New and replacement shallow and deep wells will be installed at the TWAAFA Site (as shown in Figures 50 and 51) and a broader network of wells measured than historically conducted.	New wells added and 3 of 4 groundater elevation measurement events completed to date.	No	2022 quarterly groundwater data analysis reports
EIM update	Available sampling data collected after August 1, 2005 from the TWAAFA Site will be uploaded into Ecology's EIM database.	Completed; recent data updated quarterly.	Yes	EIM
Contaminant Characterization Data Gaps				
1205 Alexander Avenue and 1300 Taylor Way Characterization - Historical documents indicated several reported fill and waste disposal areas on this property, in addition to various fill materials thought to be present on at several locations near the parcel boundary between the Port and Burlington parcels.				
Investigation of presence and type of fill materials in this area.	Completion of 4 direct push borings. Borings visually logged continuously and completed through the fill or to the water table (whichever is deeper), with field screening via a photoionization detector for VOCs. Soil and groundwater samples collected for laboratory analyses.	Completed September 2019	Yes	Port submitted Crete reports in 2020 and data included in this Data Report
Deep aquifer groundwater sampling and elevation measurement.	Completion of 2 deep aquifer borings for groundwater sampling and subsequent well installation near locations SB-1 and SB-4 to improve the coverage of deep aquifer groundwater elevation data.	Completed September 2019	Yes	Port submitted Crete reports in 2020 and data included in this Data Report
Abandonment of wells that may be screened in the silt layer.	Abandonment of wells SB-1, SB-3, and SB-4.	Completed November 2019	Yes	Port submitted Crete reports in 2020 and data included in this Data Report
Burlington Former Parcel A Assessment - VOCs were detected in some of the soil samples collected as part of area closure, including PCE and TCE, but no recent sampling had been conducted to confirm if VOC-contaminated soils remain in this area.				
Investigation of presence and type of fill materials in this area and current residual VOC soil concentrations.	Completion of 1 direct push or hand auger sample in the area of the former sample SEA-14 (approximately 4.7 feet bgs) logged to the top of the silt layer.	Completed Septmeber 2021	Yes	2022 Data Gaps Data Report

TABLE 1
DATA GAPS STATUS SUMMARY
Taylor Way and Alexander Avenue Fill Area Site
Tacoma, Washington

Data Gaps Task	Scope	Notes	Task Completed?	Reporting
Monitoring Well Network - Addition of wells will support developing a current assessment of groundwater concentrations and flow patterns across the full TWAAFA Site.				
Investigation/confirmation of COC concentrations in groundwater downgradient of the CleanCare property on the 1514 Taylor Way property .	Installation of 3 new shallow wells along the northern edge of the 1514 Taylor Way property. Replacement of a subset of monitoring wells on the western side of the 1514 Taylor Way property.	Completed December 2021	Yes	September 2021 Groundwater Monitoring Network Revision Summary memo and the April 2022 Revised Groundwater Monitoring Plan
Additional characterization of the deep aquifer at greater depths.	Completion of 5 deep aquifer borings on 1514 Taylor Way, Burlington and CleanCare properties for groundwater collection at multiple depths with possible deep wells to be installed at each location pending receipt of results and discussion with Ecology.	Completed October 2021 to January 2022	Yes	2022 Data Gaps Data Report
Investigation/confirmation of COC concentrations in groundwater on the CleanCare property, given the age of data available from CleanCare monitoring wells.	Sampling CleanCare property wells. If concentrations have reduced to levels below screening levels, additional wells downgradient may not be warranted.	Three of the four events have been completed.	No	2022 quarterly groundwater data analysis reports
Investigation/confirmation of COC concentrations in groundwater on the western Port of Tacoma property.	Replacement of several wells on the western Port of Tacoma property.	Completed November 2019	Yes	Port submitted Crete reports in 2020 and data included in this Data Report
Recent Groundwater Data - Additional groundwater monitoring will provide data to confirm groundwater flow patterns, review seasonal trends in groundwater chemistry under current site conditions, and verify current levels				
Quarterly groundwater monitoring of the TWAAFA groundwater monitoring well network.	Four quarters of monitorng for an initial period of one year (first, second, third, and fourth quarters of 2022).	Three of the four events have been completed.	No	2022 quarterly groundwater data analysis reports
Split sampling to further assess organic material bias that may be occurring at the TWAAFA Site.	Lab analysis, review of chromatograms, calculations and numerical estimations of variability or laboratory measurements based on laboratory QA/QC, and supporting evidence and criteria for use of the method, will be conducted.	Three of the four events have been completed.	No	2022 quarterly groundwater data analysis reports and Port-submitted Crete 2020 report
Indoor Air Assessment				
Assess potential for vapor intrusion at concentrations of concern using other data collected as part of data gaps efforts.	Screen newly collected groundwater data to vapor intrusion-based screening levels.	Three of the four events have been completed.	No	2022 quarterly groundwater data analysis reports
Assess potential for vapor intrusion under existing conditions at the CleanCare property parcel.	Perform a soil vapor investigation in accordance with the Soil Vapor Sampling and Analysis Plan provided as Appendix M.	Sampling completed August to September 2021.	Yes	2022 Data Gaps Data Report

TABLE 1
DATA GAPS STATUS SUMMARY
Taylor Way and Alexander Avenue Fill Area Site
Tacoma, Washington

Data Gaps Task	Scope	Notes	Task Completed?	Reporting
Assess potential for vapor intrusion at concentrations of concern across the TWAAFA Site.	Perform a vapor intrusion assessment for the full TWAAFA Site, consistent with Ecology's 2018 updated Guidance for Evaluating Soil Vapor Intrusion in Washington State: Investigation and Remedial Action, that incorporates results of the Above Ground Site Conditions Documentation data gap described in the previous section.	Site assessment and initial sampling needs determined in cooperation with Ecology.	Yes	December 2021 Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations
	Sampling as part of a Tier 2 assessment will be necessary in select portions of the TWAAFA Site and would include collection of sub-slab, indoor air, ambient air, and/or methane samples from selected Site buildings not previously evaluated for vapor intrusion risk. Collect differential pressure measurements as part of methane investigation. Assess short-term TCE exposure concentrations per recent revisions to Ecology guidance regarding this exposure concern.	Sub-slab and differential pressure testing completed September 2021 to July 2022.	No	Data Gaps Data Report
	Burlington Lab Pack Building - collect sub-slab vapor samples from the VMS to determine current soil vapor concentrations.	Work proposed in Revised TWAAFA Data Gap Investigation Progress Summary and Soil Vapor Intrusion Status and Recommendations (December 2021).	Yes	Data Gaps Data Report
	Burlington Stabilization Building - measure differential pressures under different operating scenarios. If differential pressure across the concrete slab foundation of the stabilization building indicate pressure below the slab, i.e., vapor intrusion potential, during either operational scenario, then additional vapor analytical sampling will be performed to access sub-slab vapor concentrations.		Yes	Data Gaps Data Report
	Burlington Transportation Office and Shop Building - Install and sample vapor sampling points. If the soil gas concentrations exceed sub-slab soil gas screening levels, Tier II assessment of indoor air, including an ambient air sample, would be collected to assess indoor air and the potential need for mitigation.		Yes	Data Gaps Data Report
	Burlington Parcel A - Install and sample a vapor sampling point following collection of soil samples at location TWA-SB5.		Yes	Data Gaps Data Report
	Port of Tacoma Former Potter Property - Collect three sub-slab vapor sample inside each of the two Quonset huts and timber shell structure.		Yes	Data Gaps Data Report
Provide predictability in approach for site owners and enable remedial designers to consistently investigate and address the vapor pathway as development changes at the site.	Prepare a TWAAFA Site Indoor Air Assessment Protocol to be used at the site going forward as new site development is planned and completed.	To be prepared after completion of the RI/FS	No	Per the Data Gaps Work Plan, this document will be a standalone document that would be incorporated into an Institutional Control Plan if the final remedy for the TWAAFA Site leaves contamination in place that could cause a possible vapor mitigation issue. It will follow the current version of ASTM E2993-16, Standard Guide for Evaluating Potential Hazard as a Result of Methane in the Vadose Zone.

Notes
1. All concentrations in micrograms per liter (µg/l)
2. Detected compounds are the only compounds tabulated. Additional information for non-detect constiuents is available in the lab report.

Abbreviations
BOLD denotes a detection, shading denotes value above site screening level
-- = Not Measured. For screening levels this means none were established in the Data Gaps Work Plan (DOF, 2020).
J = The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate. J- = result is likely biased low; J+ = result is likely bias high
x = The sample chromatographic pattern does not resemble the fuel standard used for quantitation.
U = Result below the numerical value shown to the left of the "U" flag.
N = chromatographic pattern does not match hydrocarbon standard used.
R= Result is rejected

RE: Soil and Groundwater Data Report
Hylebos Marsh Property - 1205 Alexander Avenue and 1300 Taylor Way
Taylor Way and Alexander Avenue Fill Area Site

Dear Mr. Teel,

CRETE Consulting Incorporated, PC (CRETE) has prepared this Soil and Groundwater Data Report for the Port of Tacoma (Port) Hylebos Marsh property, which is a portion of the Taylor Way and Alexander Avenue Fill Area (TWAAFA) Site in Tacoma, Washington (Figure 1). Historical observations suggest that the TWAAFA Site received fill material from 1946 until at least 1991. Lime waste is present on the eastern portion of the TWAAFA Site and byproducts of auto scrapping (auto fluff) are present as well. A former road may have been used to transport lime waste and other fill materials across the Hylebos Marsh property for placement onto the TWAAFA. Materials discarded and used as fill materials at the TWAAFA included lime solvent sludge, auto fluff, wood debris, and other lime wastes.

