## **1.0 Introduction**

This Remedial Investigation (RI) Report was prepared for the Dagmars Marina site located at 1870 Ross Ave, Everett, Snohomish County, Washington (Facility; Figure 1). Dagmars Marina currently operates a marina with on-land storage of marine vessels, including a fueling operation and a maintenance shop. Additional tenants include a boat repair facility, boat sales, and trailer sales. The Dagmars Marina “Site” includes the property and any area where a Site-related hazardous substance, other than a consumer product in consumer use, has been deposited, stored, disposed of, placed, or otherwise come to be located. The Site includes several localized releases, each of limited extent, at different areas of the Facility. A site location map and site plan are provided in Figures 1 and 2, respectively.

Work is being completed following the Remedial Investigation Work Proposal (Apex Companies, LLC [Apex], 2022c) that was signed by 1870 Ross Partners, LLC on November 28, 2022. This RI Report was prepared following the requirements of the Washington Administrative Code (WAC)-340-350. Enrollment of the site in the Expedited Voluntary Cleanup Program will be completed with submittal of this report.

### **1.1 Purpose and Objectives of Investigation**

The RI was completed to characterize four investigation areas identified based on the results of the 2022 Phase II Environmental Site Assessment (ESA; Apex, 2022b). A summary of investigation areas and findings are described below.

**Current Above Ground Storage Tank (AST) Area.** Apex identified a surface release associated with two 20,000-gallon ASTs near the Dagmars Marina Maintenance Shop in the northeast corner of the site.

**Maintenance Shop Area.** Apex identified a surface release associated with a 500-gallon used oil AST at the Dagmars Maintenance Shop.

**Snohomish Marine.** Apex identified subsurface contamination potentially associated with run-off to a catch-basin located 60 feet southeast from the tenant-run maintenance operation at Snohomish Marine.

**Arsenic Characterization Area.** The Confirmed and Suspected Contaminated Site List (CSCSL) listing at the Site refers to an area of elevated arsenic concentrations in groundwater identified during pre-construction activities for utilities in 2004.

**Drainage Sediment Outfall and Slough Area.** Extensive sampling was completed to characterize conditions at each stormwater outfall within the drainage system as part of the Phase II ESA. Impacts to sediments were not identified above applicable cleanup criteria. The results are incorporated into the findings of this Remedial Investigation.

---

Additionally, areas in the northern portion of the facility including a former AST area, relic piping, and an apparent cistern or manure vault system were also investigated. The 2022 ESA did not identify contamination sources associated with these features.

This RI was completed with the purposes of: 1) identifying/confirming contaminant source area(s); 2) evaluating the extent of contamination based on Washington State Model Toxics Control Act (MTCA) cleanup levels; and 3) evaluating risks and pathways to potential on-site and off-site receptors.

## **2.0 Site Background**

This section presents a brief description of the Site, its history, and available physical and chemical data. Information in this section was obtained from previously completed site investigations, to include: 1) a Phase I ESA report dated July 12, 2022 (Apex, 2022a); and 2) a Phase II ESA report dated November 21, 2022 (Apex, 2022b).

### **2.1 General Site Information**

The Site is located in an industrial setting in Everett, Washington (Figures 1 and 2). The City of Everett is located in Snohomish County, Washington approximately 30 miles north of Seattle, Washington. The Site is located approximately at sea level and is generally flat. Snohomish River is the closest body of water, located directly adjacent to the west of the Site and flowing approximately north to the Puget Sound.

The Site is comprised of two parcels adjacent to the Snohomish River and Interstate 5, totaling 37 acres. The Facility is used for on-land storage of marine vessels and includes a fueling operation and maintenance shop. Current tenants at Dagmars Marina include Snohomish Marine Maintenance, Boat Country Sales, Signal Trailer Sales, and a cellular data station. The cellular station sits several feet above the grade of the remainder of the Site. Based on the Phase I ESA (Apex, 2022a), the marina and associated buildings were developed in the 1970s, and the current operations (boat dock storage, marine maintenance, and equipment sales) have been present since the 1980s. Prior to the 1980s, the site was used for agricultural and dairy operations. The current layout of the Site is shown on Figures 3 and 4.

### **2.2 Site History**

The following description of the Site and adjacent properties is based on review of historical information. The Dagmars Facility originally included agricultural and dairy operations in the 1950s, with no significant change in use other than the addition of log boom tie-ups along the shoreline of the Site. In the late 1970s, Dagmar's Marina was constructed and has been operating since then with expansion throughout the years.

---

**Site Vicinity.** Properties to the north, south, and east of the site were vacant until at least 1941. By 1952, increased agricultural usage was observed to the north of the Site and by 1968, Interstate 5 was constructed to the east and industrial development began to the north of the Site (Buse Mill Timber & Sales Inc). Between 1968 and the present, there have been a lumber mill and various industrial developments adjoining the Site to the north and agricultural land to the south of the Site. The Site is bound by the Snohomish River to the west, and the former Everett smelter is located further west across the river from the marina.

## 2.3 Arsenic Release History

The Site has a unique listing on the CSCSL related to arsenic contamination in a groundwater sample collected during pre-construction activities for utilities in 2004. The CSCSL database listing indicates that groundwater on a portion of the Site was above MTCA Method A cleanup levels for arsenic. The CSCSL listing indicates that groundwater samples were collected near the current communications tower on Site in 2004 during subsurface telecommunication line construction. A single groundwater sample detected arsenic at concentrations exceeding the MTCA Method A cleanup levels. Groundwater analytical results detected arsenic concentrations of 50 micrograms per liter ( $\mu\text{g}/\text{L}$ ) compared to the MTCA Method A cleanup levels for arsenic of 5  $\mu\text{g}/\text{L}$ . No information was available describing whether this was a filtered or unfiltered sample.

## 2.4 Prior Site Investigation Activities

The 2022 Phase II ESA included characterization of suspected upland sources as well as the site drainage system. A summary of findings is described below.

- **Current AST Area.** A petroleum hydrocarbon surface release was identified in soil to the north of the ASTs to depths of approximately 5 feet below ground surface (bgs).
- **Maintenance Shop Area.** A petroleum hydrocarbon surface release was identified in soil on the northern side of the maintenance shop to a depth of 5 feet bgs.
- **Snohomish Marine.** A petroleum hydrocarbon release was identified near a stormwater catch-basin at the Snohomish Marine area. The release has extended to groundwater with concentrations of diesel range petroleum hydrocarbons (DRO) and residual range petroleum hydrocarbons (RRO) in groundwater ranging between 30 and 148 times higher than the applicable MTCA Method A cleanup levels, respectively. Additional soil and groundwater characterization, including monitoring wells, will be required at the Snohomish Marine area. During Phase II ESA field activities, a small septic tank was identified behind the building which was reportedly installed to manage wastewater generated by Snohomish Marine. The Phase II ESA utility locates did not identify any piping entering or leaving the small septic tank. An unknown amount of petroleum was released to the subsurface reaching groundwater near the stormwater catch-basin area.
- **Arsenic Characterization Area.** Arsenic concentrations in groundwater were noticeably lower than the historical groundwater sample of 50  $\mu\text{g}/\text{L}$ , ranging between 14 and 20  $\mu\text{g}/\text{L}$ . However, these

---

concentrations exceeded the applicable MTCA Method A cleanup level of 5 µg/L for groundwater. In soil samples, concentrations of arsenic exceeded the Puget Sound Natural Background Concentration of 7 milligrams per kilogram (mg/kg) but were below the applicable MTCA Method A cleanup level of 20 mg/kg. The arsenic concentrations detected in groundwater appear to be caused by biologically-mediated or natural background concentrations of arsenic in soil at the Site.

- **Drainage and Sediment Samples.** Sixteen drainage sediment samples were collected at each stormwater outfall identified in the Site's Stormwater Pollution Prevention Plan (SWPPP, Figures 5 and 6) to characterize drainage sediment conditions connected to the Site's stormwater system. Samples from Outfall-10 and Outfall-14 could not be collected due to drain configuration (French drain). French drain configurations discharge to the ground from perforated piping, and do not connect to the drainage ditch system. The drainage sediment samples were analyzed for a range of contaminants of interest. Drainage sediment analytical results are shown in Tables 1 through 5 and described below.

Concentrations of polychlorinated biphenyls (PCBs), organochlorine pesticides, organophosphorus pesticides, and herbicides were not detected in drainage sediment samples collected from the northern surface drainage and each outfall location sampled. Petroleum hydrocarbons were detected in samples collected at outfall locations adjacent to Interstate 5 and the northern surface drainage area. Select metals were detected in all drainage sediment samples throughout the Site. Concentrations of PCBs were not detected in any drainage sample. Concentrations of herbicides and pesticides were largely not detected in the drainage samples, and none exceeded applicable MTCA Method A cleanup levels. Outfall-10 and Outfall-14 are in the upland area of the Site more than 500 feet from the Snohomish River and will not result in sediment impacts due to their proximity. Samples collected within the vicinity of Outfall-10 and Outfall-14 indicate no analytes were detected above MTCA Method A cleanup levels. See Figures 5 and 6 for drainage sediment results.

Cleanup screening levels (CSL) were applied consistent with WAC 173-204 Sediment Cleanup User's Manual (SCUM) and WAC 173-204 Sediment Management Standards. The CSLs are used to determine if Sites require additional remedial action. When the average of the three highest samples for any single chemical exceeds the CSLs, cleanup is required. Sediment cleanup objectives (SCOs) represent long-term cleanup levels used when concentrations are above CSLs (a no-effect concentration). Sediment cleanup levels are often established between the CSL and SCO. Detected concentrations of petroleum hydrocarbons, polycyclic aromatic hydrocarbons (PAHs), and metals in each sample were below CSLs for freshwater sediment management.

Site investigation at the areas in the northern portion of the facility near the former AST area, relic piping by the barn, and apparent cistern or manure vault system did not identify releases associated with these features.

These findings form the basis for the RI field investigation.

---

## **3.0 RI Field Investigation**

Field investigation activities were completed in general accordance with the RI Proposal (Apex, 2022) and Washington Department of Ecology (Ecology) Remedial Investigation (RI) guidance and cleanup rules. Subsurface investigations and groundwater monitoring events were completed during the weeks of January 2, January 9, and January 23, 2023. Field activities completed at each investigation area consisted of:

- **Current AST Area.** Five soil borings (AST-4 through AST-8) were completed at the AST area to depths ranging from 10 to 20 feet bgs. The RI and historical borings are shown on Figure 7.
- **Maintenance Shop Area.** Three soil borings (Shop-3 through Shop-5) were completed at the maintenance shop area to a depth of 10 feet bgs. Monitoring well MW-5 was constructed to evaluate if impacts to groundwater are present in this area. The RI and historical borings are shown on Figure 8.
- **Snohomish Marine.** Soil borings were completed at several areas of Snohomish Marine. During implementation of the RI, a Snohomish Marine employee described a former underground storage tank (UST) located west of Snohomish Marine. This area was included as an RI investigation area. Soil borings completed at Snohomish Marine are shown on Figures 9 and 10 and include:
  - Two soil borings (SB-11 and SB-12) completed to depths of 10 feet bgs to assess whether hazardous substances were present in association with the inactive septic tank behind Snohomish Marine.
  - Three soil borings (SB-15 through SB-17) completed to depths of 10 feet bgs to assess whether hazardous substances were present in association with the suspected UST on the southwest corner of Snohomish Marine identified during geophysical survey.
  - Four soil borings (SB-22 through SB-25) completed to depths ranging from 15 to 20 feet bgs to investigate the historical UST reportedly associated with a former owner of Snohomish Marine.
  - Fourteen soil borings (SB-5 through SB-10 and SB-13 through 21) completed to depths ranging from 10 to 25 feet bgs to characterize the area of Snohomish Marine and an area of petroleum contamination associated with a catch-basin located south of the site.
  - Three groundwater monitoring wells (MW-2 through MW-4) completed to characterize groundwater conditions.
- **Arsenic Characterization Area.** Four soil borings (ARS-1 through ARS-4 ) were completed at the arsenic characterization area to depths ranging from 10 to 20 feet bgs. The RI and historical borings are shown on Figure 11.

