1. Introduction

Teck Washington, Inc. (TWI) has prepared this Data Gap Assessment and Feasibility Study (FS) report for the Pend Oreille Mine Historic Debris Field (Debris Field), Washington State Department of Ecology (Ecology) Facility Site ID:15428546, that is being addressed as part of Ecology's Voluntary Cleanup Program (VCP). The Debris Field primarily is located within the boundaries of the Pend Oreille Mine (POM) property. The POM is an underground lead-zinc mine located approximately 2 miles north of Metaline Falls, in Pend Oreille County, Washington (see "Vicinity Map", Figure 1) and is owned and managed by TWI. The mine generally consists of underground mine workings, administrative offices and maintenance buildings, closed Tailings Disposal Facilities (TDF) 1 and 2 (TDF1 and TDF2), an open TDF (TDF3), a Waste Rock Pile, and associated trafficways and parking areas. The mine layout is shown on the "Site Plan," Figure 2. Mining and milling operations at the POM ceased in 2019 and TWI decided to permanently close the mine in April 2021.

The Debris Field was first observed on April 6, 2005 during a scheduled inspection by the U.S. Environmental Protection Agency (EPA) and is located west-northwest of the former Load Out Building. In June 2005, TWI (then operating as Teck Cominco American, Incorporated) and adjacent property owner Seattle City Light (SCL), engaged GeoEngineers, Inc. (GeoEngineers) to assess the size of the Debris Field and identify potential contaminants of concern (COC) contained in the debris media. Findings from the assessment indicated trichloroethene (TCE) is present in a portion of the Debris Field at concentrations exceeding Ecology's Model Toxics Control Act (MTCA) Method A Cleanup Level for Unrestricted Land Use (cleanup level).

The site entered the VCP in 2022. On October 3, 2022, Ecology provided TWI an opinion and technical assistance letter for the Debris Field following review of existing assessment documents. Ecology indicated sufficient characterization of the Debris Field has been conducted, but data gaps remained regarding the magnitude and extent of hazardous waste, potential heavy metals present in soil and seep water, and slope stability. Regarding the potential presence of heavy metals, Ecology's opinion letter also stated: "Ecology does not believe that the presence of heavy metals would affect the extent of the debris field as it is currently known but may impact the designation and disposal options for any wastes generated."

To address these data gaps, TWI contracted Haley & Aldrich, Inc. (Haley & Aldrich) to prepare and implement a Data Gap Assessment and FS Work Plan. Ecology provided a subsequent opinion and technical assistance letter on April 4, 2023 that approved the work plan and provided further guidance on the data gap assessment. Haley & Aldrich completed assessment activities in 2023, and those findings are incorporated herein.

2. Background

Mining activities at the POM began in the early 1900s and continued until operations were suspended in 1977. The Debris Field was generated during this period, well before TWI's predecessor acquired the property in 1990. The limits of the Debris Field were estimated by GeoEngineers using hand-auger and hand-excavated explorations informed by a geophysical assessment conducted by GeoPotential Environmental and Exploration Geophysics (GeoPotential) in 2005. GeoEngineers estimated that the Debris Field extended northwest from the former Load Out Building and may be present on both the TWI and SCL property. GeoEngineers also conducted a slope stability assessment of the Debris Field area to evaluate whether remedial actions could result in slope failure. As part of mine closure, TWI conducted a data gap assessment in 2023 to better understand the magnitude and extent of the Debris Field.

DRAFT

3. Site Geology and Hydrogeology

The surface operations of the POM are underlain by glaciolacustrine deposits consisting of laminated clay, silt, and fine sand with thin beds of localized stratified sand and gravel (GeoEngineers, 2006). Glaciolacustrine sand and gravel terraces are also present on surrounding mountains at altitudes up to 2,600 feet, and sand and gravel overburden covers the valley floor to depths between 10 and 250 feet. The glaciolacustrine deposits at the POM are underlain by bedrock consisting of the Ledbetter Slate and Metaline Limestone Formations; the Metaline Limestone Formations contain the Josephine and Yellowhead horizons that were mined during POM's operational history.

The Ledbetter Slate formed in the Ordovician Period and occurred in thicknesses up to about 3,000 feet and the Metaline Limestone formed in the mid Cambrian Period and occurs in thicknesses up to about 2,500 feet. The Pend Oreille River valley floor, lower hills, and valley walls are comprised of these formations. The Maitlen Formation, consisting of phyllite, limestone, and shale, and the Gypsy Formation (quartzite) underlie the Metaline Limestone and are exposed in the valley walls in some locations. The Josephine Horizon is present in the upper 500 feet of the Metaline Limestone and the Yellowhead Horizon is present about 500 feet below the Josephine Horizon between about 1,000 and 2,400 feet beneath the top of the Metaline Limestone.

According to the 2000 Final Environmental Impact Statement (FEIS) for the POM, the shallow sediments of the Metaline Falls area create an unconfined aquifer that is primarily influenced by precipitation in the highland areas to the east and west of the Pend Oreille River and by the river itself, which acts as a groundwater sink. The glacial sediments can be locally saturated with groundwater in depressions and along major river courses (ENSR, 2000).

Based on the FEIS, the bedrock aquifer is located beneath the Ledbetter, which acts as an aquiclude to downward movement in the area of the Debris Field. Groundwater generally flows toward the Pend Oreille River, from the south to the northwest (ENSR, 2000). Groundwater discharges from seeps and springs in the glacial sediments east of the Debris Field

4. Debris Field Assessment History

During the 2005 assessment, several soil samples were collected from hand auger borings and hand excavated test-pits and analyzed for: total petroleum hydrocarbons (TPH), volatile organic compounds (VOCs), cyanide, pH, organochlorine pesticides, and polychlorinated biphenyls (PCBs). Analytical results indicated that TCE was identified at concentrations greater than the MTCA Method A cleanup level of 0.03 milligrams per kilogram (mg/kg) at three locations. Analytical results indicated that TPH, cyanide, dichloro-diphenyl-trichloroethane (DDT), beta-hexachlorocyclohexane (beta-BHC), and PCBs were present in several soil samples, but at concentrations less than applicable cleanup levels.

GeoEngineers also collected one water sample from a seep located near the northwest limits of the Debris Field during the 2005 assessment; the sample was collected over two consecutive days to obtain enough volume for planned analyses. The sample was analyzed for TPH, VOCs, cyanide, pH, organochlorine pesticides, and PCBs. Analytical results from the water sample indicate benzene and methyl tert-butyl ether (MTBE) were detected at concentrations less than the applicable cleanup levels. In addition, analytical results indicate that endosulfan was detected below cleanup levels and that TPH, cyanide, and PCB concentrations in the seep water sample were not detected at concentrations greater than the analytical method reporting limit (MRL).

During the 2005 slope stability assessment, GeoEngineers observed a failure of relatively loose soil/debris within the Debris Field that could have occurred during a time of heavy precipitation (GeoEngineers, 2006). Additionally, GeoEngineers concluded that “the existing slope and Debris Field are generally stable in the current configuration” and that complete removal (at the time of the assessment) is not appropriate because of the high risk to structural integrity of the buildings located upgradient of the Debris Field (i.e., the former Load Out Building).

In 2009, TWI contracted URS Corporation (URS) to prepare a mine Reclamation Plan for the POM, including a plan to reclaim the Debris Field. URS prepared the mine Reclamation Plan after reviewing assessment data from previous investigations; no additional assessment was conducted. URS concluded that there was a 5 percent chance the Debris Field could irreversibly impact the environment. URS notes that implementing controls to address risks from the Debris Field could reduce the severity of potential impacts to the environment. URS recommended that TWI selectively remove waste material from the Debris Field and revegetate the hillside to reduce the potential for erosion and improve slope stability. URS additionally acknowledged special care should be taken to prevent slope failure of the debris into the Pend Oreille River.

In 2023, TWI contracted Haley & Aldrich to conduct a Data Gap Assessment to fill data gaps remaining from the 2005 assessment and prepare an FS to consider remediation alternatives for the Debris Field. Haley & Aldrich’s data gap assessment included field activities and laboratory analyses to further refine the limits of the Debris Field, assess the magnitude and extent of contaminated soil, update the slope stability analysis, and assess heavy metals in soil and seep water samples as requested by Ecology. With the findings documented herein, the Debris Field has been sufficiently delineated and defined horizontally by completed explorations for purposes of this VCP site assessment and preparation of an FS. Findings from site assessments conducted by GeoEngineers, URS, and Haley & Aldrich are further discussed in the following sections.

5. Previous Assessments

TWI contracted GeoEngineers, URS, and Haley & Aldrich to investigate the Debris Field in 2005, 2009, and 2023, respectively. The investigations generally identified COC concentrations and the approximate magnitude and extent of COCs in the Debris Field. Locations of select explorations from assessments conducted by GeoEngineers and Haley & Aldrich are found in “Debris Field”, Figure 3. Summaries of the investigations and their findings are provided below.

5.1 SOLID WASTE DISPOSAL ASSESSMENT

GeoEngineers completed a Solid Waste Disposal Assessment in June and August of 2005. Nine explorations were completed including five augers and four test pits using hand exploration techniques in the assumed area of the Debris Field. Depths of explorations ranged from 1 to 5-1/2 feet below ground surface (bgs). Silts, sands, and gravels were observed within the explorations and six media samples were collected and submitted for the following analyses:

- VOCs by EPA Method 8260B;
- petroleum hydrocarbons by Northwest Total Petroleum Hydrocarbons (NWTPH);
- cyanide by EPA Method 335.2;
- pH by EPA Method 9045B;
- organochlorine pesticides (pesticides) by EPA Method 8081A; and
- PCBs by EPA Method 8082.

Additionally, a seep water sample was collected over two days from a seep located near the base of the Debris Field hillside and submitted for the following analyses:

- VOCs by EPA Method 8260B,
- cyanide by EPA Method 335.2, and
- petroleum hydrocarbons by NWTPH-Dx.

Analytical results for media and the seep water sample are summarized in “Summary of Chemical Analytical Results - 2005”, Table 1.

Slope stability conditions were evaluated by reviewing geologic data from publicly available sources, reviewing hand auger and test pit logs, observing for surface water runoff/seepage, reviewing local hydrogeologic conditions, and assessing slope geometry. GeoEngineers also contracted GeoPotential to survey the Debris Field using a magnetometer, ground penetrating radar (GPR), and an electromagnetic tracer to estimate the aerial extent of metal debris. The effectiveness of the magnetometer and GPR on the hillside was limited due to the steep slopes and dense vegetation.

5.1.1 2005 Solid Waste Disposal Assessment Findings

Field observations by GeoEngineers generally delineated the Debris Field as the area with smaller-diameter trees and dense underbrush; surface debris consisting of metal drums, vehicle and machine parts, wood debris; and features indicative of historical dumping of fill and debris. The Debris Field was

laterally defined as being bounded by two drainage channels to the northeast and southwest. Explorations indicated the fill and debris material deposited on the hillside is at least 5-1/2 feet thick.

Analytical results indicated that TPH, cyanide, DDT, beta-BHC, and PCBs were present in soil samples, but at concentrations less than applicable cleanup levels. Analytical results of media samples indicate TCE was present in three samples (TC-6, TC-7, and TC-9) at concentrations greater than the cleanup level. TCE was detected at concentrations greater than cleanup levels at 2 feet bgs in TC-6 and 4-1/2 feet bgs in exploration locations TC-7 and TC-9. Soil sample analytical results are presented in "Analytical Results VOCs 0 to 7 Feet", Figure 4 and in Table 1.

Analytical results of the seep water sample indicate benzene, MTBE, and endosulfan were detected at concentrations greater than the MRL but less than applicable cleanup levels. Petroleum hydrocarbons, the remaining VOCs, cyanide, the remaining pesticides, and PCBs were not detected at concentrations greater than the MRLs (see Table 1). Because the seep water sample did not contain TCE, it was concluded that TCE-contaminated soil likely is not impacting groundwater and, therefore, the threat to human health and the environment from TCE in soil is low.