The Port, Glenn Springs Holdings, Inc. (Occidental Chemical), General Metals of Tacoma, and Stericycle Environmental Solutions, Inc. are identified as potentially liable parties (PLPs) for the TWAAFA site in draft Agreed Order Number 14260 proposed by the Washington State Department of Ecology (Ecology). The PLPs agreed to prepare the Revised Data Gaps Work Plan (Work Plan [DOF 2019A[1]] with the understanding that the finalized version will be an exhibit to the Agreed Order.

The Port performed the work described in the Work Plan for the Hylebos Marsh Property in 2019 to expedite investigation. The work described in this report is consistent with the Work Plan and items 1b and 1c of Ecology's January 8, 2020 comment letter (Ecology 2020[2]) on the Work Plan. The purpose of this soil and groundwater investigation was to: 1) evaluate several reported fill and waste disposal areas; 2) assess whether TWAAFA-related fill material (lime solvent sludge, auto fluff, wood debris, and other lime wastes) are present on the Hylebos Marsh property; 3) install 2 deep aquifer wells to improve coverage of deep aquifer groundwater elevation data; and 4) abandon wells that may be screened across the silt layer.

[1] DOF 2019A. Revised Data Gaps Work Plan, Taylor Way and Alexander Avenue Fill Area Site, Tacoma Washington. Dalton Olmsted and Fuglevand, January 29, 2019.
[2] Ecology 2020. Letter dated January 8, 2020 re: "Comments on the Revised Data Gaps Work Plan, dated January 29, 2019, prepared by Dalton Olmsted Fuglevand (DOF)". Letter prepared by Steve Teel, Washington State Department of Ecology.

This Report provides the results of the field efforts completed by the Port between September 24 and November 9, 2019. This Report also provides results of the first quarterly groundwater sampling event at the Hylebos Marsh Property completed on December 10 and 11, 2019. The groundwater sampling event was completed in accordance with the Revised Groundwater Monitoring Plan (DOF 2019B[3]). Sampling results are to be included with data collected under the Data Gaps Work Plan and incorporated into the Agreed Order.

Site Hydrogeology

Prior to the 1930s, the area consisted of tidal marsh/tide flats of the Puyallup River Delta. Dredging of the Blair and Hylebos Waterways and filling the intervening land with dredge spoils likely occurred at least once during each decade from the 1930s through the 1970s. By the late 1960s, the TWAAFA had been partially filled with dredge spoils from nearby waterways, resulting in a freshwater marsh 5 to 6 feet above the former saltwater marsh.

The hydrogeology underlying the TWAAFA site has been documented in prior investigations, as described in the Work Plan. The three hydrogeological units, listed in order of increasing depth, are discussed for the Hylebos Marsh property:

Shallow Aquifer

- This unit consists of an upper fill unit composed of artificially placed material that is highly heterogeneous and is approximately 5 to 18.5 feet thick at the Hylebos Marsh property.
- The saturated thickness of the unconfined shallow groundwater unit varies seasonally. The Work Plan indicates that the saturated thickness is greatest in late winter or early spring and decreases in late summer or early autumn.
- Shallow groundwater generally flows radially out from a groundwater mound located near the center of the TWAAFA site, near the property boundary between the Stericycle and CleanCare properties. As a result, shallow groundwater generally flows southwest on the Hylebos Marsh property.

Silt Confining Unit

- The silt unit is the former mudflat that underlies the upper fill unit and overlies the deep aquifer sand unit. The silt unit is soft and contains varying amounts of clay, sand, and organic matter. The silt unit appears continuous. At the two deeper borings completed at the Hylebos Marsh property, the silt was 7 feet (TWA-5) to 11.5 feet (TWA-6) thick.

Deep Aquifer

- The deep aquifer consists of deltaic sands that are present throughout the tide flats. Silt layers are present within the deep aquifer and have been documented at the TWAAFA site at depths greater than 50 feet below ground surface (bgs). This unit was encountered at the Hylebos Marsh Property in deep borings TWA-5 and TWA-6. The top of the unit was encountered at 18.5 feet bgs at TWA-6 and at 24.5 feet bgs at TWA-5. Thin clay layers were noted, with layers no thicker than 1 foot. This deep aquifer sand unit extended to the bottom of the boreholes (60 feet bgs).

[3] DOF 2019B. Revised Groundwater Monitoring Plan, Taylor Way and Alexander Avenue Fill Area Site, Tacoma Washington. Dalton Olmsted and Fuglevand, January 29, 2019, Exh to Agreed Order.

- Groundwater within the deep aquifer flows from the northeast to the southwest. The Work Plan indicates that groundwater elevations are generally flatter than the shallow groundwater, exhibiting approximately one foot or less variation across the TWAAFA site, and a downward gradient based on measurements at paired well locations.

Shallow Soil and Groundwater Samples

Methods

Four borings were drilled to characterize fill material and to obtain 5 soil and 4 groundwater samples for laboratory analysis. TWA-SB1 through TWA-SB4 were drilled using direct push equipment (Figure 2). Each borehole was continuously logged to describe lithology and measure volatile compounds in soil using a photoionization detector (PID). Borings were drilled through the fill interval into the silt layer, encountered 8 to 10 feet bgs. Borings were drilled by Holt Drilling, a licensed drilling contractor in the State of Washington between September 24 and 27, 2019. Field logs are included in Attachment 1.

Groundwater samples were collected from each of the four borings. Groundwater samples were collected from temporary wells constructed using a new, disposable 5-foot long, 0.010-inch slot PVC screen with retractable protective sheath. Low-flow purging and sampling was performed using a peristaltic pump and disposable polyethylene tubing. Three of the four wells purged dry; when this occurred the well was allowed to recharge and the groundwater sample was collected immediately after recharge. Sampling methods otherwise followed the methods described in the Standard Operating Procedure included in the TWAAFA Groundwater Monitoring Plan (DOF 2019B).

Shallow Soil Results

Results are presented in Tables 1 and 2. Sample locations are shown on Figure 2. Borehole logs are included in Attachment 1. Laboratory reports are included in Attachment 2.

Soil samples were collected 1 to 2 feet above the water table and were analyzed for: volatile organic compounds (VOCs), northwest total petroleum hydrocarbon diesel and lube oil (NWTPH-Dx), NWTPH-gasoline (NWTPH-Gx), semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, and manganese). An additional sample was collected from a layer of wood debris observed in SB-3 and analyzed for the same parameters. Lime solvent sludge, auto fluff, other debris identified in Table 23 of the Work Plan, sheen, or discernable evidence of contamination was not noted in any of the borings. All borings were drilled through the vertical extent of fill materials until encountering the underlying native silt. No parameters were detected above site screening levels from any of the direct push soil samples.

Shallow Groundwater Results

The top of silt was encountered between 8 feet bgs (SB-1 and 4) and 10 feet bgs (SB-3). The depth to groundwater was estimated at 7 feet bgs (SB-1 and SB-4) and 7.5 feet bgs (SB-2 and SB-3) based on the presence of water-saturated soil in the geoprobe core samples. Groundwater samples were collected from each of the four borings and analyzed for: VOCs, NWTPH-Dx, NWTPH-Gx, SVOCs, PCBs, total and dissolved metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, and manganese), and methane. SVOC samples were filtered by the laboratory using a 0.70 um (micron) glass fiber filter prior to analyses.

A summary of field parameters measured during sampling are included on Table 3. Groundwater results are summarized on Tables 4 and 5. Copies of laboratory reports are included in Attachment 2.

The following parameters were detected in groundwater samples above laboratory reporting limits:

- TPH-Dx was reported to be present when silica gel cleanup was not performed in groundwater samples obtained from all four borings. One sample result (6,800 micrograms per liter [µg/L] at SB-3) was elevated and oil range TPH was also detected (1,800 µg/L at SB-3) in this sample, exceeding the 500 µg/L screening level. TPH-Dx and oil range results with silica gel cleanup were below laboratory reporting limits for all groundwater samples.
    - TPH-Dx and oil range chromatograms for samples collected from the shallow wells (SB-1 through SB-4) that did not undergo silica gel cleanup do not resemble the laboratory fuel standard. This indicates that the results of samples that did not undergo silica gel cleanup are most likely not representative of actual concentrations of TPH-Dx and oil range TPH.
    - The borehole log for SB-3 identifies a wood debris layer between 9 and 10 feet bgs, within the groundwater sample screen interval. This suggests that the concentrations reported when silica gel cleanup was not performed may be associated with naturally occurring non-petroleum organic matter.
    - SB-3 is also located downgradient of monitoring wells on the adjacent Stericycle facility where groundwater concentrations exceeding the NWTPH-Dx screening level were previously reported.
- Dissolved manganese was detected in groundwater samples above the screening level of 100 µg/L ranging from 631 µg/L (SB-4) to 832 µg/L (SB-3). A dissolved metals sample was not collected from SB-1 because there was insufficient water to fill a sample container. Total manganese was detected in groundwater samples obtained from all four site borings at concentrations ranging from 614 µg/L (SB-4) to 2,990 µg/L (SB-1).
- Total arsenic was detected just above the screening level of 5 µg/L from SB-4 (5.66 µg/L); the dissolved arsenic result (1.07 µg/L) was below the screening level.
- Total copper was detected above the screening level of 2.4 µg/L from SB-3 (3.78 J µg/L) and SB-4 (22 µg/L). Dissolved copper was not detected above the laboratory reporting limit of 2.4 µg/L.
- Dissolved and total chromium, nickel, selenium, and total zinc were detected in groundwater from site borings at concentrations below screening levels.
- Acetone, methylene chloride, 1-methylnaphthalene, acenaphthene, acenaphthylene, anthracene, fluoranthene, fluorine, phenanthrene, and pyrene were detected in groundwater from select site borings at concentrations below screening levels.
- Dissolved methane was detected in groundwater samples collected from shallow borings SB-2 through SB-4 at values ranging from 1,210 µg/L (SB-2) to 3,530 µg/L (SB-4).

