      – A CONTINUOUS VERTICAL LOAD PATH SHALL EXIST FROM WALL TOP PLTS. TO WALL BOTTOM PLTS.
      – ALL WOOD MEMBERS IN THE CONTINUOUS VERTICAL LOAD PATH SHALL BE NAILED ACCORDING TO THE EARTHBOUND SYSTEM REQUIREMENTS.
      – THE SHEAR PANEL MUST EXTEND TO INCLUDE THE TRIMMERS USED.
   E. COMPRESSION STUDS/POSTS SHALL BE INSTALLED SYMMETRICALLY ABOUT ROD. WHERE QUANTITY OF STUDS IS GREATER THAN THE SPACE BETWEEN ROD OR BEARING PLATE AND THE END OF SHEAR WALL THE ADDITIONAL REQUIRED STUDS SHALL BE ADDED TO THE OPPOSITE SIDE OF ROD (ASYMMETRICALLY).

1.0 RECOGNITION

SlackJack®, HeavyJack™ and MiniJack®, manufactured by Earthbound Corporation, were evaluated for use as compression-controlled shrinkage compensation devices in wood-framed construction. The structural properties of the devices were evaluated for compliance with the following codes and regulations:

- 2018, 2015, 2012, 2009 and 2006 International Building Code® (IBC)
- 2018, 2015, 2012, 2009 and 2006 International Residential Code® (IRC)
- 2016 and 2013 California Building Code (CBC) – See attached Supplement
- 2016 and 2013 California Residential Code (CRC) – See attached Supplement
- 2017 Florida Building Code, Building (FBC, Building) – See attached Supplement
- 2017 Florida Building Code, Residential (FBC, Residential) – See attached Supplement
- 2017 City of Los Angeles Building Code (LABC) – See attached Supplement
- 2017 City of Los Angeles Residential Code (LARC) – See attached Supplement

2.0 LIMITATIONS

Use of the SlackJack, HeavyJack and MiniJack Shrinkage Compensation Devices recognized in this report are subject to the following limitations:

2.1 The SlackJack, HeavyJack and MiniJack devices shall be limited to installations in dry, interior locations.

2.2 Use of the SlackJack, HeavyJack and MiniJack devices in direct contact with fire-retardant or preservative-treated wood is beyond the scope of recognition of this report.

2.3 Where required, designs using these products shall be submitted to the building code official for review.

2.4 No increase in the allowable capacities shown in Table 4 of this report shall be permitted.

2.5 The dead load is limited to the self-weight of the SlackJack, HeavyJack and MiniJack devices. Additional dead load on the devices is beyond the scope of this report.

2.6 The maximum offset tolerance shall be 1.33 degrees from vertical.

2.7 "When the devices are used in continuous rod systems that resist light-frame shear wall overturning forces, calculations shall be submitted to the code official confirming that the total vertical displacement, which would include steel rod elongation and the shrinkage compensating device deflection, is less than or equal to 0.20 inch (5 mm) for each story, or between restraints, whichever is more restrictive, using allowable stress design (ASD). Shear wall drift limit calculations shall consider the 0.20 inch (5 mm) vertical displacement limit. This 0.20-inch (5 mm) vertical displacement limit may be exceeded when it can be demonstrated that the shear wall story drift limit and the deformation compatibility requirements of IBC Section 1604.4 are met when considering all sources of vertical displacement." (AC316)

2.8 Buildings constructed to the IRC shall have engineered designs performed on the elements of construction using this device as required in Section R301.1.3.

2.9 The shrinkage compensation devices recognized in this report are produced by Earthbound Corporation in Monroe, Washington.

3.0 PRODUCT USE INSTRUCTIONS

3.1 The Earthbound installation instructions, this evaluation report, and the applicable provisions of the building code shall be followed when installing this product. Where conflicts occur between these documents, the more restrictive provisions shall govern. The published installation instructions shall be available at the jobsite during construction for use by installers and for quality assurance.

