Re: 2007 Groundwater Monitoring Reports, North and South Woodwaste Landfills  
J.H. Baxter & Co., Arlington, Washington

Dear Mr. Jorgenson:

On behalf of J.H. Baxter & Co. (Baxter), please find enclosed copies of the *2007 Groundwater Monitoring Report – North Woodwaste Landfill* and the *2006 Groundwater Monitoring Report – South Woodwaste Landfill* for Baxter's two closed woodwaste landfills in Arlington, Washington. These reports are being submitted to you in accordance with Washington Administrative Code (WAC) 173-304-490. A copy has also been sent directly to the Washington Department of Ecology.

If you have any questions or comments regarding these reports, please do not hesitate to contact me at (503) 241-8172 (ext 201).

Sincerely,

  
J. Stephen Barnett, L.H.G.  
Senior Hydrogeologist

## 2007 Groundwater Monitoring Report Arlington, Washington

May 2008

The J. H. Baxter & Co. (Baxter) Project Team (Baxter and Premier Environmental Services, Inc.) is submitting this Groundwater Monitoring Report for Baxter's South Woodwaste Landfill in Arlington, Washington. This report was prepared by or performed under the direction of a State of Washington Licensed Hydrogeologist. If you have any questions or comments concerning the report, please contact the individuals listed below.

## 1 Introduction

---

This report presents quarterly groundwater data collected from February to October 2007 for the J. H. Baxter & Company's (Baxter) closed South Woodwaste Landfill (South Landfill), located at 6520 188th Street NE in the City of Arlington, Snohomish County, Washington (Figure 1). The South Landfill is closed and covered with a vegetated soil cap.

Groundwater sampling was performed on monitoring wells BXS-1, BXS-2, BXS-3, and BXS-4 during quarterly monitoring events conducted in February, April, July, and October 2007. Field measurements were taken for pH, conductivity, temperature, redox potential (Eh), and dissolved oxygen. In addition, methane measurements were collected in July and October 2007. Field measurement data are summarized in Table 3a.

Groundwater samples were submitted for laboratory analysis of pH, conductivity, ammonia as nitrogen, chemical oxygen demand (COD), chloride, nitrite plus nitrate as nitrogen, total dissolved solids (TDS), sulfate, tannin and lignin, total organic carbon (TOC), total Coliform, and dissolved metals (arsenic, barium, cadmium, copper, iron, manganese, nickel, and zinc). Laboratory results are presented in Tables 3b and 3c.

All of the monitoring wells were installed in 1988. Monitoring wells BXS-1, BXS-2, and BXS-3 are located hydraulically downgradient of the South Landfill. Monitoring well BXS-4 is located hydraulically upgradient of the South Landfill (Figure 2). Monitoring well BXS-4 is the source of background groundwater analytical data to which the analytical data from the downgradient wells are compared. Boring logs, groundwater monitoring procedures, and a summary of site conditions encountered during the

2007 Groundwater Monitoring Report  
South Woodwaste Landfill  
May 2008

installation of the monitoring wells are included in the hydrogeologic report prepared by Sweet-Edwards/EMCON, Inc. (EMCON 1989) in 1989.

## 2 Hydrogeology

---

As discussed, quarterly groundwater monitoring events were performed during February, April, July, and October 2007 for the South Landfill. Monitoring activities included well purging, groundwater sampling, laboratory analysis, and water level measurement. Groundwater samples were collected from monitoring well locations BXS-1, BXS-2, BXS-3, and BXS-4 during each quarterly sampling event.

### 2.1 *Groundwater Elevations*

Groundwater levels were measured in each well during each of the four monitoring events. The elevation of the groundwater surface was calculated relative to the Baxter plant datum by subtracting the depth to water from the surveyed top of casing elevation. Measured groundwater levels throughout the 2007 monitoring period are summarized in Table 1.

Groundwater elevations were highest during the April event, with the exception of BXS-4, which was highest in February. Groundwater elevations were lowest during the October event. The static groundwater level in wells BXS-1, BXS-2, BXS-3, and BXS-4 fluctuated throughout the year by 4.52 feet, 5.04 feet, 5.70 feet, and 5.93 feet, respectively. Groundwater surface elevations measured in February 2007 (Figure 2) and the October 2007 (Figure 3) are provided for reference.

The groundwater flow direction throughout the year was toward the northwest and is consistent with the regional groundwater flow in the aquifer (Figure 4). The average gradient varied between 0.018 and 0.021 during 2007 (Table 2).

## 2.2 *Groundwater Velocities*

Groundwater velocities ( $v_x$ ) for each monitoring event were estimated using Darcy's Law.

$$v_x = -K i / n_e$$

Hydraulic conductivity ( $K$ ) in the fine sand unit beneath the landfill was estimated at  $3 \times 10^{-2}$  to  $6 \times 10^{-2}$  centimeters per second (cm/sec) based on slug tests performed in BXS-2 and BXS-4 (EMCON 1989). Porosity ( $n_e$ ) was assumed to be 0.300 (i.e., 30%).

