**RE: STATUS OF CLEANUP ACTION
COATINGS UNLIMITED
18420 68TH AVENUE SOUTH
KENT, WASHINGTON
VCP PROJECT IDENTIFICATION NO. XN0006
FARALLON PN: 2032-012**

Dear Frank:

Farallon Consulting, L.L.C. (Farallon) has prepared this letter on behalf of Lift Real Estate Partners Fund, LLC (Lift)¹ to provide the Washington State Department of Ecology (Ecology) with a summary of environmental investigation and remedial action activities completed to date at 18420 68th Avenue South in Kent, Washington (Property) (Figures 1 and 2).

The Property is part of the broader Site that is defined under the Washington State Model Toxics Control Act Cleanup Regulation (MTCA) and its implementing regulations as established in Chapter 173-340 of the Washington Administrative Code (WAC 173-340) as comprising the area where hazardous substances originating on or from the Property have come to be located at concentrations exceeding applicable cleanup levels. The Site is enrolled in the Expedited Voluntary Cleanup Program (EVCP) and has been assigned EVCP Project Identification No. XN0006.

Based on the results from the remedial investigation, the Site encompasses portions of the Property and specific areas at the boundary with the south-adjoining property at 18417 through 18421 72nd Avenue South in Kent, Washington. The south-adjoining property was enrolled in the Voluntary Cleanup Program (VCP) as “West Valley Business Park” in August 1999, and was assigned VCP Project No. NW0298. The West Valley Business Park was removed from the VCP in 2006 due to inactivity.

¹ Lift Real Estate Partners Fund, LLC is the VCP customer entity. Ownership of the property has been transferred to Lift II 18420 68th Ave LLC, and the latter entity is performing the cleanup activities.

Farallon conducted a remedial investigation and feasibility study between 2019 and 2021 to characterize the nature and extent of contamination, and to develop and evaluate a selection of potential cleanup action alternatives. The proposed cleanup action selected for the Site includes air-sparge (AS) and soil vapor extraction (SVE), limited soil excavation, engineered controls, and monitored natural attenuation. The remedial investigation and feasibility study are documented in the Remedial Investigation and Feasibility Study Report (RIFS).²

In December 2021, Ecology provided an opinion³ for the proposed cleanup action detailed in the RIFS. The opinion letter indicated that upon completion of the proposed cleanup for the Site, no further remedial action will likely be necessary at the Site. In addition, the opinion letter included a list of data gaps that required investigation. Specifically, Ecology requested: 1) installation of monitoring wells in potential source areas; 2) installation of monitoring wells proximate to reconnaissance groundwater samples with elevated concentrations of vinyl chloride and/or arsenic; and 3) installation of monitoring wells down-gradient of potential source areas depending on the results from the newly installed source area monitoring wells. A list of the data gaps is provided in Table 1.

Between January and April 2022, a subsurface investigation was conducted to evaluate the data gaps listed in the 2021 opinion letter. The results from the data gap subsurface investigation were used to: 1) update the conceptual site model; 2) redesign the selected cleanup action alternatives based on the updated conceptual site model; and 3) re-evaluate the costs to conduct the cleanup action alternatives.

In 2022, Lift decided not to pursue immediate redevelopment of the Property. Redevelopment may occur at a later date, but the Property will be leased in its current configuration for the foreseeable future.

In late-2022 and early-2023, the tenants vacated the Property. The small outbuildings and portable storage containers used for equipment, solvent, and paint storage on the southern portion of the Property, as well as the sandblast booth and associated equipment and material on the eastern portion of the Property, were demolished and removed. Following

³ Ecology. 2021. Letter Regarding Opinion on Proposed Cleanup of the Following Site: Coatings Unlimited Inc Kent, 18420 68th Avenue South, Kent, Washington 98032. From Frank Winslow. To Matthew Bean, Lift Real Estate Partners Fund, LLC. December 27 (2021 opinion letter).

this activity, source areas were accessible at the Property and selected components of the approved cleanup action were implemented based on the redesign of the selected cleanup action alternative.

This letter includes a summary of the data gap subsurface investigation activities and results, an updated conceptual site model, and a summary of the necessary modifications to the cleanup action alternatives evaluated based on the updated conceptual site model and future land use.

DATA GAP INVESTIGATION

The objective of the data gap investigation was to collect and evaluate sufficient data to address the data gaps identified by Ecology in the 2021 opinion letter. Table 1 includes a list of the data gaps and the scope of work completed to evaluate each data gap.

The data gap investigation was conducted between January and April 2022, and consisted of monitoring well installation and development, soil sampling, and groundwater monitoring. A summary of the data gap investigation activities conducted to address the data gaps is provided in the following sections.

MONITORING WELL INSTALLATION

Prior to installation of monitoring wells, Farallon retained public and private utility locating services to clear the proposed boring locations and provide additional information pertaining to the locations of subsurface utilities at the Property. Linescape, LLC of Seattle, Washington conducted a private utility locate at the Property. The private utility locate also included a video survey of the accessible sanitary sewer lines. The layout of the sanitary sewer lines is shown on Figure 2.

Holt Services, Inc. of Edgewood, Washington and Cascade Drilling LP of Woodinville, Washington installed monitoring wells FMW-18 through FMW-31 to a maximum depth of 20 feet below ground surface (bgs) using a direct-push drill rig at the locations shown on Figure 3.

During drilling, a Farallon geologist observed and logged subsurface conditions, and retained soil samples from selected intervals for laboratory analysis based on field indications of potential contamination. The information recorded for each boring log included soil types encountered, visual and olfactory observations (e.g., staining, odor), and

volatile organic vapor concentrations as measured using a photoionization detector. Boring logs are provided in Attachment A.

Soil samples were collected and transferred directly into laboratory-prepared glass sample containers. Soil samples collected for analysis for volatile organic compounds (VOCs) were fitted with a Teflon-lined lid in accordance with U.S. Environmental Protection Agency (EPA) Method 5035A for sampling for VOCs. Soil samples collected from the borings were placed on ice in a cooler under standard chain-of-custody protocols and delivered to OnSite Environmental Inc. of Redmond, Washington for analysis for one or more of the following: halogenated volatile organic compounds (HVOCs) by EPA Method 8260D; benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA 8260D; total petroleum hydrocarbons as diesel-range organics (DRO) and as oil-range organics (ORO) by Northwest Method NWTPH-Dx; and total petroleum hydrocarbons as gasoline-range organics (GRO) by Northwest Method NWTPH-Gx.

Monitoring wells were constructed in accordance with the Minimum Standards for Construction and Maintenance of Wells as established in WAC 173-160. The monitoring wells were constructed using 2-inch-diameter Schedule 40 polyvinyl chloride casing and 10 feet of 0.010-inch slotted pre-pack screen. Screen intervals were placed at intervals ranging from 7 to 17 feet bgs to 10 to 20 feet bgs, depending on the depth of groundwater and/or silt encountered at each location. Each monitoring well was completed at grade with a traffic-rated flush-mounted steel monument. The monitoring well construction logs are provided in Attachment A.

The monitoring wells were developed using a submersible pump shortly after monitoring well construction was completed. Each monitoring well was developed until the majority of fine-grained sediment had been removed from the well screen and adjacent sand pack. The location and elevation of monitoring wells were surveyed by Apex Engineering LLC of Tacoma, Washington using the North American Vertical Datum of 1988 (NAVD88) and Washington State Plane North Zone.

GROUNDWATER MONITORING EVENT

Groundwater monitoring events were conducted in January and April 2022. Groundwater monitoring events included collecting depth-to-water measurements and groundwater samples.

During each groundwater monitoring event, well caps were opened, and groundwater levels were allowed to equilibrate for at least 30 minutes. The depth to groundwater in each monitoring well was then measured to the nearest 0.01 foot using a water-level meter.

Prior to sampling, groundwater was purged from monitoring wells in accordance with EPA low-flow sampling protocols. The well purging and sampling was performed using a peristaltic pump and tubing at a flow rate of 100 to 300 milliliters per minute. The tubing intake was placed at the approximate middle portion of the water column in each monitoring well.

Water quality was monitored during purging using a water quality meter equipped with a flow-through cell. The water quality parameters temperature, pH, specific conductance, oxidation-reduction potential, turbidity, and dissolved oxygen were monitored and recorded. The monitoring wells were purged until all parameters stabilized. Following purging, groundwater samples were collected directly from the pump outlet tubing upstream of the flow-through cell, and placed into laboratory-prepared sample containers. Samples for analysis for dissolved metals were collected through a 0.45-micron field filter that was attached to the pump outlet.

Each container was labeled with a unique sample identification number, placed on ice in a cooler, and transported to APEX laboratories Tigard, Oregon or Onsite Environmental Redmond, Washington for analysis for one or more of the following: HVOCs by EPA Method 8260D; DRO and ORO by Northwest Method NWTPH-Dx; GRO by Northwest Method NWTPH-Gx; and total and dissolved arsenic by EPA Method 200.8/245.1/7470A.

DATA GAP INVESTIGATION RESULTS

A summary of the results from the data gap investigation are presented below. The tables and figures in the RIFS were updated to include the soil and groundwater analytical results from the data gap subsurface investigation. Table 1 includes a list of the data gaps, the scope of work completed to evaluate each data gap, and the results for each data gap. Tables 2 through 5 and Figures 4 through 8 provide the soil analytical results. Monitoring well construction details and groundwater elevations are provided in Table 6. Groundwater elevation contours from the April 2022 groundwater monitoring event are shown on Figure 9. Groundwater analytical results are provided in Tables 7 through 10. Water quality parameters recorded during the groundwater monitoring events are provided in Table 11. The laboratory analytical reports for the soil and groundwater analyses are provided in Attachment B.

SOIL

The subsurface lithology consisted of loose to medium dense interbedded silty sand, sandy silt, and silt to the maximum depth explored of 20 feet bgs. A shallow silt unit ranging in thickness from 1 to 5 feet was encountered at depths between approximately 5 and 14 feet bgs. Wood debris and organics were observed in borings FMW-18, FMW-20, FMW-24, and FMW-26 through FMW-29 at depths ranging from approximately 12.5 feet bgs to the maximum depth explored of 20 feet bgs. The sample locations with observed wood debris and organics are shown on Figure 13.

