1.0 Introduction

This Engineering Design Report (EDR) was prepared per the requirements of Washington Administrative Code (WAC) 173-340-400(4)(a) and describes the engineering concepts and design criteria for the cleanup action selected by the Washington State Department of Ecology (Ecology) for the Smith-Kem Ellensburg, Inc. (Smith-Kem) site (Site), as detailed in the Cleanup Action Plan (CAP; Ecology 2023). The Site is generally located at 200 S. Railroad Avenue in Ellensburg, Washington, and the Site boundary includes a small portion of adjacent properties, as defined in the CAP. The Site is included on Ecology's Confirmed and Suspected Contaminated Sites List under Facility Site ID 12832256 and Cleanup Site ID 4257.

1.1 SITE DESCRIPTION AND REGULATORY OVERVIEW

The Smith-Kem property is zoned as "heavy industrial" and located in Kittitas County (parcel no. 226833) on approximately 2 acres with a surface covered with compacted imported gravel. The Site is bounded to the north by vacant properties and to the south by various light-industrial and other commercial businesses. To the east is the BNSF Railway Company (BNSF) rail yard and a rail spur that comes onto the eastern portion of the property. To the west is S. Railroad Avenue followed by a rural residential property. The surrounding City of Ellensburg, as well as most of Kittitas County, is agricultural land. The Smith-Kem property location is shown on Figure 1.1, and key features of the property and surrounding area are shown on Figure 1.2.

Starting in the mid-1920s, Shell Oil Products US (Shell) operated a bulk fuel facility on the property and continued operations until the early 1970s. In 1948, Shell leased a portion of the property to Smith-Kem, a vendor of agricultural products. Shell sold the property to James R. and Jean Smith (Smiths) of Ellensburg, Washington, in 1972, and Smith-Kem continued to conduct operations on the property until March 31, 2015, when the McGregor Company (McGregor) acquired the business and assumed control of the property as an operator. The Smiths sold the property to Ad Gro, LLC, on August 5, 1996, but McGregor has had effective control of the day-to-day operations since April 1, 2015.

An environmental investigation in 2007 identified total petroleum hydrocarbons (TPH) in soil and groundwater, which led to subsequent investigations of soil and groundwater that documented elevated levels of pesticides, chlorinated herbicides, and ammonia. Based on those results, Shell and Smith-Kem were named potentially liable persons (PLPs) and entered into an Agreed Order (AO; AO DE 12908) with Ecology on February 29, 2016 (Ecology 2016). Remedial Investigation (RI) field activities were conducted per the AO and an Ecology-approved RI Work Plan (Floyd|Snider 2016) starting in 2016 and were completed in early 2020. After the RI field work, an RI/Feasibility Study (FS) report was prepared and submitted to Ecology in 2021 (Floyd|Snider 2021) and subsequently approved by Ecology in January 2022. In May 2023, Ecology issued the CAP, which described the preferred cleanup action for the Site.

In August 2023, Smith-Kem, Ad Gro, and Shell executed a Consent Decree (CD; CD 23-2-00247-19) with Ecology to implement remedial actions at the Site as specified in the CAP, which is Exhibit B of the CD. Ecology's selected cleanup action includes the following components:

- Excavation and off-site disposal of soil in areas of concern (AOCs) with chemical of concern (COC) concentrations greater than remediation levels (RELs) or cleanup levels (CULs)
- Installation of a geosynthetic clay liner (GCL) and drainage in the eastern portion of the Site for protection of groundwater
- In situ groundwater treatment by injecting liquid activated carbon along the downgradient edge of AOC 5 to immobilize COCs (pesticides and TPH) in groundwater
- Capping contaminated soil with COC concentrations greater than the RELs to protect workers from direct contact exposure
- Institutional controls (ICs) to prohibit use of Site groundwater as drinking water or for domestic use, irrigation, or industrial use and to maintain the cap
- Monitored natural attenuation (MNA) for groundwater recovery

1.2 PURPOSE AND OBJECTIVES

The purpose of the EDR is to provide the engineering design and planning information for cleanup action implementation described in the CAP, as well as to provide sufficient detail to implement the post-construction activities.

The primary objectives of this EDR include the following:

- Summarize the pre-remedial design investigation (PDI) results.
- Refine the lateral and vertical extents of contaminated soil excavations based on the results of the PDI soil data collection.
- Provide injection spacing and reagent quantities for the in situ groundwater treatment based on the results of the PDI data collection.
- Provide design details for GCL and drainage components.
- Provide design details and assumptions that will serve as direction to the contractor(s) and subcontractors to implement all components of the cleanup action in a protective and safe manner in accordance with the CAP.
- Comply with applicable sections of the WAC; the Model Toxics Control Act (MTCA; Chapter 70.105D RCW); and applicable state, federal, and local requirements.

This EDR meets the WAC 173-340-400(4)(a) requirements.

1.3 ROLES AND RESPONSIBILITIES

This section defines roles and responsibilities for implementation of the cleanup, consistent with WAC 173-340-400(4)(a)(iii). The PLPs, Smith-Kem and Shell, are responsible for performing the work described in this EDR as required under the CD. The Site owner, Ad Gro, will be responsible for facilitating Site access and coordination. Smith-Kem is the primary contracting party and is ultimately responsible for the performance of the work. Smith-Kem, its consultants, the selected contractor(s), and Ecology will be involved in the implementation of the project.

Ecology will provide regulatory review and approval of this EDR and applicable post-construction operation, maintenance, and monitoring plans. Ecology may additionally conduct Site inspections during implementation of the cleanup action.

Floyd|Snider is the primary consultant to Smith-Kem and is responsible for overall project management to ensure that implementation of the EDR complies with the CAP and the CD. The Engineer of Record, a professional engineer registered in the state of Washington, is responsible for the preparation and stamping of this EDR. The Engineer of Record or their designee (Engineer), on behalf of Smith-Kem, will provide quality control oversight during cleanup action implementation. Any other approving engineer responsible for oversight and documentation of the cleanup action will also be a professional engineer registered in the state of Washington and will be identified to Ecology prior to commencing field work.

PBS Engineering and Environmental Inc. (PBS) is a subconsultant to Floyd|Snider providing engineering design for the GCL and associated stormwater features described in Sections 5.4 and 6.8.

2.0 Site Background and Environmental Conditions

The following sections provide an overview of the Site background and environmental conditions, with additional detail provided in Section 2.0 of the RI/FS (Floyd|Snider 2021).

2.1 SITE BACKGROUND

Shell operated on the property as a bulk fuel distributor from approximately 1923 to 1972. According to historical property records, general operations consisted of receiving, storing, and distributing bulk fuel products, although exact details concerning unloading, storage, and operational activities are not known. From 1948 until 1972, Shell leased a portion of the property to the Smiths to conduct their agricultural products business. The Smiths operated under the Shell Chemical Company brand during that time and provided fertilizers, pesticides, and herbicides. Shell's operations ceased in the early 1970s, and Smith-Kem repurposed some of the Shell aboveground storage tanks (ASTs) for the storage of fertilizer products. In the late 1980s, all remaining steel ASTs were replaced with ASTs made of fiberglass.

The fertilizer operation expanded in the late 1970s to early 1980s, and a 70-foot by 90-foot concrete secondary containment was constructed around the fertilizer tank farm located north of the current bulk fertilizer building (the AST containment area). In 1988, the fertilizer business shifted from mostly "wet" application (i.e., anhydrous ammonia) to more "dry" application (i.e., pelletized/granular products). To accommodate the storage and mixing of fertilizers, a 5,000-square-foot building (bulk fertilizer building) was built in 1988 south of the AST containment area. The Smiths sold the property to Ad Gro in August 1996 but continued operations on the property. McGregor acquired the Smith-Kem business in March 2015 and has had effective control of Site operations since April 2015.

In 2008, Ecology identified the Site as a MTCA site based on an 2007 investigation that identified elevated levels of TPH in soil and groundwater. Several investigations were conducted between 2007 and 2020 and documented the presence of TPH, pesticides, chlorinated herbicides, nitrate, and ammonia in soil and groundwater. Additional details regarding these investigations can be found in Section 3.0 of the RI/FS.

2.2 CURRENT CONDITIONS AND FUTURE USE

The Site property is located at 200 S. Railroad Avenue in Ellensburg, Washington, in Kittitas County. The property is zoned Heavy Industrial and land uses are industrial or commercial in nature. Most of the property is currently used as a fertilizer-blending and pesticide-storage operation. Adjacent properties include a vacant lot to the north, a BNSF rail yard to the east and a rail spur that comes onto the eastern portion of the property, the roadway S. Railroad Avenue and a rural residential property to the west, and a Habitat for Humanity store to the south, as shown on Figure 1.2. The surrounding City of Ellensburg, as well as most of Kittitas County, is prime agricultural land.

There are currently three buildings on the property, including a machine shop, an office and storage building, and a bulk fertilizer building. Three ASTs, which are used to store diesel fuel and

agricultural products sold by McGregor, are located within an AST containment area. The containment area includes a concrete pad with an encompassing low concrete wall and is surrounded by a fence to restrict access. The majority of the property's surface is covered by buildings, concrete, or compacted gravel.

McGregor, a distributor and manufacturer of bulk crop nutrition and protection products, currently leases the property from Ad Gro to conduct its agricultural product distribution business. McGregor blends pre-purchased products for commercial use and reports that its operations include handling bulk liquid and dry fertilizer products, as well as handling a full range of crop protection products (which include a broad range of pesticides and herbicides). Additionally, operations consist of filling agricultural equipment for direct application to crops throughout the Ellensburg area. The property has long supported agriculture through fertilizer-blending and pesticide-storage operations, and those operations are anticipated to continue in the future after completion of the cleanup action.

2.3 GEOLOGIC AND HYDROGEOLOGIC SETTING

The approximate 2-acre property's ground surface is covered with compacted imported gravel and is relatively flat with an approximate elevation of 1,500 feet above mean sea level. The general topography of the area slopes slightly toward the south.

Shallow soils on the property consist of unconsolidated gravel and cobbles with varying amounts of sand and silt. Silt content generally increases on the northern half of the property with layers of dark brown silt and some organic matter in shallow soils (i.e., between 0 and 5 feet below ground surface [bgs]), which is consistent with this area being part of a floodway or wetland prior to development. This silt unit is not continuous across the property; however, varying amounts of silt in sandy and gravelly soils were observed in the top 5 feet of soils. All Site soils are considered to have been deposited as recent alluvium in the floodplain of the Yakima River.

Seasonal groundwater fluctuations across the Site were evaluated as part of the RI/FS. A shallow unconfined aquifer is typically encountered on the property at depths ranging from 3 to 6 feet bgs. The annual average groundwater table is at 3.5 feet bgs, with greater depths to water (ranging between 4 and 5 feet bgs) in the BNSF rail yard near the rail spur. This is consistent with the higher surface elevation of the BNSF rail yard, which is approximately 1 to 1.5 feet higher than the property. The groundwater table has a shallow horizontal gradient of about 0.002 feet per foot and fluctuates throughout the year, with highs observed during early spring (March) and lows observed during late summer (August) and winter (January). Groundwater at the Site is considered potable per WAC 173-340-720(2).

The nearest surface water bodies include Mercer Creek, approximately 225 feet west of the Site, and Wilson Creek, approximately 125 feet east of the Site. These surface water bodies eventually discharge into the Yakima River, which is about 0.9 miles southwest of the Site. Regional groundwater flow direction is generally to the south-southwest toward the Yakima River. The groundwater flow direction at the Site is also generally to the south-southwest.

2.4 CONCEPTUAL SITE MODEL

Current and former Site uses, including pesticide and fertilizer handling and storage, and the historical transfer and storage of bulk petroleum fuels, resulted in subsurface contamination at the Site. Potential sources or transport mechanisms of contamination include the following:

- Direct releases from equipment washing operations
- Generation of by-products during burning operations
- Direct releases from material storage, use, and handling
- Leaks and spills from equipment, tanks, and machinery
- Leaks and spills during fueling and fuel transfer operations at the rail spur or between ASTs and trucks
- Grading of the ground surface to maintain gravel surfaces
- Infiltration of precipitation and overland flow through contaminated soil, causing leaching into groundwater

These surficial release mechanisms and transport mechanisms have caused contamination to migrate downward from the surface through the soil to groundwater. As a result of these releases, COCs were identified in soil and groundwater as part of the RI. Most contaminated soil is close to the surface, typically between 0 and 5 feet bgs, with limited areas of contamination observed down to 10 feet bgs. COCs have spread laterally in groundwater and the groundwater plumes have been largely defined. Additionally, nitrate contamination is widespread in groundwater across the property. The Site boundary encompasses all areas where contamination greater than the CULs originating from historical and current Site activities has come to lie. A conceptual site model (CSM) of contaminant sources and migration pathways at the Site was developed as part of the RI and is included as Figure 7.1 of the RI.

2.4.1 Chemicals of Concern

Site COCs comprise the chemicals that pose the greatest overall threat to human health and the environment due to toxicity, spatial distribution, and/or concentrations present. Soil and groundwater are the two media of concern at the Site. The Site COCs were determined in the CAP and include the following:

- **Soil:** Seven legacy pesticides (aldrin, dieldrin, chlordane, alpha-chlordane, total dichlorodiphenyltrichloroethane [DDT], beta-benzene hexachloride [BHC], and toxaphene); two active-use pesticides (atrazine and simazine); total diesel- and oil-range TPH; dioxins/furans; and lead
- **Groundwater:** Nitrate, nitrite, pesticides and herbicides (2,4-dichlorophenoxyacetic acid [2,4-D], aldrin, atrazine, dieldrin, chlordane, beta-BHC, 2-methyl-4-chlorophenoxyacetic acid [MCPA], and toxaphene); and total diesel- and oil-range TPH

2.4.2 Areas of Concern and Localized Contamination

Due to the variability in the nature, extent, and media affected by the identified contamination, the cleanup action has been broken into six AOCs to be addressed by multiple remediation technologies. The AOCs are areas historically or currently used for trash burning, loading/offloading, storage, and refueling; and a low spot area that experiences seasonal ponding. AOCs are briefly described as follows:

- AOC 1: Culvert Source Area
- AOC 2: Rail Spur Loading Area
- AOC 3: Trash Burning Area
- AOC 4: Downgradient Low Spot
- AOC 5: Office and Storage Area
- AOC 6: Machine Shop

The location FS-01 north of AOC 1 was identified as an isolated area of diesel-range TPH contamination. The only known source of contamination near FS-01 is incidental leaks or spills from vehicle equipment.

A PDI was conducted in two phases during 2023 in accordance with a PDI Work Plan (Floyd|Snider 2023) to refine the boundaries of the AOCs, as described in Section 4.0. Specific details for each of the AOCs, including specific COCs and any adjustments to their lateral or vertical extents based on the PDI data, are included in Section 5.2.

3.0 Description of Cleanup Action

The cleanup action is being conducted to remediate contaminated soil and groundwater at the Site to the maximum extent practicable to meet the cleanup standards established for the Site. The cleanup action selected by Ecology for the Site was described in the CAP and includes a combination of remedial technologies to address soil and groundwater contamination and meet the Remedial Action Objectives (RAOs). This section describes the RAOs, cleanup standards, and cleanup action components to address the Site-specific COCs for soil and groundwater.

3.1 REMEDIAL ACTION OBJECTIVES

RAOs for the Site were developed in the FS and documented in the CAP to specifically identify goals that should be accomplished to meet the minimum requirements of the MTCA cleanup regulations (WAC 173-340). RAOs define the objectives that must also be met by the cleanup action to ensure substantive compliance with applicable or relevant and appropriate requirements (ARARs). RAOs for the Site include the following:

- Remediate soil and groundwater to protect human and ecological receptors from exposure to Site contamination that exceeds applicable CULs.
- Remove unacceptable human health risk resulting from direct contact with contaminated soil or groundwater.
- Remove unacceptable potential human health risk from consumption of drinking water.
- Remove unacceptable future potential human health risk from indoor vapor intrusion of TPH contamination.
- Comply with local, state, and federal laws (ARARs; WAC 173-340-710) and Site-specific cleanup standards.
- Provide compliance monitoring to evaluate the effectiveness of the cleanup action and to determine that the cleanup standards are met.
- Remediate contaminants in a method that does not interfere with or restrict proposed future use of the Site as an industrial parcel.

3.2 CLEANUP STANDARDS

Cleanup standards are defined under MTCA as a CUL combined with a point of compliance (POC) where the CUL applies. Proposed CULs were developed in the RI/FS for each chemical that was identified as a COC, and cleanup standards were established for the Site in Section 3.2 of the CAP.

3.2.1 Groundwater Cleanup Standards

A conditional POC (CPOC) was established for this Site because of widespread pesticide and nitrate/nitrite contamination; multiple COCs in groundwater exceed their respective CULs by an

order of magnitude. Consistent with WAC 173-340-720(8)(c), the CPOC for groundwater will be as close as practicable to the source of contamination, along the western edge of the property as shown on Figure 8 of Ecology's CAP. A CPOC was established for groundwater at the downgradient property line because the planned cleanup action will not result in groundwater meeting CULs within a reasonable restoration timeline at the standard POC. Groundwater CULs and areas where the COC is present with respect to each AOC are shown in Table 3.1.

Table 3.1
Groundwater Chemicals of Concern, Cleanup Levels, and AOCs

Chemical	CUL (µg/L)	AOCs Where Contamination Is Present
Miscellaneous Substances		
Nitrate	10,000	Site-wide
Nitrite	1,000	AOC 1, AOC 5
Legacy Pesticides		
Aldrin	0.0026	AOC 1
beta-BHC	0.049	AOC 1, AOC 5
Chlordane	2.0	AOC 1
Dieldrin	0.0055	Site-wide
Toxaphene	0.80	AOC 1, AOC 5
Active Use Pesticides and Herbicides		
2,4-D	70	AOC 1
Atrazine	3.0	Site-wide
MCPA	8.0	AOC 1, AOC 5
Total Petroleum Hydrocarbons		
Diesel- and oil-range TPH	500 (1)	AOC 1, AOC 5

Note:
1 Ecology has required that diesel-range and oil-range TPH results in groundwater be summed and compared to a CUL of 500 µg/L for any future assessments of TPH in groundwater. In the CAP, the nature and extent of TPH contamination is described separately for diesel-range and oil-range TPH across the Site.

Abbreviation:
µg/L Micrograms per liter

3.2.2 Soil Cleanup Standards

Soil cleanup standards were developed to be protective of both the highest beneficial use of groundwater (as drinking water) and of human and ecological receptor exposure via the direct contact pathway. The CUL protective of the leaching pathway is referred to as the "leaching CUL." The standard POC for the leaching pathway is 0 feet bgs to the maximum depth where contamination is present. The CUL protective of the direct contact pathway is referred to as the

"direct contact CUL." For protection of human health, the standard MTCA POC for the direct contact pathway of 0 to 15 feet bgs is applied across the Site. For protection of ecological receptors, a Site-specific POC of 0 to 6 feet bgs for the direct contact pathway is applied across the Site. The CUL for each chemical considers each of these pathways along with the location and depth of contamination present at the Site, such that CULs are protective of all pathways for each chemical. Soil CULs and where the COC is present with respect to each AOC are shown in Table 3.2.

Table 3.2
Soil Chemicals of Concern, Cleanup Levels, POCs, and AOCs

Chemical	CUL (mg/kg)	Pathway/Basis of CUL	AOCs Where Contamination Is Present
Metals			
Lead	250	Direct Contact/MTCA Method A	AOC 4
Legacy Pesticides			
Aldrin	0.0067	Leaching/WAC Eq. 747-1	AOC 2, AOC 5
	0.059	Direct Contact/MTCA Method B	AOC 1
beta-BHC	0.0067	Leaching/WAC Eq. 747-1	AOC 1, AOC 2
Chlordane	1.1	Leaching/WAC Eq. 747-1	AOC 2
	2.9	Direct Contact/MTCA Method B	AOC 1, AOC 4
alpha-Chlordane	2.9	Direct Contact/MTCA Method B	AOC 1
Dieldrin	0.0067	Leaching/WAC Eq. 747-1	AOC 1, AOC 2, AOC 3, AOC 4, AOC 5, AOC 6
	0.063	Direct Contact/MTCA Method B	
Total DDT	2.9	Direct Contact/MTCA Method B	AOC 3
Toxaphene	0.84	Leaching/WAC Eq. 747-1	AOC 1, AOC 2, AOC 5
	0.91	Direct Contact/MTCA Method B	AOC 3, AOC 4
Active-Use Pesticides			
Atrazine	4.3	Direct Contact/MTCA Method B	AOC 2
Simazine	8.3	Direct Contact/MTCA Method B	AOC 2
Total Petroleum Hydrocarbons [(1)]			
Total diesel-and oil-range TPH	460	Direct Contact/TEE	AOC 2, AOC 4, AOC 5, FS-01
	2,000	MTCA Method A	AOC 4, AOC 5
Dioxins/Furans			
Dioxins/furans	0.000013	Direct Contact/MTCA Method B	AOC 3

Note:

1 The CUL for TPH is based on total diesel- and oil-range TPH (calculated as a sum of both fractions) and is protective of the direct contact and leaching pathways. The POC for the direct contact criterion protective of ecological receptors (460 mg/kg) is 0 to 6 feet bgs. The POC for the MTCA Method A criterion (2,000 mg/kg) is 0 to 15 feet bgs.

3.3 REMEDIATION LEVELS

In accordance with WAC 173-340-200, a REL is "a concentration of a hazardous substance in soil, air, water, or sediment above which a particular cleanup action component will be required as part of a cleanup action at a site." RELs are, by definition, concentrations that exceed cleanup standards and are used when a combination of cleanup action components are necessary to achieve RAOs or where soil containment (i.e., under a cap) is part of the cleanup action. The cleanup action for the Site meets both of these criteria, as shown by the RAOs described in Section 3.1. A cleanup action that uses RELs must also comply with cleanup standards, which in this case means that groundwater will meet the CULs for groundwater at the CPOC. Soil RELs for select Site COCs are presented in Table 3.3.

Table 3.3
Soil Chemicals of Concern and Remediation Levels

Chemical	Leaching REL (mg/kg)	Direct Contact REL (mg/kg)
Legacy Pesticides		
Aldrin	0.13	0.43
beta-BHC	0.13	--
Chlordane	22	21
alpha-Chlordane	--	21
Dieldrin	0.13	0.46
Total DDT	--	22
Toxaphene	17	6.7
Active-Use Pesticides		
Atrazine	--	32
Simazine	--	61
Total Petroleum Hydrocarbons (1)		
Diesel-range TPH	3,800	--
Oil-range TPH	8,700	--
Dioxins/Furans		
Dioxins/furans	--	0.000094

Notes:
-- Not applicable.
1 The RELs developed for diesel- and oil- range TPH are specific to the individual chemicals (i.e., not the summed total).

The RELs, in combination with ICs, will achieve the long-term goal of compliance with the groundwater CULs at the CPOC.