3.2 Where required by the code official or other authority having jurisdiction, calculations based on applied loads to the device shall be provided by a registered design professional to show the basis for its selection. The calculations shall show the projected shrinkage, deflection, and settlement the device will compensate for, and the method of transferring the loads through the supports. The appropriate SlackJack, HeavyJack and MiniJack device shall be chosen based on the model and series characteristics. The Rated Shrinkage Capacity, Allowable

Compression Load, Deflection at Allowable Load and Device Average Travel and Seating Increment, Δ_R, for each model are shown in Table 4 of this report.

3.3 The chosen SlackJack, HeavyJack or MiniJack device shall be slid over a threaded-rod or anchor bolt, over an approved bearing surface or plate. The appropriate color-coded swivel washer (listed in Table 4 of this report), shall be installed as required by the manufacturer's installation instructions with the flat side up. A hex nut shall be installed over the rod and hand-tightened.

To place the device into service, the pull clip shall be completely removed and placed on the device to show that the device has been activated.

Where necessary, the devices may be reset in the field. The manufacturer's installation instructions shall be referenced for details.

3.4 SlackJacks may be substituted and interchangeable with HeavyJack devices per Table 3 of this report.

4.0 PRODUCT DESCRIPTION

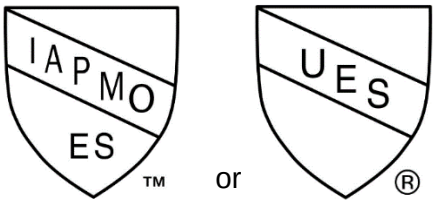
4.1 SlackJack, HeavyJack and MiniJack Shrinkage Compensation Devices are spring-loaded, compression-controlled shrinkage compensating devices that are designed to work with threaded-rod or anchor bolt hold-down systems in wood-frame construction. The devices are cylindrical, high-strength structural connectors that enable axial compression travel along a bolted or sliding connection but to withstand movement due to tensile loads.

4.2 The materials used for the inner and outer cylinders, locking rings, springs, pull-clips, capture-rings and swivel washers, for the SlackJack, HeavyJack and MiniJack models are shown in Table 1 of this report.

4.3 The model and series number describe the attributes of each shrinkage compensation device. The devices are color-coded to identify the specific model type, which varies based on strength and length of travel. The available travel lengths are: 1 inch, 1 ½ inches, 2 inches, and 3 inches (25.4 mm, 38.1 mm, 50.8 mm, and 76.2 mm). Table 2 of this report describes the model and series notations. Color coding is also used to identify the size of the swivel washer for the SlackJack devices as shown in Table 5 of this report.

5.0 IDENTIFICATION

A label shall be affixed on at least one of the following: product, packaging, installation instructions or descriptive literature. The label shall include the Earthbound name or trademark, the device model number, the IAPMO Uniform ES Mark of Conformity and the Evaluation Report Number (ER-429) to identify the products recognized in this report. A die-stamp label may be used as a substitute for the label. Either Mark of Conformity may be used as shown below:



IAPMO UES ER-429

6.0 SUBSTANTIATING DATA

Data in accordance with ICC-ES Acceptance Criteria for Shrinkage Compensating Devices (AC316), dated June 2013 (Editorially Revised November 2017).

7.0 STATEMENT OF RECOGNITION

This report describes the results of research carried out by the IAPMO Uniform Evaluation Service on Earthbound's SlackJack, HeavyJack and MiniJack Shrinkage Compensation Devices to assess their conformance to the codes and standards listed in Section 1.0 and serves as documentation of the product certification. Earthbound System Compression Bridge and Support Trimmer Calculation