Soil samples were analyzed from select locations during the subsurface investigation because extensive soil sampling has been conducted at the Property and there were no field indications of potential contamination. PCE was detected at concentrations less than the MTCA Method A cleanup level in soil samples collected from monitoring well FMW-25. The remaining HVOCs were reported non-detect at the laboratory practical quantitation limit (PQL) in soil samples analyzed (Figure 4; Table 2).

Concentrations of DRO, ORO, GRO, and BTEX were reported non-detect at the laboratory PQL in soil samples analyzed (Figures 5 and 6; Table 3).

GROUNDWATER

Groundwater was encountered during drilling at depths ranging from approximately 7 to 15 feet bgs. Based on the depth-to-water measurements, calculated groundwater elevations ranged from 10.98 to 22.18 feet NAVD88 at the Site (Table 6). Groundwater elevation contours were developed using the groundwater elevation data collected during the groundwater monitoring events. Based on groundwater elevations calculated using synoptic measurements collected on April 19, 2022, the groundwater flow direction is northwest toward the Green River, which is consistent with previous groundwater monitoring events. A groundwater elevation contour map for the Site is provided on Figure 9.

Vinyl chloride and/or cis-1,2-dichloroethene (cis-1,2-DCE) was detected at concentrations exceeding the MTCA Method A cleanup level in groundwater samples collected from monitoring wells FMW-2, FMW-4, FMW-6, FMW-16 through FMW-19, FMW-21 through FMW-24, and FWM-29 during the January and April 2022 groundwater monitoring events (Figure 10; Table 7).

Tetrachloroethene (PCE) and trichloroethene (TCE) were detected at concentrations exceeding the MTCA Method A cleanup level in groundwater samples collected from

monitoring well FMW-25 and FMW-17, respectively, during the April 2022 monitoring event (Figure 10; Table 7). PCE and TCE were reported as either non-detect at the laboratory PQL or detected at concentrations less than the MTCA Method A cleanup level in groundwater samples collected from all other monitoring wells during the January and April 2022 groundwater monitoring events.

DRO, ORO, and GRO were reported as non-detect at the laboratory PQL in groundwater samples collected from monitoring wells MW-3, FMW-1 through FMW-8, FMW-16, FMW-18, FMW-20, FMW-21, FMW-24, and FMW-25 during the January 2022 groundwater monitoring event (Figure 11; Table 8).

Dissolved arsenic was detected at concentrations exceeding the background concentration for the Puget Sound lowlands in groundwater samples collected from monitoring wells FMW-3, FMW-4, FMW-16, and FMW-24 during the January 2022 groundwater monitoring event (Figure 11; Table 10).

UPDATED CONCEPTUAL SITE MODEL

This section provides a summary of the conceptual site model derived from the results of the data gap subsurface investigation, remedial investigation, previous investigations, and interim actions. Included in this section is a discussion of the media of concern and COCs, the confirmed and suspected sources, and exposure pathways and receptors. The conceptual site model is used as a basis for developing technically feasible cleanup action alternatives and selecting a final cleanup action in accordance with MTCA regulations.

MEDIA AND CONSTITUENTS OF CONCERN

According to results from the RI and data gap investigation conducted at the Site, the following COCs have been identified at concentrations exceeding applicable MTCA cleanup levels and/or screening levels in soil, groundwater, and/or soil gas:

- HVOCs in soil, soil gas, and groundwater;
- ORO in soil;
- Lead, cadmium, and arsenic in soil; and
- Carcinogenic polycyclic aromatic hydrocarbons (cPAHs) in soil.

Arsenic was added as a constituent of concern (COC) for soil and groundwater. In soil, arsenic was detected at concentrations exceeding the MTCA Method A cleanup level in soil samples collected during 2023 excavation activities proximate to the sandblast booth. In

groundwater, arsenic has been detected at concentrations exceeding the natural background concentration for the Puget Sound lowlands of 8 micrograms per liter ($\mu\text{g/l}$).

NATURE AND EXTENT OF CONTAMINATION

The nature and extent of contamination at the Site are summarized below.

Metals and cPAHs

Soil analytical results confirm that a shallow localized area of metals (lead, cadmium, and arsenic) and cPAH-contaminated soil is present proximate to the former sandblast booth. Contaminated soil proximate to the sandblast booth was excavated to the maximum extent practicable in 1991. The excavation was limited due to the presence of the building foundations. Groundwater has not been impacted in this area.

In 2023, the sandblast booth was removed and metals and cPAH-contaminated soil was excavated for off-Property disposal. The extent of the excavation is shown on Figures 9 and 10. A summary report documenting 2023 excavation activities will be submitted to Ecology following receipt of final laboratory analytical reports and disposal documentation.

In 2019, dissolved arsenic was detected at concentration of 64 and 710 $\mu\text{g/l}$ in reconnaissance groundwater samples collected from borings B-7 and B-11, respectively. Reconnaissance groundwater samples are collected from open borings with limited to no development prior to sampling. This typically results in increased sample turbidity, which can bias detected chemical concentrations high, particularly for metals. Monitoring wells FMW-22 and FMW-24 were installed proximate to these borings to collect groundwater samples that are considered to be most representative of groundwater quality. Dissolved arsenic was only detected at concentrations slightly exceeding the natural background concentration for the Puget Sound lowlands in the groundwater sample collected from monitoring well FMW-24. These data demonstrate that dissolved arsenic concentrations were biased high in the reconnaissance groundwater samples collected from borings B-7 and B-11 in 2019.

Dissolved arsenic was detected at concentrations ranging from 3.2 to 49 $\mu\text{g/l}$ in groundwater samples collected from monitoring wells during the RI and the data gap subsurface investigation. Dissolved arsenic exceeded the natural background concentration for the Puget Sound lowlands in groundwater samples collected from monitoring wells FMW-1, FMW-3, FMW-4, FMW-16, FMW-24, and MW-3 during groundwater monitoring events conducted between 2019 and 2022. During the January 2022 groundwater monitoring event, dissolved arsenic was only detected at concentrations exceeding the natural

background concentration for the Puget Sound lowlands in groundwater samples collected from monitoring wells FMW-3, FMW-4, FMW-16, and FMW-24 (Figure 11; Table 10).

Groundwater monitoring results have indicated that the oxidation-reduction potential was negative in a majority of the monitoring wells, and that natural attenuation of HVOCs is occurring, which is indicative of reducing conditions (Table 11). Furthermore, during the January 2022 groundwater monitoring event, total petroleum hydrocarbons (DRO, ORO, and GRO) were reported non-detect at the laboratory PQLs (Figure 11; Table 10). Wood debris and organics were observed throughout the Property in borings EMS-B10, B-2, F-28 through F-30, F-32, AS-1, SVE-1, FMW-2, FMW-8, FMW-11, FMW-13, FMW-15, FMW-16, FMW-18, FMW-20, FMW-24, and FMW-26 through FMW-29 at depths ranging from approximately 8.5 feet bgs to the maximum depth explored of 20 feet bgs. The distribution of wood debris and organics at the Property is shown on Figure 11. Multiple lines of evidence indicate that the wood and organic deposits were naturally deposited throughout the Property and region in an alluvial environment.

Based on the results from the RI and the data gap investigation, concentrations of arsenic in groundwater are attributed to reducing conditions from peat and wood debris in native saturated formation materials, resulting in dissolution of naturally occurring solid-phase arsenic.

Petroleum Hydrocarbons

Results from the RI confirm that a shallow localized area of ORO-contaminated soil is present proximate to boring B-5 (Figures 5 and 6; Table 5). The source of petroleum hydrocarbons in soil is suspected to be general industrial operations and spills.

In 2023, ORO-contaminated soil was excavated for off-Property disposal. A summary report documenting 2023 excavation activities will be submitted to Ecology following receipt of final laboratory analytical reports and disposal documentation.

Concentrations of DRO, ORO, GRO, and BTEX were reported either non-detect at the laboratory PQLs or less than the MTCA Method A cleanup levels in reconnaissance groundwater samples and groundwater samples collected from monitoring wells at the Property (Figure 11; Table 6).

Halogenated Volatile Organic Compounds

The Property has been used for industrial purposes since 1968. Although specific operations were not identified as HVOCl sources, specific areas at the Site were identified as

sources based on analytical results from the RI and the data gap investigation. Analytical results for soil, groundwater, soil gas, and passive soil gas samples were evaluated to identify potential sources for HVOCs.

Generally, source areas were identified if concentrations of vinyl chloride exceeded 1 µg/l, if concentrations of TCE exceeded cleanup levels, or HVOC-contaminated groundwater was located proximate to the downgradient Property boundary. A summary of each confirmed source area is provided below (Figure 12):

- **Source Area 1:** TCE, cis-1,2-DCE, and vinyl chloride have been detected at concentrations exceeding MTCA cleanup levels proximate to monitoring well FMW-17. The extent of groundwater contamination has been defined to the west, south, and north with monitoring wells FMW-6, FMW-7, and FMW-27. The extent of groundwater contamination to the east is unknown. However, Source Area 2 is located to the east.
- **Source Area 2:** Vinyl chloride has been detected at concentrations exceeding MTCA cleanup levels proximate to monitoring well FMW-4.
- **Source Area 3:** Vinyl chloride has been detected at concentrations exceeding MTCA cleanup levels proximate to monitoring well FMW-24.
- **Source Area 4:** PCE has been detected at concentrations exceeding MTCA cleanup levels proximate to monitoring well FMW-25.
- **Source Area 5:** Vinyl chloride has been detected at concentrations exceeding MTCA cleanup levels proximate to monitoring well FMW-2. The extent of groundwater contamination has been defined. However, this isolated source area is proximate to the northern Property boundary.

Additional potential source areas may be present at the Property and will be addressed as part of the cleanup action. For example, vinyl chloride concentrations exceed the MTCA cleanup levels in the vicinity of monitoring wells FWM-6, FMW-16, and FMW-29, which may be indicative of residual HVOC-contaminated groundwater or additional sources. At this time, the cleanup action activities will focus on the confirmed source areas (Source Areas 1 through 5) listed above. Additional data collected during implementation of the cleanup action, including compliance monitoring, will be used to further refine the cleanup action. In addition, use of conditional points of compliance and remediation levels will be evaluated.