The slope stability evaluation concluded that the existing slope and Debris Field generally are stable in the current condition. GeoEngineers recommended aggressive stormwater management controls to reduce potential surface water run on through the Debris Field in combination with periodic monitoring of the slope stability. GeoEngineers concluded that complete removal of the Debris Field presented a high risk of instability to the structural integrity of the former Load Out Building and remaining hillside. GeoEngineers indicated the appropriate time for removal of the Debris Field, if necessary, is during mine closure when the incline of the overall slope could be reduced, lessening the potential for erosion of the hillside.

5.2 RECLAMATION PLAN

URS prepared a mine Reclamation Plan in September 2009 and identified potential areas of the POM that could be reclaimed. The plan included a mine reclamation cost estimate, identification of activities that can be implemented prior to mine closure, register of potential risk with identified hazards, and a framework for stakeholder engagement. The plan addressed multiple areas of the POM, including the Debris Field.

5.2.1 Reclamation Plan Findings and Recommendations

URS describes the Debris Field area as about 200 feet wide and 300 feet long (approximately 1.2 acres) and containing an estimated 9,960 cubic yards of material. The URS estimate of the Debris Field area/volume includes the portion located on SCL property. Their reclamation estimate assumes removal of debris/contaminated media to a depth of 5 feet over the areal extent of the Debris Field.

The Reclamation Plan recommended by URS proposes to remove and dispose of debris and potentially hazardous materials. After removal, the plan recommends regrading and revegetating the disturbed area to reduce the potential for erosion and improve slope stability.

5.3 2023 DATA GAP ASSESSMENT

Haley & Aldrich completed a Data Gap Assessment at the Debris Field in June, October, and December of 2023. 37 hand auger explorations were advanced within and near the Debris Field as previously delineated (see Figure 3); assessment locations primarily focused around locations that previously contained TCE concentrations greater than cleanup levels (TC-6, TC-7, and TC-9). Depths between 1 and 7 feet bgs (refusal) were explored and soil samples were collected at 1-foot depth intervals. Materials encountered are described in “Exploration Logs”, Appendix A. One seep water sample was collected from the previous seep sampled by GeoEngineers in 2005 (see Figure 3) and one media sample was collected from a metal drum containing granular, tailings-like media found in the Debris Field.

A total of 49 soil samples, the seep water sample, and the drum media sample were submitted to Eurofins Environment Testing Northwest, LLC (Eurofins) analytical laboratory in Spokane Valley, Washington for chemical analyses. Eurofins analyzed the soil samples for the following Contaminants of Potential Concern (COPC):

- total metals (arsenic, barium, cadmium, chromium, lead, selenium, silver, and zinc) by EPA Method 6010D and (mercury) by EPA Method 7471B (see “Summary of Soil Analytical Results - Metals”, Table 2);
- diesel and oil-range petroleum hydrocarbons (DRPH and ORPH, respectively) by NWTPH-Dx (see “Summary of Soil Analytical Results - PCBs and TPH”, Table 3);
- pesticides by EPA Method 8081B (see “Summary of Soil Analytical Results - Pesticides”, Table 4);
- VOCs by EPA Method 8260D (see “Summary of Soil Analytical Results - VOCs”, Table 5);
- PCBs by EPA Method 8082A (see Table 3); and
- cyanide by EPA Method 9012B (see Table 4).

Eurofins analyzed the media sample from the metal drum for total metals (arsenic, barium, cadmium, chromium, lead, selenium, silver, and zinc) by EPA Method 6010D and (mercury) by EPA Method 7471B. Eurofins analyzed the seep water sample for total metals by EPA Method 8260D and 7470A and VOCs by EPA Method 8260D (see “Summary of Seep Water Analytical Results - Metals”, Table 6 and “Summary of Seep Water Analytical Results - VOCs”, Table 7). Analytical reports for soil, drum media, and water samples are provided in “Laboratory Reports” Appendix B.

A slope stability assessment was also conducted by completing hand-driven cone penetrometer tests (CPT) at five locations in the Debris Field to evaluate relative competency of the material. These tests were conducted in areas of the Debris Field where fill material was assumed to be the thickest. Readings were converted to Standard Penetration Test (SPT) blows per foot (N) for correlation. In addition, the area was visually surveyed by walking three transects along the Debris Field slope and measuring angles of inclination of the hillside.

5.3.1 Data Gap Assessment Findings - Debris Field Limits and Slope Stability

Field observations during our assessment indicate the contiguous area of the Debris Field likely covers a smaller area than previously estimated. Haley & Aldrich generally defined the Debris Field limits based on the materials encountered during explorations and visual observations: locations containing fill material and/or various debris (metal, glass, wood, etc.) were considered as within the Debris Field limits; locations that lacked fill and/or debris were considered outside of the Debris Field limits. Based

on these indicators, the Debris Field is approximately 123 feet long and 155 feet wide and covers an area of approximately 0.25 acres; the revised estimated extent of the Debris Field is shown on Figure 3.

Results from CPT tests indicate the N values range from 20 to 51 blows per foot with an average of 33 blows per foot. Blow counts indicated the Debris Field soil ranges from medium dense to very dense. Based on standard correlation methodology, the average blow count indicates the soil has an internal friction angle of approximately 40 degrees. The interpreted relative density and friction angle are high enough to indicate the material is stable in its current condition. Due to the irregular configuration and varying thickness, it is difficult to model the Debris Field using conventional limit-equilibrium stability analysis; therefore, Haley & Aldrich relied on physical observations and professional judgement from a professional engineer licensed in the state of Washington to evaluate the slope stability.

Based on the visual inspection and the dynamic CPTs the Debris Field is considered stable and likely will remain so into the foreseeable future under current conditions. Minor settlement and sloughing is expected on a small scale as wood and other materials decompose. Haley & Aldrich recommends the Debris Field be left undisturbed (both the debris and the vegetation) unless removal of hazardous materials is required. Haley & Aldrich recommends stormwater runoff from up slope be directed around the Debris Field to limit saturation or erosion of the materials. Haley & Aldrich generated three cross section figures to visually represent profiles of the slopes and locations and depths of observed fill material; these are provided in “Cross Section A-A”, Figure 5; “Cross Section B-B”, Figure 6; and “Cross Section C-C”, Figure 7. Locations of transects are shown on Figure 3.

5.3.2 Data Gap Assessment Findings - Chemical Analyses

Analytical results indicate several metals were detected in the samples analyzed, including: arsenic, barium, cadmium, chromium, lead, mercury, selenium, silver, and zinc. DRPH and ORPH were detected between 18 and 74 mg/kg in the three samples analyzed, well below the MTCA Method A cleanup level of 2,000 mg/kg. PCBs, pesticides, and most VOCs were not detected at concentrations greater than method reporting limits. The VOCs p-isopropyltoluene, naphthalene, n-butylbenzene, toluene, and xylenes were detected in several samples, but at concentrations less than applicable MTCA Method A cleanup levels. Benzene was detected in one sample at an estimated concentration slightly greater than the MTCA Method A cleanup level. TCE also was detected at concentrations greater than cleanup levels in 16 samples from various depths.

Analytical results indicate that the eight samples collected from around TC-6 and TC-7 (exploration locations DF-HA-9 through -12 and DF-HA-3 through -6, respectively) did not contain TCE concentrations greater than the method detection limit (MDL). These results indicate that the TCE contamination at TC-6 and TC 7 is localized. Alternatively, 16 of the samples collected from around TC-9 contained concentrations of TCE greater than cleanup level. Haley & Aldrich collected these samples from the DF HA-19, -28, -33, -34, and -35 exploration locations (see Figure 4). TCE was detected at these locations between 1 and 7 feet bgs; however, vertical extent of TCE contamination at these locations could not be fully assessed due to steep slopes and challenging subsurface conditions. TCE concentrations encountered in DF-HA-19 increase from 0 to 4 feet bgs and then decrease from 4 to 7 feet bgs indicating TCE concentrations decrease with depth below 4 feet bgs. Exploration locations with TCE concentrations greater than cleanup levels are shown in Figure 4.

Analytical results for the seep water sample indicate the metals arsenic, barium, cadmium, chromium, lead, selenium, and silver were detected at various concentrations but less than applicable cleanup levels. VOCs, including TCE, were not detected at concentrations greater than the MRL.

Analytical results from the data gap assessment confirm previous findings made by GeoEngineers: TCE is present in soil at concentrations greater than cleanup levels. Benzene, cyanide, MTBE, organochlorine pesticides, DRPH, ORPH, and PCBs each were not detected in site media at concentrations greater than applicable cleanup levels. Per Ecology's 2022 opinion letter, metals exceedances within the existing Debris Field will be used to further guide the designation and disposal options for any wastes generated during remediation but will not affect the extent of the Debris Field as it is currently known. Given the above, TCE in soil remains the focus of remediation planning and is the only COC carried forward in this evaluation.

DRAFT

6. Conceptual Site Model

The conceptual site model (CSM) focuses on TCE as the primary contaminant within the Debris Field. The CSM assesses potential contaminant sources, fate and transport of chemical substances, media exposure pathways (i.e., surface soil, surface water, groundwater, and air) and potential human, aquatic, and terrestrial life receptors. The CSM is detailed in the following sections.

6.1 CONTAMINANT RELEASE

The exact source of the TCE contamination is unknown. TCE commonly has been used in stain removers, aerosol degreasers, cleaning wipes, adhesives and sealants, lubricants, and paints and coatings. It is likely that spent product was disposed in the Debris Field from maintenance activities prior to TWI operations. Detected TCE concentrations in the Debris Field generally are found in samples from exploration locations that also contained metal and/or glass debris and other fill materials indicating TCE contamination likely is co-located with other solid wastes disposed in the Debris Field.

6.2 FATE AND TRANSPORT

Analytical data from previous assessment indicates TCE concentrations are present within the delineated lateral extent of the Debris Field and the two localized areas near TC-6 and TC-7. Five hand auger locations sampled during the 2023 data gap assessment contained TCE concentrations greater than cleanup levels; these explorations are proximal to each other and are present down slope of mapped debris and/or other indications of slope failures. In addition, the greatest TCE concentrations detected are present in exploration DF-HA-19 at depths between 3 and 5 feet bgs. These findings indicate a TCE source likely is located near hand auger location DF-HA-19.

TCE does not bioaccumulate, is moderately soluble in water, is denser than water, and is not readily degraded in groundwater. TCE can breakdown the structure of clayey minerals making them more permeable. TCE does not readily bind to soil particles but will accumulate in small, residual quantities in soil pore spaces due to capillary pressure (EPA, 2024). TCE might degrade under anaerobic conditions; however, daughter products like dichloroethylene and vinyl chloride can be produced and are more difficult to degrade. Likely transportation mechanisms of TCE at the Debris Field include: infiltration, erosion (stormwater, mass wasting, anthropogenic influences, etc.), and volatilization.

6.2.1 Infiltration

The Debris Field likely was generated during mining operations prior to 1977 and has been exposed to the environment for a minimum of 47 years (as supported by the age and size of trees growing in the area). Analytical results from hand auger location DF-HA-19 indicate TCE concentrations exceed cleanup levels at 7 feet bgs, indicating infiltration of TCE might have occurred over time. The exploration log for DF-HA-19 indicates fill materials were encountered to a depth of approximately 5-1/2 feet bgs with native materials below. However, TCE contamination at this location extends to at least 7 feet bgs (refusal) indicating TCE has infiltrated into native soils beneath the debris.

6.2.2 Erosion - Stormwater

Stormwater runoff is a potential transport mechanism for TCE to enter surface water bodies-. The Debris Field is located on a steep hillside north of the former Load Out Building. The hillside slopes north/northwest toward the Pend Oreille River shoreline. Heavy storm events could have the potential to generate surface water runoff that may flow over/through the Debris Field to the north/northwest and down to the Pend Oreille River.

