RE: SITE STATUS AND SUMMARY OF MAY 2023 THROUGH AUGUST 2024 DATA
COLLECTION
LAKEVIEW FACILITY
2800 104TH STREET COURT SOUTH, LAKEWOOD, WASHINGTON
FARALLON PN: 188-004

Farallon Consulting, L.L.C. (Farallon) has prepared this Technical Memorandum on behalf of Woodworth Capital, Inc. (Woodworth) to provide a summary discussion of environmental work completed from May 2023 through August 2024 at the Lakeview Facility at 2800 104th Street Court South in Lakewood, Washington (herein referred to as the Site) (Figure 1). The Technical Memorandum provides information to facilitate discussions between the Washington State Department of Ecology (Ecology) and Woodworth to define a final scope of work for issuance of a No Further Action determination from Ecology. The environmental work was also conducted to provide additional information in response to Ecology's comments in the 2023 Technical Assistance Letter¹.

COMPLETED SCOPE OF WORK

A detailed description and analysis of the work completed, along with the laboratory analytical results, will be provided in a separate report at a future date following completion

¹ Washington State department of Ecology. 2023. Letter Regarding Technical Assistance on Further Investigation for the Woodworth & Co. Lakeview Plant. From Joseph Hunt of Ecology to Branislav Jurista of Farallon. June 20. (Technical Assistance Letter)

of the next quarterly groundwater water monitoring event scheduled for September 2024. The work completed from May 2023 through August 2024 included:

- Four Site-wide groundwater monitoring events;
- Regional aquifer assessment, including installation of one deep well screened in the regional aquifer; evaluation of data regarding the construction and pumping of the on-Site industrial water supply well; and review of publicly available data for nearby public and private water supply wells; and
- Groundwater monitoring well inspection, maintenance, and repair.

GROUNDWATER MONITORING

Site-wide groundwater monitoring events were completed in May and November 2023 and in March and June 2024. The purpose of the groundwater monitoring events was to further assess the nature and extent of hazardous substances in groundwater at the Site across a full seasonal cycle.

During each monitoring event, a Farallon field scientist gauged the depth to water at all accessible wells to estimate the groundwater flow direction for the shallow and deep water-bearing zones (Table 1). Groundwater samples were collected from monitoring and former remediation (air sparge and soil vapor extraction) wells using low-flow sampling protocols. Additionally, a grab water sample was collected from the spigot of the industrial well after the water was run for several minutes (Figure 1).

Farallon documented pH, temperature, dissolved oxygen, specific conductance, turbidity, and oxidation-reduction potential measurements during each sampling of the wells. The groundwater samples were submitted under standard chain-of-custody protocols for laboratory analysis for one or more of the following:

- Total petroleum hydrocarbons as diesel-range organics (DRO) and as oil-range organics (ORO) by Northwest Method NWTPH-Dx;
- Carcinogenic polycyclic aromatic hydrocarbons (cPAHs) by U.S. Environmental Protection Agency (EPA) Method 8270E;
- Halogenated volatile organic compounds (HVOCs) by EPA Method 8260D; and
- Total and dissolved arsenic and lead by EPA Method 200.8.

Groundwater Elevation Monitoring Results

Groundwater elevations recorded during the groundwater monitoring events conducted in May and November 2023, and in March 2024 (Table 1) were used to prepare groundwater elevation contour and flow direction maps for the shallow and deep water-bearing zones at the Lakeview Facility. Groundwater flow maps were not prepared for the June 2024 monitoring event at this time because the May 2023 event was deemed representative for the non-rainy season.

Shallow Groundwater: Groundwater in the shallow water-bearing zone flows radially inward toward the center of the Site and areas with lower topographic relief compared to the areas of higher relief at the Site boundaries (Figures 2A through 2C). This interpretation of the groundwater flow for the shallow water-bearing zone is consistent with prior estimations of the groundwater flow directions.

Deep Groundwater: Groundwater in the deep water-bearing zone flows predominantly to the north in the southern portion and to the northeast in the central and northern portions of the Site, which is consistent with prior groundwater monitoring events (Figures 3A through 3C). Mounding in groundwater elevations in the deep water-bearing zone appears to be present in the same area of the shallow water-bearing zone drawdown (i.e., the area around monitoring wells MW-9R and MW-16R), suggesting an interconnection between the shallow and deep water-bearing zones at that location. This mounding in the deep water-bearing zone causes the northeasterly deflection of the groundwater flow direction in the central portion of the Site, as the groundwater does not flow against the gradient.

Groundwater Analytical Results

The groundwater analytical results are discussed below.

Diesel- and Oil-Range Organics

DRO plus ORO analyzed without the silica-gel cleanup procedure were detected at concentrations exceeding the Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A cleanup level during one or more of the groundwater monitoring events at shallow water-bearing zone monitoring wells MW-3, MW-4, MW-6, MW-9R, MW-9A, MW-11, MW-12, MW-13, MW-31, MW-35, MW-36, and MW-X and at deep monitoring wells MW-12B, MW-16R, MW-18, SVE-2, and SVE-8 (Table 2, Figures 4A through 4C).