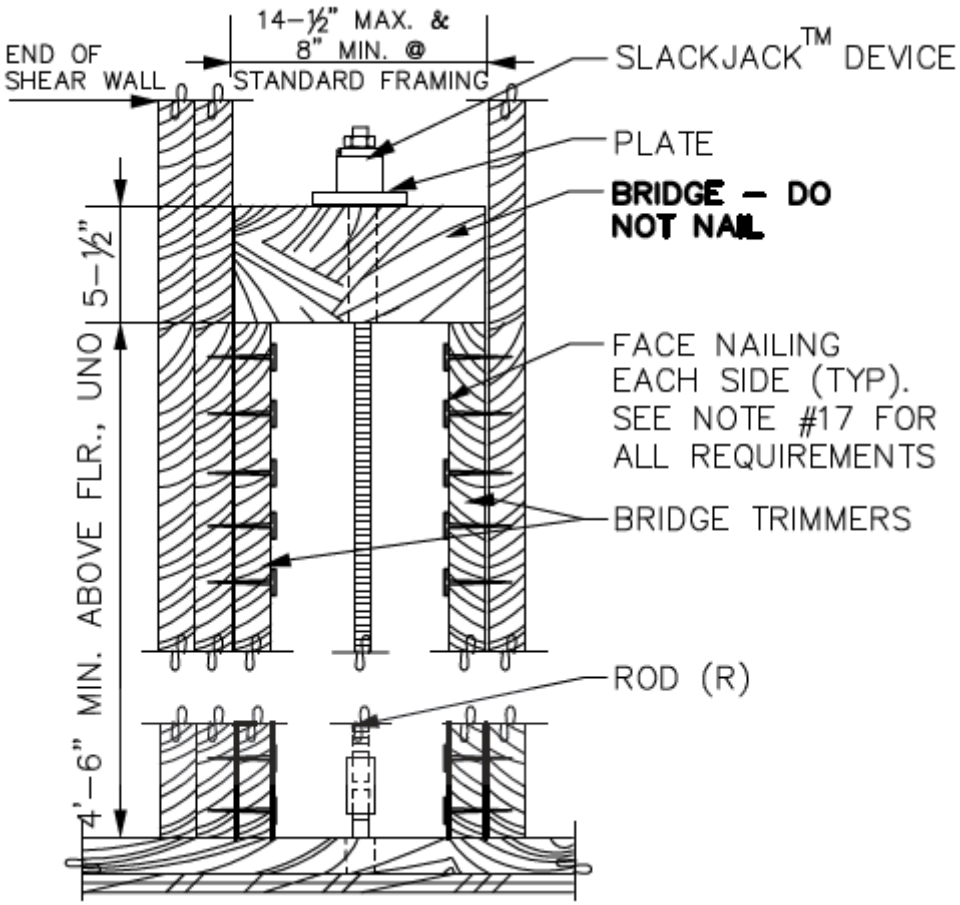
Summary of Compression Bridge Concept:

The "Compression Bridge" consists of 4x6 sawn lumber turned upright (or 6x6) and framed in the stud bay at each end of a shear wall. These bridges are utilized at the top floor of every holdown run in the Earthbound System. The 4x6 is framed in the wall similar to a header where it is supported by cripple studs. Depending on load, the minimum number of cripple studs is two, one at each end of the 4x6 bridge.

If the bearing load exceeds the maximum bearing pressure of the cripple studs peripendicular to grain of the floor plate, more studs can be added under the bridge. The outermost cripple studs are faced nailed two (2) nails on 4" o.c. to the adjacent full height stud members. The following example calculation will be based on **4'-6"** tall cripple studs in performing the face nail calculation. The Earthbound System also recommends these cripple studs receive nailing for redundancy from the sheathing side equivalent to required plywood edge nailing schedules for the shear wall. For this calculation, we will use 4" o.c. plywood edge nailing.

The Slackjack or MiniJack Device is mounted at the top of the bridge resting on the Earthbound System bearing plates. The holdown load path is intended to transfer down via the bearing plate through the 4x6 bridge to the cripple studs with load transferring from the face nails into the full length studs.



Objective: Calculate lumber and nailing capacities to support holdown load under the Shrinkage Device and bearing plate. We are using face nailing and diaphragm nailing to transfer holdown load back into wall:

Define Variables and Coefficients:

From Table 10.3.1 2015 NDS (attached at end of calculation), the following are Adjustments Factors for Corrections applicable in calculating nail and spike capacities (under Dowel-Type Fasteners)

$C_D := 1.33$;Load Duration Factor = 1.33 for seismic

$C_{D\_Nails} := 1.60$;Load Duration Factor = 1.6 for Nails in 2015 NDS.

$C_M := 1.0$;Wet Service Factor = 1.0 if dry conditions

$C_t := 1.0$;Temperature Factor = 1.0 if below 100 degrees

$C_\Delta := 1.0$;Geometry Factor = 1.0 unless you have a split ring or shear plate connection.