The average gradient ( $i$ ) ranged from 0.018 to 0.021, resulting in velocity estimates of 5.102 to 11.962 ft/day. Table 2 shows the calculated hydraulic gradients and groundwater velocities during the monitoring events in 2007.

## 3 Groundwater Quality

---

Groundwater samples were collected on February 1<sup>st</sup> for the first quarter, April 16<sup>th</sup> for the second quarter, July 16<sup>th</sup> for the third quarter, and October 8<sup>th</sup> for the fourth quarter of 2007 using sampling procedures originally described in Appendix C of EMCN's Hydrogeologic Report (EMCN 1989). Field sampling records are located in Appendix A.

Samples for total Coliform analyses were submitted to Edge Analytical Laboratory in Burlington, Washington. Samples for pH, conductivity, ammonia as nitrogen, chemical oxygen demand (COD), chloride, nitrate + nitrite as nitrogen, total dissolved solids (TDS), sulfate, tannin and lignin, total organic carbon (TOC), and dissolved metals (arsenic, barium, cadmium, copper, iron, manganese, nickel and zinc) were submitted to Columbia Analytical Services, Inc. (CAS) in Kelso, Washington. Groundwater levels were measured in each well prior to purging.

### ***3.1 Groundwater Sampling***

Groundwater sampling was performed using dedicated submersible pumps (bladder pumps) in the downgradient wells BXS-1, BXS-2, and BXS-3. Well BXS-4, the upgradient well, was sampled using a portable submersible (bladder) pump during the February and April events. A dedicated submersible pump (bladder pump) was installed in well BXS-4 prior to the July sampling event.

A field duplicate, labeled BXS-6, was collected from well BXS-1 or BXS-4 during each sampling event. Additionally, a field blank of deionized water, labeled BXS-5, was collected during the February and April sampling events.

Prior to sample collection, field measurements were taken for pH, conductivity, temperature, redox potential (Eh), and dissolved oxygen. In addition, the well headspace was tested for methane during the July and October 2007 events. Field measurement data are summarized in Table 3a.

Groundwater samples were submitted for laboratory analysis of pH, conductivity, ammonia as nitrogen, COD, chloride, nitrite plus nitrate as nitrogen, TDS, sulfate, tannin and lignin, TOC, total Coliform, and dissolved metals (arsenic, barium, cadmium, copper, iron, manganese, nickel, and zinc).

The analytical data for the groundwater samples are summarized in Tables 3a, 3b, and 3c. Laboratory analytical reports and chain-of-custody forms for the 2007 groundwater monitoring events are presented in Appendix B.

## 4 Data Review

---

This section describes the data review process that was performed to evaluate the adequacy and quality of the analytical data from the 2007 groundwater monitoring events. The objective of the data review was to identify estimated, unreliable, or invalid measurements. Information on the reliability of the data is critical to the interpretation of the results. The review was performed according to guidelines prepared by the United States Environmental Protection Agency (EPA) (EPA 1994).

### ***4.1 Field Quality Assurance/Quality Control (QA/QC)***

During the quarterly groundwater sampling events, field duplicates were prepared and containerized by Baxter field personnel in accordance with standard practice. Field blanks of deionized water were prepared during the February and April events. The field duplicate samples were collected from well BXS-1 or BXS-4 and labeled BXS-6. The field blank samples were labeled BXS-5.

Field duplicate results aid in the assessment of sampling and analytical precision. Analytical results for the original and duplicate samples collected from each sampling event were evaluated using the relative percent difference (RPD). RPD is the difference between the two results divided by the mean and expressed as a percent. The RPD between the two results was calculated when both the natural sample and duplicate sample had positive results. If the RPD was greater than 35 percent, the reported values are considered estimated concentrations.

The precision of the field duplicate samples collected in 2007 is acceptable, with the following two exceptions.

- The precision of the February and April 2007 nitrate plus nitrite as nitrogen results for BXS-4 and the field duplicate are poor. The RPD values are 70 and 136, respectively.

Field blank (deionized water blanks) results aid in evaluating the validity of the reported concentrations in the collected samples. All results greater than or equal to the method detection limit (MDL) but less than five times the concentration of the associated field blank are considered nondetected.

The field blanks are free of target analytes above the MDLs with the following exceptions. Chloride, nitrate plus nitrite as nitrogen, sulfate, and tannin and lignin were detected at low levels in one or more field blank. The field blank concentrations are below the maximum contaminant level (MCL) or secondary maximum contaminant level (SMCL) and indicate that field and laboratory contamination was minimal.

#### **4.2 Laboratory QA/QC**

Collected groundwater samples were received by the laboratory with the proper chain-of-custody (COC) documentation, were properly preserved, and at the proper temperature. Samples for total Coliform were analyzed by Edge Analytical, located in Burlington Washington. The remaining analyses were performed by Columbia Analytical Services (CAS), located in Kelso, Washington.

With the exception of pH, all analyses were performed within the required holding time for the parameters of interest. The samples were analyzed for pH between one and four days after collection.

