COMMENTS

One diesel UST was removed in 1995 and three diesel USTs were removed in 1996. During the 1995 removal approx. 300 tons of PCS were overexcavated and disposed within the on-site landfill. Confirmation samples collected after overexcavation indicated that remaining soils were below MTCA for diesel. GW was encountered during excavation and appeared impacted but was not assessed. During the 1996 removal, each tank was removed from a separate excavation. Confirmation soil samples from two of the tanks were below MTCA for diesel and a GW sample from one of these was at MTCA. The

third excavation was above MTCA as 280 ppm TPH and a GW sample was also above MTCA for TPH as 2 ppb. The consultant dewatered the excavation and an additional 20 cy of PCS were overexcavated from the third UST pit. Confirmation soil samples were below MTCA for TPH after dewatering and overexcavation. In 2000, Ecology changed the status of this site to RCU.