Note, however, that elevated DRO plus ORO concentrations in monitoring wells MW-3, MW-12B, MW-18, and SVE-8 are attributed to surface water runoff entering the well casing due to compromised well seals (expandable well plugs, monument gaskets, or both). The well seals (plugs and gaskets) were subsequently replaced as described in the Well Maintenance and Repair section of this Technical Memorandum. Following well redevelopment and resampling, DRO plus ORO in groundwater at these monitoring wells was reported as either non-detect or at concentrations less than the MTCA Method A cleanup level.

The groundwater samples collected in March and June 2024 from monitoring wells with concentrations exceeding the Method A cleanup level using the standard analytical method were also analyzed using the silica-gel cleanup procedure. Except for the groundwater sample from monitoring well SVE-2, DRO plus ORO was not detected in any groundwater samples with the silica gel procedure (Table 2). These results indicate that DRO and ORO are highly weathered and have undergone significant natural attenuation processes where only polar metabolites currently remain at the Site.

Sample results for monitoring well SVE-2 were flagged by the laboratory, indicating the hydrocarbons in the gasoline range are impacting the diesel-range result and the hydrocarbons in the diesel range are impacting the oil-range result. This is the only area where there is actual residual DRO and ORO that is not polar-metabolite or total-organic-carbon related, suggesting a release of a potential separate petroleum mixture compared to other petroleum-impacted areas at the Site.

The extent of DRO plus ORO contamination at deep water-bearing zone monitoring well SVE-2 is defined by the results for nearby monitoring wells SVE-1, MW-14, MW-2, MW-22, SVE-9, MW-21, and SVE-7, which are all below the MTCA Method A cleanup level. The extent of DRO plus ORO contamination at deep water-bearing zone monitoring well MW-16R and the area of interconnection between the shallow and deep water-bearing zones is defined to the south by the results for monitoring wells MW-22 and MW-23, and down-gradient to the east and northeast by the results for monitoring wells MW-9D and MW-12B, respectively.

In summary, DRO plus ORO impacts exceeding the MTCA Method A cleanup level are present in several discrete areas in the shallow water-bearing zone and in two discrete areas in the deep water-bearing zone at the Lakeview Facility (Figures 4A through 4C). Of particular importance, however, because the groundwater flow direction in the shallow water-bearing zone is inward toward the center of the Site and the impacts in the deep groundwater zone are properly bounded, the extent of DRO plus ORO contamination is

defined by and completely confined to the interior of the property boundary lines. The four quarters of recent data and the prior years of data indicate that the DRO and ORO groundwater concentrations in excess of the Method A cleanup level are located, and will remain, within the property boundaries.

Polycyclic Aromatic Hydrocarbons

PAHs, including cPAHs and non-carcinogenic PAHs, were analyzed at selected wells during the May and November 2023 groundwater monitoring events (Table 3). Neither cPAHs nor non-carcinogenic PAHs were detected at concentrations exceeding MTCA Method A cleanup levels in any of the groundwater samples analyzed.

Chlorinated Volatile Organic Compounds

Chlorinated volatile organic compound (CVOC) results for groundwater during this reporting period are summarized and discussed in the Regional Aquifer Assessment section below. The analytical results for CVOCs, including trichloroethene (TCE), are summarized in Table 4. The aerial and vertical distribution of TCE is confined within the property boundaries and is depicted on Figures 5A through 5C and further referenced on Figures 6A and 6B.

Arsenic and Lead

Ecology previously concurred with Farallon that dissolved arsenic and dissolved lead are the applicable results for comparison to MTCA Method A cleanup levels. Dissolved arsenic was detected at concentrations exceeding the MTCA Method A cleanup level and the natural background threshold value for the Puget Sound Basin of 8 micrograms per liter ($\mu\text{g}/\text{L}$)² in the groundwater samples collected from monitoring well MW-31 and also once in a groundwater sample from monitoring well MW-12 (Table 5, Figure 7). Dissolved lead was not detected at concentrations exceeding the MTCA Method A cleanup level in any of the groundwater samples.

REGIONAL AQUIFER ASSESSMENT

Based on the historical Site investigation and cleanup work, three groundwater-bearing zones exist at the Site (Figure 5C). A shallow water-bearing zone that ranges in thickness from 8 to 20 feet and that appears to be largely unconfined and discontinuous under predominantly perched conditions was encountered at depths ranging from approximately 5

² Washington State Department of Ecology. 2022. *Natural Background Groundwater Arsenic Concentrations in Washington State, Study Results*. Publication No. 14-09-044. January.

to 40 feet below ground surface (bgs). The large range in depth to groundwater is due to variations in topography across the Site. The lower limits of the shallow water-bearing zone are consistently bounded by the silt and silty gravel aquitard, which in some areas appears to be leaky. The aquitard soil units have not been saturated or water-bearing.

