#### RE: Everett Landfill – 2024 Groundwater Performance Monitoring Report

Dear Sunny:

Floyd | Snider has completed the Groundwater Performance Monitoring annual report for the Everett Landfill site. This report satisfies the groundwater reporting requirements outlined in Section 4.5.3 of the Compliance Monitoring and Contingency Plan.

The attached letter report presents data and results from the two Groundwater Monitoring events for 2024.

If you have any comments or questions on the attached, please don't hesitate to contact me. Alternatively, you can contact Jeff Gabster at Floyd & Snider, Inc.

Sincerely,

Randy Loveless, P.E. Principal Engineer, Landfill Site Manager

# Memorandum

- **To:** Randy Loveless, P.E., City of Everett Public Works
- From: Kate Snider, Sabine Datum, and Brett Beaulieu, Floyd | Snider
- Date: January 23, 2025
- Project No: COEv-DEVEL 2014
  - Re: 2024 Annual Groundwater Monitoring Report—Everett Landfill/Tire Fire Site, Everett, Washington

This memorandum presents the 2024 sampling and analytical results of groundwater monitoring at the Everett Landfill/Tire Fire Site (Site), located in Everett, Washington (Figure 1). Sampling was performed in accordance with the Site Cleanup Action Plan (CAP) and Compliance Monitoring and Contingency Plan (CMCP; Floyd|Snider 2001) and the Site Sampling and Analysis Plan (HWA 2015). Groundwater has been monitored at the Site since 2001. Historical groundwater data collected by HWA Geosciences, Inc. (HWA) prior to 2021 are appended to this report as Attachment 1 (HWA 2020).

# BACKGROUND

The Site is approximately 70 acres and located east of Interstate 5 and the western shore of the Snohomish River between 36<sup>th</sup> Street and 41<sup>st</sup> Street. Nine groundwater monitoring wells screened within the deep aquifer (MW-11R, MW-21R, MW-29R, MW-30, MW-31, MW-36, MW-37, MW-38, and MW-39R)<sup>1</sup> are currently selected for compliance monitoring.

Per the CMCP, evaluation monitoring was performed for 3 years, between 2001 and 2004, to supplement existing information regarding baseline conditions at the Site. The CMCP then required that performance monitoring be conducted for at least 10 years (referred to as compliance monitoring in this report), in which seasonal and long-term changes in groundwater quality are monitored semiannually. Initial compliance monitoring was performed between 2005 and 2015. In addition, the CMCP requires compliance monitoring to be reset or be reinstated after the first significant pile installation activity and after additional pile installation in a zone identified for pile restrictions. The 10-year compliance monitoring period reset in October 2020 after the first pile installation that penetrated the aquitard occurred.

<sup>&</sup>lt;sup>1</sup> Deep aquifer wells are screened at depths from 18 to 28 feet to 32 to 40.5 feet below ground surface (bgs).

Groundwater in the shallow (leachate) aquifer<sup>2</sup> is collected in the leachate collection system and conveyed off-site for treatment. A small section of the shallow aquifer is present east of the leachate collection system (and west of the East Ditch; Figure 2). There is residual waste in a narrow strip of land between the leachate collection trench and the East Ditch; however, as documented in the 2001 CAP (Floyd|Snider 2001), groundwater from this narrow strip of land is collected in the leachate collection system and conveyed off-site, preventing groundwater discharge to surface water.

The shallow aquifer point of compliance is located on the strip of land between the East Ditch and the leachate collection trench. Shallow aquifer compliance criteria are based on hydraulic control through operation of the leachate collection system. Hydraulic control is demonstrated through monitoring of water levels to show that hydraulic gradients are toward the leachate collection system, which would indicate that no shallow aquifer discharge to surface water is occurring. No water quality monitoring of the shallow aquifer is required while operating the leachate collection trench.

Because the shallow aquifer is discharging to the leachate collection system for off-site treatment, groundwater quality compliance is only monitored in the deep aquifer, per the requirements of the CMCP. Groundwater in the deep aquifer discharges to the Snohomish River. The deep aquifer is a potential future source of drinking water. The points of compliance for the deep aquifer are MW-36, MW-37, MW-38, and MW-39R, the groundwater monitoring wells closest to the Snohomish River.

Contaminants of concern (COCs) and their site-specific cleanup levels (CULs) were initially presented in the CMCP. After completion of evaluation monitoring in 2004, the COCs were refined and limited to the following for compliance monitoring: metals (arsenic, iron, manganese, nickel, and zinc), chloride, and bis(2-ethylhexyl)phthalate (BEHP; HWA 2004).

For additional background details, refer to the CMCP (Floyd|Snider 2001) and the 2004 HWA Evaluation Monitoring Report (HWA 2004).

# **GROUNDWATER MONITORING EVENTS**

Floyd|Snider completed two groundwater monitoring events in 2024. The sampling locations are depicted on Figure 2. Groundwater monitoring was performed using low-flow purging and sampling techniques, per the Floyd|Snider Standard Guideline Low-Flow Groundwater Sampling (Attachment 1).

<sup>&</sup>lt;sup>2</sup> The shallow aquifer is present at depths less than 22 feet bgs.

#### February 2024 Sampling Event

On February 28 and 29, 2024, groundwater samples were collected from the following wells:

- Deep aquifer point of compliance wells MW-36, MW-38, and MW-39R
- Deep aquifer monitoring wells MW-11R, MW-21R, MW-29R, MW-30, and MW-31

A field duplicate was collected from well MW-30.

Well MW-37 could not be accessed during the February sampling event due to the presence of a camp surrounding the well. This well was sampled on March 29, 2024.