EXPOSURE PATHWAYS AND RECEPTORS

The exposure pathways and receptors were re-evaluated based on the updated conceptual site model and future land use. A summary of the exposure pathways and receptors are presented below:

- **Groundwater to Surface Water:** The Green River is approximately 310 feet northwest of the Site. Concentrations of HVOCs, including vinyl chloride, have not been detected at concentrations exceeding MTCA surface water cleanup levels in samples collected from the down-gradient points of compliance. This exposure pathway is incomplete.
- **Soil to Groundwater:** Based on the RI results, the soil to groundwater pathway is potentially complete. Residual sources of HVOCs have been identified at the Site, although concentrations detected in soil generally are less than MTCA cleanup levels in the residual source areas. The preferred cleanup action alternative will remediate residual HVOCs in soil.
- **Soil and Groundwater Direct Contact:** Contaminated soil and groundwater are present at the Site, and the direct contact pathway is considered a complete exposure pathway. As part of implementation of the cleanup action, contaminated soil and groundwater will be exposed and will present a short-term exposure risk to construction workers. Following implementation of the cleanup action, the entire Property will be covered with pavement and a building, thus eliminating the direct contact exposure pathway.
- **Vapor Inhalation:** Based on the RI soil gas results, there is potential for an unacceptable vapor intrusion risk from PCE and TCE in soil gas intruding into existing structures at the Site, and for short-term inhalation of volatilized contaminants by construction workers during future redevelopment activities. The preferred cleanup action alternative is expected to treat the residual HVOC source areas identified during the RI. In addition, a chemical-resistant vapor barrier will be installed in the future building on the Property, which will eliminate the vapor inhalation pathway for future occupants.
- **Terrestrial:** As discussed in the RIFS, the Site qualified for a Terrestrial Ecological Evaluation exclusion, and no further consideration of ecological impacts is required under MTCA.

PILOT TESTING

AS and SVE pilot tests were conducted to evaluate Site-specific soil gas flow rates and range of influence to prepare a full-scale AS and SVE design. A detailed discussion of the AS and SVE pilot tests was provided in the RIFS and a summary is provided below.

AIR SPARGING PILOT TEST

An AS pilot test was performed on March 18, 2021. Test well AS-1 was screened from 15 to 16.5 feet bgs. The AS pilot test consisted of a step test to apply variable pressures to test well AS-1 while monitoring air flow rate and pressure at the test well. The air flow rate and pressure at the test well were measured using in-line instrumentation. Depth-to-water and dissolved-oxygen measurements were collected pre- and post-pilot test. Induced pressure was monitored in nearby wells and subslab soil gas points.

The AS pilot test on AS-1 also demonstrated communication above and below the intermittent silt layer and concentrations of vinyl chloride, cis-1,2-DCE, and TCE detected in a soil vapor sample collected from observation well SVE-1 demonstrated that test well AS-1 was effectively stripping HVOCs from saturated soil. Based on the results from the AS pilot study, a radius of influence of 20 feet was selected for full-scale design.

SOIL VAPOR EXTRACTION PILOT TEST

An SVE pilot test was performed on March 19, 2021. Test well SVE-1 was screened from 3 to 18 feet bgs, through the silt layer that begins at approximately 5 feet bgs to the sand layer below. The SVE pilot test consisted of a step test to apply variable vacuums to test well SVE-1 using a vacuum truck. The air flow rate and the vacuum at the test well were measured using in-line instrumentation. Depth-to-water measurements were collected pre- and post- pilot test. Induced vacuum was monitored in nearby wells and subslab soil gas points.

The SVE pilot test on SVE-1 demonstrated communication above and below the intermittent silt layer as demonstrated by induced vacuum in wells screened below the intermittent silt contact and in wells screened across the intermittent silt layer into the sand. Concentrations of cis-1,2-DCE and TCE were detected in a performance soil gas sample collected from SVE-1, demonstrating that the test well was effectively removing HVOCs from unsaturated soil. Based on the results from the SVE pilot study, a radius of influence of 30 feet was selected for full-scale design.

EVALUATION OF CLEANUP ACTION ALTERNATIVES

The FS conducted for the Site was documented in the RIFS. The FS included screening of potentially feasible remedial technologies and development of a range of cleanup action alternatives that achieve the proposed cleanup standards in the shortest possible restoration time frame. The cleanup action alternatives were evaluated with respect to threshold and other requirements for cleanup actions set forth in MTCA. The FS conducted for the Site evaluated the alternatives, identified those that were not effective or were not technically possible or whose costs were disproportionate to benefits, and provided the basis for identifying a preferred cleanup action alternative.

The FS evaluated three cleanup action alternatives according to criteria provided in WAC 173-340-360(2). The FS included preparation of a disproportionate cost analysis in accordance with WAC 173-340-360(3)(e)(ii). The disproportionate cost analysis used a semi-quantitative procedure to compare the cost of implementation against the environmental benefit to be achieved, and to identify which cleanup alternative is most practicable under MTCA.

The FS identified a preferred cleanup alternative for the Site in accordance with WAC 173-340-360 through 173-340-370. The cleanup action selected for the Site included AS and SVE, limited soil excavation, engineered controls, and monitored natural attenuation. The selected cleanup action alternative is considered to present the highest degree of permanence and protectiveness considering current and potential future Site conditions to the maximum extent practicable. In December 2021, Ecology provided an opinion for the proposed cleanup action and indicated that upon completion of the proposed cleanup for the Site, no further remedial action will likely be necessary at the Site.

Results from the RI, data gap investigation, and updated conceptual site model identified five confirmed source areas (Figure 10). Additional potential source areas may be present at the Property and will be addressed as part of the cleanup action. For example, vinyl chloride exceeds the MTCA cleanup levels in the vicinity of monitoring wells FWM-6, FMW-16, and FMW-29, which may be indicative of residual HVOCS-contaminated groundwater or additional sources. At this time, the cleanup action activities will focus on the confirmed source areas (Source Areas 1 through 5).

Cleanup Action Alternatives 2 and 3, described in the RIFS, were updated to focus on the cleanup of Source Areas 1 through 5 and provide contingency costs for additional cleanup that may be required in the additional potential source areas.

Based on the re-evaluation of cleanup action costs, Cleanup Action Alternative 3 is still considered to be the most practicable and present the highest degree of permanence and protectiveness considering current and potential future Site conditions to the maximum extent practicable.

Additional details for re-evaluation of Cleanup Action Alternatives 2 and 3 are provided below.

CLEANUP ALTERNATIVE 2, IN-SITU CHEMICAL OXIDATION, LIMITED SOIL EXCAVATION, ENGINEERED CONTROLS, AND MONITORED NATURAL ATTENUATION

Cleanup Alternative 2 includes in situ chemical oxidation (ISCO) injections to treat groundwater in confirmed source areas where vinyl chloride exceeds 1 µg/l, concentrations of TCE exceeded cleanup levels, or HVOCS-contaminated groundwater was located proximate to the downgradient Property boundary. In addition, the cleanup alternative includes limited soil excavation in two areas where COCs have been detected at concentrations exceeding MTCA cleanup levels for soil. Based on updates to future land use, no redevelopment is currently planned at the Property. Results from compliance groundwater monitoring will be used to evaluate the effectiveness of the remedial technology and restoration of groundwater quality. The conceptual layout for Cleanup Alternative 2 is shown on Figure 12.

Cleanup Alternative 2 assumes that a 5 percent solution of sodium permanganate will be delivered to the subsurface in each treatment area via temporary injection points. Sodium permanganate will oxidize HVOCS in groundwater and convert hazardous compounds to nonhazardous or less-toxic compounds. Localized areas of soil with concentrations of COCs exceeding MTCA cleanup levels for ORO and metals will be excavated for off-Property disposal.

Key assumptions and revisions to key assumptions for Cleanup Alternative 2 include the following:

- All existing buildings will remain in place.
- If the Property is redeveloped in the future, and depending on the status of the cleanup action, a contaminant-resistant vapor barrier will be installed with the new building foundation as an engineered control to eliminate the soil gas to indoor air exposure pathway.
- Future use of shallow groundwater at the Site is not anticipated.

- Two limited areas on the Site proximate to borings B-4 and B-5 will be excavated. A 20- by 20-foot area will be excavated at each location to depths ranging from 5 feet bgs proximate to boring B-4 to 8 feet bgs proximate to boring B-5. An estimated 600 tons of soil will be transported off the Site for disposal as nonhazardous waste at a Subtitle D landfill. Confirmation soil samples will be collected from the base of the excavations and sidewalls for compliance sampling.
- Approximately 112,000 gallons of a 5 percent solution of sodium permanganate will be injected across approximately 90 temporary injection points for the first ISCO injection event. The second ISCO injection event assumes a slightly reduced treatment area and approximately 85,000 gallons of a 5 percent solution of sodium permanganate will be injected across approximately 70 temporary injection points. Each injection event will consist of injecting approximately 1,200 gallons of sodium permanganate into each temporary injection point.
- Two injection events are anticipated to treat HVOCs in groundwater.
- In the event additional treatment is required in the potential source areas, it is estimated that approximately 31,000 gallons of a 5 percent solution of sodium permanganate will be injected across approximately 25 temporary injection points for the first ISCO injection event. The second ISCO injection event assumes a slightly reduced treatment areas and injecting approximately 25,000 gallons of a 5 percent solution of sodium permanganate will be injected across approximately 20 temporary injection points. Each injection event will consist of injecting approximately 1,200 gallons of sodium permanganate into each temporary injection point.
- Evaluation of the monitored natural attenuation geochemical parameters will occur during performance and/or compliance groundwater monitoring events.
- Groundwater monitoring for Cleanup Alternative 2 consists of monitoring a network of up to 15 monitoring wells quarterly for Years 1 and 3 (post injection events), semiannually for Years 2 and 4, and quarterly for Year 5. Groundwater monitoring reports will be submitted annually for 5 years.