A deep water-bearing zone that ranges in thickness from 46 to 60 feet was encountered at depths ranging from approximately 28 to 72 feet bgs. The soil types in the deep water-bearing zone consist primarily of sand and gravel with lesser amount of silt.

A deeper low-permeability unit consisting of silt and silty gravel was encountered at the base of the deep water-bearing zone in a number of monitoring wells installed in the southern portion of the Site, and appears to be largely absent some distance north of the industrial water well at the Site. This low-permeability unit generally separates the deep water-bearing zone from a regional aquifer that provides water for the industrial water well used at the Lakeview Facility. The regional aquifer is present at depths of approximately 90 feet bgs at the industrial water well and extends to at least the maximum depth explored of 187 feet bgs. Farallon understands that this regional aquifer is used as a sole-source aquifer for residents in the municipalities of DuPont, Fircrest, Lakewood, Ruston, Steilacoom, Tacoma, and University Place.

In the Technical Assistance Letter and prior opinion letters, Ecology expressed concerns about the occurrence of TCE at concentrations an order of magnitude less than the MTCA Method A cleanup level in the on-Site industrial water well, which has one screen from 167 to 187 bgs and a second perforated section from 107 to 129 feet bgs. Both screened intervals are within the regional aquifer zone. Ecology's Technical Assistance letter postulated the following hypothesis concerning the potential mechanism by which TCE could migrate from the shallow and deep water-bearing zones into the regional aquifer:

- The industrial well construction is compromised and leaks between aquifers;
- The deep aquitard is not comprehensive in this area of the Site and is transmitting contamination to deeper regional groundwater; and/or
- The industrial well is screened above the deep aquitard and allows shallow groundwater contamination to extend to depths of at least 130 feet bgs.

Another potential scenario not considered by Ecology for the low concentrations of TCE in the regional aquifer includes a potential for TCE migrating onto the Site or being drawn onto

the Property from an undocumented off-Site source due to the pumping of the industrial water well, which has been operational since the late 1960s.

To construct a conceptual site model for the origin and transport mechanisms for TCE and the potential for the TCE to impact public water supply wells within the Lakeview Water District and private water supply wells in the vicinity of the Lakeview Facility, Farallon conducted the following:

- Developed a scope of work to evaluate whether the source of the TCE in the regional aquifer is associated with release(s) on or off the Site;
- Completed a down-well camera survey of the industrial water well to confirm its construction;
- Obtained information regarding year-round pumping rates for the industrial water well from the current property owner, Miles Resources, Inc. and sampled and compared the industrial water well testing results for multiple periods when the pumping rates are low to periods when the pumping rates are high, to look for the evidence of the industrial water well causing the migration of TCE into the regional aquifer;
- Performed multiple rounds of groundwater monitoring at the air sparge and monitoring wells that are screened near the base of the deep water-bearing zone immediately above the deeper aquitard;
- Installed and sampled a new deep monitoring well in the regional aquifer near the southern property boundary; and
- Obtained publicly available sampling data from the Lakewood Water District and Washington State Department of Health for the nearby water supply wells.

To facilitate discussion of the evaluation results, TCE distribution in the shallow water-bearing zone and in the deep water-bearing zone/regional aquifer are depicted on Figures 5A and 5B, respectively. Cross section F-F', shown on Figure 5C, depicts the general lithology and water-bearing zones encountered at the Lakeview Facility, and TCE concentrations in groundwater detected during the last four quarterly groundwater monitoring events. Figure 6A depicts the Lakeview Water District boundary and public water-supply wells in relation to the Lakeview Facility and Figure 6B depicts a summary of TCE sampling data obtained from the nearby public and private water supply wells. Similar to the DRO/ORO conditions in the shallow aquifer, TCE impacts are confined to the interior of the property boundaries.

Industrial Water Well Construction

On December 4, 2019, Holt Services, Inc. of Fife, Washington conducted a down-well camera survey under Farallon's supervision to ascertain whether the driller's log for the industrial water supply well is accurate. The well screen and perforation depths indicated on the boring log matched observations during the survey, with a screened interval depth ranging from approximately 167 to 187 feet bgs and the perforated depth ranging from 107 to 129 feet bgs. There were no indications of any damage or other protrusions in the well casing. The total depth of the well was 187 feet bgs.

Pumping Frequency and Rates for Industrial Well

The groundwater pumped from the industrial water well is used primarily for dust suppression and occasionally washing vehicles and equipment. Miles Resources, Inc. reported that pumping from the industrial well during late fall and winter months is minimal, ranging from 0 to 5,000 gallons per day, and is up to 30,000 gallons per day during warm and busy spring and summer days.