Water level measurements from the top of casing were collected immediately prior to sampling at each well during the sampling event. Water level measurements were also collected from wells MW-22, MW-24, MW-25, MW-26, and MW-46.<sup>3</sup> Water level measurements and groundwater elevations are summarized in Table 1. During low-flow purging of the wells, field parameters (i.e., pH, temperature, dissolved oxygen, turbidity, oxidation–reduction potential [ORP], and specific conductance) were recorded every 3 to 5 minutes for up to 1 hour or until parameters stabilized prior to sampling. The recorded field parameters are reported in Table 2. Low-flow purging of the wells was maintained throughout the sampling process. Samples analyzed for dissolved metals were field filtered with a disposable 0.45-micron filter. After completion of sampling, groundwater samples were transported to the analytical laboratories and analyzed for the site-specific COCs (refer to Laboratory Analysis section).

During the February 2024 sampling event, the transducer and barometric logger<sup>4</sup> in MW-46 were removed from the well for data download. The pressure transducer measures water level and temperature continuously while the barologger measures barometric pressure to correct for barometric pressure effects on water level data. The transducer was reinstalled in MW-46 after downloading the data. The barologger was found unresponsive during the data download and was sent to the manufacturer for repair. The repaired barologger was reinstalled on April 11, 2024. Between July 20, 2023, and April 10, 2024, elevation data from the transducer was manually corrected for barometric pressure with values obtained from the National Oceanic and Atmospheric Administration (NOAA). Evaluation of transducer data related to hydraulic control of the shallow aquifer is discussed below in the Hydraulic Gradient section.

#### July 2024 Sampling Event

On July 16 and 17, 2024, groundwater samples were collected from the following wells:

- Deep aquifer point of compliance wells MW-36, MW-37, MW-38, and MW-39R
- Deep aquifer monitoring wells MW-11R, MW-21R, MW-29R, MW-30, and MW-31

<sup>&</sup>lt;sup>3</sup> MW-22, MW-24, MW-25, MW-26, and MW-46 are screened in the shallow aquifer and not sampled.

<sup>&</sup>lt;sup>4</sup> The pressure transducer consists of Model Solinst 3001 Levelogger 5 and the barometric logger consists of Model Solinst Barologger 5.

A field duplicate sample was collected from MW-29R.

Depth to water measurements were collected immediately prior to sampling at each well. Water level measurements were also collected from wells MW-22, MW-24, MW-25, MW-26, and MW-46.<sup>5</sup> Water level measurements are summarized in Table 1. Low-flow purging of the wells was performed as described above.

During the July 2024 sampling event, the transducer and barometric logger in MW-46 were removed from the well for data download. Data showed that the transducer unexpectedly stopped recording data shortly after redeployment during the February 2024 sampling event. The transducer and barologger were reinstalled and checked again the following day and were found to actively collect data. Due to this transducer failure, no elevation data for MW-46 is available between February 29, 2024, and July 17, 2024. Evaluation of transducer data related to hydraulic control of the shallow aquifer is discussed below in the Hydraulic Gradient section. Because of repeated problems with the functionality of the transducers, the existing transducers will be replaced with VanEssen Instruments Diver<sup>®</sup> transducers in 2025.

#### LABORATORY ANALYSIS

Groundwater samples collected in February, March, and July 2024 were submitted to the City of Everett Environmental Laboratory for the following analyses:

- Dissolved metals (arsenic, iron, manganese, nickel, and zinc) by USEPA Method 200.8
- Dissolved chloride by Standard Method SM4500-CL-E

Groundwater samples were also submitted to OnSite Environmental in Redmond, Washington, for the following analysis:

• BEHP by USEPA Method 8270E

#### ANALYTICAL RESULTS

Table 2 summarizes the groundwater analytical results from the 2024 sampling events. The laboratory reports are included in Attachment 2. Floyd|Snider performed data validation for all analytical data with a U.S. Environmental Protection Agency (USEPA) Level 2B Data Quality Review. The analytical data were validated in accordance with the USEPA National Functional Guidelines for Organic Superfund Methods Data Review (USEPA 2020a) and/or USEPA National Functional Guidelines for Inorganic Superfund Methods Data Review (USEPA 2020b). No qualifiers were added to the analytical results based on the data quality review. Data were determined to be of acceptable quality for use as reported by the laboratory. A data validation summary is included in Attachment 3. Historical groundwater analytical results from 2001 to 2020 (i.e., excerpts from previous HWA annual reports) are included as Attachment 4.

<sup>&</sup>lt;sup>5</sup> MW-22, MW-24, MW-25, MW-26, and MW-46 are screened in the shallow aquifer and not sampled.

### Arsenic

Arsenic concentrations were detected in wells MW-21R, MW-30, MW-31, and MW-36. No CUL exceedances were detected. The greatest arsenic concentration in 2024 was detected in MW-30 with 6.90 micrograms per liter ( $\mu$ g/L) in July. The site-specific CUL for arsenic is 25  $\mu$ g/L.

#### Iron

Iron was detected in all wells during both sampling events. Detected concentrations ranged between 310  $\mu$ g/L in MW-39R and 44,200  $\mu$ g/L in MW-31, both detected in July. The February and July 2024 iron concentrations in MW-31 exceeded the iron CUL of 23,687  $\mu$ g/L.

Iron concentrations in well MW-31 have exceeded the CUL since sampling began in 2001. Concentrations fluctuated from 2001 to 2013 between approximately 30,000 and 45,000  $\mu$ g/L, and then increased sharply to over 70,000  $\mu$ g/L between 2014 and 2015, as shown on the graph on Figure 3.

#### Manganese

Manganese was detected in all wells during both sampling events but none of the concentrations exceeded the CUL of 4,040  $\mu$ g/L. Concentrations ranged between 36.6  $\mu$ g/L in MW-39R (detected in July) and 1,540  $\mu$ g/L in MW-37 (detected in March).