$C_{eg} := 1.0$;End Grain Factor = 1.0 if non end grain nailing application

$C_{di} := 1.0$;Diaphragm Factor = 1.0 if non diaphragm nailing application. 1.1 if diaphragm nailing

$C_{tn} := 1.0$;Toenail Factor = 1.0 if non toe nailing application

$Z := 93\,lbf$;Box Nail Shear Design values from supplemental calculation from WWPA Wood-To-Wood Single Shear Connections is at the end of this document. WWPA = 148 lbs / 1.6 (Cd) = 93 lbf

Calculate Shear Value of one FACE nail based on above adjustment factors:

$Z_{nail} := Z \cdot C_{D\_Nails} \cdot C_M \cdot C_t \cdot C_\Delta \cdot C_{eg} \cdot C_{di} \cdot C_{tn}$ $Z_{nail} = 148.8\,lbf$

Calculate Face Nailing Capacity based on two (2) nails on 4"o.c. rows and 4'-6" trimmer stud length:

$StudHeight := 4.5ft$;Typically Trimmer Stud Height is set at mid floor or 1/2 full length studs used for wall framing

$NailRowSeperationOC := 4.0in$

$NumberNailRows := \left(\frac{StudHeight \cdot 12\frac{in}{ft}}{NailRowSeperationOC}\right) - 1$;We subtract one row of nails for spacing and clearance to the bridge.

$NumberNailRows = 13$

$NumberNailsPerRow := 2$

$NumberofRowArrays := 2$

$TotalFaceNailCapacity := NumberNailRows \cdot NumberNailsPerRow \cdot NumberofRowArrays \cdot Z_{nail}$

$TotalFaceNailCapacity = 7440\,lbf$;This is (number of rows) x (2 nails per row) x (2 rows, one each side) x (nail capacity)

Nailing Capacity Summary: The above calculation is based on the cripple stud height used and the spacing between rows of nails. Note that the Earthbound System does recommend sheathing nailing to match plywood edge nailing schedules. The additional transfer from shear panel nails is calculated later in this document.

Calculate Cripple Stud Bearing Capacity: This is a calculation of the maximum capacity per stud bearing perpendicular to grain on the bottom plates:

$l_e := StudHeight \cdot \frac{12in}{1ft}$ $l_e = 54 \cdot in$;Stud Height in inches

$d := 3.5in$;Stud Depth

$t := 1.5in$;Stud Thickess

$A := t \cdot d$;Stud Bearing Area

$A = 5.25 \cdot in^2$;Note the effective stud bearing area for a 2x6 cripple stud will be based on a 2x4 (1.5 in x 3.5 in) because we specify a 4x6 bridge turned upwards, the effective stud bearing area will be the same for a 2x4 or 2x6.

$Fc_{perp} := 625psi$;From 2015 NDS Table 4A Douglas Fir Stud Grade = 625 psi

$StudBearingCapacity := A \cdot Fc_{perp}$

$StudBearingCapacity = 3281 \cdot lbf$;NDS does not allow for Load Duration Factor greater than 1.0 to be applied to loads perpendicular to grain.

Calculate Trimmer Stud Vertical (Column Buckling) Capacity: This is a calculation of the maximum buckling or column capacity per stud. Calculations are based from 2015 NDS:

$Fc_{para} := 850psi$;Fc (parallel): Douglas Fir (stud grade) = 850 psi

$C_D := 1.333$;Load Duration Factor = 1.33 for seismic

$C_r := 1.00$;Repetitive Member Factor = 1.00

$C_F := 1.05$;Size Factor = 1.05, From 2015 NDS Table 4A for 2,3,4 inch width Stud Grade

$C_M := 1.0$;Wet Service Factor = 1.0, From 2015 NDS Table 4A, assume lumber is below 19% moisture content

$E := 1400000psi$;Modulus of Elasticity of wood, From 2015 NDS Table 4A: Douglas Fir Stud. Grade = 1,400,000 psi

$c := 0.80$;c = 0.8 for sawn lumber

$Adjusted\_Fc_{para} := Fc_{para} \cdot C_D \cdot C_F \cdot C_M$;Adjusted_Fc(para) is also known as F*c from NDS 2015 reference. Mathcad cannot show the asterisk in "F*c".