To evaluate whether well construction is associated with TCE migration from the deep water-bearing zone to the lower regional aquifer, Farallon prepared a time-series graph of TCE concentrations detected in the industrial water well over time (Chart 1). If the well construction is associated with TCE migration into the regional aquifer, increased TCE concentrations would be expected during summer months when the industrial water well pumping rates are much higher compared to late fall and winter months. Chart 1 indicates that there is no correlation and no evidence that the higher pumping rates during late spring and summer months result in increasing TCE concentrations. The data also indicates that TCE concentrations have been stable since the industrial well was first sampled in 2008. Therefore, the industrial well construction and pumping regime does not appear to affect TCE migration from the deep water-bearing zone into the lower regional aquifer.

Groundwater Monitoring for Regional Aquifer Assessment

Quarterly groundwater monitoring events were completed in May and November 2023 and in March and June 2024. In the shallow water-bearing zone, TCE concentrations exceeding MTCA Method A cleanup level have consistently been detected in a small, limited area within the property boundaries and proximate to the former location of the Washington State Department of Transportation (WSDOT) mobile testing laboratory (Figure 5A). This is the only TCE source area identified at the Site.

TCE concentrations in the shallow water-bearing zone exceeded the MTCA Method A cleanup level in only two monitoring wells: SVE-3 and SVE-12. The lateral extent of TCE in the shallow groundwater is defined by the data from monitoring well MW-36 to the northwest, monitoring wells SVE-6, MW-3, and MW-4 to the north and northeast, and monitoring wells MW-26 and MW-27 to the south (Table 4 and Figure 5A).

TCE concentrations exceeding the MTCA Method A cleanup level are also present in the deep water-bearing zone. TCE has been identified at concentrations exceeding the MTCA Method A cleanup level in the deep aquifer at the reported former location of the WSDOT mobile testing laboratory and extends laterally to approximately 440 feet in the down-gradient direction to the north-northeast (Figure 5B), well short of the property boundary that is approximately 700 feet to the northeast of the plume terminus.

TCE concentrations in the deep water-bearing zone exceeded the MTCA Method A cleanup level in monitoring wells SVE-4, MW-2, MW-14, MW-20, and MW-22 (Figure 5B). The TCE lateral extent in the deep water-bearing zone is defined by the data from monitoring wells AS-2, AS-4, AS-6, SVE-7, AS-8, SVE-9, and MW-21 to the east; monitoring wells MW-16R, MW-23, and AS-10 to the north and northeast; monitoring wells AS-5, AS-7, and MW-18 to the east; and monitoring wells MW-15, MW-19, MW-25, MW-28, and MW-29 to the south (Table 4 and Figure 5).

To evaluate the potential for vertical migration of TCE from the deep water-bearing zone to the regional aquifer, Farallon sampled monitoring wells AS-1 through AS-8 and MW-14C, which are screened near the base of the deep water-bearing zone immediately above the deep aquitard (Figure 5C). There were no detections of TCE at concentrations exceeding the MTCA Method A cleanup level at these wells. TCE was not detected at wells AS-2 and AS-3, which are up-gradient of the TCE source area at the reported former location of the WSDOT mobile testing laboratory, supporting a hypothesis that TCE is likely not migrating from an up-gradient off-Site source. The slightly higher TCE concentrations ranging from 1.3 to 3.0 µg/L were detected at the base of the deep water-bearing zone at wells AS-5 and MW-14C, and an order of magnitude lower TCE concentrations were present north and northeast of these wells (Table 4, Figure 5B and 5C).

Regional Aquifer Well Installation

Farallon also investigated another possible hypothesis for the source of low TCE concentrations in the industrial water well: migration from an off-Site source. Joint Base Lewis McChord, located across State Route 512 to the south of the Site, has known

releases of TCE to groundwater and the potential exists for groundwater impacted with TCE to have migrated onto the Site from those releases. At this time, Joint Base Lewis McChord is the only known source of TCE in groundwater proximate to the Site.

To evaluate the potential for an off-Site source of TCE impacting the Site, Farallon installed and sampled a monitoring well screened in the regional aquifer near the southern boundary of the Lakeview Facility (Figures 5B and 5C). Monitoring well MW-45 was installed by Holt Services, Inc. using a track-mounted sonic drill rig. The boring for monitoring well MW-45 was advanced to 160 feet bgs corresponding to 153 feet North American Vertical Datum of 1988 (NAVD 88), with the screen interval set from 145 to 150 feet bgs (168.1 to 163.1 feet NAVD 88). CVOCs, including TCE, were not detected in the soil samples collected from 12, 40, 65, 96.9, and 150 feet bgs (Table 6). TCE was not detected in reconnaissance groundwater samples collected at 80 to 85 feet bgs and 92 to 97 feet bgs during the well installation (Table 4). Similarly, TCE was not detected in the groundwater samples collected in February, March, and June 2024 (Table 4 and Figures 5B and 5C). These results indicate that migration of TCE from a potential off-Site source to the south is unlikely.