The reporting limit for bis(2-ethylhexyl) phthalate (BEHP) exceeded the screening level. The BEHP reporting limit was 3.2 µg/L compared to the screening level of 0.046 µg/L.

Deep Aquifer Borings

Methods

Two borings were drilled to sample groundwater in the deep aquifer beneath the silt unit at multiple depths. Samples were collected using the following approach:

- Conductor casing was used to seal off the upper aquifer and sample below the silt layer at both deep aquifer borings (Figure 2). TWA-5 and TWA-6 were drilled to a depth of 60 feet bgs. The bottom of the conductor casing was set at 20 feet bgs at TWA-5 and at 12 feet bgs at TWA-6.
- Depth-discrete groundwater samples were collected in higher transmissivity water-bearing units at approximately 10-foot intervals and/or at major lithology changes. At TWA-5, samples were collected at 25-30, 35-40, and 45-50 feet bgs. At TWA-6, samples were collected at 15-20, 25-35, 35-40, and 45-50 feet bgs. Samples were collected via a temporary well screen, using low flow purging and sampling methods with a peristaltic pump and polyethylene tubing.
- Soil samples were collected from fine-grained units encountered beneath the silt unit and were archived for contingent analysis in the event VOCs were detected in groundwater.

Deep Aquifer Groundwater Results

Results are summarized in Tables 6 and 7. Sample locations are shown on Figure 2. Field logs are included in Attachment 1. Laboratory reports are included in Attachment 2.

At TWA-5, wood debris was encountered at 10 to 18.5 feet bgs. The top of the silt was encountered at 18.5 feet bgs. No wood debris was encountered at TWA-6 where the top of the silt was encountered at 10 feet bgs.

Groundwater samples were analyzed for: VOCs, NWTPH-Dx, NWTPH-Gx, SVOCs, PCBs, and total metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, and manganese). SVOC samples were filtered by the laboratory using a 0.70 µm (micron) glass fiber filter prior to analyses.

The highest metals concentrations were reported in the 25-30 feet bgs samples for both locations. VOCs, NWTPH-Gx, and PCBs were not detected in any sample. SVOC compounds bis(2-ethylhexyl) phthalate (BEHP) and di-n-butyl phthalate were detected in the 25-30 feet bgs sample in TWA-5.

TPH-Dx was reported to be present in all groundwater sample results when silica gel cleanup was not performed. None of the TPH-Dx chromatograms resembled the laboratory fuel standard. Accordingly, these reported results are not representative of the actual concentration of diesel (CAS# 68334-30-5) present in the samples.

No soil samples were analyzed for VOCs because VOCs were not detected at concentrations exceeding screening levels in any of the groundwater samples.

Well Installation and Development

Two deep aquifer wells, TWA-5 and TWA-6, were installed between November 7 and 9, 2019. The well screen intervals for TWA-5 and TWA-6 were approved by Steve Teel on November 1, 2019 via electronic mail. The screen interval was selected as 25-30 feet bgs for both wells. Wells were installed by Holocene Drilling, a licensed drilling contractor in the State of Washington, using sonic drilling equipment. Wells were constructed in accordance with the Minimum Standards for Construction and Maintenance of Wells (Chapter 173-160 WAC). Well installation was overseen by an environmental professional familiar with environmental sampling and construction of resource protection wells.

The deep wells were constructed using the conductor casing method to obtain representative samples from the deep aquifer. The monitoring wells were constructed with 2-inch-diameter, flush-threaded, Schedule 40 PVC pipe with 0.010-inch machine-slotted well screens. Filter pack material consisting of pre-washed 2/12 silica sand was placed from the bottom of the well to approximately two feet above the top of the screen. Filter pack material was placed slowly and carefully to avoid bridging. A bentonite

seal was placed above the filter sand pack to within about 3 feet of ground surface. Wells were completed with above-ground protective casings and protective bollards. The well names and the identification numbers assigned by Ecology were marked on the well identification tags supplied by Ecology and were attached by the driller to each well casing following well installation.

The monitoring wells were developed on November 7 and 8, 2019 to remove formation material from the well and the filter pack prior to groundwater level measurement and sampling. Development was conducted consistent with Stericycle's previously approved SOP 121, included in the Groundwater Monitoring Plan (DOF 2019B).

Well Decommissioning

Well abandonment methods were approved by Steve Teel via electronic mail on November 19, 2019. Well SB-1 was decommissioned by over-drilling and wells SB-3 and SB-4 were decommissioned by chipping-in-place. Wells were decommissioned by Holt Drilling (a licensed drilling contractor in the State of Washington) on December 11, 2019.

Deviations

The following modifications were performed during execution of the work described in the Work Plan:

1. Work Plan Table 1 called for total metals analysis of shallow temporary groundwater samples collected from SB-1 through SB-4. Total and dissolved metals were analyzed for all shallow temporary groundwater samples with the exception of SB-1, where there was insufficient water produced to fill the sample containers for dissolved metals analysis.
2. Groundwater samples were analyzed for NWTPH-Dx both with and without silica gel cleanup because the chromatograms from samples without silica gel cleanup did not resemble the laboratory fuel standard and are not considered representative of petroleum. This may also be due to the presence of with naturally occurring non-petroleum organic matter.
3. The mercury analytical method specified in the Work Plan is EPA 7470A. The laboratory advised CRETE that the EPA 6020 trace level analysis would achieve an equivalent reporting limit.
4. The 8260SIM analytical method was specified in the Work Plan to achieve reporting limits that were below the screening levels for trichloroethylene and vinyl chloride. The laboratory advised CRETE that the standard 8260 method would achieve equivalent reporting limits.

Quarterly Groundwater Sampling

On December 10 and 11, CRETE collected groundwater samples from five site monitoring wells: TWA-5, TWA-6, SB-1A, SB-2A, and SB-3A. All samples were collected in accordance with the Revised Groundwater Monitoring Plan ("Groundwater Monitoring Plan" DOF 2019B). A summary of water level and field parameters are included in Table 8 and sample collection documentation are provided in Attachment 1.

A summary of results is provided in Tables 8 through 10. Laboratory reports are included in Attachment 2. Sample locations are shown on Figures 3 and 4.

Groundwater samples were collected at each of the wells and analyzed for: VOCs, NWTPH-Dx, NWTPH-Gx, SVOCs, PCBs, and total and dissolved metals (arsenic, cadmium, chromium, copper, lead, mercury, nickel, selenium, zinc, and manganese). SVOC samples were filtered by the laboratory using a 0.70 µm (micron) glass fiber filter prior to analyses.

The reporting limit for bis(2-ethylhexyl) phthalate (BEHP) exceeded the screening level. The BEHP reporting limit was 3.2 µg/L compared to the screening level of 0.046 µg/L.

The following parameters were detected in groundwater samples above laboratory reporting limits:

Shallow Aquifer Groundwater Results

- TPH-Dx and oil range TPH analyses that did not undergo silica gel cleanup from shallow aquifer well SB-3A reported concentrations of 1,900 µg/L and 1,200 µg/L, respectively, exceeding the 500 µg/L screening level. TPH- Dx and oil range results for all groundwater samples with silica gel cleanup were below the laboratory reporting limit.
- TPH-Dx and oil range chromatograms from the SB-3A sample that did not undergo silica gel cleanup do not resemble the laboratory fuel standard. This indicates that the sample result is most likely not representative of actual concentrations of TPH-Dx and oil-range TPH.
- Figure 5 provides the chromatograms for SB-3A and direct push groundwater sample SB-3; chromatograms are also provided in Attachment 3. Figure 5 shows that the samples that did not receive silica gel cleanup have chromatograms that are shifted to the right relative to the diesel standard and do not have the regularly spaced array of *n*-alkane peaks that are characteristic of diesel.
- Dissolved manganese was detected above the screening level (100 µg/L) in all groundwater wells. Concentrations ranged from 194 µg/L (SB-3A) to 367 (SB-2A).
- Dissolved arsenic concentrations were all below the 5 µg/L screening level.
- Dissolved nickel concentrations were all below the 8.2 µg/L screening level.
- Acenaphthene concentrations were all below the 30 µg/L screening level.