Monitoring wells will be decommissioned at the conclusion of the 5-year compliance groundwater monitoring program, or when the cleanup standards have been achieved and Ecology issues a determination of No Further Action. For the purpose of estimating the present worth cost, the time frame to implement Cleanup Alternative 2 was assumed to be 5

years for compliance groundwater monitoring. The estimated cost to complete Cleanup Alternative 2 is summarized below from Table 12:

Capital Cost:	\$4,719,000
Ongoing Periodic and Future Cost:	<u>\$ 330,000</u>
Cleanup Alternative 2 Total:	\$5,049,000

CLEANUP ALTERNATIVE 3 – AIR SPARGING AND SOIL VAPOR EXTRACTION, LIMITED SOIL EXCAVATION, ENGINEERED CONTROLS, AND MONITORED NATURAL ATTENUATION

Cleanup Alternative 3 includes installation of AS and SVE remediation systems to treat soil and groundwater in confirmed source areas where vinyl chloride exceeded 1 µg/l, concentrations of TCE exceeded cleanup levels, or HVOCS-contaminated groundwater was located proximate to the downgradient Property boundary. In addition, the cleanup alternative includes limited soil excavation in two areas where COCs have been detected at concentrations exceeding MTCA cleanup levels for soil. The conceptual layout for Cleanup Alternative 3 is shown on Figure 13. AS and SVE are proven technologies for treatment of groundwater exceeding cleanup levels, and are considered effective and implementable technologies at the Site based on both existing pilot test results and prior implementation of these technologies at the Site.

Cleanup Alternative 3 assumes that AS and SVE will be used to treat the five confirmed source areas with HVOCS detected at concentrations exceeding MTCA cleanup levels for soil and/or groundwater. Localized areas of soil with concentrations of COCs exceeding MTCA cleanup levels for ORO and metals will be excavated for off-Property disposal.

Key assumptions for Cleanup Alternative 3 include the following:

- All existing buildings and warehouses will remain in place.
- If the Property is redeveloped in the future and depending on the status of the cleanup action, the SVE system can likely be used to mitigate the soil gas to indoor air pathway and a contaminant-resistant vapor barrier will not be required.
- Future use of shallow groundwater at the Site is not anticipated.
- Two limited areas on the Site proximate to borings B-4 and B-5 will be excavated. A 20- by 20-foot area will be excavated at each location to depths ranging from 5 feet bgs proximate to boring B-4 to 8 feet bgs proximate to B-5. An estimated 600 tons of soil will be transported off the Site for disposal as nonhazardous waste at a Subtitle D landfill. Confirmation soil samples will be collected from the base of the excavations and sidewalls for compliance sampling.

- The cost estimate includes three separate AS/SVE systems that will be required for the five confirmed source areas. Each AS/SVE system will be composed of a series of AS wells with an assumed radius of influence of 20 feet and SVE wells with an assumed radius of influence of 30 feet. The AS/SVE design includes a total of 31 AS wells and 20 SVE wells for vapor recovery. The AS/SVE systems will be operational for 5 years with monthly operation and maintenance visits. Based on pilot testing it was assumed that vapor-phase treatment will not be required for the treatment systems prior to direct discharge to the atmosphere.
- Evaluation of the monitored natural attenuation geochemical parameters will occur during performance and/or compliance groundwater monitoring events.
- Groundwater monitoring for Cleanup Alternative 3 consists of monitoring a network of up to 15 monitoring wells quarterly for Year 1, semiannually for Years 3 through 5, and quarterly for Year 6. Groundwater monitoring reports will be submitted annually for 6 years.

Monitoring wells will be decommissioned at the conclusion of the 6-year compliance groundwater monitoring program, or when points of compliance have been achieved and Ecology issues a determination of No Further Action.

For the purpose of estimating the present worth cost, the time frame to implement Cleanup Alternative 3 was assumed to be 5 years for AS/SVE system operation, and 6 years for compliance groundwater monitoring. The estimated cost to complete Cleanup Alternative 3 is summarized below from Table 12:

Capital Cost:	\$2,748,000
Ongoing Periodic and Future Cost:	\$643,000
Cleanup Alternative 3 Total:	\$3,391,000

CLEANUP ACTION

The status of the cleanup action is presented below.

LIMITED EXCAVATION

In 2023, two limited soil excavations were completed to remove soil that exceeded MTCA Method A cleanup levels for off-Property disposal. ORO-contaminated soil was excavated to a depth of 8 feet bgs proximate to boring B-4. Metals- and cPAH-contaminated soil was excavated to depths ranging from 3 to 4 feet bgs proximate to the former sandblast booth. The extent of the excavation is shown on Figures 12 and 13.

Confirmation soil samples were collected from the base of the excavations and sidewalls to demonstrate compliance with the MTCA cleanup levels. Approximately 582.78 tons of soil was transported off the Property for disposal as nonhazardous waste at a Subtitle D landfill.

A summary report documenting 2023 excavation activities will be submitted to Ecology following receipt of final laboratory analytical reports and disposal documentation.

AIR SPARGING AND SOIL VAPOR EXTRACTION

Installation of the three AS/SVE remediation systems in Source Areas 1 through 5 began in September 2022 with installation of the AS and SVE wells. Between February and April 2023, the underground piping for the Southwest System and the Central System was installed. Details for each remediation system are provided below:

- **Southwest System: Source Areas 1 and 2.** Consists of 18 AS wells (AS-01 through AS-17, and AS-21) and 11 SVE wells (SVE-1 through SVE-05, SVE-08 through SVE-11, and FMW-10 and FMW-11).
- **Central System: Source Areas 3 and 4.** consists of 10 AS wells (AS-22 through AS-31) and seven SVE wells (SVE-12 through SVE-17 and SVE-19)
- **Northeast System: Source Area 5.** consists of three AS wells (AS-18 through AS-20) and two SVE wells (SVE-06 and SVE-07).

A detailed layout of the AS/SVE systems is provided in Attachment C.

The AS wells are 2 inches in diameter and have 18 inches of well screen. Pressure is applied to each AS well by the remediation system compressor in the remediation enclosure via buried 0.75-inch high-density polyethylene pipe. The SVE wells are 2 inches in diameter and are screened from 3 to 5 feet below grade to total depth. A vacuum is applied to the SVE wells to extract or capture soil vapor from each SVE well and then conveyed to the remediation enclosure via 2-inch-diameter PVC pipes. Extracted vapor passes through a moisture separator to remove free water and then discharges to the atmosphere through an elevated stack.

The Southwest AS/SVE remediation system began operating in April 2023. Monthly system operation, maintenance, and performance sampling is ongoing for the Southwest AS/SVE remediation system.

NEXT STEPS

The Central System and the Northeast System will be completed once the mechanical equipment for the remediation enclosures is delivered to the Site, which is anticipated to be June 2023. In addition, underground piping will be completed for the Northeast System at that time. Ongoing operation and maintenance will be conducted for each remediation system and includes system progress monitoring, equipment maintenance, collection of operational data, and monitoring and sampling of vapor emissions.

Once the systems are in operation, compliance groundwater monitoring events will be conducted on a semiannual basis to evaluate the performance of the AS/SVE remediation system and overall progress of the cleanup action.

CLOSING

Farallon appreciates the opportunity to provide environmental consulting services for this project. Please contact either of the undersigned at (425) 295-0800 if you have questions or need additional information.

Sincerely,

Farallon Consulting, L.L.C.

Pete Kingston, L.G.
Principal Geologist

Peter J. Kingston

Suzy Stumpf, P.E.

LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- Accuracy of Information. Farallon reviewed certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy. Should the information upon which Farallon relied prove to be inaccurate, Farallon may revise its conclusions, opinions, and/or recommendations.
- Reconnaissance and/or Characterization. Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