6.2.3 Erosion - Mass Wasting

Mass wasting is the movement of materials downslope under the influence of gravity. Mass wasting of the Debris Field was identified by GeoEngineers (2006) and by Haley & Aldrich in 2023. GeoEngineers identified a slope failure that occurred within the relatively loose soil/debris. The slope failure observed within the Debris Field likely occurred during a period of heavy precipitation when loose debris and soil became heavy and saturated and moved downhill under the force of gravity. GeoEngineers indicated these types of failures should be expected as materials in the debris degrade over time. Slope failures present a risk that large portions of the Debris Field could travel downslope, potentially introducing TCE contaminated material into the Pend Oreille River.

Haley & Aldrich did observe tilted trees during the data gap assessment. Tilted trees are commonly used as an indication of ground creep, a slow and continual movement of shallow soils downslope. Creep can be a mechanism for downslope movement over long periods of time and does not indicate a significant risk to immediate contaminant transport. However, ground creep can increase the risk of a more catastrophic mass wasting event occurring as shallow material moves downslope and other factors such as slope modification, saturated soils, and/or stormwater runoff contribute to unstable slope conditions.

6.2.4 Erosion - Anthropogenic

Potential remediation efforts may negatively influence stability of the hillside by eliminating underlying or lateral support. Remedial activities can result in fugitive dust emissions; however, this can be controlled by construction means and methods. It is likely that, after closure of the POM is complete, the Debris Field will not be subject to anthropogenic erosion.

6.2.5 Volatilization

Volatilization occurs when liquid organic compounds are converted to the gaseous phase. TCE is a VOC that has a high vapor pressure and is readily volatilized to the atmosphere. When released as a liquid to soil, TCE likely will evaporate to the atmosphere or infiltrate into the subsurface. TCE will form a vapor plume above vadose zone soils over a dissolved phase plume. When released to surface water, TCE will evaporate with a half-life of minutes or hours, depending on the surface water flow characteristics (EPA, 2024).

6.3 POTENTIAL RECEPTORS AND EXPOSURE

The potential receptors at the Debris Field include plants, animals, and humans. Potential exposure pathways include dermal contact, ingestion, and/or inhalation. Given the location of the Debris Field and steep slopes, TWI expects human activity to be rare (i.e., a random trespasser that would not linger due to the steepness of the slope); therefore, humans are not considered a primary receptor. Primary receptors going forward include soil biota, insects, avians, and small and large mammals.

6.3.1 Dermal

TWI expects small and large wildlife in the area may briefly come in contact with TCE contaminated soil. The Environmental Impact Statement (EIS) completed by ENSR in 200, identified several wildlife at the POM including:

- Amphibians and reptiles (i.e. frogs, salamander, toads, snakes turtles, and lizards),
- Birds (i.e. sparrows, thrushes, warbles, owls, and other migratory birds),
- Small and large mammals (i.e. rabbits, squirrels, gophers, mice, deer, bears, large cats)

TWI expects animal activity in the Debris Field area to primarily be transient: nesting, burrowing, and bedding areas were not observed during field activities. Dermal absorption of TCE by animals is expected to be a low risk. TWI assumes dermal contact with contaminated media is not a high-risk scenario for potential receptors.

6.3.2 Ingestion

Mammals in the area may be exposed to TCE by ingestion of small soil particles. Birds might also consume worms and other insects with soil particles attached that could contain TCE. Humans could ingest soil particles in the form of dust from the Debris Field during disturbance. Surface water samples collected from groundwater seeps did not contain detectable amounts of TCE; therefore, exposure to TCE from ingesting groundwater from seeps is not considered a complete pathway.

6.3.3 Inhalation

TCE is a volatile compound that can evaporate into the atmosphere. It is possible receptors passing through the Debris Field might be exposed to minute concentrations of TCE in the gaseous phase. However, the concentrations of TCE detected in soil samples generally are low, the lateral extent of contaminated material is relatively small, and the soil has been exposed to atmospheric conditions for at least 47 years; therefore, the risk of inhalation exposure is considered low.

7. Terrestrial Ecological Evaluation

A Terrestrial Ecological Evaluation (TEE) is required as part of the cleanup process under WAC 173-340. The goal of the TEE is to protect ecological receptors from adverse effects resulting from soil contamination. However, there are several exclusions that exclude a site from further evaluation listed under WAC 173-340-7491. Based on the preferred alternative that presented in the following sections, the site qualifies for an exclusion from the TEE process under WAC 173-340-7491 (1)(a) which states “All soil contaminated with hazardous substances is, or will be, located below the point of compliance established under WAC 173-340-7490(4). To qualify for this exclusion, an institutional control shall be required by the department under WAC 173-340-440. An institutional control is not required if the contamination is at least 15 feet bgs (WAC 173-340-7490 (4)(b)). An exclusion based on planned future land use shall include a completion date for such future development that is acceptable to the department.” The considered alternatives will remediate soil contamination up to the established point of compliance; therefore, the site is excluded from the TEE process.

The Debris Field is a steep, undeveloped, wooded hillside and likely will remain undeveloped. Considering the location of the Debris Field and closure of the POM, TWI expects that human exposures to the Debris Field contaminants likely are low and primarily would apply to trespasser scenarios. Flora and fauna are more likely receptors with complete exposure pathways. TWI plans to use the MTCA TCE Method A cleanup level of 0.03 mg/kg for unrestricted land use (cleanup level) for contaminated soil at the Debris Field. Seep sample analytical results indicate TCE contamination in soil has not impacted groundwater; therefore, remediation efforts should focus on soil and not the groundwater pathway.

8. Feasibility Study

The purpose of the FS is to consider and evaluate cleanup action alternatives and provide a recommended cleanup action for the site. Haley & Aldrich considered several factors when evaluating potential cleanup options including: the physical and chemical properties of TCE, areas of the Debris Field impacted by TCE, location of the Debris Field, and technologies and remedial techniques capable of addressing the contaminated media. The FS will provide cleanup alternatives to address TCE present in Debris Field soil at concentrations greater than 0.03 mg/kg. The desired timeframe to implement the cleanup action alternative is summer of 2025.

DRAFT

9. Point of Compliance and Remedial Action Goals

Analytical results from the Data Gap Assessment indicate TCE concentrations decrease with depth and the deepest sample was collected from about 7 feet bgs. The concentration of TCE at 7 feet bgs was slightly greater than the cleanup level (0.03 mg/kg); therefore, the vertical extent of contamination is estimated to be 8 to 10 feet bgs, which is less than the standard point of compliance in MTCA (15 feet bgs). The horizontal extent of contamination is delineated by exploration locations that contain TCE concentrations greater than the MTCA Method A cleanup level; these areas are shown on “Estimated Areal Extent of TCE Contamination”, Figure 8. For the purposes of this FS, the cleanup level for TCE is assumed to be 0.03 mg/kg, the MTCA Method A cleanup level for unrestricted land use listed in Table 740-1 in WAC 173 340-900.

DRAFT

10. Contaminated Media Characteristics

Results from investigations indicate that soil/debris materials in the Debris Field are contaminated with TCE, likely sorbed to small particles and volatilized in pore spaces. Soil material generally consists of silts, sands, and gravels, typical of native soils found at the POM. Debris material varies (glass, metal, wood, machine parts, etc.). The estimated areal extent of contamination is shown on Figure 8 and assessed depth of TCE contamination is shown on Figure 4. Haley & Aldrich used the extents of contamination shown in Figure 8, estimated depths of contamination, and ArcGIS (with a factor of safety) to estimate the volumes of contaminated soil present at the site (see “Estimated Volume of Contaminated Media”, Table 8). The estimated volume of contaminated media is 875 cubic yards.

DRAFT

11. Considered Remedial Technologies, Techniques, and Alternatives Screening

Remediation technologies considered in this FS are applicable to remediate soil contaminated with TCE. Haley & Aldrich identified five remediation technologies/alternatives (thermal remediation – electrical resistance, soil vapor extraction [SVE], *in situ* capping, removal and disposal, and the no action alternative) capable of remediating TCE contaminated soil in the Debris Field. The identified technologies are described in the following sections.

11.1 THERMAL REMEDIATION - ELECTRICAL RESISTANCE

Electrical resistance heating involves installing an *in situ* treatment system capable of inducing a direct electrical current in the soil, increasing temperatures to at least 212 degrees Fahrenheit. Electrical resistance heating requires installation of an array of electrodes around a central electrode to generate a current directed toward the central electrode. The array of electrodes is paired with vapor extraction wells that remove vapors and steam generated from the induced heat. The high temperatures introduced to contaminated soil will mobilize and volatilize VOCs like TCE. Extraction wells then remove vapors and steam containing TCE, thereby reducing TCE concentrations in soil. This technology is effective at removing TCE from soil, reducing/eliminating exposure pathways, and is considered a long-term permanent solution.

The advantage of thermal remediation is that the contaminated material remains *in situ*, eliminating potential risks and challenges associated with removal and has the potential to remediate the soil within the desired timeframe. However, this technology is known to be expensive, energy intensive, and complex to implement. The thermal reaction induced by the electrical current could react with other materials or waste products present in the Debris Field in unexpected ways and potentially generate hazardous byproducts.

11.2 SVE

SVE involves using extraction wells and induced vacuum pressure to volatilize and extract VOCs from soil. SVE technology works by installing a network of vapor extraction wells into vadose zone soil to induce subsurface airflow through contaminated soil. The induced airflow promotes volatilization of TCE, which is then expelled to the atmosphere, following treatment if necessary to comply with air quality regulations. Typical treatment includes using a filter media like granular activated carbon. SVE treatment can either be passive or active.

Passive SVE – can enhance natural attenuation of VOCs by using natural pressure gradients between the subsurface and the atmosphere; additional enhancements can be achieved by using renewable energy resources (wind and solar). This technology is limited by soil moisture and permeability. Renewable energy solutions also can be limited by daylight hours and wind variability. Passive SVE is best suited for sites with low levels of contamination and typically is performed over a longer time frame.

Active SVE – removes VOCs from soil by applying vacuum pressure using powered blowers. This technology also can be limited by soil moisture and permeability; but, the use of powered equipment generally can overcome some subsurface conditions and shortens remediation timeframes.

SVE is a viable option to treat TCE contamination, both active and passive SVE, requires permeable and low moisture soils. Based on the exploration logs, Debris Field soils primarily consist of poorly graded gravel with silt and sand which generally are favorable for SVE. In addition, concentrations of TCE greater than cleanup levels are estimated to be within 10 feet of the ground surface. Passive SVE with solar application might be limited at the Debris Field due to tree canopy cover; however, wind options are also possible and could be combined with solar to extend run times. Active SVE remediation is a viable option at the Debris Field and power for an active SVE system is available from existing infrastructure at the POM.

11.3 IN SITU CAPPING

Engineered caps are designed to remove the direct-contact pathway to contaminated media by covering the contaminated media with a barrier. Caps can be constructed using earthen materials, low permeability layers, hard caps, or other methods. The advantage of capping is that contaminated soils remain in place, eliminating challenges associated with difficult site conditions (i.e., steep slopes, unstable materials, etc.), transporting contaminated media on public roads (with the associated emissions), and disposal. In-place caps should address pathways for ecological receptors, consider surface water management to prevent infiltration, and require designs to minimize erosion and/or other disturbances that could compromise capping materials. Low-permeability caps may be used as final cover for soil disposal areas. These types of covers typically consist of a clay or high-density polyethylene (HDPE) low-permeability layer covered with topsoil and shallow-rooting vegetation to reduce infiltration of surface water and prevent contamination from migrating. Like soil capping, hard caps (such as concrete and asphalt) can prevent human contact by creating an impermeable physical barrier.