### **3.1 Pre-Investigation Field Activities**

**Health and Safety Plan.** A Site-specific health and safety plan (HASP) was prepared for the field activities. The HASP was prepared in general accordance with the Occupational Safety and Health Administration

---

(OSHA) requirements in Code of Federal Regulations (CFR) 1910.120. A copy of the HASP was maintained on-site during the field activities.

**Subcontracting.** Apex utilized the following subcontractors to complete portions of this work:

- ACT Environmental of Spokane, Washington completed the investigation-derived waste (IDW) removal services;
- Cascade Drilling Services of Woodinville, Washington completed the drilling services;
- Fremont Analytical of Seattle, Washington completed soil and groundwater analyses;
- Geophysical Survey LLC of Kennewick, Washington completed the geophysical survey; and
- CNI Locates of Bonney Lake, Washington completed the private utility locating services.

**Geophysical Survey.** On January 7, 2023, a geophysical survey was conducted throughout the entire exterior of Snohomish Marine and accessible interior areas. Survey methods included a ground penetrating radar (GPR) survey using a Geophysical Survey Systems, Inc (GSSI) G1 control unit, 350-megahertz (MHz) antenna, Geonics EM61MK2 metal detector. A Trimble Pro6H global positioning system (GPS) with sub-foot accuracy (less than 12 inches) was used to map site features. The geophysical survey mapped subsurface features such as buried utilities and a drain line that runs northeast to southwest in the interior of the building linking the storm drains. A septic tank with associated piping entering Snohomish Marine was delineated to the west of the building. A hyperbolic anomaly was detected in the southeast corner of the building. The anomaly in a single pass of GPR data is typical of the short axis of a UST; however, the area was blocked by multiple objects on the surface and the data is partially obscured by pooling water on the surface. The geophysical survey report is included in Appendix A.

**Underground Utility Locates.** Underground utilities were located and marked prior to beginning the field investigation work. This included contacting the Washington Utility Notification Center, who in turn notified the various utilities in the area to mark any underground installations. Private underground utility locates were completed by CNI Locates prior to subsurface work.

### 3.2 Soil Investigation

During the weeks of January 2, January 9, and January 23, 2023, 41 soil borings were completed at the Site (Figure 4). Soil borings were completed with direct-push equipment operated by Cascade Drilling of Woodinville, Washington. An Apex field scientist documented the soil borings and collected soil samples.

Direct-push soil borings were completed using a Geoprobe 7720DT drill rig to advance 5-foot macro-core soil samplers. Soil lithology was logged and screened continuously to the total depth of each boring, ranging from 10 to 20 feet bgs. Lithologic logs are included in Appendix B. Soil encountered in the explorations consisted of surface fill underlain by unconsolidated fine-grained material (silts, silty sands, and silty clay mixtures).

---

Depth to groundwater was variable, occurring at depths between 4 and 15 feet bgs throughout the Site during soil borings. Sampling methodology and standard operating procedures (SOPs) are discussed in Appendix D.

Soils from each exploration were field-screened with a photoionization detector (PID) and sheen test. PID readings and sheen tests were negative at all boring locations except as summarized below:

- **Current AST Area**

- PID readings were logged at soil boring AST-4, located approximately 5 feet from the northwest corner of the AST structure. The highest PID reading was 8 parts per million (ppm) at a depth of 2.5 feet bgs and quickly decreased to 5 ppm by 5 feet bgs. Slight staining and a strong hydrocarbon odor were observed in these intervals.
- PID readings were logged at soil boring AST-6, located approximately 5 feet from the northeast corner of the AST area. The highest PID reading was 228 ppm at a depth of 10 feet bgs and quickly decreased to 6ppm by 15 feet bgs. Slight staining and a strong hydrocarbon odor were observed in these intervals.

- **Maintenance Shop Area**

- PID readings were logged at soil boring Shop-4, located approximately 5 feet from the northwest corner of the maintenance shop. The highest PID reading was 368 ppm at a depth of 2.5 feet bgs and decreased to less than 5 ppm at 8 feet bgs. Heavy staining and a strong hydrocarbon odor were observed in these intervals.

- **Snohomish Marine**

- PID readings were logged at soil boring SB-7, located approximately 5 feet west of the downgradient storm drain at Snohomish marine. The highest PID reading was 17 ppm at a depth of 12 feet bgs and decreased to less than 5 ppm by 18 feet bgs. Slight petroleum staining was also observed in these intervals.
- PID readings were logged at soil boring SB-8, located approximately 5 feet south of the downgradient storm drain at Snohomish marine. The highest PID reading was 47 ppm at a depth of 11.5 feet bgs and decreased to 6 ppm by 15 feet bgs. Slight petroleum staining and hydrocarbon odor were also observed in these intervals.
- PID readings were logged at soil boring SB-9, located approximately 5 feet east of the downgradient storm drain at Snohomish Marine. The highest PID reading was 33 ppm at a depth of 11 feet bgs and decreased to less than 5 ppm by 16 feet bgs. Slight petroleum staining was observed in these intervals.

Soil samples were collected based on field screening results. Samples from borings with elevated field screening were collected from the interval with the highest PID reading as well as the bottom of the boring.

---

In remaining borings where field screening was negative, soil samples were analyzed from depths of 10 or 15 feet bgs. Soil samples from the arsenic characterization area were collected based on the presence of organic material observed (peat) or changes in stratigraphy.

### **3.3 Groundwater Investigation**

Following soil sampling and field screening of soil borings, groundwater monitoring wells MW-2 through MW-5 were constructed to characterize and monitor groundwater conditions related to the impacted soils at the maintenance shop and Snohomish Marine investigation areas. Monitoring well locations are shown on Figures 3, 4, and 8 through 12. In summary:

- Monitoring well MW-5 was constructed near soil boring Shop-4 at the maintenance shop area; and
- Monitoring wells MW-2 through MW-4 were constructed at the Snohomish Marine building to evaluate conditions associated with petroleum detected at the catch-basin.

Borings for MW-2 through MW-5 were advanced using direct-push methods (Geoprobe TM) to the depth of groundwater, varying from 2.5 to 15 feet bgs depending on the investigation area. The monitoring wells were installed in accordance with WAC Chapter 173-630, constructed using 2-inch diameter polyvinyl chloride (PVC) casing with 10-to-15-foot screens depending on the monitoring well location. Monitoring wells were finished with a flush-mount, traffic-rated monument. The boring log and well construction details are included in Appendix B.

Following construction, monitoring well development was completed to remove deleterious well construction materials and stabilize the well filter pack. Development was considered complete when the purge water was visually clear and after electrical conductivity, temperature, and pH had stabilized for three successive casing measurements.

Groundwater monitoring was completed during the week of January 23, 2023. Depth to groundwater during the event varied from 2.49 feet to 4.90 feet bgs based on investigation area. Groundwater samples were collected from the monitoring wells using a peristaltic pump with new tubing for each sample collected.

### **3.4 Investigation-Derived Waste**

Investigation-derived waste (IDW) consisted of soil cuttings and purge water. IDW soil was placed in three 55-gallon Department of Transportation (DOT)-approved drums, and IDW water was placed in two 55-gallon DOT-approved drums. IDW is temporarily stored in a designated area on the Site. The drums are labeled with the project name, generator name, contact number, general contents, and date. Waste disposal is pending.

---

## **4.0 Analytical Results**

Laboratory analyses were completed by Fremont Analytical of Seattle, Washington. Analytical results for soil and groundwater samples are summarized in Tables 6 through 13. Soil samples were analyzed using one or more of the following methods:

- Gasoline-range organics (GRO) using Northwest Method TPH-Gx;
- DRO and RRO using Northwest Method TPH-Dx;
- Volatile organic compounds (VOCs) using Environmental Protection Agency (EPA) Method 8260 with EPA 5035 preservation;
- Metals (arsenic, barium, cadmium, lead, mercury, selenium, silver, copper, nickel, and zinc) using EPA 6020B and 7471B;
- PAHs by Method 8270 SIM;
- PCBs by EPA Method 8082A; and
- Total organic carbon (TOC) by EPA Method 9060.

Groundwater samples were analyzed using one or more of the following methods:

- GRO using Northwest Method TPH-Gx;
- DRO and RRO using Northwest Method TPH-Dx;
- VOCs using EPA Method 8260 with EPA 5035 preservation;
- Metals (arsenic, barium, cadmium, lead, mercury, selenium, silver, copper, nickel, and zinc) using EPA 6020B and 7471B;
- PAHs by Method 8270 SIM; and
- PCBs by EPA Method 8082A.

A majority of the samples were analyzed on standard turnaround time. Samples collected during the week of January 23, 2023 were analyzed on 48-hour turnaround time. Copies of the laboratory reports are included in Appendix C.

### **4.1 Soil Analysis and Results**

Soil sampling results are summarized in this section. Soil analytical results and Washington MTCA Method A cleanup levels are summarized in Tables 6 through 10 and Figures 7 through 11. Soil boring logs are included in Appendix B.

---

Soil sampling results confirmed petroleum hydrocarbons and constituents were present at the current AST area, the maintenance shop area, and Snohomish Marine. The soil results at each investigation are summarized below.

**Current AST Area.** GRO and constituents (benzene, ethylbenzene, naphthalene, toluene, xylenes, and/or PAHs) were detected adjacent to the north side of the AST containment (AST-2, AST-4B, and AST-6) from the surface to depths of approximately 10 feet bgs. Higher relative concentrations of petroleum hydrocarbons were detected in AST-6 at the west end of the containment area. Gasoline-range total petroleum hydrocarbons (TPH-g) and constituents were detected to depths of 10 feet bgs in this area. Concentrations of halogenated volatile organic compounds (HVOCs) were not detected. The data set indicates a limited area of petroleum hydrocarbons is present in the area adjacent to the northeast corner of the AST containment.

**Maintenance Shop Area.** DRO and RRO were detected in soil boring Shop-4 and historical soil boring Shop-2. Petroleum constituents, HVOCs, PAHs, and PCBs were not detected. Petroleum hydrocarbons were not detected in borings completed to delineate Shop-2 and Shop-4. Higher relative concentrations of petroleum hydrocarbons were detected in the sample from the 2.5-foot interval, with DRO and RRO extending to depths of 6 feet bgs in Shop-4. The data set indicates a limited area of petroleum hydrocarbons is present in the northwest portion of the maintenance shop area.

**Snohomish Marine.** Petroleum hydrocarbons, VOCs, PAHs, and PCBs were mostly not detected in the soil borings completed around Snohomish Marine. This included borings near the Snohomish Marine Shop, the possible UST, the historical UST area, and a former septic tank.

Petroleum hydrocarbons, principally RRO, were detected in the soil boring for MW-5 and historical boring SB-04, apparently in association with the on-site catch-basin. Soil borings SB-7, SB-8, SB-9, SB-14, and SB-18 were completed to delineate this area. Samples were collected from intervals in these borings with positive field screening; however, RRO was not detected.

**Arsenic Characterization Area.** Concentrations of arsenic in soil borings ARS-1 through ARS-4 ranged from 2.33 to 13.9 mg/kg. Higher relative concentrations of arsenic and TOC were detected in the deeper intervals (10 to 20 feet bgs) compared to the shallower intervals (2 to 5 feet bgs). Natural organic matter (NOM) including peat and organic debris were observed in the soil borings completed in this area.

## 4.2 Groundwater Analysis and Results

One round of groundwater monitoring was completed at the site. The event was completed the week of January 23, 2023. Groundwater analytical results are summarized in Tables 11 through 13 and shown on Figures 8, 11, and 12.

