Subject: Remedial Action Work Plan Completion Report
Proposed Hyas Point Mixed-Use Development – Phase 1a and 1b
Former Hambleton Bros Log Yard, Department of Ecology Site No. 4399598
Port of Camas-Washougal
335 South A Street, Washougal, Clark County, Washington
EE Report No. 10-240350-66

Dear Ms. Lam,

Earth Engineers, an RMA Company (EE) is pleased to transmit our Remedial Action Work Plan Completion Report for the project referenced above. This report describes the completion of the remedial action contracted by the Port of Camas-Washougal at the former Hambleton Bros Log Yard located at 335 South A Street, Washougal, Clark County, Washington (Washington State Department of Ecology Facility Site No. 4399598); specifically, this report addresses the remedial actions conducted in the proposed Hyas Point Mixed-Use Development – Phase 1a and 1b area. Also, note that in previous EE reports, the Hyas Point project location has been referred to as “54 South 2nd Street” and also “Southeast Corner of Intersection of South Marina Way and South 2nd Street.” All of these site location descriptions are intended to refer to the same Hyas Point Mixed-Use Development project location shown in Figure 2.

This remedial action was completed in general accordance with the Work Plan titled “Geotechnical Work Plan—Overexcavation of Organic, Non-Structural Fill & Replacement with Structural Fill at Buildings A-D, Proposed Hyas Point Mixed-Use Development—Phase 1a and 1b, Port of Camas-Washougal, Southeast Corner of Intersection of South Marina Way and South 2nd Street, Washougal, Clark County, Washington, EE Report No. 10-24035-1-R2,” dated April 4, 2024. As discussed in the attached report, the Hyas Point developer and their consultants will need to complete additional remediation for Building A and a portion of Building B. If you have any questions pertaining to this report, or if we may be of further service, please contact our office.

Sincerely,

Earth Engineers, an RMA Company

Troy Hull, P.E.

1.0 PROJECT INFORMATION

1.1 Project Authorization

Earth Engineers, an RMA Company (EE) has completed the inspection and documentation of the remedial action work contracted by the Port of Camas-Washougal at the Former Hambleton Bros Log Yard located at 335 South A Street in Washougal, Clark County, Washington ("Hambleton Site"); specifically, this report addresses the remedial actions conducted in the proposed Hyas Point Mixed-Use Development – Phase 1a and 1b area ("Project Site"). Note that references in previous EE documents to a site address of 54 South 2nd Street, or the intersection of South Marina Way and South 2nd Street refer to the same Project Site in Figure 2 attached.

Our Work Plan inspection services were authorized by David Ripp, former CEO for the Port of Camas-Washougal on August 7, 2024 by signing EE Proposal No.10-242112-P-R1, dated August 1, 2024.

1.2 Project Description

This report was completed on behalf of the Port of Camas-Washougal (the Port) by Earth Engineers, an RMA Company (EE), and describes the completion of the remedial action work plan at the former Hambleton Bros Log Yard located at 335 South A Street, Washougal, Washington (Washington State Department of Ecology ["Ecology"] Facility Site No. 4399598). The remedial action was completed in general accordance with EE Report No. 10-240350-01-R2, Geotechnical Work Plan – Overexcavation of Organic, Non-Structural Fill & Replacement with Structural Fill at Buildings A-D Proposed Hyas Point Mixed-Use Development – Phase 1a and 1b.

Briefly, we understand that the Port's developer, RKm Development, intends to prepare the Hyas Point Phase 1 building pads for construction of conventional shallow foundations by overexcavating unsuitable soils and replacing with properly compacted structural fill. EE previously issued a geotechnical investigation report (EE Report No. 21-146-2-R1 dated June 5, 2024) to RKm Development that addressed the proposed construction for the Hyas Point Phase 1 development (previously referred to as The Waterfront at Parkers Landing – Phase 1 project) but that report did not include detailed recommendations specific to this scope of earthwork incorporated in the Work Plan. Hyas Point Phase 1a includes proposed Building A and B. Note that a new geotechnical consultant has recently been retained by RKm Development to replace EE and act as the Geotechnical Engineer of Record and environmental consultant for the project moving forward. As a result of this transition of Geotechnical Engineer of Record and environmental consultant, EE is no longer responsible for the recommendations issued in Report No. 21-146-2-R1 pertaining to the Hyas Point project design and construction.

Prior to EE involvement in this project, a "Soil Management and Cap Maintenance Plan, Former Hambleton Bros Log Yard" (SMCMP) was prepared for the Port (by Maul, Foster & Alongi [MFA],

and dated March 16, 2015). The SMCMP specifies that Ecology must be notified by the Port concerning any potential impacts to the protective cap area. Note that all future reference to the "cap" in this Remedial Action Work Plan Completion Report are referring to the protective cap area as presented in the SMCMP.

A portion of the excavation work associated with the Hyas Point, Phase 1 project occurred within the cap area. The cap is a gravel layer free of environmental contaminants placed on top of the residual contaminated soils (i.e. impacted soils), with a geotextile fabric placed beneath the gravel cap as demarcation layer, as described in the SMCMP. All future reference in this Remedial Action Work Plan Completion Report to "impacted soils" are referring to the residual contaminated soils below the cap. The soil cap profile was designed by MFA to ensure the appropriate degree of protectiveness for ecological and human receptors from the impacted material that remains on the property. The soil cap is at least 2 feet thick, varies in thickness, and is installed on top of a demarcation fabric.

The MFA plan was prepared in accordance with the requirement of Washington Administrative Code (WAC) 173-340-440 and related provisions of the November 2007 update of the Washington State Model Toxics Control Act (MTCA). The SMCMP addresses soil management procedures to be followed in event of future development or any condition in which the caps are breached. Because a portion of the proposed building pad overexcavation work will occur within the cap area, the work needed to comply with the SMCMP recommendations, which are outlined later in this Work Plan. See Figure 1 below for the location of the cap area in relation to the proposed building pads.

1.3 Purpose and Scope of Services

The purpose of our services was to provide environmental and geotechnical services throughout the excavation of impacted soil and subsequent backfill. The remedial action was designed to meet the requirements of the SMCMP recommendations.

This report briefly outlines the methods and procedures utilized throughout the excavation and backfill process, presents available project information, describes the Project Site and Hambleton Site history, and presents results of the confirmation environmental samples collected.

2.0 SITE LOCATION AND HISTORY

2.1 Site Location

The Project Site, shown in Figure 2, is contained within the greater Ecology Site No. 4399598 (Hambleton Site), which is located in sections 7, 12 and 13 of Township 1 North and Range 3 East, of the Willamette Meridian (see Figure 2). The Project Site is approximately 1,000 feet long and 1,600 feet wide (east-west) and is zoned as Highway Commercial (CH). The Hambleton Site is bordered by State Route 14 to the north, South Second Street to the west, a residential apartment complex to the east and the Columbia River to the south.