The method used for pH analysis, Standard Methods 4500-H+ B (APHA 1998), does not list an analysis holding time. The USEPA method for pH analysis of water samples, Method 150.1 (USEPA 1999), specifies that pH analyses be performed “as soon as possible preferably in the field at the time of sampling”. For that reason, the field analyzed pH results are utilized for trend analysis and statistical evaluation.

The laboratory reports are complete and contain results for all samples and corresponding analyses requested on the COC forms.

#### **4.3 Statistical Analysis of Data**

Groundwater sample chemical analysis results were statistically evaluated to assess if there was a significant difference between the downgradient wells and the upgradient background well. The following approach was used for performing the statistical analysis:

- **Non-Detects.** Non-detect results were replaced with a value of half of the laboratory method reporting limit (MRL).
- **Data Distribution.** A key assumption of Student's t-test was that the data are normally distributed.
- **Parametric hypothesis testing.** Parametric hypothesis testing was performed using Student's t-test for all parameters in both the upgradient and downgradient wells. For each comparison the null hypothesis was that there was no difference between the downgradient and upgradient concentrations. The null hypothesis was tested using a two-tailed test at a significance level of 0.025. The t-test statistic ( $t_{stat}$ ) was calculated from the average and variance of quarterly sampling results in a downgradient well and the upgradient well. Each quarterly sample

was compared to the previous three quarterly samples to provide a four sample running average. The average concentration in the downgradient well was significantly higher than the upgradient well if  $t_{stat}$  was greater than the critical test statistic ( $t_c$ ). The critical test statistic was computed using the percent point function. The percent point function (ppf) is the inverse of the cumulative distribution function.

Statistically significant detections above background well (BXS-4) concentrations are shown in **bold** in the tables presented in Appendix C. Statistically significant detections below background concentrations are shown in ***bold italics*** in the tables presented in Appendix C.

## 5 Discussion of Results

---

### 5.1 Statistical Results

Appendix C presents the results of the statistical analyses for each individual parameter tested in the groundwater samples from wells BXS-1 through BXS-4. These include average concentration, variance, standard deviation, and Student's t-test statistic. The parameters detected at statistically higher concentrations in specific downgradient wells compared to the upgradient well are listed below:

- Field conductivity, COD, chloride, TDS, TOC, and dissolved zinc for wells BXS-1, BXS-2, and BXS-3
- Tannin and lignin, dissolved barium, dissolved iron, and dissolved manganese for wells BXS-2 and BXS-3
- Nitrate plus nitrite as nitrogen and sulfate for well BXS-1
- Dissolved nickel for well BXS-2
- Ammonia and dissolved arsenic for well BXS-3. The dissolved arsenic concentrations in well BXS-3 were greater than background during the April, July, and October sampling events.

## **5.2 Concentration Trends over Time**

Figures 5 through 18 show the concentration trends from 2003 through 2007 for each parameter discussed below.

**Ammonia as Nitrogen** (Figure 5) – The samples collected from well BXS-3 during 2007 were higher than the concentrations in the background well. Ammonia concentrations in wells BXS-1, BXS-2, and BXS-4 have remained steady since 2003. Ammonia concentrations in well BXS-3 increased in 2007.

**Arsenic** (Figure 6) – Dissolved arsenic concentrations in well BXS-3 were above background levels during the 2007 sampling events. Concentrations of arsenic in wells BXS-1, BXS-2, and BXS-4 have been relatively stable during the last four years.

**Barium** (Figure 7) – Concentrations of dissolved barium in downgradient wells BXS-2 and BXS-3 were higher than the concentrations in the background well BXS-4 in all sampling events. The concentrations of barium in the most downgradient well, BXS-1, were below the corresponding concentrations in the background well. Concentrations of barium have been stable in all four wells during the last three years.

**Chemical Oxygen Demand (COD)** (Figure 8) – The COD concentrations in the downgradient wells were higher than the corresponding COD concentrations in the background well, BXS-4. COD concentrations have been relatively stable in wells BXS-1, BXS-2, and BXS-4 over the last two years.

**Chloride** (see Figure 9) – The concentrations of chloride in down gradient wells BXS-1, BXS-2, and BXS-3 for all sampling events were greater than the corresponding concentrations in the background well, BXS-4. Concentrations of chloride have been relatively stable over the last three years.

**Conductivity (Field)** (Figure 10) – Field conductivity measurements of the groundwater samples from all of the downgradient wells were greater than the conductivity of the background well for all four sampling events. Conductivity of the groundwater in wells BXS-2 and BXS-3 appears to be exhibiting a seasonal pattern with low values during winter/spring and high values in summer/fall. Conductivity values have been stable over the last two years.

**Iron** (Figure 11) – Dissolved iron concentrations in well BXS-3 exhibit a temporal distribution that appears to be seasonal with the lowest concentrations in fall/winter and the highest concentrations in spring/summer. The high concentration in well BXS-3 occurred in February 2007 and was greater than previous high concentrations. Concentrations of iron in groundwater samples collected from wells BXS-1, BXS-2, and BXS-4 have remained stable over the last four years.

