

Memorandum

To: Nick Garson, Boeing
From: Tom McKeon, P.E. CALIBRE
Date: July 22, 2021
Subject: **Boeing Renton - Summary of Recent Excavation Work and Sampling at Apron R Construction Site**

Executive Summary

The Boeing Company (Boeing) has been working with the Washington State Department of Ecology (Ecology) to address historic releases of hazardous substances at the Boeing Renton Facility (Facility) located in the City of Renton, Washington. Boeing entered into Agreed Order No. DE 97HZ-N233 (Agreed Order) with Ecology to address former releases at the Facility. The initial Agreed Order became effective on October 10, 1997. Following completion of the Cleanup Action Plan (CAP), Boeing entered into Agreed Order No. 8191 with Ecology to remediate former releases at the Facility in accordance with the CAP for the Facility which became effective on January 2, 2013.

Pursuant to the 2013 Order, Boeing is required to notify Ecology's Project Coordinator in writing of any newly-identified SWMU(s), newly-discovered release(s) from known SWMU(s), and newly-discovered AOCs at the Facility no later than 30 days after discovery.

During 2021, Boeing's construction contractor (Skanska) has been working on various construction projects at the north end of the Boeing Renton Facility, including the installation of a new stormwater system in Apron R. In mid-June 2021, Skanska observed a petroleum hydrocarbon-like sheen in shallow water contained within a small portion of an excavation trench. Work was stopped while Skanska coordinated next steps with Boeing Renton Environmental and Boeing Enterprise Remediation. During a July 9, 2021 teleconference, Boeing Enterprise Remediation informed the Washington State Department of Ecology (Ecology) Hazardous Waste & Toxics Reduction Program (HWTR) Project Manager of the preliminary findings. Throughout July 2021, Boeing's environmental teams have been coordinating with Skanska regarding the excavation soil and water sampling results and next steps so that they can complete their scheduled work by late July/early August 2021.

The objective of this Technical Memorandum is to notify Ecology of recent findings of a release/contamination encountered during excavation work in the Apron R construction at the Boeing Renton Facility. The enclosed information includes results from a soil stockpile and excavation water sampling to develop plans for treatment and disposal options, information about possible historical practices in this general area, and a discussion of next steps.

A brief summary of the chronology of events and the new information identified is provided below:

6/18/2021 Skanska (the Apron R construction contractor) discovered a sheen in water from an open excavation in front of Building 4-82 as part of Apron R construction and stopped work in the area. The excavation is a small area roughly 10 ft by 10 ft and extends into the shallow groundwater about 4 feet below ground surface. The location is shown in Figure 1.

6/21/2021	CALIBRE collected soil and water samples from the excavation, the on-site contractor (Skanska) described the oily seam as roughly 3 ft wide and 8-12 inches in depth.
6/25/2021	Received preliminary soil and water sampling results for VOCs and SVOCs.
7/1/2021	Briefed Skanska, Boeing Renton Environmental Group and Boeing Facilities concerning the VOC and SVOC results. Discussion of plausible sources and mitigation steps.
7/2/2021	Received complete laboratory data package
7/6/2021	Developed plans for handling/disposal of soil and water from excavation based on sampling data.
7/9/2021	Developed plans for mitigation and migration prevention of TPH and SVOCs by using a Granular Activated Carbon (GAC) layer; Received Skanska's geotechnical approval of layered construction backfill with GAC.
7/9/2021	Boeing Enterprise Remediation briefed Ecology via teleconference regarding the findings and sampling.
7/16/2021	CALIBRE visually confirmed that no sheen was observed in Lake Washington along the shoreline in vicinity and none observed at the nearest outfall to the Apron R construction activity.

Sampling Results

Environmental samples were collected by CALIBRE from the Apron R excavation on June 21st 2021. The sampling included two excavation water samples and one soil stockpile sample. The water samples were collected from two separate elevations in the pit (one at the water surface [labeled *OF-03-Surface*] and another in the water column [labeled *OF-03-Mid*]) approximately 1.5 feet below the water surface. A composite soil sample was collected from the approximately 15 cubic yard excavated soil stockpile (labeled *OF-03-Soil*). All samples were analyzed for volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), metals, TPH as gasoline range, diesel range and motor oil range. The organics analysis were analyzed by Analytical Resources, Incorporated (ARI) and the metals analysis was completed by AmTest Inc. ARI subcontracted the metals analysis to AmTest based on the fast turnaround requested and extreme heat in the Seattle area had affected many parts of the lab equipment. Laboratory results are included in Attachment 1. The lab results include additional analyses such as pH, oil & grease, settleable solids, and other parameter collected to support the water treatment and disposal plans.

The water sampling results and comparison criteria considered for water waste management are shown in Table 1. The soil sampling results and comparison criteria considered for soil waste management are shown in Table 2.

Waste Management - Water

Water in the excavation will be handled and treated in multiple steps. The plan is based on the water sample results collected on June 21, 2021. These results showed that the water samples collected below the water surface contained only trace levels of the fuel related compounds detected, see sampling results in Table 1. These results showed water samples collected below the water surface were non-detect for VOCs and TPH-G, below MTCA potable criteria for TPH-D, slightly above MTCA potable criteria for TPH as motor oil, and under 1 µg/L for the two SVOCs detected, pyrene and chrysene.

