AGREED ORDER NO. DE 14302**

Dear Ms. Seeds:

PES Environmental, Inc. (“PES”) has prepared this data submittal on behalf of BMR-Dexter LLC (“BMRD”) for the American Linen Supply Co Dexter Ave Site (the “Site”) located at 700 Dexter Avenue North, Seattle, Washington. This submittal provides the data collected from the third quarter of 2021 through the third quarter of 2022, including data from interim action performance monitoring wells at the 700 Dexter Avenue North property (the “Property”) and at the Seattle Department of Transportation Mercer Parcels Site (also known as 800 Mercer), remedial investigation (“RI”) monitoring wells, and soil vapor probes. PES conducted the monitoring consistent with the Final Interim Action Work Plan (“IAWP”)¹, the Final Contingent Action Addendum (“CAA”) to the Final IAWP², the Final Remedial Investigation/Feasibility Study (“RI/FS”) Work Plan,³ the Final RI/FS Work Plan Addendum,⁴ the Proposed Groundwater and Soil Vapor Monitoring Plan,⁵ and the Interim Action Work Plan Addendum No. 2.⁶ PES measured groundwater levels, collected groundwater samples, and collected soil vapor samples during this period to document the chlorinated volatile organic compound (“CVOC”) concentrations in groundwater and soil vapor. This data submittal summarizes the field and

analytical laboratory procedures, provides the tabulated data, presents groundwater elevation contour maps, provides CVOC time-trend plots, and includes the analytical laboratory reports and data validation review memoranda.

Construction activities were being performed on and near the Property during this monitoring period, including 700 Dexter interior build-out; 8th Avenue North street and sidewalk improvements; well monument completions or replacements on Valley Street, 8th Avenue North, and Roy Street; redevelopment activities at 701 Dexter Avenue North; and emulsified vegetable oil (“EVO”) injection in monitoring wells on the Seattle DOT Mercer Parcels.

GROUNDWATER MONITORING PROCEDURES

During quarterly groundwater monitoring, PES measured groundwater levels and performed groundwater sampling from wells within the RI/IA monitoring well network at the Site. Figure 1 shows the well and soil vapor probe locations. PES used an electronic water level probe to measure depth to groundwater in the wells, and a pressure gauge to monitor the flowing CAA wells in the Property basement. PES sampled the monitoring wells with a peristaltic or bladder pump depending on the depth to water in the wells. Wells were purged at pumping rates of 200 mL/min or less. Three casing volumes of water were purged from flowing Property CAA monitoring wells when the water level was above the well top of casing prior to sampling. One primary groundwater sample was collected from each monitoring well. Field quality assurance samples consisted of trip blanks, duplicate samples (one duplicate sample collected for every 20 primary groundwater samples), and equipment rinsate blanks for wells sampled with a bladder pump. All samples were shipped for analysis of VOCs by Environmental Protection Agency (“EPA”) Method 8260C. Groundwater samples from selected wells near the Property were also analyzed for gasoline-range organics (“GRO”) by Washington State Department of Ecology (“Ecology”) Method NWTPH-Gx, and groundwater samples from a subset of wells across the Site were also analyzed for geochemical parameters. All samples were shipped to Pace Analytical in Mount Juliet, Tennessee, with the exception of samples collected during the fourth quarter of 2021 for chloride, nitrate, and sulfate analysis by EPA Method 300.0. Fourth quarter 2021 chloride, nitrate, and sulfate samples were delivered daily to Fremont Analytical in Seattle, Washington.