#### Nickel

Nickel concentrations were detected in MW-31, MW-36, and MW-39R. Concentrations ranged between 1.10 and 3.20  $\mu$ g/L, which are less than the nickel CUL of 10  $\mu$ g/L.

#### Zinc

Zinc was only detected at concentrations greater than the laboratory reporting limits once in July: Zinc was detected at the laboratory reporting limit of 3  $\mu$ g/L in well MW-39R. The CUL for zinc is 76.6  $\mu$ g/L.

# Chloride

Chloride concentrations were detected in all wells sampled in February, March, and July 2024. Chloride in MW-37 was detected at a concentration of 1,570 milligrams per liter (mg/L) in March and at 244 mg/L in July. These concentrations exceed the CUL of 230 mg/L. Chloride concentrations in MW-37 have previously exceeded the CUL between 2005 and 2006 and at different times since 2016. Sampling was discontinued in this well between 2006 and 2015 due to the influence of saline water from the Snohomish River into groundwater. When sampling resumed in 2015, concentrations increased steadily between 2015 and 2017, decreased

between 2017 and January 2019, and have since increased again. Chloride concentrations in MW-37 over time relative to the CUL are shown on the graph depicted on Figure 4.

As discussed in previous monitoring reports and as confirmed by HWA during a 2006 study (HWA 2006), the tidally influenced rise and fall of Snohomish River water levels results in mixing of surface water into groundwater, and the presence of a saltwater wedge in the river affects the salinity in shoreline monitoring wells, specifically MW-37. Groundwater near the river is greatly influenced by river elevations. Westerly horizontal gradients away from the river were observed between MW-31 and MW-37 during both the February and July 2024 monitoring events, as shown on Figures 5 and 6.

HWA established a correlation between salinity and chloride concentrations in MW-37, determined by specific conductivity measurements as an indicator for salinity (refer to Figure 6 in Attachment 5). Specific conductivity measurements in MW-37 increased and decreased with tidally influenced water levels, following the same pattern as groundwater levels, and specific conductivity in the river varied in conjunction with tides, indicating a saltwater wedge moving up and down with the tides (refer to Figures 8 and 9 in Attachment 5).

Salinity data collected from the Snohomish River near the Site indicate salinities between 5 and 18 parts per thousand (ppt; Hall et al. 2018), whereas the site-specific chloride cleanup level of 230 mg/L would correspond to approximately 0.42 ppt salinity,<sup>6</sup> assuming minimal contribution from ions other than chloride, which is consistent with specific conductance in Site groundwater. Even the greatest chloride concentrations of 1,890 mg/L measured in MW-37 in July 2023 corresponds to only approximately 3.41 ppt salinity, less than the salinities measured in the Snohomish River near the Site. This indicates that chloride in groundwater from the deep aquifer at MW-37 is unlikely to affect chloride concentrations in the river.

# BEHP

In February, March, and July 2024, BEHP was not detected in any of the samples greater than the laboratory reporting limit.

#### HYDRAULIC GRADIENT

Hydraulic gradients in the deep aquifer have been monitored since 2001, per the requirements of the CMCP. Easterly flow toward the Snohomish River has been established and documented during the past monitoring years, with the exception of the area between MW-31 and MW-37, as discussed below. Based on groundwater levels measured in 2024 and resulting elevations, groundwater in the deep aquifer flows to the east toward the Snohomish River, with a hydraulic gradient of approximately 0.01 to 0.02 feet per foot (ft/ft). Groundwater elevations in February and July 2024 are shown on Figures 5 and 6, respectively.

<sup>&</sup>lt;sup>6</sup> Per the conversion, salinity (ppt) =  $0.0018066 \times chloride$  ion concentration (mg/L).

Reverse (westerly) groundwater flow between MW-31 and MW-37 was observed in both February 2024, with a hydraulic gradient of approximately 0.02 ft/ft, and July 2024, with a hydraulic gradient of approximately 0.06 ft/ft. These gradients may not be permanent and are also strongly affected by tidal fluctuations in nearshore groundwater elevations from variation in the Snohomish River stage elevation. The 2024 and previous sampling events have shown that seasonal groundwater elevations greatly fluctuate in the wells closest to the river. Tidal influences from the Snohomish River are responsible for these variations, as previously determined by HWA (refer to discussion about chloride in MW-37 above). Based on the United States Geological Survey (USGS) river gage readings for the Snohomish River approximately 7 miles upstream of the Site at Snohomish,<sup>7</sup> Washington, in February 2024, daily tidal fluctuations accounted for up to 10 feet in river water level differences. Seasonally, in 2024, lowest river levels fluctuated by about 9 feet and high river levels fluctuated by approximately 6 feet. As a result, in addition to seasonal variations, the time of day at which water levels were measured in the wells explains the high variability in the water levels in the near shore wells.

Per the CMCP, hydraulic control of the shallow (leachate) aquifer is demonstrated through monitoring of water levels to show that hydraulic gradients are toward the leachate collection system. For this reason, groundwater levels at and near the Everett Landfill leachate collection system are monitored to evaluate hydraulic control of the shallow aquifer with review of the transducer data from well MW-46 (screened in the shallow aguifer) and level sensor data from wet well at Lift Station 21 (LS21). Water level and barometer readings collected hourly between July 19, 2023, and February 29, 2024, are presented on Figure 7. Data show that LS21 wet well water elevations ranged from -1.8 feet to 0.4 feet North American Vertical Datum of 1988 (NAVD 88) between July 19, 2023, and February 29, 2024. Several LS21 wet well elevations outside of this range were observed between September 8 and October 4, 2023. These readings are associated with wet well maintenance activities or transducer connection interruptions. An additional spike was observed on December 6, 2023. This spike is consistent with major flood stage elevations of the Snohomish River. Groundwater elevations in MW-46 ranged from 5.64 to 13.3 feet NAVD 88 between July 2023 and February 2024. Based on the elevation data, groundwater elevations inside the wet well were 2.59 to 12.7 feet lower than groundwater elevations in MW-46. Given that the wet well groundwater elevations were below the shallow aquifer groundwater elevations, no discharge from the shallow aquifer to the Snohomish River occurred between July 2023 and February 29, 2024, as expected. The shallow aquifer continues to be hydraulically controlled. Due to the transducer failure, no elevation data for MW-46 is available between February 29, 2024, and July 17, 2024. Transducer data for the remainder of 2024 will be reported and evaluated in the 2025 Groundwater Monitoring Report.

