1.0 Introduction

This report was prepared by Leidos on behalf of the Washington State Department of Ecology (Ecology), in support of ongoing investigations along the Lower Duwamish Waterway (LDW) area of Seattle. This report presents the results of an environmental investigation to sample soil on a small portion of the Duwamish Waterway Park near the shore of the LDW. The investigation was performed according to the *Sampling and Analysis Plan with Inadvertent Discovery Plan for Site Reconnaissance Investigation* (Leidos 2021). This SAP document also included a site-specific Quality Assurance Project Plan (QAPP). The evaluation and conclusions regarding soil contamination at this site are included in Section 3.3 below.

Duwamish Waterway Park (DWP) is an important recreational resource to the South Park Community in Seattle. DWP is located at 10th Avenue S and S Elm Grove Street (Figure 1). The Seattle Parks and Recreation Department investigated soil contamination at the portion of the DWP located on Seattle City land in 2014 to 2019. Surface soil samples collected in 2014 contained concentrations of arsenic that exceeded the Washington State Model Toxics Control Act (MTCA, Ecology 2013b) Method A cleanup level based on unrestricted (residential) land use. Deeper soil samples were collected in 2019, with concentrations of arsenic and lead exceeding the Method A cleanup level. Other contaminants beyond these two chemicals may also be present in soil. The Parks and Recreation Department did not sample the entirety of the City-owned property or the commercial waterway land controlled by the Port of Seattle. As a result, it was not known if contamination extends toward the Lower Duwamish Waterway (LDW) onto this Port-controlled property.

The Washington State Department of Ecology (Ecology) has contracted Leidos to perform an initial environmental investigation on the portion of the park that is controlled by the Port of Seattle, which is in the northeastern area of the park (see Figure 1). This investigation completes a reconnaissance investigation of the site, including sampling and analyzing soil for a wide range of potential contaminants, to evaluate possible exposure pathways to human and ecological receptors.

The primary purpose of this sampling and analysis effort is to collect soil samples from several locations within the commercial waterway land (Port of Seattle “sliver”) and analyze these samples for polychlorinated biphenyls (PCBs), semivolatile organic compounds (SVOCs), total petroleum hydrocarbons (TPH), and metals. Sample analytical results may be used for the following purposes:

- Determine if PCBs, SVOCs, TPH, and metals in soil are present at levels of concern in soils at the park adjacent to the LDW bank.
- Evaluate the pathways where soil contaminants at the park could affect human or ecological receptors via direct contact, erosion of soil to LDW sediment, and leaching of soil to groundwater that could discharge to the LDW.

A summary of the terrestrial ecological evaluation is included in Appendix A.

2.0 Field Activities

2.1 Field Schedule

Investigation field activities included sampling of shallow soil for analysis, description of soil samples, collection of an equipment rinse sample for analysis, decontamination, and measurement of field boring locations. All field activities took place on April 29, 2021.

2.2 Soil Sampling

The SAP (Leidos 2021) directed the sampling of up to six borings by hand auger techniques, at depths up to 4 feet below ground surface (bgs). Samples were to be collected in the following approximate depth ranges at each boring: 0-1, 1-2, 2-3, and 3-4 feet bgs.

During the actual sampling, all six borings were capable of being augered and sampled for soil. However, due to refusal on rocks and debris in the soil, the final depths of the six borings ranged from 2 to 3.5 feet bgs. Table 1 presents information on the soil borings and the samples collected. The six soil boring locations are presented in Figure 2. The first three borings (DWP-SB-1, DWP-SB-2, and DWP-SB-3) were located adjacent to three sides of a concrete slab that supports a park bench, situated a few feet away from the slab. The last three borings (DWP-SB-4, DWP-SB-5, and DWP-SB-6) were located in a row approximately parallel to the parcel boundary, situated a few feet from the boundary. The boundary location was identified via a GIS map using a satellite photo, and confirmed in the field by a representative of the Seattle Parks and Recreation Department. At the time of sampling, a construction silt fence separated these first three and last three borings.

The procedure for soil sampling was performed according to the SAP, including the following steps at each boring:

- The surface grass and attached roots at the boring location were removed with a shovel and set aside.
- Hand augering proceeded in one-foot increments, and the soil lithologic description was recorded for each sampling interval (Table 1).
- Soil was homogenized within each increment in an aluminum foil-lined stainless steel bowl using a stainless steel spoon.
- Homogenized soil for each increment was placed into laboratory-supplied jars, which were then placed into an iced cooler chest.
- Hand augering continued at each boring until solid refusal was encountered after multiple attempts to get through the rocks/debris.
- Decontamination of sampling equipment took place before any sampling began and then following collection of each sample.
- Remaining soil was returned to the borehole, compacted, and the grass divot was replaced onto the surface.

