Hi Julia,

Below and attached are materials summarizing our proposed approach to mitigate the access constraints on the Site due to a large (1,000+ cubic yard) waste pile of gypsum backing paper that belongs to the property tenant. The tenant has not made any progress to export the material and we do not believe they will do so before they are relocated by SPU in the next ~1 year.

The following proposed sample locations are currently beneath the pile:

- proposed soil borings FS-17 and FS-28
- existing wells MW-08 and MW-09

During the utility location today, we additionally found that a sewer line runs east-west along the north side of the waste pile. Due to the sewer line, we will need to install FS-14 at its original work plan location rather than moving this boring to the southeast as discussed. In light of this, we're proposing an additional well to fill the groundwater monitoring objectives, which is discussed in more detail below.

The revised sampling plan is summarized here by location and also illustrated in the attached figure and table markups.

- FS-28: this boring was intended to characterize general fill soil quality, potential impacts from residual petroleum contamination left in interim action area A5A, and potential impacts related to slug bait handling operations. In its place, adjacent contingency boring FS-29 will be sampled and analyzed immediately according to the plan for FS-28 (refer to Figure 6.10 and Tables C.4 and C.5 for details regarding sampling and analysis)
- FS-17: this boring was intended to characterize potential soil impacts related to boat building (specifically in the vicinity of the current building in the southern part of the property) and slug bait handling. The objectives of this boring will still be adequately filled for the purposes of the RI/FS as follows (refer to Figure 6.10):
 - potential boat building impacts in the vicinity of the building will be characterized by FS-16, FS-18, FS-19 and FS-21

- potential slug bait handling impacts will be characterized by FS-15, FS-16 and FS-36 as well as by immediate analysis at boring FS-29 described above
- MW-08: this existing well was intended to characterize groundwater impacts from metals, TPH and CVOCs and to collect contaminant partitioning and hydrogeologic data. In its place, an additional well is proposed at the FS-14 boring location downgradient of MW-08 (refer to Figure 6.10). This new well (MW-22) will be installed with a screened interval spanning the water table consistent with MW-08 and sampled and analyzed according to the plan for MW-08; soil samples will be collected in accordance with the RIWP for FS-14 (refer to Figure 6.9 and Tables C.2 through C.5 for details regarding sampling and analysis).
- MW-09: this existing well was intended to characterize groundwater impacts from metals, TPH and CVOCs; to characterize potential impacts related to A5A, boat building and slug bait handling; and to collect contaminant partitioning and hydrogeologic data. In its place, an additional well is proposed at the FS-23 boring location downgradient of MW-09 (refer to Figure 6.10). This new well (MW-23) will be installed with a screened interval spanning the water table consistent with MW-09 and will be sampled and analyzed according to the plan for MW-09; soil samples will be collected in accordance with the RIWP for FS-23 (refer to Figure 6.9 and Tables C.2 through C.5 for details regarding sampling and analysis).

Additionally per RIWP Section 6.3, the need for additional remedial investigation to better define screening level exceedances or characterize hot spots will be evaluated in coordination with Ecology after receipt of the initial RI soil and groundwater data.

Thanks,

Kristin Anderson, LHG Senior Geologist (she/her)

External Email

Hi Julia, your interpretation is correct. The original MW-01 location was installed in 2003 and the stormwater treatment system was installed in the same area in 2009. The flood control infrastructure was added more recently, after the RIWP was finalized.

I'm at the site today but I can send a composite markup tomorrow.

Thanks,
Kristin

On Oct 14, 2024, at 12:06 PM, Schwarz, Julia (ECY) <jusc461@ecy.wa.gov> wrote:

Hi Kristen,

Thank you for the additional updates following utility locates. With regards to the location of MW-01R, if you cannot put in the replacement well closer to MW-01, then the proposed location is acceptable. However, it seems like previous work has been able to place a well and a boring near the shoreline area in the vicinity of MW-01. Can you please explain why it is not possible to place a replacement well within 10 feet of the original well location? Is it because of more recently installed stormwater infrastructure, and if so, when was this infrastructure installed?

Also, please provide Ecology with a combined version of this figure with the new wells MW-22 and MW-23, so that this is a compilation of all field changes proposed thus far.