---

**Maintenance Area.** One groundwater sample was collected from soil boring Shop-4 to characterize elevated field screening results encountered near the water table. The groundwater sample was analyzed for total petroleum hydrocarbons (TPH). Concentrations of DRO were detected, while all other petroleum hydrocarbons were not detected above the method reporting limit (MRL). Following installation of monitoring well MW-5, one groundwater sample was collected from MW-5. Concentrations of DRO were detected while all other petroleum hydrocarbons were not detected above the MRL.

**Snohomish Marine.** One groundwater sample was collected from soil boring SB-07 to investigate elevated field screening results encountered near the water table. The groundwater sample was analyzed for TPH, PAHs, VOCs, and total metals. Concentrations of DRO, naphthalene, arsenic, barium, chromium, and lead were detected. All other petroleum hydrocarbons, VOCs, PAHs, and metals were not detected above MRLs. Following installation of monitoring wells MW-2, MW-3, and MW-4, one groundwater sample was collected for each monitoring well and analyzed for TPH and VOCs. Concentrations of DRO were detected at MW-3, and to a lesser extent at MW-4 and MW-2. Concentrations of all other petroleum hydrocarbons and VOCs were not detected above MRLs.

## **5.0 Conceptual Site Model**

A conceptual site model (CSM) requires identifying potential exposure pathways and receptors at the site based on the site characteristics, the nature and extent of contamination, and land use.

### **5.1 Site Geology**

The Site is located at Everett, Washington, which is in the central part of the Puget Sound Lowland. The geologic unit for this Site is Qyal, a Holocene-aged younger alluvial and estuarine deposit (Minard, 1985). These deposits lie in and along the present streams near the water table. The sediment is largely sand, silt, and clay with considerable amounts of organic matter. Thicknesses of the younger alluvial and estuarine deposits probably exceed 30 meters. The alluvium overlies deposits from the last Pleistocene glaciation. Soils encountered during work at the Site included surface fill underlain by unconsolidated fine-grained alluvium. Areas of peat or organic materials were variably encountered in borings across the site.

### **5.2 Site Hydrogeology**

The Site is located adjacent and east of the Snohomish River. Groundwater was encountered at variable depths across the site. Depth to groundwater during the January monitoring event varied from 2.49 to 4.90 feet bgs. Groundwater appears to result from locally perched conditions in the low permeability soils at Dagmars Marina. Regional groundwater flow direction is expected to be westward towards the Snohomish River and Possession Sound. Survey of monitoring wells is pending.

---

There are no potable, irrigation, or production use water wells located on the Site. The City of Everett maintains a reservoir that is located approximately 16 miles east of Everett, and the Site is served by the municipal water source. Water wells were identified within a mile of the Site; however, the exact location and use are not known at this time.

### **5.3 Nature and Extent of Contamination**

The results of the 2022 and 2023 field investigations are summarized below for each investigation area.

**Current AST Area.** A limited area of petroleum hydrocarbons and constituents is present in soil beneath gravel surfaces at depths ranging from 2 to 10 feet bgs. Groundwater impacts from the area of petroleum contamination were not encountered. Separate-phase hydrocarbons (SPH) are not present.

**Maintenance Shop Area.** A limited area of petroleum hydrocarbons is present in soil beneath gravel surfaces at depths of 1 to 3 feet bgs. Groundwater impacts from the area of petroleum contamination are limited to the immediate area where petroleum hydrocarbons were detected in soil and do not extend offsite. Separate-phase hydrocarbons are not present.

**Snohomish Marine Area.** An area of petroleum hydrocarbons in soil and groundwater is present in the immediate area of a drainage catch-basin. The area of contamination extends horizontally 10 to 15 feet from the catch-basin. Separate-phase hydrocarbons are not present.

Groundwater data from the monitoring well network indicates there are isolated areas of petroleum hydrocarbons and constituents in groundwater at the maintenance shop and Snohomish Marine investigation areas. Groundwater data indicate impacts are isolated to the upland area and located at least 400 feet from the Snohomish River.

**Arsenic Characterization Area.** Arsenic concentrations in soil borings at the arsenic characterization area ranged from 2.33 to 13.9 mg/kg, with several of the detected concentrations exceeding the Puget Sound Natural Background Concentration of 7 mg/kg (Ecology, 1994) but below the MTCA Method A cleanup level of 20 mg/kg. Higher relative concentrations of arsenic and TOC were detected in the deeper intervals (10 to 20 feet bgs) compared to the shallower intervals (2 to 5 feet bgs). NOM, including peat and organic debris, were observed in the soil borings completed in this area.

### **5.4 Exposure Pathway Identification**

**Potential Receptors.** Potential receptors include occupational workers. The Site is exclusively used for commercial uses, with no daycare centers, child educational facilities, or similar uses that could be considered residential in nature. Residential uses are not present adjacent to the Site.

---

**Exposure Pathways for Soil.** Exposure pathways for soil include construction/excavation worker direct contact and vapor intrusion. Soil contamination is located at depths from 1 to 10 feet bgs depending on investigation area. Leaching to groundwater is not considered a complete exposure pathway because the limited area of contamination is confined to the Site and there are no wells for potable, production, or irrigation uses of groundwater at the Site, which is supplied with municipal water.

**Exposure Pathways in Groundwater.** Exposure pathways for groundwater include vapor intrusion and construction worker contact with groundwater in an excavation. Depth to groundwater ranges between approximately 4 and 15 feet bgs, within feasible trenching depths. Groundwater ingestion is not considered a complete exposure pathway (there are no potable or production wells on-site). The extent of petroleum hydrocarbons and constituents in groundwater is limited to the three localized areas identified (AST, maintenance shop, and Snohomish Marine).

Based on the exposure pathways identified above and Ecology's guidance, the following cleanup levels were used to evaluate the soil and groundwater data:

- For soil, the depth to groundwater ranges between 4 and 15 feet bgs, and petroleum hydrocarbon impacts have affected groundwater. MTCA Method A cleanup levels account for direct contact and leaching to groundwater. Therefore, Ecology MTCA Method A cleanup levels will be used for soil.
- Groundwater is not used at the Site; however, cleanup standards are required to be based on the highest beneficial use and maximum exposure (WAC 173-340-720). Therefore, Ecology's MTCA Method A cleanup levels will be used for groundwater.
- For soil vapor, concentrations of VOCs were largely not detected throughout all investigation areas in soil and groundwater. VOC concentrations that were detected in soil or groundwater were either below MTCA Method A cleanup levels, or isolated away from any structures on site. Therefore, no further soil vapor assessments were conducted.

## 5.5 Preliminary Ecological Evaluation

Preliminary evaluation of potential ecological risks to terrestrial and aquatic receptors was completed following the process for Terrestrial Ecological Evaluation in WAC 173-340-7490 and sediment cleanup evaluation in WAC 173-204.

**Terrestrial Ecological Evaluation (TEE).** WAC 173-340-7490 requires that contaminated sites be evaluated to assess whether contamination may have a potential effect on terrestrial ecological species and, if so, develop cleanup levels to address the ecological risk. Concentrations of petroleum hydrocarbons (GRO, DRO, and RRO) were only detected at three isolated locations. Cleanup will be completed to remove the petroleum hydrocarbons to concentrations acceptable for unrestricted land use, which will exempt the site from the TEE process. Final TEE will be completed as part of the future Cleanup Action Plan (CAP).

---

**Upland-Surface Water Pathway.** As described in Section 2.4, primary evaluation of the upland-surface water pathway was completed by comparing outfall sediment data to CSLs, consistent with the WAC 173-204 SCUM and WAC 173-204 Sediment Management Standards. Detected concentrations of petroleum hydrocarbons, PAHs, and metals in each sample were below CSLs for freshwater sediment management.

Additionally, groundwater contamination was found to be limited to isolated areas with corresponding soil contamination. The extent of each of these areas was determined to be greater than 250 feet from surface water bodies. The available data indicate groundwater contamination is not migrating to surface water and drainage sediment concentrations at stormwater outfalls do not constitute sediment impacts under WAC 173-240.

## **6.0 Risk Screening**

Soil and groundwater data were screened using the cleanup levels described in Section 5.4.

### **6.1 Current AST Area**

**Soil.** Soil samples from the Current AST area were analyzed for petroleum hydrocarbons, VOCs, metals, and PAHs. The following concentrations were observed.

- Concentrations of GRO, DRO, and RRO were detected in soil borings AST-2 and AST-4 through AST-8 from depths of 2 to 10 feet bgs. Concentrations of GRO in soil samples AST-2, AST-4B, and AST-6, collected from the northern side of the ASTs, exceeded MTCA Method A cleanup levels. Several VOC constituents were also detected at concentrations above MTCA Method A cleanup levels.
- All other samples analyzed were either not detected or detected at concentrations well below the MTCA Method A cleanup levels. Groundwater samples were not collected because impacts did not reach groundwater.

### **6.2 Maintenance Shop Area**

**Soil.** Soil samples from the maintenance shop area were analyzed for petroleum hydrocarbons, VOCs, metals, PCBs, and PAHs. The following concentrations were reported:

- Concentrations of GRO, DRO, and RRO were detected in soil borings Shop-2 through Shop-5 from depths of 2 to 5 feet bgs. At soil boring Shop-2, concentrations of DRO and RRO exceeded MTCA Method A cleanup levels in sample Shop-2 (2-2.5). In soil boring Shop-4, samples Shop-4 (2.5-3) and Shop-4 (5-6) exceeded MTCA Method A cleanup levels for GRO. The GRO concentrations of 475 mg/kg and 176 mg/kg, respectively, exceeded the MTCA Method A cleanup level (100 mg/kg).

- 
- Contaminant concentrations at all other samples analyzed were either non-detect or well below the MTCA Method A cleanup levels.

**Groundwater.** Groundwater samples from the maintenance shop were analyzed for petroleum hydrocarbons and VOCs. Concentrations of DRO were detected in groundwater samples Shop-4 and MW-5. Groundwater sample Shop-4 was a discrete sample collected during soil boring installation to investigate elevated PID readings. The DRO concentration from Shop-4 of 1,730 µg/L exceeded the MTCA Method A cleanup level of 500 µg/L. Petroleum hydrocarbons and VOCs were either not detected or detected well below MTCA Method A cleanup levels for sample MW-5. Shop-4 was a discrete sample from a temporary well and should be considered useful for screening purposes only. Additional groundwater data is pending from MW-5.

### 6.3 Snohomish Marine

**Soil.** Soil samples from Snohomish Marine were analyzed for petroleum hydrocarbons, VOCs, metals, and PCBs. Soil sample results were either non-detect or showed concentrations well below MTCA Method A cleanup levels.

**Groundwater.** Groundwater samples from the Snohomish Marine area were analyzed for petroleum hydrocarbons, VOCs, metals, and PAHs. Concentrations of DRO were detected in samples GW-7, MW-2, MW-3, and MW-4. The following concentrations were observed.

- Groundwater samples GW-7 and MW-3 exceeded MTCA Method A cleanup levels for DRO. The DRO concentrations of 1,100 µg/L and 573 µg/L, respectively, exceed the MTCA Method A cleanup level of 500 µg/L.

Concentrations of arsenic were detected in sample GW-7. An arsenic concentration of 41.8 µg/L from sample GW-7 exceeded the MTCA Method A cleanup level of 5 µg/L. Because GW-7 was a discrete sample from a temporary well, it is considered useful for screening purposes only. Future data from monitoring well MW-3 will be used to evaluate groundwater quality in this area. All other samples analyzed were either non-detect or showed concentrations well below MTCA Method A cleanup levels.

### 6.4 Arsenic Characterization Area

**Soil.** Concentrations of arsenic at the arsenic characterization area ranged from 2.33 to 13.9 mg/kg, all below the MTCA Method A cleanup level. Site-wide, only one soil sample exceeded the MTCA Method A cleanup level for arsenic.