Capping material (soil, sand, gravel, rock, etc.) may be purchased from offsite sources. However, the design process should consider the use of materials generated on site or available from nearby sources as an alternative to purchased materials. Regardless of cap design, a restrictive covenant must be recorded on the property following cap installation; the restrictive covenant will limit future use of the property and require maintenance of the cap.

11.4 REMOVAL AND DISPOSAL

Removal and disposal generally refers to excavating and removing material with TCE concentrations greater than the cleanup level, properly designating the waste, including considering the presence of heavy metals, and transporting the materials off site to an appropriate disposal facility. Contaminated media typically are transported to a landfill facility compliant with Resource, Conservation, and Recovery Act (RCRA) Subtitle C (for hazardous waste) or RCRA Subtitle D (for non-hazardous waste). This remedial alternative assumes contaminated material is removed along with solid waste from within the estimated areal extent of the Debris Field to approximately 7 to 10 feet bgs (see Figure 8). The advantage of this alternative is that it removes the direct-contact pathway, generally can be accomplished in short timeframes, and permanently removes contaminated media from the site. After removal and disposal, the hillside can be reclaimed to resemble native conditions with grading and native vegetation.

11.5 NO ACTION

A no action alternative can be an effective strategy to maintain the current ecosystem established on the Debris Field. Any implementation of the previously mentioned alternatives will necessarily disturb the existing ecosystem and could induce some instability of the slope. The current ecosystem of the

Debris Field appears to be flourishing where vegetation density and indications of wildlife appears to be similar to other, undisturbed, areas of the POM. According to the slope stability analyses conducted by GeoEngineers and Haley & Aldrich, the Debris Field is stable and a no action approach will maintain slope stability.

11.6 CLEANUP ALTERNATIVE SCREENING

Haley & Aldrich prepared a table to rank the considered remedial technologies for protectiveness, complexity, long-term effectiveness, and implementability. The alternative attributes were scored on a scale of 1 through 5 and the remedial alternatives with the highest scores were advanced for further consideration. Results of the alternative ranking are summarized in “Cleanup Alternatives Screening”, Table 9.

Given the complexity and risks associated with thermal remediation – electrical resistance TWI did not advance this remedial technology as a feasible alternative. TWI also did not advance capping as a preferred cleanup alternative because the Debris Field slopes increase the complexity and implementability of this alternative. TWI considers SVE, removal and disposal, and no action as feasible alternatives.

12. Evaluated Cleanup Alternatives

Haley & Aldrich evaluated both passive and active SVE systems along with removal and disposal alternatives to address TCE contamination at the Debris Field. Alternative scenarios focused on cleanup near explorations DF-HA-19, -33, -34, -37, and TC-9 within the approximate areal extent of TCE contamination (see Figure 8). The removal and disposal alternative assumes removal of the material contaminated with TCE at concentrations greater than MTCA Method A cleanup levels and partial reclamation of the hillside.

The estimated extent of the material to be addressed for each alternative is shown in Figure 8 and summarized in Table 8. Haley & Aldrich evaluated the alternatives detailed below based on the remedial action objectives and cost (collectively referred to herein as “performance criteria”). Detailed descriptions of each alternative and evaluations are provided in the following sections.

12.1 ALTERNATIVES 1A AND 1B - SVE

Alternatives 1A and 1B include *in situ* SVE treatment of contaminated soils with concentrations of TCE greater than cleanup levels within the approximate areal extent of TCE contamination (See Figure 8). These alternatives generally include:

- Pilot Study;
- Design;
- Installation of an SVE system;
- Operation, monitoring, and maintenance/ repair; and
- Decommissioning.

12.1.1 Alternative 1A - Passive SVE

Alternative 1A includes the design, installation, and operation of a passive SVE within the approximate areal extent of TCE contamination shown in Figure 8. TWI will backfill with borrow material sourced on site and will plant native grasses and trees.

This alternative assumes a pilot study will be completed to collect data to estimate air flow rates in soil and estimate the appropriate number of vapor extraction wells. The passive SVE system will use wind turbines to induce airflow through the soil for extraction of TCE vapors. This alternative assumes up to five vapor extraction wells will be installed and screened approximately 5 to 10 feet bgs; the wells will be completed aboveground and equipped with wind-driven turbines at the top of the well casings. TWI assumes this alternative will discharge TCE vapors to the atmosphere at concentrations that will not require an air quality permit. This alternative assumes quarterly monitoring (including sampling and analysis of TCE vapors) to track declines in TCE concentrations.

Protectiveness: This alternative would provide a high degree of protectiveness by removing TCE from the soil and reducing concentrations to below applicable cleanup levels.

Permanence: TCE would be removed from the Debris Field under this alternative, reducing the likelihood of exposure to receptors.

Long-Term Effectiveness: This alternative results in the removal of TCE in the Debris Field. As a result, this alternative is effective in the long-term.

Management of Short-Term Risk: There is potential for minor short-term risks associated with this alternative, primarily exposure to volatilized TCE from vapor well emissions. However, anticipated TCE emissions from this system are expected to be diluted and low concentrations. Short-term risks could be further minimized by administrated means (i.e., preparing and operating under a Health & Safety Plan [HASP]).

Implementability: SVE technology is an effective and widely used remediation alternative. Additionally, results from the pilot study will further determine implementability of this alternative. Contractors and supplies to support this alternative are available within 100 miles of the POM and can readily be implemented. However, the area around the TCE contamination is densely wooded and the slopes are steep; therefore, access to drill system wells will be challenging.

Consideration of Public Concerns: The Debris Field is located over 3 miles from the nearest town and the site is on private land. Public concern for this alternative likely would be minimal. This alternative will not have impacts on vulnerable populations or overburdened communities.

Restoration Time Frame: Without a pilot study to generate extraction rates, the timeframe for this option is difficult to approximate. Considering TCE concentrations, potential soil permeability, and variability of weather conditions, this option likely would require up to seven years of treatment to achieve cleanup. This alternative would require monitoring during the treatment phase.

Cost: The estimated total cost of this alternative is \$1,019,000 (costs are rounded up to the nearest thousand). The assumptions, anticipated tasks, labor and materials, and associated costs used to develop this estimate are summarized in “Alternative 1A - Cost Estimate”, Table 10.

12.1.2 Alternative 1B - Active SVE

Alternative 1B includes the design, installation, and operation of an active SVE system within the approximate areal extent of TCE contamination.

This alternative assumes a pilot study will be completed to collect data to estimate air flow rates in soil and estimate the appropriate number of vapor extraction wells. This alternative assumes an active SVE system comprised of two vapor extraction wells, associated piping, and mechanical shed will be installed at the site. Each extraction well will be manifolded to blowers that extract soil vapors. After extraction, the soil vapors will pass through a moisture knock-out system and then through a granular active carbon filter to remove TCE. This alternative assumes the system is monitored monthly to confirm system operation and to collect air samples to monitor filter performance. The active SVE system would operate until confirmation soil sample analyses confirm TCE concentrations have reduced to acceptable levels.

Protectiveness: This alternative provides a high degree of protectiveness by removing TCE from the soil and reducing concentrations to below applicable cleanup levels

Permanence: TCE would be removed from the Debris Field under this alternative, reducing the likelihood of exposure to receptors.

Long-Term Effectiveness: This alternative results in the removal of TCE in the Debris Field. As a result, this alternative is effective in the long-term.

Management of Short-Term Risk: There is potential for minor short-term risks associated with this alternative, primarily exposure to volatilized TCE from vapor well emissions. However, anticipated TCE emissions from this system will be treated. Short-term risks could be further minimized by administrated means (i.e., preparing and operating under a HASP).

Implementability: SVE technology is an effective and widely used remediation strategy. Additionally, results from the pilot study will further determine implementability of this alternative. Contractors and supplies to support this alternative are available within 100 miles of the site and, with controls in place to prevent worker exposure, can readily be implemented. This option does require electricity but, power is available at the site.

Consideration of Public Concerns: The site is located over 3 miles from the nearest town and public access to the site is not readily available. Public concern likely would be minimal with this alternative. Additionally, this alternative will not have impacts on vulnerable populations or overburdened communities.

Restoration Time Frame: A pilot study would be conducted to assess extraction rates and better estimate the timeframe to reach cleanup; but this alternative would restore soil concentrations in a shorter time period when compared to a passive SVE system (Alternative 1A). Depending on soil permeability, this option likely would achieve cleanup levels within one year of operation. This alternative would require monitoring during the treatment phase.

Cost: The estimated total cost of this alternative is between approximately \$696,000 (costs are rounded up to the nearest thousand). The assumptions, anticipated tasks, labor and materials, and associated costs used to develop this estimate are summarized in "Alternative 1B - Cost Estimate", Table 11.

12.2 ALTERNATIVE 2 - REMOVAL AND DISPOSAL

Alternative 2 includes the removal of TCE-contaminated media within the approximate areal extent shown on Figure 8. It is estimated that there is approximately 863 cubic yards of material within these areas to be removed. This alternative includes removing and disposing of TCE-contaminated material and associated debris off site. This alternative generally includes:

- Clearing trees for site access;
- Excavating TCE-contaminated soil and debris (i.e. drums, metal, glass, etc.);
- Properly designating the waste including analytical results for RCRA 8 metals (samples DF-HA-19);
- Transporting and disposing of materials at an appropriate disposal facility; and
- Backfilling using on-site borrow sources.

Protectiveness: This alternative would provide the highest degree of protectiveness by removing TCE contaminated media from the site until confirmation samples indicate TCE concentrations are reduced to acceptable levels.

Permanence: Debris and TCE-contaminated media would be removed from the site under this alternative, removing the exposure pathway for receptors.

Long-Term Effectiveness: This alternative results in the removal of debris and TCE-contaminated material from the site. As a result, this alternative provides a high degree of effectiveness over the long term.

Management of Short-Term Risk: There is potential for minor short-term risks associated with this alternative, primarily worker exposure to volatilized TCE from excavated materials. However, short-term risks could be minimized by administrated means (i.e., preparing and operating under a HASP). Physical risks include working on steep slopes and potentially unstable soil/debris conditions.

Implementability: The area is accessible from the former Load Out Building area but is on a steeper slope and would pose a greater challenge to access, excavate, and backfill. This alternative could be implemented but poses several challenges.

Consideration of Public Concerns: Transportation of contaminated media off site through residential and public rights-of-way could be public concern but, the transportation route primarily passes through rural lands. This alternative would generate a larger volume of materials when compared to Alternative 2 and a proportional increase in traffic through town areas but, this increase would occur for a short duration (eight weeks). This alternative is not anticipated to have impacts on vulnerable populations or overburdened communities.

Restoration Time Frame: This alternative does not require long-term monitoring and would be considered complete following removal, confirmation sampling and analysis, and backfilling. Removal of TCE contaminated media from the site likely would be completed in eight weeks. The restoration timeframe for this alternative is relatively short compared to the SVE alternatives.

Cost: The estimated total cost of this alternative is \$1,006,000 (costs are rounded up to the nearest thousand). The scope of work breakdown and associated costs used to develop this estimate are summarized in "Alternative 2 - Cost Estimate", Table 12.

12.3 ALTERNATIVE 3 - NO ACTION

Alternative 3 includes no action taken to address the TCE contamination present at the Debris Field. This alternative leaves the Debris Field undisturbed and in its current state, preserving the natural habitat that has developed over the Debris Field. This option reduces the risk of erosion that inevitably is increased by vegetation removal and excavation. Under this alternative, TCE present in the subsurface would be left in-place to attenuate through natural processes over time.

Protectiveness: This alternative would provide low protectiveness by allowing TCE contaminated material to remain in place and untreated.

Permanence: Debris and TCE-contaminated media would not be removed or remediated from the site providing no permanence in remediation.

Long-Term Effectiveness: This alternative results in TCE contaminated material remaining in place. As a result, this alternative provides a low degree of effectiveness over the long term.

