Subject: 2024 Annual Summary Report for Operation and Monitoring of the Landfill Gas (LFG)
Migration Control Facilities at the Closed Eastgate Area Properties Landfill, Bellevue,
Washington

Dear Mr. Purcell:

SCS Field Services (SCS) is pleased to provide an annual summary report on operation and monitoring (O&M) activities on the subject system from the months of January 2024 through December 2024. SCS performed O&M services at the City of Bellevue (COB) Closed Eastgate Area Properties landfill gas collection and control system (GCCS).

The information provided in this 2024 Annual Summary Report was conducted in accordance with the COB and SCS contract work scope. We hope you find this information of value.

Should you have any questions, do not hesitate to contact either of the undersigned.

Sincerely,

Stephen Harquail
Project Manager
SCS Field Services

Eastgate Landfill Annual Summary Report 2024

BACKGROUND

The Closed Eastgate Area Properties Landfill site is a closed municipal solid waste landfill located off of 160th Avenue SE. The City of Bellevue (COB) and Advanta Office Holdings LLC own the Eastgate landfill property. The property is undeveloped and the COB intends to develop the site as a Community Park. The closed landfill accepted household waste between 1951 and 1964 and occupies approximately 10 acres. In 1986 the original GCCS was designed and installed. The current site gas collection and control system (GCCS) consists of 2 Lampson blowers, 1 blower/carbon vent system, 20 vertical landfill gas (LFG) extraction wells, 14 subsurface gas migration monitoring wells, 13 condensate drain traps, and below grade lateral and main header piping systems.

Throughout 2024, when operating the GCCS and the carbon vent system, O&M was performed in accordance with the Discharge Confirmation Monitoring Program letter prepared by SCS Engineers, dated October 19, 2011.

Organic materials buried in a landfill decompose anaerobically (in the absence of oxygen) producing LFG a combustible gas that typically contains approximately 50 to 60 percent methane, 40 to 50 percent carbon dioxide, and trace amounts of various other gases, some of which are odorous. The Eastgate property contains a system to control the combustible gases generated in the landfill.

The LFG produced in a landfill will either vent vertically to the atmosphere or migrate horizontally through subsurface soil to locations on adjacent properties. If the soil surrounding a landfill consists of permeable materials, there is a greater likelihood that the LFG will migrate to off-site locations. If the methane gas component of LFG is allowed to accumulate in a confined area (i.e., utility lines, irrigation valve boxes, vaults, basements, wall spaces, etc.) and is exposed to an ignition source, it can be explosive at concentrations between 5 and 15 percent by volume. At higher concentrations, methane is flammable. However, the presence of methane gas in site soil does not mean there is an immediate threat of explosion because flames cannot typically propagate through soil.

GAS TESTING

Testing for methane gas (the combustible component of LFG), oxygen gas, carbon dioxide gas, and pressure were performed using either a Landtec GEM-5000 Gas Analyzer or comparable unit. These instruments measure combustible gas concentrations in air directly on one of two scales: the first as percent by volume of the lower explosive limit (LEL) of methane gas in air (5 percent); the second as percent by volume (0 to 100 percent) in the gas sampled. Pressure and temperature data were also collected utilizing the GEM-5000 Gas Analyzer. Testing for volatile organic compounds (VOC) at the blower vent station was performed using a MiniRAE 2000 portable VOC monitor. All instruments were calibrated prior to each monitoring event.

LFG monitoring probe testing procedures are as follows:

- Connect sample tubing, observe relative pressure and record data.
- Turn on sample pump, extract a minimum of one probe volume, observe and record/store methane, oxygen, and carbon dioxide gas concentrations (when readings have stabilized).
- Disconnect sample equipment and secure sample location.

Extraction well and blower vent station testing procedures are as follows:

- Connect sample tubing; observe pressure, temperature, and record data.
- Turn on sample pump, observe and record/store methane, oxygen, and carbon dioxide gas concentrations (when readings have stabilized).
- For blower vent station VOC monitoring, turn on sample pump, connect sample tubing, observe and record/store VOC concentrations (when readings have stabilized).
- Disconnect sample equipment and secure sample location.