Third Quarter 2021: On August 16, 2021, PES measured one round of groundwater levels in 89 monitoring wells within the RI/IA monitoring well network at the Property and around the Site, and in 41 monitoring wells on the Seattle Department of Transportation (“DOT”) Mercer Parcels and at the 615 Dexter site. Monitoring wells MW121, R-MW6, MW-302, W-MW-01, MW104, MW124, MW-138, and MW-160 were inaccessible and W-MW-02 contained emulsified vegetable oil (“EVO”). Water levels, therefore, were not measured in these eight wells. Between August 2 and August 23, 2021, PES collected groundwater samples from 71 monitoring wells outside of the Property, including 9 Shallow Zone wells, 21 Intermediate A Zone wells, 24 Intermediate B Zone wells, and 17 Deep Zone wells. The 24 CAA monitoring wells on the Property were also sampled during the third quarter 2021 event. Two Intermediate B Zone wells (MW-157 and W-MW-02) could not be sampled due to the presence of EVO in the wells.

One primary groundwater sample was collected from each monitoring well, with duplicate samples collected from R-MW5, MW103, MW-145R, MW-301, and MW-348. Two equipment rinsate blanks and five trip blanks were also collected. PES also submitted groundwater samples from a subset of Property CAA monitoring wells to SiREM in Knoxville, Tennessee, for Gene-Trac testing to quantify

Dehalococcoides mccartyi (Dhc), and Dhc functional genes (*vcra*, *bvcA*, and *tceA*) for biological reductive dichlorination evaluation.

Fourth Quarter 2021: Between November 3 and December 17, 2021, PES collected groundwater samples from 85 monitoring wells outside of the Property, including 17 Shallow Zone wells, 25 Intermediate A Zone wells, 21 Intermediate B Zone wells, and 22 Deep Zone wells. The 24 CAA monitoring wells on the Property were also sampled during the fourth quarter 2021 event. PES did not sample the following wells as noted:

- Shallow Zone monitoring well MW121 and Deep Zone monitoring well MW124 were inaccessible due to construction-related activities and were unable to be sampled;
- Intermediate A Zone monitoring wells FMW-142 and GEI-MW-1; Intermediate B Zone well FMW-141; and Deep Zone wells FMW-129, FMW-131, FMW-137, FMW-140, and GEI-2 were not sampled due to access restrictions;
- Intermediate B Zone monitoring wells MW-157 and W-MW-02 were not sampled due to the presence of EVO; and
- Deep Zone monitoring wells MW128 and MW-329 were not sampled due to time constraints during the sampling event.

One primary groundwater sample was collected from each monitoring well, with duplicate samples collected from MW113, MW-158A MW-135, MW-314, and MW-339. Two equipment rinsate blanks and five trip blanks were also collected. PES did not monitor groundwater levels during the fourth quarter of 2021 due to access and time restrictions.

First Quarter 2022: On February 14, 2022, PES measured one round of groundwater levels in 117 monitoring wells within the RI/IA monitoring well network at the Property and around the Site, and in 48 monitoring wells on the Seattle DOT Mercer Parcels and at the 615 Dexter site. PES did not monitor the water level in W-MW-02 due to the presence of EVO in the well.

Between February 15 and March 8, 2022, PES collected groundwater samples from 60 monitoring wells outside of the Property, including 8 Shallow Zone wells, 17 Intermediate A Zone wells, 13 Intermediate B Zone wells, and 22 Deep Zone wells. The 24 CAA monitoring wells on the Property were also sampled during the first quarter 2022 event. Intermediate B Zone wells MW-157 and W-MW-02 could not be sampled due to the presence of EVO in the wells. One primary groundwater sample was collected from each monitoring well, with duplicate samples collected from MW102, MW-156, MW-161, MW-172, and R-MW5. Two equipment rinsate blanks and five trip blanks were also collected.

Second Quarter 2022: On May 16, 2022, PES measured one round of groundwater levels in 119 monitoring wells within the RI/IA monitoring well network at the Property and around the Site, and in 32 monitoring wells on the Seattle DOT Mercer Parcels. PES did not monitor water levels in MW-157 and W-MW-02 due to the presence of EVO, and FMW-143 was inaccessible.