**Manganese** (Figure 12) – The concentrations of dissolved manganese in the downgradient wells BXS-2 and BXS-3 were higher than the corresponding levels in the background well. Concentrations for well BXS-1 were below the background well concentration in February and greater than the corresponding background concentration in April, July, and October. Manganese concentrations have been relatively stable over the last four years.

**Nickel** (Figure 13) – Dissolved nickel was not detected in upgradient well BXS-4 during 2007 (Figure 13 values are one-half the reporting limit). Dissolved nickel was detected at low concentrations in wells BXS-1 and BXS-2 and at slightly higher concentrations in well BXS-3 during 2007. Dissolved nickel concentrations have been relatively stable for the last two years.

**Sulfate** (Figure 14) – During all four sampling events the sulfate concentrations in downgradient well BXS-1 were greater than corresponding background well concentrations. The sulfate concentrations in wells BXS-2 and BXS-3 were lower than

the concentrations in the background well. The concentration of sulfate in all the wells has remained relatively stable over the last two years.

**Tannin and Lignin** (Figure 15) – Concentrations of tannin and lignin detected in wells BXS-2 and BXS-3 for all four sampling events were greater than the corresponding concentrations in the background well. Tannin and lignin concentrations in well BXS-1 were lower than or equal to the corresponding background well concentration during 2007. Tannin and lignin levels in wells BXS-1, BXS-2, and BXS-4 have remained stable for the last three years. The tannin and lignin concentration of well BXS-3 varies, but remains within historical levels.

**Total Organic Carbon (TOC)** (Figure 16) – Concentrations of TOC in the groundwater samples collected from the downgradient wells were greater than the TOC detected in background well BXS-4. Concentrations of TOC in wells BXS-1, BXS-2, and BXS-4 have remained relatively stable over the last four years. TOC detected in well BXS-3 has been stable over the last two years.

**Field pH** (Figure 17) – Field pH measurements in all of the downgradient wells were statistically equivalent to or less than the background well with results ranging from 6.02 to 7.12 standard pH units. The pH of well BXS-4 varies widely with a historic high value of 8.6 pH units in February 2007.

**Total Dissolved Solids (TDS)** (Figure 18) – TDS measured in the downgradient wells were higher than the TDS in the background well for all 2007 sampling events. TDS levels have remained fairly stable for the last four years, with the exception of the low value observed in September 2006 for well BXS-3.

**Methane** – The headspace of each well was tested for methane during the July and October 2007 sampling events. Methane was not detected in any of the monitoring wells during 2007.

## **5.3 Comparison to Standards**

MCLs for groundwater are established in WAC 173-304-9901 as equal to the primary drinking water standards set forth in WAC 246-290-310. MCLs are the maximum permissible concentration of a contaminant in drinking water supplies, whereas SMCLs are guidelines related to criteria other than adverse health effects. MCLs and SMCLs are listed in Table 3a, 3b, and 3c and are shown on the time series plots on Figures 5 through 18 for reference.

### **5.3.1 Comparison to MCLs**

Of the monitored parameters, MCLs apply to arsenic, barium, cadmium, copper, nickel, and nitrate plus nitrite as nitrogen. The concentrations in all of the groundwater samples were lower than the MCLs for barium, cadmium, copper, nickel, and nitrate plus nitrite as nitrogen during the 2006 monitoring events. The dissolved arsenic concentrations in well BXS-3 during all four 2007 events were greater than the MCL of 10 µg/L. The arsenic concentrations ranged from 67.2 to 145 µg/L.

The MCL for total Coliform is a drinking water criteria used to alert treatment system operators of potential bacterial contamination. This criterion does not apply to groundwater and the MCL is provided for informational purposes only. The high level of total Coliform found in monitoring well BXS-2 during the July 2007 sampling event is assumed to be an isolated instance until further data is collected in 2008.

### 5.3.2 Comparison to SMCLs

Among the monitored parameters, SMCLs apply to pH, conductivity, chloride, TDS, sulfate, iron, manganese, and zinc. The data from the 2007 monitoring events indicated that the groundwater concentrations from all the monitoring wells were lower than the SMCLs for chloride, sulfate, and zinc. Samples exceeded the SMCLs for conductivity, TDS, dissolved iron, and dissolved manganese, and several samples were above the SMCL for pH, as described below:

**Field Conductivity** values were higher than the SMCL of 700 µS/cm for groundwater collected from wells BXS-2 and BXS-3, with values ranging from 730 to 922 µS/cm. Conductivity measurements were below the SMCL in the background well BXS-4 and in the most downgradient well BXS-1.

**Laboratory Conductivity** values for well BXS-2 were higher than the SMCL of 700 µmhos/cm, with values ranging from 743 to 814 µmhos/cm. Conductivity values for the background well BXS-4 and down gradient wells BXS-1 and BXS-3 were below the SMCL during 2007.

**TDS** levels were slightly higher than the SMCL of 500 mg/L in well BXS-3 during the February event. The BXS-3 concentration was 522 mg/L. TDS in down gradient wells BXS-1 and BXS-2 and upgradient well BXS-4 were below the SMCL.

