APPENDIX C

Field Methods and Procedures

C. Excavation Field Methods and Procedures

Appendix C provides a description of the field methods and procedures utilized during completion of the cleanup action and excavation oversight activities, including field screening methods and soil sampling and handling methods. Field screening and sampling results are discussed in the main body of the report.

C.1. Field Screening Methods

This section describes the field screening methods used by Aspect field personnel to evaluate soil quality in the field and guide sampling locations and delineation of excavation extents. Field-screening methods used included visual and odor inspection, water-sheen testing, and headspace volatiles measurements. Implementation of each of these methods is described in the following sections.

C.1.1. Visual and Olfactory Inspection

The field representative recorded visual and odor observations of excavation sidewalls and bottom surfaces, as well as soil sample locations to identify the presence of petroleum and/or solvent impacts. Visual inspection and grab sample collection took place when a representative section of excavation sidewall or bottom surface was exposed. The field representative noted the presence, location, and elevation of any observed staining or discoloration relative to surrounding undisturbed soils. A portion of the soil sample was collected by hand with a clean nitrile glove, and an observation of any noticeable odor was recorded. The field representative took measures to reduce the influence of potential odor sources, such as:

- Open fuel containers
- Vehicle or tool exhaust
- Active excavation of impacted or contaminated soils.

C.1.2. Water Sheen Screening

The field representative performed sheen tests on soil at excavation sidewalls and bottom surfaces, as well as soil sample locations to identify the presence of petroleum and/or solvent impacts. A small portion, roughly 1 ounce, of the soil sample was placed into a black plastic sheen pan containing clear water. The field representative recorded observations of oil or organic sheen, or separate phase liquids observed on the water's surface. The sheen test results were reported in the daily field report.

C.1.3. Headspace Volatiles Measurement

The field representative screened excavation sidewalls and bottom surfaces, as well as soil sample locations, using a photoionization detector (PID) to monitor for the presence

of volatile organic compounds (VOCs). A portion of the soil sample was placed into a resealable plastic bag for headspace vapor screening. Ambient air was captured in the bag during sample introduction; the bag was sealed and then shaken gently to introduce soil vapor to the air trapped in the bag. Vapors present within the sample bag's headspace were measured by inserting the probe of the PID through a small opening in the bag, ensuring the probe did not contact the soil. The PID was calibrated regularly (approximately weekly) using the manufacturer's calibration standard (100 parts per million isobutylene gas). A calibration test, referred to as a "bump test" was performed using the calibration gas to check that the PID remained properly calibrated. A bump test or calibration was performed in the field each morning and subsequent bump tests were performed, as necessary, to check that the PID remained properly calibrated throughout the day. The PID calibration record and soil sample screening results were recorded in the daily field report.

C.2. Soil Sampling & Handling Methods

This section describes the sample collection and handling methods and procedures for soil samples collected during the cleanup action and excavation oversight activities.

C.2.1. Sample Collection

Soil samples were collected from excavation sidewalls and bottom surfaces during the work. All soil samples were placed in laboratory-provided sample containers, consisting of 4-ounce glass jars and/or volatile organic analysis (VOA) containers (preserved with 5 milliliters methanol). Soil samples were collected by hand with clean nitrile gloves for 4-ounce jars, and with laboratory-provided single-use soil sampling syringes for VOA containers.

Filled sample jars were placed on ice in coolers with internal temperature maintained at 4 degrees Celsius (°C). Sample coolers were transported by field personnel or courier to the laboratory under standard chain-of-custody procedures.

C.2.2. Sample Types and Nomenclature

Each sample container was labeled with the following nomenclature using permanent, nonvolatile ink, and included a unique sample identification, date, time, and project number.

- **Soil sample nomenclature.** The unique sample identification format is "Art-NXX-WYY-ZZZ" for which Art represents the project (The Artise Redevelopment), XX and YY are two-digit numbers indicating the closest soldier pile grid lines, northern and western, respectively, to where the sample was collected, and ZZZ is the elevation the sample was collected at in feet NAVD88.
- Quality control (QC) sample nomenclature.
 - The unique sample identification format for field duplicate soil samples is "Art-S9X-E9Y-ZZZ" for which Art represents the project (The Artise Redevelopment), XX and YY are sequential two-digit ID numbers

starting with Art-S90-E90, and ZZZ is the elevation the sample was collected at in feet NAVD88.