Between May 2 and June 9, 2022, PES collected groundwater samples from 103 monitoring wells outside of the Property, including 18 Shallow Zone wells, 27 Intermediate A Zone wells, 27 Intermediate B Zone wells, and 31 Deep Zone wells. The 24 CAA monitoring wells on the Property were also sampled during the second quarter 2022 event. PES did not sample MW-157 and W-MW-02

due to the presence of EVO in the wells. One primary groundwater sample was collected from each monitoring well, with duplicate samples collected from HMW-9IB, MW-9, MW121, MW-178. Two equipment rinsate blanks and five trip blanks were also collected.

Third Quarter 2022: On August 8, 2022, PES measured one round of groundwater levels in 113 monitoring wells within the RI/IA monitoring well network around the Site, and in 30 monitoring wells on the Seattle DOT Mercer Parcels. PES did not monitor water levels in four wells during the event, W-MW-02 due to the presence of EVO, MW-305 which was dry, and MW-330 and MW-332 due to access restrictions.

Between August 1 and August 23, 2022, PES collected groundwater samples from 56 monitoring wells outside of the Property, including 9 Shallow Zone wells, 15 Intermediate A Zone wells, 15 Intermediate B Zone wells, and 17 Deep Zone wells. The 24 CAA monitoring wells on the Property were also sampled during the third quarter 2022 event. PES did not sample MW-157 and W-MW-02 due to the presence of EVO in the wells. One primary groundwater sample was collected from each monitoring well, with duplicate samples collected from BB-8, MW121, MW125, MW-301, and W-MW-01. Two equipment rinsate blanks and five trip blanks were also collected.

VAPOR PROBE SAMPLING PROCEDURES

PES collected soil vapor samples during quarterly sampling events from shallower and deeper vadose zone soil vapor probes at the Site. Soil vapor samples were analyzed for VOCs, including tetrachloroethene (“PCE”), trichloroethene (“TCE”), cis-1,2-dichloroethene (“cDCE”), trans-1,2-dichloroethene (“tDCE”), and vinyl chloride (“VC”).

Third Quarter 2021: Between August 12 and August 14, 2021, PES collected six vapor samples, two from soil vapor probes SV-04 and SV-16 screened in the shallower portion of vadose zone soil at 6 feet below ground surface (“bgs”) and four from soil vapor probes SV01, SV-05, SV-13, and SV-15 screened in the deeper vadose zone just above the groundwater capillary fringe, at depths of 12 to 13 feet bgs. A duplicate sample was collected from SV01.

Fourth Quarter 2021: On December 16, 2021, PES collected soil vapor samples from paired shallower and deeper soil vapor probes SV01 and SV-18 located in the 8th Avenue North right-of-way.

First Quarter 2022: Between March 3 and March 8, 2022, PES collected 10 soil vapor samples from soil vapor probes along Valley Street, 8th Avenue North, and the alley east of 800 Roy/Aloha Street. Samples were collected from shallower and deeper soil vapor probe pairs SV01 and SV-18, SV-08 and SV-09, SV-12 and SV-13, and SV-21 and SV-22. Soil vapor samples were also collected from shallower vapor probes SV-17 and SV-23. A duplicate sample was collected from SV-18. PES attempted to collect a vapor sample from SV-24 however the probe screen was submerged, and water in the probe could not be cleared.

Second Quarter 2022: On May 4, 2022, PES collected soil vapor samples from paired shallower and deeper soil vapor probes SV01 and SV-18 located along the in the 8th Avenue North right-of-way.

Third Quarter 2022: On August 22, 2022, PES collected soil vapor samples from paired shallower and deeper soil vapor probes SV01 and SV-18 located in the 8th Avenue North right-of-way.

NOTES:

TOCs were surveyed relative to an established datum of 521.41 feet prior to 2012. TOCs were resurveyed by Axis Survey and Mapping of Kirkland, WA on March 16th, 2012, relative to an arbitrary benchmark of 499.89 feet above mean sea level, and by Bush, Roed & Hitchings, Inc. of Seattle, WA in multiple surveys since February 2012 using the North American Vertical Datum 1988.

^a As measured in feet below a fixed spot on the well casing rim.