$Adjusted\_Fc_{para} = 1189.7 \cdot psi$

$CoV_E := 0.25$;Coefficient of variation of E, CoV(E) = 0.25 for sawn lumber, 0.10 for glue lam lumber per NDS 2015 Appendix F.2.

$$E_{min} := 1.03 \times E \times \frac{\left(1 - 1.645 \times CoV_E\right)}{1.66}$$

$E_{min} = 511432.2 \times psi$

;Equation D-4 in NDS 2015. Determine reference modulus of elasticity where:
E = Modulus of Elasticity
1.03 = adjustment factor to convert E to pure bending basis.
Use 1.05 for structural glued laminated timber.
1.66 = factor of safety
CoV(E) = cofficient of varation in modulus of elasticity defined in NDS 2015 Appendix F.2.
Emin represents an approx 5% lower exclusion value on pure bending MOE, plus a factor of safety of 1.66.

$$F_{cE} := \frac{\left(0.822 \times E_{min}\right)}{\left(\frac{l_e}{d}\right)^2} \qquad F_{cE} = 1766 \times psi$$

;Equation H-2 in NDS 2015: The 0.822 factor in Equation H-2 represents the Euler buckling coefficient for rectangular columns calulated as $p^2/12$. MOE for beam and column stability Emin in H-2 represents an approximate 5% lower exclusion value on pure bending MOE, plus a 1.66 factor of safety (See NDS 2015 D.4.)

We effectively removed the 1.66 factor of safety from Equation H-2 by dividing Emin by 1.66 used in Equation D-4 above.

The maximum design value Fc in psi of cross-sectional area of individual members of columns shall be determined in accordance with the following formula. (Taken from 2015 NDS Equation 3.7-1).

$$F_c := Adjusted\_Fc_{para} \times \left[\frac{\left[1 + \left(\frac{F_{cE}}{Adjusted\_Fc_{para}}\right)\right]}{2 \times c} - \sqrt{\left[\frac{\left[1 + \left(\frac{F_{cE}}{Adjusted\_Fc_{para}}\right)\right]}{2 \times c}\right]^2 - \left(\frac{\frac{F_{cE}}{Adjusted\_Fc_{para}}}{c}\right)}\right]$$

$F_c = 960.6 \times psi$

The vertical capacity of this column if design value Fc multiplied by the bearing area of the stud, in this case a 2x4:

$d = 3.5 \times in \qquad t = 1.5 \times in$

$StudVerticalCapacity := d \times t \times F_c$

$StudVerticalCapacity = 5043 \times lbf$

$StudBearingCapacity = 3281 \times lbf$;From above bearing calculations, based on DF at Fc(perp)=625 psi.

The allowable stud capacity should be the <u>lower</u> value between Vertical Capacity and Bearing Capacity:

$$AllowStudCapacity := if(StudBearingCapacity > StudVerticalCapacity, StudVerticalCapacity, StudBearingCapacity)$$

;The above formula is a conditional statement inherent to Mathcad to use the lower capacity as the final value.

$AllowStudCapacity = 3281 \times lbf$

Calculate Shear Value of 10d nail assuming 1/2" Plywood:

$Z := 70lbf$;Box Nail Shear Design values from 2015 NDS Table 11Q (attached at end of calc) using 1/2" side member thickness 10d nails (x 3 inches nail length) and Douglas Fir Larch lumber.

$C_{di} := 1.1$;Cdi is 1.1 for diaphragm nailing.

