Re: Additional Subsurface Investigation
Heritage Square Shopping Center
760 NW Gilman Boulevard
Issaquah, Washington 98027

EPI Project No. 45001.0

Dear Mr. Boswell:

Environmental Partners, Inc. (EPI) is pleased to provide this letter report presenting the results of a recently completed Additional Subsurface Investigation (ASI) for the property located at 760 NW Gilman Boulevard in Issaquah, Washington (subject property). The subject property is occupied by Daniel's Dry Cleaners, which is a tenant of the Heritage Square Shopping Center. The general location of the subject property is indicated on Figure 1.

An initial subsurface investigation of the Daniel's Dry Cleaners lease space was performed in February 2004 by Environmental Associates, Inc. (EAI) on behalf of Spencer Retirement Group Limited Partnership. The findings of that investigation were described in the *Soil & Ground Water Sampling & Testing* report dated March 3, 2004 by EAI which was provided to EPI by The Stratford Group, Ltd. According to that report, the investigation focused on the interior of Daniel's Dry Cleaners and included the collection of soil and/or ground water samples from four locations inside the lease space. These soil and ground water samples were collected using standard direct-push technology (DPT) sampling techniques and each sample was submitted for analysis of volatile organic compounds (VOCs) by EPA Method 8260.

The EAI subsurface investigation identified a relatively shallow water table aquifer (i.e., 7 to 8 feet below grade) and generally sandy soils. The laboratory analyses detected the presence of perchloroethylene (i.e., dry cleaning solvent, PCE) at concentrations above both the Model Toxics Control Act (MTCA; WAC 173-340) Method A cleanup levels for soil and ground water.

The work described herein was performed in general accordance with the basic scope of work described in EPI's proposal to the Spencer Retirement Group Limited Partnership, dated April 22, 2004.

The general objective of this ASI was to assess the lateral extent of soil and ground water impacts from PCE and associated degradation compounds [i.e. trichloroethene (TCE), cis-1,2-dichloroethene, trans-1,2-dichloroethene and vinyl chloride] associated with the historical use of the Daniels Dry Cleaners lease space as a dry cleaning facility.

SCOPE OF WORK

EPI advanced a total of fourteen soil borings using standard DPT sampling techniques in the locations indicated on Figures 2, 3, 4 and 5. The maximum depth of exploration during the course of the ASI was 11 feet below grade.

During drilling, soil samples were collected at approximate 1.0 to 2.0-foot vertical intervals and screened for the presence of volatile compounds using a photoionization detector (PID). The soil conditions encountered during drilling were described using the Unified Soil Classification System (USCS) visual-manual procedures (ASTM 2488D). The results of field screening and the soil conditions encountered during drilling are presented on soil borings logs in Attachment A.

Soil samples were selected for laboratory analysis based upon the results of field screening. When field screening did not suggest the presence of impacts, soil samples were selected for analysis based on providing a representative distribution of data. A total of 15 soil samples were submitted to CCI Analytical Laboratories in Everett, Washington for the analyses indicated below in Table 1.

Ground water was encountered in each of the fourteen boring locations at depths ranging from approximately 6 to 9 feet below grade. Ground water samples were collected using a peristaltic pump and dedicated tubing. Ground water was purged from the sampling point for several minutes then pumped directly into appropriate sample containers at a flow rate of less than 100 milliliters/minute.

Fourteen ground water samples were submitted to CCI Analytical Laboratories in Everett, Washington for the analyses indicated below in Table 1.

Table 1
Summary of Requested Laboratory Analyses for Soil and Ground Water Samples

(a) Halogenated Volatile Organic Compounds

Immediately upon collection, all soil and ground water samples were labeled and placed in an iced cooler pending submittal to the analytical laboratory. All samples were handled and transported under standard chain-of-custody protocols.

FINDINGS

Subsurface Conditions

Subsurface conditions at the subject property generally consisted of concrete, asphalt and/or flooring material at the surface underlain by intermittent intervals of Well Graded Sand, Sandy Silt, and Poorly Graded Sand, which were observed to the maximum depth of exploration of 11 feet below grade.

A water table was consistently encountered at depths between 6 and 9 feet below grade.