<sup>&</sup>lt;sup>7</sup> According to the USGS, the Snohomish River gage datum is 9.86 feet below National Geodetic Vertical Datum of 1929.

#### SUMMARY

The 2024 groundwater analytical results are similar to results in previous monitoring years. Exceedances of the iron CUL were detected in MW-31 and exceedances of the chloride CUL were detected in MW-37. MW-37 is a point of compliance well, in which sampling was discontinued between 2006 and 2015 following the evaluation of the influence of saline water from the Snohomish River into groundwater. Chloride concentrations have been fluctuating in MW-37 since 2016, between 242 and 1,890 µg/L, exceeding the CUL. The data suggest that chloride concentrations at MW-37 are affected by saline water from the Snohomish River, based on proximity to the river and observed westerly gradients during sampling events. This is supported by HWA's previous evaluation and the comparison of Snohomish River salinities with corresponding chloride concentrations. The chloride concentrations in groundwater at MW-37 are less than the Snohomish River chloride concentrations based on its range of salinities, and groundwater is therefore not expected to increase the chloride concentration in the river.

Floyd|Snider will continue to sample the nine wells selected for compliance monitoring semiannually. Per the CMCP, the 10-year performance monitoring period reset in October 2020 after the first pile installation that penetrated the aquitard occurred.

Attachment 1 Floyd | Snider Standard Guidelines

# F|S STANDARD GUIDELINE

# **Low-Flow Groundwater Sample Collection**

DATE/LAST UPDATE: December 2022

These procedures should be considered standard guidelines and are intended to provide useful guidance when in the field but are not intended to be step-by-step procedures, as some steps may not be applicable to all projects.

All field staff should be sufficiently trained in the standard guidelines for the sampling method they intend to use and should review and understand these procedures prior to going into the field. It is the responsibility of the field staff to review the standard guidelines with the field manager or project manager and identify any deviations from these guidelines prior to field work. When possible, the project-specific Sampling and Analysis Plan should contain any expected deviations and should be referenced in conjunction with these standard guidelines.

# **1.0** Scope and Purpose

This standard guideline provides details necessary for collecting representative groundwater samples from monitoring wells using low-flow methods. These guidelines are designed to meet or exceed guidelines set forth by the Washington State Department of Ecology (Ecology). Low-Flow sampling provides a method to minimize the volume of water that is purged and disposed from a monitoring well, and minimizes the impact that purging has on groundwater chemistry during sample collection.

# 2.0 Equipment and Supplies

#### **Groundwater Sampling Equipment and Tools**

- For wells with head less than 25 feet:
  - Peristaltic pump with fully charged internal battery or standalone battery and appropriate connectors
- For wells with head greater than 25 feet:
  - Bladder pump and controller, as well as an air cylinder, or air compressor (with extension cord if near an electrical outlet; with battery and appropriate connectors or generator if not near an outlet)

- Low-flow submersible pump and controller (with extension cord if near an electrical outlet; with battery and appropriate connectors or generator if not near an outlet)
- Multi-parameter water quality meter
- Water level meter
- Polyethylene tubing, Teflon tubing, or similar (assume polyethylene unless otherwise specified in SAP) and tubing weights (for wells deeper than approximately 10 feet)
- Silicone tubing
- Filters (if field filtering)
- Tools for opening wells and drums (1/2-inch, 9/16-inch, 5/8 and 15/16-inch sockets ratchet, screwdriver, hammer/rubber mallet, bung wrench; any other necessary tools if non-standard monuments have been used)
- Well keys
- Tube cutters, razor blade, or scissors
- 5-gallon buckets, lids, and clamp
- Decontamination supplies: Alconox (or similar), distilled or deionized water, spray bottles, and paper towels
- Bailer or hand pump to drain well box if full of stormwater
- Trash bags

#### Lab Equipment

- Sample jars/bottles
- Coolers
- Chain-of-Custody Forms
- Labels
- Ice
- Ziploc bags

#### Paperwork

- Field notebook with site maps
- Table of well construction details and/or well logs, if available
- Sampling forms (enclosed)
- Purge water plan
- Rite-in-the-Rain pens, paper, and permanent markers

- Site-Specific Health and Safety Plan (HASP) and F|S Accident Prevention Plan (APP)
- List of emergency contacts for the Site or facility
- Safety Data Sheets (SDS) binder
- Sampling and Analysis Plan (SAP) and/or Quality Assurance Project Plan (QAPP) (including tables of analytes and bottle types)

### Safety Equipment

- PPE:
  - Waterproof boots (safety toed, depending on site)
  - o Safety vest
  - Safety glasses
  - o Rain gear
  - Nitrile gloves
  - Work gloves
- First Aid kit
- Emergency kit (fire extinguisher, road flares)
- Traffic barricades or cones

# **3.0** Standard Procedures

Low-flow groundwater sampling consists of purging groundwater within the well casing at a rate equal to or less than the flow rate of representative groundwater from the surrounding aquifer into the well screen. The flow rate will depend on the hydraulic conductivity of the aquifer and the drawdown, with the goal of minimizing drawdown within the monitoring well. Field parameters are monitored during purging and groundwater samples are collected after field parameters have stabilized. Deviations from these procedures should be approved by the Project Manager and fully documented.