2.2 Site History

Earth Engineers has had limited involvement in the former Hambleton Site starting in about 2021. Our description of the Hambleton Site below is based on review of existing documentation.

"Between approximately 1948 and 2010, the Site was occupied by a lumber mill. The lumber mill operations expanded over the years to occupy most of the Site. The Hambleton Lumber Company originally leased the land from the Port in 1953 and eventually bought the Site in the 1970s. The company operated in a niche market, with approximately 75 percent of the mill production in large dimension green Douglas fir, hemlock, and spruce timbers. Historical lumber mill activities included log storage, sawmill, planer, lumber storage and shipping, and other operations ancillary to mill operations."¹

At one time, the Hambleton Site contained an equipment mechanical shop, a chemical storage shed, a single family residence, a mill, a debarker, and a planer building. Wood-treating activities were reported to not be conducted on the Hambleton Site. The debarker burned to the ground in 2009. Because of poor economic conditions, the mill closed in 2010 and the Hambleton Site was purchased by the Port in 2012. The eastern portion of the Hambleton Site was later sold to Killian Pacific to construct the Ninebark Apartments, which borders the Project Site to the east. The portion of the Hambleton Site currently owned by the Port encompasses the areas where impacts are present above MTCA cleanup levels (CULs) as a result of former Hambleton Lumber Company operations.¹

There have been no above grade structures on the portion of the Hambleton Site owned by the Port since demolition of the lumber mill, shop, office, chemical storage shed, and planer building. Demolition of these structures was generally completed in November 2011. Concrete foundations from the demolished structures remained. The Hambleton Site is generally surfaced with asphalt and gravel; however, areas are covered in woody debris from log storage.¹

The Port received a legislative appropriation through the Department of Commerce to complete the remedial action described in this report. The Port released a request for proposal and selected the low bidder (Swofford Excavation, Inc. [Swofford]) to complete the remedial action. The

construction contract was awarded on July 15, 2024, and construction began in August 2024. The Port's remedial action on the Project Site was completed on November 21, 2024. The portion of the remedial action to be completed on the Project Site by RKm Development (i.e. Building A and a portion of building B) has not been completed.

3.0 PROJECT TEAM AND CONSTRUCTION OVERSIGHT

The following presents the project organization:

- Regulator – State of Washington, Department of Ecology; Danielle Gibson
- Owner – Port of Camas-Washougal; Trang Lam, CEO
- Surveyor – PBS Engineering, Inc.
- Geotechnical Engineer – Earth Engineers, an RMA Company; Troy Hull, PE
- Environmental Geologist – Earth Engineers, an RMA Company; Adam Reese, LG, LEG
- Site Work Contractor – Swofford Excavation, Inc. (Swofford)
- Underground Storage Tank Removal Contractor – Anderson Environmental Construction, Inc. (AEC)

EE's construction oversight activities for the project included oversight of environmental and geotechnical site work. Environmental oversight activities included the oversight of excavation activities within and adjacent to the cap area, including field assessing the vertical extent of contaminated soils within the Building B footprint and its associated zone of influence (i.e. 15 horizontal feet from exterior building foundation edge) and confirmation soil sampling within the excavation floor and walls. Geotechnical oversight activities included oversight of structural backfill and compaction activities, including compaction testing and inspections. Photographs taken during the remedial action are included in Appendix A. Field reports prepared by EE are available upon request.

4.0 REMEDIAL ACTION SUMMARY

4.1 Site Preparation and Layout

The work conducted throughout this remedial action was done in general accordance with the Work Plan. Prior to beginning remedial actions, best management practices (BMPs) were installed by the contractor in order to contain contaminated soils, reduce soil erosion during construction, and prevent surface runoff from leaving the Project Site. Additionally, fencing was placed around the perimeter of the excavation work area and signage was posted on the fencing separating the public from uncapped areas.

4.2 Excavation of Protective Cap Soil

The excavation of the protective cap soil began on August 7, 2024. An approximate two-foot-thick protective clean soil cap was removed by Swofford utilizing a Kobelco SK 350 LC equipped with a 48-inch smooth edge bucket. Only the portion of the contaminated soil that was designated for removal was disturbed. Portions of the cap material east, south and west of the Hyas Point Phase 1a proposed buildings A and B remain in place. The remaining cap surface slopes were retained for adequate stormwater flow, and BMPs were implemented to prevent erosion of the cap material.

The clean soil cap material removed during the initial phase of excavation was stockpiled along the east side of the excavation. Additional clean soil cap material removed from the southwest portion of the excavation area was stockpiled along the southwest corner of the excavation. It should be noted that the clean soil cap stockpiled material was not initially covered by the contractor to protect it from wind erosion and stormwater runoff, as recommended by EE. Ultimately, the clean soil stockpile was covered with an impermeable covering and secured in place using rocks and sandbags.

An orange demarcation fabric was observed at the base of the protective cap soil layer and above the contaminated soil layer. The demarcation fabric was removed by the contractor using excavation equipment. The protective cap soil layer was observed to be approximately 2 to 3 feet thick throughout the excavation area. Some large boulders and fill debris (metal scraps, etc.) were observed while excavating the protective cap soil.

4.3 Excavation of Impacted Soil

Once the clean soil cap material was removed from the excavation area and stockpiled, Swofford began to excavate and stockpile the impacted soil. The proposed procedure for excavating and hauling the impacted soil initially involved loading the excavated impacted soil directly into a haul truck to be taken to the Wasco County Landfill, a Subtitle D Landfill in The Dalles, Oregon. Due to an inability to arrange sufficient haul trucks for direct loading of impacted soil, Swofford opted

to temporarily stockpile the impacted soil within the northwest corner of the excavation until it was able to be loaded and hauled off site. Since the impacted soil stockpile's location was within the excavation extent, waddles and berms were not considered necessary to eliminate erosion and transport of contaminants in the event of precipitation. The impacted soil stockpile was covered at the end of each work day with an impermeable covering and secured in place using rocks.

Excavated soil within the cap area beneath the orange demarcation fabric was assumed to be contaminated and was handled as such. Lateral excavation extents were predetermined based on historical information. Contaminated soil beyond the cap area (determined by the absence of orange demarcation fabric) was observed in the northern portion of the excavation. EE representative utilized a photoionization detector (PID), along with visual and olfactory indicators, to determine the extent of contaminated soil beyond the cap area. Soil observed to have visual staining or hydrocarbon odors were treated as contaminated and were excavated, stockpiled and hauled to Wasco County Landfill.