**Dissolved iron** concentrations detected in groundwater samples from wells BXS-2 and BXS-3 were higher than the SMCL of 300 µg/L. Dissolved iron detected in BXS-2 ranged from 656 to 846 µg/L and ranged from 62,700 to 110,000 µg/L in BXS-3. The dissolved iron concentrations in the wells BXS-1 and BXS-4 were below the SMCL.

**Dissolved manganese** concentrations detected in all four wells exceeded the 50 µg/L SMCL during the 2007 monitoring period. Concentrations detected in well BXS-3 were the highest, averaging 13,925 µg/L and concentrations in down gradient well BXS-4 were the lowest, averaging 114 µg/L.

**Field pH** measurements were outside the SMCL range of 6.5 to 8.5 standard pH units for at least one event for each well during the 2007 monitoring period. Field pH values were below the SMCL for well BXS-1 during the April, July, and October events, well BXS-2 during April and October, and well BXS-3 during the October event. The field pH value was above the SMCL for well BXS-4 during the February event.

**Laboratory pH** measurements were below the SMCL range of 6.5 to 8.5 standard pH units for wells BXS-1, BXS-2, and BXS-3 during at least one 2007 monitoring event. Laboratory pH values were below the SMCL for wells BXS-1 and BXS-3 during all four events, and BXS-2 during February, April and October. Laboratory pH values were consistently within the SMCL range for upgradient well BXS-4.

## 6 Summary

---

Quarterly groundwater monitoring samples were collected from one upgradient well and three downgradient wells during 2007 at the J.H. Baxter South Woodwaste Landfill. The samples were analyzed for eleven groundwater quality parameters, eight dissolved metals, and vapor phase methane.

Groundwater samples collected during the 2007 monitoring events did not exceed the MCLs for any of the monitored parameters, with the exception of arsenic. Dissolved arsenic concentrations in well BXS-3 exceeded the MCL during all four sampling events. The statistical analysis of dissolved arsenic concentrations in well BXS-3 indicates that concentrations in April, July, and October are statistically greater than background.

There were no exceedances of the SMCLs for chloride, sulfate, or dissolved zinc in the groundwater samples collected during the quarterly groundwater monitoring events. The parameters that exceeded the SMCLs in the groundwater samples collected during the 2007 monitoring events include field and laboratory conductivity, field and laboratory pH, TDS, dissolved iron, and dissolved manganese. These exceedances are discussed below.

**Field Conductivity** – Field conductivity measurements exceeded the SMCL in well BXS-3 during all 2007 monitoring events and in well BXS-2 during events in April, July, and October. The statistical evaluation indicated that all measured conductivity values in the downgradient wells are statistically greater than background. Field conductivity in the farthest downgradient well BXS-1 was below the SMCL during 2007. Field conductivity has remained stable over the last three years.

**Laboratory Conductivity** – Laboratory conductivity measurements exceeded the SMCL in well BXS-2 during all 2007 events. Laboratory conductivity measurements have remained fairly stable for the last four years.

**Field pH** – Field pH values were below the lower SMCL for the April, July, and October quarterly measurements in well BXS-1, during the April and October events for well BXS-2, and during the October event for well BXS-3. The field pH value of well BXS-4 exceeded the SMCL during the February event. None of the pH values were found to be statistically greater than background.

**Laboratory pH** – Laboratory pH values were below the lower SMCL for all three downgradient wells during all four sampling events, with one exception. The pH value measured in well BXS-2 during July 2007 was with the SMCL range. Laboratory pH values have been relatively stable since 2003.

**TDS** – TDS exceeded the SMCL in well BXS-3 during February 2007. All TDS concentrations in the downgradient wells were determined to be statistically greater than background. TDS concentrations in wells BXS-1 and BXS-4 have remained stable while concentrations in wells BXS-2 and BXS-3 have remained stable or decreased slightly.

**Dissolved Iron** – The iron SMCL was exceeded in wells BXS-2 and BXS-3 during all quarterly sampling events of 2007. Dissolved iron concentrations in wells BXS-2 and BXS-3 were statistically greater than background. Dissolved iron concentrations in wells BXS-1, BXS-2, and BXS-4 have been stable for the last five years. The dissolved iron concentration in well BXS-3 appears to have increased over the last five years.

**Dissolved Manganese** – Dissolved manganese concentrations in the upgradient and downgradient wells exceeded the SMCL during quarterly monitoring in 2007. Dissolved manganese levels in wells BXS-2 and BXS-3 during all four events were statistically

greater than background. Dissolved manganese levels have remained stable for the last four years.

For parameters without MCLs or SMCLs, the statistical evaluation of groundwater results for the three downgradient wells indicated that the following parameter concentrations are statistically greater than the background concentrations.

**COD** – COD levels in the downgradient wells BXS-2 and BXS-3 were statistically greater than background during 2007. COD levels in well BXS-1 were statistically above background during the February and April events. COD levels in well BXS-1 and BXS-2 have remained stable, while COD levels in well BXS-3 appear to be slowly increasing.

**Chloride** – Chloride concentrations in all three downgradient wells during all of 2007 were statistically greater than background. Chloride levels have been stable for three years.