#### 3.1 OFFICE PREPARATION

First, meet with the PM to identify the key objectives of the groundwater sampling effort. This may include the order of wells to be sampled (e.g., if using non-dedicated equipment, wells may need to be sampled in order of least contaminated to most contaminated), whether any wells require redevelopment at least 24-hours prior to sampling, and/or key stabilization parameters (e.g., elevated turbidity may require purging beyond 30 minutes, even if the readings are within 10%).

Conduct a kick-off meeting with the sampling team to discuss site health and safety protocols, data quality objectives, and any site-specific special considerations or sampling procedures.

# 3.2 TAILGATE SAFETY MEETING

Conduct a tailgate safety meeting prior to beginning work at the site. Emergency evacuation procedures, rally points, and onsite communication protocols should be discussed at the first tailgate meeting and repeated if new personnel join the field team onsite.

The safety meeting should cover the hazards specific to groundwater sampling. Typical hazards include the following:

- Chemical hazards (refer to HASP for site chemical exposure hazards)
- Site hazards
  - Traffic hazards onsite (e.g., truck traffic, heavy machinery)
  - Biological hazards (e.g., spiders or wasps within well monuments)
- Physical hazards associated with lifting and carrying heavy equipment and repeated bending while sampling
- Cuts and abrasions associated with using blades and tools
- Electrical hazards (make sure all wires/cables are in good condition and connections to battery or outlet are secure)
- Heat stress and cold stress

Record the meeting attendees and topics discussed on the front page of the tailgate safety meeting form (included as an attachment to the HASP). All attendees should sign the form.

# 3.3 OTHER HEALTH AND SAFETY GUIDELINES

The following are additional health and safety guidelines that should be followed in the field. These guidelines are intended to supplement the guidelines and requirements identified in the HASP and are not intended to replace the HASP.

- Review and sign the HASP prior to going into the field.
- Conduct a tailgate safety meeting prior to beginning work at the site as discussed in Section 3.2
- When moving between monitoring wells or switching to different tasks (e.g., transitioning from sampling to cooler QC prior to lab pickup), assess any additional hazards that may be associated with the new location or task. Record additional hazards noted and corrective actions to address those hazards on the Daily Tailgate Safety Meeting and Debrief Form (included as an attachment to the HASP).
- Record near misses and incidents on the Near Miss and Incident Reporting Form (included as an attachment to the HASP) and conduct management/client notifications according to the protocols detailed in the HASP.

# 3.4 CALIBRATION OF WATER QUALITY METERS

All multi-parameter water quality meters to be used will be calibrated prior to each sampling event. Calibration procedures are outlined in each instrument's specific user manual.

# 3.5 MONITORING, MAINTENANCE, AND SECURITY

Prior to sampling, depth to water and total depth measurements will be collected and recorded for accessible monitoring wells onsite (or an appropriate subset for larger sites). Check for an existing measuring point (notch or visible mark on top of casing). If a measuring point is not observed, a measuring point should be established on the north side of the casing. The conditions of the well box and bolts will also be observed, and deficiencies will be recorded on the sampling forms or logbook (i.e., missing or stripped bolt). The following should also be recorded:

- Condition of the well box, lid, bolts, locks, and gripper cap, if deficiencies
- Condition of gasket if deficient and if water is present in the well box
- Note any obstructions or kinks in the well casing
- Note any equipment in the well casing, such as transducers, bailers, or tubing
- Condition of general area surrounding the well, such as subsidence, potholes, or if the well is submerged within a puddle.

Replace any missing or stripped bolts and redevelop wells if needed.

# 3.6 LOW-FLOW PURGING METHOD AND SAMPLING PROCEDURES

Groundwater samples will be collected using low-flow purging and sampling procedures consistent with Ecology guidelines and the U.S. Environmental Protection Agency (USEPA) standard operating procedures (USEPA 1996). The following describes the Low-Flow purging and sampling procedures for collecting groundwater samples using a peristaltic pump. If the water level is greater than approximately 20 to 25 feet below ground surface (bgs), Grundfos or Geotech submersible pumps or bladder pumps can be used since their pumping rates can be adjusted to low-flow levels. Submersible pumps are preferable to bladder pumps in situations where less than 5 feet of water column are present in the well casing.

 Place the peristaltic pump and water quality equipment near the wellhead. Slowly lower new poly tubing down into the well casing approximately to the middle of the well screen. When sampling wells with a bottom screen depth greater than approximately 10 feet, it is important to measure the length of tubing prior to placement as longer lengths of tubing are more likely to get caught or otherwise obstructed and feel like it has reached the well bottom; this issue can be mitigated by using decontaminated stainless steel tubing weights. If the depth of the well screen is not known, lower the appropriate length of tubing to the bottom of the well, making sure that the tubing has not been caught on the slotted well casing, and then raise the tubing 3 to 5 feet off the bottom of the casing (limit this distance to 2 feet for wells with total depth less than 10 feet). Document the estimated depth of the tubing placement within the well. Connect the tubing to the peristaltic pump using new flex tubing and connect the discharge line to the flow-through cell of the water quality meter. The discharge line from the flow cell should be directed to a bucket to contain the purged water.