**Groundwater.** Samples from MW-1 ranged between 14.7 and 20.4 µg/L, above the 5 µg/L MTCA Method A cleanup level. The leaching to groundwater Method B cleanup level for arsenic is 0.15 mg/kg, reflecting higher relative arsenic solubility. The combination of higher relative soil concentrations, organic material at depth,

---

and higher relative arsenic solubility point to natural conditions resulting in the elevated arsenic concentrations in groundwater.

## **7.0 Summary and Conclusions**

The RI field activities consisted of a Site-wide geophysical survey, soil borings, and groundwater characterization. The investigation results indicate that limited areas of petroleum hydrocarbons are present in soils at the current AST area, the maintenance shop, and Snohomish Marine at depths ranging from 2 to 10 feet bgs. Groundwater impacts are limited to the area of soil impacts at the maintenance shop area and Snohomish Marine, and do not extend offsite or impact freshwater sediments related to the Snohomish River.

The data support remedial action at the current AST area, the maintenance shop, and Snohomish Marine. The detected contamination includes petroleum hydrocarbons and related constituents, present at depths of 10 feet or less. Preliminary remedial action areas were designated based on the results of the data evaluation in Section 4.0. These include:

- Petroleum at the AST area: an area of approximately 400 square feet of petroleum hydrocarbons in soil (see Figure 7), to a depth of 10 feet bgs.
- Petroleum at the maintenance shop area: an area of approximately 250 square feet of petroleum hydrocarbons in soil (see Figure 8), to a depth of 6 feet bgs.
- Petroleum at the Snohomish Marine area: an area of approximately 600 square feet of petroleum hydrocarbons in soil (see Figures 9 and 10), to a depth of 10 feet bgs.

Results of sampling and analysis at the arsenic characterization area suggest the elevated arsenic concentrations are the results of locally elevated background concentrations and subsurface organic materials. Additional monitoring at MW-1 is planned to evaluate seasonal trends and collect a consistent groundwater data set. Remedial activities are not proposed at this time.

---

**Notes:**

1. mg/kg = Milligrams per kilogram
2. Bold values indicate the compound was detected above method detection limits
3. < = Analyte was not detected above the reporting limit shown
4. Shaded results exceed the Model Toxics Control Act (MTCA) Method A soil cleanup level for unrestricted land use.
5. Soil cleanup levels from the MTCA Method A 173-340 WAC (July 2022 update)
6. -- = Value not available.
7. The MTCA Method A Cleanup Level for TPH as gasoline range organics is 30 mg/kg when benzene is detected, and 100 mg/kg when benzene is not detected.
8. bgs = Below ground surface.
9. J = Result is estimated

Kennewick, Washington 99336

January 7, 2023

Anders Utter  
Apex Companies, LLC  
801 NW 42<sup>nd</sup> Street, Suite 204  
Seattle, WA 98107

**Re:** *Geophysical Investigation  
Dagmars Marina  
Everett, Washington*

Mr. Utter:

Geophysical Survey LLC conducted a geophysical investigation at Dagmars Marina in Everett, Washington on January 7, 2023. The objective of the investigation was to detect and delineate underground storage tanks (USTs) and subsurface utilities.

## **Methodology**

### ***Ground-Penetrating Radar***

Ground-penetrating radar (GPR) uses a transducer to transmit FM frequency electromagnetic energy into the ground. Interfaces in the ground, defined by contrasts in dielectric constants, magnetic susceptibility, and to some extent, electrical conductivity, reflect the transmitted energy. The GPR system then measures the travel time between transmitted pulses and arrival of reflected energy. Buried objects such as pipes, barrels, foundations, and buried wires can cause all or a portion of the transmitted energy to be reflected back towards a receiving antenna. Geologic features such as cross-bedding, lateral and vertical changes in soil properties, and rock interfaces can also cause reflections of a portion of the EM energy.

The dielectric constant and magnetic susceptibility of the medium primarily control the velocity of the EM energy. Values of EM velocities, for depth calculations, are determined by measurement, experience in an area, by ties to known buried reflectors, and from knowledge of the subsurface medium.

The depth of investigation is a function of the transmit power, receiver sensitivity, frequency of the antenna, and attenuation of the transmitted energy due to the geologic medium. The maximum depth of investigation may vary significantly as a result of the changing soil conditions. High attenuation, and consequent smaller penetration depths, of the EM energy typically occurs where the soil conductivity is greater than 25 millisiemens per meter and/or in areas with numerous reflective interfaces. Depth of investigation is also affected by highly conductive material, such as metal drums and pipes that essentially reflect all the energy. The method cannot “see” directly below areas of highly reflective material because all of the energy is reflected.

## FIELD SURVEY

### *Mapping Control*

A Trimble Pro6H GPS with sub-foot accuracy (<12in) was used to map site features.

### *GPR Data Acquisition*

GPR data were acquired with a Geophysical Survey Systems, Inc. (GSSI) G1 control unit and a 350 MHz antenna. GPR data were collected at 36 scans/foot with a with a 60 nano-second window (depth of investigation of approximately 9 feet). Gains were adjusted manually across the site to match local conditions.

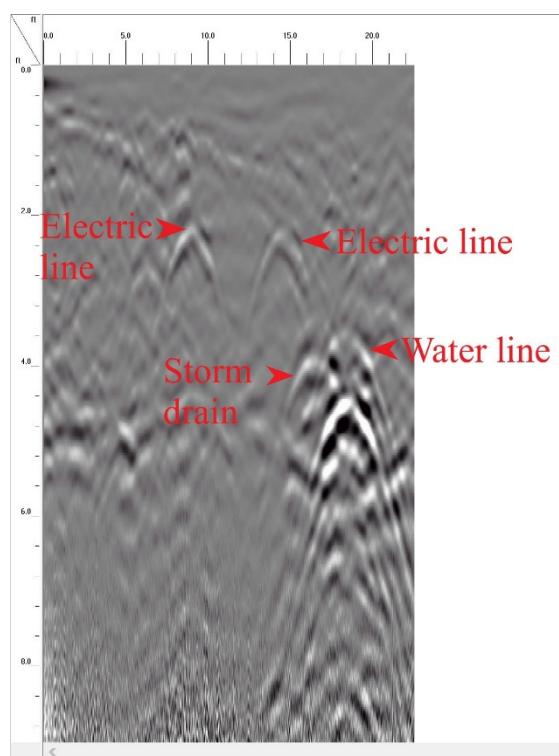

## DATA PROCESSING

### *GPR Data Processing*

GPR data were processed using RadaN 7 from GSSI. Processing included a background filter and deconvolution. Anomalies were digitized to CAD format.

## RESULTS AND INTERPRETATION

A drain line runs northeast to southwest in the interior if the building linking the storm drains. A septic tank was delineated to the west of the building and multiple subsurface utilities were detected.

GPR Data 1

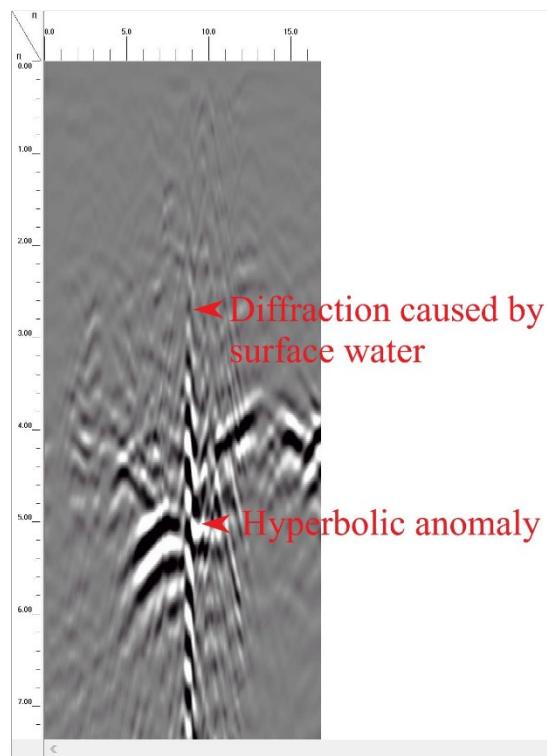

Geophysical Investigation  
Dagmars Marina  
Everett, WA

Page 3

A hyperbolic anomaly was detected in the southeast corner of the building. The anomaly in a single pass of GPR data is typical of the short axis of a UST however the area was blocked by multiple objects on the surface and the data is partially obscured by the puddle of water at the surface.

LOCATION 1

GPR Data 2

**CLOSURE**

Geophysical surveys performed as part of this survey may or may not successfully detect or delineate any or all subsurface objects or features present. Locations, depths and scale of buried objects or subsurface features mapped as a result of this survey are a result of geophysical interpretation, and should be considered as confirmed, actual, or accurate only where recovered by excavation or drilling.

Geophysical Survey LLC performed this work in a manner consistent with the level of skill ordinarily exercised by members of the profession currently practicing under similar conditions. No warranty, express or implied, beyond exercise of reasonable care and professional diligence, is made. This report is intended for use only in accordance with the purposes of the study described within.

Respectfully,

Geophysical Survey LLC

Mark Villa L.G.

**Boring Logs**

## Sample Descriptions

Classification of soils in this report is based on visual field and laboratory observations which include density/consistency, moisture condition, and grain size, and should not be construed to imply field nor laboratory testing unless presented herein. Visual-manual classification methods of ASTM D 2488 were used as an identification guide.

Soil descriptions consist of the following:

MAJOR CONSTITUENT with additional remarks; color, moisture, minor constituents, density/consistency.

## Density/Consistency

Soil density/consistency in borings is related primarily to the Standard Penetration Resistance. Soil density/consistency in test pits and push probe explorations is estimated based on visual observation and is presented parenthetically on test pit and push probe exploration logs.

SAND and GRAVEL <u>Density</u>	Standard Penetration Resistance in Blows/Foot	SILT or CLAY <u>Density</u>	Standard Penetration Resistance in Blows/Foot	Approximate Shear Strength in TSF
Very loose	0 - 4	Very soft	0 - 2	<0.125
Loose	4 - 10	Soft	2 - 4	0.125 - 0.25
Medium dense	10 - 30	Medium stiff	4 - 8	0.25 - 0.5
Dense	30 - 50	Stiff	8 - 15	0.5 - 1.0
Very dense	>50	Very Stiff	15 - 30	1.0 - 2.0
		Hard	>30	>2.0

## Moisture

		<b>Minor Constituents</b>	<u>Estimated Percentage</u>
Dry	Little perceptible moisture.	Not identified in description	0 - 5
SI. Moist	Some perceptible moisture, probably below optimum.	Slightly (clayey, silty, etc.)	5 - 12
Moist	Probably near optimum moisture content.	Clayey, silty, sandy, gravelly	12 - 30
Wet	Much perceptible moisture, probably above optimum.	Very (clayey, silty, etc.)	30 - 50

## Sampling Symbols

## **Appendix C**

### **Laboratory Data Reports and Quality Assurance Review**

## **Appendix C – Laboratory Analytical Reports and Quality Assurance/Quality Control Results Summary**

### **1.0 Introduction**

This appendix documents the results of a quality assurance (QA) review of the analytical data for soil and groundwater samples, that were collected during the 2023 Remedial Investigation activities performed at Dagmars Marina in Everett, Washington.

Report	Report Date	Sampling Event
Rpt_2301086	January 19, 2023	Subsurface Investigation (Soil & GW)
Rpt_2301108	January 19, 2023	Subsurface Investigation (Soil & GW)
Rpt_2301194	January 23, 2023	Subsurface Investigation (Soil & GW)
Rpt_2301517	January 31, 2023	Subsurface Investigation (Soil)

The data reviewed herein are representative of soil and groundwater samples collected from the Dagmars Marina property. The samples were analyzed by Fremont Analytical of Seattle Washington. This QA results summary did not include a review of the calibration or raw data.