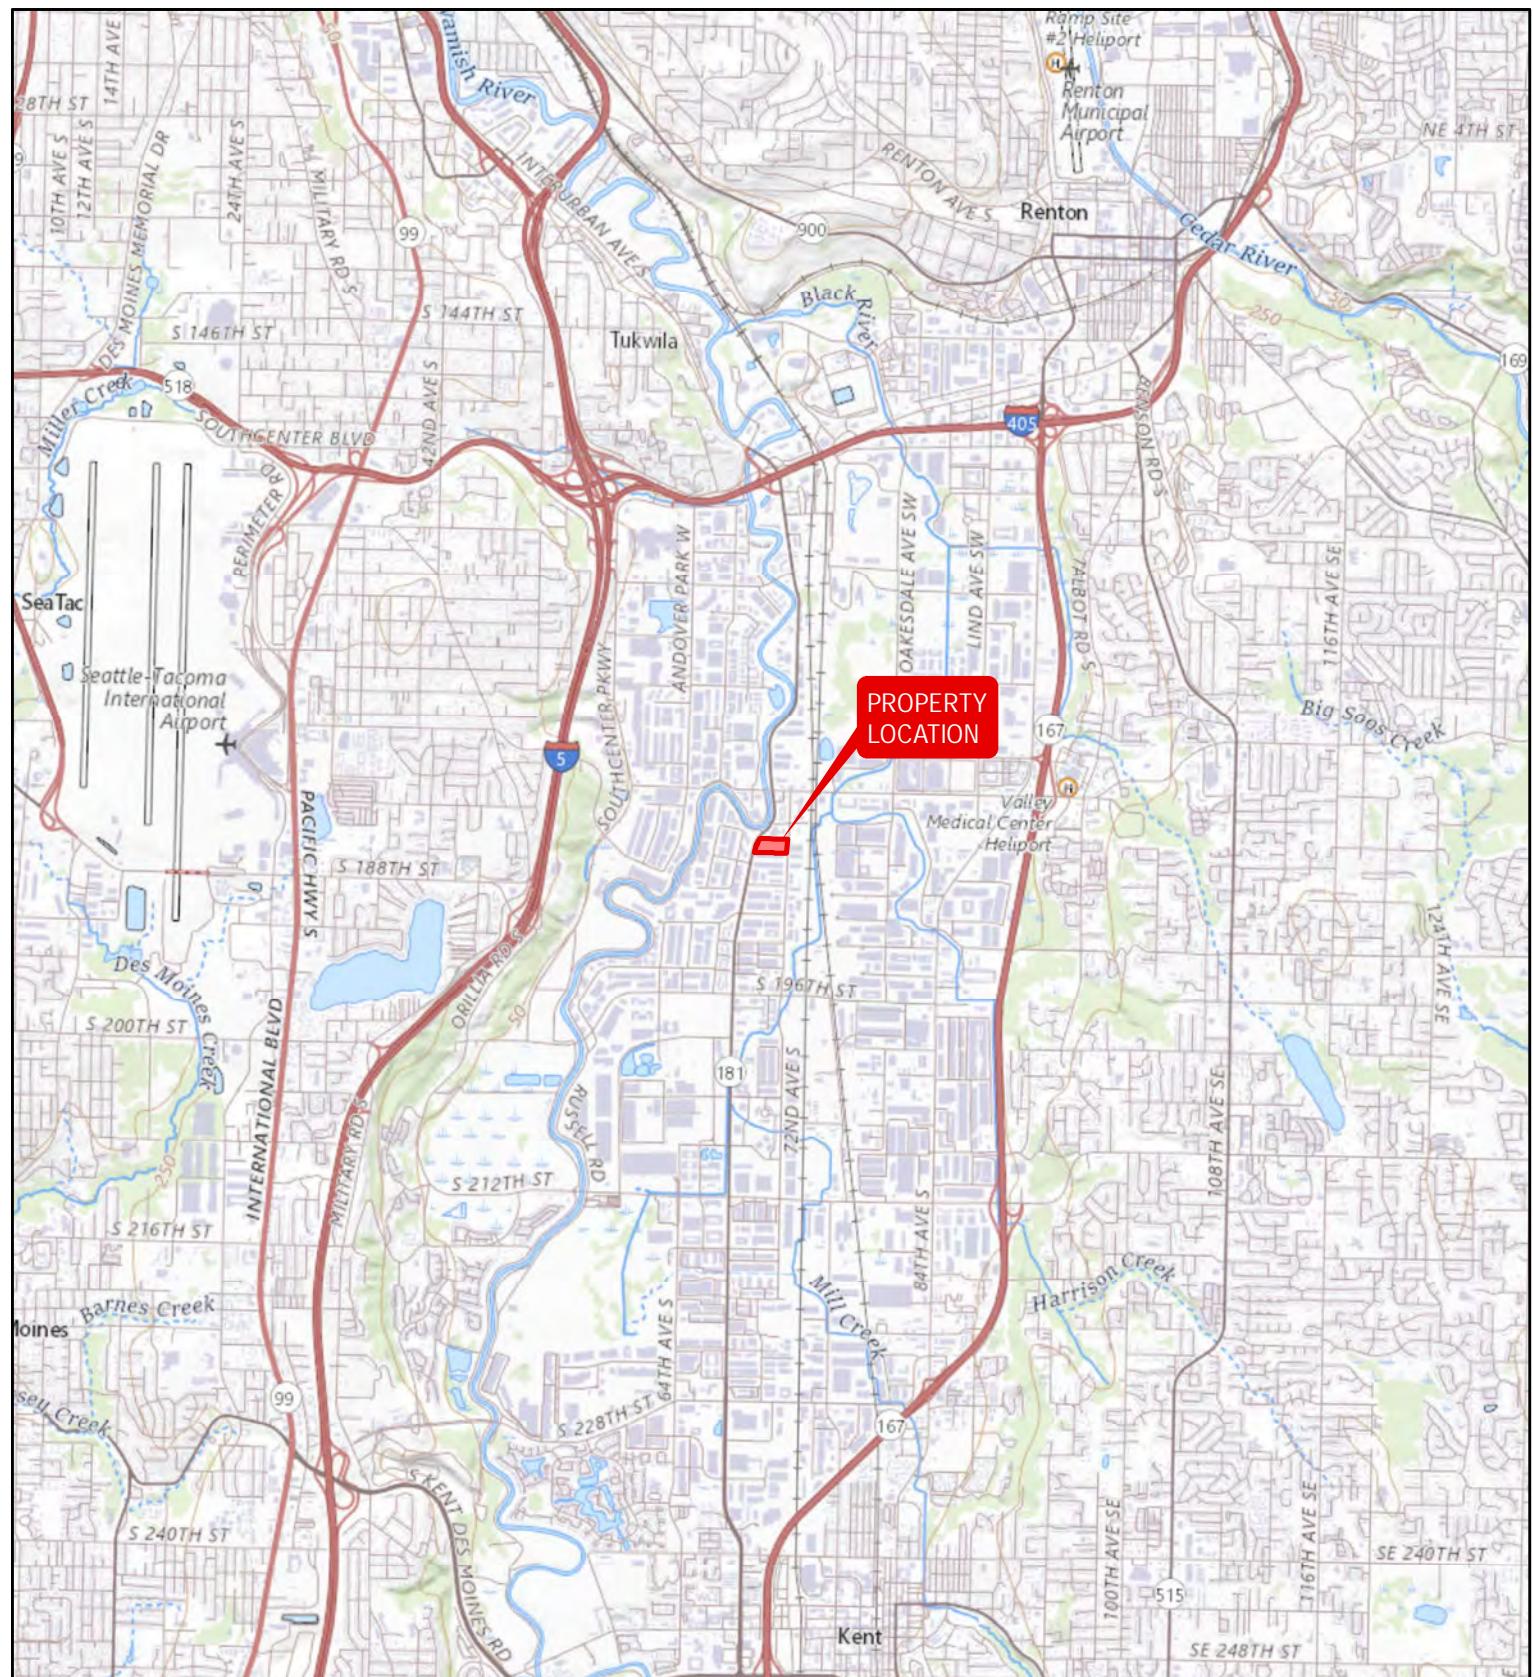

Farallon does not guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions are as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Lift Real Estate Fund Partners LLC. No other warranties, representations, or certifications are made.

Kent, Washington

Farallon PN: 2032-012

Table 1
Data Gap Summary
18420 68th Avenue South
Kent, Washington
Farallon PN: 2032-012

Potential Source Area	Data Gap Identified by Ecology	Ecology Description of Data Gap	Data Gap Evaluation
1	Source area monitoring well	A source area monitoring well is needed in source area #1 in the vicinity of F-31 or EMS- B9. Existing monitoring well FMW-17 was evidently not sampled for HVOCS and it is currently unclear whether this location will be sufficient.	Vinyl chloride and/or cis-1,2-DCE were detected at concentrations exceeding the MTCA Method A cleanup levels in the reconnaissance groundwater samples collected from borings EMS-B9 and F-31 in 2008 and 2021, respectively. In September 2021, monitoring well FMW-17 was installed adjacent to borings EMS-B9 and F-31. TCE, cis-1,2-DCE, and/or vinyl chloride were detected at concentrations exceeding the MTCA cleanup level in the groundwater sample collected from monitoring well FMW-17 in September 2021, January 2022, and April 2022. These data confirm that the area proximate to FMW-17 is a source area. However, the specific operations and release mechanisms are unknown. In April 2022, monitoring well FMW-27 was installed up-gradient of the source area to evaluate groundwater quality. HVOCS were less than the cleanup levels in the groundwater sample collected from monitoring well FMW-27.
2	No data gap noted.	Existing monitoring well FMW-4 appears to serve as a source area monitoring well and the extent of contamination was defined by location B-11.	Ecology identified a data gap for arsenic proximate to boring B-11. To evaluate that data gap, Farallon installed monitoring well FMW-22 in January 2022. In addition to evaluating the arsenic data gap proximate to boring B-11, the monitoring well was used to confirm the extent of HVOCS in groundwater down-gradient of the source area proximate to monitoring well FMW-4. Groundwater samples were collected from monitoring well FMW-22 and analyzed for HVOCS to further evalaute the nature and extent of HVOCS in groundwater down-gradient of the source area. Vinyl chloride was detected at a concentration of 0.258 ug/l, which slightly exceeds the cleanup level of 0.2 ug/l, in the groundwater sample collected from FMW-22 in January 2022. However, the laboratory flagged the result and the reported concentration is considered to be an estimate. A subsequent groundwater sample collected from FMW-22 in April 2022 did not contain HVOCS at concentrations exceeding MTCA cleanup levels. Based on these data, the downgradient extent of contamination for the source area proximate to FMW-4 is defined.
3	Source area monitoring well	A source area monitoring well is needed in source area #3 in the vicinity of F-29. An appropriate location would be in the north-northwestern portion of the source area.	Monitoring well FMW-21 was installed in January 2022 to evaluate the nature and extent of HVOCS proximate to boring F-29. Vinyl chloride was detected at a concentration of 0.215 ug/l, which slightly exceeds the cleanup level of 0.2 ug/l in the groundwater sample collected from FMW-21 in January 2022. However, the laboratory flagged the result and the reported concentration is considered to be an estimate. A subsequent groundwater sample collected from FMW-22 in April 2022 did not contain HVOCS at concentrations exceeding MTCA cleanup levels. Based on these data, this area is not considered to be a source.
	Contingency downgradient monitoring well	If elevated HVOOC concentrations are found in the source area #3 monitoring well, then a downgradient compliance monitoring well will be needed to the north-northwest of this location.	Elevated HVOOC concentrations were not detected in groundwater samples analyzed from monitoring well FMW-21. Therefore, a downgradient monitoring well was not installed. Residual HVOOC-containted groundwater is present proximate to monitoring well FMW-6, which is located down-gradient of FMW-21.
4	Source area monitoring well	A source area monitoring well is needed in source area #4 in the vicinity of F-28. An appropriate location would be in the NNW portion of the source area.	Monitoring wells FMW-18 and FMW-26 were installed in January and April 2022, respectively, to evaluate the nature and extent of HVOCS proximate to boring F-28. Vinyl chloride was detected at a concentration of 0.203 ug/L, which slightly exceeds the cleanup level of 0.2 ug/L, in the groundwater sample collected from FMW-18 in January 2022. However, the laboratory flagged the result and the reported concentration is considered to be an estimate. A subsequent groundwater sample collected from FMW-18 in April 2022 contained vinyl chloride at a concentration of 0.33 ug/L slightly exceeding the MTCA cleanup level. Concentrations of HVOCS were reported non-detect at the laboratory PQL in the groundwater sample collected from monitoring well FMW-26 in April 2022. Based on these data, this area is not considered to be a source.