On September 11, 2024, an underground storage tank (UST) was discovered while excavating the organic-rich soil north of the cap area (in an area previously noted as not being environmentally contaminated). The UST was inadvertently damaged by the excavator upon discovery, and resulted in deformation and a large tear within the wall of the UST. The UST was not active at the time of discovery and was void of any liquid product, however, approximately five gallons of water was observed draining from the damaged UST upon discovery. EE representative utilized a PID to obtain volatile organic compound (VOC) concentrations of the vapor within the UST. PID readings of up to 65 parts per million (ppm) were observed. EE representative immediately notified the Port, and subsequently Ecology of the discovery. Swofford contracted with Anderson Environmental Construction, Inc. (AEC) to provide decommissioning, transport and disposal of the UST. On September 19, 2024 AEC removed the damaged UST from the Project Site. Upon removal of the UST, environmental soil samples were collected from within the tank trench to confirm the presence or absence of released contaminants. A separate Underground Storage Tank Sampling Report dated October 18, 2024 was submitted to the Port of Camas and Ecology on October 18, 2024.

On September 25, 2024, while extending the excavation along the planned western edge toward the area of proposed Building A, impacted soils were observed within the sidewalls of the excavation. EE representative observed degraded hydrocarbon odor as well as visually stained soils to a depth of approximately 10 feet below ground surface (bgs) while observing a test trench being excavated to assess the presence and extent of additional impacted soils in this area. Timbers and fill debris were observed within the upper portions of the test trench. At approximately 10 feet bgs, gray sand and rounded gravel, interpreted to be native material, was observed. The test trench was loosely backfilled with the excavated soil on the same day. It is understood that excavation west of the limits detailed in Figure 3 and generally within the influence zone of Building A will be completed by RKm Development or their related contracting firm Central Bethany Construction (CBC) under a separate contract.

The extent of the remedial action work observed by EE as documented in this report is depicted in Figure 3.

4.4 Confirmation Environmental Sampling and Testing

Confirmation environmental sampling and testing was conducted in general accordance with the Work Plan and was done to verify that impacted soil within the footprint of the proposed building and the building zone of influence (i.e. 15 horizontal feet from building edge) was successfully removed. Confirmation samples were collected from the sidewalls and floor of the excavation area to confirm concentrations of indicator hazardous substances (IHSs) remaining in soil were below cleanup levels as defined in Table 1 of the 2013 Ecology Draft Cleanup Action Plan (reference Table 1 below).

To address the variability of the soil, a representative soil sample was collected by compositing five subsamples of the material source. The clean sampling tool was penetrated into the sidewall or floor to a depth of at least one foot and the subsample was collected by hand with clean, disposable gloves. Gloves were changed and the sampling tool was decontaminated between composited samples, with the procedures specified in Section 2.3 of the SAP. Composite subsamples were selected to obtain representative material, based on visual inspection and professional judgement. To the extent possible, subsamples consisted of fine-grained material, with larger gravel removed.

One confirmation grab sample was collected every 40 linear feet horizontally along the sidewalls, and one confirmation composite sample was collected for every 625 square feet of the excavation floor footprint. This confirmation sampling frequency was approved via email by Ecology on July 26, 2024, and deviates from that specified in the Work Plan. Floor and wall samples were collected utilizing stainless steel hand tools (i.e. spade shovel and hand auger). Floor composite samples were mixed in a stainless-steel bowl with a stainless-steel spoon. Each confirmation soil sample was screened for VOCs utilizing a PID before being transferred into laboratory-supplied glass jars. Samples were labeled with pertinent information and then stored in a cooler with ice at an approximate temperature of 2° C prior to being shipped to Pace Analytical in Juliet, Tennessee for analysis. Pace Analytical is an Ecology approved lab. Samples that were collected were analyzed using the following methods:

- Residual-range organics (RRO) by Northwest Total Petroleum Hydrocarbons (NWTPH),
- Semi-volatile petroleum products analytical method NWTPH-Dx,
- Lead by U.S. Environmental Protection Agency (USEPA) Method 6010,
- Mercury by USEPA Method 7471,
- Polychlorinated biphenyls (PCBs) by USEPA Method 8082, and
- Carcinogenic polycyclic aromatic hydrocarbons (cPAHs) by USEPA Method 8270 selective ion monitoring (SIM).

As specified in the Work Plan, all confirmation samples collected were analyzed for all IHSs identified in Table 1 of the 2013 Ecology Cleanup Action Plan (reference Table 1 below).

Indicator Hazardous Substances	Soil CULs (mg/kg)	Groundwater CULs ($\mu\text{g}/\text{L}$)
Metals		
Lead	250	NV
Mercury	2	NV
Polychlorinated Biphenyls		
Total PCBs	1	NV
Petroleum Hydrocarbons		
DRO	2000	500
RRO	2000	500
Carcinogenic Polycyclic Aromatic Hydrocarbons		
Benzo(a)anthracene	NV	NV
Benzo(a)pyrene	0.1	NV
Benzo(b)fluoranthene	NV	NV
Benzo(k)fluoranthene	NV	NV
Chrysene	NV	NV
Dibeno(a,h)anthracene	NV	NV
Indeno(1,2,3-cd)pyrene	NV	NV
cPAH TEC	0.1	NV
Volatile Organic Compounds		
Methylene chloride	0.02	NV
Notes:		
cPAH TEC = carcinogenic polycyclic aromatic hydrocarbon toxicity equivalent concentration.		
CULs = Cleanup levels		
DRO = diesel-range organics		
$\mu\text{g}/\text{L}$ = micrograms per kilogram		
mg/kg = milligrams per kilogram		
NV = no value		
PCBs = polychlorinated biphenyls		
RRO = residual range organics		

Table 1: Summary of impacted Soil Cleanup Levels (source: Table 1 in the 2013 Ecology Draft Cleanup Action Plan).

4.5 Quality Assurance/Quality Control (QA/QC) Analytical Results

The laboratory notes and qualifiers for the Pace Analytical National report were reviewed. Many of the constituent results were "J" qualified, indicating that the analyte identification is acceptable, and the reported value is an estimate. The J qualified diesel results ranged from a low of 1.71 mg/kg to a high of 7.49 mg/kg. Heavy oil range results that were J qualified ranged from 4.93 mg/kg to 13.7 mg/kg. Given soil CULs of 2,000 mg/kg for both diesel and heavy oil range

hydrocarbons, these results being J qualified are not considered to materially impact the findings of this report.

Polychlorinated biphenyl (“PCB”) congeners were not detected in any compliance samples except for sample B_F_A-25_9+0@13.5-14. In this sample PCB 1254 was detected at a concentration of 0.0116 mg/kg with the result J and P qualified. The P qualification indicates that the RPD between the primary and confirmatory analysis exceeded 40%. Since the CUL is 1.0 for all congeners combined the data qualifications are not considered to materially impact the findings of this report.

Various VOC constituent results were “C3”, “J”, “J3”, and “J4” qualified. The “C3” qualifier indicates that the reported concentrations are an estimate due to the continuing calibration standard associated with the data being low. All VOC constituents where a C3 qualifier is present are reported by Pace to be below the reported detection limit “RDL”. “J” qualified VOC results are either significantly below the CUL or are not established by MTCA Method A. The “J3” and “J4” qualifiers indicate that the associated batch QC were outside the established quality control range for precision and accuracy, respectively. Most of the “J3” and “J4” qualified results are reported by Pace to be below the RDL. Several of the VOC acetone results with either “J3” or “J4” qualifiers were reported above the RDL at concentrations ranging from 0.0532 mg/kg to 1.09 mg/kg. Acetone is not a CUL described in the Work Plan and concentrations up to 1.09 mg/kg are not considered to materially impact the findings of this report.