**Nitrate plus nitrite as nitrogen** – Nitrate plus nitrite concentrations in well BXS-1 were statistically greater than background during 2007.

**Sulfate** – Sulfate concentrations in well BXS-1 were statistically greater than background during 2007. All sulfate concentrations were below the SMCL. Sulfate levels in wells BXS-1, BXS-2, and BXS-4 have remained stable for the last two years, while sulfate levels in well BXS-3 are very low or undetected.

**TOC** – TOC levels were statistically greater than background for the downgradient wells during all 2007 sampling events. TOC levels in wells BXS-1 and BXS-2 have been stable since 2002. TOC levels in well BXS-3 have increased slightly since 2004.

**Tannin and Lignin** – Tannin and Lignin concentrations in wells BXS-2 and BXS-3 were statistically greater than background during 2007. Tannin and lignin levels in wells BXS-1 and BXS-2 have been stable since 2002.

**Dissolved Barium** – Dissolved barium concentrations were statistically greater than background in wells BXS-2 and BXS-3 during 2007. Dissolved barium concentrations in all wells are below the MCL and have been stable since 2004.

**Dissolved Nickel** – Dissolved nickel levels in well BXS-2 for all monitoring events were statistically greater than background. Dissolved nickel was not detected in upgradient well BXS-4. Dissolved nickel concentrations were below the MCL.

Concentrations of two parameters in well BXS-3 were at historically high levels in February 2007. Dissolved arsenic and dissolved iron concentrations were at their highest since monitoring began.

- The high dissolved arsenic concentration observed in well BXS-3 in February was not statistically above background. The arsenic concentration remained above historic levels in April and July. The dissolved arsenic concentration in well BXS-3 appears to be increasing.
  
- The elevated dissolved iron concentration in well BXS-3 during February is part of a seasonal pattern with high values observed in spring/summer. The concentration of dissolved iron in well BXS-3 appears to be increasing.

The nature of elevated metals concentrations in BXS-3 will be further evaluated in 2008. The well will be redeveloped and data will be carefully reviewed to determine the need for further action, if needed.

## 7 Limitations

---

Work for this project was performed, and this report prepared, in accordance with generally accepted professional practices for the nature and conditions of the work completed in the same or similar localities, at the time the work was performed. It is intended for the exclusive use of J. H. Baxter & Co. for specific application to the referenced property. This report is not meant to represent a legal opinion. No other warranty, express or implied, is made.

Arlington, WA 98223

## RE: Arlington Landfill Wells/BXS-Wells-Landfill

Dear Mary:

Enclosed are the results of the sample(s) submitted to our laboratory on February 02, 2007. For your reference, these analyses have been assigned our service request number K0700844.

All analyses were performed according to our laboratory's quality assurance program. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3275. You may also contact me via Email at EErickson@kelso.caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

Elissa Erickson  
Project Chemist

EE/lmb

DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

### Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.

### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- B The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.
- \* The duplicate analysis not within control limits. See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.

### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a chromatographic interference.
- X See case narrative.

### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

## **Case Narrative**

COLUMBIA ANALYTICAL SERVICES, INC.

Client: JH Baxter  
Project: Arlington Landfill Wells  
Sample Matrix: Water

Service Request No.: K0700844  
Date Received: 2/2/07

**CASE NARRATIVE**

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

**Sample Receipt**

Six water samples were received for analysis at Columbia Analytical Services on 2/2/07. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

**General Chemistry Parameters**

**pH by EPA Method 150.1**

Samples were received past the recommended holding time. The analysis was performed as soon as possible after receipt by the laboratory.

No other anomalies associated with the analysis of these samples were observed.

**Dissolved Metals**

No anomalies associated with the analysis of these samples were observed.

Approved by Elissa Ein

Date 3-7-07

## CHAIN OF CUSTODY

1317 South 13th Ave. • Kelso, WA 98626 • (360) 577-7222 • (800) 695-7222x07 • FAX (360) 636-1068

SR#: 1010  
2 COC #

K6100844

## **REPORT REQUIREMENTS**

- I. Routine Report: Method Blank, Surrogate, as required
  - II. Report Dup., MS, MSD as required
  - III. Data Validation Report (includes all raw data)
  - IV. CLP Deliverable Report
  - V. EDD

**INVOICE INFORMATION**

P.O. 8

Bill To: JTH Bandit/12  
PO Box 10777  
Eugene, OR 97440

#### **TURNAROUND REQUIREMENTS**

24 hr.                          48 hr.

5 Day

Standard (10-15 working days)

Provide FAX Results

Requested Report Date

**Circle which metals are to be analyzed**

Cooler Receipt and Preservation Form

Project/Client JH Baxter

Service Request K07 00844

Cooler received on 2-2-07 and opened on 2-2-07 by BW

1. Were custody seals on outside of coolers?

If yes, how many and where? Front

Y  N

2. Were custody seals intact?

Y  N

3. Were signature and date present on the custody seals?

Y  N

4. Is the shipper's airbill available and filed? If no, record airbill number:

Greyhound  
enclosed

Y  N

5. COC#

Temperature of cooler(s) upon receipt: (°C)

1.9

3.1

\_\_\_\_\_

\_\_\_\_\_

Temperature Blank: (°C)

1.0

2.4

\_\_\_\_\_

\_\_\_\_\_

Were samples hand delivered on the same day as collection?