Nearby Potable Water Supply Well Information

Farallon obtained publicly available sampling data for the nearby potable water supply wells from the Lakewood Water District and Washington State Department of Health and evaluated those records for the presence of TCE. Farallon previously requested information from the Lakewood Water District regarding the capture zones for water supply wells in its district to evaluate whether water supply wells in the vicinity of the Site could potentially capture groundwater from the Site. A representative of the Lakewood Water District provided a map of the water supply well locations and stated that the Lakewood Water District does not track specific capture zones by well or well cluster, but instead considers the entire area within the district to be part of the capture zone for its wells (Figure 6A). As depicted on Figure 6A, the Site is not located within the boundaries of the Lakewood Water District and, based on the communications with the Lakewood Water District, is outside of their groundwater supply wells' capture zone.

The Scotts well cluster, also known as the G-well cluster; the 88th and Pine well cluster, also known as the J-well cluster; and the Majestic Oaks water system to the east and north are the water supply wells closest to the Site within the Lakewood Water District (Figure 6B). Laurel Lane mobile home park to the northwest and Bryants Trailer Court and Rental to the south include other private water wells in the general vicinity of the Site. Except for the

Majestic Oaks water system, these wells have periodically been sampled for CVOCs, including TCE, as far back as 1981 and as recently as 2022. The sampling data obtained from the Washington State Department of Health indicated that there have been no historical or recent detections of CVOCs in any of the water samples collected from these water supply wells.

Based on the information obtained from the Lakewood Water District and Washington State Department of Health, TCE in groundwater at the Site is not impacting the water supply wells in the area.

In summary, all of the data collected to date indicate that the TCE groundwater concentrations across the Site vertically and laterally are stable, are confined well within the Lakeview Facility property boundaries, and are not impacting any off-Site potable water supply wells.

WELL MAINTENANCE AND REPAIR

The results of the March 2024 sampling identified the unexpected presence of DRO and/or ORO at multiple wells where DRO and/or ORO was previously absent or present at concentrations that were consistently less than the MTCA Method A cleanup levels. Farallon and Holt Services, Inc. inspected and, where needed, performed maintenance and repairs at selected wells where well plugs and/or monument lids were damaged. The damaged well plugs and/or monument lids represented a potential for stormwater to enter the well casing, resulting in the false-positive detections of DRO and/or ORO concentrations where prior sampling had indicated historical compliance with the MTCA Method A cleanup levels.

Several well monuments and/or well lids (at monitoring wells MW-3, MW-4, MW-19, MW-30, SVE-6, SVE-8, AS-4, AS-6, and AS-7) were replaced. Additionally, two wells (monitoring wells MW-18 and MW-32) were converted from flush mounted monuments to aboveground stick ups with steel well protectors and bollards. Farallon performed a down-well camera survey at monitoring wells MW-11, MW-12, MW-12B, MW-X, SVE-8, SVE-11, and AS-7 to evaluate whether the wells had visible damage or fouling to the screen or casing. No damage was observed, but wells that showed evidence of fouling, including monitoring wells MW-12, MW-12B, SVE-2, SVE-8, and AS-7, were cleaned using down-well brushes and deionized water and then redeveloped. Monument gaskets and expendable plugs were inspected at all accessible wells, and replaced with new ones where necessary.

SUMMARY AND CONCLUSIONS

Groundwater in the shallow water-bearing zone flows radially inward toward the center of the Site where it flows under the natural gradient vertically into the deep water-bearing zone. Groundwater in the deep water-bearing zone flows predominantly to the north in the southern portion and to the northeast in the central and northern portions of the Lakeview Facility,

DRO plus ORO impacts exceeding the MTCA Method A cleanup level are present in discrete areas in the shallow water-bearing zone and in two discrete areas in the deep water-bearing zone. Because of the groundwater flow direction in the shallow water-bearing zone trending to the interior of the Site, the extent of DRO plus ORO contamination is defined and confined to the Site property boundary. The extent of DRO plus ORO contamination at two areas within the deep water-bearing zone is contained within the property boundaries based on the results for the down-gradient monitoring wells screened in the deep water-bearing zone. The sampling results using silica gel cleanup indicate that DRO and ORO are highly weathered and have undergone significant natural attenuation processes where only polar metabolites currently remain at the Site. PAHs, including cPAHs and non-carcinogenic PAHs, were not detected at concentrations exceeding MTCA Method A cleanup levels in any of the groundwater samples analyzed and should not be retained as constituents of concern for the Site.

The detections of DRO plus ORO at several wells were attributed to compromised well seals and were mitigated by performing well repairs, cleaning, and redevelopment.