Polycyclic aromatic hydrocarbon (“PAH”) analytical results included various “J” qualified constituents. In all instances the resulting cPAH TECs were at least one order of magnitude below the CUL and accordingly the qualified results are not considered to materially impact the findings of this report. Mercury results for several samples were “J” qualified but are at least an order of magnitude below the CUL.

4.6 Laboratory Analytical Results

Laboratory analytical results are summarized in Tables 1 through 11 located in Appendix B. Full laboratory reports are included in Appendix C. As can be observed in the tables all confirmation sample analytical results are below the established CULs as specified in the Work Plan with the exception of sample B_W_A+O_9 @ 13.5. This sample was collected from the south wall of the excavation in the roadway area. Pursuant to the Work Plan sampling on the south side of the excavation was performed to document areas outside of Building A and B influence zones to document contaminant concentrations remaining.

4.7 Estimated Haul Off Volume

Impacted soil excavated from within the cap area was characterized as described in the SAP (SMCMP) and was disposed of off-site by Swofford to the Wasco County Landfill, a Subtitle D

landfill in The Dalles, Oregon. All records for hauling and disposal of impacted soil removed from the Project Site were retained by Swofford and a copy was provided to the Port.

The total volume of impacted soil removed from the Project Site was calculated to be approximately 11,760 loose cubic yards (LCY). This calculation assumes a truck and trailer volume of approximately 24 LCY. Table 2 shows the date, number of trucks, and the approximate volume and area in which the soil was excavated from. The record of impacted soil disposal provided by Swofford are included in Appendix D.

Date	No. of Trucks w/Trailers	Volume (LCY)	Area	Truck & Trailer Volume (LCY)
8/15/2024	18	432	Stockpile - Building B	24
8/16/2024	18	432	Stockpile - Building B	Swell Factor (assumed)
8/19/2024	25	600	Stockpile + Building A & B + Roadway	4%
8/20/2024	25	600	Stockpile + Building A & B + Roadway	
8/21/2024	18	432	Stockpile + Building A & B + Roadway	
8/22/2024	25	600	Stockpile + Building A & B + Roadway	
8/26/2024	21	504	Stockpile + Building A & B + Roadway	
8/27/2024	22	528	Stockpile + Building A & B + Roadway	
8/28/2024	22	528	Stockpile + Building A & B + Roadway	
8/29/2024	20	480	Stockpile + Building A & B + Roadway

9/18/2024	17	408	Stockpile + Building A & B + Roadway	
9/19/2024	18	384	Stockpile + Building A & B + Roadway	
9/20/2024	17	408	Building A & B + Roadway	
9/23/2024	16	384	Building A & B + Roadway	
9/24/2024	14	336	Building A & B + Roadway	
9/25/2024	14	336	Building A & B + Roadway	
9/26/2024	12	288	Building A & B + Roadway	
Totals	490	11760		
Disposed Total vs originally estimated values		190%		
			Where:	
			V _L = Volume in Loose Cubic Yards	BCY = Bank Cubic Yards
			V _B = Volume in Bank Cubic Yards	LCY = Loose Cubic Yards
			S _w = Swell (%)	

Table 2: Approximate volume of impacted soil removed from the Project Site.

4.8 Overexcavation of Non-Structural Fill

As specified in the Work Plan, soil that has concentrations of IHSs below the current and relevant Ecology and MTCA cleanup levels but was considered from a geotechnical standpoint as non-structural fill due to the presence of organics, debris, or other factors was disposed of off-site by Swofford. The existing non-structural fill was excavated from the northern portion of the Building

B footprint and zone of influence and stockpiled within a corner of the excavation. A five-point composite sample was collected from the stockpile and analyzed for all IHSs. Upon receipt of lab analytical results indicating IHS concentrations below cleanup levels, the excavated soil was hauled off site and disposed of by Swofford. An EE geotechnical inspector was present on the Project Site during excavation of the existing non-structural fill soil and confirmed when the overexcavation had penetrated through the existing fill to the required dense, native silty gravel stratum.

4.9 Survey of Excavation Extents

On October 3, 2024, a PBS survey crew was onsite to locate and stake the building corners and zone of perimeter foundation loading influence envelope for Building B. Upon completion of the survey of Building B, it was apparent that the excavation extents required for Swofford in the Work Plan, to include the zone of influence (approximately 15 feet from exterior edge of building foundation) of Building B, had not been fully encompassed by the current excavation. A meeting between the Port, Swofford, Earth Engineers and Central Bethany Construction (CBC) was held on October 4, 2024 to discuss the outcome of the survey and the corrective action. It was agreed that the Port would have Swofford excavate and dispose of the additional soil volume required to achieve the full extent of the planned Building B footprint and zone of influence on the east and north sides. The west side excavation would be left to CBC. The Port's portion of the additional soil to be removed by Swofford from the Project Site was subsequently hauled off and disposed of as non-impacted material after confirmation wall sample results reported IHS concentrations below CULs.

On October 17, 2024, a PBS survey crew returned to the Project Site to confirm that the new excavation extents now fully encompassed the north and east and south sides of the Building B footprint and zone of footing influence (the result of that survey are found in Appendix E attached). As of November 21, 2024, when EE was last onsite, the west side excavation of Building B had not been started by CBC. The scope of the additional soil excavation work to be completed by CBC is outside the scope of this report. CBC and their geotechnical/environmental consultant who replaced EE should submit a separate report to Ecology documenting that work.

4.10 Structural Backfill and Compaction Testing

Upon receipt of confirmation sample results indicating concentrations of IHSs below cleanup levels, backfill processes were initiated by Swofford. In order to prepare the excavation for the placement and compaction of structural backfill, Swofford removed the existing large boulders from the excavation floor and roughly graded the remaining soil level. An orange geotextile composed of woven polypropylene was laid out throughout the excavation as a demarcation layer, and a thin layer (i.e. 6 inches or less) of structural backfill was placed and compacted in order to recompact the surface of the disturbed excavation bottom to a condition that was dense and unyielding. EE representative performed a visual inspection of the compaction process and results and approved the placement of subsequent lifts of structural backfill.

The structural backfill placed consisted of granular material and was free of organics or other deleterious materials. Lifts were placed and compacted in a manner in which each final lift height was no greater than approximately 12 inches. The material placed within the initial lifts is described as 1-1/4 inch minus gravel (mostly rounded) and was sourced from the Glacier Dallesport Quarry. EE determined optimal compaction of the Glacier backfill material using ASTM D1557 Modified Proctor lab test to be 148.1 pounds per cubic foot (pcf) with an optimal moisture content of 5.6% (EE report No. 10-240350-8). Subsequent lifts (i.e. those placed after November 6, 2024) placed and compacted consisted of material described as 1-1/4 inch minus crushed rock gravel sourced from the Stordahl Mountain Top Pit. EE determined the optimal compaction for the Stordahl backfill material using ASTM D1557 Modified Proctor lab test to be 139.3 pcf with an optimal moisture of 7.5% (EE report No. 10-240350-42).