Between each sample, all soil sampling equipment (hand auger, spoons, and bowls) were decontaminated using a three-part wash/rinse process consisting of a Liquinox™ scrub wash, a tap water rinse, and a deionized/distilled water rinse.

One soil field duplicate sample was collected at location DWP-SB-1 (at 0-1 feet bgs). Including the field duplicate, a total of 21 soil samples were collected and submitted for analysis. One equipment rinse sample (ER-1) was collected on the hand auger, by pouring laboratory reagent-grade water through the decontaminated auger and collecting the drainage into sample jars.

All soil encountered during this investigation consisted of firm, dense fill material. The soil contained fragments of anthropogenic debris, including brick, glass, asphalt, tile, and a rusted metallic object. The water table was not encountered in any boring, and soil samples were described as damp to very moist.

2.3 Sample Handling

The samples in the ice cooler chest were returned to the Leidos Bothell office warehouse following sample collection on April 29, 2021 and placed in the sample refrigerator until the day of pickup by the laboratory. The samples in the cooler, with chain-of-custody form, were picked up by a laboratory courier on May 4th and delivered to the analytical laboratory. The laboratory utilized for this project was Eurofins Frontier Global Sciences (formerly TestAmerica), located in Fife, Washington.

3.0 Analytical Results

3.1 Laboratory Analyses

All soil samples for this project were analyzed for the following laboratory analyses by Eurofins:

- Polychlorinated Biphenyl (PCB) Aroclors by EPA Method 8082A (low-level)
- Semivolatile Organic Compounds (SVOCs) by EPA Method 8270E (low-level)
- Total Petroleum Hydrocarbons (TPH) for diesel-range organics and heavy oils by Ecology Method NWTPH-Dx
- Metals by EPA Methods 6020B (low-level) and 7471A
- Total Organic Carbon (TOC) by Method SW 9060A
- Percent Moisture by Method SM 2540G

The one equipment rinse sample was analyzed for the following laboratory analyses by Eurofins:

- PCB Aroclors by EPA Method 8082A
- SVOCs by EPA Method 8270E (low-level)
- TPH for diesel-range organics and heavy oils by Ecology Method NWTPH-Dx
- Metals by EPA Methods 6020B (low-level) and 7470A

3.2 Data Validation

A comprehensive quality assurance/quality control (QA/QC) program was followed by Leidos for the DWP Initial Investigation to ensure that analytical results and any decisions based on these results are representative of the environmental conditions.

All samples were submitted to Eurofins Frontier Global Sciences in one sample delivery group. The laboratory provided Leidos with a Level IV deliverable package, with three revisions, suitable for Leidos to validate the analytical results. The analytical data generated during the investigation, including all soil and equipment rinse samples, underwent data verification and validation according to EPA Stage 2B validation (EPA 2009). Guidance from the QAPP (Leidos 2021) and EPA's National Functional Guidelines for data review (EPA 2004, 2008) were applied during the data validation process. The project data validation summary report is provided in Appendix B. The analytical laboratory data report is provided in Appendix C.

The following data validation qualifiers were applied to the analytical results, as dictated by laboratory QC outliers:

- **U** – Non-detect. Indicates the analyte was analyzed for, but not detected above the level of the associated value. These results are qualitatively acceptable.
- **J** – Estimated. The analyte was detected and identified. The numerical value is the approximate concentration of the analyte in the sample. These results are qualitatively acceptable but considered as estimates.

- **UJ** – Estimated non-detect. Indicates the analyte was analyzed for, but not detected above the associated value. However, the reported value is an estimate. These results are qualitatively acceptable but considered as estimates.
- **R** – Rejected. The data are unusable, and the presence or absence of the analyte cannot be verified.

Validation adjustments to sample result qualifiers are individually listed in Appendix B. For the samples collected during the Duwamish Waterway Park Initial Investigation, 99.8 percent of the analytical data were considered usable. The overall quality of the data meets or exceeds the established project objectives. Only two sample results were rejected. Benzoic acid was rejected in samples DWP-SB-3-0 and DWP-SB-4-2 due to matrix spike / matrix spike duplicate (MS/MSD) recoveries less than 10 percent. In all the project samples, benzoic acid was never detected.