Y  N

6. Were custody papers properly filled out (ink, signed, etc.)?

Y  N

7. Type of packing material present foam insert, ice

8. Did all bottles arrive in good condition (unbroken)?

Y  N

9. Were all bottle labels complete (i.e analysis, preservation, etc.)?

Y  N

10. Did all bottle labels and tags agree with custody papers?

Y  N

11. Were the correct types of bottles used for the tests indicated?

Y  N

12. Were all of the preserved bottles received at the lab with the appropriate pH?

Y  N

13. Were VOA vials checked for absence of air bubbles, and if present, noted below?

Y  N

14. Were the 1631 Mercury bottles checked for absence of air bubbles, and if present, noted below?

Y  N

15. Did the bottles originate from CAS/K or a branch laboratory?

Y  N

16. Are CWA Microbiology samples received with >1/2 the 24hr. hold time remaining from collection?

Y  N

17. Was C12/Res negative?

Y  N

Explain any discrepancies:

Analytical Report for Service Request No: K0703368

Kathy Gunderson  
Premier Environmental Services  
981 State Street  
Raymond, WA 98577

**RE: Arlington Landfill Wells/BXS-Wells-Landfill**

Dear Kathy:

Enclosed are the results of the sample(s) submitted to our laboratory on April 23, 2007. For your reference, these analyses have been assigned our service request number K0703368.

All analyses were performed according to our laboratory's quality assurance program. Where applicable, the methods cited conform to the Methods Update Rule (effective 4/11/2007), which relates to the use of analytical methods for the drinking water and waste water programs. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3275. You may also contact me via Email at EErickson@kelso.caslab.com.

Respectfully submitted,

**Columbia Analytical Services, Inc.**

Elissa Erickson  
Project Chemist

EE/lmb

### Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

### Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.

### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- B The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.
- \* The duplicate analysis not within control limits. See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.

### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a chromatographic interference.
- X See case narrative.

### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

### Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.

### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- B The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.
- \* The duplicate analysis not within control limits. See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.

### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a chromatographic interference.
- X See case narrative.

### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

## **Case Narrative**

**00005**

COLUMBIA ANALYTICAL SERVICES, INC.

Client: JH Baxter & Company  
Project: Arlington Landfill Wells  
Sample Matrix: Water

Service Request No.: K0703368  
Date Received: 4/23/07

**CASE NARRATIVE**

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier III validation deliverables including summary forms and all of the associated raw data for each of the analyses. When appropriate to the method, method blank results have been reported with each analytical test.

**Sample Receipt**

Twelve water samples were received for analysis at Columbia Analytical Services on 4/23/07. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

**General Chemistry Parameters**

No anomalies associated with the analysis of these samples were observed.

**Dissolved Metals**

No anomalies associated with the analysis of these samples were observed.

Analytical Report for Service Request No: K0706283

Kathy Gunderson  
Premier Environmental Services  
981 State Street  
Raymond, WA 98577

**RE: Arlington Landfill Wells/Landfills**

Dear Kathy:

Enclosed are the results of the sample(s) submitted to our laboratory on July 19, 2007. For your reference, these analyses have been assigned our service request number K0706283.

All analyses were performed according to our laboratory's quality assurance program. Where applicable, the methods cited conform to the Methods Update Rule (effective 4/11/2007), which relates to the use of analytical methods for the drinking water and waste water programs. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3275. You may also contact me via Email at EErickson@kelso.caslab.com.

Respectfully submitted,

**Columbia Analytical Services, Inc.**

## Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

### Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.

### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- B The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.
- \* The duplicate analysis not within control limits. See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.

### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a chromatographic interference.
- X See case narrative.

### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

## **Case Narrative**

**00005**

COLUMBIA ANALYTICAL SERVICES, INC.

Client: JH Baxter & Company  
Project: Arlington Landfill Wells  
Sample Matrix: Water

Service Request No.: K0706283  
Date Received: 7/19/07

**CASE NARRATIVE**

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix/Duplicate Matrix Spike (MS/DMS), and Laboratory Control Sample (LCS).

**Sample Receipt**

Eleven water samples were received for analysis at Columbia Analytical Services on 7/19/07. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

**General Chemistry Parameters**

No anomalies associated with the analysis of these samples were observed.

**Total Metals**

**Matrix Spike Recovery Exceptions:**

The control criteria for matrix spike recovery of Manganese for sample BXN-2 is not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

No other anomalies associated with the analysis of these samples were observed.