When the placed and compacted backfill was ready for testing, an EE representative tested the compaction using a Troxler 3440 nuclear density gauge, and compared the density of the placed fill to the laboratory determined (ASTM 1557) maximum density of the given material. In order for the lift to be approved, the density of the compacted structural backfill was required to be at least 95% of the laboratory determined value.

Compaction testing was performed by EE using a nuclear density gauge on each approximately 1 foot thick lift of backfill. All lifts achieved passing compaction tests before the next lift was placed. To track lift thickness, EE representative spray painted 1 foot height intervals on the plastic draped over the sidewall of the excavation.

Daily Inspection Reports documenting the geotechnical special inspections of the backfill and compaction process and results of compaction testing are available upon request.

Note that when EE's inspection services ended on November 21, 2024, there were 2 areas that had backfill that was not properly compacted. The construction ramp entering the excavation consisted of loose fill, except for the bottom 2 feet. This is documented in EE Report No. 10-240350-63. An additional area that did not pass compaction testing was the final backfill lift placed at the south side of the overexcavation area—at the proposed new roadway (reference EE Report No. 10-240350-63). These areas will need to be addressed by CBC and their geotechnical consultant that has replaced EE. It's our understanding that this was discussed on site between CBC and the Port. In addition, an e-mail was sent by the Port to CBC on November 25, 2024.

5.0 FINAL INSPECTION

The final inspection of the remedial action work was completed by EE on November 21, 2024 (reference EE Report No. 10-24035-65). The segment of work contracted by the Port for the project has been completed. While no additional work remains for the Port's contracted phase of the project, we understand CBC has agreed to oversee the remedial action required for the removal of impacted soils within the Building A footprint that were observed to be present in the western sidewall of the Building B excavation. CBC's geotechnical/environmental consultant will be responsible for fulfilling the role of providing a Work Plan, performing inspections to ensure that the Work Plan is followed, and issuing a Work Plan Completion Report (these items are excluded from EE's scope, and EE excludes the additional work areas from EE's scope and liability).

6.0 FINDING AND CONCLUSION

The construction oversight and final inspection described in this report were performed by Earth Engineers on behalf of the Port of Camas-Washougal for all activities related to the excavation and removal of impacted soils and subsequent backfill and compaction of the excavation with structural backfill. Based on the observations made during the remedial activities, it is EE's finding and conclusion that the Former Hambleton Bros Log Yard Remedial Action for the areas detailed in this report was completed in general accordance with the standard trade practices, in general compliance with the technical specifications, and in general accordance with the design intent as approved by Ecology, except as noted.

7.0 VARIANCES TO WORK PLAN

While the construction by Swofford was intended to follow the Work Plan, it is possible that there could have been variances that we weren't aware of. Ultimately, it was the responsibility of the contractor to follow the Work Plan.

Variances that we observed included:

1. The Port did not complete the removal of all impacted soil from Building B and Building A. We understand CBC will complete the portion not yet completed.
2. Some backfill at the northwest corner of the excavation area (for the temporary construction ramp) was not properly compacted (reference EE Report No. 10-240350-63). CBC will need to complete this.
3. The final backfill lift placed at the south side of the overexcavation area—at the proposed new roadway did not pass compaction testing (reference EE Report No. 10-240350-63). CBC will need to complete this.
4. The Port negotiated an agreement with Ecology allowing impacted soils at depths greater than 15 feet bgs to remain in place. Based on the results of confirmatory floor samples collected within the cap area of the excavation, no impacted soils were observed at depths greater than the sample collection depth.

It is our professional opinion that none of the observed variances noted above affected the intent of removing and disposing of the impacted soil.

8.0 LIMITATIONS

We understand that CBC will be disturbing the area that this report covers (e.g., excavating for site investigation test pits, utility trenches, footings, and road grade; removing and replacing additional impacted soil; etc.). It is highly possible that the backfill that EE inspected and tested will be disturbed by the construction activities carried out by CBC. Because EE will not be retained to perform inspections and testing when these ground disturbance activities occur, we cannot attest to the quality of the backfill beyond the last date of our inspection (November 21, 2024).