- If using a low-flow submersible pump, connect the pump head to dedicated or disposable tubing. If using a bladder pump, connect both the air intake and water discharge ports to decontaminated or disposable tubing, using the manufacturer's instructions to ensure a secure connection. Lower the pump with tubing into the well as described above and connect the water discharge tubing directly to the flowthrough cell.
- Measure the depth to water to the nearest 0.01 foot with a decontaminated water level meter and record the information on a sampling form.
- Start pumping the well at a purge rate of 0.1 to 0.2 liters per minute and slowly increase the rate. Purge rate is adjusted using a speed control knob or arrows on peristaltic and low-flow submersible pumps. The purge rate for bladder pumps is controlled by the air compressor, which first pressurizes the pump chamber in order to compress the flexible bladder and force water through the discharge line, and then vents the chamber in order to allow the bladder to refill with water.
  - A good rule of thumb is to pressurize to 10 psi + 0.5 psi/foot of tubing depth and begin with 4 discharge/refill cycles per minute; using greater air pressure and accelerating the pump cycles will increase the purge rate.
- Check the water level. If the water level is dropping, lower the purge rate. Maintain a steady flow with no or minimal drawdown (less than 0.33 feet according to USEPA 2002). Maintaining a drawdown of less than 0.33 feet may not be feasible depending on hydrogeological conditions. If possible, measure the discharge rate of the pump with a graduated cylinder or use a stopwatch when filling sampling jars (500 milliliters [mL] polyethylene or glass ambers) to estimate the rate. When purging water through a flow cell, the maximum flow rate for accurate water quality readings is about 0.5 liters per minute (L/minute).
- The discharge tubing should be connected to the flow cell immediately upon initial water discharge, unless the discharge water is visibly turbid or flocculant is observed. Monitor and record water quality parameters every three to five minutes after one tubing volume (including the volume of water in the flow cell) has been purged.
  - One foot of ¼-inch interior diameter tubing holds about 10 mL of water, and flowthrough cells typically hold less than 200 mL of water; one volume should be purged after about 5 minutes at a flow rate of 0.1 L/minute.
- Water-quality indicator parameters that will be monitored and recorded during purging include:
  - o pH
  - Specific conductivity

- Dissolved oxygen
- Temperature
- o Turbidity
- Oxidation reduction potential (ORP)
- Continue purging until temperature, pH, turbidity, and specific conductivity are approximately stable (when measurements are within 10 percent) for three consecutive readings, or 30 minutes have elapsed. Because these field parameters (especially dissolved oxygen and ORP) may not reach the stabilization criteria, collection of the groundwater sample will be based on the professional judgment of field personnel at the time of sampling. A minimum of 5 water quality readings should be collected prior to sampling.
- The water sample can be collected once the criteria above have been met.
- If drawdown in the well cannot be maintained at 0.33 feet or less, reduce the flow or turn off the pump for 15 minutes and allow for recovery. If the water quality parameters have stabilized, and if at least two tubing volumes and the flow cell volume have been purged, then sample collection can proceed when the water level has recovered, and the pump is turned back on. This should be noted on the sampling form.
- To collect the water sample, maintain the same pumping rate. After the well has been purged and the sample bottles have been labeled, the groundwater sample will be collected by directly filling the laboratory-provided bottles from the pump discharge line prior to passing through the flow cell. All sample containers should be filled with minimum disturbance by allowing the water to flow down the inside of the bottle or vial. When collecting a volatile organic compound (VOC) sample, fill to the top to form a meniscus over the mouth of the vial prior to placing the cap to eliminate air bubbles. Be careful not to overflow preserved bottles/pre-cleaned Volatile Organic Analyte (VOA) vials.
- If sampling for filtered metals, collect these samples last and fit an in-line filter at the end of the discharge line. Take note of the flow direction arrow on the filter prior to fitting, invert filter to eliminate air bubbles, and allow minimum of 0.5 to 1 liter of groundwater to pass through the filter prior to collecting the sample.
- Sample labels will clearly identify the project name, sampler's initials, sample location and unique sample ID, analysis to be performed, date, and time. After collection, place samples a cooler maintained at a temperature of approximately 4 to 6 degrees Celsius (°C) using ice (if required). Complete the chain-of-Custody forms. Upon transfer of the samples to the laboratory, the Chain-of-Custody Form will be signed by the persons transferring custody of the sample containers to document change in possession.
- When sample collection is complete at a designated location, remove and properly dispose of the non-dedicated tubing. In most cases, this waste is considered solid waste and can be disposed of as refuse. Close and lock the well.

# 4.0 Decontamination

All reusable equipment that comes into contact with groundwater should be decontaminated using the processes described in this section prior to moving to the next sampling location.

**Water Level Meter:** The water level indicator and tape will be decontaminated between sampling locations and at the end the day by spraying the entire length of tape that came in contact with groundwater with an Alconox (or similar)/clean water solution followed by a thorough rinse with distilled or deionized water.

Water Quality Sensors and Flow-Through Cell: Distilled water or deionized water will be used to rinse the water quality sensors and flow-through cell. No other decontamination procedures are recommended since they are sensitive equipment. After the sampling event, the water quality meters will be cleaned and maintained according to the specific manual.

**Submersible Pump (if applicable):** Decontaminating the pump requires running the pump in three progressively cleaner grades of water.

- 1. Fill a bucket with approximately 4 gallons of an Alconox (or similar)/clean water solution to sufficiently cover the pump. Place the pump and the length of the power cord (if applicable) that was in contact with water into the bucket and run the pump for approximately two minutes or until the volume of water in the bucket has been exhausted.
- 2. Fill a second bucket containing approximately 4 gallons of clean water to sufficiently cover the pump. Place the pump and cord into this bucket and run the pump for approximately two minutes or until the volume of water in the bucket has been exhausted.
- 3. Fill a third bucket with approximately 4 gallons of distilled or deionized water to sufficiently cover the pump. Place the pump and cord into this bucket and run the pump for approximately two minutes or until the volume of water in the bucket has been exhausted.

The soap/water solution may be reused; however, rinse water should be collected for disposal as described in Section 5.0 below. When done for the day, dry the exterior of the pump and cord with clean towels to the extent practical prior to storage.

**Bladder Pump:** Clean the inside and outside of the pump body with an Alconox (or similar)/clean water solution, followed by a thorough rinse with distilled or deionized water. The outside of the air supply line that came in contact with groundwater may also be cleaned with Alconox (or similar) solution and re-used; bladders and water discharge lines must be replaced after each sample is collected.