3.4 CLEANUP ACTION COMPONENTS

The cleanup action components presented in the CAP[1] that will be applied to AOCs at the Site are shown on Figure 8 of the CAP and described as follows:

- Excavation and off-Site disposal of soil in AOCs 1 through 5 with COC concentrations greater than the following:
  - Leaching-based RELs for pesticides in AOCs 1, 2, and 4
  - Direct contact-based RELs for pesticides in AOCs 3 and 5
  - Leaching-based REL for TPH in AOCs 2 and 4
  - Direct contact-based REL for dioxins/furans in AOC 3 on-property
  - Direct contact-based CUL for dioxins/furans in AOC 3 off-property
  - CULs for lead in AOC 4
- Excavation and off-Site disposal of shallow pesticide contamination in soil in AOC 6 and shallow TPH contaminated soil in the area around FS-01 to CULs.
- Installation of a GCL and drainage in the area of AOC 1 and AOC 2 for protection of groundwater where contaminated soil remains in place with pesticide concentrations greater than the leaching RELs and groundwater contains exceedances of pesticide CULs.
- In situ groundwater treatment of the downgradient plume using a liquid activated carbon matrix. The groundwater treatment is designed to immobilize and treat organic contaminants in groundwater migrating from beneath the office and storage building.
- Capping contaminated soil with COC concentrations greater than the RELs to protect worker direct contact exposure, including pesticide and TPH contamination beneath the office and storage building in AOC 5 and deeper TPH contamination beneath the gravel surface in AOC 4.
- ICs that prohibit use of Site groundwater as drinking water or for domestic use, irrigation, or industrial use and include provisions for maintaining the cap.
- MNA for groundwater recovery and implementation of a Groundwater Monitoring Plan (GMP) after cleanup action completion.

[1] Excavation limits presented in the CAP were refined and adjusted as described in subsequent sections in this EDR.

4.0 Summary of Pre-Remedial Design Investigation

The first deliverable required under the CD was a PDI Work Plan. A draft PDI Work Plan was submitted to Ecology on May 2, 2023, and was revised to address Ecology comments and finalized on June 29, 2023 (Floyd|Snider 2023). Ecology subsequently approved the PDI Work Plan on July 6, 2023. This section provides a summary of the PDI fieldwork and results.

Two PDI phases (Phase 1 and Phase 2) were completed to collect information and data necessary to support design of the remedial components of the cleanup action. Details of the proposed Phase 1 PDI were described in the PDI Work Plan and Phase 1 field activities were completed in August/September 2023. Phase 1 PDI results and details of the proposed Phase 2 PDI were verbally discussed with Ecology on November 30, 2023, and additional details regarding Phase 2 PDI activities were transmitted to Ecology via email on December 4, 2023. Ecology approved the proposed Phase 2 PDI in an email on December 6, 2023. Phase 2 field activities were completed on December 14, 2023. PDI investigation locations and monitoring wells are shown on Figure 4.1 relative to AOC boundaries and the location of soil borings included in the RI.

4.1 PRE-REMEDIAL DESIGN INVESTIGATION DATA COLLECTION OVERVIEW

Phase 1 of the PDI included the following activities:

- A private utility locate of underground utilities for all utilities that fall within or potentially within the anticipated excavation areas.
- Passive flux meters (PFMs) were deployed near the proposed in situ groundwater treatment (i.e., PlumeStop) area to measure the vertical profile of groundwater flow and support the in situ groundwater treatment design.
- Groundwater samples were collected on August 15 and 16, 2023, to support the in situ groundwater treatment design. Results of this sampling are reported in Table 4.1; the analytical schedule is summarized as follows:
    - Samples collected from monitoring wells MW-1, MW-2, and MW-10 were analyzed for conventional characteristics (including hardness, aluminum, calcium, and magnesium; alkalinity; and total organic carbon), volatile organic compounds (VOCs), and gasoline-range TPH to understand groundwater quality and total organic mass.
    - Samples were collected from monitoring wells MW-1 and MW-6 based on previous groundwater data in the area and were analyzed for targeted COCs including pesticides (aldrin, chlordane, dieldrin, toxaphene, and atrazine) and diesel- and oil-range TPH.
- Between September 5 and 7, 2023, a total of 41 soil borings were advanced in AOCs 1, 2, 3, 4, and 5 to maximum depths between 3 and 15 feet bgs. Samples at 39 of these locations were analyzed, as reported in Table 4.2. Soil samples were collected for

COCs that exceeded CULs or RELs within each AOC to supplement existing data and refine excavation extents and to support excavation design.

- One soil sample for grain-size analysis was also collected from AOC 5 for design verification of the in situ groundwater treatment barrier.

Based on the results of the Phase 1 PDI event, the Phase 2 PDI included the following activities completed between November and December 2023:

- Nine additional soil borings were advanced in AOC 2, and samples at eight of these locations were analyzed to further delineate lateral and vertical excavation extents, as follows:
  - Two step-out soil borings (AOC2-09 and AOC2-10) were advanced 5 feet apart northwest of AOC 2 to delineate pesticide REL exceedances detected at 2 feet bgs at AOC2-08.
  - An additional seven borings (AOC2-11 through AOC2-17) were advanced along the eastern boundary of AOC 2 along the rail spur and property line to delineate TPH exceeding RELs at AOC2-03 and AOC2-04.
  - One grain size analysis sample was collected from AOC2-11, along the eastern boundary of AOC 2, to provide geotechnical information to support the GCL design.
- One additional soil boring (AOC4-09) was advanced in AOC 4 along the northeast boundary near the containment area to delineate oil-range TPH.
- PBS completed a site topographical survey as part of the GCL and stormwater conveyance structure design.

Soil samples collected during the PDI were submitted to ALS Environmental (ALS) in Kelso, Washington, for laboratory analysis of legacy pesticides and atrazine; Pacific Agricultural Laboratory for analysis of simazine; Friedman & Bruya, Inc. (FBI) for analysis of diesel- and oil-range TPH, lead, and grain size; and Analytical Resources, LLC (ARL) for analysis of dioxins/furans. Groundwater samples were submitted to ALS for analysis of atrazine; ARL for analysis of other pesticides; and FBI for analysis of TPH, VOCs, metals, and conventional characteristics. PFM samples were analyzed by EnviroFlux, LLC, in Gainesville, Florida. The grain size sample collected from AOC 2 for the GCL design was submitted to PBS for analysis at their geotechnical laboratory. Analytical laboratory reports for these samples are included in Appendix A, Attachment A.1; data validation reports are included in Appendix A, Attachment A.2; and soil boring logs are included in Appendix B.

4.1.1 Deviations from the PDI Work Plan

The following deviations from the PDI Work Plan occurred due to conditions encountered in the field and laboratory restrictions:

- The laboratory performing pesticide analysis by USEPA Method 8081 groundwater changed from ALS to ARL due to laboratory equipment availability.
- Poor soil recovery occurred at location AOC4-02 and the base sample was subsequently collected at 4.5 feet bgs instead of 5 feet bgs.
- Location AOC1-04 in AOC 1 was moved 4 feet west due to drill rig access limitations between ecology blocks and the wooden retaining wall.
- Location AOC1-07 in AOC 1 was moved 9 feet east due to safety concerns of maintaining adequate distance from the overhead power line.
- Sample location H4H-05 in AOC 3 shifted 6 feet northeast due to obstruction by a Habitat for Humanity roll-off dumpster.

4.2 PRE-REMEDIAL DESIGN INVESTIGATION SUMMARY AND RESULTS

The following sections summarize the field investigation and results of the two PDI field events.

4.2.1 Utility Survey

A utility survey was completed to support design and planning of cleanup action excavations. An initial desktop review of the Site utilities was completed by Floyd|Snider using City of Ellensburg public utility records, available Site records, and communications with McGregor about private Site utilities. Overhead power lines are present over the AOC 1 excavation area, and underground utilities (gas, water, sewer, electric, and/or communications) are present in AOC 4 and AOC 6 excavation areas. Based on communication with Darin Yusi, Gas Engineer at the City of Ellensburg Gas Division (City Gas Division), any work within 10 feet of the gas lines at the Site must be coordinated directly with the City Gas Division to determine work and oversight requirements. In addition, any work between 2 and 10 feet of a gas line must be completed in a protective manner in close coordination with the City Gas Division to ensure the utility is not damaged. Utility pothole locations were determined based on this initial desktop review.

A Site utility survey was conducted on August 15, 2023, to confirm utility locations, depths, and materials in proposed excavation areas. Conductible utilities were first magnetically located by Applied Professional Services (APS) and then potholed by APS using air knifing. After each utility was exposed, the depth (inches bgs) to top of pipe, diameter, and material were recorded, and the utility location was surveyed using a hand-held GPS and measured off existing Site features for additional reference.

The private water and sewer lines running between the main office building and machine shop could not be located using aboveground tracing and there were no cleanouts or other aboveground indicators to determine the pipes' locations. Therefore, these pipes will need to be located by the contractor during the excavation of AOC 1, as further described in Section 6.4.

Utility details, locations, and depth at each pothole point, as well as the 10-foot gas line buffers, are shown on Figure 4.2.

4.2.2 Passive Flux Meter Data

PFMs were installed by Floyd|Snider in monitoring wells MW-2 and MW-10 near the proposed in situ groundwater treatment area to measure the vertical profile of groundwater flow and support design. PFMs are constructed from a long outer mesh liner filled with a mixture of sorbent and tracer material that are placed into the groundwater column in existing monitoring wells and later retrieved for analysis after a set amount of time. The tracer chemicals are then leached away at a steady rate based on the groundwater flow. After the PFM is retrieved and tested for the concentration of tracer chemical remaining, the Darcy velocity of groundwater through the vertical profile of the groundwater table can be calculated.[2]

Two 5-foot PFMs were installed in each monitoring well to fully cover the 10-foot well screen interval (3 to 13 feet bgs at MW-2 and 5 to 15 feet bgs at MW-10). The PFMs were deployed by Floyd|Snider on August 16, 2023, and retrieved on August 29, 2023. Once retrieved, each PFM was sampled at 1.5-foot intervals. The PFM data were analyzed by Enviroflux and provided to Regenesis (the manufacturer of PlumeStop in situ treatment barrier) to support design, including injection spacing and reagent selection and quantities. The average measured Darcy velocities for MW-2 and MW-10 are 5.4 and 17.1 centimeters (cm) per day, respectively. Based on these results, the average groundwater velocities in these wells ranged from 65 feet per year at MW-2 to 205 feet per year at MW-10. The PFM results are shown in Appendix D.

4.2.3 Grain Size Data

Grain size data (included in Appendix A, Attachment A.1) were collected as requested by Regenesis and PBS to support remedial design. Grain size analysis was performed in AOC 5 to support Regenesis' in situ groundwater treatment design. This analysis found that the major soil type at that location was gravel with sand and limited silt, and this soil profile was generally consistent between 5 and 15 feet bgs. The percentage of soil meeting the standard for gravel (i.e., retained on #4 sieve) decreased with depth from 77% at 5 to 6 feet bgs to 54% at 14 to 15 feet bgs. Conversely, the percentage of sand increased with depth from 22% at 5 to 6 feet bgs to 44% at 14 to 15 feet bgs. These results support the high groundwater velocities measured by the PFMs.

A grain size sample was also collected from location AOC2-11 from 1.5 to 3 feet bgs, as requested by PBS, to provide additional geotechnical data to support GCL and drainage system design. This sample was specifically targeted in shallow, siltier soil representative of the underlying foundation of the GCL layer. The soil type at this location was majority sand (62%) with silt (30%) and gravel (8%). The grain size report is included in PBS's Geotechnical Engineering Letter Report in Appendix E.

[2] Measurement of contaminants absorbed to the PFMs were not necessary for designing the PlumeStop due to low concentrations of contaminants in groundwater.

4.2.4 Groundwater Sample Collection and Analyses

Groundwater samples were collected from selected monitoring wells in the vicinity of AOC 5 to support in situ groundwater treatment design. Groundwater samples were collected using low-flow procedures using a peristaltic pump and new dedicated tubing. The monitoring wells were purged prior to sampling at a maximum rate of 0.5 liters per minute. During purging, field parameters (i.e., temperature, pH, specific conductivity, oxidation–reduction potential, dissolved oxygen, and turbidity) were recorded at 5-minute intervals using a multiparameter water quality meter. Groundwater samples were collected once the field measurements for water quality parameters were stable.

MW-1, MW-2, MW-6, and MW-10 were sampled as described in Section 4.1 to provide current data for total organic mass and COC concentrations in the vicinity of the in situ treatment area, and to characterize groundwater parameters that could affect in situ groundwater treatment design. The PDI groundwater results are presented on Table 4.1 with comparison to the relevant groundwater CULs. Pesticide results at MW-1 and MW-6 exceeded the CUL of 0.0055 µg/L for dieldrin (0.14 µg/L and 0.30 µg/L, respectively) and the CUL of 0.8 µg/L for toxaphene (1.2 µg/L and 4.0 µg/L, respectively). These results were within the range of previous dieldrin and toxaphene data from MW-1 and MW-6 presented in the RI. Results for TPH, aldrin, and chlordane were all less than the respective groundwater CULs. VOCs and hardness characteristic results are presented in Table 4.1 but do not have relevant groundwater CULs for comparison because they are not Site COCs.

4.2.5 Soil Sample Collection and Chemical Analyses

AOCs were initially defined in the RI based on CUL exceedances. Soil borings collected during the PDI were advanced to collect data that could be used to refine excavation extents in each AOC based on REL exceedances, as further described in this section. Soil borings during Phase 1 were advanced by Anderson Environmental Contracting, LLC, and borings during Phase 2 were advanced by Cascade Environmental. Sonic core drilling technology was used for both phases. Floyd|Snider personnel completed the soil profiling and collected soil samples for targeted COCs to further define the vertical and horizontal limits of excavation in AOCs 1 through 5. Field screening was performed with a photoionization detector (PID) in areas with TPH contamination.

During Phase 1, a two-tiered approach was used for collection and analysis of PDI soil samples to minimize the number of mobilizations. The first-tier soil samples were collected at the mid-point and/or base of the AOCs as needed to delineate the horizontal and vertical extents of the excavation. Second-tier soil samples were strategically collected at select locations from deeper intervals and archived at the laboratory for subsequent analysis as needed if the respective first-tier soil sample at the same location had REL exceedances of one or more COCs.

The PDI soil results along with previous investigation results compared to the applicable RELs and CULs in each AOC are presented on Table 4.2. Figures 4.3 through 4.7 summarize exceedance information for soil sampling results collected within and near AOCs 1 through 5. Additionally, Figures 4.8 and 4.9 show the same features and data for AOC 6 and FS-01; however, no additional

samples were collected in these areas during the PDI. These data summary figures show the revised extents of excavation which were modified from the CAP based on the PDI data described in this section and additional design considerations described in Section 5.0. A summary of the PDI data collected in AOCs 1 through 5 is described as follows.

AOC 1: PDI samples in AOC 1 were analyzed for legacy pesticides based on unbounded REL exceedances in RI sample results and are compared to leaching RELs based on collocated groundwater exceedances for legacy pesticides. Pesticide COC results met leaching RELs except at location AOC1-03, where dieldrin exceeded the leaching REL of 0.13 mg/kg at 2 and 4 feet bgs. Toxaphene also exceeded the direct contact REL of 6.7 mg/kg at 2 feet bgs at this location. The maximum dieldrin and toxaphene results at AOC1-03 were 0.37 and 6.8 mg/kg, respectively. Toxaphene at AOC1-03 was less than the direct contact REL at 4 feet bgs. AOC1-03 is directly adjacent to the BNSF property boundary, and therefore, an additional step-out sample to delineate the REL exceedances was not collected due to BNSF property access constraints and limitations on excavation near the rail spur. The other Phase 1 samples all had pesticide concentrations less than applicable RELs. No additional samples were collected in AOC 1 during Phase 2.

AOC 2: PDI samples in AOC 2 were analyzed for legacy pesticides, active use pesticides, and/or TPH based on unbounded REL exceedances in RI sample results. Pesticide results are compared to leaching RELs based on collocated groundwater exceedances for dieldrin. Concentrations of dieldrin (4.7 mg/kg) and toxaphene (100 mg/kg) exceeded applicable direct contact RELs at one location on the northwest boundary of AOC 2 (AOC2-08 at 2 feet bgs). The deeper sample (4 feet bgs) at the same location did not exceed any pesticide RELs or CULs. A step-out location (AOC2-09) was sampled during the Phase 2 PDI and had no CUL exceedances at 2 and 4 feet bgs.

Samples from AOC2-3 and AOC2-4, Phase 1 locations along the eastern boundary of AOC 2, exceeded the diesel-range TPH REL at 6.5 feet bgs (8,300 mg/kg) and 6 feet bgs (19,000 mg/kg), respectively. These sample intervals were selected for analysis based on elevated PID measurements (refer to boring logs in Appendix B). Both boring locations had diesel-range TPH concentrations less than the CUL at 8.5 feet bgs, consistent with a lack of PID response in the deeper interval. Additional borings along the rail spur and eastern property boundary were advanced during Phase 2 to delineate the eastern extent of TPH impacts. One location west of the rail spur (AOC2-13) exceeded the diesel-range TPH REL at 6.5 feet bgs (13,000 mg/kg). This sample was also analyzed for TPH using silica gel cleanup, with numerically equivalent results of 13,000 mg/kg for diesel-range TPH. A sample collected from 7.5 feet bgs at AOC2-13 was less than the REL and bounds the vertical extent of contamination. Results from the surrounding PDI locations east of the rail spur along the property line (AOC2-12, AOC2-14, and AOC2-17) were less than the diesel-range TPH REL, indicating the extent of TPH impacts greater than RELs is fully bounded within the Smith-Kem property. These bounding locations also include AOC2-16, which was sampled for TPH and archived. The sample for AOC2-16 was later analyzed and diesel-range TPH was reported as not detected, but the analysis was completed outside of the allowable holding time; therefore, the result is not reported (refer to the data validation report in Appendix A for more details). Field PID screening at AOC2-16 showed no indications of TPH

contamination. Field observations during the drilling in this area of AOC 2 indicated that TPH was limited to thin lenses (i.e., lenses less than 1 foot thick) with evident staining that correlated with elevated PID readings.

AOC 3: PDI samples in AOC 3 were analyzed for legacy pesticides and dioxins/furans based on unbounded REL exceedances in RI sample results. AOC 3 pesticide results are compared to the direct contact REL based on no collocated groundwater exceedances. All pesticide and dioxin/furan results on-property within AOC 3 were less than applicable direct contact RELs. Dioxin/furan results on the Habitat for Humanity property (i.e., off-property) were compared to the CUL of 13 nanograms per kilogram (ng/kg). In total, one of the five locations analyzed (H4H-01) exceeded the CUL with a result of 38.0 ng/kg. Additional step-out data to delineate the extent of the off-property dioxin/furan CUL exceedance were not collected due to the concern of unassociated operations and/or ambient contributions potentially impacting concentrations.

AOC 4: PDI samples in AOC 4 were analyzed for legacy pesticides and/or TPH based on unbounded REL exceedances in RI sample results. Pesticide results are compared to leaching RELs based on collocated groundwater exceedances for dieldrin. All pesticide results in AOC 4 were less than applicable leaching RELs. Samples from AOC4-2 and AOC4-3, Phase 1 locations along the eastern boundary of AOC 4 near the containment area, had exceedances of the oil-range TPH REL at 8.5 feet bgs (17,000 mg/kg) and 6.5 feet bgs (9,600 mg/kg), respectively. Both of these locations had deeper samples with oil-range TPH less than the CUL (9.5 feet bgs at AOC4-2 and 7 feet bgs at AOC4-3). Similar to the TPH observed in AOC 2, the deeper TPH was limited to a thin (less than 1 foot) layer and was evident in the field based on visual observations of staining and elevated PID measurements. One additional boring (AOC4-09) was advanced during Phase 2 north of the TPH exceedances and did not exceed the TPH RELs.

AOC 5: PDI samples in AOC 5 were analyzed for legacy pesticides based on unbounded REL exceedances in RI sample results and are compared to the direct contact REL based on no collocated groundwater exceedances. All pesticide results in AOC 5 were less than applicable direct contact RELs and CULs. PDI data were used to refine the excavation extent within AOC 5.

4.2.6 Site Topography Survey

PBS completed a topography survey of the Site, which extended across the full property and documented survey points for Site features including buildings, fence lines, and the below grade conveyor belt structure south of AOC 4. The property topography surveyed features are shown on the GCL and stormwater features plan set drawings in Appendix F.

4.3 INVESTIGATION-DERIVED WASTE MANAGEMENT AND DISPOSAL

Soil and groundwater investigation-derived waste (IDW) generated during PDI activities were stored in DOT-approved drums on-site and disposed of at the end of the PDI Phase 2 event to appropriately licensed disposal facilities. Groundwater was treated and disposed of at Patriot Environmental Services, Inc. (Patriot) in Portland, Oregon. Soil was first transported to Patriot, then was transported and disposed of at a Subtitle D landfill, Coffin Butte Landfill, under a bulk waste

profile. All contaminated media disposed of off-site was characterized based on representative data collected during the PDI. The waste manifest for IDW generated during both phases of the PDI and transported to Patriot is included in Appendix C. Patriot re-manifested the bulk solid waste from multiple generators under their own profile maintained by Patriot, so a manifest for soils transported to Coffin Butte is not included in Appendix C.

4.4 AREAS OF CONCERN DATA SUMMARY

A summary of the COCs in soil and groundwater and the depth of contamination for each AOC is presented in this section. Excavation extents and depths were refined in AOCs 1 through 5 based on analytical data collected during the PDI as discussed as follows. Additional constructability design considerations and the final excavation extents are described in Section 5.0.

AOC 1 contains multiple pesticides, TPH, and dioxins/furans in soil at concentrations greater than CULs to a maximum depth of 8 feet bgs for pesticides and a maximum depth of 3.5 feet bgs for TPH and dioxins/furans. Legacy pesticides aldrin, chlordane, dieldrin, and toxaphene are in soil at concentrations greater than RELs to a known depth of 6 feet bgs. Multiple pesticides, TPH, and nitrate/nitrite are in groundwater within AOC 1 at concentrations greater than CULs. Groundwater exceedances extend onto the BNSF property, as indicated by concentrations of dieldrin, toxaphene, and nitrate greater than the CULs in groundwater at monitoring well MW-16. The northeastern excavation boundary was expanded north relative to the boundary presented in the CAP based on a leaching REL exceedance for dieldrin and a direct contact REL exceedance for toxaphene at location AOC1-03. The western boundary of excavation was shifted east based on pesticide concentrations less than RELs and CULs at locations AOC1-01, AOC1-07, and AOC1-08. No remediation is planned to be conducted on the BNSF property due to offset requirements for excavation adjacent to the rail spur (refer to Section 5.2).