$Z_{nail} := Z \cdot C_{D\_Nails} \cdot C_M \cdot C_t \cdot C_\Delta \cdot C_{eg} \cdot C_{di} \cdot C_{tn}$;Incorporate all adjustment factors including C(D_Nails) = 1.60

$Z_{nail} = 123.2 \cdot lbf$

Calculate Plywood Side Nailing Capacity based on 4"o.c. and 6'-0" trimmer stud length:

$StudHeight := 4.5ft$

$NailRowSeperationOC := 4.0in$

$$NumberNailsPerStud := \left(\frac{StudHeight \cdot 12\frac{in}{ft}}{NailRowSeperationOC}\right) - 1$$

$NumberNailsPerStud = 12.5$

$NumberStuds := 4$

$TotalPlywoodNailCapacity := NumberNailsPerStud \cdot NumberStuds \cdot Z_{nail}$

$TotalPlywoodNailCapacity = 6160 \cdot lbf$

$TotalNailCapacity := TotalPlywoodNailCapacity + TotalFaceNailCapacity$; See Page 2 for Face Nail Calc...

$TotalNailCapacity = 13600 \cdot lbf$

Nailing Capacity Summary: The above calculation is based on the trimmer stud height used and the spacing between rows of nails. Note that the Earthbound System does require 4" o.c. sheathing nailing on all trimmer members and 4" o.c. face nailing of the outermost trimmer to the full height stud members.

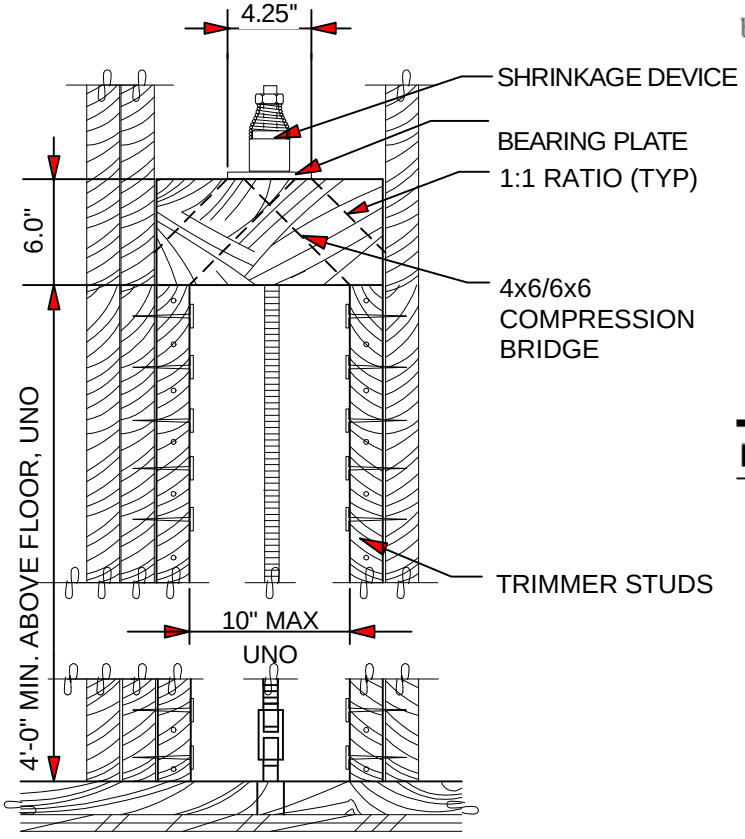
Calculation Summary:

For a given bearing load underneath the take up device, the required amount of cripple studs under the bridge is an even number of multiples of the above Allowable Stud Capacity. We use even numbers to balance the supporting under the 4x6 or 6x6 bridge.

This bearing load may be greater that the actual uplift load required for the top floor due to assignment of loads upward in the building using the threaded rod system. The face nailing portion of the cripple studs need to exist to transfer shear load that occurs above the bridge back underneath the bridge and into the threaded rod. The loads required for panel nailing calculations will be the uplift load for that floor only. The additional studs required are to take up the bearing loads from loads transferred from below.

Examine Shear at Bridge:

The figure at the left shows a worst case scenario of a bridge trimmer with our smallest plate (Part "P8" 3 1/4 x 4 1/4 x 3/8) and only two (2) trimmers total. By inspection we are within a 1:1 requirement per 2015 NDS 3.4.3 to ignore shear force. If the load under the shrinkage device exceeds 8,000 lbs, a larger bearing plate will used. Depending on the lumber species (Hem vs Doug Fir) of the trimmers and floor plates, we would also increase the number of trimmer members under the bridge.