# 5.0 Investigation-Derived Waste (IDW)

Unless otherwise specified in the project work plan, water generated during groundwater sampling activities will be contained, transported, disposed of in accordance with applicable laws, and stored in a designated area until transported off-site for disposal. This includes purge water and decontamination waste water.

The approach to handling and disposal of these materials for a typical cleanup site is as follows.

For IDW that is containerized, such as purge water, 55-gallon drums (or other smaller sized drums) approved by the Washington State Department of Transportation will be used for temporary storage pending profiling and disposal. Each container holding IDW will be sealed and labeled as to its contents (e.g., "purge water"), the dates on which the wastes were placed in the container, the owner's name and contact information for the field person who generated the waste, and the site name.

IDW containerized within drums will be characterized relative to applicable waste criteria using data from the sampling locations whenever possible. Material that is designated for off-site disposal will be transported to an off-site facility permitted to accept the waste. Manifests will be used, as appropriate for disposal. Refer to the FS Special Condition Standard Guideline for Investigation Derived Waste for additional information regarding proper profiling and disposal of wastewater generated by groundwater sampling.

Disposable sampling materials and incidental trash such as tubing, paper towels and gloves/other disposable used in sample processing will be placed in heavy-duty garbage bags or other appropriate containers and disposed of as trash in the municipal collection system unless otherwise specified in the SAP.

# 6.0 Field Documentation

Groundwater sampling activities will be documented in field sampling forms and/or field notebooks, and Chain-of-Custody Forms. Information recorded will, at a minimum, include personnel present (including subcontractors or client representatives), purpose of field event, weather conditions, sample collection date and times, sample analytes, depths to water, water quality parameters, well box/lid conditions, amount of purged water generated, and any deviations from the SAP. Photographs of damaged well casings or well boxes should be taken.

At the end of the day, complete and review the second page of the tailgate safety meeting form detailing additional hazards, corrective actions, near-misses or incidents. Any incidents that result in equipment damage or field staff injuries should be reported immediately to the PM.

# 7.0 Demobilization

Upon returning to the office, ensure that all equipment is property cleaned and put away in the field room. Equipment with rechargeable batteries should be plugged in as appropriate. It is

preferable to dispose of trash on-site, but any trash left in the field vehicle should be disposed as regular trash at Two Union Square.

If rented equipment or sample coolers will be placed at the front desk for pickup, clearly label each item with the company picking it up, anticipated pickup time frame, and your contact information so front desk staff can contact you if there are any questions. Notify front desk staff if any items require a signature at pickup.

Within one week of returning from the field, the field lead for the event should review field notes, sampling forms and tailgate safety meeting forms with the PM. Following PM review and approval, field notes will be scanned and saved to the project folder. Hard copies should be filed. The PM will provide copies of near miss and incident reports to the Safety Program Manager.

Attachment 2 Analytical Laboratory Reports

March 6, 2024

Kate Snider Floyd & Snider 601 Union Street, Suite 600 Seattle, WA 98101

Re: Analytical Data for Project COEV DEVEL Laboratory Reference No. 2402-392

Dear Kate:

Enclosed are the analytical results and associated quality control data for samples submitted on February 29, 2024.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister Project Manager

Enclosures

Date of Report: March 6, 2024 Samples Submitted: February 29, 2024 Laboratory Reference: 2402-392 Project: COEV DEVEL

#### **Case Narrative**

Samples were collected on February 28 and 29, 2024 and received by the laboratory on February 29, 2024. They were maintained at the laboratory at a temperature of  $2^{\circ}$ C to  $6^{\circ}$ C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

#### **Data Qualifiers and Abbreviations**

- A Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B The analyte indicated was also found in the blank sample.
- C The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E The value reported exceeds the quantitation range and is an estimate.
- F Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I Compound recovery is outside of the control limits.
- J The value reported was below the practical quantitation limit. The value is an estimate.
- K Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L The RPD is outside of the control limits.
- M Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 Hydrocarbons in diesel range are impacting lube oil range results.
- O Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P The RPD of the detected concentrations between the two columns is greater than 40.
- Q Surrogate recovery is outside of the control limits.
- S Surrogate recovery data is not available due to the necessary dilution of the sample.
- T The sample chromatogram is not similar to a typical
- U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 The practical quantitation limit is elevated due to interferences present in the sample.
- V Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X Sample extract treated with a mercury cleanup procedure.
- X1 Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 Sample extract treated with a silica gel cleanup procedure.
- Y The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.

Kate Snider Floyd & Snider 601 Union Street, Suite 600 Seattle, WA 98101

Re: Analytical Data for Project COEV DEVEL Laboratory Reference No. 2403-413

Dear Kate:

Enclosed are the analytical results and associated quality control data for samples submitted on March 29, 2024.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister Project Manager

Enclosures

Date of Report: April 3, 2024 Samples Submitted: March 29, 2024 Laboratory Reference: 2403-413 Project: COEV DEVEL

#### **Case Narrative**

Samples were collected on March 29, 2024 and received by the laboratory on March 29, 2024. They were maintained at the laboratory at a temperature of  $2^{\circ}$ C to  $6^{\circ}$ C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

#### **Data Qualifiers and Abbreviations**

- A Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B The analyte indicated was also found in the blank sample.
- C The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E The value reported exceeds the quantitation range and is an estimate.
- F Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I Compound recovery is outside of the control limits.
- J The value reported was below the practical quantitation limit. The value is an estimate.
- K Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L The RPD is outside of the control limits.
- M Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 Hydrocarbons in diesel range are impacting lube oil range results.
- O Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P The RPD of the detected concentrations between the two columns is greater than 40.
- Q Surrogate recovery is outside of the control limits.
- S Surrogate recovery data is not available due to the necessary dilution of the sample.
- T The sample chromatogram is not similar to a typical
- U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 The practical quantitation limit is elevated due to interferences present in the sample.
- V Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X Sample extract treated with a mercury cleanup procedure.
- X1 Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 Sample extract treated with a silica gel cleanup procedure.
- Y The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.

