Two USTs (gas, diesel) were removed from this property in 1992. Identified PCS was overexcavated and confirmation soil samples from sidewalls and bottom of excavation were ND for diesel, gas, BTEX. Excavated PCS (53 tons) were disposed off-site. However, something is missing. A figure shows three USTs and points out three excavations but report only mentions one. There is no clear figure showing sampling locations and no explanation in narrative. Only 2 samples were analyzed for diesel but not oil and one of the three tanks was a heating oil. If three excavations were done, as the figure shows, then

SITE NAME Shop & Equipment Yard

the correct number of samples were not collected and analyzed since bottom and sidewall samples from 2 excavations had to been analyzed for diesel and heavy oil (total of at least 6 samples) and then at a minimum three for gas/BTEX. Seems that Ecology's protocol was not followed.