The sample collected at the water surface included visible sheen/oil blobs, intentionally captured in the sample bottles, and had higher levels of TPH and SVOCs in addition to detecting other SVOCs and FOG. In late July, the surface of the water in the excavation will be skimmed to remove the previously observed sheen/minor oil

blobs. The skimmed water will go through an oil skimmer, ultrafiltration and then undergo the standard process for pre-treatment¹ at the Building 4-83 Waste Water Treatment Plant (WWTP) which discharges under permit to the King County sanitary sewer. A separate transfer log of the waste water will be prepared when the removal actions occur. Following treatment, the treated water from WWTP will be discharged to the sanitary sewer.

To complete the remaining construction tasks estimated for late July/early August 2021, the trench will be dewatered and water pumped from the excavation will be transferred to on-site Baker tanks in compliance with King County Discharge Authorization No 4486-02, which is a specific discharge permit into sanitary sewer for the Apron R project. The water will be pumped via a continuous process to Baker tanks for settling, sampled for pH and settleable solids using field tests and discharged to the sanitary sewer under the King County permit referenced above. Written documentation by the construction contractor (Skanska) for tracking the water pumped from the excavation will be prepared when the action is complete. Pads or/and booms will be used to prevent any additional hydrocarbons from entering the water, as well as additional skimming (if needed) as described above.

Waste Management – Soil Stockpile

Sampling results showed that the soil from the excavation is not classified as a listed or hazardous waste; for the organic compounds (VOCs and SVOCs) all analytes except benzo(a)pyrene are below the MTCA Method B criteria in CLARC for unrestricted/residential land use, and the benzo(a)pyrene detected is below the MTCA Method C criteria for industrial land use. Following the existing soil waste management plan developed for the Apron R construction project, the soil will be transported off site to a transfer station for off-site disposal at a licensed facility which accepts petroleum impacted soil. A separate tracking ticket will be prepared by Skanska and the transfer station when these actions happens.

Potential Source of Observed Release

The hydrocarbon observed in the Apron R excavation trench appears to be a weathered fuel from a discrete seam located on the north side of the excavation. The sample collected from the water surface intentionally included some of the oil blobs observed and no VOCs were detected in this water with visible oil/sheen present. Based on visual observations and sampling results, it is most likely a heavy fuel such as Bunker C. At the present time we do not know the source of the historic release. Relevant maps and historical aerial photos are included in Attachment 2. The historical information we have reviewed includes the following:

The Apron R excavation area is near the former fueling dock used to supply tanks for Shuffleton Power plant. The Shuffleton Power plant was built in 1929 and is visible in a 1936 aerial photo (including the fueling dock, pump house, 2 large tanks, and power plant). The fueling dock extended about 350+ feet into Lake Washington.

¹ The 4-83 WWTP process, operated under King County permit 7630-06, includes coagulation/ precipitation and settling, sand filtration, air stripping, return to storage tanks and sampling verification prior to discharge to the King County sanitary sewer.

A 1960 aerial photo includes the fueling dock, pump house, above ground piping, and 2 storage tanks in containment berms. The Shuffleton Power plant is outside of the photo but other records indicate it remained in standby/operations mode until 1989, and it is visible in a 1990 aerial photo.

Historical Boeing design/as-built drawings for the 4-81 and 4-82 buildings (1967) include pre-existing conditions before construction and include 2 large storage tanks, pump house, pipelines to the fueling dock, the fueling dock, and pipelines to Shuffleton Plant. All these structures, except the power plant, were removed prior to the Boeing 4-81 and 4-82 construction in the mid -1960s. The 1967 Boeing drawing indicates the prior fueling dock was removed and a new cooling water discharge canal (associated with the Shuffleton plant) was to be constructed on land and in-water on DNR property in Lake Washington. Ecology records from the TCP program (included in Attachment 2) describe this area as the Puget Sound Energy (PSE) Shuffleton, Dept. of Natural Resources (DNR) Lease Area, Parcel: 723059105, Facility Site ID: 82611157, Cleanup Site ID: 14484. Ecology records indicate that in 1966-1967, while they held the DNR lease, PSE created the upland portion of the lease area with dredged material from Lake Washington. An NFA letter for the upland portion of the DNR lease area was issued on June 26, 2000. The same TCP records also note cleanup actions for Bunker C contamination on some part of the larger PSE/ Shuffleton Parcels.

A 2014 aerial photo shows construction in the DNR parcel north of the Apron R excavation (construction by other parties) to remove the Shuffleton cooling water discharge canal on the DNR lease land and in-water work. A 2015 aerial photo shows the completed construction work where the trenching for stormwater discharge lines is visible on the PSE DNR Lease Parcel (highlighted with a yellow line added to the aerial photo). The construction shown in these two photos shows excavations across the area where the prior Shuffleton fuel line ran.

Next Steps

Skanska will complete Apron R stormwater system construction work in the current excavation area and expand the excavation approximately 20+ft to North to repair/replace a 10" fire water line that runs NW-SE at the edge of paved area. We presently anticipate that this work will be completed in late July with estimated completion of all other Apron R related construction work by 4Q 2021.

Skanska is on a tight schedule and the Boeing Enterprise Remediation Group has limited options at the current time for addressing the hydrocarbons observed in the Apron R excavation trench. However, as discussed with Ecology during the July 9 teleconference, planned mitigation measures include coordinating with Skanska to backfill the trench in late July with a GAC/backfill mixture in the open excavation. Figure 3 presents the conceptual details for this mitigation plan. This should substantially adsorb any dissolved hydrocarbons (dissolved TPH and PAH compounds) present in the immediate area.