Deep Aquifer Groundwater Results

- TPH-Dx and oil range TPH analyses that did not undergo silica gel cleanup for all deep aquifer monitoring wells exceeded the 500 µg/L screening level. TPH-Dx and oil range results for all groundwater samples with silica gel cleanup are below the laboratory reporting limit.
- TPH-Dx and oil range chromatograms from the samples that did not undergo silica gel cleanup do not resemble the laboratory fuel standard. This indicates that the sample result is most likely not representative of actual concentrations of TPH-Dx and oil-range TPH.
- Figure 6 shows that the samples that did not receive silica gel cleanup have chromatograms that are shifted to the right relative to the diesel standard and do not have the regularly spaced array of *n*-alkane peaks that are characteristic of diesel.
- Dissolved arsenic concentrations ranged from 8.82 µg/L to 9.19 µg/L, slightly exceeding the 5 µg/L screening level
- Dissolved chromium concentrations were all below the 50 µg/L screening levels.
- Dissolved copper concentration in TWA-5 (7.6 µg/L) exceeded the 2.4 µg/L screening level.
- Dissolved manganese was detected above the screening level (100 µg/L) in all groundwater wells. Concentrations ranged from 262 µg/L (TWA-5) to 944 µg/L (TWA-6).
- Dissolved nickel concentrations in all samples were below the 8.2 µg/L screening level.
- Dissolved zinc concentrations in all samples were below the 81 µg/L screening level.
- Chloroform, dichlorobromomethane, and 1,4-dioxane concentrations were all below screening levels

Conclusions

This investigation did not identify suspected shallow fill materials and did not find any hazardous substances in shallow soil. Hazardous substances measured in the groundwater during this investigation are not associated with shallow fill soils located on the Hylebos Marsh Property; rather impacts are likely a result of migration through the groundwater from a source off the Hylebos Marsh Property.

Soil

A portion of this investigation targeted potential shallow fill areas identified in the Work Plan. Field observations and data indicate that suspected landfilling within shallow fill soils did not occur on the Hylebos Marsh Property. In addition, boreholes TWA-SB-3 and TWA-5 along the eastern portion of the property, did not identified TWAAFA-related fill areas identified in Figures 8 through 10 of the Work Plan. Specifically, lime waste and auto fluff were not observed at TWA-SB-3 as mapped respectively on Figures 8 and 9 of the Work Plan and auto fluff and woodwaste/debris were not observed as mapped respectively on Figures 9 and 10 of the Work Plan. Sample results confirm that TWAAFA-related hazardous substances, including lime solvent sludge and auto fluff mixed with other hazardous material, **do not** extend onto the Hylebos Marsh Property. The soil data exhibit no exceedances of soil screening levels on the Property, which is consistent with previous data summarized in the Data Gaps Work Plan (Table 14).

Groundwater

Metals in Groundwater

The monitoring well data show relatively minor concentrations of hazardous constituents in shallow groundwater (Table 9). Dissolved manganese was detected at concentrations exceeding the 100 µg/L screening value (surface water, human health, Clean Water Act §304) in all samples, ranging from 194 µg/L (SB-3A) to 367 µg/L (SB-2A). Total copper was detected at concentrations exceeding the 2.4 µg/L screening value (surface water, aquatic life, chronic NTR 40 CFR 131) in all samples, ranging from 3.28 µg/L (SB-3A) to 23.1 µg/L (SB-1A). All dissolved copper concentrations are below screening levels. The difference in dissolved and total copper data is likely attributable to the presence of sediment with naturally-occurring metals in the unfiltered (totals) samples.

Direct push shallow groundwater sample data (Table 3) show higher concentrations of total and dissolved manganese relative to the monitoring well data, and comparable concentrations of total copper. Total arsenic was also detected at concentrations exceeding the 5.0 µg/L screening value (natural background concentration in Washington State) in a sample obtained from SB-4 (5.66 µg/L). Total nickel was also detected at concentrations exceeding the 8.2 µg/L screening value[4] in two samples, with concentrations up to 17.7 µg/L (SB-4); dissolved nickel was only detected in SB-3 (9.44 µg/L). The differences between the dissolved monitoring well data and the direct push sample results is attributable to the presence of sediment with metals in the unfiltered (totals) direct push samples.

The monitoring well data also show relatively minor concentrations of hazardous substances in deep groundwater (Table 9). Dissolved manganese was detected at concentrations exceeding the 100 µg/L screening value (surface water, human health, Clean Water Act §304) in all samples, ranging from 262 µg/L (TWA-5) to 944 µg/L (TWA-6). Dissolved and total arsenic were detected at concentrations exceeding the 5 µg/L screening level (background concentration in Washington State) in TWA-6 samples

[4] Surface water, aquatic life, chronic, WAC 173-201A

at concentrations of 9.19 µg/L and 7.84 µg/L, respectively. Dissolved arsenic was also measured in samples obtained from TWA-5 (9.08 µg/L) and TW-6 (9.19 µg/L) slightly exceeding the 5 µg/L screening level. Total copper was detected at concentrations exceeding the 2.4 µg/L screening value (surface water, aquatic life, chronic NTR 40 CFR 131) in all samples, ranging from 35.4 µg/L (TWA-5) to 69 µg/L (Duplicate TWA-6). The dissolved copper concentrations are below screening levels with the exception of TWA-5 (7.6 "J" µg/L). The difference in dissolved and totals data is likely attributable to the presence of sediment with naturally-occurring metals in the unfiltered (totals) samples.

"Grab" total metals sample from the deep aquifer (Table 6) identified four additional metals that were not found at concentrations exceeding the screening levels in the groundwater samples obtained from the deep aquifer monitoring wells. Maximum concentrations for these metals are 137 µg/L (chromium[5]), 114 µg/L (lead[6]), 123 µg/L (nickel), and 488 µg/L (zinc[7]). The differences between the dissolved monitoring well data and the "Grab" total metals sample results is attributable to the presence of sediment with naturally-occurring metals in the "Grab" total metals samples.

TPH-Dx and Oil Range TPH in Groundwater

TPH-Dx and oil range TPH were present in monitoring well groundwater samples for which silica gel cleanup was not performed. Both deep aquifer well concentrations exceeded the 500 µg/L screening level while 1 of 3 shallow aquifer well concentrations exceeded the screening level. TPH-Dx and oil range TPH results were all below reporting limits for these same groundwater samples when silica gel cleanup was performed.

Silica gel cleanup removes polar organic compounds that may be present due to conditions such as wood debris, sea water mixing, or polar metabolites associated with the biodegradation of petroleum. Wood debris is present in some locations on the property, electrical conductance is elevated in deep groundwater, and a petroleum (diesel and oil) soil and groundwater source is present upgradient of the property in both the shallow and deep aquifers.

Figure 7 presents the chromatograms for a shallow well (SB-3A) and a deep well (TWA-5). The chromatograms for the samples without silica gel cleanup are shifted right of the diesel standard and do not have the regularly spaced array of *n*-alkane peaks that are characteristic of the diesel standard. These chromatograms are typical of chromatograms for biogenic material or polar metabolites associated with the biodegradation of petroleum. While this assessment has not definitively identified the nature of the material the laboratory has reported as TPH-Dx when silica gel cleanup was not performed, we have concluded that: (1) it is not representative of diesel [CAS# 68334-30-5] and (2) potential sources of TPH-Dx and/or oil range TPH are not associated with shallow fill soils at the Hylebos Marsh Property.

Quality Control

A duplicate was collected from TWA-6; results are shown on Table 11. The relative percent difference goal for duplicate samples is less than 30%. This was achieved for all detected compounds except for total copper, which had a RPD of 47%. The dissolved copper RPD was 0%. For sample results below the laboratory detection limit, total metals reporting limits between the parent sample (TWA-6) and the

[5] 50 µg/L – Surface water, aquatic life, chronic, WAC 173-201A
[6] 8.2 µg/L – Surface water, aquatic life, chronic, WAC 173-201A
[7] 81 µg/L – Surface water, aquatic life, chronic, WAC 173-201A

duplicate (TWA-1120) were different, which affects the RPD for total cadmium, lead, and zinc; all other laboratory reporting limits were consistent. Total cadmium, lead, and zinc compounds all were detected below the laboratory reporting limit, but the parent sample (TWA-6) was re-run at a dilution because of estimated flags in the initial run. Dissolved metal reporting limits are consistent between the parent and duplicate sample.

Results from the field blank are summarized on Table 11. Deionized water was provided by the laboratory and water was transferred to a new empty sampling container in the field. Results of the field blank indicate that metals, including copper, chromium, manganese, and zinc as well as chlorinated water byproducts (chloroform and dichlorobromomethane) were detected in the sample. The laboratory was contacted and it was determined that the water provided was not the highest quality deionized water but was a high volume supply of water that goes through less filtration compared to the deionized water used in the instruments. Future events will use the higher quality deionized water.

Laboratory validation and standards are all acceptable and within in the limits provided in Groundwater Monitoring Plan.

Schedule

The following quarterly groundwater sampling event occurred on March 9 and 10, 2020. Monitoring wells were also surveyed on March 10, 2020. Laboratory results will be provided to Ecology within 30 days of data validation.

Sincerely,

CRETE CONSULTING INCORPORATED, PC

Notes

1. Turbidity value not recorded, unable to read the value on the instrument because of condensation on control screen.

* = wells purged dry during sampling, last value recorded prior to going dry is included on this table.