- The unique sample identification format for trip blank air samples is “Art-TB-XX” for which Art represents the project (The Artise Redevelopment), TB represents the type of QC sample being submitted, and XX is a sequential two-digit ID number starting with Art-TB-01.

C.2.3. Chain of Custody

After collection, samples were maintained in Aspect’s custody until formally transferred to the analytical laboratory. A chain-of-custody record provided by the laboratory was initiated at the time of sampling for all samples collected and signed by the field representative and all others who subsequently took custody of the samples, including the laboratory representative who received the cooler. The laboratory notified the Aspect project manager, as soon as possible, of any issues noted with the sample shipment or custody.

C.3. Tracking & Documentation Methods

This section describes the methods used to track and document the cleanup action and excavation activities, including procedures for horizontal and vertical locating within the excavation, and documentation methods for tracking the progress, completion, and key communication.

C.3.1. Horizontal and Vertical Locating

Soil sample locations, remedial excavation, and redevelopment excavation extents were identified by horizontal and vertical locating methods. Before installation of soldier piles to support mass excavation, horizontal locating was accomplished using a handheld GPS unit and measuring relative distances to identifiable Site features, such as monitoring wells, environmental borings, building foundations, etc. During mass excavation and foundational excavations, horizontal locating was done by measuring position relative to the soldier pile grid. The average error inherent in these horizontal locating methods is estimated to be +/- 2 feet.

Elevations of sample locations and vertical excavation extents were identified by vertical locating methods. Vertical locating was accomplished by measuring vertical position relative to surveyed features on the topographic surveys with measuring tape and/or with a laser level and grade rod. The average error inherent in these vertical locating methods is estimated to be +/- 1 foot.

C.3.2. Field Report Documentation

Excavation progress and activities were documented by field personnel in a daily field report. The field report included equipment calibration records, summary of subcontractor activities relative to cleanup action, status of remedial and redevelopment excavations, summary of soil transportation for disposal, soil sample inventory, and field

screening results log. The daily field report was supplemented by a log of photos, laboratory chain-of-custody forms, a site sketch indicating relative areas of activities, and a soil export trucking log prepared by the earthwork contractor (Northwest Construction).

C.3.3. Exported Soil Tracking

Exported soil tracking records were maintained by the earthworks contractor (Northwest Construction) by collecting and tabulating physical truck logs and weight tickets provided by the disposal facility. The soil tracking record indicated the soil type for each load (impacted, contaminated, or contained-in) exported. The soil tracking record was provided to Aspect electronically on a weekly basis, and weight tickets were provided to Aspect at the end of the excavation activities.

APPENDIX D

Data Quality Review and Laboratory Reports – Excavation Data

D. Data Quality Review

Aspect Consulting, LLC (Aspect) performed a data quality review of all analytical data for this study. The findings of Aspect's data quality review and the analytical data reports provided by the subcontracted laboratories are provided in this appendix.

D.1. Laboratory QA/QC Procedures

Standard chain-of-custody procedures were used while transporting samples from the field to the analytical laboratory, where samples were held in cold storage pending extraction/analysis. The subcontracted laboratory, Fremont Analytical in Seattle, Washington, maintains an internal quality assurance program as documented in their quality assurance manual. To evaluate the validity of analytical results from analysis of the samples for this study, the laboratory uses a combination of blanks, blank spike and spike duplicate, and matrix spike and spike duplicate recoveries compared against data quality goals. The analytical results, analytical methods used, and laboratory quality control records are included in the laboratory analytical reports included in this appendix.