AOC 2 contains multiple pesticides and TPH in soil at concentrations greater than CULs to a maximum known depth of 7 feet bgs for pesticides and 10 feet bgs for TPH. Dieldrin, toxaphene, atrazine, simazine, and diesel-range TPH are present at concentrations greater than RELs to a known depth of 5 feet for pesticides and 6.5 feet for TPH. Dieldrin and nitrate are also in groundwater at concentrations greater than CULs. AOC 2 is also along the eastern property edge and extends onto the BNSF property due to concentrations of dieldrin and toxaphene greater than the CULs in soil at monitoring well MW-17. No remediation is planned to be conducted on the BNSF property due to offset requirements for excavation adjacent to the rail spur (refer to Section 5.2). The northwestern boundary of excavation in AOC 2 was extended west based on pesticide REL exceedances at AOC2-08, and the southeastern extent of excavation was extended east and deepened to 8.5 feet bgs based on diesel-range TPH REL exceedances at AOC2-03, AOC2-04, and AOC2-13.

AOC 3 contains multiple pesticides and dioxins/furans in soil at concentrations greater than CULs to a maximum known depth of 2 feet bgs, and dieldrin and toxaphene are present in soil at concentrations greater than RELs to a maximum known depth of 1 foot bgs. There are no groundwater impacts in AOC 3. Dioxin/furan concentrations greater than the CUL extend onto

the Habitat for Humanity property southwest of AOC 3. A 1-foot-deep excavation area was extended south from AOC 3 to remove detected off-property CUL exceedances.

AOC 4 contains multiple pesticides and TPH in soil at concentrations greater than CULs to a maximum known depth of 5 feet bgs for pesticides and 9 feet bgs for TPH. Dieldrin, toxaphene, and diesel- and oil-range TPH are in soil at concentrations greater than RELs to a known depth of 4 feet bgs for pesticides and 8.5 feet bgs for TPH. Dieldrin and nitrate/nitrite are present in groundwater at concentrations greater than CULs in AOC 4. The eastern excavation extent of AOC 4 was extended east to the AST containment area based on oil-range TPH REL exceedances at AOC4-02 and AOC4-03. This area of excavation was also deepened to 7 feet bgs around AOC4-03 and 9.5 feet bgs around AOC4-02. The excavation depth in the southern portion of AOC 4 was refined to 1 foot bgs based on the only REL exceedance in this area at FS-30 at 0.5 to 1 foot bgs.

AOC 5 contains multiple pesticides and TPH in soil at concentrations greater than CULs to a maximum known depth of 7 feet bgs for pesticides and TPH. These deeper REL exceedances will remain capped beneath the office and storage building. Outside of the office and storage building, dieldrin is in soil at concentrations greater than RELs to a known depth of 4 feet bgs. In groundwater, multiple pesticides, TPH, and nitrates/nitrites are present at concentrations greater than their respective CULs. The AOC 5 excavation extent was shallowed around the perimeter to 2.5 feet bgs based on all PDI soil concentrations being less than CULs.

AOC 6 is characterized by shallow dieldrin and toxaphene in soil at concentrations greater than the CULs to a maximum depth of 2.5 feet bgs adjacent to and underneath the machine shop. Groundwater contamination is not present in this AOC.

FS-01 is characterized by a shallow soil exceedance of the diesel- and oil-range TPH CUL at a depth range of 0.5 to 1 foot bgs. Groundwater contamination is not present near FS-01.

5.0 Engineering Design

In accordance with WAC 173-340-400, this section includes the design criteria and engineering justification for design of the cleanup action to ensure compliance with ARARs and other requirements consistent with MTCA. The cleanup action components were designed to comply with the CAP and to achieve the RAOs described in Section 3.1. An overview of the cleanup action components finalized as part of this design is shown on Figure 5.1.

5.1 ENGINEERING JUSTIFICATION AND DESIGN CRITERIA

The cleanup action components were selected because they are implementable and efficient in removing or destroying contaminants to achieve Site cleanup standards and RELs. The Site data presented in the RI and the additional PDI data described in Section 4.0 provide the basis of design for the cleanup action. The expected efficiencies and effectiveness of the cleanup action components, and expectations of how these technologies will allow for achieving the cleanup standards, are described in the following sections.

5.1.1 Expected Efficiencies and Degree of Effectiveness

The remedial technologies for the cleanup action include soil excavation, capping with a GCL, and in situ groundwater treatment. The effectiveness and remediation time frame for each of these technologies is described in the following sections.

5.1.1.1 Excavation Effectiveness

Excavation is a proven and effective method of removing contaminants from the subsurface. A contractor experienced with excavation and contaminated material handling will be selected to ensure the project is completed per design. The excavation design is intended to remove soil with COC concentrations greater than the relevant RELs or CULs for off-property exceedances and will immediately achieve compliance with soil cleanup criteria across the Site. Removal of soil that exceeds leaching RELs that acts as a source of contamination to groundwater will improve groundwater quality over time.

5.1.1.2 Geosynthetic Clay Liner Effectiveness

The GCL and associated stormwater conveyance system have been designed by a professional engineer with experience installing similar systems. The GCL will consist of a manufactured sodium bentonite material with a certified hydraulic conductivity of less than $5x10^{-10}$ cm per second to limit surface water infiltration through the soil column as described in the plan set drawings in Appendix E. The GCL will be installed in areas where COC groundwater concentrations exceed the CULs and where residual soil contamination greater than soil leaching CULs will remain in place. Blocking the soil to groundwater leaching pathway will improve groundwater conditions over time. The estimated restoration time frame for groundwater to meet CULs at the CPOC is 10 years.

5.1.1.3 In Situ Groundwater Remediation Effectiveness

In situ groundwater treatment using liquid activated carbon is a proven and effective method of reducing concentrations of organic contaminants (e.g., dieldrin and toxaphene) in groundwater. In situ activated carbon products are colloidal compounds designed to disperse minimally through the saturated zone to form a stationary treatment area that relies on passive groundwater flow through the barrier. Organic contaminants are adsorbed to the porous activated carbon media due to its extremely high surface area. In situ groundwater treatment using activated carbon products is a proven technology that has been effectively used at other sites to treat organic compounds. The estimated restoration time frame for groundwater to meet CULs at the CPOC is 10 years.

5.1.2 Compliance with Cleanup Requirements

The requirements for cleanup actions are specified in MTCA. These include both the general requirements described in WAC 173-340-360(3)(a) and additional requirements described in WAC 173-340-360(3)(b-d). The threshold requirements are to protect human health and the environment, comply with cleanup standards, comply with applicable state and federal laws, and provide for compliance monitoring. The additional requirements are to use permanent solutions to the maximum extent practicable, provide for a reasonable restoration time frame, and consider public concerns.

The cleanup action is designed to achieve compliance with RELs in soil and cleanup standards in groundwater Site-wide. The cleanup standards are protective of exposures to all human and environmental receptors per the requirements of state and federal law. Compliance with RELs in soil will be met immediately after excavation, installation of the GCL, and the implementation of ICs. The cleanup standards for groundwater will be met within an approximate restoration time frame of 10 years, as described in the CAP. Compliance with additional applicable laws related to worker safety, environmental media management and disposal, and in situ injection is ensured by the provisions of this EDR. Proposed compliance monitoring, which is a key component to assess progress toward cleanup standards, is additionally described in this EDR in Section 7.0.

5.2 CONTAMINATED SOIL EXCAVATION DESIGN

Excavation of contaminated soil with concentrations greater than the applicable RELs will be completed in AOCs 1 through 5 and excavation of contaminated soil with concentrations greater than CULs will be completed in the area around FS-01 and in the portion of AOC 3 that extends off-property, as shown on Figure 5.1. Figure 5.2 summarizes the excavation footprints and depths for each excavation area and provides contractor notes guiding excavation. Excavation areas, depths, design elements, and notes for AOCs 1 through 5 and FS-01 are shown individually on Figures 5.3 through 5.8.

Soil data for the COCs presented in the RI and PDI soil data collected in 2023 (and summarized in Section 4.0) were used to verify current conditions and establish the final excavation extents for construction (refer to Figures 5.3 through 5.8). A primary goal of the PDI soil sampling was to

collect samples that confirm the lateral and vertical extents of the excavations to minimize sample collection during excavation. Additional confirmation sampling to be completed during construction and the current confirmation sample dataset are further described in Section 7.1.3.

An overview of the excavation areas and construction contractor notes for the work are provided on Figure 5.2. Individual construction detail figures for each AOC and the FS-01 area are shown on Figures 5.3 through 5.8.

Excavation will be completed using standard excavation means and methods as described in Section 6.7. A summary of each excavation area and its respective design considerations, including groundwater conditions, required shoring areas, and relevant infrastructure (e.g., utilities and monitoring wells) is provided as follows.

AOC 1: The excavation extent within AOC 1 and construction details are shown on Figure 5.3. The western portion of AOC 1 will be excavated to 5 feet bgs, the central portion to 8 feet bgs, and the eastern portion to 4 feet bgs. The total estimated volume of soil to be removed from AOC 1 is 680 cubic yards (CY). Pesticides, TPH, and dioxins/furans in soil within AOC 1 have been fully delineated within the property boundary and will not require additional sampling during excavation.[3] Additional excavation considerations are described as follows:

- The following structures in AOC 1 will require additional protection including required offsets and sidewall shoring:
  - A 2-foot offset will be maintained from the concrete pad to the north and the office and storage building to the south.
  - A 5-foot offset will be maintained from the on-property rail spur.
  - A 15-foot offset will be maintained from the off-property rail spur in accordance with the Union Pacific Railroad (UPRR) and BNSF Guidelines for Temporary Shoring (UPRR and BNSF 2021) for excavations requiring shoring (i.e., not including the shallow GCL installation).
- The following utilities are present in or near AOC 1 and were considered as part of design:
  - A subgrade gas line approximately 17 inches bgs is located near the western boundary of AOC 1 and must be protected in place. The western excavation extent of AOC 1 was modified to eliminate subgrade work within 10 feet of this gas line based on guidance provided by the City Gas Division.
  - Two private lines (water and sewer) run between the office building and machine shop and will require protection or temporary disconnection during excavation. These utilities could not be located during design due to the lack of access points and, therefore, will require additional care to expose and protect during excavation. If they cannot be protected during excavation, the contractor will

[3] REL exceedances at AOC1-03 near the BNSF property boundary were not further delineated due to access requirements with BNSF and the limitation of excavation near the rail spur.

coordinate with McGregor and the Engineer to temporarily disconnect or reroute these utilities.

- Private overhead power lines are present over AOC 1 and may require coordination with McGregor to disconnect and supply temporary external power to the office building during excavation. There is also an overhead power line along the eastern boundary of AOC 1 that should not interfere with construction.

- The culvert running below the rail spur at the eastern boundary of AOC 1 will be permanently plugged by the contractor prior to backfilling to eliminate this preferential pathway.
- The wooden retaining wall adjacent to the rail spur is within the 5-foot offset from the rail spur and, therefore, will remain in place. The top of the retaining wall will be removed as need to install the GCL and necessary foundation material.
- Portions of the AOC 1 excavation will be below the groundwater table and require management of wet soils or dewatering (refer to Sections 6.7.2 and 6.11.3).
- Monitoring well MW-4 will be decommissioned prior to excavation. Decommissioning will follow the requirements of WAC 173-160-460.

AOC 2: The excavation extent within AOC 2 and construction details are shown on Figure 5.4. The northwestern portion of AOC 2 will be excavated to 4 feet bgs and the southwestern portion will be excavated to 8.5 feet bgs to address localized deeper diesel-range TPH near the rail spur. The total estimated volume of soil to be removed from AOC 2 is 640 CY. Pesticides and TPH in soil within AOC 2 have been fully delineated; however, some soil with diesel-range TPH concentrations greater than the REL will remain in place beneath the rail spur near location AOC2-13. It is important to note that the TPH REL is based on residual saturation to ensure no accumulation of non-aqueous phase liquid (NAPL) and to prevent leaching into groundwater. NAPL has not been observed in soil or groundwater in this area, and groundwater collected from well MW-5 located within the deeper portion of the excavation area does not contain dissolved TPH. Additional confirmation sampling is proposed along a portion of the southeastern AOC 2 boundary based on field indications of TPH impacts as described in Section 7.1.3. Additional excavation considerations are described as follows:

- The following structures in AOC 2 will require additional protection including required offsets and sidewall shoring:
  - A 2-foot offset will be maintained from the concrete pad to the south.
  - A 5-foot offset will be maintained from the on-property rail spur.
- Portions of the AOC 2 excavation will be below the groundwater table and will require dewatering or management of wet soils (refer to Sections 6.7.2 and 6.11.3).
- Monitoring well MW-5, which is located within the limits of excavation, will be decommissioned prior to excavation. Decommissioning will follow the requirements of WAC 173-160-460.

AOC 3: The excavation extent within AOC 3 and construction details are shown on Figure 5.5. The AOC 3 excavation area within the property boundary will be excavated to 2 feet bgs. Off-property CUL exceedances of dioxins/furans on the adjacent Habitat for Humanity property will be excavated to 1 foot bgs and backfilled with gravel. The total estimated volume of soil to be removed from AOC 3 is 230 CY. Pesticides and dioxins/furans in soil within AOC 3 exceeding RELs have been fully delineated within the property boundary, and dioxins/furans in soil exceeding CULs off-property have been delineated around all but one sample location.[4] Additional excavation considerations are described as follows:

- A 5-foot offset will be maintained from the rail spur east of AOC 3.
- The southern portion of AOC 3 extends across the property boundary onto the property operated by Habitat for Humanity. Refer to Section 6.1 for details about Site access for off-property excavation.
- Groundwater dewatering or wet soil management will not be required in AOC 3.
- MW-13, which is located within the excavation limits and outside the area of groundwater contamination, will be decommissioned prior to excavation. Decommissioning will follow the requirements of WAC 173-160-460.

AOC 4: The excavation extent within AOC 4 and construction details are shown on Figure 5.6. The northern portion of AOC 4 will be excavated to 5 feet bgs and the southern portion of AOC 4 will be excavated to 1 foot bgs. A localized area associated with a thin (less than 1 foot) lens of deeper TPH-contaminated soil is located along the eastern edge of AOC 4 near the AST containment area and will be excavated in two subareas to 7 and 9.5 feet bgs. The total estimated volume of soil to be removed from AOC 4 is 670 CY. Pesticides in soil within AOC 4 have been fully delineated; however, the extent of TPH in soil south of the containment area has not been fully delineated. Additional confirmation sampling is proposed along a portion of the southeastern AOC 4 boundary based on field indications of TPH impacts as described in Section 7.1.3. Additional excavation considerations are described as follows:

- The AST containment area borders the northeast boundary of AOC 4 and will require additional shoring. A 2-foot offset must be maintained between the excavation boundary and the AST containment area.
- The following utilities are present in or near AOC 4 and were considered as part of design:
    - A gas line (approximately 35 to 42 inches bgs), city water line (approximately 37 inches bgs), and water vault are within AOC 4 and must be protected. The excavation extent in AOC 4 was modified to not impact these utilities by maintaining a 2-foot offset. Shoring will be required adjacent to these utilities along the southern boundary of the deeper (5 to 7 feet bgs) excavation.

[4] Additional step-out data to delineate the extent of off-property dioxin/furan CUL exceedances were not collected due to the concern of unassociated operations and/or ambient contributions potentially impacting concentrations.

  - A subgrade communication line (approximately 17 to 27 inches bgs) is present along the eastern extent of AOC 4 and must be protected in place to the extent practicable. If the contractor cannot adequately protect this line during excavation, then the contractor will coordinate with the tenant and appropriate utility services to temporarily disconnect or reroute the obstructing utility.
- The base of AOC 4 will be below the groundwater table and will require dewatering or management of wet soils (refer to Sections 6.7.2 and 6.11.3).
- Monitoring well MW-12 will be decommissioned prior to excavation. Decommissioning will follow the requirements of WAC 173-160-460.

AOC 5: The excavation extent within AOC 5 and construction details are shown on Figure 5.7. This area will be excavated to a maximum depth of 5 feet bgs. The total estimated volume of soil to be removed is 40 CY. Based on the results of the PDI sampling, the depth of excavation will slope up from the center from 5 feet to a depth of 2.5 feet bgs along the perimeter of the excavation. Pesticides in soil have been fully delineated in AOC 5. The base of AOC 5 may be below the groundwater table and may require dewatering or management of wet soils (refer to Sections 6.7.2 and 6.11.3).

AOC 6: The utility survey completed as part of the PDI identified a gas line at approximately 22 inches bgs within AOC 6 that must be protected in place. As shown in Figure 4.8, this gas line and associated 10-foot buffer covers the majority of the proposed AOC 6 excavation area identified in the CAP and would significantly impede the excavation work. The soil pesticide exceedances within AOC 6 do not exceed the RELs and AOC 6 is outside of the area with exceedances of pesticide CULs in groundwater. Therefore, the AOC 6 excavation was removed as part of design.

FS-01: The localized surficial hot spot area around boring location FS-01 is shown on Figure 5.8 and will be excavated to 1 foot bgs removing approximately 10 CY of soil. Diesel-range TPH in soil greater than the CUL has not been fully delineated around FS-01 and additional confirmation sampling around this area is described in Section 7.1.3. Additional excavation considerations are described as follows:

- A 2-foot offset must be maintained between the excavation boundary and the machine shop.
- Groundwater dewatering or wet soil management will not be required in FS-01.

The final volume of contaminated soil to be removed from each excavation area is summarized in Table 5.1.

Table 5.1
Excavation Area Details

Area	Depth (feet bgs)	Area (SF)	Volume of Contaminated Soil Removed (CY)
AOC 1 Subareas	4	190	30
	5	920	170
	8	1,620	480
AOC 1 Total		**2,730**	**680**
AOC 2 Subareas	4	2,790	410
	8.5	710	230
AOC 2 Total		**3,500**	**640**
AOC 3 Subareas	1	370	20
	2	2,830	210
AOC 3 Total		**3,200**	**230**

5.3 IN SITU GROUNDWATER TREATMENT DESIGN

In situ groundwater treatment will be conducted southwest of the office and storage building and containment area to address organic pesticides in groundwater migrating from beneath these structures. Additional PDI data were collected as described in Section 4.2 to support the Site-specific design of the in situ treatment barriers. PDI data included grain size data, PFM groundwater velocity data, groundwater hardness characteristics, groundwater quality

measurements, and groundwater COC concentrations. These data, in combination with existing soil and groundwater data and Site-specific geology and hydrogeology, were reviewed by Regenesis to support selection of appropriate reagents, reagent quantities, and injection spacing. The treatment design was completed by Regenesis in collaboration with the Floyd|Snider engineering team and will include two parallel in situ treatment barriers as shown on Figure 5.9. The barriers' placement and orientation were designed to intercept chemical concentrations in groundwater greater than CULs migrating from beneath the office and storage building and AST containment area.

The northern barrier will be installed using injection of the Regenesis product PlumeStop. The southern barrier will be installed by mixing the Regenesis product PetroFix into a portion of the AOC 4 excavation area, followed by injection of PlumeStop along the northwestern portion of the southern barrier, outside of the AOC 4 excavation area. PlumeStop and PetroFix are both proprietary liquid activated carbon products that work by binding to the surrounding soil to create a passive treatment barrier that then adsorbs and breaks down organic contaminants. PetroFix was selected to be better suited for the soil mixing applications based on its higher concentration of carbon and soil adsorptive properties. Implementation details for the injection and mixing barriers are included in Section 6.9.

The northern barrier will be approximately 40 feet long and include injection of PlumeStop at borings spaced 5 feet apart along the barrier line with a targeted injection interval of 4 to 15 feet bgs. PlumeStop will be injected under low pressure through a series of direct-push borings that will create an evenly distributed passive treatment zone. The reagent will coat soil particles to increase the adsorption of groundwater contaminants and act as a passive treatment zone to immobilize contaminants and passively treat groundwater as it flows downgradient.

The southern barrier is approximately 60 feet long and will be installed within the AOC 4 excavation area by the contractor mixing PetroFix into a 5-foot-wide area along the excavation boundary as shown on Figure 5.9. PetroFix will be mixed into the 5-foot-wide trench to a depth of 12 feet bgs and applied at a rate of 32.7 pounds of product per CY of backfill material. Two PlumeStop injection points will also be completed at the southern barrier's western end to extend the barrier to the estimated extent of pesticide impacts in groundwater based on groundwater interpolations completed in the RI.

The injection intervals and product dosage rates were determined by Regenesis based on soil and groundwater characterization data collected by Floyd|Snider. Additional details for the PlumeStop and PetroFix applications are described in Regenesis' design memorandum included in Appendix G.

5.4 GEOSYNTHETIC CLAY LINER CAP DESIGN

After completion of excavation and backfill of AOC 1 and 2, a GCL cap and associated stormwater conveyance features will be installed over and surrounding AOC 1 and AOC 2 (up to 17,000 SF), as shown on Figure 5.1. The GCL cap will provide additional protection of groundwater in this area where contaminated soil remains in place with pesticide concentrations greater than the leaching CULs and where pesticide concentrations in groundwater exceed CULs. The intent of the

GCL cap is to minimize stormwater infiltration through residual contaminated soil and into groundwater, which would control plume migration and provide an added degree of source control in areas with high traffic and/or ongoing bulk fertilizer operations.

Data collected during the PDI and described in Section 4.2 were evaluated by PBS during design and included the survey topography data, grain size data, and boring logs. As part of the Site data evaluation and design, PBS prepared the following deliverables:

- The geotechnical analysis including recommendations related to grading, slope protection, backfill, and subgrade preparation are described in PBS's Geotechnical Engineering Letter Report in Appendix E.
- GCL and stormwater plan set drawings providing the details and specifications for the design are included in Appendix F.
- Stormwater hydrologic and hydraulic calculations for the stormwater drainage system are included in Appendix H.

5.4.1 Geosynthetic Clay Liner Design Details

The GCL cap consists of a laminated GCL, which includes a layer of sodium bentonite between a polypropylene woven geotextile, and a polypropylene nonwoven geotextile needle-punched together and laminated to a polyethylene geofilm. The laminated GCL will be extended beyond the area of known contamination as an added protective measure. The gravel surface will be excavated in areas where the laminated GCL would be placed outside contaminated soil excavation footprints to an approximate depth of 1 foot bgs. Up to 400 CY of surface soil will be removed in addition to the contaminated soil excavation quantities described in Section 5.2 and summarized in Table 5.1. The laminated GCL will be installed with multiple layers of gravel and additional geosynthetic material to provide structure and security against accidental breaches.

Prior to installing the laminated GCL, the subgrade will be compacted as described in Section 6.8 and nonwoven geotextile will be placed to provide a protective cushion between the laminated GCL cap and the underlying subgrade. The laminated GCL will be installed with the geofilm side up to prevent overdrying during the summer and will be protected with an additional overlying layer of nonwoven geotextile. The laminated GCL and additional protective geotextile fabric will be covered with 4 inches of crushed surfacing base course (CSBC), a biaxial geogrid, and another 4 inches of CSBC to provide structural integrity to the laminated GCL cap. A high-visibility (orange colored) high-density polyethylene grid indicator layer would be placed over the CSBC and is intended as a visual cue to warn operators who may be performing future excavation activities before more critical underlying geosynthetics are damaged. The final and top layer will consist of a minimum of 4 inches of CSBC to restore the surface grade elevation. In total, up to 400 CY of CSBC would be placed as part of the laminated GCL cap construction.