### **2.0 Data Validation**

The QA review outlines the applicable quality control criteria utilized during the data review process, as well as any deviations from those criteria. Examination and validation of the laboratory summary reports include:

- Analytical preparation and quantitation methods;
- Analytical method holding times;
- Sample handling;
- Chain of custody handling;
- Detection and reporting limits;
- Method blank detections;
- Laboratory control samples, matrix spikes, and surrogates to assess laboratory accuracy; and
- Laboratory control sample duplicates, matrix spike duplicates, and field duplicates to assess laboratory precision.

#### **2.1 Data Qualifiers**

Any data that is found to have possible bias or error were qualified and flagged. The flags used in the data table are below.

## **Appendix C – Laboratory Analytical Reports and Quality Assurance/Quality Control Results Summary**

J	Result is an estimated value.
J+	Result is an estimated value and may be biased high.

### **3.0 Analytical Methods**

Chemical analyses of water samples consisted of the following:

- Gasoline Range Organics (GRO) using Northwest Method TPH- Gx,
- Diesel Range Organics (DRO) and Residual Range Organics (RRO) using Northwest Method TPH- Dx,
- Volatile organic compounds (VOCs) by United States Environmental Protection Agency (EPA) Method 8260D,
- Total Metals (Arsenic, Barium, Cadmium, Lead, Mercury, Selenium, Silver, Copper, Nickel, and Zinc) using EPA 6020B and 7471B
- Polycyclic Aromatic Hydrocarbons (PAHs) using EPA Method 8270C
- Polychlorinated Biphenyls (PCBs) using EPA Method 8082A

Chemical analyses of soil samples consisted of the following:

- Gasoline range organics (GRO) using Northwest Method TPH-Gx,
- Diesel range organics (DRO) and residual oil range organics (RRO) using Northwest Method TPH- Dx,
- VOCs using Environmental Protection Agency (EPA) method 8260, with EPA 5035 preservation'
- Metals (arsenic, barium, cadmium, lead, mercury, selenium, silver, copper, nickel, and zinc) using EPA 6020B and 7471B,
- Polycyclic Aromatic Hydrocarbons (PAHs) by Method 8270C,
- Polychlorinated biphenyls (PCBs) by EPA Method 8082A, and
- Total Organic Carbon by EPA Method 9060.

### **4.0 Quality Assurance Objectives and Review**

The general QA objectives for this project were to develop and implement procedures for obtaining, evaluating, and confirming the usability of data of a specified quality for monitoring. To collect such information, analytical data must have an appropriate degree of accuracy and reproducibility, samples

## **Appendix C – Laboratory Analytical Reports and Quality Assurance/Quality Control Results Summary**

---

collected must be representative of actual field conditions, and samples must be collected and analyzed using unbroken chain-of-custody procedures.

Reporting limits and analytical results were compared to action levels for each parameter in the matrix of concern. Precision, accuracy, representativeness, completeness, and comparability parameters used to indicate data quality are defined as follows.

### **4.1 Holding Times and Sample Integrity**

Holding times are the length of time a sample can be stored after collection and prior to analysis or extraction without significantly affecting the analytical results. Holding times vary by analyte, sample matrix, and analytical methodology. The groundwater and vapor samples included in this QA/QC review were analyzed within the method recommended holding time.

Groundwater samples were shipped on wet ice below 6 degrees Celsius ( $^{\circ}\text{C}$ ) and were received without headspace in VOA sampling containers with appropriate preservative ( $\text{pH} < 2$  with hydrochloric acid [HCl]). Sampling containers generally arrived intact and unbroken to the laboratory.

Soil samples were shipped on wet ice below 6 degrees Celsius ( $^{\circ}\text{C}$ ) and were received in 4 ounce, unpreserved glass jars, or VOA sampling containers with appropriate preservative ( $\text{pH} < 8.3$  with methanol [ $\text{CH}_3\text{OH}$ ]) Sampling containers generally arrived intact and unbroken to the laboratory

Chain of custody (COC) documents were appropriately relinquished by the Apex Companies sampler and received by the laboratory. COCs were filled out with the correct sample ID, sampling date, sampling time, and analyses requested. There were no discrepancies found between container labels and the chain of custodies received.

### **4.2 Reporting Limits**

Reporting limits are the lowest concentration an instrument is capable of accurately quantifying an analyte. They are determined by the laboratory and are based on instrumentation capabilities, the matrix of field samples, sample preparation procedures and suggested reporting limits by the EPA. In some cases, reporting limits for soil and groundwater exceeded the MTCA cleanup levels. To account for this difference, the laboratory reported results to the lowest method detection limits, which were below the MTCA cleanup levels. Method detection limits (MDL) are the lowest concentrations that the instrument can positively identify an analyte; however, concentrations reported between the MDL and reporting limit are estimated and are 'J' flagged as such.

## **Appendix C – Laboratory Analytical Reports and Quality Assurance/Quality Control Results Summary**

---

For the Remedial Investigation, analysis of AST-6 (2.5-3), and AST-6 (10-11), dilutions were performed resulting in elevated reporting limits above the MTCA Method B Cleanup levels for air for Ethylbenzene. Lower reporting limits could not be obtained due to high levels of non-target analytes present in the sample.

### **4.3 Method Blanks**

A method – or laboratory – blank is a quality control sample prepared by the laboratory from an analyte-free matrix and analyzed in an analytical batch along with environmental and other QC samples. It is used to assess laboratory contamination or background interferences.

No analytes were detected in the method blanks for analytical batch 2301086, 2301194, 2301517, and 2301108.

### **4.4 Accuracy**

Accuracy compares the accepted reference concentration of an analyte to the concentration determined analytically. Accuracy is measured as a percent recovery. This recovery must be within a certain range – or control limit – for the data in an analytical batch to be considered acceptable. The analytical laboratory provides quality control samples and surrogates to help determine the accuracy and acceptability of the data reported. These quality control samples and surrogates are discussed below.

#### **4.4.1 Laboratory Control Samples**

Laboratory control samples (LCS) and laboratory control sample duplicates (LCSD) were analyzed by the laboratory to assess the accuracy of the analytical methods. One set of LCS and LCSDs were analyzed per analytical batch. The LCS and LCSDs are prepared from an analyte-free matrix that is spiked with known levels of compounds of concern. The concentrations are measured and compared to the known spiked levels; expressed as a percent recovery. Analyte recoveries were within control limits for LCS and LCSDs for analytical batch 2301086, 2301194, 2301517, and 2301108.

#### **4.4.2 Surrogates**

Surrogates are organic compounds that are similar in chemical composition to the analytes of interest but are not likely to be found in the environment. They are spiked at a known concentration into environmental and batch QC samples prior to sample preparation and analysis. Surrogate recoveries for environmental samples are used to evaluate matrix interference, sample preparation efficiency, and analysis performance on a sample-specific basis. Surrogate recoveries were within control limits with the following exceptions.

One of the surrogates used for polycyclic aromatic hydrocarbons (Terphenyl-d14) was recovered below its lower control limit for groundwater sample GW-07-0123. Associated data may be biased low. (2301086).

## **Appendix C – Laboratory Analytical Reports and Quality Assurance/Quality Control Results Summary**

---

One of the surrogates used for polycyclic aromatic hydrocarbons (Terphenyl-d14) was recovered below its lower control limit for the matrix spike of groundwater sample GW-07-0123. Associated data may be biased low. (2301086).

The surrogates used for total petroleum hydrocarbons-diesel range organics (o-Terphenyl and 2-Fluorobiphenyl) were recovered below their lower control limits for soil sample SB-07 (12.5-13). A duplicate analysis was performed with similar results indicating a possible matrix effect. Associated data may be biased low. (2301086).

The surrogates used for total petroleum hydrocarbons-diesel range organics (o-Terphenyl and 2-Fluorobiphenyl) were recovered below their lower control limits for soil sample Shop-4 (9.5-10). A duplicate analysis was performed with similar results indicating a possible matrix effect. Associated data may be biased low. (2301086).

A surrogate used for total petroleum hydrocarbons-diesel range organics (o-Terphenyl) was recovered below its lower control limit for soil sample Shop 4B (13-14). Associated data may be biased low. (2301108).

The surrogates used for total petroleum hydrocarbons-diesel range organics (o-Terphenyl and 2-Fluorobiphenyl) were recovered below their lower control limits for soil sample Shop 4B (19-20). Associated data may be biased low. (2301108).

A surrogate used for total petroleum hydrocarbons-diesel range organics (2-Fluorobiphenyl) was recovered below its lower control limit for soil sample AST 4B(5.0-5.5). Associated data may be biased low. (2301108).

A surrogate used for total petroleum hydrocarbons-gasoline range organics (4-Bromofluorobenzene) was recovered below its lower control limit for soil sample Shop-4 (5-6). However, associated data may be biased high due to overlap with diesel range material. (2301086).

A surrogate used for total petroleum hydrocarbons-gasoline range organics (toluene-d8) was recovered below its lower control limit for soil sample Shop-4 (2.5-3). However, associated data may be biased high due to overlap with diesel range material. (2301086).

### **4.4.3 Matrix Samples**

A matrix spike QC sample is used to assess the performance of the analytical method by determining potential matrix interferences. Matrix spike (MS) and matrix spike duplicate (MSD) analyses are performed on one environmental sample per analytical batch. A matrix spike sample uses an environmental sample that is spiked with known concentrations of analytes of interest. The matrix spike is then prepared and analyzed with the same analytical procedures as environmental samples in the analytical batch. The resulting concentration of the matrix spike is then compared to the known – or true – values added to the non-spiked

## **Appendix C – Laboratory Analytical Reports and Quality Assurance/Quality Control Results Summary**

environmental sample concentration. This comparison is expressed as a percent recovery. Matrix spike recoveries were within control limits for analytical batch 2301086, 2301194, 2301517, and 2301108.

### **4.4.4 Continuing Calibration Verification**

Calibration verification samples are analyzed at method-specified intervals to assess the performance and accuracy of the instrumentation.

## **4.5 Precision**

Precision is measured by how close values of duplicate analyses are to each other. These duplicate analyses are prepared from separate aliquots of the same sample and are analyzed at the same (or similar) time. Precision in the field ensures that samples taken are representative of field concentrations; this is demonstrated by field duplicates. Analytical precision is the ability of the laboratory to reproduce results that are similar to each other; this is measured through the duplicate analysis of environmental and batch QC samples. Precision is estimated by the relative percent difference (RPD) between the original analysis and the duplicate analysis.

### **4.5.1 Laboratory Control Sample Duplicates**

The analytical batch LCS concentration of an analyte is compared to the LCSD concentration of the same analyte. The RPD is calculated from these two concentrations; which must be below a certain percentage to be considered acceptable. RPDs were within control limits for analytical batch 2301086, 2301194, 2301517, and 2301108.

### **4.5.2 Matrix Spike Duplicate**

Similar to the LCS/LCSD, the analytical batch MS/MSD analyte concentrations are also compared to each other and expressed as an RPD. Analytical batch MS/MSD RPDs were within control limits for analytical batch 2301086, 2301194, 2301517, and 2301108.

## **5.0 Conclusion**

In conclusion, the QA objectives have been met and the data are of sufficient quality for use in this project.

***Total Metals by EPA Method 200.8***

***Total Metals by EPA Method 6020B***

***Volatile Organic Compounds by EPA Method 8260D***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

*DoD-ELAP Accreditation #79636 by PJLA, ISO/IEC 17025:2017 and QSM 5.3 for Environmental Testing  
ORELAP Certification: WA 100009 (NELAP Recognized) for Environmental Testing  
Washington State Department of Ecology Accredited for Environmental Testing, Lab ID C910*

**CLIENT:** Apex Companies, LLC  
**Project:** Dagmars Marina RI

---

### I. SAMPLE RECEIPT:

Samples receipt information is recorded on the attached Sample Receipt Checklist.

