COMMENTS

This site is a lumber mill in Everson who clean lumber imported from Canada. No wood treating is done at the site and they do not use haz. materials. Two USTs (gas, diesel) were removed from this property in 1999. Approx. 15 cy of PCS were overexcavated and disposed off-site. Results of confirmation soil samples from the excavation were ND for gas, diesel, and heavy oil TPH (HCID). The one soil stockpile sample was above MTCA for diesel (410 ppm). No GW was encountered during excavation. The excavation was backfilled with clean imported fill. A TCP file for the site was also observed. Apparently,

the site used to dispose of extra/waste glue on the boneyard. An Ecology official went on a site inspection in 2004 after the Company conducted cleanup and indicated the site looked much cleaner and there were no signs of the glue. He indicated he had no idea what was the final disposition of the glue material removed. He indicated he thought the matter was an NFA. A Toxic cleanup inspection in 2004 also brought the attention of Ecology regarding about 30 "blue drums" on pallets containing waste oil or empties, and old rusty unlabeled drums observed. The site called for pick up and disposal of these while Ecology was on-site. Other site inspections on 2003 and 2004 dealt with housekeeping and BMPs on waste disposal, secondary containment, oil and red paint overspray on the ground, hydraulic oil leaking from forklifts, and they pour oil on chainsaws. Numerous internal e-mails were observed regarding the BMPs, and site visits. A final e-mail (July 2004) with the final site visit indicated that the drums were properly disposed of, the milky substance (glue) had been removed from soil, and the boneyard looked much cleaner. Ecology indicated the owner would send receipts for disposal etc. but no confirmation sampling was done. Another e-mail had confirmed that the paperwork had arrived and that the matter was considered and NFA. No additional info in file.