We anticipate that future sampling may be needed to bound the impacted Apron R groundwater. As a first step, in late July 2021 we propose first to observe the conditions in the expanded excavation to the north in order to develop a plan. We will scope out possible Geoprobe sampling locations during this phase of the work and will prepare a future work plan after consultation with Ecology, including a schedule when the Apron R area can be accessed for groundwater investigation and plume delineation work.

Work Order Case Narrative

Diesel/Heavy Oil Range Organics - WA-Ecology Method NW-TPHDx

The sample(s) were extracted and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

The surrogate percent recoveries were within control limits.

The method blank(s) were clean at the reporting limits.

The blank spike (BS/LCS) percent recoveries were within control limits.

Total Metals -

The total metals samples were subcontracted for analysis.

Wet Chemistry

The sample(s) were prepared and analyzed within the recommended holding times with the exception of pH which was sent to the lab outside of the holding time.

Initial and continuing calibrations were within method requirements.

The method blank(s) were clean at the reporting limits.

The blank spike (BS/LCS) percent recoveries were within control limits.

The reference material (SRM) percent recoveries were within control limits.

The matrix spike (MS) percent recoveries and the duplicate (DUP) relative percent difference (RPD) were within advisory control limits.

Gasoline Range Organics - WA-Ecology Method NW-TPHG

The sample(s) were analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements.

The surrogate percent recoveries were within control limits.

The method blank(s) were clean at the reporting limits.

The Boeing Company
PO Box 3707 M/S 1W-12
Seattle WA, 98124

Project: Boeing Renton Apron R
Project Number: Boeing Renton Apron A
Project Manager: Nick Garson

Reported:
02-Jul-2021 14:20

The blank spike and blank spike duplicate (BS/LCS and BSD/LCSD) spike recoveries and relative percent difference (RPD) were within control limits.

Semivolatiles - EPA Method SW8270E

The sample(s) were extracted and analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements with the exception of all associated "Q" flagged analytes which are out of control low in the CCAL and pyrene and 2,4-Dinitrophenol are out of control high. All associated samples that contain analyte have been flagged with a "Q" qualifier.

Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

The method blank(s) were clean at the reporting limits.

The blank spike (BS/LCS) percent recoveries were within control limits with the exception of analytes flagged on the associated forms.

Volatiles - EPA Method SW8260D

The sample(s) were analyzed within the recommended holding times.

Initial and continuing calibrations were within method requirements with the exception of all associated "Q" flagged analytes which are out of control high in the CCAL and 2-Butanone, 2-hexanone, acetone, acrolein, chloromethane and acrylonitrile are out of control low. All associated samples that contain analyte have been flagged with a "Q" qualifier.

Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

The method blank(s) were clean at the reporting limits.

The blank spike and blank spike duplicate (BS/LCS and BSD/LCSD) spike recoveries and relative percent difference (RPD) were within control limits with the exception of analytes flagged on the associated forms.

Preservation Confirmed By

06/21/2021

Date

ARI Client: Boeing
COC No(s): _____ NA
Assigned ARI Job No: 21F0324

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of the cooler? YES NO

Were custody papers included with the cooler? YES NO

Were custody papers properly filled out (ink, signed, etc.) YES NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)

Time 1454

24.7

If cooler temperature is out of compliance fill out form 00070F

Temp Gun ID#: D00 5226

Cooler Accepted by: DL Date: 06/21/21 Time: 1454

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO

What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: _____

Was sufficient ice used (if appropriate)? YES NO

How were bottles sealed in plastic bags? YES NO

Individually Grouped Not

Did all bottles arrive in good condition (unbroken)? YES NO

Were all bottle labels complete and legible? YES NO

Did the number of containers listed on COC match with the number of containers received? YES NO

Did all bottle labels and tags agree with custody papers? YES NO

Were all bottles used correct for the requested analyses? YES NO

Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs) YES NO

Were all VOC vials free of air bubbles? YES NO

Was sufficient amount of sample sent in each bottle? YES NO

Date VOC Trip Blank was made at ARI. YES NO

Were the sample(s) split by ARI? NA YES Date/Time: _____ Equipment: _____ Split by: _____

DL 06/21/21

Samples Logged by: DL Date: 06/21/21 Time: 1650 Labels checked by: _____

**** Notify Project Manager of discrepancies or concerns ****

Sample ID on Bottle	Sample ID on COC	Sample ID on Bottle	Sample ID on COC

Additional Notes, Discrepancies, & Resolutions:

- Brought in extra vials not listed on the COC & w/ no labels.*
- 4 vials have air bubbles, lab to determine size.
- TBS not listed on COC, logged as final sample.

By: DL

Date: 06/21/21

*Extra container count sent to PM to see if billing is necessary.

Notes and Definitions

- * Flagged value is not within established control limits.
- D The reported value is from a dilution
- D1 Surrogate was not detected due to sample extract dilution
- E The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL)
- H Hold time violation - Hold time was exceeded.
- J Estimated concentration value detected below the reporting limit.
- M Estimated value for a GC/MS analyte detected and confirmed by an analyst but with low spectral match parameters.
- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20% RSD, <20% drift or minimum RRF)
- U This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).
- DET Analyte DETECTED
- ND Analyte NOT DETECTED at or above the reporting limit
- NR Not Reported
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- [2C] Indicates this result was quantified on the second column on a dual column analysis.

Attachment 2 – Other Historical Photos and Maps in the Area and Other Information

Photo 1. Aerial photo from 1936 of the area, this pre-dates Boeing and is all as farmland. Important structures in the photo are the Shuffleton power plant with the associated fueling dock and two large oil tanks.