Descriptions of the soil types encountered at each boring location and the results of field screening are presented on the boring logs in Attachment A. No substantially elevated PID readings were observed in any of the 14 boring locations.

Analytical Results

The analytical results discussed in this section are compared to site-specific cleanup levels discussed below in the Cleanup Level Evaluation section.

Soil Samples

As noted above, a total of 15 soil samples were submitted for the analyses indicated in Table 1. The analytical results for these soil samples are summarized in Table 4. The locations and detected HVOC concentrations for these samples are depicted on Figure 2. The estimated extent of HVOC impacts to soil is depicted on Figure 4. Final laboratory analytical reports are presented in Attachment B.

PCE was detected in one soil sample location (B-9) at a concentration below the site-specific soil cleanup level of 0.07 milligrams/kilogram (mg/kg). The detected PCE concentration in sample B-9 was 0.002 mg/kg at approximately 3 feet below grade. This location is situated approximately 6 feet west of the Daniel's Dry Cleaners lease space and approximately 12 feet southwest of an area which was identified in the EAI *Soil & Ground Water Sampling & Testing* report as having PCE impacts to soil above MTCA Method A Soil Cleanup Levels. None of the remaining fourteen soil samples submitted for analysis contained detectable concentrations of target analytes above compound specific laboratory detection limits.

Detected concentrations of methylene chloride above MTCA Method A Soil Cleanup Levels were present in all of the soil samples submitted to the laboratory by EAI in February 2004. The laboratory reports which were included as Attachment A of the *Soil & Ground Water Sampling & Testing* report indicated that "the reported value is likely due to exposure from the laboratory". Methylene chloride can be a ubiquitous laboratory contaminant and was not detected above laboratory detection limits in any of the 15 soil samples submitted for analysis during the course of this ASI. It is unlikely that methylene chloride is actually present in soil or ground water at the subject property.

Ground Water Samples

As noted above, a total of 14 ground water samples were submitted for the analyses indicated in Table 1. The analytical results for these ground water samples are summarized in Table 5. The locations

and detected HVOC concentrations of these samples are depicted on Figure 3. The estimated extent of HVOC impacts to ground water is depicted on Figure 5. Final laboratory analytical reports are presented in Attachment B.

Vinyl chloride was detected in two ground water sample locations at concentrations above the site-specific ground water cleanup level of 0.029 micrograms/liter ($\mu\text{g}/\text{L}$). In boring B-10, the detected vinyl chloride concentration was 19 $\mu\text{g}/\text{L}$ and in boring B-9 the concentration was 7 $\mu\text{g}/\text{L}$. TCE and cis-1,2-dichloroethene were also detected in these locations but at concentrations below their respective site-specific cleanup levels of 3.98 $\mu\text{g}/\text{L}$ and 80 $\mu\text{g}/\text{L}$, respectively. Both of these locations are situated approximately 10 feet west to northwest of the area which was identified in the EAI *Soil & Ground Water Sampling & Testing* report as having PCE impacts to ground water above MTCA Method A Ground Water Cleanup Levels.

Cleanup Level Evaluation

The MTCA regulation requires that several potential exposure pathways be addressed during remedial actions. These potential exposure pathways include:

- Direct human contact with soil
- Ground water as a drinking water source,
- Migration from soil to ground water,
- Migration of vapors from soil to indoor air,
- Migration of vapors from ground water to indoor air, and
- Ecological exposures.

For the purposes of further discussion it has been assumed that it will not be necessary to evaluate ecological exposures through a Terrestrial Ecological Evaluation (WAC 173-340-7490), based upon the exclusion provided in WAC 173-340-7491 (1)(b). That is, that all areas of impacted soil or ground water are covered by a physical barrier preventing ecological exposure.

MTCA provides two different methods for evaluating cleanup levels at the subject property; Method A and Method B. Method A is generally for use on simple sites with relatively few contaminants and is based primarily on protection of ground water for soil cleanup levels and upon ingestion of ground water for ground water cleanup levels. In many cases, Method A is less strict (i.e., higher cleanup levels) than Method B. Method B is considered the "Universal Method" and can be applied to all sites. This method can be tailored to various exposure pathways and can be modified for site-specific risks.