Table 1
Data Gap Summary
18420 68th Avenue South
Kent, Washington
Farallon PN: 2032-012

Potential Source Area	Data Gap Identified by Ecology	Ecology Description of Data Gap	Data Gap Evaluation
	Contingency downgradient monitoring well	If elevated CVOC concentrations are found in the source area #4 monitoring well, then a downgradient compliance monitoring well may be needed to the NNW of this location.	Elevated HVOCS were not detected in groundwater samples analyzed from monitoring well FMW-18 and FMW-26. Therefore, a downgradient monitoring well was not installed.
5	Source area monitoring well	A source area monitoring well is needed in source area #5 in the vicinity of F-30. An appropriate location would be in the north-northwestern portion of the source area.	Monitoring well FMW-19 was installed in January 2022 to evaluate the nature and extent of HVOCS proximate to boring F-30. Vinyl chloride was detected at a concentration of 0.445 ug/l, which exceeds the cleanup level of 0.2 ug/l in the groundwater sample collected from FMW-19 in January 2022. A subsequent groundwater sample collected from FMW-19 in April 2022 did not contain HVOCS at concentrations exceeding MTCA cleanup levels. Based on groundwater analytical results from wells in the vicinity of boring F-30, a localized source of HVOCS is present proximate to the Property boundary. However, the specific operations and release mechanisms are unknown.
	Contingency downgradient monitoring well	If elevated CVOC concentrations are found in the source area #5 monitoring well, then a downgradient compliance monitoring well will be needed to the north-northwest of this location.	Monitoring wells FMW-2 and FMW-15 are installed downgradient of the localized source area. In addition, monitoring well FMW-31 was installed in April 2022 to further characterize the extent of HVOCS-contaminated groundwater.
6	Source area monitoring well	Source area #6 was based on slightly elevated TCA in passive soil gas samples; however, no other data are indicative of a source area between locations F3 and F4. Ecology recommends that the designation "Source Area 6" be used for the vicinity of Area-2-B8 and Area-2-B9. Historical cleanup activities were conducted in this area; however, current conditions need to be assessed and monitoring data are needed to confirm cleanup of groundwater in this area.	Monitoring well FMW-20 was installed in January 2022 to evaluate current groundwater conditions and confirm that historical cleanup activities continue to be protective of human health and the environment in this area. HVOCS, including 1,1,1-trichloroethane, were reported non-detect at the laboratory PQLs in groundwater samples collected on January and April 2022. Based on these data, the interim action that was previously conducted in this area was effective in reducing concentrations of HVOCS and this area is not considered to be a source.
7	Source area monitoring well	A source area monitoring well is needed in source area #7 the vicinity of soil gas location F-11.	Angled monitoring well FMW-25 was installed in January 2022 to characterize groundwater proximate to soil gas location F-11. PCE was detected at a concentration of 9.9 ug/l, which exceeds the cleanup level of 5 ug/l, in the groundwater sample collected from FMW-25 in April 2022. These data confirm that the area proximate to FMW-25 is a source area. However, the specific operations and release mechanisms are unknown.
8	Source area monitoring well	A source area monitoring well is needed in source area #8 in the vicinity of B-10. Existing monitoring well FMW-16 was evidently not sampled for CVOCs and it is currently not certain if this location will be sufficient.	Vinyl chloride was detected at a concentration of 7.0 ug/l, exceeding the MTCA Method A cleanup level, in the reconnaissance groundwater sample collected from boring B-10 in 2019. In September 2021, monitoring well FMW-16 was installed adjacent to boring B-10 to collect representative groundwater samples. Vinyl chloride was detected at concentrations ranging from 0.539 to 0.92 ug/l in the groundwater samples collected from monitoring well FMW-16 in September 2021, January 2022, and April 2022. These data confirm that the area proximate to FMW-16 is not a source area, but an area of residual HVOCS-contaminated groundwater.

Table 1
Data Gap Summary
18420 68th Avenue South
Kent, Washington
Farallon PN: 2032-012

Potential Source Area	Data Gap Identified by Ecology	Ecology Description of Data Gap	Data Gap Evaluation
	Contingency downgradient monitoring well	If elevated CVOC concentrations are found in the source area #8 monitoring well, a downgradient compliance monitoring well will be needed to the north-northwest of this location.	Monitoring well FMW-29 was installed downgradient of monitoring well FMW-16 to further evaluate the nature and extent of CVOCs in groundwater. Vinyl chloride was detected at a concentration of 0.37 ug/l, which exceeds the cleanup level of 0.2 ug/l, in the groundwater sample collected from FMW-29 in April 2022.
9	Source area monitoring well	A source area monitoring well is needed in source area #9 in the vicinity of F-27. An appropriate location would be in the north-northwestern portion of the source area.	Monitoring well FMW-23 was installed in January 2022 to evaluate the nature and extent of HVOCs proximate to boring F-27. cis-1,2-DCE was detected at a concentration of 34.8 ug/l, which exceeds the MTCA cleanup level of 16 ug/l, in the groundwater sample collected from FMW-23 in January 2022. cis-1,2-DCE was detected at a concentration of 0.80 ug/l, which is less than the MTCA cleanup level, in a subsequent groundwater sample collected from FMW-23 in April 2022. PCE and TCE were detected at concentrations less than the MTCA cleanup levels in groundwater samples collected from FMW-23 in January and April 2022. Based on groundwater analytical results from wells in the vicinity of boring F-30, a localized source of HVOCs may be present. However, the specific operations and release mechanisms are unknown.
	Contingency downgradient monitoring well	If elevated CVOC concentrations are found in the source area #9 monitoring well, a downgradient compliance monitoring well will be needed to the north-northwest of this location.	Monitoring well FMW-28 was installed down-gradient of monitoring well FMW-23 to further evaluate the extent of HVOCs in groundwater. In addition, existing monitoring well FMW-9 is installed down-gradient of FMW-23. HVOCs either were reported non-detect at the laboratory PQMs or less than the MTCA cleanup levels in groundwater samples analyzed from monitoring wells FMW-9 and FMW-28.
10	No data gap noted	Source area #10 was based on slightly elevated TPH in passive soil gas samples; however, no other data are indicative of a TPH source in the area south of location F-11. Sampling of the new source area monitoring well for Source Area #7 should include analysis by NWTPH-Gx, NWTPH-Dx, and BTEX.	Monitoring wells FMW-24 and FMW-25 are installed proximate to the area with elevated concentrations of total petroleum hydrocarbons in passive soil gas samples. Concentrations of DRO, ORO, GRO, and BTEX were reported non-detect at the laboratory PQL in groundwater samples collected from FMW-24 and FMW-25 in January 2022.
B-5	Monitoring well	The source of VC in groundwater at B-5 at 2 ug/l in 2019 is uncertain. A monitoring well may be needed.	Multiple monitoring wells, including MW-1, MW-2, MW-3, FMW-18, and FMW-20, have been installed in the historical treatment area proximate to boring B-5. Concentrations of HVOCs were significantly reduced in this area following the interim action and ongoing monitored natural attenuation. Considering this, an additional monitoring well near B-5 is not warranted at this time.
Area-2-B13	No data gap noted	Location MW-1 sampled in 2021 shows vinyl chlroide is no longer above CUL at this location. The source may have been from source area #6 (Area-2-B9).	Agreed. In addition, MW-1 and Area-2-B9 are located within the historical treatment area. Groundwater analytical results from monitoring wells in this area continue to demonstrate that the interim action previously conducted in this area is protective of human health and the environment.
B-6	No data gap noted	Location only slightly above CUL for vinyl chloride, source may be from source area #6 (Area-2-B8).	Agreed. In addition, concentrations of HVOCs were less than the MTCA cleanup levels in groundwater samples collected from monitoring well FMW-20, which is located in the former source area.

Table 1
Data Gap Summary
18420 68th Avenue South
Kent, Washington
Farallon PN: 2032-012

Potential Source Area	Data Gap Identified by Ecology	Ecology Description of Data Gap	Data Gap Evaluation
B-7	Monitoring well	Source of vinyl chloride in groundwater at 3.2 ug/l in 2019 and Arsenic at 64 ug/l uncertain. Monitoring well (temporary, and potentially, permanent) needed.	To evaluate this data gap, monitoring well FMW-24 was installed proximate to boring B-7 in January 2022. Groundwater samples were collected from this monitoring well and analyzed for HVOCs and arsenic. Vinyl chloride was detected at concentrations of 1.1 and 1.11 ug/l in the groundwater samples analyzed in January and April 2022, respectively. Dissolved arsenic was detected at a concentration of 10.8 ug/l, which slightly exceeds the natural background concentration. These data indicate that arsenic detected in the reconnaissance groundwater sample analyzed from boring B-11 was not representative of groundwater conditions.
B-11	Monitoring well	Source of arsenic in groundwater at 710 ug/l in 2019 uncertain. Monitoring well (temporary, and potentially, permanent) needed.	Monitoring well FMW-22 was installed proximate to boring B-11 in January 2022. Groundwater samples were collected from this monitoring well and analyzed for HVOCs and arsenic. Arsenic was reported non-detect at the laboratory PQL in the groundwater samples analyzed in January 2022. These data indicate that arsenic detected in the reconnaissance groundwater sample analyzed from boring B-11 was not representative of groundwater conditions.

NOTES:

BTEX = benzene, toluene, ethylbenzene, and xylenes

CUL = cleanup levels

cis-1,2-DCE = cis,1,2-dichloroethene

CVOCs = chlorinated volatile organic compounds

DRO = TPH as diesel-range organics

GRO = TPH as gasoline-range organics

HVOCs = halogenated volatile organic compounds

MTCA = Washington State Model Toxics Control Act Cleanup Regulation

ORO = TPH as oil-ranged organics

PCE = tetrachloroethene

PQL = practical quantitation limit

TPH = total petroleum hydrocarbons

ug/l = micrograms per liter

Surface Water Human Health, Water, and Organisms Screening Levels, 173-201A WAC⁵									4.9	0.38	NE	600	0.02		

NOTES:

Results in **bold** and highlighted **gold** denote concentrations exceeding MTCA Cleanup Levels for Groundwater.

Results in **bold** denote concentration detected at or above the laboratory practical quantitation limit.

< denotes analyte not detected at or exceeding the reporting limit listed. Non-detect results for samples analyzed in January 2022 reported to the method detection limit.

--- denotes sample not analyzed or information is unknown.

^A Angled monitoring well.

* denotes analyzed by U.S. Environmental Protection Agency (EPA) Method 8260D-SIM

¹ Depths in feet below ground surface (bgs). Elevations in feet referenced to North American Vertical Datum of 1988 (NAVD88).

² Analyzed by EPA Method 8260 except for samples analyzed in 1998 and 2003; 1998 and 2003 samples analyzed by EPA Method 8021B. Only select VOCs shown in table; see lab reports for full list of analytes.

³ Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised 2013.