LFG MONITORING WELLS

In accordance with the approved 2024 testing schedule, LFG perimeter monitoring wells were tested twice each month. During each month, all perimeter monitoring wells were tested for the presence of LFG.

With more reliable and daily timer- controlled operation of the blower vent station and on-going monthly GCCS and extraction well adjustments, the monthly testing indicated that, all monitoring wells exhibited methane gas concentrations below 5 percent by volume or no methane gas was detected.

SCS observed slightly elevated methane gas concentrations detected at MW-2S, M and D, MW-3S, M and D, and MW-4S, M and D but had remained below 5 percent by volume at all locations during all monthly testing events. Test results for the entire 2024-year and locations are shown on attached data Table 1 and location Figure 1, respectively.

Consistent with previous historical reports by the COB and other consulting firms, SCS continues to believe that any elevated methane gas concentrations detected in the perimeter monitoring wells during fall, winter and spring months are attributed to shallow water infiltration into the condensate drain traps and the gas collection piping system, restricting the amount of available vacuum to the LFG extraction wells.

As previously reported, the below grade GCCS repair project completed in 2020 resulted in allowing the condensate to drain properly to the new locations and is pumped out to a designated discharge point. This project also resulted in an increase of system vacuum across the West side LFG extraction wells resulting in an increase of negative relative pressure to Perimeter Monitoring Well Nos. MW-2, MW-3 and MW-4. The total amount of condensate manually pumped out of the Condensate Trap No. CT-5R was approximately 387.6 gallons for the reporting year 2024.

During this reporting period, January 2024 through December 2024, no other major repairs or

modifications were needed or required on the LFG perimeter monitoring well network.

LFG EXTRACTION WELLS

In accordance with the approved 2024 monitoring schedule, perimeter and interior LFG extraction wells were monitored and vacuum/flow adjustments made twice each month. Test results are shown in attached data Table 2 and locations on Figure 1, respectively. System adjustments were performed when an LFG extraction well exhibited an unacceptable change in methane and/or oxygen gas concentration (which could be due to an overpull or underpull condition).

In addition, each month all perimeter and interior LFG extraction well vacuum and flow adjustments were performed to help maintain observed fluctuating methane gas concentrations detected at perimeter Monitoring Well Nos. MW-2, MW-3, and MW-4 to below 5 percent by volume.

Twice each month, LFG temperatures at all perimeter and interior LFG extraction wells were monitored (see attached data Table 2). The observed temperatures for the 2024 reporting year are considered to be in the low to normal range for anaerobic decomposition. No indication (high temperatures in excess of 130 degrees) of subsurface oxidation was detected or observed at any LFG extraction wells during the monthly monitoring events.

During this reporting period, January 2024 through December 2024, no other additional repairs or modifications were needed or required on the LFG extraction well network.

LFG COLLECTION SYSTEM

In accordance with the approved 2024 monitoring schedule, visual observation of the LFG collection system was conducted at a minimum of twice each month. During these visits, observations were made to verify no pipe breakages had occurred and condensate drainage systems are working properly. Minor repairs were completed as required.

During monthly LFG extraction well monitoring activities, SCS conducts a pressure drop survey (i.e., measurement of pipeline pressure at various points throughout the LFG collection system). The results of this survey (where applicable) indicated that several partial below grade pipeline condensate restrictions within the LFG collection system existed during winter months and were causing decreased or no available vacuum to several extraction wells. SCS understands that, historically, groundwater levels at the site increase during winter/rain months which inhibits liquid to drain from some of the below grade pipeline condensate drain traps. In addition, SCS collected data in 2024 that indicates a below grade pipeline settlement issue along the East side that had resulted in a reduction of vacuum and as a result of this occurrence, had decreased or no available vacuum to some of the LFG extraction wells.