Management of Short-Term Risk: There is no potential for short term risks to this alternative. This alternative will eliminate short term risks associated with loose or unstable debris.

Implementability: The implementability of this alternative is high as no action is necessary.

Consideration of Public Concerns: There will be no considerations of public concern to implement this alternative.

Restoration Time Frame: Restoration time frame to attenuate TCE concentrations to acceptable levels (based on a first order decay model with starting concentration of 5.7 mg/kg and ending concentration of 0.03 mg/kg) is approximately 52 years.

Cost: The estimated total cost of this alternative is zero dollars.

13. Preferred Alternative

Haley & Aldrich compared each of the three cleanup alternatives listed above by ranking the performance criteria of each from 1 to 5, with 1 being the lowest score and 5 being the highest. Performance criteria considered included: protectiveness, performance, long-term effectiveness, short-term risk, implementability, consideration of public concerns, and restoration timeframe. The alternatives also were ranked 1 through 4 using a disproportionate cost analysis (DCA) where the most expensive alternative was ranked the lowest (1) and the least expensive alternative was ranked the highest (4). The total score for each alternative is simply the sum of the individual performance criteria values plus the DCA value. Total scores and rankings are provided in “Alternative Ranking and Disproportionate Cost Analysis”, Table 13. Alternatives 1A, 1B, 2, and 3 scored 28, 29, 27, and 24 respectively.

Alternative 1B had the highest total score of 29 and has a similar performance criteria score when compared to Alternatives 1A and 2. Alternative 1B requires less disturbance of the hillside and is more protective of the established ecosystem within the Debris Field when compared to the removal option (Alternative 2). Additionally, Alternative 1B has a shorter restoration timeframe than Alternative 1A and is estimated to be about \$323,000 less expensive than installing and monitoring a passive SVE system (Alternative 1A). With no cost to implement, the benefit of maintaining the established ecosystem currently present above the Debris Field, and a score of 24, Alternative 3 should be considered if maintaining the ecosystem is considered a greater benefit than remediation of TCE in the Debris Field. However, based on the alternative ranking and disproportionate cost analysis, Alternative 1B is the recommended remedial action to address TCE-contaminated media in the Debris Field.

14. Limitations

Work for this project was performed, and this report prepared, in accordance with generally accepted professional practices for the nature and conditions of the work completed in the same or similar localities, at the time the work was performed. This report is intended for the exclusive use of TWI for specific application to the referenced property. This report is not meant to represent a legal opinion. No other warranty, express or implied, is made.

MTCA Method A Cleanup Level Unrestricted Land Use				-												1				2,000		2,000				

Notes:**Bold** denotes a detected concentration.

Blue shading denotes a detected analyte concentration exceeding a MTCA Method A Unrestricted Cleanup Level.

-: Not analyzed or not available.

bgs: below ground surface

Diesel- and Oil-range petroleum hydrocarbons analyzed by Northwest Total Petroleum Hydrocarbon Method NWTPHDx

ft: feet

J: Value is estimated

mg/kg: Milligrams per kilogram.

MTCA: Model Toxics Control Act

PCBs: Polychlorinated biphenyls

U: Not detected above the indicated laboratory method detection limit.

MTCA Method B Direct Contact				8,000	-	-	1,600	-	-	24,000	240	-	-	-	16,000	-

Notes:

Bold denotes a detected concentration.

Blue shading denotes a detected analyte concentration exceeding a cleanup level.

-: Not analyzed or not available.

*+: LCS and/or LCSD is outside acceptance limits, high biased.

bgs: below ground surface

F1: MS and/or MSD recovery exceeds control limits.

ft: feet

J: Value is estimated

mg/kg: Milligrams per kilogram.

MTCA: Model Toxics Control Act

NA: No Action level established

R: value rejected, the data are unusable

U: Not detected above the indicated laboratory reporting limit.

Not detected above the indicated method detection limit for Trichloroethene.

HISTORIC DEBRIS FIELD
PEND OREILLE MINE
TECK WASHINGTON INC
METALLINE FALLS, WASHINGTON

Technology/Alternative		Protectiveness	Complexity	Long-Term Effectiveness	Implementability	Score
Thermal Remediation - Electrical Resistance	Electrical Resistance Heating involves installing an in-situ treatment system capable of inducing a direct electrical current in the soil material to increase soil temperatures to at least 212 degrees fahrenheit. The heated soil will volatize the TCE present in the soil thereby reducing concentrations. The steam and vapors produced by the reaction will be captured and treated at the surface.	5	1	5	1	12
Soil Vapor Extraction	Soil vapor extraction includes installation of extraction wells designed to remove vapor within pore space of soil. This technology can be applied either passively or actively and will work to create a flow of air that removes volatile contaminants from the soil.	5	3	5	4	17
Capping	Capping includes placing a low permeability barrier on top of the contaminated soil. The barrier will reduce potential of meteoric water infiltration into the subsurface eliminating the surface soil to groundwater pathway.	3	4	4	1	12
Removal and Disposal	Removal and disposal include excavating and disposing of TCE contaminated soil and/or solid waste. Soil material will be excavated, transported offsite, and disposed of in a landfill at an acceptable disposal facility.	5	5	5	2	17
No Action	No action alternative includes leaving all soil material in place and limiting access to site.	1	5	2	5	13

Note:

Criteria ranked between 1 and 5. 1 represents the least protective, most complex, least effective, and most difficult to implement and 5 represents the most protective, least complex, most effective, and easiest to implement.

APPENDIX A
Exploration Logs

DRAFT

Sample Description

Identification of soils in this report is based on visual field and laboratory observations which include density/consistency, moisture condition, grain size, and plasticity estimates and should not be construed to imply field nor laboratory testing unless presented herein. ASTM D 2488 visual-manual identification methods were used as a guide. Where laboratory testing confirmed visual-manual identifications, then ASTM D 2487 was used to classify the soils.

Relative Density/Consistency

Soil density/consistency in borings is related primarily to the standard penetration resistance (N). Soil density/consistency in test pits and probes is estimated based on visual observation and is presented parenthetically on the logs.

SAND or GRAVEL Relative Density	N (Blows/Foot)	SILT or CLAY Consistency	N (Blows/Foot)
Very loose	0 to 4	Very soft	0 to 1
Loose	5 to 10	Soft	2 to 4
Medium dense	11 to 30	Medium stiff	5 to 8
Dense	31 to 50	Stiff	9 to 15
Very dense	>50	Very stiff	16 to 30
		Hard	>30

Minor Constituents

Sand, Gravel	Estimated Percentage
Trace	<5
Few	5 - 15
Cobbles, Boulders	
Trace	<5
Few	5 - 10
Little	15 - 25
Some	30 - 45

Soil Test Symbols

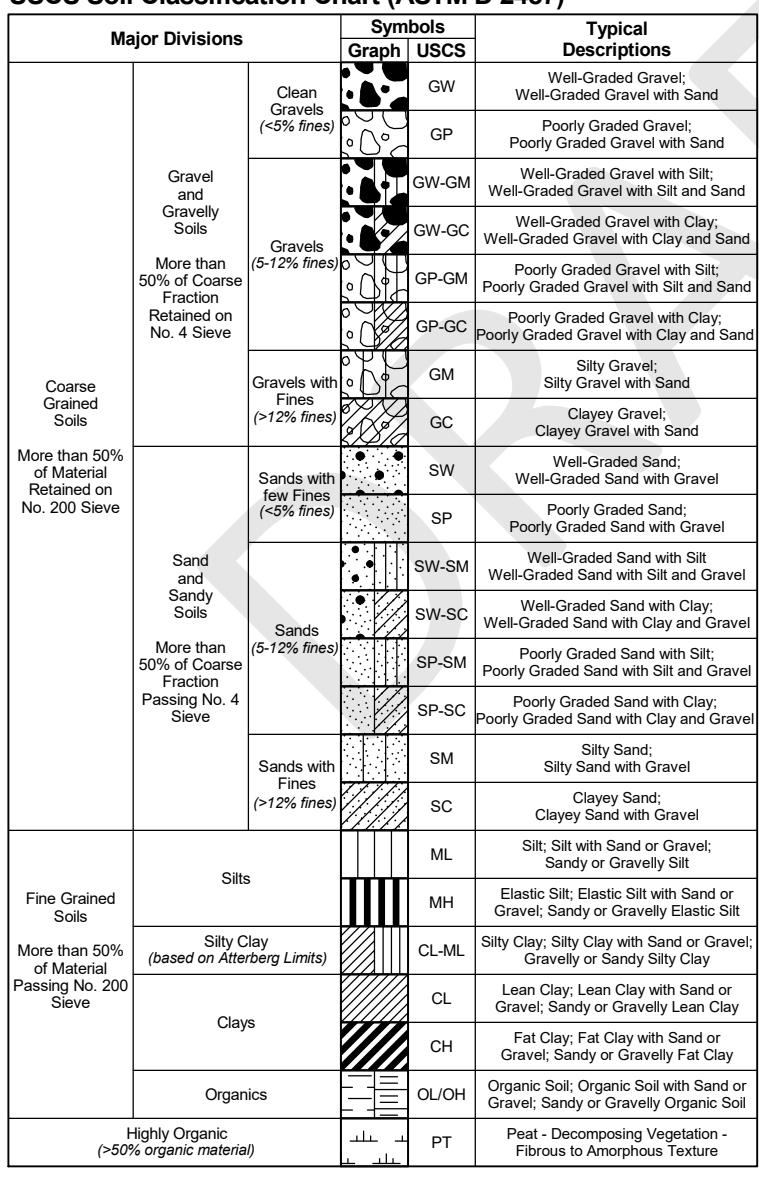

%F	Percent Passing No. 200 Sieve
AL	Atterberg Limits (%)
	Liquid Limit (LL)
	Water Content (WC)
	Plastic Limit (PL)

CA	Chemical Analysis
CAUC	Consolidated Anisotropic Undrained Compression
CAUE	Consolidated Anisotropic Undrained Extension
CBR	California Bearing Ratio
CIDC	Consolidated Drained Isotropic Triaxial Compression
CIUC	Consolidated Isotropic Undrained Compression
CK0DC	Consolidated Drained k0 Triaxial Compression
CK0DSS	Consolidated k0 Undrained Direct Simple Shear
CK0UC	Consolidated k0 Undrained Compression
CK0UE	Consolidated k0 Undrained Extension
CRSCN	Constant Rate of Strain Consolidation
DS	Direct Shear
DSS	Direct Simple Shear
DT	In Situ Density
GS	Grain Size Classification
HYD	Hydrometer
ILCN	Incremental Load Consolidation
K0CN	K0 Consolidation
kc	Constant Head Permeability
kf	Falling Head Permeability
MD	Moisture Density Relationship
OC	Organic Content
OT	Tests by Others
P	Pressuremeter
PID	Photoionization Detector Reading
PP	Pocket Penetrometer
SG	Specific Gravity
TRS	Torsional Ring Shear
TV	Torvane
UC	Unconfined Compression
UUC	Unconsolidated Undrained Triaxial Compression
VS	Vane Shear
WC	Water Content (%)

Moisture

Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

USCS Soil Classification Chart (ASTM D 2487)

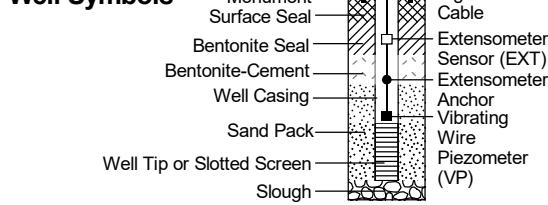

Groundwater Indicators

▽	Groundwater Level on Date or At Time of Drilling (ATD)

Hole Diameter: 4 inches Well Casing Diameter: NA
Total Depth: 2 feet Depth to Groundwater: Not Identified