The laminated GCL will be sloped to convey stormwater toward a perforated collection pipe along the eastern boundary of the property and away from existing building structures. This pipe will convey the collected stormwater to a new catch basin inlet structure connected to the existing culvert at the southeast corner of the Site.

5.4.2 Stormwater Conveyance Design Details

The GCL will be constructed with a gentle slope to direct stormwater to a drainage trench installed along the eastern property boundary (for a total of approximately 390 feet of trenching). The trench depth will extend approximately 2.5 feet bgs and will have a 12-inch-diameter perforated underdrain pipe within the GCL footprint that will be wrapped with geotextile and bedded in a 2-inch surrounding layer of clean coarse sand. The underdrain pipe will be covered with washed drain rock to convey surface runoff and shallow subsurface flow from above the GCL. The drainage rock trench will be 1.5 feet wide and wrapped with nonwoven geotextile for protection.

Downstream of the GCL footprint, solid conveyance pipes will be used instead of perforated pipe to prevent exfiltration of collected surface water to other areas of the Site. Collected stormwater will be conveyed to a single collection structure (catch basin) in the southeastern corner of the facility. The catch basin will have a sump to encourage sedimentation. The catch basin will provide access to the upstream and downstream conveyances for maintenance. Additionally, maintenance will entail periodic removal of sediment accumulated in the catch basin sump. Stormwater will leave the new catch basin structure through an existing 36-inch-diameter culvert that flows off the property to the south.

The drainage trench and pipe were sized for the peak flow from a 25-year, 24-hour storm event (refer to Appendix H for stormwater calculations). The following assumptions and criteria were used in the stormwater system design:

- Storms: Type II distribution with 24-hour duration
- 25-year Design Storm: 1.70 inches
- Contributing Area: 32,533 SF
- Curve Number: 98 (impervious liner, compacted gravel, building roof)
- Manning's roughness coefficient for open-channel conveyance pipe flow: 0.011
- Stormwater conveyance system: Assumed empty at the beginning of each event
- Longitudinal slope: 0.0024 to 0.0025 feet per foot

Analysis was performed using the Soil Conservation Service TR-20 Method in the HydroCAD software program. Conveyance analysis was performed using the Manning's Equation for open-channel flow. The analysis yielded the following results that have been incorporated into the design:

- Design storm peak flow: 1.77 cubic feet per second
- Minimum pipe diameter: 12 inches
- Pipe percent full during peak flow: 84% to 87%

5.5 GREEN AND SUSTAINABLE REMEDIATION COMPONENTS

Green and sustainable cleanup considerations are increasingly being integrated into cleanup programs, including under MTCA in Washington. *Sustainable Remediation: Climate Change*

Resiliency and Green Remediation (Ecology 2023) is a Washington-specific resource to incorporate resiliency into the selected cleanup remedy. In accordance with green and sustainable remediation (GSR) principles, best management practices (BMPs) related to the five core elements of energy, air, water, land/ecosystems, and materials/waste should be considered to reduce the project's net environmental footprint in ways that are consistent with applicable statutes and regulations. Common GSR BMPs that may be incorporated into design of a cleanup action include the reduction of waste generation, optimization of material use or reuse, minimization of impacts to resources, minimization of air pollutants, and positive economic impact to the local community.

Environmental remediation is intrinsically a beneficial process to the environment as the risk to the community and human health is reduced or diminished. The environmental "footprint" associated with Site remediation has been reduced by incorporating the following GSR elements into the design:

- Collecting key samples to delineate excavations during predesign, which minimizes potentially unnecessary mobilization of extra equipment for activities such as shoring and dewatering
- Using in situ groundwater treatment, which relies on the natural flow of groundwater through an in situ treatment barrier rather than energy-intensive ex situ treatment technologies
- Designing the GCL using improved, impermeable materials to eliminate the import of sand as a foundation layer to the GCL
- Scheduling construction during the dry season and allowing wet soils to drain within the excavation footprint to minimize water management, treatment, and potential off-Site transport
- Implementing additional measures during construction to minimize environmental and community impacts, including the following:
    - A no-idling policy will be implemented for all construction equipment and support vehicles when not in use.
    - To the fullest extent possible, trucking mileage for disposal and import of materials will be minimized by identifying backfill sources proximal to disposal facilities and allowing stockpiling of backfill on-Site, to facilitate round-trip rather than one-way truck trips.
    - Local remediation contractors and vendors will be used when available.
    - The truck haul route will be limited to arterial streets where practical to minimize traffic, noise, and economic impacts to neighborhoods.

Finally, during post-construction monitoring, field sample collection activities will be performed in accordance with Floyd|Snider's GSR practices, which include minimizing vehicle trips and using dedicated sampling equipment, where practical.

6.0 Cleanup Action Construction Planning and Implementation

The PLPs are responsible for performing the work described in this EDR as required under the CD, including constructing the cleanup action. Specific details regarding the planning and management for cleanup action implementation are included in this section.

6.1 SITE ACCESS

The property is currently owned by Ad Gro and has been leased to McGregor since 2015. McGregor uses the property to conduct its agricultural product distribution business and they are responsible for all current operations at the facility. Cleanup action implementation will be closely coordinated with McGregor (or with the current tenant, if McGregor terminates their lease prior to construction) to minimize disruption to its operations.

A portion of AOC 3 (Figure 5.5) extends onto the south-adjoining property that is operated by Habitat for Humanity and owned by Ryan Wales. The property access agreement will be updated with Ryan Wales prior to construction beginning on this property, and construction activities will be coordinated with Habitat for Humanity to ensure the area is cleared for excavation and to minimize disruption to operations.

There is a rail spur located along the eastern property boundary. The rail spur is active and is used intermittently by McGregor to transport goods. An industrial agreement between BNSF and McGregor dated December 8, 2016, establishes that McGregor controls and maintains the rail spur on the Smith-Kem property and BNSF controls and maintains the rail spur on the BNSF rail yard. The current property access agreement with BNSF will be updated if needed prior to the remediation to allow the contractor access onto the BNSF property to implement the remedial design along the eastern property boundary. Excavation performed near the rail spur on the BNSF right-of-way property (near AOC 1) will need to follow the UPRR and BNSF Guidelines for Temporary Shoring (UPRR and BNSF 2021). As part of this requirement, a 15-foot offset will be maintained from the BNSF-owned rail spur centerline to any subsurface excavation work (i.e., excavation work not including the shallow GCL installation).

The rail spur on the Smith-Kem property will be temporarily deactivated by contacting the BNSF rail master prior to any work near the spur to ensure train cars will not travel on the spur adjacent to open excavations when temporary shoring is in place. A notice of temporary deactivation will be provided to the contractor prior to the start of excavation.

6.2 PERMITS AND EXEMPT PERMITS

The cleanup action must comply with MTCA cleanup regulations, federal laws, and substantive requirements of applicable local and state laws. Because the cleanup action will be performed under a CD, it is exempt from the procedural requirements of certain laws and all local permits (WAC 173-340-710(9)(b)) but must comply with the substantive requirements of these laws and permits. This remedial action will meet the substantive requirements for applicable regulations

and standards and will comply with all action-, chemical-, and location-specific ARARs as identified in the RI/FS.

Location-specific ARARs will be met through compliance with all applicable state and federal regulations based on the physical location of the Site. Action-specific ARARs will be met through implementation of construction activities in compliance with all applicable construction-related requirements such as disposal for excavated soil. Chemical-specific ARARs will be met through compliance with CULs and RELs. The relevant ARARs and a description of how the cleanup action meets the substantive requirements of each ARAR is included in Table 6.1.

6.3 SITE PREPARATION AND SITE CONTROLS

Floyd|Snider will select a contractor to complete the excavation, GCL, and stormwater system installation work after Ecology's approval of the final EDR. Before subgrade work begins, the contractor will use the following site controls and BMPs to ensure that environmental quality of the Site and surrounding area are maintained during construction. Additionally, subgrade work will be completed in accordance with the Inadvertent Discovery Plan prepared for the work (Appendix J).

6.3.1 Site Security

Temporary fencing will be used to prevent public access to the work areas during construction. Because the Site will continue to be used by tenants during construction, temporary fencing will be required around active excavation areas to ensure worker safety and may be adjusted as excavations are completed. Temporary fencing around open excavations must be secured at the end of each workday.

6.3.2 Vehicle Access and Traffic Controls

To minimize track-out of soil during construction, designated construction access driveways will be established by the contractor and may be stabilized with quarry spalls to remove excess soil from vehicle tires. The contractor will be responsible for laying out the truck access and soil loading and unloading zones to minimize soil track-out during construction.

6.3.3 Stormwater Controls

Currently, stormwater at the Site infiltrates in unpaved areas or surface flows to the existing culvert at the southeast corner of the Site (shown on Figure 5.2).

Stormwater and erosion-control measures will be installed by the contractor around the construction perimeter prior to initiation of ground-disturbing activities to reduce or control construction stormwater runoff and minimize run-on. The perimeter controls may be composed of compost socks, compost berms, silt fence, straw bales, straw wattles, or a combination of these elements. Stockpiles will be bermed using a straw bale, ecology block, or other approved containment berm to control runoff, and stockpiles will be covered at the end of each working day. Preliminary Temporary Erosion and Sediment Control (TESC) details are shown in the GCL

and stormwater features plan set drawings to provide a general layout of TESC BMPs that may be used. Specific TESC measures will be determined by the contractor, and a project-specific TESC Plan detailing the stormwater BMPs will be prepared by the contractor. The BMPs outlined in the TESC Plan will be implemented by the contractor to reduce or control stormwater runoff during construction.

6.3.4 Spill Control

Construction equipment will be kept in good working condition and inspected regularly for fuel leaks. Equipment fueling will be completed in a dedicated refueling area, with an accessible spill kit within 25 feet and containment measures such as absorbent cloths deployed as necessary to prevent the release of dripping or spilled fuel to the ground surface. Basic spill containment materials, including absorbent cloths and booms, will be kept at the refueling area and restocked as needed. Any releases of fuel or other chemicals on the Site as part of construction will be reported as follows:

Spills into Waters of the State (including ponds, ditches, seasonally dry streams, and wetlands)
Immediately call all of the following: **National Response Center at 1-800-424-8802** **Washington Military Department, Emergency Management Division at 1-800-258-5990** **Ecology Central Regional Office at 1-509-575-2490**
Spills to Soil
Report immediately if threatening to health or environment (i.e., explosive, flammable, toxic vapors, shallow groundwater, nearby creek), otherwise within 90 days. **Ecology Central Regional Office at 1-509-575-2490** Notify public utilities department if spill enters sanitary sewer, stormwater system, streets, ditches, streams, or wetlands. **Ellensburg Public Utilities at 1-509-962-7201**

6.4 UTILITIES

Active utilities within the Site, except for the private water and sewer lines, were located using air knifing methods on August 15, 2023, as described in Section 4.2.1. Potholed utility location and depth to top of utility are shown on Figure 4.2. Private water and sewer lines running north–south between the office and storage building and machine shop could not be located during the survey event, as described in Section 4.2.1. Figure 4.2 shows the approximate/ assumed locations of these lines.

All active utilities within and outside the limits of construction will be located and protected in place by the contractor to the extent practicable. The contractor will be required to coordinate with local utility companies to accurately locate, and temporarily disconnect (if necessary), any

active utilities that may interfere with excavation activities. The contractor must employ excavation methods such as hand digging or use of a designated spotter when working in the vicinity of active utilities. Work within the 10-foot buffer of any gas line must be proactively coordinated with the City Gas Division, and work will not occur within 2 feet of the gas lines based on guidance from the City Gas Division. Gas lines are present near excavation areas at AOC 1 and AOC 4.[5] The 2-foot gas line buffer is shown on Figure 4.2 and the respective construction detail figures (Figures 5.3 and 5.6).

Overhead power lines are located between the office and storage building and machine shop (above AOC 1) as well as along the eastern property boundary near AOCs 1, 2, and 3. The contractor will be required to ensure there is adequate clearance when working around overhead lines or coordinate with the current tenant and the local utility companies to temporarily shield or disconnect and route temporary service, if necessary.

6.5 ENGINEERING OVERSIGHT

Consistent with WAC 173-340-400(6)(b)(i), implementation of the cleanup action will be performed under the oversight of a professional engineer registered in Washington, who will be the Engineer, or a qualified technician under the direct supervision of the Engineer. The Engineer or qualified technician will document the completion of the cleanup action components during implementation, which will be summarized in a Remedial Action Completion Report (RACR).

6.6 HEALTH AND SAFETY

The cleanup action construction work described herein will comply with the health and safety standards prescribed by the Occupational Safety and Health Act (OSHA) and the Washington Industrial Safety and Health Act (WISHA). A Site-specific Health and Safety Plan (HASP) will be developed by the contractor and provided to the Engineer prior to beginning work. A Site-specific HASP will also be developed by Floyd|Snider for oversight of the work. All work will be performed by remediation contractors or subcontractors with active Hazardous Waste Operations and Emergency Response (HAZWOPER) certifications, First Aid/cardiopulmonary resuscitation certifications, and all applicable task training for the work required.

All Site personnel who have the potential to contact hazardous waste or contaminated media must also comply with the OSHA and WISHA health and safety training and medical monitoring requirements, including HAZWOPER training and certification. All certifications must be kept up to date according to the requirements set by the Occupational Safety and Health Administration and the Washington State Department of Labor and Industries Division of Occupational Safety and Health for OSHA and WISHA, respectively.

[5] A gas line is also present within AOC 6 (shown on Figure 4.8) and impedes excavation in this AOC.

6.7 CONTAMINATED SOIL EXCAVATION MEANS AND METHODS

Contaminated soil excavation will be performed in AOCs 1 through 5 and FS-01, as shown on Figures 5.3 through 5.8. Excavation will be performed using standard construction equipment. Excavation means and methods that meet the requirements of the EDR will be determined by the contractor and must be approved by the Engineer prior to the start of the work. Requirements for completion of the excavations are presented in the following sections.

6.7.1 Soil Handling and Disposal

Soil loading will occur either directly from excavations or in a designated loading area. Soil off-loading will also be performed in a designated stockpiling area. When loading contaminated soil for off-Site disposal, the ground surface of the loading area will be covered, and any spilled soil picked up and placed into the appropriate container to prevent the spread of contamination. Loads will be securely covered prior to transport. If contaminated soils are stockpiled, they will be managed as described in Section 6.7.1.1.

Proper disposal of contaminated soil, whether at a Subtitle C or Subtitle D licensed facility, will depend on waste profiling, consistent with the requirements under WAC 173-303. Based on available Site data, it is expected that contaminated soil can be disposed of at a Subtitle D licensed facility as nonhazardous waste. The contractor will be responsible for obtaining a waste profile from their selected facility using (1) soil characterization data presented in Table 4.2 and the laboratory data reports in Appendix A and (2) any additional waste characterization data that may be collected or required by the waste disposal facility prior to disposal. The contractor will submit the approved waste disposal profile to the Engineer for approval prior to the start of excavation.

6.7.1.1 Stockpile Management

All stockpiles will be managed in accordance with the Stormwater Management Manual for Eastern Washington (Ecology 2019), including surrounding stockpiles with appropriate berms to prevent stormwater run-on and run-off. Stockpiles will be covered and stabilized to prevent erosion when not actively being worked and at the end of each workday.

Contaminated soil stockpiles shall be placed next to an AOC being actively excavated or at a designated location within the limits of the active construction area. If the contractor chooses to stockpile contaminated material it must be kept segregated from any stockpiles of clean import material. If accidental mixing occurs, the mixed soil will be considered contaminated. A clean import stockpile area may be established by the contractor within the construction area so clean material does not contact contaminated material.

Temporary stockpiles of contaminated material placed outside the limits of an AOC or the FS-01 excavation area shall be placed upon either 10-millimeter-thick polyethylene sheeting or woven waterproof tarps provided by the contractor, with a straw bale, ecology block, or other approved containment berm secured beneath the sheet or tarp to prevent erosion. Water draining from

contaminated soil stockpiles must be diverted back to the AOC where the soil was excavated from to infiltrate or be collected, treated, and properly disposed of off-Site (refer to Section 6.11.3). Alternately, if the volume of contaminated soil to be stockpiled is expected to be small, a lined roll-off container may be used to store excess soil, which eliminates the need to reload stockpiled soil onto trucks.

6.7.2 Groundwater Management

The water table at the Site typically ranges in depths from 3 to 6 feet bgs with an annual average groundwater table of 3.5 feet bgs. The seasonal high typically occurs in early spring, and the seasonal low typically occurs in late summer to early winter. To the extent practical, excavation will be scheduled to target the seasonal low water table to minimize groundwater management needs during construction. The depth of excavation in AOC 1 through AOC 5 ranges between 1 to 9.5 feet bgs. Dewatering may be necessary to remove contaminated soil in excavations below the water table. The need for dewatering and the means and methods of dewatering will be determined by the contractor. The method of dewatering proposed by the contractor shall conform to the requirements of all applicable regulations. To minimize the need for dewatering and ensure that soils are dry for loading and disposal, deeper contaminated soil excavation will be scheduled for days when precipitation is not forecasted whenever possible.

Soil excavated below the water table that is free draining may be stockpiled within the excavation boundaries if feasible to drain prior to direct loading into trucks or stockpiling. Contaminated soil stockpiled outside the excavation boundary, including side-slope areas outside the excavation, must be managed in accordance with Section 6.7.1.1. Contaminated groundwater will not be allowed to infiltrate outside of the excavation areas shown on Figure 5.1 or within any excavation area that has been backfilled.

If the contractor removes groundwater from an excavation area via pumping (dewatering) to facilitate excavation, the groundwater will be required to pass through a water treatment system approved by the Engineer prior to discharge or be transported off-Site for proper disposal. If necessary, drying agents (e.g., sawdust) may be used to allow materials to be transported to the receiving landfill without free liquid accumulation. Refer to Section 6.11.3 for details about managing wastewater.

6.7.3 Existing Structure Protection and Shoring

The contractor will be required to stabilize excavation sidewalls through means of sloping, shoring, or other stabilization methods chosen by the contractor and approved by the Engineer. Information about the subsurface conditions at the Site and recommendations for shoring design are included in Sections 4.0 and 5.0, as well as in the Geotechnical Engineering Letter Report in Appendix E. The presence of existing structures such as buildings, concrete pads, and the rail spur, as well as protected utilities, will require shoring within AOC 1, AOC 2, and AOC 4 and surrounding FS-01 to prevent undermining or settlement of existing structures and utilities.

The excavations in AOC 1 and AOC 2 are adjacent to the rail spur and will require temporary shoring to prevent potential undermining and damage to the rail. Excavation work in AOC 2 and the southeast portion of AOC 1 adjacent to the rail spur maintained by McGregor (i.e., on-property rail spur) will maintain a 5-foot offset from the rail spur. Excavation work in the northeast portion of AOC 1 adjacent to the rail spur on BNSF property will maintain a 15-foot offset from the rail spur. Excavation in AOC 3 is also adjacent to the rail spur but is shallow and, therefore, will not require temporary shoring. A 2-foot offset will be maintained between existing structures (including the AST containment area) and the extent of excavation, including side slopes.

Required structure offsets and shoring protection boundaries are shown on Figures 5.3 through 5.8.

6.7.4 Monitoring Well Protection

During construction, all monitoring wells that are located outside excavation areas and are not identified for decommissioning will be protected to the extent practicable. The monitoring wells that will be protected include MW-2, MW-3, MW-6, MW-10, and MW-14. Monitoring wells fully within excavation limits and shoring areas will be decommissioned in accordance with WAC 173-160-460. Monitoring wells that will be decommissioned prior to construction include MW-4, MW-5, MW-7, MW-8, MW-11, MW-12, and MW-13, as shown on Figure 6.1.

Select monitoring wells may be replaced as part of future groundwater compliance monitoring, as described in Section 7.2 and 8.1, and in consultation with Ecology.

6.7.5 Survey

Prior to excavation, the remediation contractor will be required to pre-mark the excavation control points, shown on Figures 5.3 through 5.8, to the nearest 0.1 horizontal feet. Excavation control points may be adjusted in the field prior to excavation by the Engineer based on existing site features to ensure the required offsets from structures are maintained.

The final excavation depth will be verified by the contractor using surveying equipment accurate to within 0.1 feet. Additionally, the contractor will survey and provide final coordinates for any sidewalls that are extended to remove TPH soil contamination beyond the specified control points.

6.7.6 Backfilling and Site Restoration

Prior to backfill, some excavation sidewalls will need to be sampled by the Engineer once the sidewall is exposed to confirm COC concentrations meet the applicable RELs. This includes select sidewalls in AOC 2 and AOC 4, shown on Figures 5.4 and 5.6. The FS-01 excavation extents will also need to be confirmed. These areas will not be backfilled until the Engineer confirms that the applicable RELs have been met at the excavation extents. Based on the location and depth of AOC 2 and AOC 4, confirmation samples collected at these sidewalls will be analyzed on an

expediated turn-around time to limit delays to backfilling. Additional details about confirmation sampling are included in Section 7.1.3.

Once each AOC excavation is complete and the Engineer approves the final excavation limits, the contractor will backfill the excavation with clean import soil meeting Washington State Department of Transportation (WSDOT) standard specifications for Select Borrow (specification 9.03.14(2)) to match the existing grade surface or the base of the GCL section (refer to Section 6.8). Quarry spalls may be placed at the base of the excavation below the groundwater table, if necessary, to stabilize the excavation base. The final 6 inches of backfill material (outside of GCL footprint) will be CSBC meeting WSDOT standard specification 9-03.9(3). The contractor will restore the final surface elevation to match the surrounding grade.

Backfill will be placed in 8-inch loose lifts and compacted to at least 95% of maximum dry density per ASTM D1557 for import materials. In place density tests will be the responsibility of the contractor.

6.8 INSTALLATION OF GCL AND STORMWATER CONTROLS

Installation directions for the GCL and stormwater controls are included in the Geotechnical Engineering Letter Report and plan set drawings in Appendices E and F, respectively. The GCL will be installed by the contractor after excavation and backfill in AOC 1 and 2. The GCL subgrade within the AOC 1 and 2 backfill areas will be placed by the contractor in lifts no greater than 8 inches and compacted by the contractor to at least 95% of maximum dry density per ASTM D1557. Soil outside of AOC 1 and 2 will be excavated to 1 foot bgs to install the GCL, and soil will be managed and disposed of as contaminated soil in accordance with Section 6.7.1. Native subgrade will be field verified by the Engineer using either a proof rolling or probe method to determine structural suitability. Unsuitable areas identified during the field evaluation will be compacted to a firm condition or removed and replaced with structural fill. The Bentomat 600 CL GCL will be rolled out by the contractor as shown and in accordance with the directions in the plan set drawings.