### II. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

### III. ANALYSES AND EXCEPTIONS:

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

**Qualifiers:**

- \* - Flagged value is not within established control limits
- B - Analyte detected in the associated Method Blank
- D - Dilution was required
- E - Value above quantitation range
- H - Holding times for preparation or analysis exceeded
- I - Analyte with an internal standard that does not meet established acceptance criteria
- J - Analyte detected below Reporting Limit
- N - Tentatively Identified Compound (TIC)
- Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria
- S - Spike recovery outside accepted recovery limits
- ND - Not detected at the Reporting Limit
- R - High relative percent difference observed

**Acronyms:**

- %Rec - Percent Recovery
- CCB - Continued Calibration Blank
- CCV - Continued Calibration Verification
- DF - Dilution Factor
- DUP - Sample Duplicate
- HEM - Hexane Extractable Material
- ICV - Initial Calibration Verification
- LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
- MCL - Maximum Contaminant Level
- MB or MBLANK - Method Blank
- MDL - Method Detection Limit
- MS/MSD - Matrix Spike / Matrix Spike Duplicate
- PDS - Post Digestion Spike
- Ref Val - Reference Value
- REP - Sample Replicate
- RL - Reporting Limit
- RPD - Relative Percent Difference
- SD - Serial Dilution
- SGT - Silica Gel Treatment
- SPK - Spike
- Surr - Surrogate

Surr: 1-Bromo-4-fluorobenzene	1.51		1.521		99.6	80	120				

**NOTES:**

S - Outlying spike recoveries were associated with this sample.

## Sample Log-In Check List

Client Name: APEXCO

Work Order Number: 2301086

Logged by: Clare Griggs

Date Received: 1/5/2023 5:16:00 PM

### Chain of Custody

1. Is Chain of Custody complete? Yes  No  Not Present   
2. How was the sample delivered? Client

### Log In

3. Coolers are present? Yes  No  NA   
4. Shipping container/cooler in good condition? Yes  No   
5. Custody Seals present on shipping container/cooler?  
(Refer to comments for Custody Seals not intact) Yes  No  Not Present   
6. Was an attempt made to cool the samples? Yes  No  NA   
7. Were all items received at a temperature of >2°C to 6°C \* Yes  No  NA   
8. Sample(s) in proper container(s)? Yes  No   
9. Sufficient sample volume for indicated test(s)? Yes  No   
10. Are samples properly preserved? Yes  No   
11. Was preservative added to bottles? Yes  No  NA   
MeOH VOA extracted for SHOP-4 (2.5-3)  
12. Is there headspace in the VOA vials? Yes  No  NA   
13. Did all samples containers arrive in good condition(unbroken)? Yes  No   
14. Does paperwork match bottle labels? Yes  No   
  
15. Are matrices correctly identified on Chain of Custody? Yes  No   
16. Is it clear what analyses were requested? Yes  No   
17. Were all holding times able to be met? Yes  No

### Special Handling (if applicable)

18. Was client notified of all discrepancies with this order? Yes  No  NA

Person Notified:	Anders Utter	Date:	1/6/2023
By Whom:	Matt Langston	Via:	<input type="checkbox"/> eMail <input checked="" type="checkbox"/> Phone <input type="checkbox"/> Fax <input type="checkbox"/> In Person
Regarding:	Metals selection. Labeling discrepancies.		
Client Instructions:	RCRA8+3		

19. Additional remarks:

### Item Information

Item #	Temp °C
Sample	4.2

\* Note: DoD/ELAP and TNI require items to be received at 4°C +/- 2°C

January 19, 2023

**Attention Anders Utter:**

Fremont Analytical, Inc. received 16 sample(s) on 1/6/2023 for the analyses presented in the following report.

***Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.***

***Gasoline by NWTPH-Gx***

***Mercury by EPA Method 7471B***

***Sample Moisture (Percent Moisture)***

***Total Metals by EPA Method 6020B***

***Total Organic Carbon by EPA 9060***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes  
Project Manager

*DoD-ELAP Accreditation #79636 by PJLA, ISO/IEC 17025:2017 and QSM 5.3 for Environmental Testing  
ORELAP Certification: WA 100009 (NELAP Recognized) for Environmental Testing  
Washington State Department of Ecology Accredited for Environmental Testing, Lab ID C910*

## Case Narrative

WO#: 2301108

Date: 1/19/2023

---

**CLIENT:** Apex Companies, LLC  
**Project:** Dagmar

---

### I. SAMPLE RECEIPT:

Samples receipt information is recorded on the attached Sample Receipt Checklist.

### II. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

### III. ANALYSES AND EXCEPTIONS:

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

**Qualifiers:**

- \* - Flagged value is not within established control limits
- B - Analyte detected in the associated Method Blank
- D - Dilution was required
- E - Value above quantitation range
- H - Holding times for preparation or analysis exceeded
- I - Analyte with an internal standard that does not meet established acceptance criteria
- J - Analyte detected below Reporting Limit
- N - Tentatively Identified Compound (TIC)
- Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria
- S - Spike recovery outside accepted recovery limits
- ND - Not detected at the Reporting Limit
- R - High relative percent difference observed

**Acronyms:**

- %Rec - Percent Recovery
- CCB - Continued Calibration Blank
- CCV - Continued Calibration Verification
- DF - Dilution Factor
- DUP - Sample Duplicate
- HEM - Hexane Extractable Material
- ICV - Initial Calibration Verification
- LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
- MCL - Maximum Contaminant Level
- MB or MBLANK - Method Blank
- MDL - Method Detection Limit
- MS/MSD - Matrix Spike / Matrix Spike Duplicate
- PDS - Post Digestion Spike
- Ref Val - Reference Value
- REP - Sample Replicate
- RL - Reporting Limit
- RPD - Relative Percent Difference
- SD - Serial Dilution
- SGT - Silica Gel Treatment
- SPK - Spike
- Surr - Surrogate

## Sample Log-In Check List

Client Name: APEXCO

Work Order Number: 2301108

Logged by: Matt Langston

Date Received: 1/6/2023 2:25:00 PM

### Chain of Custody

1. Is Chain of Custody complete? Yes  No  Not Present   
2. How was the sample delivered? Client

### Log In

3. Coolers are present? Yes  No  NA   
4. Shipping container/cooler in good condition? Yes  No   
5. Custody Seals present on shipping container/cooler?  
(Refer to comments for Custody Seals not intact) Yes  No  Not Present   
6. Was an attempt made to cool the samples? Yes  No  NA   
7. Were all items received at a temperature of >2°C to 6°C \* Yes  No  NA   
8. Sample(s) in proper container(s)? Yes  No   
9. Sufficient sample volume for indicated test(s)? Yes  No   
10. Are samples properly preserved? Yes  No   
11. Was preservative added to bottles? Yes  No  NA   
12. Is there headspace in the VOA vials? Yes  No  NA   
13. Did all samples containers arrive in good condition(unbroken)? Yes  No   
14. Does paperwork match bottle labels? Yes  No   
15. Are matrices correctly identified on Chain of Custody? Yes  No   
16. Is it clear what analyses were requested? Yes  No   
17. Were all holding times able to be met? Yes  No

### Special Handling (if applicable)

18. Was client notified of all discrepancies with this order? Yes  No  NA

**Work Order Number: 2301194**

January 23, 2023

**Attention Anders Utter:**

Fremont Analytical, Inc. received 29 sample(s) on 1/11/2023 for the analyses presented in the following report.

***Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.***

***Gasoline by NWTPH-Gx***

***Sample Moisture (Percent Moisture)***

***Total Metals by EPA Method 6020B***

***Total Organic Carbon by EPA 9060***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes  
Project Manager

*DoD-ELAP Accreditation #79636 by PJLA, ISO/IEC 17025:2017 and QSM 5.3 for Environmental Testing  
ORELAP Certification: WA 100009 (NELAP Recognized) for Environmental Testing  
Washington State Department of Ecology Accredited for Environmental Testing, Lab ID C910*

## Case Narrative

WO#: 2301194

Date: 1/23/2023

---

**CLIENT:** Apex Companies, LLC  
**Project:** Dagmar

---

### I. SAMPLE RECEIPT:

Samples receipt information is recorded on the attached Sample Receipt Checklist.

### II. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

### III. ANALYSES AND EXCEPTIONS:

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

**Qualifiers:**

- \* - Flagged value is not within established control limits
- B - Analyte detected in the associated Method Blank
- D - Dilution was required
- E - Value above quantitation range
- H - Holding times for preparation or analysis exceeded
- I - Analyte with an internal standard that does not meet established acceptance criteria
- J - Analyte detected below Reporting Limit
- N - Tentatively Identified Compound (TIC)
- Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria
- S - Spike recovery outside accepted recovery limits
- ND - Not detected at the Reporting Limit
- R - High relative percent difference observed

**Acronyms:**

- %Rec - Percent Recovery
- CCB - Continued Calibration Blank
- CCV - Continued Calibration Verification
- DF - Dilution Factor
- DUP - Sample Duplicate
- HEM - Hexane Extractable Material
- ICV - Initial Calibration Verification
- LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
- MCL - Maximum Contaminant Level
- MB or MBLANK - Method Blank
- MDL - Method Detection Limit
- MS/MSD - Matrix Spike / Matrix Spike Duplicate
- PDS - Post Digestion Spike
- Ref Val - Reference Value
- REP - Sample Replicate
- RL - Reporting Limit
- RPD - Relative Percent Difference
- SD - Serial Dilution
- SGT - Silica Gel Treatment
- SPK - Spike
- Surr - Surrogate

## Sample Log-In Check List

Client Name: APEXCO

Work Order Number: 2301194

Logged by: Clare Griggs

Date Received: 1/11/2023 2:07:00 PM

### Chain of Custody

1. Is Chain of Custody complete? Yes  No  Not Present   
2. How was the sample delivered? Client

### Log In

3. Coolers are present? Yes  No  NA   
4. Shipping container/cooler in good condition? Yes  No   
5. Custody Seals present on shipping container/cooler?  
(Refer to comments for Custody Seals not intact) Yes  No  Not Present   
6. Was an attempt made to cool the samples? Yes  No  NA   
7. Were all items received at a temperature of >2°C to 6°C \* Yes  No  NA   
8. Sample(s) in proper container(s)? Yes  No   
9. Sufficient sample volume for indicated test(s)? Yes  No   
10. Are samples properly preserved? Yes  No   
11. Was preservative added to bottles? Yes  No  NA   
12. Is there headspace in the VOA vials? Yes  No  NA   
13. Did all samples containers arrive in good condition(unbroken)? Yes  No   
14. Does paperwork match bottle labels? Yes  No   
15. Are matrices correctly identified on Chain of Custody? Yes  No   
16. Is it clear what analyses were requested? Yes  No   
17. Were all holding times able to be met? Yes  No

### Special Handling (if applicable)

18. Was client notified of all discrepancies with this order? Yes  No  NA

Person Notified:	Anders Utter	Date:	1/13/2023
By Whom:	Clare Griggs	Via:	<input checked="" type="checkbox"/> eMail <input type="checkbox"/> Phone <input type="checkbox"/> Fax <input type="checkbox"/> In Person
Regarding:	Sample labeling discrepancies.		
Client Instructions:			

19. Additional remarks:

### Item Information

Item #	Temp °C
Sample	5.9

\* Note: DoD/ELAP and TNI require items to be received at 4°C +/- 2°C

Portland, OR 97201

**RE: Dagmars Marina**  
**Work Order Number: 2301517**

January 31, 2023

**Attention Anders Utter:**

Fremont Analytical, Inc. received 10 sample(s) on 1/27/2023 for the analyses presented in the following report.

***Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.***

***Gasoline by NWTPH-Gx***

***Sample Moisture (Percent Moisture)***

***Volatile Organic Compounds by EPA Method 8260D***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes  
Project Manager

DoD-ELAP Accreditation #79636 by PJLA, ISO/IEC 17025:2017 and QSM 5.3 for Environmental Testing  
ORELAP Certification: WA 100009 (NELAP Recognized) for Environmental Testing  
Washington State Department of Ecology Accredited for Environmental Testing, Lab ID C910

## Case Narrative

WO#: 2301517

Date: 1/31/2023

---

**CLIENT:** Apex Companies, LLC  
**Project:** Dagmars Marina

---

### I. SAMPLE RECEIPT:

Samples receipt information is recorded on the attached Sample Receipt Checklist.

### II. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

### III. ANALYSES AND EXCEPTIONS:

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

**Qualifiers:**

- \* - Flagged value is not within established control limits
- B - Analyte detected in the associated Method Blank
- D - Dilution was required
- E - Value above quantitation range
- H - Holding times for preparation or analysis exceeded
- I - Analyte with an internal standard that does not meet established acceptance criteria
- J - Analyte detected below Reporting Limit
- N - Tentatively Identified Compound (TIC)
- Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria
- S - Spike recovery outside accepted recovery limits
- ND - Not detected at the Reporting Limit
- R - High relative percent difference observed

**Acronyms:**

- %Rec - Percent Recovery
- CCB - Continued Calibration Blank
- CCV - Continued Calibration Verification
- DF - Dilution Factor
- DUP - Sample Duplicate
- HEM - Hexane Extractable Material
- ICV - Initial Calibration Verification
- LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
- MCL - Maximum Contaminant Level
- MB or MBLANK - Method Blank
- MDL - Method Detection Limit
- MS/MSD - Matrix Spike / Matrix Spike Duplicate
- PDS - Post Digestion Spike
- Ref Val - Reference Value
- REP - Sample Replicate
- RL - Reporting Limit
- RPD - Relative Percent Difference
- SD - Serial Dilution
- SGT - Silica Gel Treatment
- SPK - Spike
- Surr - Surrogate

## Sample Log-In Check List

Client Name: APEXCO

Work Order Number: 2301517

Logged by: Clare Griggs

Date Received: 1/27/2023 1:43:00 PM

### **Chain of Custody**

1. Is Chain of Custody complete? Yes  No  Not Present   
2. How was the sample delivered? Client

### **Log In**

3. Coolers are present? Yes  No  NA   
4. Shipping container/cooler in good condition? Yes  No   
5. Custody Seals present on shipping container/cooler?  
(Refer to comments for Custody Seals not intact) Yes  No  Not Present   
6. Was an attempt made to cool the samples? Yes  No  NA   
7. Were all items received at a temperature of >2°C to 6°C \* Yes  No  NA   
8. Sample(s) in proper container(s)? Yes  No   
9. Sufficient sample volume for indicated test(s)? Yes  No   
10. Are samples properly preserved? Yes  No   
11. Was preservative added to bottles? Yes  No  NA   
12. Is there headspace in the VOA vials? Yes  No  NA   
13. Did all samples containers arrive in good condition(unbroken)? Yes  No   
14. Does paperwork match bottle labels? Yes  No   
15. Are matrices correctly identified on Chain of Custody? Yes  No   
16. Is it clear what analyses were requested? Yes  No   
17. Were all holding times able to be met? Yes  No

### **Special Handling (if applicable)**

18. Was client notified of all discrepancies with this order? Yes  No  NA

### **Standard Operating Procedures**

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.1

**STANDARD FIELD SCREENING PROCEDURES**

Date: November 9, 2009

Revision Number: 1.1

Page: 1 of 2

**1. PURPOSE AND SCOPE**

This Standard Operating Procedure (SOP) provides instructions for standard field screening. Field screening results are used to aid in the selection of soil samples for chemical analysis. This procedure is applicable during Apex Companies, LLC (Apex) soil sampling operations.

Standard field screening techniques include the use of a photoionization detector (PID) to assess for volatile organic compounds (VOCs), for the presence of separate-phase petroleum hydrocarbons using a sheen test. These methods will not detect all potential contaminants, so selection of screening techniques shall be based on an understanding of the site history. The PID is not compound or concentration-specific, but it can provide a qualitative indication of the presence of VOCs. PID measurements are affected by other field parameters such as temperature and soil moisture. Other field screening methods, such as screening for dense non-aqueous phase liquid (DNAPL) using dye or UV light, are not considered "standard" and will be detailed in the site-specific sampling and analysis plan (SAP).

**2. EQUIPMENT AND MATERIALS**

The following materials are necessary for this procedure:

- PID with calibration gas (record daily calibration/calibration check in field notes);
- Plastic resealable bags (for PID measurement); and
- Glass jars or stainless steel bowls (for sheen testing).

**3. METHODOLOGY**

Each soil sample will be field screened for VOCs using a PID and for the presence of separate-phase petroleum hydrocarbons using a sheen test. If the presence of DNAPL is suspected, then screening using dye and UV light may also to be completed. For information regarding screening using dye or UV light, refer to the site specific sampling and analysis plan.

PID lamps come in multiple sizes, typically 9.8, 10.6, and 11.7 electron volts (eV). The eV rating for the lamp must be greater than the ionization potential (in eV) of a compound in order for the PID to detect the compound. For petroleum hydrocarbons, a lamp of at least 9.8 eV should be used. For typical chlorinated alkenes (dichloroethene, trichloroethene, tetrachloroethene, or vinyl chloride.), a lamp of at least 10.6 eV should be used. The compatibility of the lamp size with the site constituents should be verified prior to the field event and will be detailed in the site-specific SAP.

**PID Calibration Procedure:** The PID used on-site should be calibrated daily or more frequently if needed. Calibration of the PID should be documented in field notes. Calibrations procedures should be conducted according to the manufacturer's instructions. .

**PID Screening Procedure:**

- Place a representative portion (approximately one ounce) of freshly exposed, uncompacted soil into a clean resealable plastic bag.
- Seal the bag and break up the soil to expose vapors from the soil matrix.
- Allow the bag to sit to reach ambient temperature. Note: Ambient temperature and weather conditions/humidity should be recorded in field notes. Changes in ambient temperature and weather during the field work should also be recorded, as temperature and humidity can affect PID readings.
- Carefully insert the intake port of the PID into the plastic bag.
- Record the PID measurement in the field notes or boring logs.

**Sheen Test Procedure:**

- Following the PID screen, place approximately one ounce of freshly exposed, uncompacted soil into a clean glass jar or stainless steel bowl.

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.1

Date: November 9, 2009

**STANDARD FIELD SCREENING PROCEDURES**

Revision Number: 1.1

Page: 2 of 2

- Add enough water to cover the sample.
- Observe the water surface for signs of discoloration/sheen and characterize

No Sheen (NS)	No visible sheen on the water surface
Biogenic Film (BF)	Dull, platy/blocky or foamy film.
Slight Sheen (SS)	Light sheen with irregular spread, not rapid. May have small spots of color/iridescence. Majority of water surface not covered by sheen.
Moderate Sheen (MS)	Medium to heavy coverage, some color/iridescence, spread is irregular to flowing. Sheen covering a large portion of water surface.
Heavy Sheen (HS)	Heavy sheen coverage with color/iridescence, spread is rapid, entire water surface covered with sheen. Separate-phase hydrocarbons may be evident during sheen test.

# STANDARD OPERATING PROCEDURE

SOP Number: 2.4

Date: July 28, 2009

## PUSH-PROBE EXPLORATION PROCEDURES

Revision Number: 0.02

Page: 1 of 2

### 1. PURPOSE AND SCOPE

This Standard Operating Procedure (SOP) describes the methods for observing and sampling from push-probes (i.e., GeoProbe™). Subsurface soil cores may be obtained using this system for purposes of determining subsurface soil conditions and for obtaining soil samples for physical and/or chemical evaluation. Grab groundwater samples may be collected using temporary well screens. Soil vapor samples may be obtained using temporary well points. Shallow (less than 50 feet), small-diameter (2-inch max) pre-packed wells may also be installed using push-probe equipment. This procedure is applicable during all Apex Companies, LLC (Apex) push-probe activities.

### 2. EQUIPMENT AND MATERIALS

The following materials are necessary for this procedure:

- Traffic cones, measuring tape, spatula, and buckets/drums
- Sampling equipment (water level probe, pumps, tubing) and laboratory-supplied sample containers
- Field documentation materials
- Decontamination materials
- Personal protective equipment (as required by project Health and Safety Plan)

### 3. METHODOLOGY

#### Coring Procedure (Conducted by Drilling Subcontractor):

The sampling procedure includes driving a 2-inch outside-diameter, 5-foot-long, push-probe soil sampler to the desired depth using a combination of hydraulic pressure and mechanical hammer blows. When the sampling depth is reached, the pin attaching the sampler's tip is released (if a tip is used), which allows the tip to slide inside the sampler (Macro-Core Sampler with removable plastic liner). The sampler is driven the length of the sampler to collect a soil core, which is then withdrawn from the exploration. When the sampler is retrieved from the borehole the drive head/cutting shoe is detached and the liner is removed. Soil cores are collected continuously to the full depth of the exploration unless otherwise specified in a project-specific sampling and analysis plan (SAP). Verify that the subcontractor decontaminates the sampling device (per SOP 1.2) prior to its initial use and following collection of each soil sample.

#### Logging and Soil Sample Collection:

Remove the soil core from the sampler for field screening, description, and placement into sample jars. Soil samples will be collected for field screening and possible chemical analysis on two foot intervals unless otherwise specified in a project-specific SAP. The sampling interval will be determined in the field based on recovery, soil variability, and evidence of contamination. Complete field screening as specified in SOP 2.1. Soil samples should be collected using different procedures for volatile on non-volatile analyses, as follows.

- **Volatile Analyses.** Sampling for volatile organics analysis (VOA) is different than other routine physical or chemical testing because of the potential loss of volatiles during sampling. To limit volatile loss, the soil sample must be obtained as quickly and as directly as possible. If a VOA sample is to be collected as part of a multiple analyte sample, the VOA sample portion will be obtained first. The VOA sample should be obtained from a discrete portion of the entire collected sample and should not be composited or homogenized. Sample bottles should be filled to capacity, with no headspace. Specific procedures for collecting VOA samples using the EPA Method 5035 are discussed in SOP 2.7.
- **Other Analyses.** Soil samples for non-volatile analyses will be thoroughly homogenized in a stainless steel bowl prior to bottling. Sample homogenizing is accomplished by manually mixing the entire soil

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.4

**PUSH-PROBE EXPLORATION PROCEDURES**

Date: July 28, 2009

Revision Number: 0.02

Page: 2 of 2

sample in the stainless steel bowl with a clean sampling tool until a uniform mixture is achieved. The sample jar should be filled completely.

Any extra soil generated during probing activities will be placed in Department of Transportation (DOT) approved drums.

**Grab Groundwater Sample Collection:**

Collect grab groundwater samples using a sampling attachment with a 4 to 5-foot-long temporary screen (specify to drillers whether to use decontaminated stainless steel or disposable PVC. Also, specify whether a filter pack is necessary based on field observations). Obtain samples using a peristaltic pump unless otherwise specified in the SAP with new tubing for each boring. Record field parameters (e.g., temperature, conductivity, and pH) prior to sampling.

**Backfilling the Excavation (Conducted by Drilling Subcontractor):**

After sampling activities are completed, abandon each exploration in accordance with Oregon Water Resources Department (OWRD) regulations and procedures. The abandonment procedure typically consists of filling the exploration with granular bentonite and hydrating the bentonite with water. Match the surface completion to the surrounding materials.