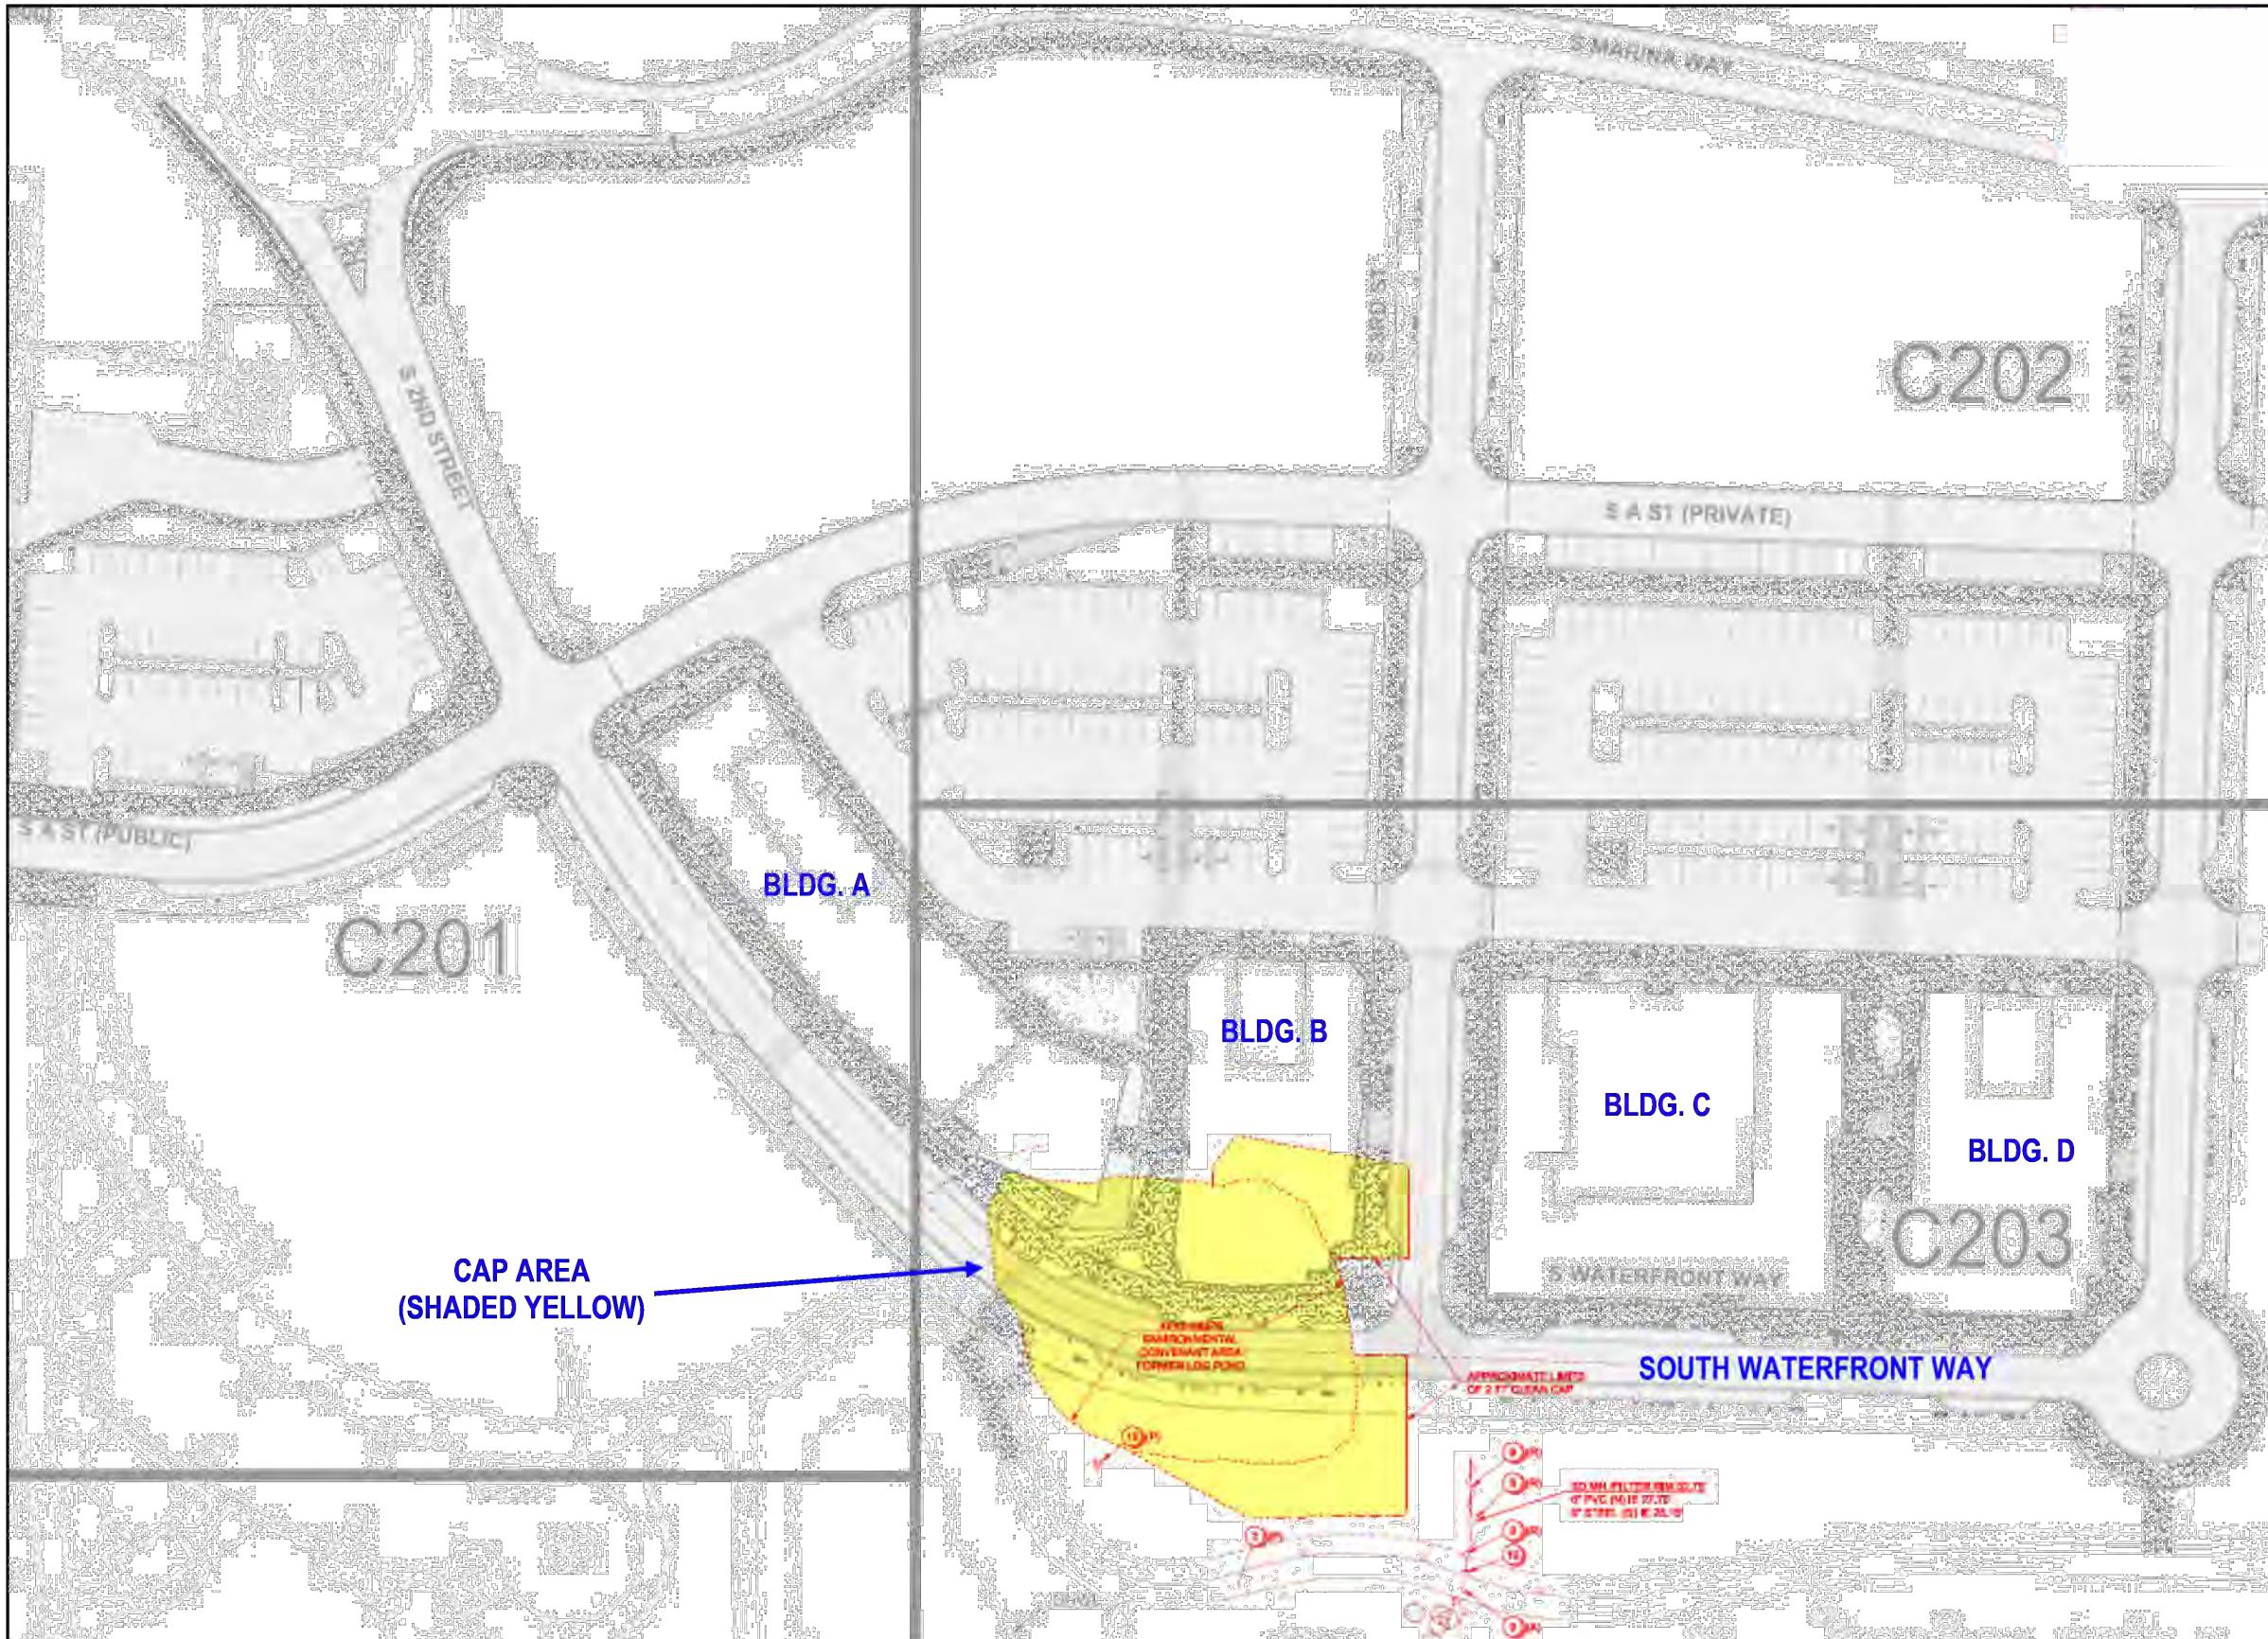

As noted in EE Report No. 10-24035-1-R2, the Work Plan was not intended to address all conditions that the contractor may encounter at the Project Site and it is possible that supplemental and/or revised recommendations may need to be provided at some later date.

As is standard practice in the industry, the conclusions contained in our report are considered preliminary because they are based on assumptions made about the soil, rock, and groundwater conditions exposed at the Project Site during our subsurface investigation. A more complete extent of the actual subsurface conditions can only be identified when they are exposed during construction. Therefore, EE should be retained as the consultant during construction to observe the actual conditions and to provide our final conclusions. When a different geotechnical consultant is retained to perform inspection during construction then they should be relied upon to provide final design conclusions and recommendations, and should assume the role of geotechnical engineer of record. This pertains to the portion of impacted soil work that will be completed by CBC after November 21, 2024. To be clear, CBC's geotechnical/environmental consultant shall not rely on EE's work and shall perform their own due diligence to develop their own evaluation and recommendations.

This report has been prepared for the exclusive use of the Port of Camas-Washougal for the specific use for the proposed Former Hambleton Bros Log Yard Remedial Action project. EE does not authorize the use of the advice herein nor the reliance upon the report by third parties without prior written authorization by EE.

Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan

NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan

NA = Not applicable

Qualifiers:

C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.

J: The identification of the analyte is acceptable; the reported value is an estimate.

J3: The associated batch QC was outside the established quality control range for precision.

J4: The associated batch QC was outside the established quality control range for accuracy

P: RPD between the primary and confirmatory analysis exceeded 40%

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan				NA = Not applicable					
Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan									
NOTES:									
*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025									
Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.									
cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.									
Qualifiers: C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. J: The identification of the analyte is acceptable; the reported value is an estimate.

	Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan				Indicates analyte tested above 2013 Washington DOE Cleanup Action limits				NA = Not applicable				NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan							

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan				NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan					NA = Not applicable								

Qualifiers:

C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.

J: The identification of the analyte is acceptable; the reported value is an estimate.

J3: The associated batch QC was outside the established quality control range for precision.

J4: The associated batch QC was outside the established quality control range for accuracy

P: RPD between the primary and confirmatory analysis exceeded 40%

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

	Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan				NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan												
Qualifiers:																	
C3:	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.																
J:	The identification of the analyte is acceptable; the reported value is an estimate.																
J3:	The associated batch QC was outside the established quality control range for precision.																