Notes:
U - detected below the laboratory reporting limit
J - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.
x = The sample chromatographic pattern does not resemble the fuel standard used for quantification.
Bold denotes a detection, shading denotes value above site Screening Levels
Only detected compounds are shown on this table.
* - Screening Levels are from TWAAFA Revised Data Gaps Work Plan, if provided. Otherwise the Method B marine surface water default cleanup level is used.
All results are in micrograms per liter (ug/L)

Notes:

U - detected below the laboratory reporting limit

x = The sample chromatographic pattern does not resemble the fuel standard used for quantification.

J - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

x = The sample chromatographic pattern does not resemble the fuel standard used for quantification.

Bold denotes a detection

All results are in micrograms per liter (ug/L)

Notes:

U - detected below the laboratory reporting limit

x = The sample chromatographic pattern does not resemble the fuel standard used for quantification.

Bold denotes a detection

All results are in micrograms per liter (ug/L)

RPD - relative percent difference.

Note 1. Laboratory reporting limits were estimated in the parent sample at the same reporting limits as the duplicate, then the samples were diluted.

Sample Collection:							Duplicate Details:		

*Achievement of turbidity levels of less than 5 NTU, and stable drawdowns of less than 0.3 feet, while desirable, are not mandatory. If after 2 hours of purging indicator field parameters have not stabilized, discontinue purging, collect samples and provide full explanation of attempts to achieve stabilization.

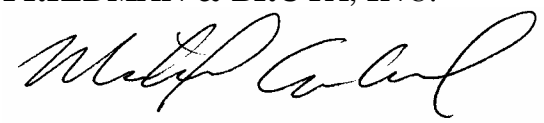
Dear Ms Stevens:

Included are the results from the testing of material submitted on September 27, 2019 from the Hylebos, F&BI 909487 project. There are 23 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 27, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos, F&BI 909487 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909487 -01	TWA-6-3
909487 -02	TWA-6-4
909487 -03	TWA-6-48-S

Several compounds in the 8270D laboratory control sample and laboratory control sample duplicate failed the acceptance criteria. The data were flagged accordingly.

The 8260C calibration standard failed the acceptance criteria for methylene chloride. The data were flagged accordingly. In addition, several compounds in the 8260C laboratory control sample and matrix spike exceeded the acceptance criteria. The analytes were not detected in the sample, therefore the data were acceptable.

All other quality control requirements were acceptable.

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR POLYCHLORINATED BIPHENYLS AS AROCLOR 1016/1260 BY EPA METHOD 8082A

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	ug/L (ppb)	0.25	52	59	35-111	13
Aroclor 1260	ug/L (ppb)	0.25	58	63	29-130	8

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on September 27, 2019 from the Hylebos, F&BI 909487 project. There are 6 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 27, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos, F&BI 909487 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909487 -01	TWA-6-3
909487 -02	TWA-6-4
909487 -03	TWA-6-48-S

All quality control requirements were acceptable.

Analysis For Total Metals By EPA Method 6020B

Client ID:	TWA-6-3	Client:	Crete Consulting
Date Received:	09/27/19	Project:	Hylebos, F&BI 909487
Date Extracted:	10/01/19	Lab ID:	909487-01

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR TOTAL METALS USING EPA METHOD 6020B

Laboratory Code: 910005-01 (Matrix Spike)

Analyte	Reporting Units	Spike Level	Sample Result	Percent Recovery MS	Percent Recovery MSD	Acceptance Criteria	RPD (Limit 20)
Selenium	ug/L (ppb)	5	<1	97	98	75-125	1

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Acceptance Criteria
Selenium	ug/L (ppb)	5	90	80-120

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

October 9, 2019

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the results from the testing of material submitted on September 25, 2019 from the Hylebos Marsh, F&BI 909421 project. There are 47 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 25, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos Marsh project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909421 -01	SB-1-0919
909421 -02	SB-2-0919
909421 -03	SB-3-0919
909421 -04	SB-4-0919
909421 -05	SB-1
909421 -06	SB-2
909421 -07	SB-3-1
909421 -08	SB-3-2
909421 -09	SB-4
909421 -10	TWA-5-1
909421 -11	TWA-5-30-S
909421 -12	TWA-5-38-S
909421 -13	Trip blank-01

The 6020B calibration standard failed the acceptance criteria for arsenic. The samples were reanalyzed with acceptable results. Both data sets were reported. In addition, copper and lead in the matrix spike and matrix spike duplicate failed the acceptance criteria. The data were flagged accordingly.

The 8260C surrogate in samples SB-1-0919 and TWA-5-1 did not pass acceptance criteria. The data were flagged accordingly.

Benzoic acid and 2,4-dinitrophenol in the 8270D laboratory control sample and laboratory control sample duplicate failed the acceptance criteria. The data were flagged accordingly.

The 8260C calibration standard failed the acceptance criteria for acetone. The data were flagged accordingly.

The 8270 SVOC samples were filtered at Friedman and Bruya prior to extraction. The data were flagged accordingly.

All other quality control requirements were acceptable.

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR POLYCHLORINATED BIPHENYLS AS AROCLOR 1016/1260 BY EPA METHOD 8082A

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	ug/L (ppb)	0.25	58	52	35-111	11
Aroclor 1260	ug/L (ppb)	0.25	62	60	29-130	3

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

RE: 909421
Work Order Number: 1909424

October 03, 2019

Attention Michael Erdahl:

Fremont Analytical, Inc. received 4 sample(s) on 9/26/2019 for the analyses presented in the following report.

Dissolved Gases by RSK-175

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes
Project Manager

Date: *10/03/2019*

CLIENT: Friedman & Bruya
Project: 909421
Work Order: 1909424

Work Order Sample Summary

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received
1909424-001	SB-1-0919	09/26/2019 9:22 AM	09/26/2019 1:51 PM
1909424-002	SB-2-0919	09/26/2019 1:30 PM	09/26/2019 1:51 PM
1909424-003	SB-3-0919	09/26/2019 11:40 AM	09/26/2019 1:51 PM
1909424-004	SB-4-0919	09/26/2019 10:55 AM	09/26/2019 1:51 PM

Case Narrative

WO#: **1909424**
Date: **10/3/2019**

CLIENT: Friedman & Bruya
Project: 909421

I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below Reporting Limit
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit
R - High relative percent difference observed

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on September 25, 2019 from the Hylebos Marsh, F&BI 909421 project. There are 4 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 25, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos Marsh, F&BI 909421 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909421 -01	SB-1-0919
909421 -02	SB-2-0919
909421 -03	SB-3-0919
909421 -04	SB-4-0919
909421 -05	SB-1
909421 -06	SB-2
909421 -07	SB-3-1
909421 -08	SB-3-2
909421 -09	SB-4
909421 -10	TWA-5-1
909421 -11	TWA-5-30-S
909421 -12	TWA-5-38-S
909421 -13	Trip blank-01

All quality control requirements were acceptable.

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS DIESEL EXTENDED USING METHOD NWTPH-Dx

Laboratory Code: Laboratory Control Sample Silica Gel

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Diesel Extended	ug/L (ppb)	2,500	100	92	61-133	8

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

October 03, 2019

Attention Michael Erdahl:

Fremont Analytical, Inc. received 4 sample(s) on 9/26/2019 for the analyses presented in the following report.

Dissolved Gases by RSK-175

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes
Project Manager

Case Narrative

WO#: **1909424**
Date: **10/3/2019**

CLIENT: Friedman & Bruya
Project: 909421

I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below Reporting Limit
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit
R - High relative percent difference observed

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on September 25, 2019 from the Hylebos Marsh, F&BI 909421 project. There are 25 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 25, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos Marsh, F&BI 909421 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909421 -01	SB-1-0919
909421 -02	SB-2-0919
909421 -03	SB-3-0919
909421 -04	SB-4-0919
909421 -05	SB-1
909421 -06	SB-2
909421 -07	SB-3-1
909421 -08	SB-3-2
909421 -09	SB-4
909421 -10	TWA-5-1
909421 -11	TWA-5-30-S
909421 -12	TWA-5-38-S
909421 -13	Trip blank-01

Per request, 6020B copper and mercury were requantified using a lower reporting limit and selenium was added to the samples. The copper calibration was out of control limits for the full strength analysis of sample SB-3-0919, the data were qualified accordingly.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on September 25, 2019 from the Hylebos Marsh, F&BI 909421 project. There are 35 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 25, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos Marsh, F&BI 909421 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909421 -01	SB-1-0919
909421 -02	SB-2-0919
909421 -03	SB-3-0919
909421 -04	SB-4-0919
909421 -05	SB-1
909421 -06	SB-2
909421 -07	SB-3-1
909421 -08	SB-3-2
909421 -09	SB-4
909421 -10	TWA-5-1
909421 -11	TWA-5-30-S
909421 -12	TWA-5-38-S
909421 -13	Trip blank-01

The 8270D laboratory control sample and laboratory control sample duplicate failed the relative percent difference for 2,4-dimethylphenol. The analyte was not detected therefore the data were acceptable.

Methylene chloride in the 8260C laboratory control sample exceeded the acceptance criteria. The analyte was not detected in the sample, therefore the data were acceptable. In addition, acetone was detected in samples SB-1 and SB-3-2. The data were flagged accordingly.

