SCL North Substation Landscaping

SHARP Report — Part 1 of 2

Site narrative summary

On 9/26/17, the Interim Environmental Characterization Report for North Substation Property Vegetation/Landscape Investigation dated August 24, 2017, was submitted to Donna Musa (Kirkman) during a meeting at Ecology NWRO between Ecology and Seattle City Light (SCL) Tom Meyer and Shannon Straws. The report documents the investigation of metals, petroleum, pesticides and herbicides in the landscaped areas surrounding the substation, including the sidewalk planter areas.

On May 18, 2017, SoundEarth consultants conducted a near-surface soil investigation at the North Substation Property's vegetation and landscaping area. Soil samples were collected from 11 sampling areas along the western, southern, and southeastern Property boundaries. Each sample was collected at a depth of 0 to 0.5 feet below ground surface. Samples were analyzed for TPH constituents, pesticides, herbicides, and RCRA 8 metals.

Dieldrin was detected at concentrations exceeding the MTCA Method B cleanup levels (CULs). Lead was detected exceeding MTCA Method A CULs. All other analytes were either non-detect or detected at concentrations not exceeding CULs.

A cost-benefit analysis report dated June 16th, 2022 was completed by SoundEarth consultants. No remedial action has taken place.

Shallow soil contaminated with Dieldrin and Lead exceeding Method A cleanup levels (CULs) is present at the property. Initial Investigation Recommendation: Add to Contaminated Sites List.