Thanks,
Julia

Subject: Silver Bay Logging Site- utility locate update

External Email

Hi Julia,

I have an additional update to share with you after completing the utility locates today. All of our soil boring locations were fortunately able to be placed within ~5 feet of their proposed RIWP locations. We were also generally able to site the wells as proposed, with a couple moves as summarized below and shown on the attached markup. We did not have to remove any locations due to utility conflicts.

MW-14 and MW-15 both had minor moves to the north (approximately 15 feet) due to interfering utilities. This will not impact the achievement of DQOs:

MW-14

- extent of TPH in groundwater surrounding MW-03R and MW-10
- general groundwater quality relative to CVOCs
- groundwater quality in the former treated wood storage area
- upgradient groundwater quality
- contaminant partitioning
- hydrogeology (groundwater elevations)

MW-15

general groundwater quality relative to CVOCs
<!--[if !supportLists]-->>• <!--[endif]-->upgradient groundwater quality
<!--[if !supportLists]-->>• <!--[endif]-->contaminant partitioning
<!--[if !supportLists]-->>• <!--[endif]-->hydrogeology
(groundwater elevations)

A larger move at MW-01R (approximately 40 feet to the southeast) was necessitated by sewer pipes/outfalls, above- and below-ground stormwater treatment infrastructure, and recently constructed flood control infrastructure along the top of the riverbank. There are not any concerns for achieving most of the DQOs at the new location, including:

- general groundwater quality relative to metals and CVOCs
- potential impacts from historical boat-building/repair in the east-central portion of the property
- general quality of groundwater discharges to surface water
- contaminant partitioning
- hydrogeology (groundwater elevations)

Our only concern with the new MW-01R location is further investigating the total DRO+ORO impacts that were previously detected at MW-01. However, the new location in combination with MW-12 and new well MW-21 will give good information regarding the extents and potential source of those impacts, therefore we don't have concerns relative to RI/FS at this time.