Based on the assessment the Site/regional hydrogeology and contaminant fate and transport presented herein and the historical investigation and cleanup work performed, there is no apparent evidence of TCE migration from an off-Site source onto the Site at this time. The TCE occurrence in the regional aquifer near the location of the on-Site industrial water well is more likely than not associated with the historical release from the WSDOT mobile testing lab that formerly operated at the Lakeview Facility. TCE has migrated vertically from the shallow water-bearing zone into the deep water-bearing zone and penetrated through the silt and silty gravel aquitard into the regional aquifer.

The construction and current operation of the on-Site industrial water well does not appear to exacerbate the vertical migration of TCE into the regional aquifer. The silt and silty gravel aquitard is likely transmissive at some locations and the low-level TCE appears to have migrated to the regional aquifer under natural conditions induced by a vertical gradient.

Concentrations of TCE at the base of the deep water-bearing zone and within the regional aquifer do not exceed the MTCA Method A cleanup level. A review of sampling data for the nearby water supply wells within and outside the Lakewood Water District demonstrates that these wells are not impacted by TCE and are not at future risk by TCE present at the Site.

Based upon the historical data and the work completed in 2023 to 2024, the groundwater impacts in the shallow, deep, and regional aquifers are confined to the Lakeview Facility property boundary. Of particular note, the recent work confirms that TCE impacts in the regional aquifer are below MTCA Method A concentrations and not at risk of impacting potable water supply wells in the area.

As noted in prior reports, significant soil source removal has occurred in numerous areas at the Site. There are limited areas of remaining soil impacted with concentrations exceeding MTCA Method A levels. All of these remaining soil impacts are within the boundaries of the property. Moreover, as discussed in previous Farallon reports submitted to Ecology, the closure requirements for the on-going sand and gravel mining operation require placement of 30 feet of clean fill to bring the Site back to required elevations. Any soil impacts are either currently under paved surfaces or will be at a depth of more than 15 feet bgs upon completion of the reclamation process, which is the vertical separation considered reasonable under MTCA as the point of compliance for potential exposure to contaminated soil via a direct contact.

Based on the soil and groundwater conditions at the Site, we look forward to discussing a defined and limited scope of work to move the Site to issuance of a conditional No Further Action letter with the following elements:

- Institutional controls to preclude the extraction of groundwater for domestic purposes;
- A materials management plan to address the handling and proper disposal of any remaining soil impacted above MTCA Method A cleanup levels which may be disturbed by on-going sand and gravel operations;
- A groundwater conditional point of compliance at the down-gradient property boundary;
- Installation of a limited number of additional groundwater monitoring wells at the conditional point of compliance; and
- Periodic groundwater monitoring to confirm MTCA Method A concentrations are achieved at the conditional point of compliance.

LIMITATIONS

The conclusions contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location. The conclusions contained herein are subject to the following inherent limitations:

- Accuracy of Information. Farallon reviewed certain information used in this report/assessment from sources that were believed to be reliable. Farallon's conclusions, opinions, and recommendations are based in part on such information. Farallon's services did not include verification of its accuracy. Should the information upon which Farallon relied prove to be inaccurate, Farallon may revise its conclusions, opinions, and/or recommendations.
- Reconnaissance and/or Characterization. Farallon performed a reconnaissance and/or characterization of the Site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions. Contamination may exist in other areas of the Site that were not investigated or were inaccessible. Site activities beyond Farallon's control could change at any time after the completion of this report/assessment.

Farallon does not guarantee that the Site is free of hazardous or potentially hazardous substances or conditions, or that latent or undiscovered conditions will not become evident in the future. Farallon's observations, findings, and opinions are as of the date of the report.

This report/assessment has been prepared in accordance with the contract for services between Farallon and Woodworth Capital, Inc. No other warranties, representations, or certifications are made.

(281.60) GROUNDWATER ELEVATION MEASURED
IN FEET REFERENCED TO NORTH AMERICAN
VERTICAL DATUM OF 1988 (NAVD88)

(NM) NOT MEASURED

280.00 — GROUNDWATER ELEVATION CONTOUR
(DASHED WHERE INFERRED)

→ APPROXIMATE GROUNDWATER FLOW DIRECTION

NOTES:

1. ALL LOCATIONS ARE APPROXIMATE.
2. FIGURES WERE PRODUCED IN COLOR. GRayscale COPIES MAY NOT REPRODUCE ALL ORIGINAL INFORMATION.

NOTES:

--- denotes groundwater elevation not calculated.

~ denotes approximate value.

¹ Feet North American Vertical Datum of 1988 (NAVD88).

² Well casing compromised. .

Elevation converted from NGVD 1929 by adding 3.415 feet

bgs = below ground surface

Miscellaneous = not associated with any particular area of concern

NA = not available

NM = not measured

NOTES:

Results in **bold** denote concentrations exceeding applicable cleanup levels.