J4:	The associated batch QC was outside the established quality control range for accuracy																
P:	RPD between the primary and confirmatory analysis exceeded 40%																
NOTES:																	
*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025																	
Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.																	
cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan		Indicates analyte tested above 2013 Washington DOE Cleanup Action limits				NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan																	
Qualifiers:																									
C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.																									
J: The identification of the analyte is acceptable; the reported value is an estimate.																									
J3: The associated batch QC was outside the established quality control range for precision.																									
J4: The associated batch QC was outside the established quality control range for accuracy																									
P: RPD between the primary and confirmatory analysis exceeded 40%																									
NOTES:																									
*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025																									
Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.																									
cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan		Indicates analyte tested above 2013 Washington DOE Cleanup Action limits			NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan									
Qualifiers:																
C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.																
J: The identification of the analyte is acceptable; the reported value is an estimate.																
J3: The associated batch QC was outside the established quality control range for precision.																
J4: The associated batch QC was outside the established quality control range for accuracy																
P: RPD between the primary and confirmatory analysis exceeded 40%																
NOTES:																
*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025																
Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.																
cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan			Indicates analyte tested above 2013 Washington DOE Cleanup Action limits		NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan															

Qualifiers:

C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.

J: The identification of the analyte is acceptable; the reported value is an estimate.

J3: The associated batch QC was outside the established quality control range for precision.

J4: The associated batch QC was outside the established quality control range for accuracy

P: RPD between the primary and confirmatory analysis exceeded 40%

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAH

Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan		Indicates analyte tested above 2013 Washington DOE Cleanup Action limits		NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan															

Qualifiers:

C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.

J: The identification of the analyte is acceptable; the reported value is an estimate.

J3: The associated batch QC was outside the established quality control range for precision.

J4: The associated batch QC was outside the established quality control range for accuracy

P: RPD between the primary and confirmatory analysis exceeded 40%

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

	Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan		Indicates analyte tested above 2013 Washington DOE Cleanup Action limits		NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan							Sample is for soil characterization to confirm that additional soils excavated from this area can be disposed of as clean fill.			Sample from an area at or exceeding excavation limits						

Qualifiers:

C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.