3.4.3 Shear Design

3.4.3.1 When calculating the shear force, V, in bending members:

(a) For beams supported by full bearing on one surface and loads applied to the opposite surface, uniformly distributed loads within a distance from supports equal to the depth of the bending member, d, shall be permitted to be ignored. For beams supported by full bearing on one surface and loads applied to the opposite surface, concentrated loads within a distance, d, from supports shall be permitted to be multiplied by x/d where x is the distance from the beam support face to the load (see Figure 3C).

GENERAL NOTES, unless otherwise noted:
1. This design is based only upon the parameters shown and is for an individual building component. Applicability of design parameters and proper incorporation of component is the responsibility of the building designer.
2. Design assumes the top and bottom chords to be laterally braced at 2' o.c. and at 10' o.c. respectively unless braced throughout their length by continuous sheathing such as plywood sheathing(TC) and/or drywall(BC).
3. 2x Impact bridging or lateral bracing required where shown + +
4. Installation of truss is the responsibility of the respective contractor.
5. Design assumes trusses are to be used in a non-corrosive environment, and are for "dry condition" of use.
6. Design assumes full bearing at all supports shown. Shim or wedge if necessary.
7. Design assumes adequate drainage is provided.
8. Plates shall be located on both faces of truss, and placed so their center lines coincide with joint center lines.
9. Digits indicate size of plate in inches.

3M™ Fire Barrier Duct Wrap 615+
Product Data Sheet and Installation Guide

1. Product Description

3M™ Fire Barrier Duct Wrap 615+ is a flexible fire-resistant wrap consisting of an inorganic fiber blanket encapsulated with a scrim-reinforced foil. The product is 1-1/2" thick, 6 pcf density.[1] It is used to fire rate commercial kitchen grease ducts as well as ventilation ducts. 3M™ Fire Barrier Duct Wrap 615+ is a proven alternative to 1- or 2-hour fire-resistant rated shaft enclosures for grease ducts (ICC-ES ESR-1255). With its excellent insulating capabilities, low weight and thin profile, it is an ideal choice for a duct enclosure system. This non-asbestos[2] wrap installs easily due to its high flexibility and strength.

[1] In accordance with the tolerances in ASTM C 892 Standard Specification for High-Temperature Fiber Blanket Thermal Insulation.
[2] These fibers are not biopersistent and are therefore non-carcinogenic per Note Q of EU Directive 67/548/EEC (guideline 97/69/EG).

2. Applications

3M™ Fire Barrier Duct Wrap 615+ is an ideal fire resistive enclosure for commercial kitchen grease ducts and ventilation air ducts. It is a proven alternative to a 1- or 2-hour fire-resistant rated shaft enclosures for grease ducts and provides zero clearance to combustible construction throughout the entire enclosure system (per ICC-ES ESR-1255). 3M™ Fire Barrier Water Tight Sealant 1000 NS, 3M™ Fire Barrier Water Tight Sealant 1003 SL or 3M™ Fire Barrier Silicone Sealant 2000+ is used in combination with 3M™ Fire Barrier Duct Wrap 615+ to firestop the duct when the duct penetrates fire-rated floor or wall assemblies. 3M™ Fire Barrier Duct Wrap 615+ also provides a firestop solution where a T-rating is required for penetrations located outside wall cavities or outside fire-resistance rated shaft enclosures.

Two-layer grease duct applications: 3M™ Fire Barrier Duct Wrap 615+ meets the criteria of ASTM E 2336 Standard Test Methods for Fire Resistive Grease Duct Enclosure Systems.

Single-layer ventilation duct applications: 3M™ Fire Barrier Duct Wrap 615+ has passed ISO 6944-1985 Fire Resistance Tests – Ventilation Ducts.

T-rating for metallic through-penetrating items: 3M™ Fire Barrier Duct Wrap 615+ is used in conjunction with 3M Fire Barrier sealants to achieve up to 2-hour equal F & T-ratings in ASTM E 814 (UL 1479) tested through-penetrations.

(2) PIPING INSULATION EXPOSED TO WEATHER SHALL BE PROTECTED FROM DAMAGE. CONTRACTOR SHALL PROVIDE SHIELDING FROM SOLAR RADIATION THAT CAN CAUSE DEGRADATION OF THE MATERIAL. ADHESIVE TAPE SHALL NOT BE PERMITTED.