Photo 2. Aerial photo from approximately 1960 of the area containing a portion of the current Boeing Renton Facility. Important structures in the photo include the presence of the fueling dock (bottom left) and two large oil tanks for Shuffleton power plant, with associated pump house and containment berms. The pipelines are above ground by the tanks as they bend over the berms and 2 fuel lines appear to be above ground to the fueling dock. Some type of structure exists on land at end of the fueling dock and is included on 1967 drawings. This 1960 aerial photo is before Boeing Buildings 4-81/82 and Apron R were constructed in 1967.

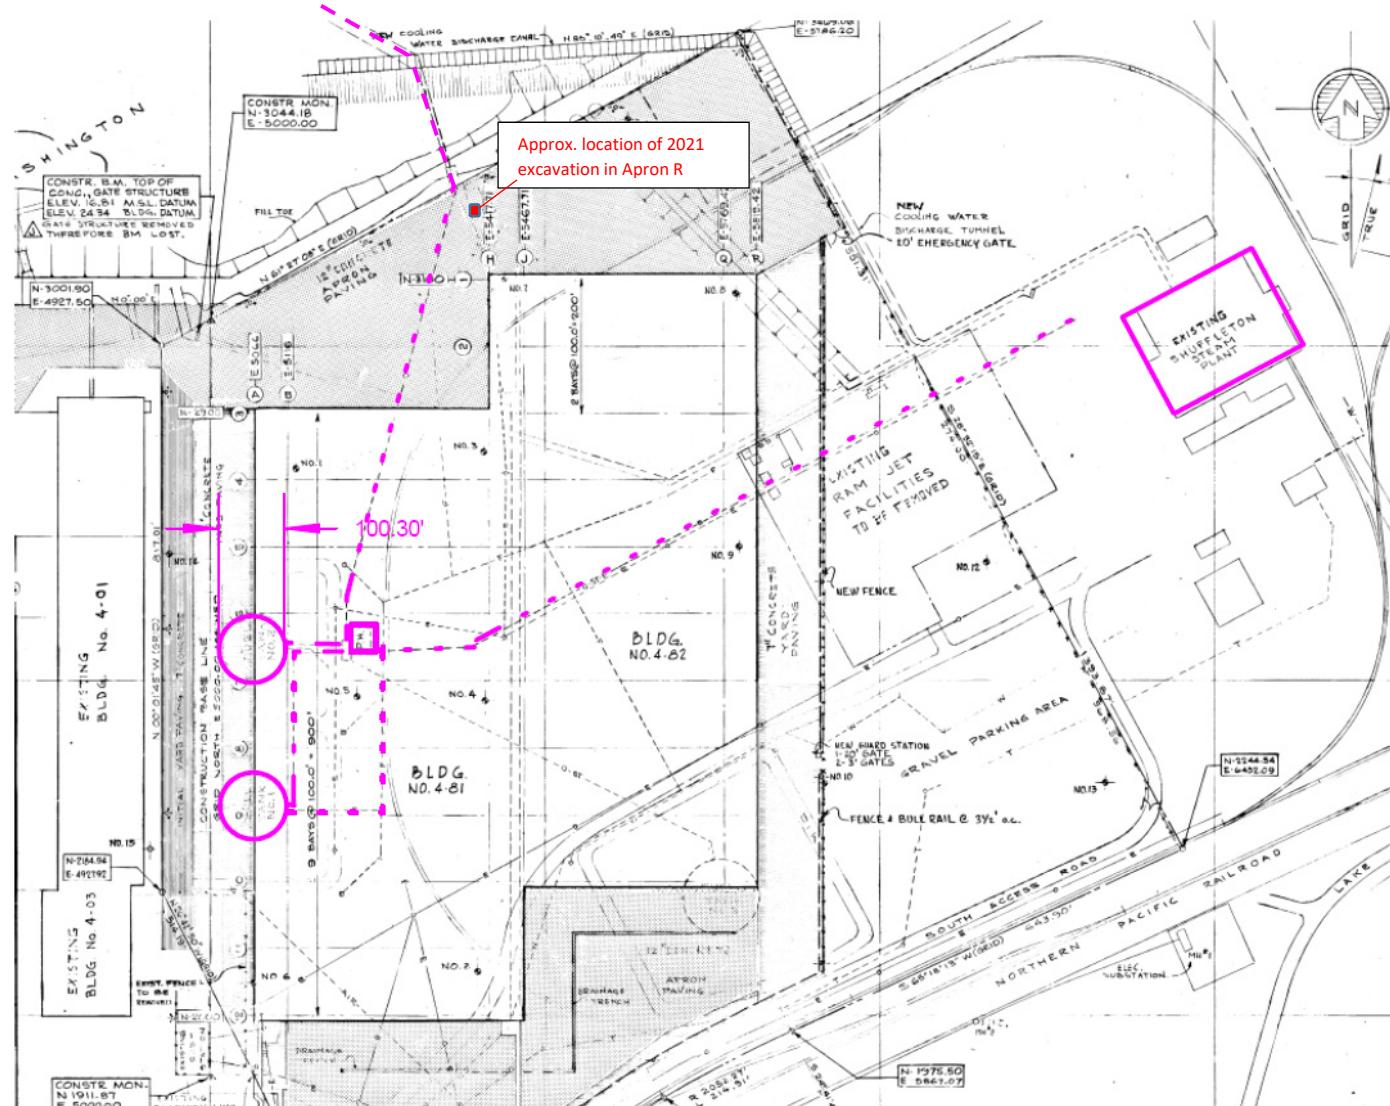

Photo 3. 1967 Boeing 'As-Built' construction drawing of Building 4-81/82 area. The drawing background includes of the prior Shuffleton Power plant and the associated infrastructure highlighted in purple.