The NWTPH-Gx, NWTPH-Dx, 8260C, and 8270D tests were requested outside of the holding time. The data were flagged accordingly.

All other quality control requirements were acceptable.

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF SOIL SAMPLES FOR POLYCHLORINATED BIPHENYLS AS AROCLOR 1016/1260 BY EPA METHOD 8082A

Laboratory Code: 90942105 1/6 (Matrix Spike) 1/6

Analyte	Reporting Units	Spike Level	Sample Result (Wet Wt)	Percent Recovery MS	Control Limits
Aroclor 1016	mg/kg (ppm)	0.25	<0.02	89	30-123
Aroclor 1260	mg/kg (ppm)	0.25	<0.02	89	26-131

Laboratory Code: Laboratory Control Sample 1/6

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	mg/kg (ppm)	0.25	108	115	55-137	6
Aroclor 1260	mg/kg (ppm)	0.25	110	117	51-150	6

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the results from the testing of material submitted on September 27, 2019 from the Hylebos Marsh, F&BI 909483 project. There are 46 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 27, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos Marsh, F&BI 909483 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909483 -01	TWA-6-2-R
909483 -02	TWA-6-2
909483 -03	TWA-6-1
909483 -04	TWA-5-S9-S
909483 -05	TWA-6-21-S
909483 -06	DRUM-1
909483 -07	TWA-5-3
909483 -08	TWA-5-2
909483 -09	Trip Blank

A 6020B calibration standard and internal standard failed the acceptance criteria for samples TWA-6-2-R, TWA-6-2, TWA-6-1, DRUM-1, TWA-5-3, and TWA-5-2. The samples were diluted and reanalyzed with acceptable results. Both data sets were reported.

Several compounds in the 8270D laboratory control sample, laboratory control sample duplicate, and the associated relative percent difference failed the acceptance criteria. The data were flagged accordingly.

All other quality control requirements were acceptable.

Date of Report: 10/08/19
Date Received: 09/27/19
Project: Hylebos Marsh, F&BI 909483
Date Extracted: 10/01/19
Date Analyzed: 10/01/19

RESULTS FROM THE ANALYSIS OF WATER SAMPLES FOR TOTAL PETROLEUM HYDROCARBONS AS GASOLINE USING METHOD NWTPH-Gx

Results Reported as ug/L (ppb)

Sample ID Laboratory ID	Gasoline Range	Surrogate (% Recovery) (Limit 51-134)
TWA-6-2-R 909483-01	<100	85
TWA-6-2 909483-02	<100	85
TWA-6-1 909483-03	<100	85
TWA-5-3 909483-07	<100	84
TWA-5-2 909483-08	<100	87
Method Blank 09-2319 MB	<100	95

Date of Report: 10/08/19

Project: Hylebos Marsh, F&BI 909483

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR POLYCHLORINATED BIPHENYLS AS AROCLOR 1016/1260 BY EPA METHOD 8082A

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	ug/L (ppb)	0.25	52	59	35-111	13
Aroclor 1260	ug/L (ppb)	0.25	58	63	29-130	8

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on September 27, 2019 from the Hylebos Marsh, F&BI 909483 project. There are 12 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on September 27, 2019 by Friedman & Bruya, Inc. from the Crete Consulting Hylebos Marsh, F&BI 909483 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
909483 -01	TWA-6-2-R
909483 -02	TWA-6-2
909483 -03	TWA-6-1
909483 -04	TWA-5-S9-S
909483 -05	TWA-6-21-S
909483 -06	DRUM-1
909483 -07	TWA-5-3
909483 -08	TWA-5-2
909483 -09	Trip Blank

Review of the 6020B data shows the water samples reported for seleniuim may be affected by a brackish sample matrix.

All quality control requirements were acceptable.

November 12, 2019

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

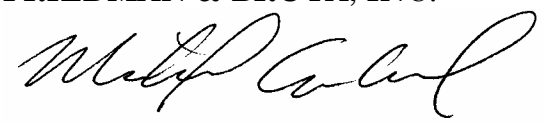
Dear Ms Stevens:

Included are the results from the testing of material submitted on November 1, 2019 from the POS T-30, F&BI 911020 project. There are 15 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.



Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on November 1, 2019 by Friedman & Bruya, Inc. from the Crete Consulting POS T-30, F&BI 911020 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
911020 -01	Disposal-19

The sample was sent to Fremont Analytical for flashpoint analysis. The report is enclosed.

The 8270D SIM phenanthrene concentration exceeded the calibration range of the instrument. The data were flagged accordingly.

Bromomethane in the 8260C matrix spike, laboratory control sample, and laboratory control sample duplicate exceeded the acceptance criteria. The analyte was not detected in the sample, therefore the data were acceptable.

The 8260C acetone laboratory control sample and calibration standard did not pass the acceptance criteria. The data were flagged accordingly.

All other quality control requirements were acceptable.

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR POLYCHLORINATED BIPHENYLS AS AROCLOR 1016/1260 BY EPA METHOD 8082A

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	ug/L (ppb)	0.25	62	62	35-111	0
Aroclor 1260	ug/L (ppb)	0.25	77	81	29-130	5

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

RE: 911020
Work Order Number: 1911023

November 05, 2019

Attention Michael Erdahl:

Fremont Analytical, Inc. received 1 sample(s) on 11/4/2019 for the analyses presented in the following report.

Flashpoint by EPA 1010/ASTM D93

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes
Project Manager

Date: *11/05/2019*

CLIENT: Friedman & Bruya
Project: 911020
Work Order: 1911023

Work Order Sample Summary

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received

Case Narrative

WO#: **1911023**
Date: **11/5/2019**

CLIENT: Friedman & Bruya
Project: 911020

I. SAMPLE RECEIPT:
Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry"). Flashpoint is reported in °F.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

* - Flagged value is not within established control limits
B - Analyte detected in the associated Method Blank
D - Dilution was required
E - Value above quantitation range
H - Holding times for preparation or analysis exceeded
I - Analyte with an internal standard that does not meet established acceptance criteria
J - Analyte detected below Reporting Limit
N - Tentatively Identified Compound (TIC)
Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
S - Spike recovery outside accepted recovery limits
ND - Not detected at the Reporting Limit
R - High relative percent difference observed

Acronyms:

%Rec - Percent Recovery
CCB - Continued Calibration Blank
CCV - Continued Calibration Verification
DF - Dilution Factor
HEM - Hexane Extractable Material
ICV - Initial Calibration Verification
LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
MB or MBLANK - Method Blank
MDL - Method Detection Limit
MS/MSD - Matrix Spike / Matrix Spike Duplicate
PDS - Post Digestion Spike
Ref Val - Reference Value
RL - Reporting Limit
RPD - Relative Percent Difference
SD - Serial Dilution
SGT - Silica Gel Treatment
SPK - Spike
Surr - Surrogate

Dear Ms Stevens:

Included are the results from the testing of material submitted on December 13, 2019 from the POT-Hylebos, F&BI 912238 project. There are 69 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on December 13, 2019 by Friedman & Bruya, Inc. from the Crete Consulting POT-Hylebos, F&BI 912238 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
912238 -01	TWA-5
912238 -02	TWA-6
912238 -03	TWA-1120
912238 -04	SB-1A-1219
912238 -05	SB-2A-1219
912238 -06	SB-3A-1219
912238 -07	TWA-1099-1219
912238 -08	Trip Blank

A 6020B internal standard failed the acceptance criteria for samples TWA-5 and TWA-6. The samples were diluted and reanalyzed with acceptable results. Both data sets were reported.

The 8082A PCB surrogate failed below the acceptance criteria in sample TWA-6. The data were flagged accordingly. There was insufficient sample for reextraction and reanalysis.

Several compounds in the 8260C matrix spike, matrix spike duplicate, laboratory control sample and laboratory control sample duplicate exceeded the acceptance criteria. The analytes were not detected in the samples, therefore the data were acceptable.

Benz(a)anthracene in the 8270D matrix spike and matrix spike duplicate exceeded the acceptance criteria. The analyte was not detected in the samples, therefore the data were acceptable.

All other quality control requirements were acceptable.

QUALITY ASSURANCE RESULTS FOR THE ANALYSIS OF WATER SAMPLES FOR POLYCHLORINATED BIPHENYLS AS AROCLOR 1016/1260 BY EPA METHOD 8082A

Laboratory Code: 912238-05 (Matrix Spike)

Analyte	Reporting Units	Spike Level	Sample Result	Percent Recovery MS	Percent Recovery MSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	ug/L (ppb)	0.25	<0.1	62	63	50-150	2
Aroclor 1260	ug/L (ppb)	0.25	<0.1	65	72	50-150	10

Laboratory Code: Laboratory Control Sample

Analyte	Reporting Units	Spike Level	Percent Recovery LCS	Percent Recovery LCSD	Acceptance Criteria	RPD (Limit 20)
Aroclor 1016	ug/L (ppb)	0.25	76	78	35-111	3
Aroclor 1260	ug/L (ppb)	0.25	72	74	29-130	3

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on December 13, 2019 from the POT-Hylebos, F&BI 912238 project. There are 10 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on December 13, 2019 by Friedman & Bruya, Inc. from the Crete Consulting POT-Hylebos, F&BI 912238 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
912238 -01	TWA-5
912238 -02	TWA-6
912238 -03	TWA-1120
912238 -04	SB-1A-1219
912238 -05	SB-2A-1219
912238 -06	SB-3A-1219
912238 -07	TWA-1099-1219
912238 -08	Trip Blank

The 8270D full list analysis was performed using 8270D SIM extracts. The samples were not prepared using full list 8270D surrogates or QC, therefore the reported concentrations should be considered estimates. In addition, an acid phase separation was not performed and the affected compounds were reported with a ca qualifier.