The stormwater conveyance system, including associated cleanout and catch basin features, will be installed per the plan set drawings. Existing stormwater solids buildup at the culvert entrance will be removed by the contractor and rock will be placed around the new inlet to protect against erosion. Solids within the culvert pipe and at the culvert egress will need to be removed by the contractor. Built-up solids within and around the culvert must be removed and properly disposed of, consistent with waste profiling performed to determine disposal at an appropriate landfill based on the material's waste designation. Solids will not be allowed to be flushed downstream.

6.9 IN SITU GROUNDWATER TREATMENT INJECTION

The following sections describe the alignment, injection, and mixing details for installation of in situ groundwater treatment. In situ groundwater treatment will be conducted southwest of the office and storage building and AST containment area to address pesticides in groundwater migrating from beneath these structures. The in situ treatment zone will include two parallel barriers as shown on Figure 5.9.

6.9.1 PlumeStop Injection Methodology

Regenesis will field-mark the injection point locations corresponding to injection points within each barrier shown on Figure 5.9 prior to drilling. The PlumeStop product will be batch-mixed on-Site in aqueous solution to achieve the manufacturer-recommended dosage concentration prior to injecting. The PlumeStop mixture will then be injected into the subsurface under low pressure (less than 80 pounds per square inch) using a direct-push drill rig to create an evenly distributed permeable barrier of treatment media within the target treatment zone of 4 to 15 feet bgs. PlumeStop will be injected at a rate of 75 gallons of aqueous solution (65 pounds of product) per vertical foot at each injection point.

The method of injection (i.e., using either a top-down or bottom-up approach) will be determined in the field by Regenesis based on the observed injection conditions and may be adjusted as needed to meet the design objectives. Any injection points modified due to the presence of utilities or other obstructions will be documented by Regenesis.

6.9.2 PetroFix Mixing Methodology

PetroFix will be mixed into a 5-foot-wide trench along the northern boundary of AOC 4 as shown on Figure 5.9 using the in situ soil mixing technique described in Regenesis' *Excavation Application Guidance for PetroFix™,* included in Appendix G. The contractor will mix PetroFix into the subsurface to create an 8-foot-deep barrier (i.e., extending from 4 feet bgs to 12 feet bgs) by spraying the product directly into the excavation at a dosage rate of 32.7 pounds of product per CY of backfill and then mixing into the area with an excavator. The PetroFix application area will be below the water table from 4 feet bgs to a maximum depth of 12 feet bgs. The application depth range accounts for the anticipated product movement downward and depth of contamination observed in this area. Product mixing will be completed in 2-foot lifts to achieve the design product dosage and even mixing. The area of mixing may be adjusted by the Engineer based on the field conditions. The water level of the excavation area will be managed such that the product is mixed below the water table to ensure an even distribution throughout the soil and backfill. The groundwater level in AOC 4 ranges seasonally from approximately 3 to 4 feet bgs. If necessary, potable water may also be added to the excavation for mixing to ensure the material is distributed evenly.

6.10 DECONTAMINATION

Decontamination procedures will be strictly followed to prevent the spread of contamination. All construction and drilling equipment will be decontaminated before it leaves the Site. Decontamination procedures will additionally be implemented for equipment when moving between handling contaminated and uncontaminated media (such as using an excavator bucket to remove contaminated soil, then using the bucket to place backfill).

Equipment and vehicle decontamination will consist of dry sweeping to achieve a visually debris-free surface. If dry sweeping is not sufficient to remove visual evidence of debris, equipment will be decontaminated by pressure washing with detergent solution followed by a potable water

rinse. Direct-push drill rods will be decontaminated using the above procedure or by steam cleaning.

Equipment decontamination wash water will be captured and not allowed to run onto the ground surface. Wash water generated during decontamination will be managed according to the procedures for wastewater management as described in Section 6.11.3.

6.11 WASTE HANDLING AND MANAGEMENT

Environmental media, including excavated soil and other solids and waste waters, will be managed in accordance with the following sections.

6.11.1 Soil Waste Management

BMPs will be implemented during contaminated soil handling to prevent the spread of contamination. BMPs for excavation include the following:

- Contaminated soil will be directly loaded to trucks or lined roll-off containers when feasible. Temporary stockpiles for contaminated soil will be kept in designated areas and managed to prevent the migration of contaminated material as described in Section 6.7.1.1.
- Loading will be performed only where ground surface protection is installed. Ground surface protection will be regularly cleaned or replaced and secured at the end of each workday. Any soil spills in the stockpile loading area will be cleaned up immediately and placed in appropriate containers or a dump truck for disposal.
- Construction trucks will be required to use the established haul route and cover loads before exiting the property onto nearby roadways.

Contaminated soil that is excavated will either be directly loaded into trucks, placed in roll-offs for temporary staging, or placed in managed stockpiles prior to transport off-Site to an approved Subtitle C or Subtitle D landfill for disposal under an approved waste disposal profile. If necessary, drying agents may be used to allow materials to be transported to the receiving landfill without free liquid accumulation.

Trucks transporting contaminated soil from the Site will comply with all applicable regulations, including standards per WAC 173-350-300, and local ordinances.

6.11.2 Solid Waste Management

The top of the wooden retaining wall in AOC 1 will be demolished and removed by the contractor to 6 inches below the bottom elevation of the GCL. Wood debris may be disposed of at an approved recycling facility if it is not creosote-treated, as determined by the Engineer; otherwise, it must be disposed of at a licensed Subtitle D solid waste landfill.

All miscellaneous solid waste, such as personal protective equipment, disposable sampling equipment, and general construction waste will be containerized or bagged in heavy-duty plastic bags and disposed of as municipal solid waste.

6.11.3 Wastewater Management

Wastewater that may be generated during construction of the cleanup action includes groundwater from excavation dewatering (if the contractor chooses to dewater) and decontamination wash water. Wastewater has the potential to contain elevated concentrations of Site COCs and, therefore, may be discharged from the Site under an Ecology Construction Stormwater General Permit (CSGP) obtained by the contractor. Treated water meeting applicable discharge criteria may be discharged to the existing stormwater culvert near the southeast corner of the Site. If acquired, a copy of the approved CSGP will be provided to Ecology's Toxics Cleanup Program. If water cannot be treated to meet applicable discharge criteria, as specified in the CSGP, then it must be transported off-Site or discharged to the sewer under an approved City of Ellensburg sewer discharge permit. Wastewater stored on-site for treatment or disposal will be stored in tanks equipped with secondary containment capable of containing 10% of the total enclosed tank volume or 110% of the volume contained in the largest tank, whichever is greater, or in double-walled tanks.

6.12 PROPOSED CONSTRUCTION SEQUENCING AND SCHEDULE

Construction will proceed in two phases. An excavation contractor will complete the excavation first to remove the contaminated soil source material. After excavation in AOC 1 and AOC 2 is complete, then surface soil excavation and installation of the GCL and associated drainage system can occur. The PetroFix portion of the in situ groundwater remedy will be completed concurrently with the excavation work in AOC 4. After Site restoration, the in situ treatment barrier injection of PlumeStop will be completed.

A general schedule for implementation of the cleanup action was provided in the CAP (Ecology 2022). A contractor will be selected for the excavation portion of the work after Ecology approval of the final EDR. Construction is anticipated to begin in summer 2025 and to be completed by the end of 2025. Injection of the PlumeStop barrier walls will be completed by Regenesis and will occur at the end of 2025 or in early 2026. The construction schedule is not anticipated to be affected by the City of Ellensburg's sewer extension project; however, coordination with the City will continue. The City anticipates their sewer extension project to occur in the South Railroad Avenue right-of-way in early 2025. Due to the anticipated dewatering during the City of Ellensburg's work, their work adjacent to the Site needs to be completed prior to installation of the in situ groundwater treatment barriers.

Ecology will be kept up to date regarding the construction schedule and progress in monthly progress reports.

7.0 Compliance Monitoring

Compliance monitoring to ensure the protectiveness of the cleanup action will be implemented in accordance with WAC 173-340-410. These regulations call out three types of compliance monitoring: protection, performance, and confirmation. Each will be implemented at the Site during cleanup action implementation to ensure protectiveness of the cleanup.

The objectives of compliance monitoring, as stated in WAC 173-340-410, are as follows:

- **Protection Monitoring** is used to evaluate whether human health and the environment are adequately protected during construction of the cleanup action and post-construction monitoring. Protection monitoring requirements will be described in Site-specific HASPs that address worker activities during cleanup action construction, performance monitoring, and post-construction monitoring.
- **Performance Monitoring** is used to confirm that the cleanup action has attained cleanup standards, including RELs and other construction-related performance standards. Performance monitoring will be conducted throughout each phase of construction to document that cleanup goals are being achieved. For example, post-construction surveys will be used to document excavation goals have been met, and selected monitoring wells located in source areas (e.g., MW-4) will be replaced after remedy implementation to evaluate remedy performance.
- **Confirmation Monitoring** is used to confirm the long-term effectiveness of the cleanup action. Confirmation monitoring will include long-term groundwater monitoring to document that CULs are met at the CPOC.

The required protection, performance, and confirmation monitoring for the Site will include several compliance monitoring elements specified in the Construction Compliance Monitoring Plan (CCMP), included as Section 7.1, and the Long-Term Compliance Monitoring Plan (LTCMP), which will be prepared after construction is complete, as summarized in Section 7.2.

7.1 CONSTRUCTION COMPLIANCE MONITORING PLAN

The section presents the CCMP to be implemented during construction and consists of protection monitoring for health and safety, performance monitoring to verify RELs and ensure quality control during implementation of the cleanup action, and confirmation monitoring to ensure cleanup standards are met. The CCMP includes provisions for Site-specific HASPs prepared by the contractor and Floyd|Snider and a Sampling and Analysis Plan/Quality Assurance Project Plan (SAP/QAPP; Appendix I) for monitoring and sample collection during cleanup action implementation.

7.1.1 Protection Monitoring

Protection monitoring will be conducted during remedy construction to confirm the protection of human health and the environment during cleanup action implementation activities (refer to

Section 6.6). Site activities completed by Floyd|Snider personnel will follow a HASP, which will be updated prior to construction. A Site-specific HASP will be prepared by the contractor to address worker safety requirements during construction. All contractors and subcontractors will be required to use workers trained for hazardous waste work and to comply with the HASP. The contractor will provide a copy of its HASP to the Engineer prior to mobilization.

7.1.2 Performance Monitoring

Performance monitoring during construction will include testing, measuring, and documentation to ensure that the implementation of the remedial technologies and actions were effectively applied.

Prior to construction and decommissioning of monitoring wells, groundwater will be gauged and then sampled for the Site groundwater COCs from monitoring wells within and downgradient of the remediation work areas. These data will provide a baseline of pre-remediation aquifer conditions to evaluate post-remediation groundwater performance. Monitoring wells to be sampled include MW-1 through MW-8, MW-10 through MW-14, and MW-20.

During excavation, performance monitoring will include completing surveys to verify that the minimum horizontal and vertical limits of contaminated soil exceeding RELs have been removed. Once confirmation monitoring via soil sampling (refer to Section 7.1.3) has verified that the applicable RELs are met, the excavation areas will be backfilled and compacted. During backfilling, the remediation contractor will perform compaction testing to ensure that the final backfilled area meets the compaction requirements described in Section 6.7.6.

During in situ treatment barrier injection, both the weights/volumes of each component when batch-mixing the aqueous injection solution and the volume of solution injected in each interval of the treatment zone will be recorded. Periodic verification testing of soil within the injection zone will also be performed as directed by Regenesis or the Engineer. One to two soil verification tests will be performed by advancing a direct-push boring within the barrier after completion of the injection. Adequate dispersion of treatment barrier in soil and groundwater in the target treatment zone is visually assessed by noting color change to dark gray/black caused by liquid activated carbon. The injection spacing may be field adjusted to be more closely or widely spaced if indicated appropriate by the findings of visual assessment, with corresponding adjustment made to the quantities of treatment components injected per depth interval at each point, to ensure consistent and even application of the specified quantities of treatment components required for the PlumeStop barrier.

The PetroFix barrier application area will be visually assessed during mixing by noting heterogeneous color change to dark gray/black to ensure full mixing of the barrier prior to backfill. Groundwater geochemical indicators (such as dissolved oxygen, conductivity, and oxidation–reduction potential) will be monitored as one line of evidence for successful in situ treatment barrier injection. Changes in these indicator parameters may not be immediately apparent during injection or mixing but will be monitored as field parameters for changes relative

to historical averages during subsequent groundwater performance monitoring after injection, as described in Section 8.1.

7.1.3 Confirmation Monitoring

Confirmation monitoring during construction will consist of collection of soil samples for chemical analysis to ensure that the RELs are met within each excavation.

The extent of COC-contaminated soil was fully delineated for most of the AOCs during the PDI events described in Sections 4.1 and 4.2.5. The PDI samples that meet the applicable soil cleanup criteria represent the base (vertical) and sidewall (lateral) extents of excavations and will be used as confirmation samples. Contractor surveying and Engineer verification will be completed prior to backfilling each excavation to ensure the excavation extents have met the design based on the PDI confirmation samples and additional confirmation samples described as follows. Compliance monitoring locations for each excavation area are shown on Figures 7.1 through 7.6.

Additional confirmation monitoring and sampling will be required for excavation extents that have not been fully delineated in AOC 2, AOC 4, and FS-01. Confirmation samples in these respective areas will be collected and analyzed in accordance with the procedures presented in the SAP/QAPP provided as Appendix I. Confirmation sampling and analytical requirements are described as follows:

- **AOC 2 and AOC 4:** Diesel-range TPH and oil-range TPH concentrations greater than RELs have not been fully delineated laterally in the southeast corners of AOC 2 and AOC 4, shown on Figures 7.2 and 7.4, respectively. Field screening will be completed by the Engineer during these excavations using visual/olfactory indicators and PID measurements to determine the extent of excavation and the location of additional confirmation samples. These confirmation samples will be collected in the respective sidewall locations at the interval of the highest observed PID measurements. Confirmation samples in AOC 2 and AOC 4 will be analyzed for diesel- and oil-range TPH.
- **FS-01:** Total diesel- and oil-range TPH concentrations (summed) greater than the CUL have not been laterally delineated around FS-01. Confirmation samples will be collected at the locations shown in Figure 7.6 and analyzed for diesel- and oil-range TPH. One sample will be collected at the base of the excavation, and two samples will be collected from the midpoint of the southern and eastern sidewalls. An additional sidewall sample adjacent to the machine shop may be collected if indications of contamination are measured with a PID near the building foundation.

7.2 LONG-TERM COMPLIANCE MONITORING PLAN

A post-cleanup LTCMP will be prepared after implementation of the cleanup action and will describe required long-term operations, maintenance, and monitoring to ensure the long-term protectiveness of the cleanup action. The LTCMP will include a GMP, Soil Management Plan (SMP), and an updated SAP/QAPP.

The GMP will document groundwater monitoring locations, sampling frequency, analytes, and data analysis procedures. The GMP will describe long-term post-construction groundwater monitoring and adaptive management to ensure the long-term protectiveness of the cleanup action, as described in Section 8.1

The SMP will define specific source areas and depths where soil contamination that remains in place at concentrations greater than CULs would limit land use. Any activities that would be proposed within these restricted areas would require compliance with the SMP, which would outline health and safety protocols along with soil handling and management procedures and notification requirements. The SMP will also provide details for routine inspection and maintenance of remedial elements (such as the cap, the drainage system, and monitoring wells). These procedures will be applicable to any future development or maintenance that involves ground-disturbing activities. The SMP will also outline procedures if existing structures are removed in the future that may have potential subsurface contamination at concentrations greater than CULs (refer to Section 8.3 for potential contingency actions).

8.0 Post-Construction Activities

This section provides a summary of the activities and reporting that will occur after implementation of the cleanup action.

8.1 GROUNDWATER MONITORING

MNA for groundwater will be required after other cleanup activities are complete. A groundwater monitoring program that includes both performance and confirmation monitoring will be implemented as part of the LTCMP to assess the effectiveness of source soil removal and performance of the in situ groundwater treatment barrier. The GMP, which will be an attachment or section in the LTCMP, will describe long-term groundwater monitoring and adaptive management to ensure the long-term protectiveness of the cleanup action, and the GMP will detail the process for the MNA evaluation.

In addition, a monitoring well network will be established as part of the GMP that would include locations for performance monitoring for the components of the cleanup action (e.g., excavation, in situ groundwater treatment, and MNA). Selected monitoring wells located in source areas or proximate to cleanup activities (e.g., MW-4, MW-12) will be replaced after the cleanup action to evaluate cleanup action performance. Additional wells may be installed for performance monitoring, as warranted, based on post-cleanup conditions and in consultation with Ecology.

Groundwater compliance will be determined based on a comparison of groundwater data to CULs at the CPOC, along the western edge of the property (refer to Figure 6.1). Compliance at the CPOC would be measured by direct sampling of groundwater in monitoring wells that are along this boundary. Monitoring wells MW-2, MW-3, MW-10, MW-12, and MW-14 will provide the baseline for monitoring at the CPOC. Additional monitoring wells may be added to the monitoring well network, as needed and in consultation with Ecology, to demonstrate compliance. The post-cleanup action monitoring well network and frequency of sampling will be defined in the GMP, which will be prepared as part of the LTCMP.

8.2 REMEDIAL ELEMENT INSPECTIONS AND MONITORING

The SMP would include measures for routine inspection, operations, and maintenance of cleanup elements including the GCL and indicator layer, gravel surface, drainage and conveyance system, and monitoring wells. This will include inspection requirements of the gravel surface covering the GCL to ensure the indicator layer is not exposed potentially leading to future damage of the GCL. The SMP will be a part of the LTCMP and will be prepared after implementation of the remedial action.

These procedures would be applicable to any future development or maintenance that involves ground-disturbing activities. The SMP would also outline procedures if existing structures, which may overlie potential subsurface contamination at concentrations greater than CULs, are removed in the future.

The LTCMP will include procedures for sampling stormwater at the installed manhole to evaluate if current operations are contributing to nitrate/nitrite loading in stormwater greater than groundwater CULs. Maintenance of the stormwater conveyance system, including inspection and cleanout frequency, will also be included in the LTCMP.

8.3 CONTINGENCY ACTIONS

Contingency actions may be required if additional risk reduction measures are needed after cleanup action implementation, as described in the CAP. Specific details regarding contingency actions and contingency action triggers will be updated, as needed, after cleanup action implementation in the LTCMP. The contingency measures for the Site are anticipated to include the following:

- Source control efforts are in place to control potential ongoing nitrate and nitrite contributions to groundwater associated with current fertilizer handling operations. There are no data that quantify the ongoing contribution from current operations; therefore, it will be important to assess the potential for ongoing contributions after the cleanup. After installation of the GCL, surface water that infiltrates to the GCL will be conveyed to a collection catch basin at the southeastern property line. The collection system was designed so that water that is conveyed to this catch basin can be sampled to determine if an ongoing nitrate/nitrite source exists. If it is determined that fertilizer handling on-Site is an ongoing source of nitrate/nitrite in groundwater and post-cleanup groundwater concentrations of nitrate/nitrite are not adequately improving, as measured at the CPOC, then a contingency source control evaluation will be done to propose additional BMPs for the Site. Details regarding water sample collection from the catch basin and contingency source control evaluation will be described further in the LTCMP.
- Pesticide and TPH contamination greater than RELs are present in soil beneath the office and storage building. If future property development includes removal of this building, then excavation may be necessary to remove contaminated soil beneath this structure. Specific procedures regarding this contingency will be included in the SMP.
- TPH contamination greater than RELs is present beneath the AST containment area. If future property development includes removal of the AST containment area, then additional investigation may be necessary to determine if contamination is present beneath this structure, which could warrant excavation. Investigation and evaluation details regarding this contingency will be included in the SMP.

8.4 INSTITUTIONAL CONTROLS

ICs are a necessary component of the cleanup action design and are necessary to protect the long-term safety of humans and the environment where hazardous substances will remain in place after implementation of the cleanup action. ICs, in the form of an environmental covenant, will be required for the Site, and a deed restriction will be needed to restrict future uses of the

Site. Ecology would prepare the environmental covenant in consultation with Ad Gro (or the current property owner at that time), consistent with WAC 173-340-440 and Chapter 64.70 RCW.

ICs would prohibit the use of groundwater as drinking water at the Site and would also prohibit the use of groundwater for domestic use, irrigation, or industrial use. ICs would require provisions for maintaining the GCL as an engineered barrier to subsurface soil contamination, including the implementation of an Ecology-approved SMP specifying routine inspection and maintenance of remedial elements and soil management procedures for future subsurface work in areas where soil contamination is present described in Section 7.2.

8.5 REPORTING

Per the CAP and CD, the following are reporting requirements after the completion of all cleanup action components.

- Submit draft RACR and draft LTCMP to Ecology no more than 180 days after remedial action completion.
- Submit final RACR and LTCMP to Ecology no more than 45 days after receipt of Ecology's final comments on the draft documents.

Per Section VI(7) of the CD, monthly progress reports will be submitted to Ecology by the 10th day of the month to summarize activities conducted during the previous month. This monitoring frequency may be reduced in coordination with Ecology, likely concurrent with Ecology approval of the LTCMP.

Routine groundwater monitoring reports will be prepared and submitted to Ecology after implementation of the groundwater compliance monitoring program.[6] The specific details regarding schedule and frequency of the groundwater sampling events and reporting will be included as part of the LTCMP approved by Ecology.

[6] Per the CAP, the final LTCMP shall be implemented no later than 1 year after cleanup action construction completion.

Notes:

Italic Nondetect result exceeds CUL.

RED/BOLD Detected exceedance of CUL.

1 Proposed CULs were developed for each chemical retained as a COC in the RI and are presented in Table 3.1 of the EDR.

2 The total chlordanes result is the sum of detected cis-chlordane, trans-chlordane, cis-nonachlor, trans-nonachlor, and oxychlordane concentrations. If all component analytes were non-detect, the highest reporting limit is used to represent the sum.

3 The laboratory noted that the sample chromatographic pattern does not resemble the fuel standard used for quantitation.

4 Ecology has required that diesel-range and oil-range TPH results be summed and compared to a CUL of 500 µg/L for assessments of TPH in groundwater.

5 VOCs and hardness characteristic compounds were analyzed for the purpose of designing the in situ groundwater treatment and do not have developed CULs, because these chemicals are not COCs.

Abbreviations:

COC Chemical of concern
CUL Cleanup level
DRO Diesel-range organics
Ecology Washington State Department of Ecology
EDR Engineering Design Report
µg/L Micrograms per liter
mg/L Milligrams per liter
ORO Oil-range organics
RI Remediation Investigation
TPH Total petroleum hydrocarbons
VOC Volatile organic compound

Qualifiers:

J Chemical was detected; concentration is an estimate.
U Chemical was not detected at the associated reporting limit.
UJ Chemical was not detected at the associated reporting limit, which is an estimate.

Notes:

Dioxin/furan results are rounded to three significant figures; all other results are rounded to two significant figures.