D.2. Analytical Data Review

D.2.1. Data Quality Review

Aspect's standard Data Quality Review, referred to herein as DQR, was developed based on the U.S. Environmental Protection Agency (EPA) Stage 2A data validation, with minor modifications designed to meet Aspect's internal data quality and management program goals and the project objectives. Based on this review, a series of qualifier flags are assigned to the data where appropriate. Qualifier flags assigned to the data are included in the analytical data tables attached to this report and summarized in the tables included in this appendix along with definitions of all qualifier flags used during Aspect's DQR.

D.2.2. Data Usability Review

Following the DQR, qualified data were reviewed for usability to meet the specific goals and objectives of this study. In general:

- Data assigned a J, UJ, or E qualifier (estimated) may be used for site evaluation purposes, but the reasons for qualification should be considered when interpreting sample concentrations.
- Data assigned an X (poor match to fuel standard) may be used for both qualification and quantification purposes, but the chromatograms should be reviewed to assess the source of the detected concentration.
- Data assigned a C (laboratory contamination) should be reviewed in the context of the site conditions to assess usability of the data to meet the study objectives.

- Data marked as do-not-report/rejected (R) should not be used under any circumstances.

Values without qualification meet all data measurement quality objectives and are suitable for use.

D.3. Data Quality Review Findings

Based on the results of Aspect's Data Quality Review summarized on Table D-1, all data are determined to be suitable for use by this study.

March 11, 2021

Attention Ali Cochrane:

Fremont Analytical, Inc. received 26 sample(s) on 3/9/2021 for the analyses presented in the following report.

***Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260D***

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Brianna Barnes
Project Manager

Project: Schnitzer NE 8th

I. SAMPLE RECEIPT:

Samples receipt information is recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:

Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:

Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Qualifiers:

- * - Flagged value is not within established control limits
- B - Analyte detected in the associated Method Blank
- D - Dilution was required
- E - Value above quantitation range
- H - Holding times for preparation or analysis exceeded
- I - Analyte with an internal standard that does not meet established acceptance criteria
- J - Analyte detected below Reporting Limit
- N - Tentatively Identified Compound (TIC)
- Q - Analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20% Drift or minimum RRF)
- S - Spike recovery outside accepted recovery limits
- ND - Not detected at the Reporting Limit
- R - High relative percent difference observed

Acronyms:

- %Rec - Percent Recovery
- CCB - Continued Calibration Blank
- CCV - Continued Calibration Verification
- DF - Dilution Factor
- DUP - Sample Duplicate
- HEM - Hexane Extractable Material
- ICV - Initial Calibration Verification
- LCS/LCSD - Laboratory Control Sample / Laboratory Control Sample Duplicate
- MCL - Maximum Contaminant Level
- MB or MBLANK - Method Blank
- MDL - Method Detection Limit
- MS/MSD - Matrix Spike / Matrix Spike Duplicate
- PDS - Post Digestion Spike
- Ref Val - Reference Value
- REP - Sample Replicate
- RL - Reporting Limit
- RPD - Relative Percent Difference
- SD - Serial Dilution
- SGT - Silica Gel Treatment
- SPK - Spike
- Surr - Surrogate

Chain of Custody

1. Is Chain of Custody complete? Yes No Not Present
2. How was the sample delivered? Picked up by FAI

Log In

3. Coolers are present? Yes No NA
4. Shipping container/cooler in good condition? Yes No
5. Custody Seals present on shipping container/cooler?
(Refer to comments for Custody Seals not intact) Yes No Not Present
6. Was an attempt made to cool the samples? Yes No NA
7. Were all items received at a temperature of >2°C to 6°C * Yes No NA
8. Sample(s) in proper container(s)? Yes No
9. Sufficient sample volume for indicated test(s)? Yes No
10. Are samples properly preserved? Yes No
11. Was preservative added to bottles? Yes No NA
12. Is there headspace in the VOA vials? Yes No NA
13. Did all samples containers arrive in good condition(unbroken)? Yes No
14. Does paperwork match bottle labels? Yes No
15. Are matrices correctly identified on Chain of Custody? Yes No
16. Is it clear what analyses were requested? Yes No
17. Were all holding times able to be met? Yes No

Special Handling (if applicable)

18. Was client notified of all discrepancies with this order? Yes No NA