All other quality control requirements were acceptable.

Note: Surrogates have not been added.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Jamie Stevens, Project Manager
Crete Consulting
108 S. Washington St., Suite 300
Seattle, WA 98104

Dear Ms Stevens:

Included are the additional results from the testing of material submitted on December 13, 2019 from the POT-Hylebos, F&BI 912238 project. There are 26 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on December 13, 2019 by Friedman & Bruya, Inc. from the Crete Consulting POT-Hylebos, F&BI 912238 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Crete Consulting
912238 -01	TWA-5
912238 -02	TWA-6
912238 -03	TWA-1120
912238 -04	SB-1A-1219
912238 -05	SB-2A-1219
912238 -06	SB-3A-1219
912238 -07	TWA-1099-1219
912238 -08	Trip Blank

Per request, 6020B copper and mercury were requantified using a lower reporting limit and selenium was added to the samples.

The 6020B dissolved copper internal standard recoveries in samples TWA-5 and TWA-6 were outside of control limits. The data were qualified accordingly.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

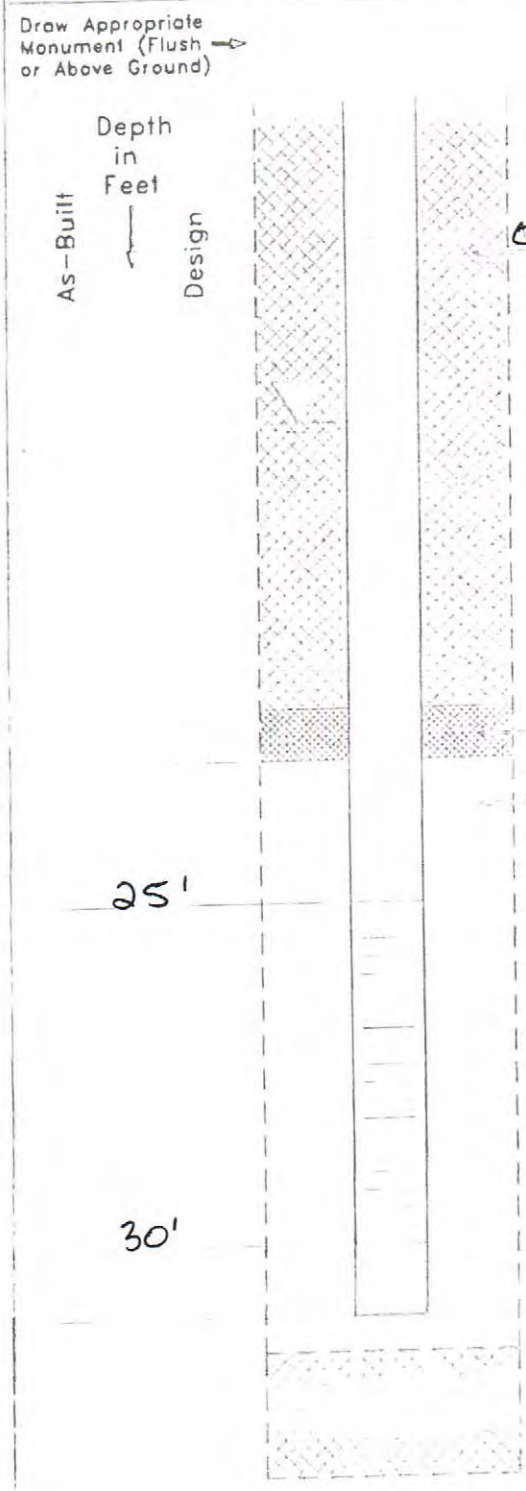
Boring Log: Sheet 2 of 2

CRETE CONSULTING, INC.

WELL INSTALLATION REPORT

Well No. TWA-6D
Job well tag ID # BLU-456
Date 11.7.2019
Job No.
Observer Waldo
Drilling Method Sonic



Approx. Elevation
Type of Monument groundwater well
Stickup Monument — X — Well
Seal Material
Borehole Diameter
Drillers: Holocene Drilling
Water Level Date ~6.5 ~~6.7~~ 11.7.2019
Riser Pipe Diameter 2 inch
Riser Pipe Material schedule 40 PVC
Type of Joints
"O"-Ring Seals? (Yes) No
Seal Material Bentonite to surface
Filter Pack Material 2/12 silica sand
Filter Pack Size —
Screen Diameter 2 inch
Screen Material —
Screen Slot Size 0.010-inch slotted
Screen Construction: Milled / Wire Wound
Tail Pipe Diameter 2"
Tail Pipe Length 4"
Tail Pipe Material
Bottom Seal Type

CONSULTING, INC

conductor set at 9.5 to 12.5' to seperate shallow and deep groundwater

60										

Total Depth = 60.0 feet bgs

NOTES:

1. bgs = below ground surface. 2. Depths are relative to feet below ground surface. 3. ID = identification. 4. PID = photoionization detector. 5. ppm = parts per million. 6. CB = core barrel. 7. GW = groundwater sample.

Borehole Completion Details

0 to 3.0 feet: Concrete.
3.0 to 50.0 feet: Bentonite chips hydrated with potable water.
50.0 to 58.0 feet: 10/20 silica sand.
58.0 to 60.0 feet: Slough.

Monitoring Well Completion Details

Washington State Department of Ecology Well No. BNN188.
Traffic-grade, above ground monument with 3 bollards, 3 foot stickup.
+2.5 to 52.0 feet: 2-inch diameter, schedule 40, polyvinyl chloride riser pipe.
52.0 to 57.0 feet: 2-inch diameter, schedule 40, polyvinyl chloride, 0.010 machine slot, well screen with threaded polyvinyl chloride end cap.
Total well completion depth is approximate.

Subject: Taylor Way and Alexander Ave Fill Area (TWAAFA) Site - CleanCare Vapor Sampling and Parcel A Soil Sample Data Validation Summary
Client Project No.: Not Specified
QA/QC Solutions, LLC Project No.: 092221.1

Dear Tasya:

This letter documents the results of the data validation summary of selected organic compounds completed on soil and soil vapor gas samples associated with the August and September sampling events associated with the Taylor Way and Alexander Ave Fill Area (TWAAFA) Site - CleanCare Vapor Sampling and Parcel A Soil Sample located in Tacoma, Washington.

The available data were validated to verify applicable laboratory quality assurance and quality control (QA/QC) measurements were reported, documented, and of sufficient quality to support its intended purpose(s). A summary of the overall assessment of data quality, the data set, a summary of the analytical methods used to complete the chemical analyses, a summary of the data validation procedures used, and a summary of the reasons why data were qualified (including other items noted during data validation) is presented below.

Overall Assessment of Data Quality

Overall, the data reported are of good quality and the results for the applicable QA/QC measurements that were used by the laboratories during the analysis of the samples were generally acceptable. Some sample results required qualification during data validation because method-specific QA/QC criteria were not met; results maybe qualified for more than one reason. During data validation the following actions were taken:

- A total of 46 results required qualification as estimated (*J*).
- A total of 4 results required restatement as undetected and estimated (*UJ*).
- No results reported as detected required restatement as undetected (assigned a *U* qualifier).
- No results required rejection (*R*).

Analytical data that did not meet method- and/or laboratory-established control limits for applicable quality control measurements were qualified as estimated (*J or UJ*) by the laboratory or during data validation. These qualified data are usable and represent data of good quality and reasonable confidence and have an acceptable degree of uncertainty (i.e., may be less precise or less accurate than unqualified data). Analytical data that were reported as undetected (*U or UJ*) by the laboratory or during data validation are usable.

Data Set

The data set consisted of one soil sample, one aqueous trip blank, and 27 soil gas samples, and 1 soil gas field duplicate sample that were collected on between August 31, 2021 and September 1, 2021.

Analyses were completed by Friedman & Bruya, Inc. Environmental Chemists located in Seattle, Washington. The laboratory submitted three hardcopy data validation deliverable and electronic data deliverable (EDDs).

Analytical Methods

The analytical methods used to complete the chemical analyses are listed as follows and are also listed in Table 2.