-- Not applicable; pathway is not active or proposed CUL listed in this table is protective of other pathways.

Italics Nondetect result exceeds soil REL for either the direct contact or leaching pathway.

BOLD Detected result exceeds soil CUL for either the direct contact or leaching pathway.

RED/BOLD Detected result exceeds applicable soil REL. The applicable soil REL is specific to the AOC as determined in the FS. AOCs 1, 2, and 4 are compared to the leaching RELs and AOCs 3 and 5 are compared to the direct contact RELs. AOC 6, off-property exceedances in AOC 3, and locations not associated with an AOC are compared only to CULs.

1 Only chemicals identified as soil COCs in the RI and presented in Table 3.2 of the EDR are included in this table.

2 The total chlordanes result is the sum of detected alpha-chlordane, gamma-chlordane, nonachlor (cis), nonachlor (trans), and oxychlordane concentrations. If all component analytes were non-detect, the highest reporting limit is used to represent the sum.

3 The laboratory reported generic chlordane as an individual chemical.

4 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDT.

5 The dioxin/furan result is equivalent to the total dioxin/furan TEQ summed using toxic equivalent factor values in WAC Table 708-1 and 1/2 of the reported result for nondetect results in each sample.

6 The TPH CUL is applied to the sum of diesel- and oil-range TPH. The direct contact-based CUL of 460 mg/kg is protective of ecological receptors and has a point of compliance from 0 to 6 feet bgs. For protection of human health, TPH data are evaluated relative to the MTCA Method A-based CUL of 2,000 mg/kg, which has a point of compliance from 0 to 15 feet bgs.

7 The leaching pathway is not complete in AOC 3.

8 The result for toxaphene at AOC1-03 exceeds the direct contact REL but not the leaching REL. Although results in AOC 1 are compared to the leaching REL, this exceedance is noted based on the proximity of this location to the property boundary.

9 The laboratory noted that the sample chromatographic pattern does not resemble the fuel standard used for quantitation.

10 Result was not detected, but was rejected in validation. Refer to data validation report.

Abbreviations:

AOC Area of concern
bgs Below ground surface
BHC Benzene hexachloride
CAS Chemical Abstracts Service
COC Chemical of concern
CUL Cleanup level
DDT Dichlorodiphenyltrichloroethane
HCH Hexachlorocyclohexane
mg/kg Milligrams per kilogram
MTCA Model Toxics Control Act
ng/kg Nanograms per kilogram
REL Remediation Level
RI Remedial Investigation
TEQ Toxic equivalent
TPH Total petroleum hydrocarbons

Qualifiers:

J Chemical was detected, concentration is considered to be an estimate.
JM Chemical was detected, concentration is considered to be an estimate due to poor match to chromatographic standard.
U Chemical was not detected at the given reporting limit.
UJ Chemical was not detected at the given reporting limit, which is considered to be an estimate.

Notes:

Dioxin/furan results are rounded to three significant figures; all other results are rounded to two significant figures.

-- Not applicable; pathway is not active or proposed CUL listed in this table is protective of other pathways.

Italics Nondetect result exceeds soil REL for either the direct contact or leaching pathway.

BOLD Detected result exceeds soil CUL for either the direct contact or leaching pathway.

RED/BOLD Detected result exceeds applicable soil REL. The applicable soil REL is specific to the AOC as determined in the FS. AOCs 1, 2, and 4 are compared to the leaching RELs and AOCs 3 and 5 are compared to the direct contact RELs. AOC 6, off-property exceedances in AOC 3, and locations not associated with an AOC are compared only to CULs.

1 Only chemicals identified as soil COCs in the RI and presented in Table 3.2 of the EDR are included in this table.

2 The total chlordanes result is the sum of detected alpha-chlordane, gamma-chlordane, nonachlor (cis), nonachlor (trans), and oxychlordane concentrations. If all component analytes were non-detect, the highest reporting limit is used to represent the sum.

3 The laboratory reported generic chlordane as an individual chemical.

4 Samples were not analyzed for the 2,4' isomer of DDT-family compounds. The result for the 4,4' isomer is compared to relevant criteria developed for total DDT.

5 The dioxin/furan result is equivalent to the total dioxin/furan TEQ summed using toxic equivalent factor values in WAC Table 708-1 and 1/2 of the reported result for nondetect results in each sample.

6 The TPH CUL is applied to the sum of diesel- and oil-range TPH. The direct contact-based CUL of 460 mg/kg is protective of ecological receptors and has a point of compliance from 0 to 6 feet bgs. For protection of human health, TPH data are evaluated relative to the MTCA Method A-based CUL of 2,000 mg/kg, which has a point of compliance from 0 to 15 feet bgs.

7 Consistant with the RI tables, all data shown are compared to the leaching and direct contact CULs. The leaching pathway is not complete in AOC 3.

8 The result for toxaphene at AOC1-03 exceeds the direct contact REL but not the leaching REL. Although results in AOC 1 are compared to the leaching REL, this exceedance is noted based on the proximity of this location to the property boundary.

9 The laboratory noted that the sample chromatographic pattern does not resemble the fuel standard used for quantitation.

10 Result was rejected in validation. Refer to data validation report.

Abbreviations:

AOC Area of concern
bgs Below ground surface
BHC Benzene hexachloride
CAS Chemical Abstracts Service
COC Chemical of concern
CUL Cleanup level
DDT Dichlorodiphenyltrichloroethane
HCH Hexachlorocyclohexane
mg/kg Milligrams per kilogram
MTCA Model Toxics Control Act
ng/kg Nanograms per kilogram
REL Remediation Level
RI Remedial Investigation
TEQ Toxic equivalent
TPH Total petroleum hydrocarbons

Qualifiers:

J Chemical was detected, concentration is considered to be an estimate.
JM Chemical was detected, concentration is considered to be an estimate due to poor match to chromatographic standard.
U Chemical was not detected at the given reporting limit.
UJ Chemical was not detected at the given reporting limit, which is considered to be an estimate.

Table 6.1
Applicable or Relevant and Appropriate Requirements and Substantive Compliance Actions

Standard, Requirement, or Limitation [1]	Description	Substantive Compliance
Location-Specific ARARs [2]		
City of Ellensburg Critical Areas Regulations (EMC Chapter 15.620 [Wetlands] and EMC Chapter 15.650 [Fish and Wildlife Habitat Conservation Areas])	These chapters establish regulations pertaining to development within or adjacent to designated critical areas. The subject property is located approximately 125 feet west of Wilson Creek, 220 feet east of Mercer Creek, and 125 feet north of a freshwater forested/shrub wetland. The City of Ellensburg regulates all development activities within 300 feet of stream and wetland resources.	The cleanup action will protect all nearby critical areas using site controls and best management practices described in Section 6.3, which include establishing vehicle haul routes, stormwater BMPs, and spill prevention and control measures.
Native American Graves Protection and Repatriation Act (25 USC 3001 through 3013; 43 CFR 10) Washington's Indian Graves and Records Law (RCW 27.44)	These statutes prohibit the destruction or removal of Native American cultural items and require written notification of inadvertent discovery to the appropriate agencies and Native American tribe.	Subgrade work will be completed in accordance with an Inadvertent Discovery Plan to be completed prior to construction (Appendix J). If an inadvertent discovery of Native American or other culturally significant item is found, the work activities will cease in the area of discovery. Notice will be provided to the relevant parties and a reasonable effort will be made to protect the items discovered. Continued work in the area of discovery may occur after coordination and approval with relevant parties and may include the oversight of a licensed archaeologist.
Archaeological Resources Protection Act (16 USC 470aa et seq.; 43 CFR 7)	This program sets forth requirements that are triggered when archaeological resources are discovered. These requirements only apply if archaeological items are discovered during implementation of the selected remedy.	
National Historic Preservation Act (16 USC 470 et seq.; 36 CFR parts 60, 63, and 800)	This program sets forth a national policy of historic preservation and provides a process that must be followed to ensure that impacts of actions on archaeological, historic, and other cultural resources are protected.	
Action-Specific ARARs [3]		
State Environmental Policy Act (RCW 43.21C, WAC 197-11)	Establishes the state's policy for protection and preservation of the natural environment. Applies to cleanup actions conducted under MTCA; Ecology will be the lead agency for this effort.	Ecology, as the lead agency, issued a SEPA DNS on March 8, 2023, for implementation of the cleanup action.
Resource Conservation and Recovery Act (42 USC 6921-6949a; 40 CFR Part 268, Subtitles C and D)	Establishes requirements for the identification, handling, and disposal of hazardous and non-hazardous waste.	All contaminated soil at the site is considered a non-hazardous and non-dangerous waste per state and federal regulations. Contaminated soil will be transported off-site under an approved waste profile to a licensed subtitle D landfill facility for disposal. Waste certificates of disposal will be retained and included in the Construction Completion Report.
Dangerous Waste Regulations (RCW 70.105; WAC 173-303)	Establishes regulations that are the state equivalent of RCRA requirements for determining whether a solid waste is a state dangerous waste. This regulation also provides requirements for the management of dangerous wastes.	
Solid Waste Disposal Act (42 USC Sec. 6901-6992; 40 CFR 257-258) Federal Land Disposal Requirements (40 CFR 268)	Protects health and the environment and promotes conservation of valuable material and energy resources. The Solid Waste Disposal Act establishes a framework for regulation of solid waste disposal. Federal land disposal requirements promulgated under the authority of the Solid Waste Disposal Act set minimum safety requirements for landfills including limitations on storage and land disposal for hazardous substances.	
Department of Transportation Hazardous Materials Regulations (49 CFR 172)	Regulates the safe and secure transportation of hazardous materials, including documentation and handling requirements for shipping.	
Washington Minimum Functional Standards for Solid Waste Handling (WAC 173-304)	Sets minimum functional standards for the proper handling of all solid waste materials originating from residences, commercial, agricultural, and industrial operations, as well as other sources.	
Washington Solid Waste Handling Standards (RCW 70.95 and WAC 173-350)	Establishes minimum standards for handling and disposal of solid waste. Solid waste includes wastes that are likely to be generated as a result of site remediation, including contaminated soils, construction and demolition wastes, and garbage.	
Washington Water Pollution Control Law (RCW 90.48; WAC 173-216, WAC 173-220) National Pollution Discharge Elimination System (CWA Part 402)	Washington has been delegated authority to issue NPDES permits. CWA Section 301, 302, and 303 require states to adopt water quality standards and implement a NPDES permitting process. The Washington Water Pollution Control Law and regulations address this requirement.	Stormwater will be managed on-site in accordance with the substantive requirements of Ecology's Construction Stormwater General Permit (Section 6.11.3).

Table 6.1
Applicable or Relevant and Appropriate Requirements and Substantive Compliance Actions

Standard, Requirement, or Limitation [1]	Description	Substantive Compliance
Action-Specific ARARs (cont.) [3]		
City of Ellensburg Noise Ordinance (EMC Chapter 5.60)	Establishes the definition of excessive noise and exceptions, including requirements for construction activity.	Project construction shall comply with the noise limitations set forth in City of Ellensburg's noise ordinance. Specifically, noise generated from construction activity will be limited to between 6:00 a.m. and 10:00 p.m.
Noise Control Act of 1974 (RCW 70.107, WAC 173-60)	Establishes maximum noise levels on a state level; the local noise ordinance regulations prevail given that they are more restrictive than the regulations set forth for the state.	
Washington State Underground Injection Control Program (WAC 173-218)	Washington is authorized under CWA Sections 144 through 147 to administer a statewide UIC program to protect groundwater by regulating the discharge of fluid from injection wells including temporary injection points.	The temporary injection wells associated with PlumeStop injections will be registered with Ecology as Class V UIC wells for cleanup sites prior to injection. Discharged water from each injection point must meet the non-endangerment standard as defined in WAC 173-218-030.
City of Ellensburg Site Development Permit (EMC 15.250.020)	City of Ellensburg Site Development Permits authorize the following activities: paving, grading, clearing, filling, tree removal, on-site utility installation, and stormwater facility installation.	All excavation, paving, and utility and stormwater facility installation work will require substantive compliance with the Site Development Permit requirements and any supporting technical memoranda (e.g., City of Ellensburg Storm Standards for design and installation of stormwater facilities).
Federal, State, and Local Air Quality Protection Programs State Implementation of Ambient Air Quality Standards NWAPA Ambient and Emission Standards Regional Standards for Fugitive Dust Emissions Toxic Air Pollutants	Regulations promulgated under the federal Clean Air Act (42 USC 7401) and the Washington State Clean Air Act (RCW 70.94) govern the release of airborne contaminants from point and non-point sources. State and local air pollution control authorities such as the Ecology Central Regional Office and City of Ellensburg have also set forth regulations for implementing these air quality requirements.	Fugitive dust emissions will be managed by the contractor during construction using standard dust control means and methods in accordance with the Stormwater Management Manual for Eastern Washington.
Chemical-Specific ARARs [4]		
Model Toxics Control Act (WAC 173-340)	Establishes Washington administrative processes and standards to identify, investigate, and clean up facilities where hazardous substances are located.	The selected cleanup action was designed to meet the minimum requirements of MTCA cleanup regulations.
Drinking Water Standards—State MCLs (WAC 246-290-310)	Establishes standards for contaminant levels in drinking water for water system purveyors.	CULs and RELs for contaminants of concern were developed in the RI/FS to meet the requirements of MTCA drinking water and groundwater quality standards. Implementation of the cleanup action will cause groundwater to meet CULs within a reasonable restoration time frame.
Water Quality Standards for Groundwaters of the State of Washington (WAC 173-200)	Implements the Water Pollution Control Act and the Water Resources Act of 1971 (90.54 RCW).	

Notes:

1 Projects conducted under an Agreed Order are exempt from the procedural requirements of most state and local permits (RCW 70.105D.090); however, the remedial actions must still comply with the substantive requirements of the exempt permits.
2 Location-specific ARARs are requirements that are applicable to the specific area where the site is located and can restrict the performance of activities, including cleanup actions, solely because they occur in specific locations.
3 Action-specific ARARs are requirements that are applicable to certain types of activities that occur or technologies that are used during the implementation of cleanup actions.
4 Chemical-specific ARARs are applicable to the types of contaminants present at the Site. The cleanup of contaminated media at the site must meet the applicable CULs or RELs developed under MTCA; these criteria are considered chemical-specific ARARs.

Abbreviations:

ARAR	Applicable or relevant and appropriate requirement
BMP	Best management practice
CFR	Code of Federal Regulations
CUL	Cleanup level
CWA	Clean Water Act

Outside AOCs (GCL Area): 400

Selected Cleanup Action

Excavate to CULs

Excavate and dispose of soil at off-site landfill. Backfill with clean fill and gravel surface.

· AOC 3 (Off-Property)
· FS-01

Excavate to Direct Contact RELs

Excavate and dispose of soil at off-site landfill. Backfill with clean fill and gravel surface.

· AOC 3 · AOC 5

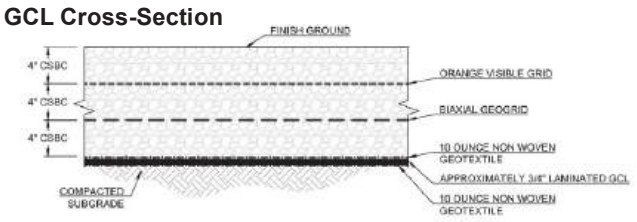
Excavate to Leaching RELs

Excavate and dispose of soil at off-site landfill. Backfill with clean fill and gravel surface.

· AOC 1 · AOC 2 · AOC 4

In Situ Groundwater Treatment

Inject trademarked colloidal activated carbon matrix (PlumeStop™ or PetroFix™) to create a passive treatment zone.



Geosynthetic Clay Liner

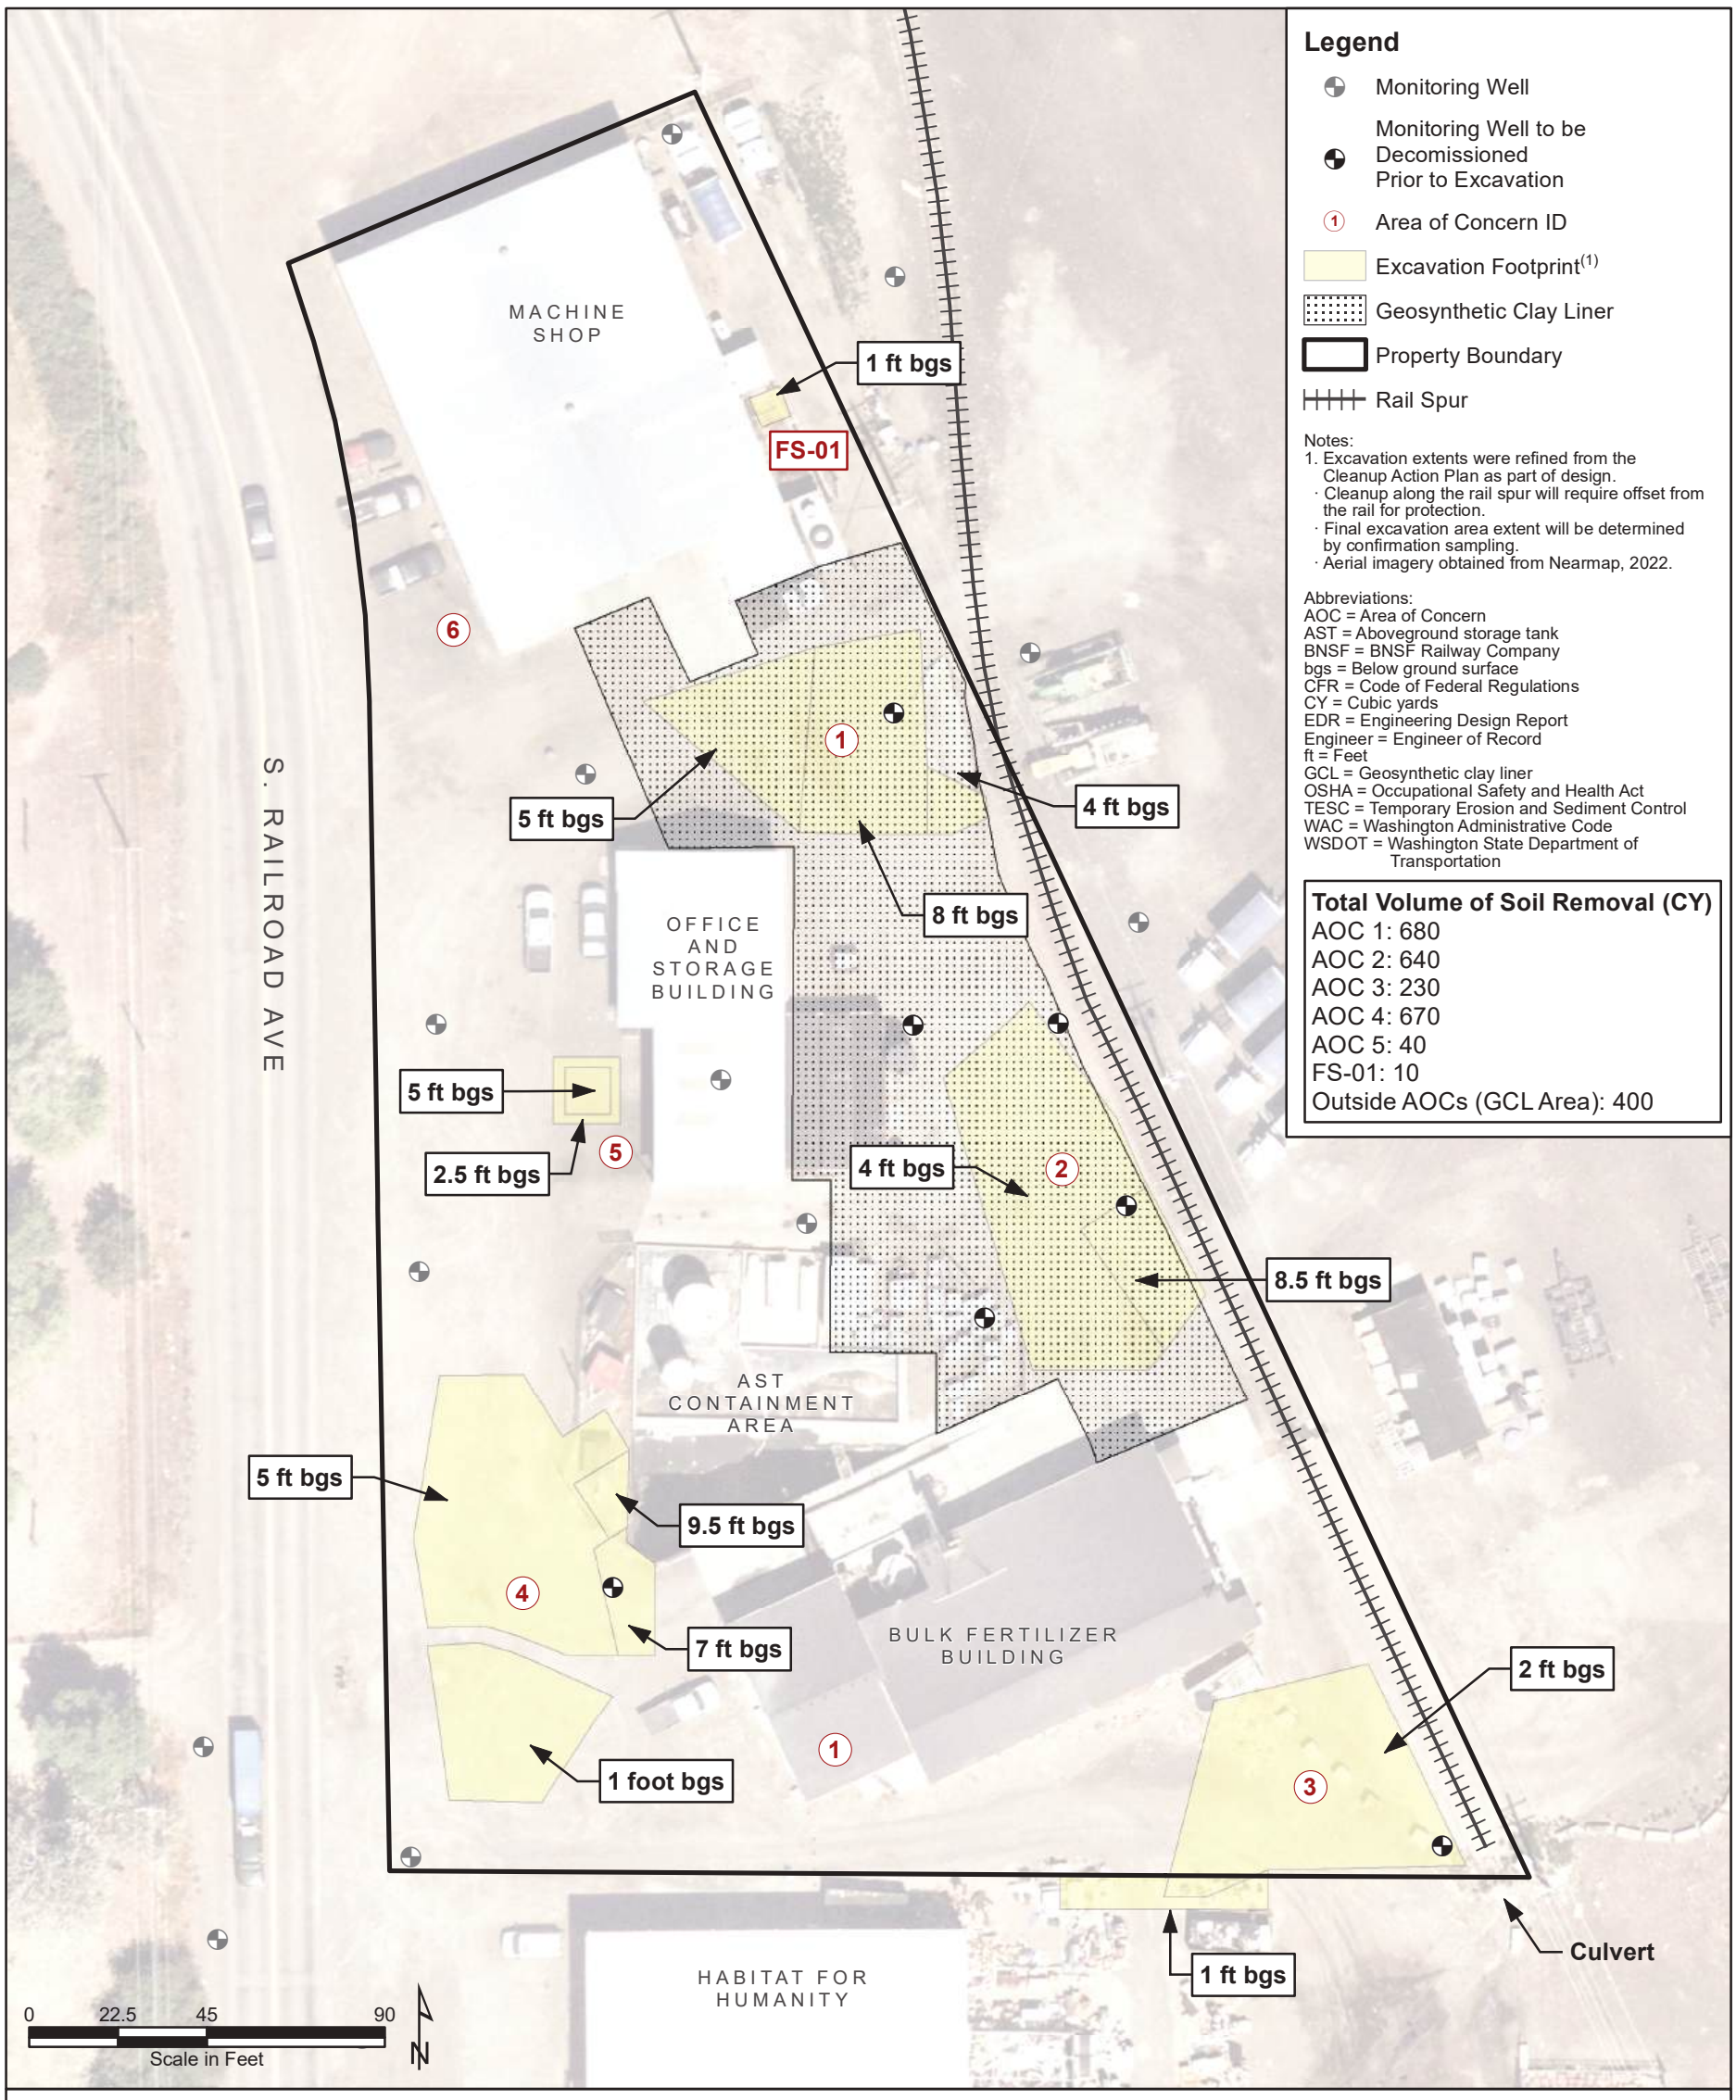
Install GCL as barrier for protection of groundwater from residual soil contamination.