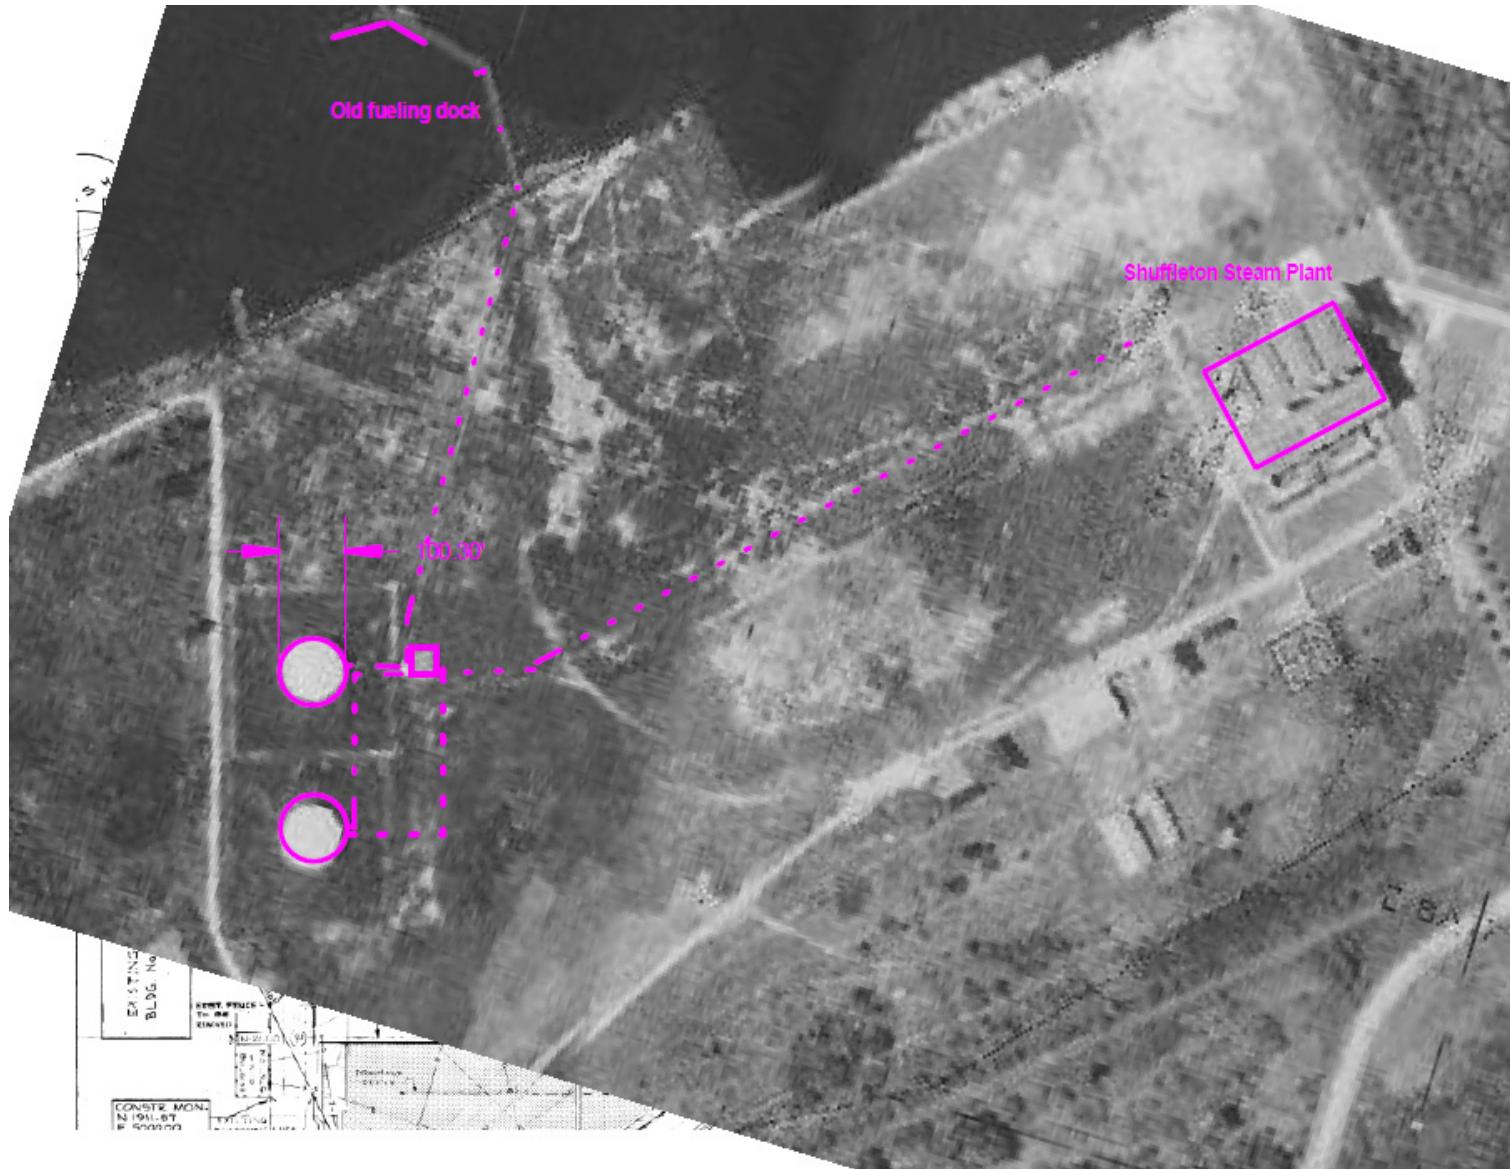

Photo 4. 1967 details from Boeing Construction drawing of Building 4-81/82 with overlay on the 1936 aerial photo of the Shuffleton Power plant and associated infrastructure, highlighted in purple.