- On the soil sample and trip blank, gasoline-range petroleum hydrocarbons by purge and trap and analysis by gas chromatography/flame ionization detection (GC/FID) using the Washington Department of Ecology NWTPH-Gx method (Ecology 1997).
- On the soil sample, diesel- and oil-range petroleum hydrocarbons by extraction and analysis by GC/FID using the Washington Department of Ecology NWTPH-Dx (extended) method (Ecology 1997).
- On the soil sample, total metals (arsenic, cadmium, chromium, copper, lead, manganese, mercury, nickel, selenium, and zinc by digestion with nitric acid and analysis by inductively coupled plasma-mass spectrometry (ICP-MS) EPA Method 200.8 (U.S. EPA 1994).
- On the soil sample, semivolatile organic compounds (SVOCs) for 66 target analytes (including co-eluting SVOCs) by extraction and analysis by gas chromatography/mass spectrometry (GC/MS) using U.S. EPA SW-846 Method 8270E (U.S. EPA 2021).
- On the soil sample and trip blank, volatile organic compounds (VOCs) for 63 target analytes (including co-eluting VOCs) by purge and trap and analysis by GC/MS using U.S. EPA SW-846 Method 8260D, respectively (U.S. EPA 2021).
- On the soil sample, polychlorinated biphenyls (PCBs) for nine Aroclors® by extraction and analysis by gas chromatography/electron capture detection (GC/ECD) using U.S. EPA SW-846 method 8082A (U.S. EPA 2020).
- On all air samples, analyses were completed for air phase hydrocarbon (APH) ranges for APH EC5-8 and EC9-10 Aliphatics and APH EC9-10 Aromatics by the Method for the Determination of Air Phase Hydrocarbons (MA APH) prepared by the Massachusetts Department of Environmental Protection (MA APH 2009) using GC/MS).

- On all air samples, analyses were completed for 11 VOCs (including co-eluting VOCs) by gas chromatography/mass spectrometry (GC/MS) EPA Method TO-15 (U.S. EPA 1999).

Data Validation Procedures

Data validation procedures included evaluating a summary of the sample results and applicable quality control results reported by the laboratory; this level of validation is also referred to as an abbreviated data review (equivalent to "Stage 2A/2B" review per U.S. EPA 2009. The analytical data were validated generally following the applicable guidance and requirements:

- Method-specific and laboratory-established quality control requirements, as applicable.
- Guidance on Environmental Data Verification and Validation (U.S. EPA 2002)
- Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use. OSWER No. 9200.1-85. EPA 540-R-08-005. (U.S. EPA 2009).
- National Functional Guidelines for Organic Superfund Methods Data Review. OLEM 9240.0-51 EPA 540-R-20-005 November 2020 OLEM 9355.0-136. USEPA-540-R-2017-002. June 2017. U.S. Environmental Protection Agency (EPA), Office of Superfund Remediation and Technology Innovation (OSRTI), Washington, DC. (U.S. EPA 2020a).
- National Functional Guidelines for Inorganic Data Superfund Data Review. Final. OLEM 9240.1-66 EPA 542-R-20-006 November 2020. U.S. Environmental Protection Agency (EPA), Office of Superfund Remediation and Technology Innovation (OSRTI), Washington, DC. (U.S. EPA 2020b).

The laboratory data deliverables that were validated and available for review included the following:

- Case narratives discussing analytical problems (if any) and procedures.
- Chain-of-custody documentation to verify completeness of the data set.
- Sample preparation logs or laboratory summary result forms to verify analytical holding times were met.
- Results for applicable method blanks and trip blanks to determine whether an analyte that may have been reported as detected in a sample was the result of possible contamination introduced at the laboratory or during transport of samples, respectively.
- Results for applicable surrogate compound, laboratory control sample (LCS) (i.e., blank spike), duplicate LCS, matrix spike (MS), and matrix spike duplicate (MSD) recoveries to assess analytical accuracy.
- Results for applicable laboratory duplicate sample, duplicate LCS, and MSD analyses to assess analytical precision.
- Laboratory summary of analytical results.

Verification and validation of 100-percent of all applicable laboratory calculations, transcriptions, review of instrument printouts, and review of bench sheets were not completed during the data validation review. There may be analytical problems that could only be identified by reviewing every instrument printout and

associated analytical quality control results. Verification of all possible factors that could result in the degradation of data quality was not completed nor should be inferred at this time. The laboratory case narratives did not indicate any significant problems with data that were not reviewed during data validation. The adequacy of the sampling procedures was not completed during the data validation.

Performance based control limits established by the laboratory, applicable control limits specified in the analytical methods, and best professional judgement were used to evaluate data quality and to determine if specific data required qualification. Data qualifiers were assigned during data validation following guidance specified by U.S. EPA (2002, 2020a, and 2020b) to the EDD when applicable QC measurement criteria were not met and qualification of the data was warranted.

Reasons for Data Qualification

The reasons for qualification of samples results are summarized in Table 2 (Summary of Qualified Data).

General Comments:

- Several samples required multiple dilutions.

This concludes the data validation review. Should you have any questions regarding the information presented herein, please contact me by telephone at 503.763.6948 or by e-mail at jjmcateer@msn.com.

Cordially,

James J. Mc Ateer, Jr., BS, MRSC

Dalton Olmsted Fuglevand
1001 SW Klickitat Way
Seattle, WA 98134

Dear Mr Louviere:

Included are the results from the testing of material submitted on August 31, 2021 from the TWAAFA-001, F&BI 108515 project. There are 36 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

CASE NARRATIVE

This case narrative encompasses samples received on August 31, 2021 by Friedman & Bruya, Inc. from the Dalton Olmsted Fuglevand TWAAFA-001, F&BI 108515 project. Samples were logged in under the laboratory ID's listed below.

Laboratory ID	Dalton Olmsted Fuglevand
108515 -01	TWS-SV-1-083121
108515 -02	TWS-SV-10-083121
108515 -03	TWS-SV-2-083121
108515 -04	TWS-SV-11-083121
108515 -05	TWS-SV-3-083121
108515 -06	TWS-SV-4-083121
108515 -07	TWS-SV-12-083121
108515 -08	TWS-SV-13-083121
108515 -09	TWS-SV-13-083121-D
108515 -10	TWS-SV-14-083121
108515 -11	TWS-SV-9-083121
108515 -12	TWS-SV-16-083121
108515 -13	TWS-SV-6-083121
108515 -14	TWS-SV-5-083121

Individually certified canisters were provided for TO-15 sampling.

Non-petroleum compounds identified in the air phase hydrocarbon (APH) ranges were subtracted per the MA-APH method.

Several APH ranges and TO-15 target analytes exceeded the calibration range of the instrument. The data were flagged accordingly.

All other quality control requirements were acceptable.

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht – The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

FORMS\COC\COCTO-15.DOC

SAMPLE CONDITION UPON RECEIPT CHECKLIST

PROJECT # 108515 CLIENT DOF INITIALS/ DATE: NP 8/31/21

If custody seals are present on cooler, are they intact? ☑ NA ☐ YES ☐ NO

Cooler/Sample temperature 19 °C

Were samples received on ice/cold packs? ☐ YES ☑ NO

How did samples arrive?
- ☐ Over the Counter
- ☑ Picked up by F&BI
- ☐ FedEx/UPS/GSO

Number of days samples have been sitting prior to receipt at laboratory 0 days

Is there a Chain-of-Custody* (COC)? ☑ YES ☐ NO
*or other representative documents, letters, and/or shipping memos

Are the samples clearly identified? (explain "no" answer below) ☑ YES ☐ NO

Is the following information provided on the COC* ? (explain "no" answer below)

Sample ID's	☑ Yes	☐ No	# of Containers	☑ Yes	☐ No
Date Sampled	☑ Yes	☐ No	Relinquished	☑ Yes	☐ No
Time Sampled	☑ Yes	☐ No	Requested analysis	☑ Yes	☐ No

Were all sample containers received intact (i.e. not broken, leaking etc.)? (explain "no" answer below) ☑ YES ☐ NO

Were appropriate sample containers used? (explain "no" answer below) ☑ YES ☐ NO

If custody seals are present on samples, are they intact? ☑ NA ☐ YES ☐ NO

Are samples requiring no headspace, headspace free? ☑ NA ☐ YES ☐ NO

Air Samples: Were any additional canisters received? ☐ NA ☐ YES ☑ NO

If Yes, number of unused 1L canisters _____

number of unused 6L canisters _____

Explain "no" items from above (use the back if needed)

EPA TO-15
Checklists

F&B Project 108515

TO15 Sequence Procedure

7016D Previous Run

- ☑ Print sequence from Chemstation (colored and white paper).
- ☑ Compare Entech and Chemstation sequences
- ☑ Check Entech position and canister #:
  Position 2 to 6
  Position _____ to _____

TO15 Tear Down
(previous day samples done running)

- ☑ Close all canisters (blue valves)
- ☑ Remove canisters on tree- EXCEPT Rinse (Position 1)
  loosten nut closest to tree.

If hissing occurs. List cans below under "Canisters Vented".

- ☑ Handtighten caps onto canisters
- ☑ Place canisters on floor next to tree
- ☑ If certified canisters, check starting pressure. Record any less than 20 PSI below

TO15 Start Up

- ☑ Check all canisters closed: Rinse, Cal, IS, and lines 2,3, 4
- ☑ Cleaning System ~1hr
  Flush x2: (O) ✓ (C) ✓
  (If only can cert was ran x1, closed)
  Leak check : ✓
- ☑ Clean Lines ~35min _____
  Entech: Load Morning System Condition
- ☑ Entech: Load sequence: TO15MorningSTARTUP
  Change name to month, day, and sample: (080501)
  Chemstation: Load TO15Morning sequence
  Change name, data path, and batch number
  Run Sequence
- ☐ Open all cans attached: Rinse, Cal, IS, and lines 2,3, 4
  Run sequence on Entech

Certified Canisters with starting pressure below 20 PSI	**Canisters Vented**
☐ Check if none	☐ Check if none
_____	_____
_____	_____

Notes:_____