Drainage System

Collect infiltrated precipitation drainage from the GCL and convey to a collection catch basin at the southeast corner of the property. Drainage system design details are included in Appendix F.

GCL Cross-Section

Not to Scale.



Note: GCL cross-section provided by PBS Engineering and Environmental Inc.

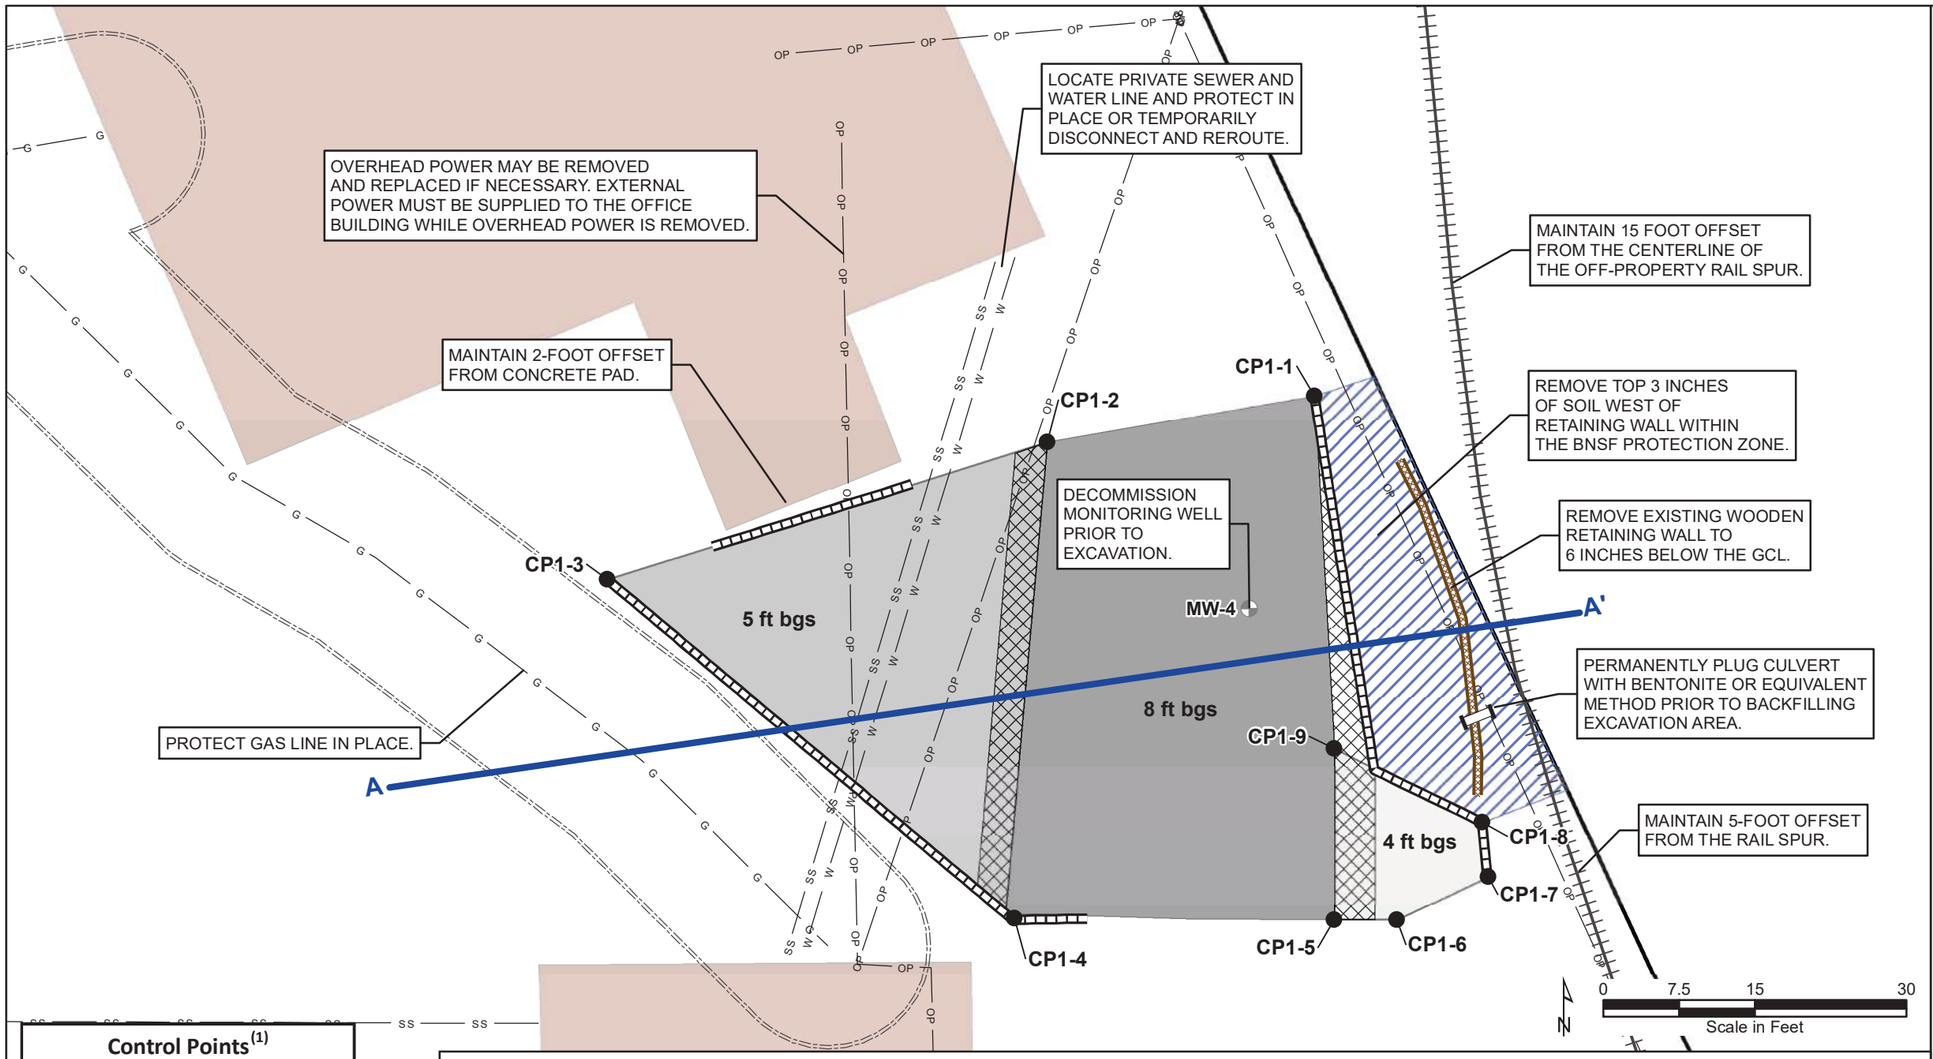
Notes:
1. Excavation extents were refined from the Cleanup Action Plan as part of design.
   - Cleanup along the rail spur will require offset from the rail for protection.
   - Final excavation area extent will be determined by confirmation sampling.
   - Aerial imagery obtained from Nearmap, 2022.

Abbreviations:
AOC = Area of Concern
AST = Aboveground storage tank
BNSF = BNSF Railway Company
bgs = Below ground surface
CFR = Code of Federal Regulations
CY = Cubic yards
EDR = Engineering Design Report
Engineer = Engineer of Record
ft = Feet
GCL = Geosynthetic clay liner
OSHA = Occupational Safety and Health Act
TESC = Temporary Erosion and Sediment Control
WAC = Washington Administrative Code
WSDOT = Washington State Department of Transportation

Total Volume of Soil Removal (CY)
AOC 1: 680
AOC 2: 640
AOC 3: 230
AOC 4: 670
AOC 5: 40
FS-01: 10
Outside AOCs (GCL Area): 400

Contractor Notes:



1. Excavation work shall be completed in accordance with OSHA's Excavation Standards (29 CFR 1926, Subpart P).
2. The contractor is responsible for submitting a TESC plan for Engineer approval prior to the start of work and implementing the plan consistent with Section 6.3.3 of the EDR.
2. Excavation depths are presented in feet below surrounding grade. The contractor shall verify total depth of excavations below the surrounding grade using surveying equipment accurate to within ± 0.1 feet.
4. Excavated material shall be disposed of at a licensed Subtitle C or Subtitle D disposal facility, consistent with soil profiling.
5. Excavated areas shall be backfilled and compacted with clean import material. Excavation areas within the GCL footprint area shall be backfilled to the bottom elevation of the GCL foundation layer (refer to the GCL and stormwater feature design drawings in Appendix F). Imported backfill must be granular material meeting WSDOT standard specifications for Select Borrow (Specification 9.03.14(2)). All final surfaces shall be restored to match the surrounding grade. The top 6 inches of surface material shall be crushed surfacing base (Specification 9-03.9(3)).
6. Shoring is required, at a minimum, adjacent to existing structures where stable side slopes cannot be established. Undermining or settlement of existing structures as well as side slopes onto the adjacent property are not allowed. The contractor is responsible for determining the appropriate shoring methods based on the work and soil type. Site boring logs are included in Appendix C. Any damage to existing structures or the rail spur as a result of the work execution shall be repaired at the contractor's expense.
7. Groundwater table elevation fluctuates seasonally between approximately 3 to 5 ft bgs. Excavations below the groundwater table will require dewatering or management of wet soils. Refer to Section 5.2 of the EDR for more details. Additional shoring may be needed for groundwater management in deeper excavation areas.
8. Monitoring wells to be decommissioned shall be decommissioned by a licensed driller in accordance with WAC-173-160-460. Monitoring wells not called out for decommissioning shall be protected in place.

RE: Smith-Kem ([none])

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

Associated Work Order(s)	Associated SDG ID(s)
23I0156	N/A

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclosed Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, LLC

Kelly Bottem, Client Services Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Cooler Receipt Form

ARI Client: Floyd - Snide Project Name: Smith Ken

COC No(s): ____ (NA) Delivered by: Fed-Ex UPS Courier Hand Delivered Other: ____

Assigned ARI Job No: 23I0196 Tracking No: ____ (NA)

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of the cooler?	YES	(NO)
Were custody papers included with the cooler?	(YES)	NO
Were custody papers properly filled out (ink, signed, etc.)	(YES)	NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)

Time 1158 5.7

If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: IR00708

Cooler Accepted by: JR Date: 09/08/23 Time: 1158

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?		YES	(NO)
What kind of packing material was used?	Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other:		
Was sufficient ice used (if appropriate)?	NA	(YES)	NO
How were bottles sealed in plastic bags?	Individually	Grouped	(Not) PZB 09/11/23
Did all bottles arrive in good condition (unbroken)?		(YES)	NO
Were all bottle labels complete and legible?		(YES)	NO
Did the number of containers listed on COC match with the number of containers received?		(YES)	NO
Did all bottle labels and tags agree with custody papers?		YES	(NO)
Were all bottles used correct for the requested analyses?		(YES)	NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)	(NA)	YES	NO
Were all VOC vials free of air bubbles?	(NA)	YES	NO
Was sufficient amount of sample sent in each bottle?		(YES)	NO
Date VOC Trip Blank was made at ARI	(NA)		

Were the sample(s) split by ARI? (NA) YES Date/Time: ____ Equipment: ____ Split by: ____

Samples Logged by: PZB Date: 09/11/23 Time: 9:21 Labels checked by: PZB

*** Notify Project Manager of discrepancies or concerns ***

Floyd - Snider	Project: Smith-Kem	
601 Union Street Two Union Square, Suite 600	Project Number: [none]	**Reported:**
Seattle WA, 98101-2341	Project Manager: Pamela Osterhout	07-Mar-2024 15:51

Case Narrative

Dioxin/Furans - EPA Method 1613

The sample(s) were extracted and analyzed within the recommended holding times for frozen samples. Analysis was performed using an application specific column developed by Restek. The RTX-Dioxin2 column has unique isomer separation for the 2378-TCDF, eliminating the need for confirmation analysis.

Initial and continuing calibrations were within method requirements.

Labeled internal standard areas were within limits.

The cleanup surrogate percent recoveries were within control limits.

The method blank(s) contained positive results. Samples that contain analyte have been flagged with a "B" qualifer.

The OPR (Ongoing Precision and Recovery) standard percent recoveries were within control limits.

The duplicate (DUP) relative percent difference (RPD) were within advisory control limits with the exception of analytes flagged on the associated forms.

QUALIFIERS AND NOTES

Qualifier	Definition
X	Indicates possible CDPE interference.
U	This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).
J	Estimated concentration value detected below the reporting limit.
EMPC	Estimated Maximum Possible Concentration qualifier for HRGCMS Dioxin
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL)
B	This analyte was detected in the method blank.
*	Flagged value is not within established control limits.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference

CDD/CDF CHROMATOGRAPHIC RESOLUTION SUMMARY

EPA 1613B

Lab Name: Analytical Resources, LLC
SDG: 23I0156
Instrument .ID: AUTOSPEC01
Lab File ID: 23121443
Date Analyzed: 12/16/23
Time Analyzed: 01:26
Lab Sample ID: SLL0222-RES3
Sequence: SLL0222

Percent Valley Determination for Column: RTX-Dioxin2 ID: 0.25 (mm)

1278-TCDD/2378-TCDD: 14.2

3467-TCDF/2378-TCDF: 11.5

Quality Control (QC) Limits: ≤ 25%

WELLINGTON LABORATORIES

CERTIFICATE OF ANALYSIS
DOCUMENTATION

CS3WT

Calibration and Verification Solution (EPA-1613CS3) combined with Window Defining and 2,3,7,8-TCDD Resolution Testing Congeners

PRODUCT CODE:	CS3WT
LOT NUMBER:	CS3WT0918
SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	10/24/2018
LAST TESTED: (mm/dd/yyyy)	10/29/2018
EXPIRY DATE: (mm/dd/yyyy)	10/29/2025
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place

DESCRIPTION:

CS3WT is a solution/mixture of native and $^{13}C_{12}$-labelled chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Table A.

CS3WT was designed and prepared to be used as a HRMS calibration standard according to U.S. EPA Method 1613B.

It is to be used for calibration verification in place of EPA-1613CS3 (Lot: 13CS30918). It also contains the PCDD and PCDF window defining congeners for a DB-5 (or equivalent) capillary column as well as the TCDD isomers required to test and confirm the resolution of 2,3,7,8-TCDD.

The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%. The individual native 2,3,7,8-substituted PCDD and PCDF congeners all have chemical purities of >98%; the other congeners (window defining and resolution testing) should only be considered semi-quantitative.

This current lot of CS3WT is to be used with the 1613 calibration solutions having the following lot numbers:

PRODUCT CODE	LOT NUMBER
EPA-1613CS1	13CS10918
EPA-1613CS2	13CS20918
EPA-1613CS3	13CS30918
EPA-1613CS4	13CS40918
EPA-1613CS5	13CS50918
EPA-1613CSL	13CSL0918
EPA-1613CS0.5	13CS0.50918

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA
519-822-2436 • Fax: 519-822-2849 • info@well-labs.com

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Figure 1: HRGC/HRMS Data (SIR; 10,000 mass resolving power)

ADDITIONAL INFORMATION:

- See page 3 for further details.
- Only the 2,3,7,8-substituted PCDDs and PCDFs should be used for quantitation. The other congeners (window defining and 2378-TCDD resolution testing) should be considered semi-quantitative (within ±20% of their design value). Impurities have been identified where possible.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

CALA Testing Accreditation No. A1226

ANAB ACCREDITED ISO 17034 REFERENCE MATERIAL PRODUCER

CS3WT

Calibration and Verification Solution (EPA-1613CS3) combined with Window Defining and 2,3,7,8-TCDD Resolution Testing Congeners

PRODUCT CODE:	CS3WT
LOT NUMBER:	CS3WT1019
SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	10/30/2019
LAST TESTED: (mm/dd/yyyy)	10/31/2019
EXPIRY DATE: (mm/dd/yyyy)	10/31/2026
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place

H 12366
Recd 12/20/19

DESCRIPTION:

CS3WT is a solution/mixture of native and $^{13}C_{12}$-labelled chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Table A.

CS3WT was designed and prepared to be used as a HRMS calibration standard according to U.S. EPA Method 1613B.

It is to be used for calibration verification in place of EPA-1613CS3 (Lot: 13CS31019). It also contains the PCDD and PCDF window defining congeners for a DB-5 (or equivalent) capillary column as well as the TCDD isomers required to test and confirm the resolution of 2,3,7,8-TCDD.

The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%. The individual native 2,3,7,8-substituted PCDD and PCDF congeners all have chemical purities of >98%; the other congeners (window defining and resolution testing) should only be considered semi-quantitative.

This current lot of CS3WT is to be used with the 1613 calibration solutions having the following lot numbers:

PRODUCT CODE	LOT NUMBER
EPA-1613CS1	13CS11019
EPA-1613CS2	13CS21019
EPA-1613CS3	13CS31019
EPA-1613CS4	13CS41019
EPA-1613CS5	13CS51019
EPA-1613CSL	13CSL1019
EPA-1613CS0.5	13CS0.51019

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA

DOCUMENTATION/ DATA ATTACHED:

Table A: Components and Concentrations of the Solution/Mixture
Figure 1: HRGC/HRMS Data (SIR; 10,000 mass resolving power)

ADDITIONAL INFORMATION:

- See page 3 for further details.
- Only the 2,3,7,8-substituted PCDDs and PCDFs should be used for quantitation. The other congeners (window defining and 2378-TCDD resolution testing) should be considered semi-quantitative (within ±20% of their design value). Impurities have been identified where possible.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, \ldots x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

DESCRIPTION:

EPA-1613CVS is a series of 5 calibration solutions containing native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$ and $^{37}Cl_4$) chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components of each solution, and their concentrations, are given in Table A.

They were designed for, and prepared to be used according to, U.S. EPA Method 1613 (Revision B). They are to be used as received.

EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to EPA-1613CVS. Neither is required by the method, but either or both can be used to extend the calibration to lower levels.

The individual native PCDDs and PCDFs all have chemical purities of >98%. The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-Tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%.

Expires 10/24/2026
Prepared By Joshua Rains 6/23/2020

DESCRIPTION:

EPA-1613CVS is a series of 5 calibration solutions containing native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$ and $^{37}Cl_4$) chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components of each solution, and their concentrations, are given in Table A.

They were designed for, and prepared to be used according to, U.S. EPA Method 1613 (Revision B). They are to be used as received.

EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to EPA-1613CVS. Neither is required by the method, but either or both can be used to extend the calibration to lower levels.

The individual native PCDDs and PCDFs all have chemical purities of >98%. The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-Tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

ADDITIONAL INFORMATION:

- See page 3 for further details.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a series of standards for the identification and quantification of specific chemical compounds.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned values, and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analytes is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

CALA Testing Accreditation No. A1226

ANAB ACCREDITED ISO 17034 REFERENCE MATERIAL PRODUCER

Prepared By Joshua Rains 6/23/2020

DESCRIPTION:

EPA-1613CVS is a series of 5 calibration solutions containing native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$ and $^{37}Cl_4$) chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components of each solution, and their concentrations, are given in Table A.