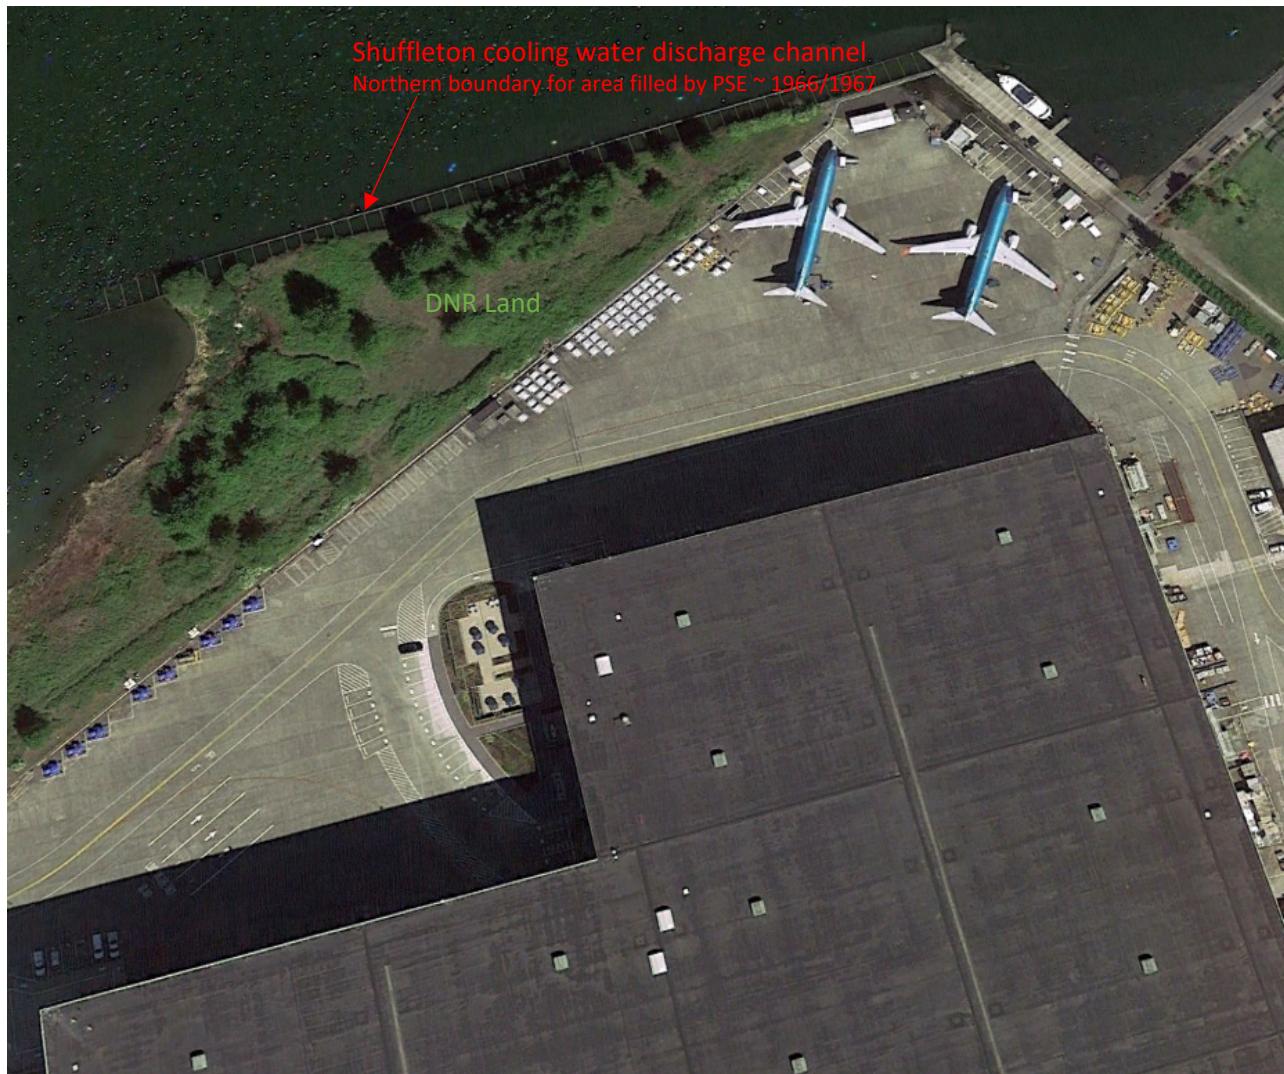

Photo 5. 2013 Aerial photo of Apron R and Building 4-81/82. The Shuffleton cooling water discharge canal is visible in the image. The prior cooling water discharge canal is important as its construction was part of the dismantling of the fueling dock and filling the DNR lease land in 1967 (completed by PSE).