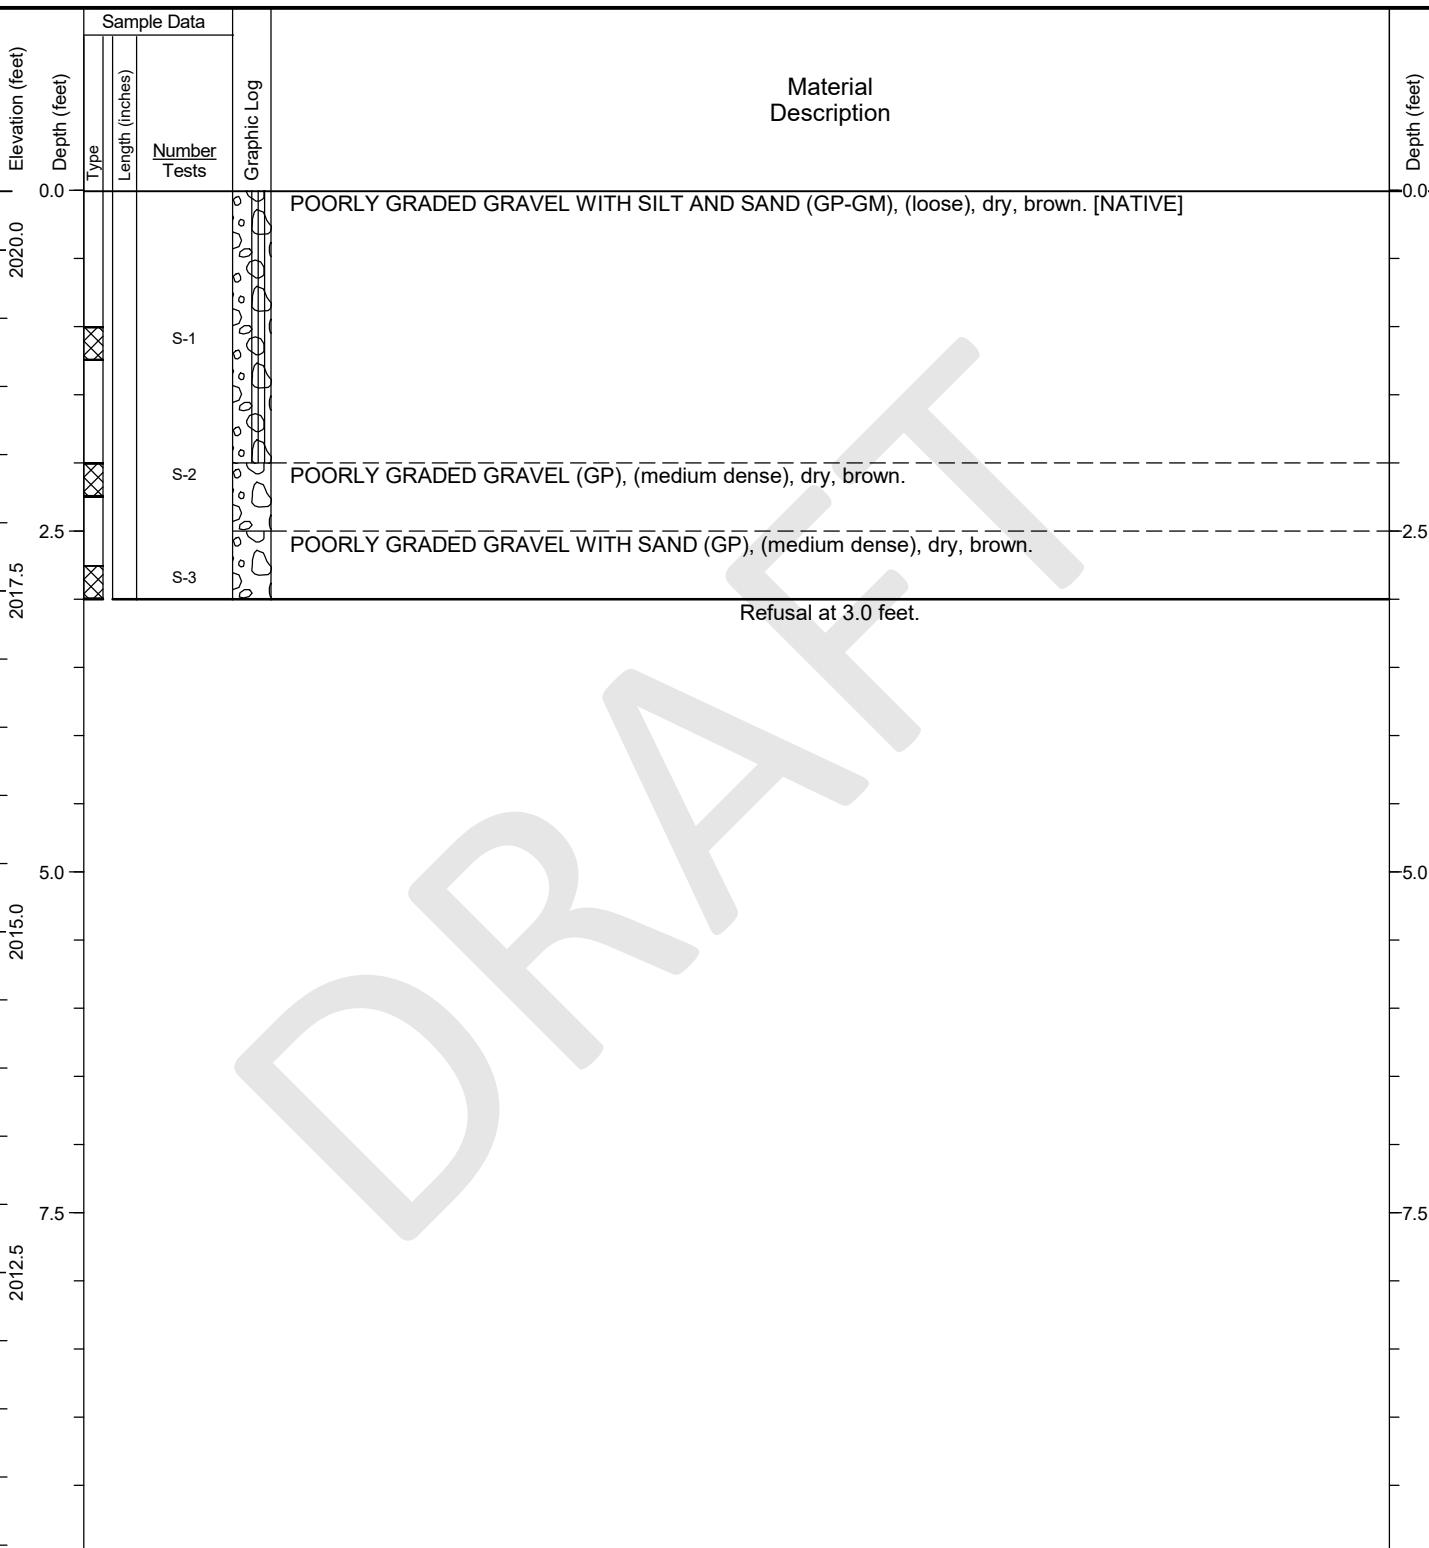

Comments: _____

General Notes:

- General Notes:**

 1. Refer to Figure A-1 for explanation of descriptions and symbols.
 2. Material stratum lines are interpretive and actual changes may be gradual. Solid lines indicate distinct contacts and dashed lines indicate gradual or approximate contacts.
 3. USCS designations are based on visual-manual identification (ASTM D 2488), unless otherwise supported by laboratory testing (ASTM D 2487).
 4. Groundwater level, if indicated, is at time of drilling/excavation (ATD) or for date specified. Level may vary with time.
 5. Location and ground surface elevations are approximate.

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Narrative

Revision

The report being provided is a revision of the original report sent on 6/29/2023. The report (revision 1) is being revised due to: Reanalyzed the following samples for Cadmium at a lesser dilution: DF-HA-2(1) 590-20704-4, DF-HA-6(1) 590-20704-13 & DF-HA-17(1) 590-20704-18.

Receipt

The samples were received on 6/7/2023 10:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.3° C.

Receipt Exceptions

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): DF-HA-12(3) (590-20704-41). The sample has been placed on hold.

The following samples were listed on the Chain of Custody (COC); however, no samples were received: DF-HA-17(1) (590-20704-31), DF-HA-17(2) (590-20704-33), DF-HA-10(1) (590-20704-35) and DF-HA-10(2) (590-20704-36). The samples appear to be listed in duplicate.

GC Semi VOA

Method 8081B: The %RPD between the primary and confirmation column exceeded 40% for trans-Chlordane, Heptachlor epoxide, and Endosulfan sulfate for the following samples: DF-HA-6(1) (590-20704-13). The lower value has been reported and qualified in accordance with the laboratory's SOP.

Method 8081B: The continuing calibration verification (CCV) associated with batch 280-617595 recovered above the upper control limit for 4,4'-DDT. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: DF-HA-6(1) (590-20704-13), (CCV 280-617595/18) and (CCVIS 280-617595/4).

Method 8081B: The following sample required a mercury clean-up, via EPA Method 3660A, to reduce matrix interferences caused by sulfur: DF-HA-6(1) (590-20704-13). The reagent lot number used was: P14J012.

Method 8081B: The method blank associated with preparation batch 280-617243 and analytical batch 280-617595 contained 4,4'-DDT greater than one-half the reporting limit (RL). Associated samples were ND for the analytes; therefore, the data have been reported.

Method NWTPH-Dx: Detected hydrocarbons appear to be due to individual peaks and may be possible biogenic interference in the following samples: DF-HA-6(1) (590-20704-13), DF-HA-10(1) (590-20704-16) and (590-20704-A-13-B DU).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 7471B: The method blank for preparation batch 590-42091 and 590-42091 and analytical batch 590-42102 contained Mercury above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep

Method 3546: The following sample was re-prepared outside of preparation holding time due to DDT contamination in the method blank: DF-HA-6(1) (590-20704-13). Method 8081B.

Method 3546: Insufficient sample volume was available to perform a matrix spike/matrix spike duplicate (MS/MSD) associated with preparation batch 280-617243, therefore, LCSDs were performed instead. Method

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
p1	The %Difference between the primary and confirmation column/detector is >40%. The lower value has been reported.

Metals

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty

Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyze

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty.

Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyze

Chain of Custody Record

Client Information (Sub Contract Lab)

Note: Since laboratory accreditation are subject to change, Eurofins Environment Testing Northwest, LLC places the ownership of method, analysis & accreditation compliance upon our subcontract laboratories. This same shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analytes/testmatrix provided, the samples must be shipped back to the Eurofins Environment Testing Northwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northwest, LLC attention immediately. If all requested accreditations are current to date, return the signature Chain of Custody attesting to Eurofins Environment Testing Northwest, LLC.

Narrative

Receipt

The samples were received on 6/7/2023 10:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.3° C.

Receipt Exceptions

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): DF-HA-12(3) (590-20704-41)

The following samples were listed on the Chain of Custody (COC); however, no samples were received: DF-HA-17(1) (590-20704-31), DF-HA-17(2) (590-20704-33), DF-HA-10(1) (590-20704-35) and DF-HA-10(2) (590-20704-36).