They were designed for, and prepared to be used according to, U.S. EPA Method 1613 (Revision B). They are to be used as received.

EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to EPA-1613CVS. Neither is required by the method, but either or both can be used to extend the calibration to lower levels.

The individual native PCDDs and PCDFs all have chemical purities of >98%. The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-Tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

ADDITIONAL INFORMATION:

- See page 3 for further details.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a series of standards for the identification and quantification of specific chemical compounds.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned values, and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analytes is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

CALA Testing Accreditation No. A1226

ANAB ACCREDITED ISO 17034 REFERENCE MATERIAL PRODUCER

EXPIRY DATE: (mm/dd/yyyy)	10/24/2026
RECOMMENDED STORAGE:	Store ampoules in a cool, dark place

I005459
1613 CS5 CAL STD
Expires 10/24/2026
Prepared By Joshua Rains 6/23/2020

DESCRIPTION:

EPA-1613CVS is a series of 5 calibration solutions containing native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$ and $^{37}Cl_4$) chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components of each solution, and their concentrations, are given in Table A.

They were designed for, and prepared to be used according to, U.S. EPA Method 1613 (Revision B). They are to be used as received.

EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to EPA-1613CVS. Neither is required by the method, but either or both can be used to extend the calibration to lower levels.

The individual native PCDDs and PCDFs all have chemical purities of >98%. The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-Tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

- See page 3 for further details.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a series of standards for the identification and quantification of specific chemical compounds.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned values, and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analytes is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

CALA Testing Accreditation No. A1226

ANAB ACCREDITED ISO 17034 REFERENCE MATERIAL PRODUCER

Note: EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to this calibration set that must be ordered separately.

EPA-1613CS0.5	13CS0.51019
EPA-1613CSL	13CSL1019

SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	10/22/2019
LAST TESTED: (mm/dd/yyyy)	10/24/2019
EXPIRY DATE: (mm/dd/yyyy)	10/24/2026
RECOMMENDED STORAGE:	Store ampoules in a cool, dark place

I005460
1613 CSL CAL STD
Expires 10/24/2026
Prepared By Joshua Rains 6/23/2020

DESCRIPTION:

EPA-1613CVS is a series of 5 calibration solutions containing native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$ and $^{37}Cl_4$) chlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs). The components of each solution, and their concentrations, are given in Table A.

They were designed for, and prepared to be used according to, U.S. EPA Method 1613 (Revision B). They are to be used as received.

EPA-1613CSL and EPA-1613CS0.5 are lower level extensions to EPA-1613CVS. Neither is required by the method, but either or both can be used to extend the calibration to lower levels.

The individual native PCDDs and PCDFs all have chemical purities of >98%. The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-$^{37}Cl_4$-Tetrachlorodibenzo-p-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

ADDITIONAL INFORMATION:

- See page 3 for further details.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a series of standards for the identification and quantification of specific chemical compounds.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned values, and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analytes is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A 1226), and ISO 17034 by ANSI-ASQ National Accreditation Board (ANAB; AR-1523).

CALA Testing Accreditation No. A1226

ANAB ACCREDITED ISO 17034 REFERENCE MATERIAL PRODUCER

DESCRIPTION:

EPA-1613PAR is a solution/mixture of all the 2,3,7,8-substituted polychlorinated dibenzo-*p*-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Table A.

EPA-1613PAR was designed and prepared to be used according to U.S. EPA Method 1613, Revision B.

The individual PCDDs and PCDFs all have chemical purities of >98%.

DOCUMENTATION/ DATA ATTACHED:

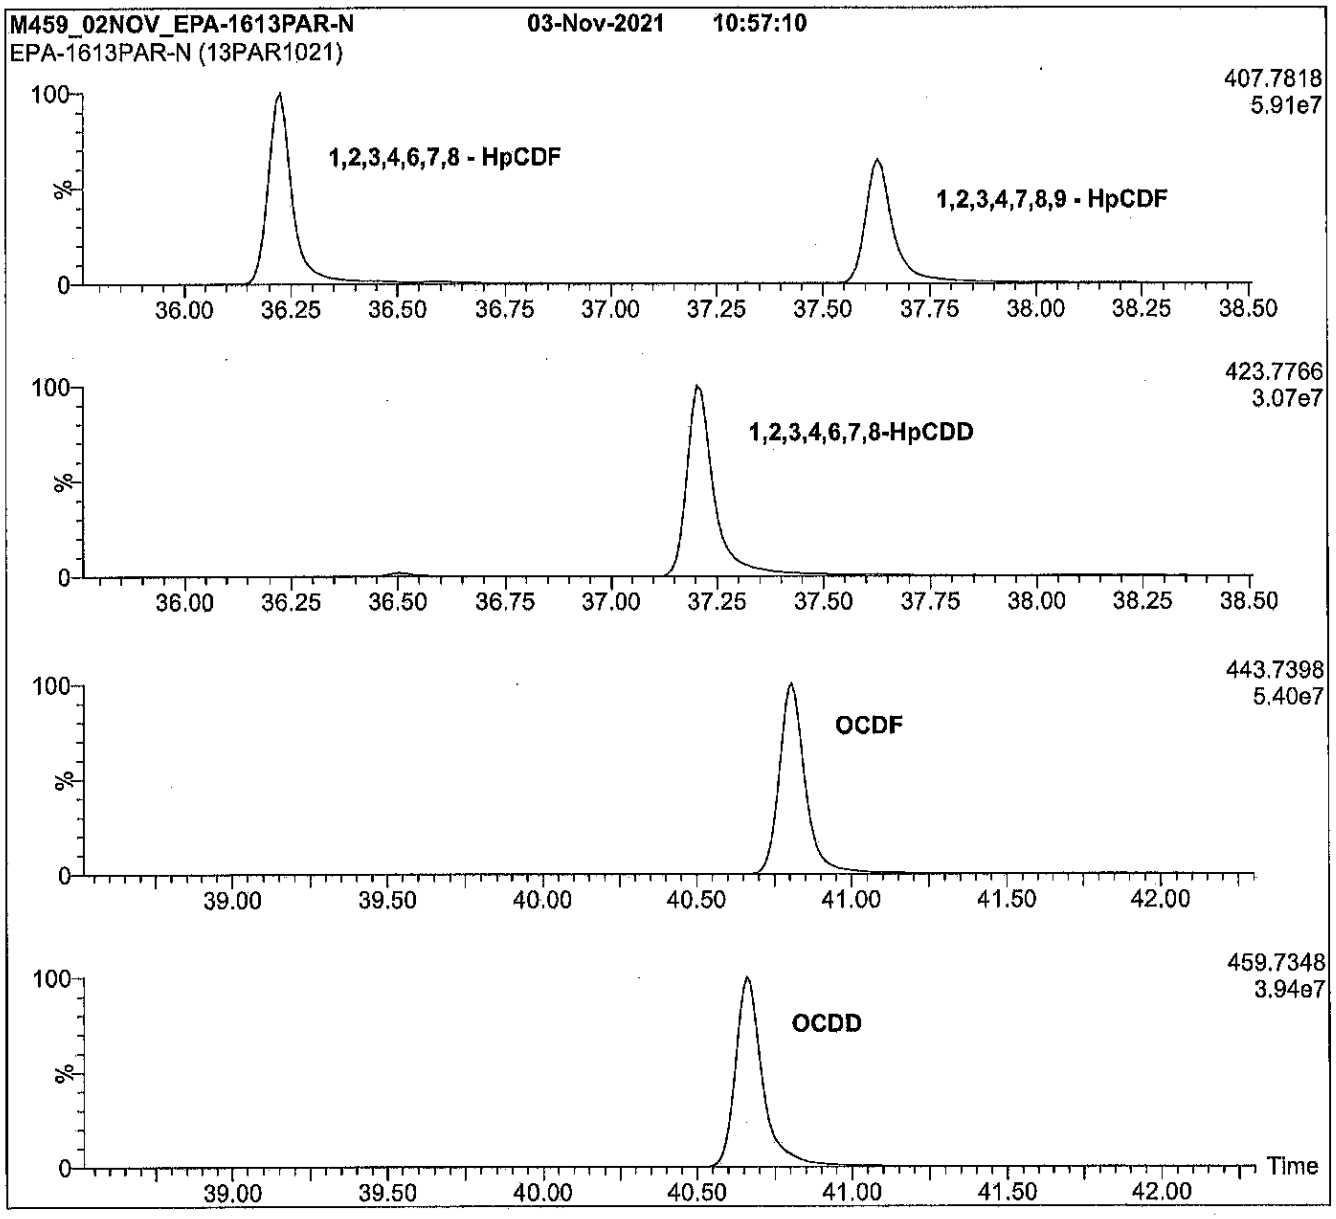
FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE



Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA
519-822-2436 • Fax: 519-822-2849 • info@well-labs.com

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters $x_1, x_2, ...x_n$ on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A1226), and ISO 17034 by ANSI National Accreditation Board (ANAB; AR-1523).

CS3WT

Calibration and Verification Solution (EPA-1613CS3) combined with Window Defining and 2,3,7,8-TCDD Resolution Testing Congeners

PRODUCT CODE:	CS3WT
LOT NUMBER:	CS3WT1021
SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	11/01/2021
LAST TESTED: (mm/dd/yyyy)	11/02/2021
EXPIRY DATE: (mm/dd/yyyy)	11/02/2028
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place

DESCRIPTION:

CS3WT is a solution/mixture of native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$) polychlorinated dibenzo-*p*-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Tables A and B.

CS3WT is an HRGC/HRMS calibration solution that was designed and prepared to be used according to U.S. EPA Method 1613, Revision B, in place of EPA-1613CS3 (lot: 13CS31021). Additionally, it contains the PCDD and PCDF isomers required to set retention time windows as well as test and establish isomer specificity for 2,3,7,8-TCDD on a DB-5 (or equivalent) capillary column.

The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-($^{37}Cl_4$)tetrachlorodibenzo-*p*-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%. The individual native 2,3,7,8-substituted PCDD and PCDF congeners all have chemical purities of >98%; the other congeners (window defining and resolution testing) should only be considered semi-quantitative.

This current lot of CS3WT is to be used with the 1613 calibration solutions having the following lot numbers:

PRODUCT CODE	LOT NUMBER
EPA-1613CS1	13CS11021
EPA-1613CS2	13CS21021
EPA-1613CS3	13CS31021
EPA-1613CS4	13CS41021
EPA-1613CS5	13CS51021
EPA-1613CSL	13CSL1021
EPA-1613CS0.5	13CS0.51021

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA
519-822-2436 • Fax: 519-822-2849 • info@well-labs.com

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) has been assigned to the quantitative components in this product. A maximum combined percent relative uncertainty of ±20% has been assigned to the semi-quantitative components in this product.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. CS3WT

Calibration and Verification Solution (EPA-1613CS3) combined with Window Defining and 2,3,7,8-TCDD Resolution Testing Congeners

PRODUCT CODE:	CS3WT
LOT NUMBER:	CS3WT1021
SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	11/01/2021
LAST TESTED: (mm/dd/yyyy)	11/02/2021
EXPIRY DATE: (mm/dd/yyyy)	11/02/2028
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place

LOO 6734

DESCRIPTION:

CS3WT is a solution/mixture of native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$) polychlorinated dibenzo-*p*-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Tables A and B.

CS3WT is an HRGC/HRMS calibration solution that was designed and prepared to be used according to U.S. EPA Method 1613, Revision B, in place of EPA-1613CS3 (lot: 13CS31021). Additionally, it contains the PCDD and PCDF isomers required to set retention time windows as well as test and establish isomer specificity for 2,3,7,8-TCDD on a DB-5 (or equivalent) capillary column.

The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-($^{37}Cl_4$)tetrachlorodibenzo-*p*-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%. The individual native 2,3,7,8-substituted PCDD and PCDF congeners all have chemical purities of >98%; the other congeners (window defining and resolution testing) should only be considered semi-quantitative.

This current lot of CS3WT is to be used with the 1613 calibration solutions having the following lot numbers:

PRODUCT CODE	LOT NUMBER
EPA-1613CS1	13CS11021
EPA-1613CS2	13CS21021
EPA-1613CS3	13CS31021
EPA-1613CS4	13CS41021
EPA-1613CS5	13CS51021
EPA-1613CSL	13CSL1021
EPA-1613CS0.5	13CS0.51021

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

DOCUMENTATION/ DATA ATTACHED:

Table A: Quantitative Components and Concentrations of the Solution/Mixture
Table B: Semi-Quantitative Components and Concentrations of the Solution/Mixture
Figure 1: HRGC/HRMS Data (SIR; 10,000 mass resolving power)

ADDITIONAL INFORMATION:

- See page 3 for further details.
- Only the 2,3,7,8-substituted PCDDs and PCDFs should be used for quantitation. The other congeners (window defining and 2,3,7,8-TCDD resolution testing) should be considered semi-quantitative (within ±20% of their design value). Impurities have been identified where possible.

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters $x_1, x_2, \ldots x_n$ on which it depends is:

$$u_c(y(x_1, x_2, \ldots x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) has been assigned to the quantitative components in this product. A maximum combined percent relative uncertainty of ±20% has been assigned to the semi-quantitative components in this product.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A1226), and ISO 17034 by ANSI National Accreditation Board (ANAB; AR-1523).

CALA Testing Accreditation No. A1226

ANAB ANSI National Accreditation Board ACCREDITED ISO 17034 REFERENCE MATERIAL PRODUCER

EPA-1613LCS

U.S. EPA Method 1613
Labelled Compound Stock Solution

PRODUCT CODE:	EPA-1613LCS
LOT NUMBER:	13LCS1021
SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	10/29/2021
LAST TESTED: (mm/dd/yyyy)	10/31/2021
EXPIRY DATE: (mm/dd/yyyy)	10/31/2028
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place

L 10372

DESCRIPTION:

EPA-1613LCS is a solution/mixture of mass-labelled ($^{13}C_{12}$) polychlorinated dibenzo-*p*-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Table A.

EPA-1613LCS was designed and prepared to be used according to U.S. EPA Method 1613, Revision B.

The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%.

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

Wellington Laboratories Inc., 345 Southgate Dr. Guelph ON N1G 3M5 CANADA
519-822-2436 • Fax: 519-822-2849 • info@well-labs.com

INTENDED USE:

The products prepared by Wellington Laboratories Inc. are for laboratory use only. This certified reference material (CRM) was designed to be used as a standard for the identification and/or quantification of the specific chemical compounds it contains.

HANDLING:

This product should only be used by qualified personnel familiar with its potential hazards and trained in the handling of hazardous chemicals. Due care should be exercised to prevent unnecessary human contact or ingestion. All procedures should be carried out in a well-functioning fume hood and suitable gloves, eye protection, and clothing should be worn at all times. Waste should be disposed of according to national and regional regulations. Safety Data Sheets (SDSs) are available upon request.

SYNTHESIS / CHARACTERIZATION:

Our products are synthesized using single-product unambiguous routes whenever possible. They are then characterized, and their structures and purities confirmed, using a combination of the most relevant techniques, such as NMR, GC/MS, LC/MS/MS, SFC/UV/MS/MS, x-ray crystallography, and melting point. Isotopic purities of mass-labelled compounds are also confirmed using HRGC/HRMS and/or LC/MS/MS.

HOMOGENEITY:

Prior to solution preparation, crystalline material is tested for homogeneity using a variety of techniques (as stated above) and its solubility in a given diluent is taken into consideration. Duplicate solutions of a new product are prepared from the same crystalline lot and, after the addition of an appropriate internal standard, they are compared by GC/MS, LC/MS/MS, and/or SFC/UV/MS/MS. The relative response factors of the analyte of interest in each solution are required to be <5% RSD. New solution lots of existing products, as well as mixtures and calibration solutions, are compared to older lots in a similar manner. This further confirms the homogeneity of the crystalline material as well as the stability and homogeneity of the solutions in the storage containers. In order to maintain the integrity of the assigned value(s), and associated uncertainty, the dilution or injection of a subsample of this product should be performed using calibrated measuring equipment.

UNCERTAINTY:

The maximum combined relative standard uncertainty of our reference standard solutions is calculated using the following equation:

The combined relative standard uncertainty, $u_c(y)$, of a value y and the uncertainty of the independent parameters x_1, x_2,...x_n on which it depends is:

$$u_c(y(x_1, x_2, ...x_n)) = \sqrt{\sum_{i=1}^{n} u(y, x_i)^2}$$

where x is expressed as a relative standard uncertainty of the individual parameter.

The individual uncertainties taken into account include those associated with weights (calibration of the balance) and volumes (calibration of the volumetric glassware). An expanded maximum combined percent relative uncertainty of ±5% (calculated with a coverage factor of 2 and a level of confidence of 95%) is stated on the Certificate of Analysis for all of our products.

TRACEABILITY:

All reference standard solutions are traceable to specific crystalline lots. The microbalances used for solution preparation are regularly calibrated by an external ISO/IEC 17025 accredited laboratory. In addition, their calibration is verified prior to each weighing using calibrated external weights traceable to an ISO/IEC 17025 accredited laboratory. All volumetric glassware used is calibrated, of Class A tolerance, and traceable to an ISO/IEC 17025 accredited laboratory. For certain products, traceability to international interlaboratory studies has also been established.

EXPIRY DATE / PERIOD OF VALIDITY:

Ongoing stability studies of this product have demonstrated stability in its composition and concentration, until the specified expiry date, in the unopened ampoule. Monitoring for any degradation or change in concentration of the listed analyte(s) is performed on a routine basis.

LIMITED WARRANTY:

At the time of shipment, all products are warranted to be free of defects in material and workmanship and to conform to the stated technical and purity specifications.

QUALITY MANAGEMENT:

This product was produced using a Quality Management System registered to the latest versions of ISO 9001 by SAI Global, ISO/IEC 17025 by the Canadian Association for Laboratory Accreditation Inc. (CALA; A1226), and ISO 17034 by ANSI National Accreditation Board (ANAB; AR-1523).

CS3WT

Calibration and Verification Solution (EPA-1613CS3) combined with Window Defining and 2,3,7,8-TCDD Resolution Testing Congeners

PRODUCT CODE:	CS3WT
LOT NUMBER:	CS3WT1021
SOLVENT(S):	Nonane/Toluene
DATE PREPARED: (mm/dd/yyyy)	11/01/2021
LAST TESTED: (mm/dd/yyyy)	11/02/2021
EXPIRY DATE: (mm/dd/yyyy)	11/02/2028
RECOMMENDED STORAGE:	Store ampoule in a cool, dark place

L13952

DESCRIPTION:

CS3WT is a solution/mixture of native ($^{12}C_{12}$) and mass-labelled ($^{13}C_{12}$) polychlorinated dibenzo-*p*-dioxins (PCDDs) and dibenzofurans (PCDFs). The components and their concentrations are given in Tables A and B.

CS3WT is an HRGC/HRMS calibration solution that was designed and prepared to be used according to U.S. EPA Method 1613, Revision B, in place of EPA-1613CS3 (lot: 13CS31021). Additionally, it contains the PCDD and PCDF isomers required to set retention time windows as well as test and establish isomer specificity for 2,3,7,8-TCDD on a DB-5 (or equivalent) capillary column.

The individual ^{13}C-labelled PCDDs and PCDFs all have chemical purities of >98% and isotopic purities of ≥99%. The 2,3,7,8-($^{37}Cl_4$)tetrachlorodibenzo-*p*-dioxin has a chemical purity of >98% and an isotopic (^{37}Cl) purity of ≥95%. The individual native 2,3,7,8-substituted PCDD and PCDF congeners all have chemical purities of >98%; the other congeners (window defining and resolution testing) should only be considered semi-quantitative.

This current lot of CS3WT is to be used with the 1613 calibration solutions having the following lot numbers:

PRODUCT CODE	LOT NUMBER
EPA-1613CS1	13CS11021
EPA-1613CS2	13CS21021
EPA-1613CS3	13CS31021
EPA-1613CS4	13CS41021
EPA-1613CS5	13CS51021
EPA-1613CSL	13CSL1021
EPA-1613CS0.5	13CS0.51021

FOR LABORATORY USE ONLY: NOT FOR HUMAN OR DRUG USE

RE: Smith-Kem ([none])

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclosed Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, LLC

Kelly Bottem, Client Services Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Cooler Receipt Form

ARI Client: Floyd - Snider Project Name: Smith Kern

COC No(s): 1 NA Delivered by: Fed-Ex UPS Courier Hand Delivered Other:

Assigned ARI Job No: 231196 / 232454 Tracking No: NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of the cooler?	YES	(NO)
Were custody papers included with the cooler?	(YES)	NO
Were custody papers properly filled out (ink, signed, etc.)	(YES)	NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)

Time 1153 5.7

If cooler temperature is out of compliance fill out form 00070F Temp Gun ID# Thermo Fisher

Cooler Accepted by: [signature] Date: 09/08/23 Time: 1153

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?		YES	(NO)
What kind of packing material was used?	Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other:		
Was sufficient ice used (if appropriate)?	NA	(YES)	NO
How were bottles sealed in plastic bags?	Individually	(Grouped)	Not
Did all bottles arrive in good condition (unbroken)?		(YES)	NO
Were all bottle labels complete and legible?		(YES)	NO
Did the number of containers listed on COC match with the number of containers received?		(YES)	NO
Did all bottle labels and tags agree with custody papers?		YES	(NO)
Were all bottles used correct for the requested analyses?		(YES)	NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)	(NA)	YES	NO
Were all VOC vials free of air bubbles?	(NA)	YES	NO
Was sufficient amount of sample sent in each bottle?		(YES)	NO
Date VOC Trip Blank was made at ARI	(NA)		

Were the sample(s) split by ARI? (NA) YES Date/Time: _____ Equipment: _____ Split by: _____

Samples Logged by: PJD Date: 09/11/23 Time: 7:21 Labels checked by: PJD

Case Narrative

Dioxin/Furans - EPA Method 1613

This is a revised report. The initial report had incorrect sample weights and results may have been biased high.

The sample(s) were extracted and analyzed within the recommended holding times. Analysis was performed using an application specific column developed by Restek. The RTX-Dioxin2 column has unique isomer separation for the 2378-TCDF, eliminating the need for confirmation analysis.

Initial and continuing calibrations were within method requirements.

Labeled internal standard areas were within limits.

The cleanup surrogate percent recoveries were within control limits.

The method blank(s) contained analyte above the RLs. Samples that contain analyte have been flagged with a "B" qualifer.

The OPR (Ongoing Precision and Recovery) standard percent recoveries were within control limits.

The duplicate (DUP) relative percent difference (RPD) were outside advisory control limits and flagged on the associated forms.

QUALIFIERS AND NOTES

Qualifier	Definition
X	Indicates possible CDPE interference.
U	This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).
J	Estimated concentration value detected below the reporting limit.
EMPC	Estimated Maximum Possible Concentration qualifier for HRGCMS Dioxin
B	This analyte was detected in the method blank.
*	Flagged value is not within established control limits.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