Photo 6. 2014 Aerial photo of Apron R and Building 4-81/82. The storm drain outfall is visible during the removal of the cooling water discharge channel from the Shuffleton Power plant (this work was completed by others at the start of the Southport redevelopment)

Photo 7. 2015 Aerial photo of Apron R and Building 4-81/82. With a visible excavation line in the DNR lease parcel (leased to PSE) where the storm water drain has been buried. The location of the storm water lines to outfall would have crossed path with any historical lines from the prior Shuffleton refueling dock.

DEPARTMENT OF ECOLOGY
Toxics Cleanup Program

Memorandum

March 12, 2018

TO: TCP Files for PSE Shuffleton Steam Plant, Shuffleton Substation, and DNR Lease Area
FROM: Donna Musa, Toxics Cleanup Program, Northwest Regional Office
SUBJECT: Recommendation for Site and File Reorganization

Ecology's Integrated Site Information System (ISIS) database indicates only one "site" for the multiple parcel property known as PSE Shuffleton Substation. After a review of the site files (see attached PSE Shuffleton Summary: Site History), it has been determined that there are three separate areas of contamination, not one, as previously reflected in ISIS and Ecology site files.

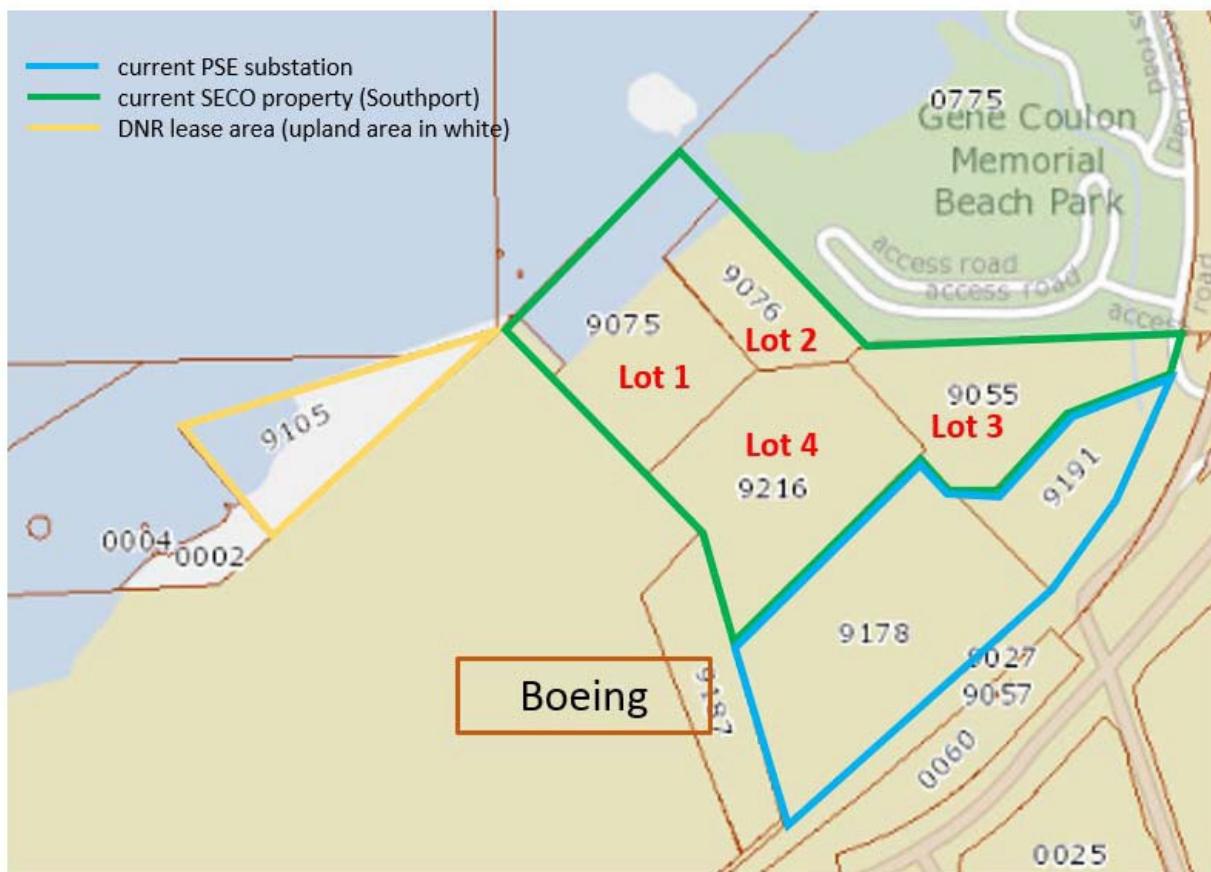

Ecology will be updating the ISIS database and site files to reflect the following:

- 1) PSE Shuffleton Substation
Also known as: PSE Shuffleton Complex, Puget Sound Power & Light
Address: 1095 Lake Washington Blvd N, Renton
Parcels: 0823059178, 0823059191
Facility Site ID: 14655
Cleanup Site ID: 6716
UST ID: 8530
Historic LUST Release ID: 301394
Site Status: Cleanup Started
- 2) PSE Shuffleton Steam Plant
Also known as: PSE Shuffleton Complex, Southport, SECO
Address: 1101 Lake Washington Blvd N, Renton
Parcels: 0523059075, 0523059076, 0823059055, 0823059216
Facility Site ID: 82611157
Cleanup Site ID: 14483
Unit 1: Lots 1-3, NW0149, NFA on 9/20/99
Unit 2: Lot 4, NW0461, NFA on 12/23/00
Site Status: No Further Action
- 3) PSE Shuffleton DNR Lease Area
Address: N/A
Parcel: 0723059105
Facility Site ID: 82611157
Cleanup Site ID: 14484
Site Status: No Further Action (6/26/00)