The laboratory also noted a temperature blank anomaly during sample receipt, as discussed in Appendix B.

3.3 Soil Sample Results

3.3.1 Comparison to Preliminary Cleanup Levels

This section provides a summary and discussion of validated analytical results and comparison with MTCA cleanup level criteria for soil samples collected at the site. Cleanup levels and metals background values are taken from Ecology's LDW Preliminary Cleanup Level (PCUL) workbook, which is updated periodically (Ecology 2021). The PCUL workbook includes criteria from all pertinent regulations, including MTCA (Ecology 2013b) and the Sediment Management Standards (Ecology 2013a).

In consultation with Ecology, four PCUL soil criteria in addition to natural background metals concentrations were utilized for this evaluation. PCULs were selected based on the exposure pathways and receptors that have been identified for this site. These PCULs include the following criteria, using the SL (soil) designations in the workbook (Ecology 2021):

- Method B direct contact, human health, unrestricted land use (SL-1)
- Protection of surface water via groundwater from soil leaching, vadose zone (SL-3)
- Protection of sediment via erosion of soil (SL-8)
- Simplified terrestrial ecological evaluation (TEE), unrestricted land use (SL-9, modified, see Appendix A)
- Natural background for metals in soil, Puget Sound region (SL-10)

The first four bulleted PCULs above are used as direct comparison criteria in this report. The fifth bulleted item (natural background) is applied across the other four criteria, such that none of these metals PCUL values can be lower than the background concentration. If any PCUL values are lower than background, the PCUL value is elevated to the corresponding background concentration.

A summary data table of soil sample maximum concentrations and their exceedances of PCULs for each of the six borings is included in Table 2. A detailed listing of all individual soil sample

results, along with comparison to PCULs, is included in Table 3. The analytical data for the equipment rinse sample data is included in Table 4.

In Tables 2 and 3, the PCULs are arranged in order of approximate prioritization of criteria based on current site exposure concerns. On the left is the highest priority PCUL, SL-1, direct contact by humans within surface soil and shallow soil. This is followed by concerns for terrestrial ecological receptors exposure to soil (SL-9, modified for simplified TEE). This is followed by protection of LDW sediment due to erosion of upland soil near the shore (SL-8). And lastly, on the right, is vadose zone soil leaching to groundwater and discharging to LDW surface water (SL-3).

The evaluation in these tables indicates that a total of 20 chemicals (hazardous substances) have concentrations that exceed one or more of these PCULs in soil samples at the site, including exceedances for both detected and non-detected concentrations. Table 2 includes only these 20 chemicals, and it lists the maximum concentration from each soil boring for the chemicals that exceed PCULs in that boring. This table specifies which of the four PCULs show exceedances in each boring. As expected, the most number of exceedances are for SL-3, leaching of soil to surface water, because this pathway generally has the most conservative (lowest) PCUL values.

Table 3 presents all the analytical data for all samples and all chemicals, and thus the highlighted colored exceedances are only shown for one PCUL per individual analytical result (for simplicity in this large table). Consequently, the above exposure prioritization of PCUL exceedances is applied, as explained in the table footnote. This means that if an analytical result is highlighted/colored as an exceedance (such as SL-1 in red), other PCULs may also be exceeded but only SL-1 is indicated due to the higher priority.

Figure 3 presents soil sample results for detected concentrations that exceed three PCULs. These include the three higher prioritized PCULs: human direct contact (SL-1), terrestrial ecological exposure (SL-9), and protection of sediment via soil erosion (SL-8). The fourth PCUL, leaching to groundwater and surface water (SL-3), is not utilized in this figure due to the large number of exceedances and lower prioritization for this pathway.

3.3.2 Evaluation of Soil Contamination

Arsenic was the only chemical with high enough concentrations that it exceeded all four PCUL values in a single sample. This situation was identified in each of the three samples collected in boring DWP-SB-4, with arsenic concentrations ranging from 25 to 300 mg/kg. Consequently, arsenic showed significantly elevated PCUL exceedance factors (multiples of the PCUL value), as discussed below. Soil samples from boring DWP-SB-4 contained the most number of exceedances and highest concentrations of chemicals in this investigation. The following is a summary for each boring of the highest detected concentrations of chemicals in this investigation (see Tables 2 and 3, and Figure 3):

- DWP-SB-1 did not include the highest concentrations for any chemical.
- DWP-SB-2 concentrations were highest for silver.
- DWP-SB-3 concentrations were highest for copper and pentachlorophenol.
- DWP-SB-4 concentrations were highest for total PCBs, antimony, arsenic, lead, zinc, and bis(2-ethylhexyl) phthalate.