Approved by EUS

- |  |                |                    |   |                                   |                |                    |            |                 |                       |           |
|--|----------------|--------------------|---|-----------------------------------|----------------|--------------------|------------|-----------------|-----------------------|-----------|
| 1. Samples were received via?  | <i>US Mail</i> | <i>Fed Ex</i>      | <i>UPS</i>                              | <i>DHL</i>                        | <i>GH</i>      | <i>GS</i>          | <i>PDX</i> | <i>Courier</i>  | <i>Hand Delivered</i> |           |
| 2. Samples were received in: (circle)  | <i>Cooler</i>  |                    |   |                                   |                |                    | <i>Box</i> | <i>Envelope</i> | <i>Other</i> _____    | <i>NA</i> |
| 3. Were <u>custody seals</u> on coolers?   | <i>NA</i>      | <i>Y</i>           | <i>N</i>                                | If yes, how many and where? _____ |                |                    |            |                 |                       |           |
| If present, were custody seals intact?   | <i>Y</i>       | <i>N</i>           | If present, were they signed and dated? |                                   |                |                    |            |                 | <i>Y</i>              | <i>N</i>  |
| 4. Is shipper's air-bill filed? If not, record air-bill number:  |                |                    |   |                                   |                |                    | <i>NA</i>  | <i>Y</i>        | <i>N</i>              |           |
| 5. Temperature of cooler(s) upon receipt (°C):   | <i>4.4</i>     | <i>1.3</i>         | <i>-0.7</i>                             | <i>3.6</i>                        |                |                    |            |                 |                       |           |
| Temperature Blank (°C):  | <i>3.4</i>     | <i>4.5</i>         | <i>1.4</i>                              | <i>4.7</i>                        |                |                    |            |                 |                       |           |
| 6. If applicable, list Chain of Custody Numbers:   |                |                    |   |                                   |                |                    |            |                 |                       |           |
| 7. Were custody papers properly filled out (ink, signed, etc.)?  |                |                    |   |                                   |                |                    | <i>NA</i>  | <i>Y</i>        | <i>N</i>              |           |
| 8. Packing material used.  | <i>Inserts</i> | <i>Bubble Wrap</i> | <i>Gel Packs</i>                        | <i>Wet Ice</i>                    | <i>Sleeves</i> | <i>Other</i> _____ |            |                 |                       |           |
| 9. Did all bottles arrive in good condition (unbroken)? <i>Indicate in the table below.</i>                            | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 10. Were all sample labels complete (i.e analysis, preservation, etc.)?  | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 11. Did all sample labels and tags agree with custody papers? <i>Indicate in the table below.</i>                      | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 12. Were the correct types of bottles used for the tests indicated?  | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 13. Were all of the preserved bottles received at the lab with the appropriate pH? <i>Indicate in the table below.</i> | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 14. Were VOA vials and 1631 Mercury bottles checked for absence of air bubbles? <i>Indicate in the table below.</i>    | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 15. Are CWA Microbiology samples received with >1/2 the 24hr. hold time remaining from collection?                     | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |
| 16. Was C12/Res negative?  | <i>NA</i>      | <i>Y</i>           |   |                                   |                |                    |            |                 |                       |           |

Analytical Report for Service Request No: K0709387

Kathy Gunderson  
Premier Environmental Services  
981 State Street  
Raymond, WA 98577

**RE: Arlington Landfill Wells/BXS-Wells-Landfill**

Dear Kathy:

Enclosed are the results of the samples submitted to our laboratory on October 11, 2007. For your reference, these analyses have been assigned our service request number K0709387.

All analyses were performed according to our laboratory's quality assurance program. Where applicable, the methods cited conform to the Methods Update Rule (effective 4/11/2007), which relates to the use of analytical methods for the drinking water and waste water programs. The test results meet requirements of the NELAC standards. Exceptions are noted in the case narrative report where applicable. All results are intended to be considered in their entirety, and Columbia Analytical Services, Inc. (CAS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3275. You may also contact me via Email at JSedlak@caslab.com.

Respectfully submitted,

Columbia Analytical Services, Inc.

  
Janice Sedlak  
Project Chemist

JS/lb

### Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.

### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- B The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
  - i The MRL/MDL has been elevated due to a matrix interference.
- X See case narrative.
- \* The duplicate analysis not within control limits. See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.

### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated concentration that is less than the MRL but greater than or equal to the MDL.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- P The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results (25% for CLP Pesticides).
- U The compound was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.
- i The MRL/MDL has been elevated due to a chromatographic interference.
- X See case narrative.

### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

## **Case Narrative**

**0005**

**COLUMBIA ANALYTICAL SERVICES, INC.**

**Client:** JH Baxter & Company      **Service Request No.:** K0709387  
**Project:** Arlington Landfill Wells / BXS-Wells-Landfill      **Date Received:** 10/11/2007  
**Sample Matrix:** Water

**CASE NARRATIVE**

All analyses were performed consistent with the quality assurance program of Columbia Analytical Services, Inc. (CAS). This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), and Laboratory Control Sample (LCS).

**Sample Receipt**

Eleven water samples were received for analysis at Columbia Analytical Services on 10/11/2007. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4°C upon receipt at the laboratory.

**General Chemistry Parameters**

**pH by SM 4500-H+**

Samples were received past the recommended holding time. The analysis was performed as soon as possible after receipt by the laboratory.

No other anomalies associated with the analysis of these samples were observed.

**Total and Dissolved Metals**

No anomalies associated with the analysis of these samples were observed.