SITE HISTORY

The Puget Sound Energy Shuffleton site housed two main facilities: a steam plant on the northern portion of the site and a substation on the southern portion of the site. The steam plant portion of the property also contained other associated buildings, including a pump house, analytical laboratory, and storage buildings. The steam plant was functional daily until the mid-1950s, and remained functional in a standby status until 1989. The steam plant and associated buildings were demolished in the mid-1990s, at which point remediation of this portion of the site began prior to sale of the property. The substation portion of the site remains a functioning PSE property to the present.

The former steam plant portion of the property was divided into four regions, referred to as Lots 1-4. These regions correspond to current parcel numbers 0523059075, 0523059076, 0823059055, and 0823059216. The current Shuffleton substation property includes parcel numbers 0823059178 and 0823059191. A DNR lease area along Lake Washington was historically held by PSE. The DNR area primarily borders the Boeing property to the west of the site, and is approximately designated by current parcel 0723059105. Lots 1-4 were sold to SECO Development in 1999. Current property boundaries are indicated in the figure below.

CLEANUP ACTIVITIES PRIOR TO NFA LETTERS

The upland site first entered VCP in 1998 (VCP # NW0149). Multiple meetings are documented as being attended by PSE, consulting, and Ecology staff to discuss cleanup while remedial actions were being performed. The focus of the cleanup was Lots 1-4, and not the section of the property that was to remain PSE property. Chemicals of concern in this area included TPH, PAH, PCB, arsenic, and lead in soil, with areas of contamination located near areas of former plant activity. Groundwater was also characterized during remedial activities, and the only chemical present at elevated concentrations was arsenic. Based on information from other sites in the area, this was attributed to high natural background concentrations of arsenic in the region and not attributed to site activities.

Primary remediation activities were completed in 1999 (VCP # NW0149). Following this, an NFA letter was issued by Ecology on September 20, 1999 for soil and groundwater on Lots 1, 2, and 3. One remaining area of petroleum contaminated soil remained on Lot 4, and it was decided that this area would be addressed during construction activities when the soil would be accessible. Remediation was completed on Lot 4 in 2000 (VCP # NW0461), and an NFA letter for Lot 4 soil was issued on December 23, 2000. Groundwater conditions on Lot 4 had not been reported to differ from Lots 1-3, so it is unclear why different media were included in the two NFA letters.

The portion of the site to be retained by PSE was not well characterized during remedial activities. One soil sampling area on Lot 3 (EZ-11) extended across boundaries into the substation property. Soil on the SECO property were cleaned up, and contaminated soil on the PSE property were left in place due to difficulties in accessibility. Multiple reports were submitted documenting the removal of USTs near the former pump island, including LUST #3865 (UST #8530), and the cleanup of contaminated soil in this area. The DNR lease area was addressed separately from the steam plant and substation property. In 1966-1967, while they held the DNR lease, PSE created the upland portion of the lease area with dredged Lake Washington fill, and were therefore responsible for cleaning up any contamination prior to ending their lease. An NFA letter for the upland portion of the DNR lease area was issued on June 26, 2000.

CLEANUP ACTIVITES SINCE NFA LETTERS

The only cleanup activity reported to Ecology on Lots 1-4 since 2000 was the discovery and cleanup of a small area of Bunker C fuel oil contaminated soil. This was discovered on Lot 4 during construction activities in 2001 and removed. On the PSE substation, multiple remediated spills have been reported. Details on these spills are in the table below.

<u>DATE OF REPORT</u>	<u>TYPE OF SPILL</u>	<u>ERTS#</u>
October 2001	mineral oil	520270
February 2002	mineral oil	
March 2002	mineral oil	525102
May 2007	mineral oil	
January 2014	mineral oil	645655
April 2014	diesel	647602
October 2014	mineral oil	651666
November 2016	mineral oil	665783
April 2017	mineral oil	670760

CURRENT QUERY REGARDING NFA FOR LOTS 1-4

On December 20, 2017, FloydSnider submitted a letter to Ecology on behalf of SECO Development inquiring about a change in site status from NFA to Cleanup Started. They believe that this change in designation was related to a mineral oil spill reported on the PSE substation property in February 2017. This spill was designated NFA during the Initial Investigation. For this spill, a new site ID (CSID 14410) was created for the substation property; all cleanup activities from both the SECO property and the substation prior to this had been recorded in the original PSE Shuffleton cleanup site (CSID 6716). They inquired both about reestablishing the NFA for the site, and the possibility of splitting the sites to designate incidents on SECO property from those on the PSE substation property.

From notes from meetings attended by Ecology and PSE as part of the VCP cleanup process, it appears that separation of the sites was considered before cleanup began. To expedite cleanup, it was decided to leave it as one site with the option to separate the sites at a later date. Historically, there has been a clear difference in the level of cleanup activities on the SECO vs substation properties. Contamination on the SECO property has, to date, all been attributable to historic PSE contamination. In contrast, the substation property is still active and has reported a number of spills and cleanups that are unrelated to activities on the SECO property. Current tax parcel boundaries capture the designation between the two sites well, and would provide a good basis for site delineation.