< denotes analyte not detected at or exceeding the reporting limit listed.

— denotes sample not analyzed.

¹Analyzed by Northwest Method NWTPH-Dx. DRO+ORO results are calculations. A value of half the detection limit was used for non-detect values. Beginning in May 2023, results were quantified by the laboratory as hydrocarbon range C10 to C36 (diesel and oil ranges).

²Analyzed by U.S. Environmental Protection Agency Method 8260C/8260D.

³Washington State Model Toxics Control Act Cleanup Regulation Method A Cleanup Levels for Groundwater, Table 720-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as amended 2013.

⁴The monument cover for monitoring well MW-16 was found to be destroyed and the internal cap/casing damaged during the December 2017 groundwater monitoring and sampling event, impacting the integrity of the monitoring well and the results from this well.

BSE = BlueStone Environmental, LLC

BTEX = benzene, toluene, ethylbenzene, and xylenes

DRO = total petroleum hydrocarbons (TPH) as diesel-range organics

Farallon = Farallon Consulting, L.L.C.

M = hydrocarbons in the diesel-range are impacting the oil-range result

N = hydrocarbons in the oil-range are impacting the diesel-range result

O = hydrocarbons in the gasoline-range are impacting the diesel-range result

ORO = TPH as oil-range organics

MTCA Method A Cleanup Level for Groundwater⁵								160	480⁶	NE	2,400⁶	NE	640⁶	320⁶	NE	240⁶							0.1

NOTES:

Results in **bold** denote concentrations exceeding applicable cleanup levels.

< denotes analyte not detected at or exceeding the reporting limit listed.

— denotes sample not analyzed

¹Analyzed by U.S. Environmental Protection Agency (EPA) Method 8270E/SIM. Samples with only naphthalene results were analyzed by EPA Method 8260.

²Sum of naphthalene, 1-methylnaphthalene and 2-methylnaphthalene.

³Total carcinogenic polycyclic aromatic hydrocarbons derived using the total toxicity equivalency method in Section 708(8) of Chapter 173-340 of the Washington Administrative Code.

⁴For concentrations reported at less than the laboratory reporting limit, half the reporting limit was used to calculate the TEC.

⁵Washington State Model Toxics Control Act Cleanup Regulation Method A Cleanup Levels for Groundwater, Table 720-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised 2013, unless otherwise noted.

⁶Washington State Model Toxics Control Act Cleanup Regulation Cleanup Levels and Risk Calculations, Standard Method B Values for Groundwater,
<https://ecology.wa.gov/Regulations-Permits/Guidance-technical-assistance/Contamination-clean-up-tools/CLARC>

cPAHs = carcinogenic polycyclic aromatic hydrocarbons

PAHs = polycyclic aromatic hydrocarbons

TEC = toxic equivalent concentration

NE = not established

NOTES:

< denotes analyte not detected at or exceeding the reporting limit listed.

¹Depth in feet below ground surface.

²Analyzed by U.S. Environmental Protection Agency Method 8260D.

³Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Levels for Unrestricted Land Uses, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised 2013, unless otherwise noted.

⁴Washington State Cleanup Levels and Risk Calculations (CLARC) under Washington State MTCA, Standard Method B Formula Values for Soil from CLARC Master spreadsheet, <https://ecology.wa.gov/Regulations-Permits/Guidance-technical-assistance/Contamination-clean-up-tools/CLARC>