J: The identification of the analyte is acceptable; the reported value is an estimate.

J3: The associated batch QC was outside the established quality control range for precision.

J4: The associated batch QC was outside the established quality control range for accuracy.

O1: The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

P: RPD between the primary and confirmatory analysis exceeded 40%

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

	Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan		Indicates analyte tested above 2013 Washington DOE Cleanup Action limits		NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan								Sample is for soil characterization to confirm that additional soils excavated from this area can be disposed of as clean fill.			Sample from an area at or exceeding excavation limits			

Qualifiers:

C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.

J: The identification of the analyte is acceptable; the reported value is an estimate.

J1: Surrogate recovery limits have been exceeded; values are outside upper control limits.

J3: The associated batch QC was outside the established quality control range for precision.

J4: The associated batch QC was outside the established quality control range for accuracy

P: RPD between the primary and confirmatory analysis exceeded 40%

NOTES:

*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025

Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.

cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

	Indicates analyte cited in the 2013 Washington DOE Cleanup Action plan		Indicates analyte tested above 2013 Washington DOE Cleanup Action limits			NA = Not applicable		NV = NO VALUE As cited in 2013 Washington DOE Cleanup Action Plan						
Qualifiers:														
B: The same analyte is found in the associated blank.														
C3: The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.														
J: The identification of the analyte is acceptable; the reported value is an estimate.														
J4: The associated batch QC was outside the established quality control range for accuracy														
Q: Sample was prepared and/or analyzed past holding time as defined in the method. Concentrations should be considered minimum values.														
NOTES:														
*Methylene Chloride non-detects reported with a Method Detection Limit ("MDL") to meet Washington Department of Ecology detection standards. Pace Analytical MDL = .00664 and RDL = .025														
Total PCBs based on summation of 1/2 nondetect limits, peak reported value, or a summation of the two when appropriate.														
cPAH TEC values were calculated utilizing the MTCATPH_V12.0 Spreadsheet, based on recommendations provided by the WA DOE in a 2015 report titled: Evaluating the Human Health Toxicity of Carcinogenic PAHs Using Toxicity Equivalency Factors.

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].	¹ Cp
MDL	Method Detection Limit.	² Tc
MDL (dry)	Method Detection Limit.	³ Ss
RDL	Reported Detection Limit.	⁴ Cn
RDL (dry)	Reported Detection Limit.	⁵ Sr
Rec.	Recovery.	⁶ Qc
RPD	Relative Percent Difference.	⁷ GI
SDG	Sample Delivery Group.	⁸ AI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	⁹ SC
U	Not detected at the Reporting Limit (or MDL where applicable).	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
J	The identification of the analyte is acceptable; the reported value is an estimate.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
P	RPD between the primary and confirmatory analysis exceeded 40%.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J7	Surrogate recovery cannot be used for control limit evaluation due to dilution.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.

Entire Report Reviewed By:

Brian Ford
Project Manager

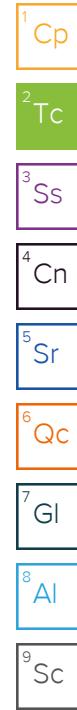

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].	1 Cp
MDL	Method Detection Limit.	2 Tc
MDL (dry)	Method Detection Limit.	3 Ss
RDL	Reported Detection Limit.	4 Cn
RDL (dry)	Reported Detection Limit.	5 Sr
Rec.	Recovery.	6 Qc
RPD	Relative Percent Difference.	7 GI
SDG	Sample Delivery Group.	8 AI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	9 Sc
U	Not detected at the Reporting Limit (or MDL where applicable).	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
V	The sample concentration is too high to evaluate accurate spike recoveries.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].	1 Cp
MDL	Method Detection Limit.	2 Tc
MDL (dry)	Method Detection Limit.	3 Ss
RDL	Reported Detection Limit.	4 Cn
RDL (dry)	Reported Detection Limit.	5 Sr
Rec.	Recovery.	6 Qc
RPD	Relative Percent Difference.	7 GI
SDG	Sample Delivery Group.	8 AI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	9 Sc
U	Not detected at the Reporting Limit (or MDL where applicable).	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
P	RPD between the primary and confirmatory analysis exceeded 40%.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
J6	The sample matrix interfered with the ability to make any accurate determination; spike value is low.
P	RPD between the primary and confirmatory analysis exceeded 40%.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.

Earth Engineers - Camas, WA

Sample Delivery Group: L1780967
Samples Received: 09/24/2024
Project Number: 10-240350
Description: Waterfront Soils Removal
Site: HYAS POINT SOILS REMOVAL
Report To: Steven Day
2411 SE 8th Ave
Camas, WA 98607

Entire Report Reviewed By:

Mark W. Beasley
Project Manager

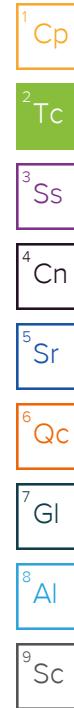

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J4	The associated batch QC was outside the established quality control range for accuracy.
J5	The sample matrix interfered with the ability to make any accurate determination; spike value is high.
P	RPD between the primary and confirmatory analysis exceeded 40%.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].	1 Cp
MDL	Method Detection Limit.	2 Tc
MDL (dry)	Method Detection Limit.	3 Ss
RDL	Reported Detection Limit.	4 Cn
RDL (dry)	Reported Detection Limit.	5 Sr
Rec.	Recovery.	6 Qc
RPD	Relative Percent Difference.	7 GI
SDG	Sample Delivery Group.	8 AI
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.	9 Sc
U	Not detected at the Reporting Limit (or MDL where applicable).	
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.	
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.	
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.	
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.	
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.	
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.	
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.	
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.	
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.	
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.	
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.	
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.	

Qualifier	Description
C3	The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.
J2	Surrogate recovery limits have been exceeded; values are outside lower control limits.
J3	The associated batch QC was outside the established quality control range for precision.
J4	The associated batch QC was outside the established quality control range for accuracy.
P	RPD between the primary and confirmatory analysis exceeded 40%.
V	The sample concentration is too high to evaluate accurate spike recoveries.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J4	The associated batch QC was outside the established quality control range for accuracy.
O1	The analyte failed the method required serial dilution test and/or subsequent post-spike criteria. These failures indicate matrix interference.

CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

GLOSSARY OF TERMS

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

(dry)	Results are reported based on the dry weight of the sample. [this will only be present on a dry report basis for soils].
MDL	Method Detection Limit.
MDL (dry)	Method Detection Limit.
RDL	Reported Detection Limit.
RDL (dry)	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Original Sample	The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state "ND" (Not Detected) or "BDL" (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier Description

B	The same analyte is found in the associated blank.
J	The identification of the analyte is acceptable; the reported value is an estimate.
J1	Surrogate recovery limits have been exceeded; values are outside upper control limits.
J4	The associated batch QC was outside the established quality control range for accuracy.