- DWP-SB-5 concentrations were highest for selenium, butyl benzyl phthalate, diethyl phthalate, and dimethyl phthalate (note that phthalates and other chemicals are of potential concern for erosion of surface soils to LDW sediment).
- DWP-SB-6 concentrations were highest for mercury and for total carcinogenic polycyclic aromatic hydrocarbons – toxicity equivalent (total cPAH TEQ).

Because a high priority exposure concern for this site is human direct contact with shallow soils, the following summary focuses on the 0 to 1 foot bgs interval. Two borings show exceedances of PCUL SL-1 in this shallow soil interval, as listed in the table below with the concentrations and the PCUL exceedance factors.

Sample ID (0-1 foot bgs)	Chemical	Concentration (mg/kg)	SL-1 Exceedance Factor
DWP-SB-4-0	Antimony	180	5.6
	Arsenic	300	41
	Lead	340	1.4
	Total cPAH	0.31	1.6
DWP-SB-5-0	Arsenic	13	1.8

A secondary priority is the exposure of terrestrial ecological receptors to shallow soils. All six borings show exceedances of PCUL SL-9 (simplified TEE) in the 0 to 1 foot bgs interval, as listed in the table below.

Sample ID (0-1 foot bgs)	Chemical	Concentration (mg/kg)	SL-9 Exceedance Factor
DWP-SB-1-0 and duplicate	Copper	160	1.6
	Selenium	3.1	3.9
DWP-SB-2-0	Copper	140	1.4
	Selenium	3.1	3.9
DWP-SB-3-0	Copper	770	7.7
	Selenium	2.0	2.5
DWP-SB-4-0	Arsenic	300	15
	Copper	230	2.3
	Lead	340	1.5
	Selenium	2.1	2.6
	Zinc	1,100	4.1
DWP-SB-5-0	Selenium	1.9	2.4
DWP-SB-6-0	Selenium	2.3	2.9

In summary, a number of PCUL exceedances for chemicals, particularly metals, were identified at the Duwamish Waterway Park site. The highest concentrations and greatest PCUL exceedances of concern in this investigation are found in boring DWP-SB-4, with next highest concern levels found in DWP-SB-5. These two borings are located in the western portion of the investigation area, close to the Seattle city parcel line. Consequently, some contamination exposure risks from this park are present for human and ecological receptors.

Preliminary Cleanup Levels for Soil (PCUL values for metals have been adjusted to be no lower than natural background):

- Method B direct contact, unrestricted land use (SL-1)
- Simplified terrestrial ecological evaluation (TEE), unrestricted land use (SL-9, modified)
- Protect sediment via erosion of soil (SL-8)
- Protect surface water (SW) via groundwater from soil leaching, vadose zone (SL-3)
- Natural background for metals in soil, Puget Sound region (SL-10)

Italicized, colored PCUL values for SL-1, 3, 8, 9 (in left columns) are those values exceeded in one or more sample results (* = all non-detected exceedances).

The chemicals listed in this table are only those with concentrations that exceed at least one PCUL value in at least one sample from the site.

Maximum concentrations are shown for each soil boring where at least one PCUL value is exceeded in samples from that boring (bold exceedances are detected, non-bold are not detected).

For PCUL exceedances in each soil boring, an upper case "X" is for borings with at least one detected exceedance, and a lower case "x" is for borings with only non-detected exceedances.

J = estimated value (between reporting limit and method detection limit)

U = non-detected

Samples were all collected on 4/29/2021. All sample results are validated.

Preliminary Cleanup Levels for Soil (PCUL values for metals have been adjusted as needed for natural background):

- Method B direct contact, unrestricted land use (SL-1)
- Simplified terrestrial ecological evaluation (TEE), unrestricted land use (SL-9, modified)
- Protect sediment via erosion of soil (SL-8)
- Protect surface water (SW) via groundwater from soil leaching, vadose zone (SL-3)
- Natural background for metals in soil, Puget Sound region (SL-10)

Italicized, colored PCUL values for SL-1, 9, 8, 3 columns are those values exceeded in one or more sample results (* = all non-detected).