The following samples were listed on the COC in duplicate: DF-HA-1(1) (590-20704-1), DF-HA-1(2) (590-20704-2), DF-HA-1(2.5) (590-20704-3), DF-HA-2(1) (590-20704-4), DF-HA-2(2) (590-20704-5), DF-HA-3(1) (590-20704-6), DF-HA-3(2) (590-20704-7), DF-HA-4(1) (590-20704-8), DF-HA-4(2) (590-20704-9), DF-HA-4(3) (590-20704-10), DF-HA-5(1) (590-20704-11), DF-HA-5(2) (590-20704-12), DF-HA-6(1) (590-20704-13), DF-HA-6(2) (590-20704-14), DF-SW-1 (590-20704-15), DF-HA-10(1) (590-20704-16), DF-HA-10(2) (590-20704-17), DF-HA-17(1) (590-20704-18), DF-HA-17(2) (590-20704-19), DF-HA-17(3) (590-20704-20), DF-HA-15(1) (590-20704-21), DF-HA-15(2) (590-20704-22), DF-HA-12(1) (590-20704-23), DF-HA-12(2) (590-20704-24), DF-HA-23(1) (590-20704-25), DF-HA-23(2) (590-20704-26), DF-HA-23(3) (590-20704-27), DF-HA-11(1) (590-20704-28), DF-HA-11(2) (590-20704-29), DF-HA-11(3) (590-20704-30), DF-HA-17(1) (590-20704-31), DF-HA-9(3) (590-20704-32), DF-HA-17(2) (590-20704-33), DF-DRUM-1 (590-20704-34), DF-HA-10(1) (590-20704-35), DF-HA-10(2) (590-20704-36), DF-HA-9(2) (590-20704-37), DF-HA-9(1) (590-20704-38), DF-HA-11(5) (590-20704-39), DF-HA-11(4) (590-20704-40) and DF-HA-12(3) (590-20704-41).

The following sample was activated for 6010D RCRA 8 Metals and 6020B Zinc analysis by the client on 06/12/23: DF-DRUM-1 (590-20704-34). This analysis was not originally requested on the chain-of-custody (COC).

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-42042 recovered outside acceptance criteria, low biased, for Hexachlorobutadiene. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-42059 recovered above the upper control limit for 1,2,3-Trichloropropane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The method blank for analytical batch 590-42059 contained 1,2,3-Trichlorobenzene above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep

Method 5035: For the following samples, containers with matching sample IDs could not be located. Many containers in this job had no sample IDs on them at all and the laboratory had to use their best judgment to determine their ID's and thus, there is a possibility they are incorrect.

DF-HA-5(1) (590-20704-11) and DF-HA-6(1) (590-20704-13)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received extra samples not listed on COC. and missing samples
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

JOB DESCRIPTION

POM Historic Debris Field/0203154-013

JOB NUMBER

590-20704-4

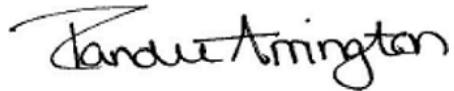

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-20704-4

Job ID: 590-20704-4

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/7/2023 10:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.3° C.

Receipt Exceptions

The following samples were activated for 6010D Lead analysis by the client on 07/05/23: DF-HA-2(2) (590-20704-5), DF-HA-4(2) (590-20704-9), DF-HA-5(2) (590-20704-12), DF-HA-6(2) (590-20704-14) and DF-HA-17(2) (590-20704-19). This analysis was not originally requested on the chain-of-custody (COC).

The following samples were activated for 6010D Cd & Pb analysis by the client on 07/05/23: DF-HA-15(2) (590-20704-22), DF-HA-23(2) (590-20704-26), DF-HA-11(2) (590-20704-29) and DF-HA-9(2) (590-20704-37). This analysis was not originally requested on the chain-of-custody (COC).

The following samples were activated for 6010D As, Cd & Pb analysis by the client on 07/05/23: DF-HA-10(2) (590-20704-17) and DF-HA-12(2) (590-20704-24). This analysis was not originally requested on the chain-of-custody (COC).

Metals

Method 6010D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 590-42434 and analytical batch 590-42461 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010D: The sample duplicate (DUP) precision for preparation batch 590-42434 and analytical batch 590-42461 was outside control limits. Sample matrix interference is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received extra samples not listed on COC. and missing samples
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Attn: John Haney
Haley & Aldrich, Inc.
505 W Riverside Ave
Suite 205
Spokane, Washington 99201

Generated 8/7/2023 4:24:30 PM

JOB DESCRIPTION

POM Historic Debris Field/0203154-013

JOB NUMBER

590-20704-5

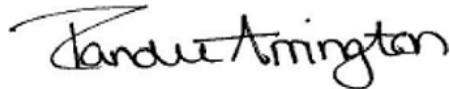

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-20704-5

Job ID: 590-20704-5

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/7/2023 10:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.3° C.

Receipt Exceptions

The following sample was activated for 6010D Cadmium analysis by the client on 07/21/23: DF-HA-9(3) (590-20704-32). This analysis was not originally requested on the chain-of-custody (COC).

The following samples were activated for 6010D Cd & Pb analysis by the client on 07/21/23: DF-HA-17(3) (590-20704-20), DF-HA-23(3) (590-20704-27), DF-HA-11(3) (590-20704-30) and DF-HA-12(3) (590-20704-41). This analysis was not originally requested on the chain-of-custody (COC).

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Job ID: 590-20704-5

Qualifiers

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty

Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyze

JOB NUMBER

590-20704-6

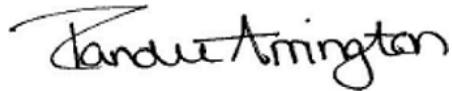

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/7/2023 10:25 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 5.3° C.

Receipt Exceptions

The following sample was activated for 6010D Cd & Pb analysis by the client on 8/8/2023: DF-HA-11(5) (590-20704-39). This analysis was not originally requested on the chain-of-custody (COC).

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F1	MS and/or MSD recovery exceeds control limits.
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

☒	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Haley & Aldrich, Inc.

Project/Site: POM Historic Debris Field/0203154-013

Job ID: 590-20704-6

Laboratory: Eurofins Spokane

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Washington	State	C569	01-07-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
Moisture		Solid	Percent Moisture
Moisture		Solid	Percent Solids

Laboratory: Eurofins Seattle

All accreditations/certifications held by this laboratory are listed. Not all accreditations/certifications are applicable to this report.

eurofins

Environment Testing

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northwest, LLC.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	IR9 5.3c
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	N/A	Received project as a subcontract.
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Attn: John Haney
Haley & Aldrich, Inc.
505 W Riverside Ave
Suite 205
Spokane, Washington 99201

Generated 6/23/2023 2:03:12 PM

JOB DESCRIPTION

POM Historic Debris Field/0203154-013

JOB NUMBER

590-20747-1

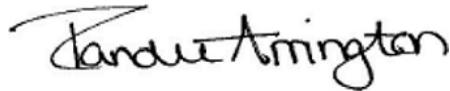

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Case Narrative

Client: Haley & Aldrich, Inc.

Job ID: 590-20747-1

Project/Site: POM Historic Debris Field/0203154-013

Job ID: 590-20747-1

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

Receipt Exceptions

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): DF-HA-18(3) (590-20747-38).

GC Semi VOA

Method 8081B: The %RPD between the primary and confirmation column exceeded 40% for Heptachlor for the following sample: DF-HA-20(1) (590-20747-11). The lower value has been reported and qualified in accordance with the laboratory's SOP.

Method NWTPH-Dx: Detected hydrocarbons appear to be due to individual peaks and may be possible biogenic interference in the following samples: DF-HA-20(1) (590-20747-11), (590-20704-A-13-A) and (590-20704-A-13-B DU)

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 6010D: The sample duplicate (DUP) precision for preparation batch 590-42122 and analytical batch 590-42143 was outside control limits. Sample matrix interference is suspected.

Method 7471B: The sample duplicate (DUP) precision for preparation batch 590-42123 and analytical batch 590-42144 was outside control limits. Sample matrix interference is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Organic Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC Semi VOA

Qualifier	Qualifier Description
p1	The %Difference between the primary and confirmation column/detector is >40%. The lower value has been reported.

Metals

Qualifier	Qualifier Description
F3	Duplicate RPD exceeds the control limit
F5	Duplicate RPD exceeds limit, and one or both sample results are less than 5 times RL, and the absolute difference between results is < the upper reporting limits for both.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Environment Testing

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/ matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northwest, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Narrative

Revision

The report being provided is a revision of the original report sent on 6/19/2023. The report (revision 1) is being revised due to: An extra 0 added to a sample ID, and needs to be removed.

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

Receipt Exceptions

The following sample was submitted for analysis; however, it was not listed on the Chain-of-Custody (COC): DF-HA-18(3) (590-20747-38). Sample has been placed on hold.

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-42042 recovered outside acceptance criteria, low biased, for Hexachlorobutadiene. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job ID: 590-20747-4

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-42075 recovered outside acceptance criteria, low biased, for Bromomethane, Carbon tetrachloride and Hexachlorobutadiene. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: Reanalysis of the following sample was performed outside of the analytical holding time due to QC failure: DF-HA-19(2) (590-20747-17).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

Method 7471B: The sample duplicate (DUP) precision for preparation batch 590-42123 and analytical batch 590-42144 was outside control limits. Sample matrix interference is suspected.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☒	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty.

Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyze

List Source: Eurofins Spokane

List Number: 1

Creator: Arrington, Randee E

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Attn: John Haney

JOB DESCRIPTION

POM Historic Debris Field/0203154-013

JOB NUMBER

590-20747-5

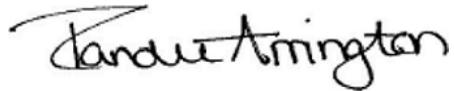

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-20747-5

Job ID: 590-20747-5

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

Receipt Exceptions

The following sample was activated for 6010D As, Cd & Pb analysis by the client on 06/23/23: DF-HA-14(2) (590-20747-7). This analysis was not originally requested on the chain-of-custody (COC).

The following samples were activated for 6010D Cd & Pb analysis by the client on 06/23/23: DF-HA-19(2) (590-20747-17) and DF-HA-21(2) (590-20747-35). This analysis was not originally requested on the chain-of-custody (COC).

The following samples were activated for 6010D Pb analysis by the client on 06/23/23: DF-HA-8(2) (590-20747-19) and DF-HA-16(2) (590-20747-37). This analysis was not originally requested on the chain-of-custody (COC).

Metals

Method 6010D: The sample duplicate (DUP) precision for preparation batch 590-42272 and analytical batch 590-42294 was outside control limits. Sample matrix interference is suspected.

Method 6010D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 590-42272 and analytical batch 590-42294 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

Method 6010D: The sample duplicate (DUP) precision for preparation batch 590-42272 and analytical batch 590-42299 was outside control limits. Sample matrix interference is suspected.

Method 6010D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 590-42272 and analytical batch 590-42299 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
E	Result exceeded calibration range.
F3	Duplicate RPD exceeds the control limit
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

%	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Narrative

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

Receipt Exceptions

The following sample was activated for 8260D Volatiles analysis by the client on 06/26/23: DF-HA-19(3) (590-20747-16). This analysis was not originally requested on the chain-of-custody (COC).

GC/MS VOA

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
D	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Attn: John Haney
Haley & Aldrich, Inc.
505 W Riverside Ave
Suite 205
Spokane, Washington 99201

Generated 7/20/2023 4:41:00 PM

JOB DESCRIPTION

POM Historic Debris Field/0203154-013

JOB NUMBER

590-20747-7

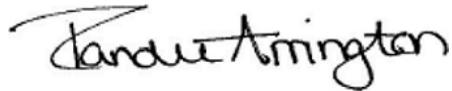

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-20747-7

Job ID: 590-20747-7

Laboratory: Eurofins Spokane

Narrative

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

Receipt Exceptions

The following sample was activated for 8260D Volatiles analysis by the client on 07/05/23: DF-HA-19(4) (590-20747-15). This analysis was not originally requested on the chain-of-custody (COC).

The following samples were activated for 6010D Cd & Pb analysis by the client on 07/10/23: DF-HA-14(3) (590-20747-5) and DF-HA-19(3) (590-20747-16). This analysis was not originally requested on the chain-of-custody (COC).

