**COMPLAINT (Brief Summary of ERTS Complaint):**

Two trucks crashed onto the bank of the Columbia River at about MP 25.5 on southbound I-5.

**CURRENT SITE STATUS (Brief Summary of why Site is recommended for Listing or NFA):**

The release from Truck #2 requires cleanup. List Truck #2 release to the CSCSL.

Investigator: **Tim Mullin**

Date Submitted: 4/17/2023

**OBSERVATIONS**  Please check this box if you included information on the Supplemental Page at end of report.

**Description** (If site visit made, please be sure to include the following: site observations, site features and cover, chronology of events, sources/past practices likely responsible for contamination, presence of water supply wells and other potential exposure pathways, etc):

On April 26, 2022, two semi-trucks crashed on southbound I-5 about MP 25.5. Both ended up on the bank of the Columbia River and each had a diesel release.

The initial investigation regarding Truck #1 has been evaluated under separate cover.

Truck #2:

A second diesel release to at least soil and potentially sediment was associated with the second truck in the wreck, operated by Stonewall Trucking LLC. The insurance company for Truck #2 is Qualitas Insurance, to which Ecology sent an information request letter on January 4, 2023. As specified in the letter, no response within 30 days of the letter would result in listing of this release to the CSCSL. The letter was also cced to Stonewall Trucking LLC. Though Qualitas Insurance confirmed receipt of Ecology's letter, no response was received by Ecology within the required 30 days. Field screening data provided by the contractor cleaning up the release from Truck #1, identified contamination likely remains in place in soil and potentially sediment related to the release from Truck #2. Groundwater and surface water may also have been contaminated by the release from Truck #2. The boom containing the original sheen on surface water adjacent to the release area has been removed. No remedial efforts have been completed to clean up the release related to Truck #2.

Recommendation: List to the CSCSL, based on no response to information request letter and field data. Suspect a diesel release to at least soil and sediment.

(fill in contaminant matrix above with appropriate status choice from the key below the table)

Status choices for contaminants	
Contaminant Status	Definition
B— Below Cleanup Levels (Confirmed)	The contaminant was tested and found to be below cleanup levels. (Generally, we would not enter each and every contaminant that was tested; for example if an SVOC analysis was done we would not enter each SVOC with a status of "below". We would use this for contaminants that were believed likely to be present but were found to be below standards when tested)
S— Suspected	The contaminant is suspected to be present; based on some knowledge about the history of the site, knowledge of regional contaminants, or based on other contaminants known to be present
C— Confirmed Above Cleanup Levels	The contaminant is confirmed to be present above any cleanup level. For example—above MTCA method A, B, or C; above Sediment Quality Standards; or above a presumed site-specific cleanup level (such as human health criteria for a sediment contaminant).
RA— Remediated - Above	The contaminant was remediated, but remains on site above the cleanup standards (for example—capped area).
RB— Remediated - Below	The contaminant was remediated, and no area of the site contains this contaminant above cleanup standards (for example—complete removal of contaminated soils).

**Halogenated chemicals and solvents:** Any chemical compound with chloro, bromo, iodo or fluoro is halogenated; those with eight or fewer carbons are generally solvents (e.g. halogenated methane, ethane, propane, butane, pentane, hexane, heptane or octane ) and may also be used for or registered as pesticides or fumigants. Most are dangerous wastes, either listed or categorical. Organic compounds with more carbons are almost always halogenated pesticides or a contaminant or derivative. Referral to the HSDB is recommended if you are unfamiliar with a chemical name or compound, as it contains useful information about synonyms, uses, trade names, waste codes, and other regulatory information about most toxic or potentially toxic chemicals.

**Dibenzodioxins and dibenzofurans** are normalized to a combined equivalent toxicity based on 2,3,7,8-tetrachloro-p-dibenzodioxin as set out in WAC 173-340-708(8)(d) and in the Evaluating the Toxicity and Assessing the Carcinogenic Risk of Environmental Mixtures using Toxicity Equivalency Factors Focus Sheet (<https://fortress.wa.gov/ecy/clarc/FocusSheets/tef.pdf> ). Results may be reported as individual compounds and isomers (usually lab results), or as a toxic equivalency value (reports).