Green highlighted concentrations are greater than the most stringent PCUL value (bold exceedances = detected, non-bold = non-detected) For PCUL exceedances of sample results: the **SL-1 PCUL (red)** is prioritized first and all exceedances are colored; if SL-1 is not exceeded, then any **SL-9 (brown)** exceedances are colored; if both SL-1 and SL-9 are not exceeded, then any **SL-8 (purple)** exceedances are colored; lastly, if SL-1 and SL-9 and SL-8 are not exceeded, then any **SL-9 (blue)** exceedances are colored.

ft bgs = feet below ground surface (sample depth range)

APPENDIX A

TERRESTRIAL ECOLOGICAL EVALUATION DUWAMISH WATERWAY PARK INITIAL INVESTIGATION

The following evaluation was performed to determine the applicability of a terrestrial ecological evaluation (TEE) to this site, based on the process and definitions in MTCA (WAC 173-340-7490). The site is located in an area that currently does and likely will continue to attract some terrestrial wildlife receptors to a certain degree. This site does not qualify for a TEE exclusion via WAC 173-340-7491(1). The criteria in WAC 173-340-7491(2), which would require a site-specific TEE, do not apply to this site. To evaluate if a simplified TEE is required, the two exposure analysis components of WAC 173-340-7492(a) are utilized. For the first component, the contamination at the site does exceed 350 square feet, and thus the simplified TEE cannot be ended on this basis. For the second component, the procedure in MTCA Table 749-1 is applied, as detailed below:

- (1) The area of continuous (connected) undeveloped terrestrial land on the site or within 500 feet of any area of the site = approximately 1.8 acres (score = 8).
 - (2) Industrial or commercial property = No (score = 1)
 - (3) Habitat quality of the site = Low (score = 3)
 - (4) Undeveloped land likely to attract wildlife = No, not to a significant degree (score = 2)
 - (5) Are there certain soil contaminants present, including PCB mixtures and pentachlorophenol = Yes (score = 1)
 - (6) Add numbers above for items 2 through 5 = total of 7.
- If this score (of 7) is greater than the score for item 1 (which is 8), then the simplified TEE may be ended. Therefore, the simplified TEE must be conducted.

As a result of this evaluation, the priority contaminant concentrations for the simplified TEE in MTCA Table 749-2, for unrestricted land use, are applied in this report. Note that LDW preliminary cleanup level (PCUL) SL-9 refers to the site-specific TEE, and SL-9-modified is for the simplified TEE (Ecology 2021).

APPENDIX B
DATA VALIDATION REPORT
DUWAMISH WATERWAY PARK INITIAL INVESTIGATION

Introduction

A comprehensive quality assurance/quality control (QA/QC) program was followed by Leidos during the Duwamish Waterway Park Initial Investigation to ensure that analytical results and the decisions based on these results are representative of the environmental conditions.

Laboratory Quality Control Assessment

The analytical data generated during the investigation underwent data verification and validation according to EPA Stage 2B validation (EPA 2009). Guidance from the SAP/QAPP (Leidos 2021) and EPA's National Functional Guidelines for Organic Data Review (EPA 2008) and EPA's National Functional Guidelines for Inorganic Data Review (EPA 2004) were used during the data validation process, as described in the Section 3.2.4 of the SAP/QAPP. All samples were submitted to Eurofins Frontier Global Sciences (TestAmerica), Fife, Washington, and results were submitted in one sample delivery group.

Data Validation Summary

The following summary provides the information necessary to determine data usability for project decision-making. The data were verified and validated and the qualifiers described below were applied to data as appropriate. Results that were qualified as non-detect (U) or estimated (J or UJ) for various reasons during the validation process encountered minor analytical problems, but are considered fully usable for decision-making. Results that were rejected (R) were not used.

The following data validation qualifiers were applied to the results as dictated by laboratory QC outliers:

- *U* – Non-detect. Indicates the analyte was analyzed for, but not detected above the level of the associated value. These results are qualitatively acceptable.
- *J* – Estimated. The analyte was detected and identified. The numerical value is the approximate concentration of the analyte in the sample. These results are qualitatively acceptable but considered as estimates.
- *UJ* – Estimated non-detect. Indicates the analyte was analyzed for, but not detected above the associated value. However, the reported value is an estimate. These results are qualitatively acceptable but considered as estimates.
- *R* – Rejected. The data are unusable, and the presence or absence of the analyte cannot be verified.

The methods used for analysis of the samples collected during the DWP investigation are included in Table A, below.