CVOCs = chlorinated volatile organic compounds

PCE = tetrachloroethene

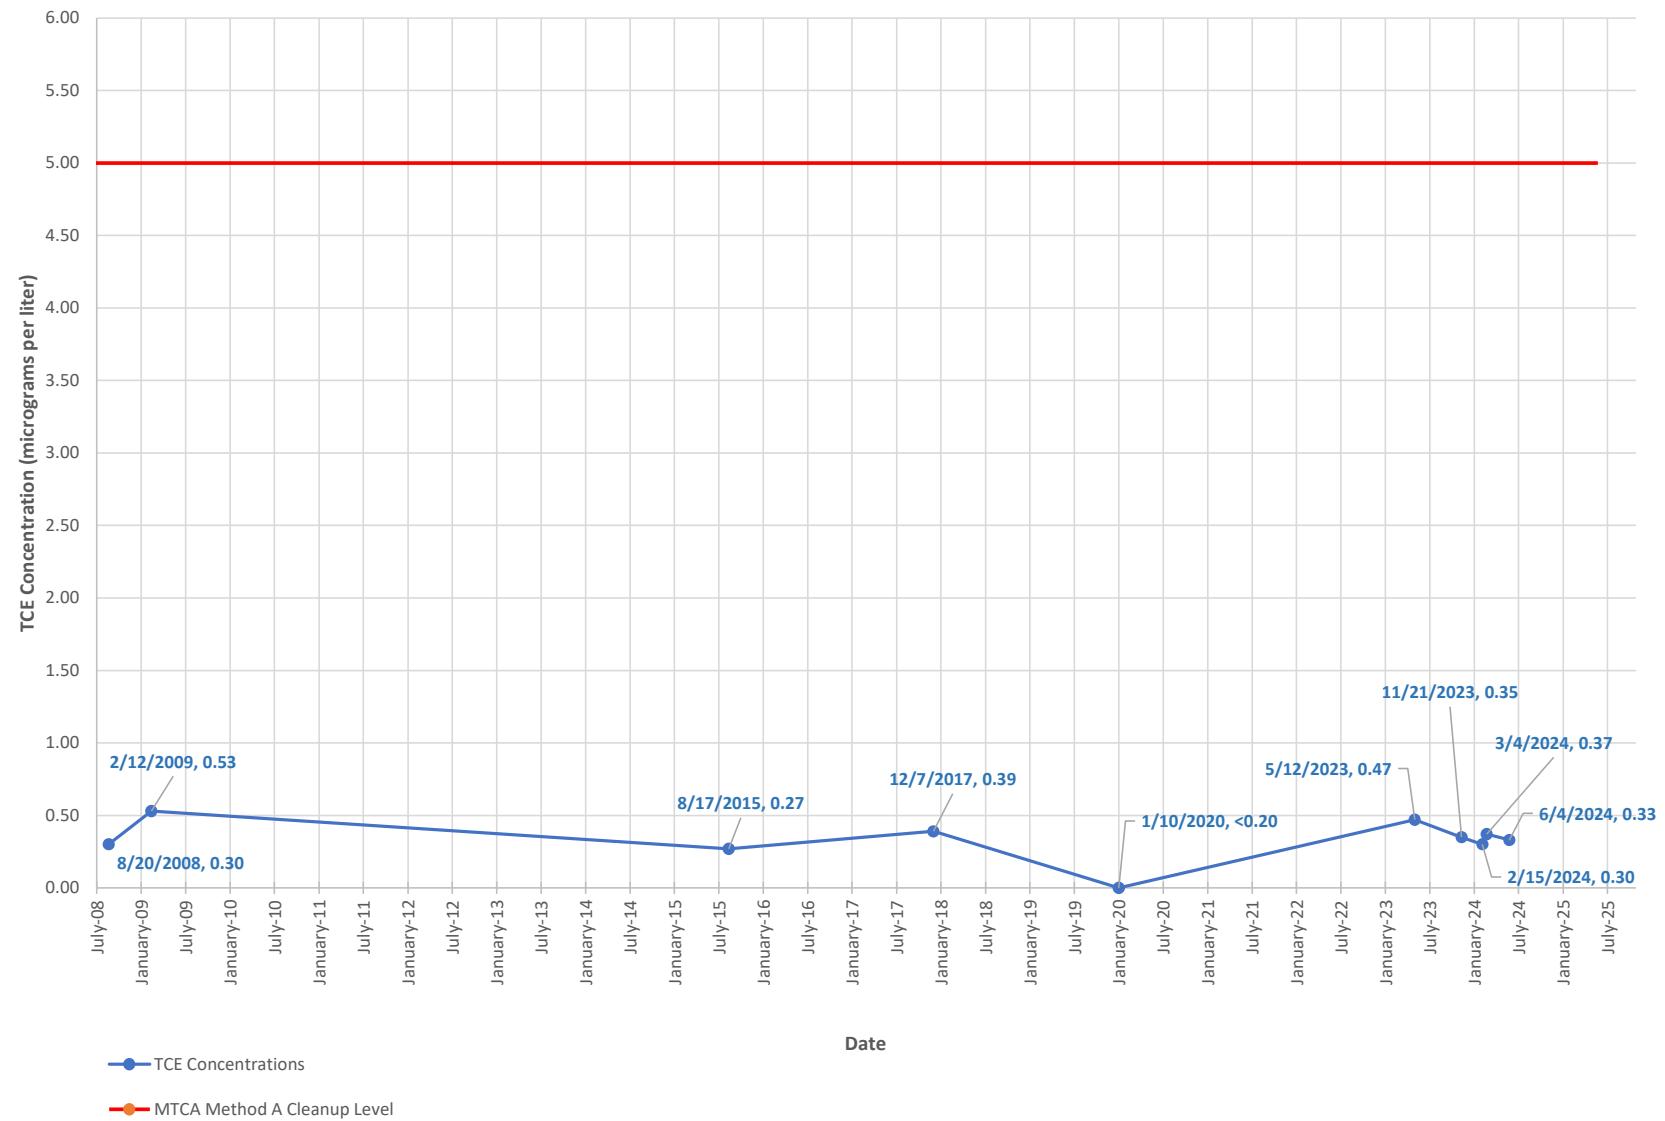

TCE = trichloroethene