(3) PER 2015 WSEC SECTION R403.5.3 (RESIDENTIAL-PERSPECTIVE) INSULATION FOR HOT WATER PIPE SHALL HAVE A MINIMUM R-VALE OF R-3.

(4) PER 2015 WSEC SECTION C404.6 (NON-RESIDENTIAL):
(4.1) PIPING FROM WATER HEATER TO THE TERMINATION OF HEATED WATER SUPPLY PIPE SHALL BE INSULATED IN ACCORDANCE WITH TABLE C403.2.9.
(4.2) ON BOTH THE INLET AND OUTLET PIPING OF A STORAGE HOT WATER HEATER, THE FIRST 8 FEET OF PIPING OR PIPING FROM WATER HEATER TO HEAT TRAP SHALL BE INSULATED.
(4.3) HEAT TRACED PIPING SHALL BE INSULATED IN THE SAME MANNER AS NOT HEAT TRACED PIPING OR PER HEAT TRACE MANUFACTURER SPEC.
(4.4) TUBULAR PIPING INSULATION SHALL NOT BE REQUIRED FOR THE FOLLOWING:
A. TUBING FROM FROM THE CONNECTION AT THE TERMINATION OF THE FIXTURE PIPING TO A PLUMBING FIXTURE SUPPLY PIPING TO A PLUMBING FIXTURE.
B. VALVES, PUMPS, STRAINERS AND THREADED UNIONS IN PIPING THAT IS 1 INCH OR LESS.
C. PIPING FROM USER CONTROLLED SHOWER AND BATH MIXING VALVES TO THE WATER OUTLET.
D. COLD WATER PIPING OF A DEMAND RETICULATION WATER SYSTEM
E. TUBING FROM A HOT DRINKING WATER UNIT TO THE WATER OUTLET.
F. PIPING AT LOCATION WHERE A VERTICAL SUPPORT OF PIPING IS INSTALLED.
G. PIPING SURROUNDED BY BUILDING INSULATION WITH R-VALUE OF NOT LESS THAT R-3.

(5) PER 2015 WSPC, SECTION 312.6 NO WATER, SOIL OR WASTE PIPE SHALL BE INSTALLED OR PERMITTED OUTSIDE OF THE BUILDING, IN ATTIC OR IN AN EXTERIOR WALL UNLESS ADEQUATE PROVISION IS MADE TO PROTECT SUCH PIPE FROM FREEZING. ALL HOT AND COLD WATER PIPES OUTSIDE THE CONDITIONED SPACE SHALL BE INSULATED TO MINIMUM R-3.

(6) HEAT TRACING SHALL BE PROVIDED FOR COLD WATER AND IRRIGATION WATER IN UNCONDITIONED SPACES. REFER TO HEAT TRACING SCHEDULE FOR DETAIL. CONTACT ENGINEERING IF NECESSARY. PER 2015 WSEC SECTION C403.2.4.6 FREEZE PROTECTION SYSTEMS, SUCH AS HEAT TRACING OF OUTDOOR PIPING SHALL INCLUDE AUTOMATIC CONTROLS CONFIGURED TO SHUT OFF THE SYSTEM WHEN OUTDOOR AIR TEMPERATURES ARE ABOVE 40°F.

(7) PER 2015 WSEC TABLE C403.2.9 (FOR NON-RESIDENTIAL) INSULATION FOR HOT WATER AND HOT WATER RETICULATION SHALL HAVE CONDUCTIVITY OF 0.21-0.28 (BTU.IN/H.FT².°F) AT OPERATING TEMPERATURE.

(8) INSULATION R-VALUE SHALL MEET MINIMUM REQUIREMENT. THICKNESS IS BASED ON GRAINGER SAMPLE DATA FOR K-FLEX(PVC/NBR) AND OWENS CORNING(FIBER GLASS).

(9) REQUIRED BY ENGINEERING BASED ON BEST PRACTICE.

(10) INSULATION IS NOT REQUIRED ON PLASTIC PIPING.