MTCA also requires that, for sites covered with structures, the potential exposure of humans to indoor air vapors originating from contaminated soil or ground water beneath a site be considered. This is performed using the Johnson & Ettinger (J&E) model.

The various cleanup levels that are potentially applicable for soil at the subject property have been evaluated and are summarized in Table 2 below. Similarly, the various cleanup levels potentially applicable for ground water at the subject property have been evaluated and are summarized in Table 3, also below.

Soil cleanup levels in Table 2, which are based upon protection of ground water to either a drinking water or vapor migration standard were developed pursuant to the provisions of MTCA (WAC 173-340-747) and using equations 747-1 and 747-2. The calculation of these cleanup levels is presented in Table 6.

Table 2
Summary of Potentially Applicable Cleanup Levels for Soil
in mg/kg

Compounds	MTCA Method A	Method B for Direct Contact	Method B for Protection of Ground Water	Protection of Indoor Air	Protection of Ground Water for Indoor Air
PCE	0.05	19.6	0.009	0.07	2.0
TCE	0.03	90.9	0.026	0.04	2.4
Cis-1,2-DCE	NVE	800	0.40	1.2	58.5
Trans-1,2-DCE	NVE	1,600	0.87	1.2	54.8
Vinyl Chloride	NVE	0.67	0.00018	0.002	0.1

Table 3
Summary of Potentially Applicable Cleanup Levels for Ground Water
in µg/L

Compounds	MTCA Method A	Method B for Ground Water Ingestion	Protection of Indoor Air
PCE	5.0	0.86	185
TCE	5.0	3.98	360
Cis-1,2-DCE	NVE	80	11,700
Trans-1,2-DCE	NVE	160	10,100
Vinyl Chloride	0.2	0.029	15.7

NVE – No Value Established

The only potentially completed exposure pathway at the subject property is human exposure to indoor air. While protection of ground water as a drinking water source is a primary focus of Ecology, the ASI has established that the lateral extent of impacts is limited to soil and ground water beneath the subject property, and in particular, beneath the Daniel's Dry Cleaners lease space.

It appears that protection of indoor air will be the primary driving mechanism for site remediation and that protection of ground water will be secondary concern. Both soil and ground water represent a

potential threat to indoor air quality. Based upon this, it is EPI's opinion that the following cleanup levels may be most appropriate for the subject property:

Summary of Selected Cleanup Levels

Compound	Soil Cleanup Level in mg/kg	Ground Water Cleanup Level in µg/L
PCE	0.07	0.86
TCE	0.04	3.98
Cis-1,2-DCE	1.2	80
Trans-1,2-DCE	1.2	160
Vinyl Chloride	0.02	0.029

Only PCE and TCE have been detected at a concentration exceeding a selected soil cleanup level. Similarly, only PCE, TCE, and vinyl chloride have been detected at a concentration exceeding a selected ground water cleanup level.

Recent conversations and correspondence with Ecology on other PCE-impacted properties indicates that they may be unwilling to apply MTCA Method A at sites that have contaminants of concern that do not appear in the MTCA Method A tables. The observed presence of DCE isomers and vinyl chloride in soil and DCE isomers in ground water would seem to preclude the use of MTCA Method A cleanup levels.

EXTENT OF IMPACTS

Soil

Figure 4 presents the estimated extent of soil with concentrations exceeding a site-specific cleanup level for PCE and TCE. Soil impacts are centered on the location of the former dry cleaning equipment. All of the samples in which PCE was detected also contained a concentration exceeding a cleanup level that is protective of ground water as a drinking water source. The concentration of PCE at SP-1 also exceeded a concentration protective of vapor migration from ground water into indoor air. A PCE concentration at SP-2 also very nearly exceeded the soil cleanup level protective of ground water as a source of vapor for indoor air.

The volume of contaminated soil beneath the floor slab that would need to be addressed to protect potential indoor air exposures is about 155 cubic yards.

Ground Water

Figure 5 presents the estimated area of ground water impacts that exceed a cleanup level. The contaminants that exceed a ground water cleanup level are PCE, TCE, and vinyl chloride. Ground water impacts also appear centered on the former dry cleaning equipment but also extend to the northwest beneath the adjacent lease space. Of particular concern is that the detected concentrations of vinyl chloride in ground water beneath the Daniel's Dry Cleaners lease space and the adjacent space to the west also exceed a concentration that is protective of indoor air. Ground water samples from B-10 and SP-1 contained 18 µg/L and 19 µg/L of vinyl chloride, respectively, and a concentration that is considered protective of indoor air is 15.7 µg/L.