<b>STANDARD OPERATING PROCEDURE</b>	SOP Number: 2.5
	Date: August 8, 2022
<b>LOW FLOW GROUNDWATER SAMPLING PROCEDURES</b>	Revision Number: 0.04
	Page: 1 of 2

## 1. PURPOSE AND SCOPE

This Standard Operating Procedure (SOP) describes the methods for collection of groundwater samples from monitoring wells applying low flow protocols. Low flow sampling is a method of collecting samples that does not require the removal of large volumes of water and therefore does not overly agitate the water, suspend particles, or potentially aspirate VOCs. Typical flow rates for low flow sampling range from 0.1 L/min to 0.5 L/min depending on site characteristics. The groundwater monitoring activities will consist of measuring water levels, purging and sampling groundwater, and measuring groundwater field parameters. This procedure is applicable during Apex Companies low flow groundwater sampling activities.

## 2. EQUIPMENT AND MATERIALS

The following materials are necessary for this procedure:

- Traffic cones, tools, keys, and buckets/drums
- Water quality meter with calibration solutions (record daily calibration/calibration check in field notes)
- Sampling equipment (water level probe, pumps, tubing) and laboratory-supplied sample containers
- Field documentation materials
- Well construction details, if available
- Decontamination materials
- Personal protective equipment (as required by project Health and Safety Plan)

## 3. METHODOLOGY

### Water Levels:

Water levels in the wells will be measured and recorded for the purpose of determining groundwater elevations and gradient prior to initiating purging of any of the wells. The wells will be opened and the water level allowed to equilibrate before the measurements are taken. Measurements of the depth to water will be made to the nearest 0.01 foot using an electronic probe.

### Purging:

Purge using low-flow sampling equipment (e.g., peristaltic pump or bladder pump) at a low-flow rate to limit water table drawdown. Unless specified otherwise in the project-specific sampling and analysis plan (SAP) the sample tubing/pump will be lowered to the middle of the saturated screened interval. To assess the effectiveness of purging, groundwater field parameters (pH, specific conductance, dissolved oxygen, oxidation/reduction potential, temperature and turbidity) will be measured using a flow cell connected to the discharge tubing of the sample pump. Purging will be considered complete when the water quality parameters meet the following criteria:

pH	+/- 0.1 pH units
Specific Conductance	+/- 3% of prior reading
Dissolved Oxygen	+/- 10% of prior reading for values greater than 0.5 mg/L. If three DO values are less than 0.5 mg/L, consider the DO stabilized
Oxidation/Reduction potential	+/- 20 mV
Temperature	+/- 3% of prior reading
Turbidity (if measured)	10% of prior reading for values greater than 5 NTUs. If three turbidity values are less than 5 NTUs, consider the values as stabilized. Measure turbidity before flow-through cell.

Consult the project-specific SAP for additional parameters and stabilization criteria. Purge water will be placed in Department of Transportation (DOT) approved drums.

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.5

**LOW FLOW GROUNDWATER SAMPLING PROCEDURES**

Date: August 8, 2022

Revision Number: 0.04

Page: 2 of 2

Sample Collection:

After the purging of each well is complete, collect groundwater samples for chemical analyses using the same pump used for the well purging. Disconnect the flow-through cell and collect the samples directly from the pump tubing. Do not collect samples from the downstream side of the flow-through cell.

Low Yield Sampling Procedure:

If drawdown of the water table is unavoidable and a well pumps dry during purging, discontinue measurement of water quality parameters. Collect groundwater samples once the water level recovers to 90 percent of the pre-purge water column. Contact project manager in the event of slow recharge conditions. Always collect samples for VOC analysis as soon after recharge as possible.

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.7

**EPA METHOD 5035A SOIL SAMPLING PROCEDURES**

Date: January 25, 2010

Revision Number: 0.01

Page: 1 of 2

## 1. PURPOSE AND SCOPE

This Standard Operating Procedure (SOP) describes the methods used for obtaining soil samples for chemical analysis for volatile organic compounds (VOCs) by EPA Method 5035A. Samples collected using the 5035A protocols are not exposed to the atmosphere after sampling thereby reducing the potential for loss of VOCs during sample transport, handling, and analysis. This procedure assumes the use of the PowerStop Handle sampler with disposable EasyDraw Syringes or Terra Core Samplers. This procedure is applicable during Apex Companies, LLC (Apex) soil sampling activities where the 5035A protocols are employed.

## 2. EQUIPMENT AND MATERIALS

The following materials are necessary for this procedure:

- Sampling equipment (PowerStop Handle, disposable EasyDraw Syringes, Terra Core Samplers)
- Laboratory-supplied sample containers (pre-weighed 40ml VOA vials including labels, preservative, stir bars, etc. [number and type as specified by the lab], two ounce jars)
  - Vials used from ACA stock must be weighed to confirm loss of reagents is less than 0.02 grams. Record vial tare weight in field notes. Discard vials with dates over 6 months old.
- Field documentation materials
- Decontamination materials
- Personal protective equipment (as required by Health and Safety Plan)

## 3. METHODOLOGY

The project-specific sampling and analysis plan (SAP) will define the specific requirements for 5035A methodology required for a particular site or by a regulatory agency.

### Analytical Requirements

- VOCs must be analyzed within 14 days of collection.
- Field preserved samples (e.g., sodium bisulfate or methanol) must be maintained at 4° C.
- Sample collected without preservative (e.g., reagent water) must frozen or analyzed within 48 hours.

### Collection of Samples

- When using the PowerStop Handle, clip the syringe into the handle in one of the three 5 gram positions. Use the heavy position for dense clay, the light position for dry sandy soil, and the medium position for all others.
- Using the handle, push the sampler into the soil to collect the sample. Continue pushing until the soil column has forced the plunger in the syringe to the stopping point or filled the sampler.
- Wipe all debris from the outside of the sampler. The soil plug should be flush with the mouth of the sampler. Remove any excess soil that extends beyond the mouth of the sampler.
- Extrude the 5 gram sample into vial and cap vial immediately. Hold vial at an angle when extruding to minimize splashing. Gently swirl vial for 10 seconds to break up soil particles (do not shake).
- When capping the vial, be sure to remove any soil or debris from the threads of the vial.
- Repeat process for each additional vial.
- Fill a two ounce container (to capacity) for percent total solids determination.

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.7

**EPA METHOD 5035A SOIL SAMPLING PROCEDURES**

Date: January 25, 2010

Revision Number: 0.01

Page: 2 of 2

Additional Considerations

- Methanol contamination can occur from adjacent activities (e.g., exhaust from running equipment or vehicles, hot tar roofing, facility operations, etc). Collection and analysis of methanol field blank (e.g., additional methanol vial left open during period of sampling) is recommended.
- Acidification of carbonaceous soils with sodium bisulfate can cause effervescence and loss of VOCs.
- Certain volatile compounds such as 2-chloroethylvinyl ether may be lost by acidification.
- Acidification of certain soils with sodium bisulfate may cause the formation of acetone through oxidation of soil waxes and humic material (e.g., organic materials such as roots).

# STANDARD OPERATING PROCEDURE

SOP Number: 2.13

## MONITORING WELL INSTALLATION PROCEDURES

Date: July 30, 2009

Revision Number: 0.01

Page: 1 of 1

### 1. PURPOSE AND SCOPE

This Standard Operating Procedure (SOP) describes the methods for installing monitoring wells (using conventional PVC or pre-packed well screens). A pre-packed well screen generally consists of 5-foot sections of an inner PVC well screen and an outer stainless steel wire mesh. The sand filter pack is housed between the inner screen and outer wire mesh. Well installations are typically completed using push probe drilling to save time and cost but may include many other techniques for drilling a borehole to install the well. This procedure is applicable during all Ash Creek Associates (ACA) drilling activities for installation of monitoring wells.

### 2. EQUIPMENT AND MATERIALS

The following materials are necessary for this procedure:

- Field documentation materials
- Personal protective equipment (as required by project Health and Safety Plan)

### 3. METHODOLOGY

The soil boring for the monitoring well will be completed in accordance with SOP-2.4.

#### Installation/Construction of Monitoring Well:

**Filter Pack.** Wells will be constructed of flush-threaded Schedule 40 PVC casing connected to a conventional PVC well screen or pre-packed well screen, placed at the bottom of the boring. A clean silica sand pack will be placed between the boring wall and the PVC screen/riser (i.e., the annulus) from the bottom of the well to approximately one to two feet above the screened interval. Prior to installation of the seal, the well will be surged using a surge block or similar technique. The depth to sand will be measured prior to setting the bentonite seal.

**Seal.** A bentonite seal, 1 to 2 feet thick, will be placed above the sand. The bentonite will be hydrated and allowed to sit for a minimum of 30 minutes for proper hydration and sealing. The depth to the top of the seal will be measured prior to placing grout. In Washington State and some California counties, the bentonite seal may be placed to within 1 foot of the ground surface in place of grout (per local/state regulations).

**Grout.** A cement-bentonite slurry will be placed above the bentonite seal following proper hydration. The cement-bentonite slurry will be placed to within 1 foot of the ground surface.

**Surface Seal.** A concrete surface seal will secure a flush-mounted, traffic-rated monument, or a bollard protected stove-pipe stickup. A locking cap and lock will secure the wellhead, and tamper-resistant bolts (either pentagonal or Allen wrench) will secure a monument cover if a flush-mounted monument is used for surface completion. Flush-mounted surface completions will be completed slightly above grade to prevent the ponding of water in, and around, the monument. All monuments will be permanently marked with well identification numbers. The identification number should be marked on the well (e.g., punched into monument ring, written on the well casing and/or cap with permanent marker, etc.). A survey point should also be added to the well casing (e.g., v-notch cut in PVC).

#### Documentation:

The field geologist will document the well construction activities. Details to be noted include the following:

- Length of well components;
- Measurements of bentonite, sand, and concrete depths;
- Types, brands, and amounts of materials used;
- Documentation of decontamination; and
- Any deviation from standard procedures or problems during the installation activities.

The drilling contractor will be responsible for conforming to all applicable regulations pertaining to well construction.

**STANDARD OPERATING PROCEDURE**

SOP Number: 2.14

Date: October 7, 2009

**MONITORING WELL DEVELOPMENT PROCEDURES**

Revision Number: 0.01

Page: 1 of 1

**1. PURPOSE AND SCOPE**

This Standard Operating Procedure (SOP) describes the methods for developing monitoring wells following construction; however, this procedure is also applicable for the redevelopment of existing monitoring wells. Monitoring wells will be allowed to sit for a minimum of 48 hours following completion, or applicable local or state regulated waiting period, before initiating the well development process. This procedure is applicable during all Ash Creek Associates (ACA) well development activities.

**2. EQUIPMENT AND MATERIALS**

The following materials are necessary for this procedure:

- Field documentation materials
- Well Purge Equipment (i.e., High flow centrifugal down-hole pump or bailer)
- Multi-parameter meter (temperature, pH, and conductivity)
- Decontamination materials
- Drums and/or high-capacity tank for storage of purged water
- Personal protective equipment (as required by project Health and Safety Plan)

**3. METHODOLOGY**

The well will be set up in a manner such that the volume of water generated can be easily determined and field parameters can be collected. The development activities will be completed to maximize the removal of sediment from the well casing.

**Procedures:**

- Measure depth to water (DTW) and total depth of the well prior to development and calculate the casing volume.
- Field parameters (temperature, pH, and conductivity) will be measured for each casing volume removed.
- Purge water will be placed in Department of Transportation (DOT) approved drums or high-capacity tank.
- After the removal of eight casing volumes, field parameters will be monitored for stability.

The well will be considered developed after a minimum of 10 casing volumes have been removed, field parameters have stabilized, and purged water is as free of sediment as possible. Field parameters will be considered stable if temperature, pH, and conductivity are within 10% for three consecutive casing volumes. Wells will also be considered developed if the well is pumped dry during the development process. Consult the project-specific SAP for additional parameters and stabilization criteria.

**Documentation:**

The field representative will document the well development activities. Details to be noted include the following:

- Depths to water;
- Total depth of the well;
- Purging type and rate;
- Field parameters; and
- Total volume of water purged.