^b Calculated by subtracting the depth to groundwater from the casing elevation. Groundwater elevation in angled monitoring well calculated subtracting the product of the measured depth to groundwater in the angled well by the sine of its angle.

– = unknown or not applicable

ROW = right-of-way

TOC = top of casing

Notes:
 Alkalinity analyzed by EPA Method 2320.
 Anions analyzed by EPA Method 9056A.
 Total Organic Carbon (TOC) analyzed by EPA Method 9060A.
 Metals Analyzed by EPA Method 6020B.
 Ferrous Iron measured during field sampling using a Hach field kit.
 Dissolved gases analyzed by EPA Method RSK175.
 Ferric iron = total iron minus ferrous iron; if total iron < ferrous iron, ferric iron is reported as zero ("0").
 mgCaCO₃/L= milligrams of calcium carbonate per liter
 mg/L = milligrams per liter
 ug/L = micrograms per liter
 Samples prior to 2017 were collected by SoundEarth Strategies (SES).
 U = Not detected at or above the laboratory method detection limit (MDL).
 Detected results shown in bold.
 J = The identification of the analyte is acceptable; the reported value is an estimate.
 J+ = The identification of the analyte is acceptable; the reported value is an estimate, but the result may be biased high.
 R = The data is unusable. The sample result is rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
 - = Not sampled or results not available.
 Beginning October 2020, select locations were sampled for an abbreviated analyte list (Sulfate, TOC, Total Iron, Total Manganese, Methane, Ethane, and Ethene).

<p>Notes:</p> <p>a = Percent <i>Dehalococcoides</i> (Dhc) in microbial population. This value is calculated by dividing the number of Dhc 16S ribosomal ribonucleic acid (rRNA) gene copies by the total number of bacteria as estimated by the mass of DNA extracted from the sample. Range represent normal variation in Dhc enumeration.</p> <p>b = Based on quantification of Dhc 16s rRNA gene copies. Dhc are generally reported to contain one 16s rRNA gene copy per cell; therefore, this number is often interpreted to represent the number of Dhc cells present in the sample.</p> <p>10⁵-10⁶ Dhc gene copies per liter: indicates the sample contains moderate concentrations of Dhc which may, or may not, be associated with observable dechlorination activity.</p> <p>1 x 10⁷ Dhc gene copies per liter (or above): indicates that the sample contains high concentrations of Dhc often associated with significant dechlorination rates.</p> <p>c = Percent of functional gene in microbial population. This value is calculated by dividing the functional gene copies quantified by the total number of estimated prokaryotes in the sample (based on the total quantity of DNA extracted from the sample). A value of 100% would suggest that all microbes in the sample contain the gene.</p> <p>Well screen elevations (feet relative to the North American Vertical Datum of 1988 (NAVD88)) shown in parentheses.</p>

Notes:

1. TOC = top of PVC casing
2. Monitoring wells and vapor probes were surveyed by Bush, Roed & Hitchings, Inc. (BR&H) of Seattle, Washington, relative to the North American Vertical Datum of 1988 (NAVD 88) and NAD83/91, Washington State Plane Coordinate System North Zone. The perimeter injection wells were surveyed by Turner Construction to an on-Site datum and converted from the resulting CAD drawing to the Washington State Plane Coordinate System by PES Environmental
3. bgs = below ground surface; ft = feet; ROW = right-of-way; - = not available or not applicable
4. HSA = hollow-stem auger; DP = direct-push probe; Sonic = roto-sonic or rotary vibratory drilling
5. Casing depth = depth where casing or auger size was reduced, with the larger casing left in place during drilling
6. 10-foot-long well screens assumed for MW-214, SCL-MW101, SCL-MW105, SCS-2, and SMW-3
7. Treatment Zone D wells PRB-D14, PRB-D18, and PRB-D19 were damaged during construction; the wells were decommissioned and replaced by wells PRB-D14R, PRB-D18R, and PRB-D19R, respectively, each installed in separate borings