Review of vacuum profile data (during winter months) and liquid level data collected in 2023-2024 continues to indicate that Condensate Drain Trap Nos. CT-1, CT-2, CT-3, CT-8 and CT-10 became inundated with liquid inhibiting condensate to drain freely from the main LFG pipelines. The results of this occurrence have historically been reduced vacuum to LFG Extraction Well Nos. EW-10 through EW-15, and subsequent increased LFG migration to perimeter Monitoring Well Nos. MW-2, MW-3, MW-4 and MW-15. With more consistent daily operation of the blower vent station, LFG collection system vacuum decreases were observed to be less during the 2024 winter months. This resulted in maintaining all perimeter monitoring well locations below 5 percent by volume methane gas concentrations throughout the entire 2024 reporting year.

During 2024, SCS observed an increase of available system vacuum to LFG Extraction Well Nos. EW-02R, EW-03R, EW-4R and EW-5R and this is allowing the condensate to drain properly from the main LFG pipelines to Condensate Drain Trap No. CT-5R which was installed and activated in 2020. In addition, an evaluation of Condensate Drain Trap Nos. CT-1 and CT-2 and potential below grade pipe sloping issues on the East side both resulted in reduced vacuum to LFG Extraction Well Nos. EW-10, EW-11, EW-12, EW-13, EW-14, EW-19, and EW-20. The re-sloping of East side below grade piping and CT-1 and CT-2 will be evaluated further in 2025.

LFG BLOWER VENT SYSTEM (BVS).

In accordance with the 2024 monitoring schedule, visual observation and testing of the LFG BVS was conducted at a minimum of twice each month. During these visits, operating parameters were monitored, and mechanical and electrical components were checked for functionality.

During the annual reporting period from January 1, 2024 through December 31, 2024, the BVS automatic time controller was set and operated on average 12 hours per day /7 days per week throughout the year.

BVS test port monitoring results are shown in data Table 3. Monthly operational runtime information provided in data Table 4 shows that the BVS operated a total of 4,380 hours during the 2024 reporting year.

Twice per month during 2024, SCS performed carbon vent system VOC breakthrough field monitoring and results are provided in Table 3. The carbon vent system (while in operation) maintained the outlet VOC concentrations below the prescribed operating criteria and no carbon vent drums were required to be replaced during the 2024 reporting year.

During this reporting period, January 2024 through December 2024, no other repairs or modifications were needed or required on the BVS.

SITE SURFACE OBSERVATION

In accordance with the 2024 monitoring schedule, visual observation of the landfill surface along the extent of the LFG extraction system is performed at a minimum of twice per month. Observations for erosion, surface cracks (that might allow LFG to escape or promote air intrusion) and settlement around wells, laterals, and pipelines are conducted.

During this reporting period, some significant/major settlement was observed around LFG Extraction Well No. EW-4. During this reporting period, the road and sidewalk was raised and re-sloped by others in this area to allow rain/storm water to flow to drains properly, this was the second repair done in this area. No other erosion or surface cracks that could adversely impact the LFG collection system operation was observed. Other minor surface erosion and cracks were repaired as needed.

**Table 4. LFG Blower Vent Station Operational Runtime Data
January 2024 through December 2024
Eastgate Area Properties Landfill**

Month	Manual or Automatic Operation	Total Monthly Runtime (Hours)	Comments
January 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
February 28, 2024	Automatic	336	Operated 28 days for 12 hours each day
March 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
April 30, 2024	Automatic	360	Operated 30 days for 12 hours each day
May 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
June 30, 2024	Automatic	360	Operated 30 days for 12 hours each day
July 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
August 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
September 30, 2024	Automatic	360	Operated 30 days for 12 hours each day
October 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
November 30, 2024	Automatic	360	Operated 30 days for 12 hours each day
December 31, 2024	Automatic	372	Operated 31 days for 12 hours each day
	Total Operational Runtime for 2024:	4380.00