⁴ Washington State Model Toxics Control Act Cleanup Regulation Cleanup Levels and Risk Calculations, Standard Method B Values for Groundwater, <https://ecology.wa.gov/Regulations-Permits/Guidance-technical-assistance/Contamination-clean-up-tools/CLARC>

⁵ Values from Table 240, Section 240 of the Water Quality Standards for Surface Waters of the State of Washington, Chapter 173-201A of the Washington Administrative Code, as adopted on August 1, 2016, and updated on December 1, 2019. These values are subject to approval by the U.S. Environmental Protection Agency and are subject to change.

ATC = ATC Environmental, Inc.

Coatings = Coatings Unlimited, Inc.

EMS = Environmental Management Services, LLC

Farallon = Farallon Consulting, L.L.C.

J = result is an estimate

ND = analyte not detected exceeding an unknown laboratory reporting limit

NE = not established

PCE = tetrachloroethene

TCE = trichloroethene

URS = URS Corporation

Versar = Versar, Inc.

VOC = volatile organic compound

West Valley = West Valley Business Park

NOTES:

Results in **bold** and highlighted **gold** denote concentrations exceeding applicable cleanup levels.

ATC = ATC Environmental Inc.

Samples highlighted **green** denote sample over excavated during interim action.

BTEX = benzene, toluene, ethylbenzene and xylenes

< denotes analyte not detected at or exceeding the laboratory reporting limit listed.

Coatings = Coatings Unlimited, Inc.

— denotes sample not analyzed.

DRO = total petroleum hydrocarbons (TPH) as diesel-range organics

^A Angled monitoring well.

EMS = Environmental Management Services, LLC

* = analyzed by Washington Department of Ecology Method WTPH-HCID

Farallon = Farallon Consulting, L.L.C.

** = analyzed by WTPH-HCID following silica-gel cleanup

GRO = TPH as gasoline-range organics

^ Analyzed by a total petroleum hydrocarbon method (ranges not identified).

H = sample analyzed outside of holding time

¹Depth in feet below ground surface.

HLA = Harding Lawson Associates

²Analyzed by Northwest Method NWTPH-Dx, Environmental Protection Agency (EPA) Method 8015 (1990-1991 samples), or Washington Department of

J = result is an estimate

Ecology Method WTPH-D (1996-1998 samples)

N = hydrocarbons in the oil-range are impacting the diesel-range result

³Analyzed by Northwest Method NWTPH-Gx or EPA Method 8015 (1990-1991 samples).

ND = analyte not detected and laboratory reporting limit is unknown

⁴Analyzed by EPA Method 8021B, 8260D, 8240 (1990-1991 samples), or 8260 (1996 samples).

NE = not established

⁵Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of

ORO = TPH as oil-range organics

Chapter 173-340 of the Washington Administrative Code, as revised 2013.

West Valley = West Valley Business Park

⁶Cleanup level is 30 milligrams per kilogram if benzene is detected and 100 milligrams per kilogram if benzene is not detected.

NOTES:

< denotes analyte not detected at or exceeding the reporting limit listed.

— denotes sample not analyzed.

Samples highlighted green denote sample over excavated during interim action.

¹Analyzed by Northwest Method NWTPH-Dx or Washington Department of Ecology Method WTPH-D (1997 samples).

²Analyzed by Northwest Method NWTPH-Gx.

³Analyzed by U.S. Environmental Protection Agency Method 8021B, 8260A, 8260D, 8260D/SIM.

⁴Washington State Model Toxics Control Act Cleanup Regulation Method A Cleanup Levels for Groundwater, Table 720-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as amended 2013.

⁵Cleanup level is 800 micrograms per liter if benzene is detected and 1,000 micrograms per liter if benzene is not detected.

ATC = ATC Environmental, Inc.

Coatings = Coatings Unlimited, Inc.

BTEX = benzene, toluene, ethylbenzene, and xylenes

DRO = total petroleum hydrocarbons (TPH) as diesel-range organics

EMS = Environmental Management Services, LLC

Farallon = Farallon Consulting, L.L.C.

GRO = TPH as gasoline-range organics

ORO = TPH as oil-range organics

N = hydrocarbons in the lube oil range are impacting the oil range results

T = the sample chromatogram is not similar to a typical diesel standard

Versar = Versar, Inc.

NOTES:

Results in **bold** and highlighted **gold** denote concentrations exceeding applicable cleanup levels.

Samples highlighted **green** denote sample over excavated during interim action.

< denotes analyte not detected at or exceeding the laboratory reporting limit listed.

--- denotes sample not analyzed

¹Depth in feet below ground surface.

²Analyzed by U.S. Environmental Protection Agency (EPA) Methods 6020B/7471B or 7060/6010/7471 (1990-1996 samples).

MTCA Cleanup Levels for Groundwater²					8	5	50	15					2	

NOTES:

Results in **bold** and highlighted **yellow** denote concentrations exceeding applicable cleanup levels.

< denotes analyte not detected at or exceeding the reporting limit listed.

— denotes sample not analyzed.

Coatings = Coatings Unlimited, Inc.

Farallon = Farallon Consulting, L.L.C.

¹Analyzed by U.S. Environmental Protection Agency Methods 200.8/6020B/7470A.

Re: Analytical Data for Project 2032-012
Laboratory Reference No. 2201-013

Dear Pete:

Enclosed are the analytical results and associated quality control data for samples submitted on January 4, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DBS".

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: January 25, 2022
Samples Submitted: January 4, 2022
Laboratory Reference: 2201-013
Project: 2032-012

Case Narrative

Samples were collected on January 3 and 4, 2022 and received by the laboratory on January 4, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The client requested the analysis of samples FMW-20-6.0 and FMW-20-12.5 after the holding time had expired.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
 - B - The analyte indicated was also found in the blank sample.
 - C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
 - E - The value reported exceeds the quantitation range and is an estimate.
 - F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
 - H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
 - I - Compound recovery is outside of the control limits.
 - J - The value reported was below the practical quantitation limit. The value is an estimate.
 - K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
 - L - The RPD is outside of the control limits.
 - M - Hydrocarbons in the gasoline range are impacting the diesel range result.
 - M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
 - N - Hydrocarbons in the lube oil range are impacting the diesel range result.
 - N1 - Hydrocarbons in diesel range are impacting lube oil range results.
 - O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
 - P - The RPD of the detected concentrations between the two columns is greater than 40.
 - Q - Surrogate recovery is outside of the control limits.
 - S - Surrogate recovery data is not available due to the necessary dilution of the sample.
 - T - The sample chromatogram is not similar to a typical _____.
 - U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
 - U1 - The practical quantitation limit is elevated due to interferences present in the sample.
 - V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
 - W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
 - X - Sample extract treated with a mercury cleanup procedure.
 - X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
 - Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
 - Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
 - Z -
- ND - Not Detected at PQL
 PQL - Practical Quantitation Limit
 RPD - Relative Percent Difference

Seattle, WA 98101

Re: Analytical Data for Project 2032-012
Laboratory Reference No. 2201-043

Dear Pete:

Enclosed are the analytical results and associated quality control data for samples submitted on January 6, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DBS".

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: February 1, 2022
Samples Submitted: January 6, 2022
Laboratory Reference: 2201-043
Project: 2032-012

Case Narrative

Samples were collected on January 5 and 6, 2022 and received by the laboratory on January 6, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

NWTPH-Gx Analysis

The client requested the analysis of samples FMW-25-7.0 and FMW-25-12.0 after the holding time had expired.

NWTPH-Dx Analysis

The client requested the analysis of samples FMW-25-7.0 and FMW-25-12.0 after the holding time had expired.

Volatiles EPA 8260D Analysis

The client requested the analysis of samples FMW-25-7.0 and FMW-25-12.0 after the holding time had expired.

Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
 - B - The analyte indicated was also found in the blank sample.
 - C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
 - E - The value reported exceeds the quantitation range and is an estimate.
 - F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
 - H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
 - I - Compound recovery is outside of the control limits.
 - J - The value reported was below the practical quantitation limit. The value is an estimate.
 - K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
 - L - The RPD is outside of the control limits.
 - M - Hydrocarbons in the gasoline range are impacting the diesel range result.
 - M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
 - N - Hydrocarbons in the lube oil range are impacting the diesel range result.
 - N1 - Hydrocarbons in diesel range are impacting lube oil range results.
 - O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
 - P - The RPD of the detected concentrations between the two columns is greater than 40.
 - Q - Surrogate recovery is outside of the control limits.
 - S - Surrogate recovery data is not available due to the necessary dilution of the sample.
 - T - The sample chromatogram is not similar to a typical _____.
 - U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
 - U1 - The practical quantitation limit is elevated due to interferences present in the sample.
 - V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
 - W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
 - X - Sample extract treated with a mercury cleanup procedure.
 - X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
 - Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
 - Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
 - Z -
- ND - Not Detected at PQL
 PQL - Practical Quantitation Limit
 RPD - Relative Percent Difference

Re: Analytical Data for Project 2032-012
Laboratory Reference No. 2204-267

Dear Pete:

Enclosed are the analytical results and associated quality control data for samples submitted on April 22, 2022.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DBS".

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: April 27, 2022
Samples Submitted: April 22, 2022
Laboratory Reference: 2204-267
Project: 2032-012

Case Narrative

Samples were collected on April 19, 20 and 21, 2022 and received by the laboratory on April 22, 2022. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

This report pertains to the samples analyzed in accordance with the chain of custody,
 and is intended only for the use of the individual or company to whom it is addressed.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
 - B - The analyte indicated was also found in the blank sample.
 - C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
 - E - The value reported exceeds the quantitation range and is an estimate.
 - F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
 - H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
 - I - Compound recovery is outside of the control limits.
 - J - The value reported was below the practical quantitation limit. The value is an estimate.
 - K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
 - L - The RPD is outside of the control limits.
 - M - Hydrocarbons in the gasoline range are impacting the diesel range result.
 - M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
 - N - Hydrocarbons in the lube oil range are impacting the diesel range result.
 - N1 - Hydrocarbons in diesel range are impacting lube oil range results.
 - O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
 - P - The RPD of the detected concentrations between the two columns is greater than 40.
 - Q - Surrogate recovery is outside of the control limits.
 - S - Surrogate recovery data is not available due to the necessary dilution of the sample.
 - T - The sample chromatogram is not similar to a typical _____.
 - U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
 - U1 - The practical quantitation limit is elevated due to interferences present in the sample.
 - V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
 - W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
 - X - Sample extract treated with a mercury cleanup procedure.
 - X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
 - X2 - Sample extract treated with a silica gel cleanup procedure.
 - Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
 - Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
 - Z -
- ND - Not Detected at PQL
 PQL - Practical Quantitation Limit
 RPD - Relative Percent Difference

RE: A2A0558 - 68th Ave South - 2032-012

Thank you for using Apex Laboratories. We greatly appreciate your business and strive to provide the highest quality services to the environmental industry.