Re: Analytical Data for Project COEv DEVEL Laboratory Reference No. 2407-187

Dear Kate:

Enclosed are the analytical results and associated quality control data for samples submitted on July 17, 2024.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister Project Manager

Enclosures

Date of Report: July 24, 2024 Samples Submitted: July 17, 2024 Laboratory Reference: 2407-187 Project: COEv DEVEL

#### **Case Narrative**

Samples were collected on July 16 and 17, 2024 and received by the laboratory on July 17, 2024. They were maintained at the laboratory at a temperature of  $2^{\circ}$ C to  $6^{\circ}$ C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

OnSite Environmental, Inc. 14648 NE 95<sup>th</sup> Street, Redmond, WA 98052 (425) 883-3881

#### **Data Qualifiers and Abbreviations**

- A Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B The analyte indicated was also found in the blank sample.
- C The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E The value reported exceeds the quantitation range and is an estimate.
- F Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I Compound recovery is outside of the control limits.
- J The value reported was below the practical quantitation limit. The value is an estimate.
- K Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L The RPD is outside of the control limits.
- M Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 Hydrocarbons in diesel range are impacting lube oil range results.
- O Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P The RPD of the detected concentrations between the two columns is greater than 40.
- Q Surrogate recovery is outside of the control limits.
- S Surrogate recovery data is not available due to the necessary dilution of the sample.
- T The sample chromatogram is not similar to a typical
- U The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 The practical quantitation limit is elevated due to interferences present in the sample.
- V Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X Sample extract treated with a mercury cleanup procedure.
- X1 Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 Sample extract treated with a silica gel cleanup procedure.
- Y The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.

Attachment 3 Data Validation Summaries

# **Data Validation Summary**

Prepared by:	Henry Bates
Date:	May 22, 2024
Project ID:	COEv-DEVEL-2014
Sample Event(s):	Spring 2024 Groundwater Sampling
Sample Delivery Group(s):	2402-392, 2403-413, 65851, 66050
Sample Media:	Groundwater

A Compliance Screening (Stage 2A) data quality review was performed on dissolved metals, chloride, and bis(2-ethylhexyl) phthalate data resulting from laboratory analysis. The data were reviewed using guidance and quality control (QC) criteria documented in the *Everett Landfill/Tire Fire Site 2015 Ground Water Sampling and Analysis Plan* (HWA 2015), *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods* (USEPA 1986), *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA 2020a), and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA 2020b).

A total of nine groundwater samples and one field duplicate were submitted to OnSite Environmental Inc. (OnSite) in Redmond, Washington, for chemical analysis by USEPA 8270E, and City of Everett Environmental Laboratory (CoEEL) in Everett, Washington, for chemical analysis by USEPA 200.8 and Standard Method (SM) 4500-CL-E. OnSite reported results under two sample delivery groups (SDGs): 2402-392 and 2403-413; CoEEL reported results under two SDGs: 65851 and 66050.

# DATA QUALITY REVIEW

Field and laboratory QC parameters for all samples met project criteria.

# DATA QUALITY SUMMARY

All data are determined to be of acceptable quality for use as reported.

# **Data Validation Summary**

Prepared by:	Charlie Lentz
Date:	August 27, 2024
Project ID:	COEv-DEVEL-2014
Sample Event(s):	July 2024 Groundwater Sampling
Sample Delivery Group(s):	2407-187, 66893
Sample Media:	Groundwater

A Compliance Screening (Stage 2A) data quality review was performed on dissolved metals, chloride, and bis(2-ethylhexyl) phthalate data resulting from laboratory analysis. The data were reviewed using guidance and quality control (QC) criteria documented in the *Everett Landfill/Tire Fire Site 2015 Ground Water Sampling and Analysis Plan* (HWA 2015), *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods* (USEPA 1986), *National Functional Guidelines for Organic Superfund Methods Data Review* (USEPA 2020a), and the *National Functional Guidelines for Inorganic Superfund Methods Data Review* (USEPA 2020b).

A total of nine groundwater samples and one field duplicate were submitted to OnSite Environmental Inc. (OnSite) in Redmond, Washington, for chemical analysis by USEPA 8270E, and City of Everett Environmental Laboratory (CoEEL) in Everett, Washington, for chemical analysis by USEPA 200.8 and Standard Method (SM) 4500-CL-E. OnSite reported results under sample delivery group (SDG) 2407-187; CoEEL reported results under SDG 66893.

# DATA QUALITY REVIEW

Field and laboratory QC parameters for all samples met project criteria.

# DATA QUALITY SUMMARY

All data are determined to be of acceptable quality for use as reported.

 NOTES:
 Bold
 Analyte detected

 Highlighted
 Analyte detected

 NET = network well for Performance and Confirmational Monitoring

 BG = upgradient background well

 POC = deep aquifer point of compliance monitoring well

 C.L. = cleanup level

 ug/L = micrograms per liter

 ug/L = miligrams per liter

 U = not detected at reporting limit shown

 J = estimated concentration

 NS = Not sampled

 BKG = background (established after 3 year evaluation monitoring period)

 B = likely laboratory contamination, analyte detected in field blank

 D = duplicate sample collected

 H = Sample analyzed outside of holding time

NOTES:

NR = no reading, well decommissioned, damaged, or not located

S = shallow well (all others are in deep aquifer)

INT = Interior, well located in interior of site

BG =Upgradient background well BGM= background metals well POC = deep aquifer point of compliance monitoring well

Attachment 5 Excerpts from December 2006 HWA MW-37 Chloride Investigation Everett Landfill