Table A. Analytical Methods

Analytical Name	Analytical Method
PCB Aroclors	EPA 8082A (low-level for soil)
Semivolatile Organic Compounds	EPA 8270E (low-level)
Total Petroleum Hydrocarbons (DRO/ORO)	NWTPH-Dx (diesel/heavy oil)
Metals (Ag, As, Cd, Cr, Cu, Pb, Ni, Sb, Se, Zn)	SW 6020B (low-level)
Metals (Hg)	SW 7470A/7471A
Total Organic Carbon	SW 9060A
Percent Moisture	SM 2540G

Table B (on page 4-5) provides a summary of data that were qualified as a result of the validation and indicates the validation qualifiers, reason codes, and potential bias applied to the data. Reason code definitions are provided in Table C (page 6). The following items (as applicable) were examined during the data verification and validation process:

- Sample custody and sample receipt, integrity, and preservation
- Sample handling and preparation
- Sample holding times
- Sample dilutions
- Laboratory method blanks and initial/continuing calibration blanks
- Equipment rinse sample
- Instrument performance checks
- Initial and continuing calibrations
- Matrix spikes and matrix spike duplicates (MS/MSDs)
- laboratory control samples / laboratory control sample duplicates (LCS and/or LCSDs)
- Laboratory duplicates
- Serial dilutions
- Interference check samples
- Post-digestion spikes
- Surrogate recovery
- Internal standards

General Data Package Comments

The laboratory submitted all required deliverables, which involved three revisions to the analytical data report (Appendix C). The laboratory followed adequate corrective action processes and all anomalies were discussed in the case narrative, with a few minor exceptions.

All samples were received by the laboratory courier and the laboratory in good condition, properly preserved, and on ice. Upon receipt at the laboratory, the single cooler was checked in and initially noted as being without ice and at a temperature of 11.2°C. The laboratory later acknowledged in their narrative and in discussion that ice was actually included in the cooler; however, they maintained that the measured temperature was high.

Leidos believes that this anomalous temperature is erroneous based on the following history of sample storage and shipment. The samples in the ice cooler chest were returned to the Leidos

warehouse refrigerator on the evening of April 29, 2021. Samples and temperature blanks were placed in this dedicated sample refrigerator, which is consistently maintained at between 33°F and 40°F (0.6°C and 4.4°C).

The samples were then removed from this refrigerator on May 4, 2021, and placed immediately into a shipment cooler with two temperature blanks, a large bag of freezer ice, and the chain-of-custody form. The temperature blanks were placed adjacent to the samples, in direct contact with the ice. The sealed cooler was then picked up by a Eurofins laboratory courier about one hour after sample packaging, at 12 pm, and was delivered to the laboratory that afternoon.

This refrigerator is used frequently to store samples (only the DWP samples were in the refrigerator on these days), and this equipment and process has never resulted in a recorded laboratory temperature that is anywhere near this high (11.2°C), even for cases with delayed two-day shipment. Thus, given the history and timing of storage and delivery, Leidos believes that this anomalous recorded temperature is in error.

General Data Validation Comments

The results of the data validation process demonstrate that the overall quality of the data is acceptable to identify and quantify the contaminants listed in the SAP/QAPP (Leidos 2021) with the exception of two rejected results for benzoic acid. Benzoic acid was rejected in samples DWP-SB-3-0 and DWP-SB-4-2 due to MS/MSD recoveries less than 10 percent. GC/MS analysis has demonstrated that benzoic acid is one of the difficult, poor performing semivolatile compounds, and corrective action/reanalysis was not required.

Through data verification, validation, and review, the analytical data have been qualified as appropriate. Data are considered usable if they are not qualified or are qualified as estimated. For the samples collected during the Duwamish Waterway Park Initial Investigation, 99.8 percent of the data were considered usable. The overall quality of the data meets or exceeds the established project objectives. All data validation qualifiers and their associated reason codes are presented below.

Data Usability

Overall, data produced for this investigation demonstrate that it can withstand scientific scrutiny, are appropriate for its intended purpose, are technically defensible, and are of known and acceptable sensitivity, precision, and accuracy with the exception of the benzoic acid results discussed above. Data integrity has been documented through proper implementation of QA and QC measures. The environmental information presented has an established confidence that allows utilization for the project objectives and provides data for future needs.

CASE NARRATIVE
Client: Leidos, Inc.
Project: Duwamish Waterway Park
Report Number: 580-102849-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) resulting from a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are an unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes within the calibration range of the instrument or that reduces the interferences thereby enabling the quantification of target analytes.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

This report has been revised to include missing SVOC CCV data.

RECEIPT

The samples were received on 05/04/2021; the samples arrived in good condition, properly preserved and on ice. The temperature of the coolers at receipt was 11.2 C.

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.