CONCLUSIONS

The following conclusions are supported by the findings of this Additional Subsurface Investigation and in connection with the data from the previous EAI investigation:

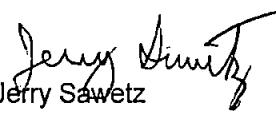

- Surface and subsurface conditions at the subject property generally consist of concrete, asphalt, and/or flooring material at the surface underlain by intermittent intervals of Well Graded Sand, Sandy Silt and Poorly Graded Sand, which were observed to the maximum depth of exploration of 11 feet below grade.
- A water table was encountered in each of the fourteen boring locations at depths between 6 and 9 feet below grade.
- Concentrations of PCE in soil exceed a soil cleanup level protective of indoor air quality (i.e., 0.07 mg/kg) in all four previous sampling locations inside the Daniel's Dry Cleaners lease space. TCE concentrations also exceeded a cleanup level protective of indoor air (i.e., 0.04 mg/kg) in two of those sampling locations. Similarly, a sample from each of the sampling locations contained concentrations of either PCE, TCE, or vinyl chloride at a concentration exceeding a cleanup level protective of ground water as a drinking water source. The distribution of these impacts appears centered on the location of the former dry cleaning equipment and does not appear to extent substantially, if at all, into adjacent lease spaces.
- Concentrations of PCE, TCE, and vinyl chloride exceed ground water cleanup levels based upon protection of ground water as a drinking water source in areas beneath the Daniel's Dry Cleaners lease space and the lease space immediately to the west. The concentrations of vinyl chloride in ground water in the lease space to the west and beneath the northern end of the Daniel's Dry Cleaners lease space exceed a concentration that is protective of indoor air quality. The westward limit of these impacts has not been fully characterized but is not expected to be extensive given the pattern of concentration attenuation observed in other locations.
- It appears that the conditions at the subject property trigger a requirement to report the release to the Washington Department of Ecology. The criterion for reporting a release is whether the resulting impacts represent a threat to human health or the environment. It is likely that the subject property meets this criterion based upon the concentrations of vinyl

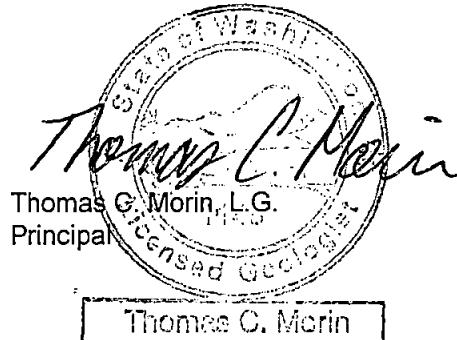

chloride in ground water. The responsibility for reporting to Ecology lies with the owner or operator of a facility.

- It is possible that PCE concentrations in soil higher than those previously detected are present beneath the floor slab in the area of the former dry cleaning equipment. It is unlikely that the previous level of investigation identified the "hot spot" for these impacts.
- The distribution of contaminants at the subject property is consistent with a release(s) of PCE to the floor of the Daniel's Dry Cleaners lease space and subsequent migration of those compounds through the concrete slab. The underlying soils were then impacted and serve as a source of dissolution of PCE to the shallow ground water. Relatively little degradation of PCE appears to be occurring in the soil as evidenced by PCE and TCE as the predominant compounds. As the PCE and TCE migrate to the ground water it appears that anaerobic biodegradation is attenuating the PCE and TCE into the DCE isomers and vinyl chloride. The prevalence of cis-1,2-DCE over trans-1,2-DCE strongly suggest biotic degradation.
- It appears that a readily applicable remedial strategy for the subject property would be to remove source soil and then perform in situ chemical oxidation. Unlike enhanced biological degradation, this approach will also adequately address the potential vinyl chloride exposure.

EPI appreciates the opportunity to be of assistance on this project. As always, if you have any questions or comments please do not hesitate to contact me at (425) 395-0010.

Sincerely,

Jerry Sawetz
Environmental Scientist