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-42414 recovered outside acceptance criteria, low biased, for Bromomethane and Methylene Chloride. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-42414 recovered above the upper control limit for 1,1,2,2-Tetrachloroethane, 1,1,2-Trichloroethane, 1,1-Dichloropropene, 1,2,3-Trichloropropane, 1,2,4-Trimethylbenzene, 1,2-Dibromo-3-Chloropropane, 1,2-Dichloropropane, 1,3,5-Trimethylbenzene, 1,3-Dichloropropane, 2-Chlorotoluene, 4-Chlorotoluene, Bromobenzene, Hexachlorobutadiene, m,p-Xylene, Naphthalene, N-Propylbenzene, tert-Butylbenzene, Tetrachloroethene, Toluene and trans-1,3-Dichloropropene. The samples associated with this CCV were either detected below the reporting limit or non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample (LCS) and / or laboratory control sample duplicate (LCSD) for preparation batch 590-42416 and 590-42416 and analytical batch 590-42414 recovered outside control limits for the following analytes: 1,2,3-Trichloropropane, 1,3,5-Trimethylbenzene, N-Propylbenzene and tert-Butylbenzene. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The method blank for preparation batch 590-42416 and 590-42416 and analytical batch 590-42414 contained Toluene above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

Method 8260D: Surrogate recovery for the following sample was outside the upper control limit: (LCS 590-42416/2-A).

Method 8260D: The following sample was analyzed outside of analytical holding time due to activation out of hold: DF-HA-19(4) (590-20747-15).

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Sample Summary

Client: Haley & Aldrich, Inc.

Project/Site: POM Historic Debris Field/0203154-013

Job ID: 590-20747-7

Lab Sample ID	Client Sample ID	Matrix	Collected	Received

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
B	Compound was found in the blank and sample.
H	Sample was prepped or analyzed beyond the specified holding time. This does not meet regulatory requirements.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
S1+	Surrogate recovery exceeds control limits, high biased.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Narrative

Receipt

The samples were received on 6/9/2023 9:27 AM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperatures of the 2 coolers at receipt time were 2.1° C and 2.9° C.

Receipt Exceptions

The following samples were activated for 6010D Cadmium and Lead analysis by the client on 07/21/23: DF-HA-14(4) (590-20747-6) and DF-HA-19(4) (590-20747-15). This analysis was not originally requested on the chain-of-custody (COC).

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.
F3	Duplicate RPD exceeds the control limit

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

☒	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Environment Testing

Note: Since laboratory accreditations are subject to change, Eurofins Environment Testing Northwest, LLC places the ownership of method, analyte & accreditation compliance upon our subcontract laboratories. This sample shipment is forwarded under chain-of-custody. If the laboratory does not currently maintain accreditation in the State of Origin listed above for analysis/tests/matrix being analyzed, the samples must be shipped back to the Eurofins Environment Testing Northwest, LLC laboratory or other instructions will be provided. Any changes to accreditation status should be brought to Eurofins Environment Testing Northwest, LLC attention immediately. If all requested accreditations are current to date, return the signed Chain of Custody attesting to said compliance to Eurofins Environment Testing Northwest, LLC.

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-22134-1

Laboratory: Eurofins Spokane

Narrative

Job Narrative 590-22134-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 10/31/2023 10:55 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.4°C

GC/MS VOA

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

D	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Narrative

**Job Narrative
590-22134-1**

REVISION

The report being provided is a revision of the original report sent on 11/3/2023. The report (revision 1) is being revised due to Added 8260D full list analytes to the final report.

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 10/31/2023 10:55 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.4°C

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-44383 recovered above the upper control limit for Chloroethane and Methylene Chloride. The samples associated with this CCV were either detected below the reporting limit, or non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The initial calibration verification (ICV) result for batch 590-44383 was above the upper control limit for Methylene Chloride . Sample results were non-detects, and have been reported as qualified data.

Method 8260D: The RPD of the laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) for preparation batch 590-44406 and analytical batch 590-44383 recovered outside control limits for the following analytes: <AffectedAnalytes>.

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 590-44406 and analytical batch 590-44383 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

FEBRUARY 2016

Login Sample Receipt Checklist

Client: Haley & Aldrich, Inc.

Job Number: 590-22134-1

Login Number: 22134

List Source: Eurofins Spokane

List Number: 1

Creator: Morris, Mackenzie 1

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received extra samples not listed on COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Attn: John Haney
Haley & Aldrich, Inc.
505 W Riverside Ave
Suite 205
Spokane, Washington 99201

Generated 11/8/2023 12:37:33 PM

JOB DESCRIPTION

Pend Oreille Mine

JOB NUMBER

590-22134-3

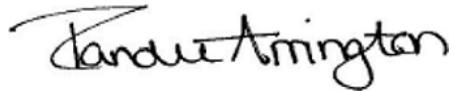

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-22134-3

Job ID: 590-22134-3

Laboratory: Eurofins Spokane

Narrative

Job Narrative 590-22134-3

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 10/31/2023 10:55 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.4°C

Receipt Exceptions

The following samples were activated by the client on 11/06/23: DF-HA-19(6) (590-22134-2) and DF-HA-28(2) (590-22134-5).

GC/MS VOA

Method 8260D: The initial calibration verification (ICV) result for batch 590-44464 was above the upper control limit for Methylene Chloride. Sample results were non-detects, and have been reported as qualified data.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Sample Summary

Client: Haley & Aldrich, Inc.
Project/Site: Pend Oreille Mine

Job ID: 590-22134-3

Lab Sample ID	Client Sample ID	Matrix	Collected	Received
590-22134-2	DF-HA-19(6)	Solid	10/30/23 11:30	10/31/23 10:55
590-22134-5	DF-HA-28(2)	Solid	10/30/23 14:10	10/31/23 10:55

Definitions/Glossary

Client: Haley & Aldrich, Inc.
Project/Site: Pend Oreille Mine

Job ID: 590-22134-3

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received extra samples not listed on COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

JOB DESCRIPTION

Pend Oreille Mine

JOB NUMBER

590-22134-4

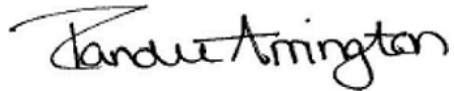

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Project/Site: Pend Oreille Mine

Job ID: 590-22134-4

Job ID: 590-22134-4

Laboratory: Eurofins Spokane

Narrative

Job Narrative 590-22134-4

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 10/31/2023 10:55 AM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.4°C

GC/MS VOA

Method 8260D: The laboratory control sample (LCS) for preparation batch 590-44538 and analytical batch 590-44534 recovered outside control limits for the following analytes: Bromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-44590 recovered outside acceptance criteria, low biased, for 1,2-Dibromo-3-Chloropropane. A reporting limit (RL) standard was analyzed, and the target analytes are detected. Since the associated samples were non-detect for the analyte(s), the data are reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Sample Summary

Client: Haley & Aldrich, Inc.

Client: Haley & Aldrich, Inc.
Project/Site: Pend Oreille Mine

Job ID: 590-22134-4

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
D	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

CHAIN OF CUSTODY RECORD

Phone 509-960-7460

18

Page 1 of 1

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate Laboratory should (specify if applicable) _____ analyze

List Source: Eurofins Spokane

List Number: 1

Creator: Morris, Mackenzie 1

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	False	Received extra samples not listed on COC.
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

ANALYTICAL REPORT

PREPARED FOR

Attn: John Haney
Haley & Aldrich, Inc.
505 W Riverside Ave
Suite 205
Spokane, Washington 99201

Generated 11/6/2023 4:51:45 PM

JOB DESCRIPTION

POM Historic Debris Field/0203154-013

JOB NUMBER

590-22150-1

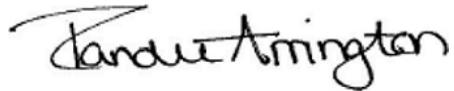

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Job ID: 590-22150-1

Job ID: 590-22150-1

Laboratory: Eurofins Spokane

Narrative

Job Narrative 590-22150-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The sample was received on 11/1/2023 4:40 PM. Unless otherwise noted below, the sample arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 4.5°C

GC/MS VOA

Method 8260D: The initial calibration verification (ICV) result for batch 590-44464 was above the upper control limit for Methylene Chloride. Sample results were non-detects, and have been reported as qualified data.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Narrative

Job Narrative 590-22385-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers are applied to indicate exceptions. Noncompliant quality control (QC) is further explained in narrative comments.

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method. Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt

The samples were received on 12/1/2023 4:25 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 3.2°C

GC/MS VOA

Method 8260D: The matrix spike / matrix spike duplicate (MS/MSD) recoveries for preparation batch 590-44923 and analytical batch 590-44921 were outside control limits. Sample matrix interference is suspected because the associated laboratory control sample (LCS) recovery was within acceptance limits.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

General Chemistry

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
F1	MS and/or MSD recovery exceeds control limits.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
D	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty.

Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyze

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Eurofins Spokane

Job Notes

This report may not be reproduced except in full, and with written approval from the laboratory. The results relate only to the samples tested. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

The test results in this report relate only to the samples as received by the laboratory and will meet all requirements of the methodology, with any exceptions noted. This report shall not be reproduced except in full, without the express written approval of the laboratory. All questions should be directed to the Eurofins Environment Testing Northwest, LLC Project Manager.

Narrative

Receipt

The samples were received on 12/1/2023 4:25 PM. Unless otherwise noted below, the samples arrived in good condition, and where required, properly preserved and on ice. The temperature of the cooler at receipt was 3.2° C.

Receipt Exceptions

The following samples were activated by the client on 11/7/23: DF-HA-37 (1) (590-22385-5), DF-HA-33 (2) (590-22385-9), DF-HA-35 (2) (590-22385-10) and DF-HA-34 (2) (590-22385-12).

The following sample was activated for 8260D SIM TCE by the client on 11/07/23: DF-HA-33 (1) (590-22385-7).

GC/MS VOA

Method 8260D: The continuing calibration verification (CCV) associated with batch 590-45004 recovered above the upper control limit for Trichlorofluoromethane, Methylene Chloride, 1,2-Dichloroethane, Dibromomethane, 1,2,4-Trichlorobenzene and 1,2,3-Trichlorobenzene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

Method 8260D: The laboratory control sample (LCS) for preparation batch 590-45010 and 590-45010 and analytical batch 590-45004 recovered outside control limits for the following analytes: Dichlorodifluoromethane, Chloroform, 1,2-Dichloroethane and Dibromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

No additional analytical or quality issues were noted, other than those described above or in the Definitions/Glossary page.

General Chemistry

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

VOA Prep

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
*+	LCS and/or LCSD is outside acceptance limits, high biased.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
D	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Accreditation/Certification Summary

Client: Haley & Aldrich, Inc.

Project/Site: POM HDF/0203154-013

Job ID: 590-22385-3

Laboratory: Eurofins Spokane

Unless otherwise noted, all analytes for this laboratory were covered under each accreditation/certification below.

Authority	Program	Identification Number	Expiration Date
Washington	State	C569	01-07-24

The following analytes are included in this report, but the laboratory is not certified by the governing authority. This list may include analytes for which the agency does not offer certification.

Analysis Method	Prep Method	Matrix	Analyte
8260D SIM	5035	Solid	Trichloroethene
Moisture		Solid	Percent Moisture
Moisture		Solid	Percent Solids

Presumptive Certainty Data Package (Laboratory to use applicable DEP CAM methods)

If Presumptive Certainty Data Package is needed, initial all sections:

The required minimum field QC samples, as designated in BWSC CAM-VII have been or will be collected, as appropriate, to meet the requirements of Presumptive Certainty.

Matrix Spike (MS) samples for MCP Metals and/or Cyanide are included and identified herein.

This Chain of Custody Record (specify) _____ includes _____ does not include samples defined as Drinking Water Samples.

If this Chain of Custody Record identifies samples defined as Drinking Water Samples, Trip Blanks and Field Duplicates are included and identified and analysis of TICs are required, as appropriate. Laboratory should (specify if applicable) _____ analyze

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