Enclosed are the results of analyses for work order A2A0558, which was received by the laboratory on 1/13/2022 at 8:30:00AM.

If you have any questions concerning this report or the services we offer, please feel free to contact me by email at: pnerenberg@apex-labs.com, or by phone at 503-718-2323.

Please note: All samples will be disposed of within 30 days of sample receipt, unless prior arrangements have been made.

Cooler Receipt Information

(See Cooler Receipt Form for details)

Cooler #1	0.5 degC	Cooler #2	1.1 degC
Cooler #3	0.6 degC	Cooler #4	0.2 degC
Cooler #5	0.2 degC	Cooler #6	2.3 degC
Cooler #7	0.8 degC		

This Final Report is the official version of the data results for this sample submission, unless superseded by a subsequent, labeled amended report.

All other deliverables derived from this data, including Electronic Data Deliverables (EDDs), CLP-like forms, client requested summary sheets, and all other products are considered secondary to this report.

Apex Laboratories

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

- J** Estimated Result. Result detected below the lowest point of the calibration curve, but above the specified MDL.
- PRES** Incomplete field preservation. Additional preservative was added to adjust the pH within the appropriate range for this analysis.
- Q-01** Spike recovery and/or RPD is outside acceptance limits.
- Q-16** Reanalysis of an original Batch QC sample.
- Q-19** Blank Spike Duplicate (BSD) sample analyzed in place of Matrix Spike/Duplicate samples due to limited sample amount available for analysis.
- Q-54** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +12%. The results are reported as Estimated Values.
- Q-54a** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +13%. The results are reported as Estimated Values.
- Q-54b** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +15%. The results are reported as Estimated Values.
- Q-54c** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +2%. The results are reported as Estimated Values.
- Q-54d** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +20%. The results are reported as Estimated Values.
- Q-54e** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +22%. The results are reported as Estimated Values.
- Q-54f** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +27%. The results are reported as Estimated Values.
- Q-54g** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +3%. The results are reported as Estimated Values.
- Q-54h** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +4%. The results are reported as Estimated Values.
- Q-54i** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +6%. The results are reported as Estimated Values.
- Q-54j** Daily Continuing Calibration Verification recovery for this analyte failed the +/-20% criteria listed in EPA method 8260/8270 by +9%. The results are reported as Estimated Values.
- Q-56** Daily CCV/LCS recovery for this analyte was above the +/-20% criteria listed in EPA 8260

6700 S.W. Sandburg Street

Tigard, OR 97223

503-718-2323

ORELAP ID: OR100062

Farallon Consulting - Issaquah975 5th Ave NW
Issaquah, WA 98027Project: **68th Ave South**Project Number: **2032-012**Project Manager: **Greg Peters****Report ID:****A2A0558 - 01 28 22 1559****REPORTING NOTES AND CONVENTIONS:****Abbreviations:**

- DET Analyte DETECTED at or above the detection or reporting limit.
ND Analyte NOT DETECTED at or above the detection or reporting limit.
NR Result Not Reported
RPD Relative Percent Difference. RPDs for Matrix Spikes and Matrix Spike Duplicates are based on concentration, not recovery.

Detection Limits: Limit of Detection (LOD)

Limits of Detection (LODs) are normally set at a level of one half the validated Limit of Quantitation (LOQ). If no value is listed ('----'), then the data has not been evaluated below the Reporting Limit.

Reporting Limits: Limit of Quantitation (LOQ)

Validated Limits of Quantitation (LOQs) are reported as the Reporting Limits for all analyses where the LOQ, MRL, PQL or CRL are requested. The LOQ represents a level at or above the low point of the calibration curve, that has been validated according to Apex Laboratories' comprehensive LOQ policies and procedures.

Reporting Conventions:

- Basis: Results for soil samples are generally reported on a 100% dry weight basis.
The Result Basis is listed following the units as "dry", "wet", or " " (blank) designation.
- "dry" Sample results and Reporting Limits are reported on a dry weight basis. (i.e. "ug/kg dry")
See Percent Solids section for details of dry weight analysis.
- "wet" Sample results and Reporting Limits for this analysis are normally dry weight corrected, but have not been modified in this case.
- " " Results without 'wet' or 'dry' designation are not normally dry weight corrected. These results are considered 'As Received'.

QC Source:

In cases where there is insufficient sample provided for Sample Duplicates and/or Matrix Spikes, a Lab Control Sample Duplicate (LCS Dup) may be analyzed to demonstrate accuracy and precision of the extraction batch.

Non-Client Batch QC Samples (Duplicates and Matrix Spike/Duplicates) may not be included in this report. Please request a Full QC report if this data is required.

Miscellaneous Notes:

- "---" QC results are not applicable. For example, % Recoveries for Blanks and Duplicates, % RPD for Blanks, Blank Spikes and Matrix Spikes, etc.
- "***" Used to indicate a possible discrepancy with the Sample and Sample Duplicate results when the %RPD is not available. In this case, either the Sample or the Sample Duplicate has a reportable result for this analyte, while the other is Non Detect (ND).

Blanks:

Standard practice is to evaluate the results from Blank QC Samples down to a level equal to $\frac{1}{2}$ the Reporting Limit (RL).

-For Blank hits falling between $\frac{1}{2}$ the RL and the RL (J flagged hits), the associated sample and QC data will receive a 'B-02' qualifier.

-For Blank hits above the RL, the associated sample and QC data will receive a 'B' qualifier, per Apex Laboratories' Blank Policy.

For further details, please request a copy of this document.

Farallon Consulting - Issaquah975 5th Ave NW
Issaquah, WA 98027Project: **68th Ave South**Project Number: **2032-012**Project Manager: **Greg Peters****Report ID:****A2A0558 - 01 28 22 1559****REPORTING NOTES AND CONVENTIONS (Cont.):****Blanks (Cont.):**

Sample results flagged with a 'B' or 'B-02' qualifier are potentially biased high if the sample results are less than ten times the level found in the blank for inorganic analyses, or less than five times the level found in the blank for organic analyses.

'B' and 'B-02' qualifications are only applied to sample results detected above the Reporting Level.

Preparation Notes:**Mixed Matrix Samples:****Water Samples:**

Water samples containing significant amounts of sediment are decanted or separated prior to extraction, and only the water portion analyzed, unless otherwise directed by the client.

Soil and Sediment Samples:

Soil and Sediment samples containing significant amounts of water are decanted prior to extraction, and only the solid portion analyzed, unless otherwise directed by the client.

Sampling and Preservation Notes:

Certain regulatory programs, such as National Pollutant Discharge Elimination System (NPDES), require that activities such as sample filtration (for dissolved metals, orthophosphate, hexavalent chromium, etc.) and testing of short hold analytes (pH, Dissolved Oxygen, etc.) be performed in the field (on-site) within a short time window. In addition, sample matrix spikes are required for some analyses, and sufficient volume must be provided, and billable site specific QC requested, if this is required. All regulatory permits should be reviewed to ensure that these requirements are being met.

Data users should be aware of which regulations pertain to the samples they submit for testing. If related sample collection activities are not approved for a particular regulatory program, results should be considered estimates. Apex Laboratories will qualify these analytes according to the most stringent requirements, however results for samples that are for non-regulatory purposes may be acceptable.

Samples that have been filtered and preserved at Apex Laboratories per client request are listed in the preparation section of the report with the date and time of filtration listed.

Apex Laboratories maintains detailed records on sample receipt, including client label verification, cooler temperature, sample preservation, hold time compliance and field filtration. Data is qualified as necessary, and the lack of qualification indicates compliance with required parameters.

Dear Mr Kingston:

Included are the results from the testing of material submitted on February 10, 2022 from the 18420 68th 2032-012, F&BI 202195 project. There are 13 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

CASE NARRATIVE

This case narrative encompasses samples received on February 10, 2022 by Friedman & Bruya, Inc. from the Farallon Consulting, LLC 18420 68th 2032-012, F&BI 202195 project. Samples were logged in under the laboratory ID's listed below.

<u>Laboratory ID</u>	<u>Farallon Consulting, LLC</u>
202195 -01	Exterior-SS
202195 -02	Interior-East-SS
202195 -03	Interior-West-SS

The samples were sent to Amtest for strontium, tin, and titanium analyses. The report is enclosed.

All quality control requirements were acceptable.

FRIEDMAN & BRUYA, INC.

ENVIRONMENTAL CHEMISTS

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht - The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Attention: MICHAEL ERDAHL

Dear MICHAEL ERDAHL:

Enclosed please find the analytical data for your project.

The following is a cross correlation of client and laboratory identifications for your convenience.

CLIENT ID	MATRIX	AMTEST ID	TEST
EXTERIOR-SS	Soil	22-A001872	MET
INTERIOR-EAST-SS	Soil	22-A001873	MET
INTERIOR-WEST-SS	Soil	22-A001874	MET

Your samples were received on Friday, February 11, 2022. At the time of receipt, the samples were logged in and properly maintained prior to the subsequent analysis.

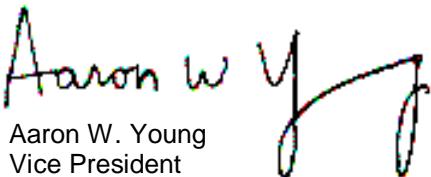

The analytical procedures used at AmTest are well documented and are typically derived from the protocols of the EPA, USDA, FDA or the Army Corps of Engineers.

Following the analytical data you will find the Quality Control (QC) results.

Please note that the detection limits that are listed in the body of the report refer to the Practical Quantitation Limits (PQL's), as opposed to the Method Detection Limits (MDL's).

If you should have any questions pertaining to the data package, please feel free to contact me.

Sincerely,

Aaron W. Young
Vice President