Thanks and have a great weekend,

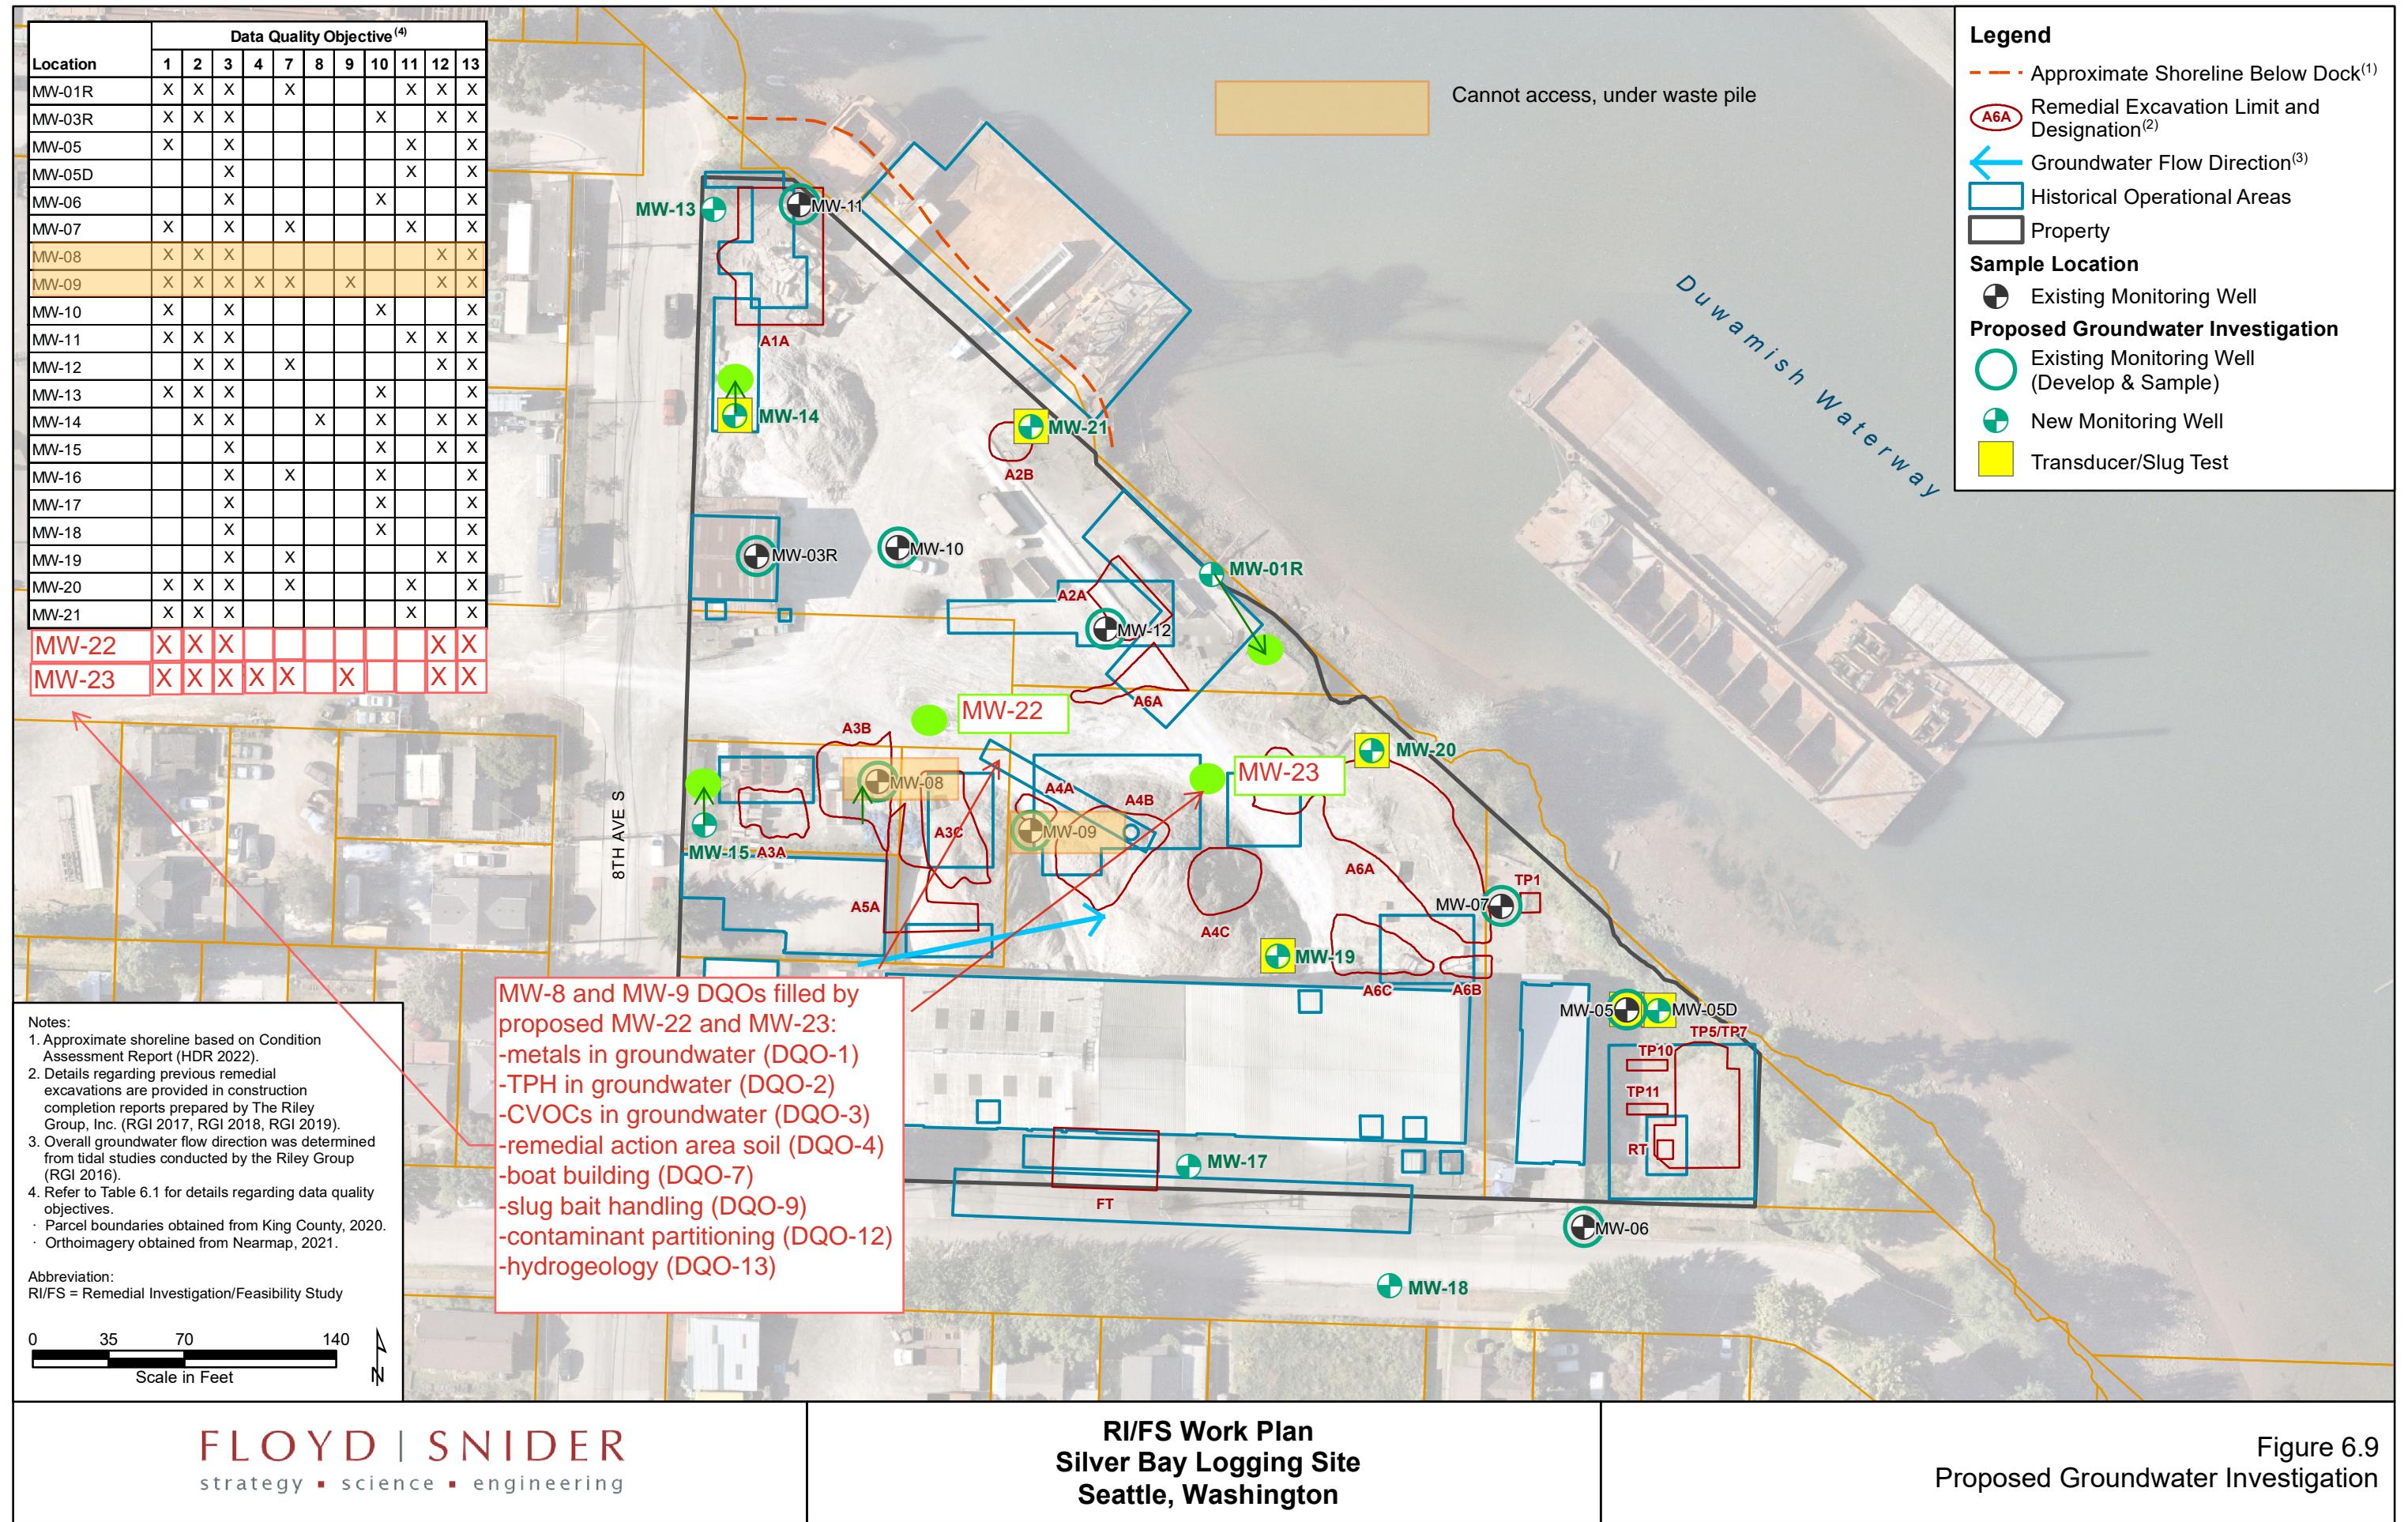

Kristin Anderson, LHG Senior Geologist (she/her)

Notes:

- 1 Initial PCB Aroclor analysis will be performed. Additional PCB congener analysis will be performed if PCB Aroclor results are non-detect.
- 2 Analyze TPHD with acid/silica gel clean-ups and EPH/VPH only if TPH is detected.
- 3 Analyze if detected in soil.
- 4 Analyze during subsequent monitoring rounds if detected in upgradient groundwater results during initial groundwater monitoring.
- 5 PAHs are a subset of the list of SVOCs. See Table C.7 for PAH and SVOC analyte lists.

Abbreviations:

bgs	Below ground surface	TBT	Tributyltin
CVOC	Chlorinated volatile organic compound	TOC	Total organic carbon
D/F	Dioxins/furans	TPH	Total petroleum hydrocarbons
EPH	Extractable petroleum hydrocarbons	TPHD	Total petroleum hydrocarbons-diesel
PAH	Polycyclic aromatic hydrocarbon	TPHG	Total petroleum hydrocarbons-gasoline
PCB	Polychlorinated biphenyl	VPH	Volatile petroleum hydrocarbons
PCP	Pentachlorophenol	VOC	Volatile organic compound
SVOC	Semi-volatile organic compound

Notes:

- 1 Sample collection will begin below recent gravel surfacing and/or asphalt pavement. Assuming all intervals are in 'feet' and will be 2-feet or less in length when possible. Borings will be expanded deeper if needed to vertically delineate field indications of contamination. If a boring location has poor recovery, a second attempt will be advanced. See QAPP section 3.2.3 for further description of sample collection.
- 2 Assume archive sample intervals will be 2 feet or less when possible. If archive analyses are triggered, samples will be analyzed sequentially from shallower to deeper depths until results are less than PSLs.
- 3 Initial PCB Aroclor analysis will be performed. Additional PCB congener analysis will be performed if PCB Aroclor results are non-detect.
- 4 Five samples with highest metals results from the shoreline fill unit will be analyzed for this parameter. If any additional COIs exceed PSLs, the samples bounding the area of metals impacts will also be analyzed for those COIs.
- 5 Analysis will only be performed if PID field screen is greater than 10 times background. Additionally, the interval immediately below initial interval will be collected and analyzed.
- 6 Representative samples will be collected from each fill unit to characterize general fill quality, and will additionally be collected from the specified intervals to characterize the extent of the unit of metals-impacted shoreline fill.
- 7 Metals: As, Cr, Cu, Hg, Pb
- 8 Archive for dioxin/furan analysis if pentachlorophenol is detected.
- 9 Slug bait COIs will be analyzed if detected at a concentration exceeding the PSL at location FS-36 or FS-15.
- 10 Two samples with the highest metals results will be analyzed for this parameter.
- 11 PAHs are as subset of the list of SVOCs. See Table C.8 for PAH and SVOC analyte lists.

Shading indicates volume required for analysis will be collected and archived.

Abbreviations:

As Arsenic
COI Contaminant of interest
Cr Chromium
Cu Copper
CVOC Chlorinated volatile organic compound

D/F Dioxins/furans
EPH Extractable petroleum hydrocarbons
Hg Mercury
PAH Polycyclic aromatic hydrocarbon
Pb Lead

PCB Polychlorinated biphenyl
PCP Pentachlorophenol
PID Photoionization detector
PSL Preliminary screening level
SVOC Semi-volatile organic compound

TBT Tributyltin
TOC Total organic carbon
TPHD Total petroleum hydrocarbons-diesel
TPHG Total petroleum hydrocarbons-gasoline
VPH Volatile petroleum hydrocarbons
VOC Volatile organic compound
