1.0 Introduction

This report describes the March 2025 groundwater assessment conducted at Stillwater Holdings Chevron cleanup site (herein referred to as "Site"), as shown on the Vicinity Map, Figure 1. The Site includes the Chevron gas station located at 7 East Rose Street, the Marcus Whitman Hotel located at 6 West Rose Street, and the 106 Building located at 106 North 2nd Avenue, in Walla Walla, Washington, as shown on the Site Plan, Figure 2. The Washington State Department of Ecology (Ecology) reference numbers for this Site include Facility Site ID (FSID) No. 28575673 and Cleanup Site ID (CSID) No. 5818.

This assessment report has been prepared by GeoEngineers for Ecology under Ecology Master Contract No. C2500073. This report describes Site history, field activities, observations and chemical analytical results associated with groundwater samples collected at the Site in March 2025. The purpose of this assessment is to act in compliance with Washington Administrative Code (WAC) 173-340-430 (Interim Actions) to reduce a threat to human health or the environment by eliminating or substantially reducing one or more pathways for exposure to contaminated groundwater. Data generated from this assessment, in combination with previous groundwater sampling data from the Site, will be used to support the development of the interim cleanup action.

2.0 Site Description and Background

In September 2023, Ecology was notified of gasoline odor complaints at the Marcus Whitman Hotel. It was determined that gasoline vapors were entering the hotel building via the basement and gasoline was present in groundwater beneath the hotel building. The basement underlies the original portion of the historic Marcus Whitman building and includes hotel operations and utility rooms (electrical, boiler, air handler, etc.).

In the east corner of the basement, a lower-level basement (referred to as the sub-basement) contains a partial dirt floor and contains a vault and groundwater sump, which were identified as likely preferential pathways for vapor to enter the basement. Further investigation identified gasoline vapors and gasoline contaminated water in two sumps and a vault in an adjacent 106 Building. Emergency actions were taken to vent potentially explosive levels of volatile organic compounds (VOCs) and recover product from the sumps.

The Chevron gas station, located northeast of the Marcus Whitman and adjacent to the 106 Building, was identified as the source of the gasoline release. Thirteen monitoring wells were installed to delineate and monitor the release, as shown in Groundwater Assessment – March 2025, Figure 3. Four wells (AMW-01 through AMW-04) are located on the Chevron property. Nine wells (MW-1 through MW-9) are located nearby City of Walla Walla (City) right-of-way. Chevron property wells, as well as MW-7 through MW9) are 4-inches in diameter, and MW-1 through MW-6 are 2-inches in diameter. All wells are installed in the shallow, unconfined aquifer below the Site.

Emergency Removal Actions have continued at the Site since the identification of the release, including interception of contaminated groundwater in the sumps, treatment of contaminated groundwater using granular activated carbon (GAC) and discharging the treated groundwater to the municipal sewer. In May 2024, Stillwater Holdings, the owner of the Chevron gas station, petitioned Ecology to take over the continued remediation of the Site due to lack of funds.

Emergency interim action remains necessary at the site as unmitigated response to groundwater contamination or exposure to soil vapors would create a potential risk to public safety and could present a threat to the environment.

2.1 PREVIOUS INVESTIGATIONS

Assessment and remediation actions have been conducted at the Site since identification of the release in September 2023. Ecology and consultants hired by Stillwater Holdings have installed groundwater wells, implemented interim remediation measures, and monitored Site air and groundwater concentrations. Assessment and remediation actions have included:

- Using venting fans and isolation of rooms (sealed plastic sheets) to reduce VOC levels to less than the lower explosive limit (LEL) and mitigate risks to human health in the Marcus Whitman and the 106 Building.
- Intercepting groundwater in existing sumps within the Marcus Whitman and the 106 Building, where it is then manually removed and treated for VOCs prior to discharge to the Walla Walla publicly owned treatment works (POTW);
- Conducting indoor air sampling for VOCs in the 106 Building and the Marcus Whitman to evaluate the efficacy of the vapor ventilation systems in use at the properties;
- Sampling intercepted groundwater for VOCs and other constituents, following treatment by GAC, as required by the Industrial Pretreatment Program with the Walla Walla POTW;
- Installing and sampling thirteen groundwater monitoring wells (AMW-01-AMW-4, MW1-MW-9) to delineate and monitor the impacts of the September 2023 release. The groundwater monitoring well network has been sampled by Ecology or Aspect Consulting (Aspect) for VOCs, lead, naphthalene and product thickness in wells; and
- Conducting a preferential pathway investigation to determine pathways of soil vapor entering the 106 Building. The stormwater sump was identified as a soil vapor pathway to this building.

2.2 PRIOR ANALYTICAL RESULTS

Chemical analytical results from groundwater sampling between November 2023 and May 2024 indicated that gasoline-range petroleum hydrocarbons (GRPH) and petroleum-related VOCs were present in groundwater in nine monitoring wells (AMW-01 through AMW-04, MW-2, MW-3, MW-5, MW-6 and MW-9) at concentrations greater than the Model Toxics Control Act (MTCA) Method A cleanup levels. Chlorinated solvents including tetrachloroethene (PCE) and trichloroethene (TCE) were also detected in MW-7 and MW-8 concentrations greater than their respective MTCA Method A groundwater cleanup levels. There is no known use of chlorinated solvents at the Site. Lead has not been detected in the groundwater samples. MW-1 was damaged shortly after installation and does not produce water, and has not been sampled. All prior sampling has been performed by Ecology of Aspect.

3.0 Field Investigation Activities

The following sections describe field activities and a discussion of observed groundwater conditions during the March 2025 groundwater assessment.

3.1 GROUNDWATER AND SUMP WATER ASSESSMENT

Depth to water, presence of free product, and well headspace volatile organic vapor concentrations were measured prior to sample collection. Free product was not observed in any wells. Headspace vapor concentrations were observed to be between <1.0 ppm to 1,672.0 ppm (MW-6). Groundwater samples were collected in monitoring wells AMW-01 through AMW-04 located on the Chevron property, and monitoring wells MW-2 through MW-9 located on the City right-of-way on March 25 and 26, 2025. The monitoring wells were purged using low-flow techniques and groundwater quality parameters were monitored prior to sampling as described in Appendix A. Groundwater level measurements and groundwater quality parameters at the time of sample collection are summarized in Table 1, Summary of Groundwater Field Parameters. Depths to groundwater ranged between 8.42 feet below top of casing (BTOC) in MW-6 to 13.61 feet BTOC in MW-7. Groundwater elevations ranged between 937.02 feet in MW-7 and 943.98 feet in MW-6, and the groundwater gradient was to the southeast. Groundwater elevations and the groundwater gradient are shown on Figure 3.

Samples were additionally collected from the two sumps currently intercepting groundwater from beneath the Marcus Whitman (Marcus Whitman Sump) and the 106 Building (BLDG 106 Sump). Samples were collected using low flow techniques on March 27, 2025 following the standard procedures in Appendix A and submitted for chemical analysis.

3.2 INVESTIGATION-DERIVED WASTE

Investigation-derived waste (IDW), including purge and decontamination water generated during groundwater sampling activities, was placed in the groundwater treatment system and discharged to the municipal sewer under permit with Walla Walla publicly owned treatment works.

4.0 Chemical Analytical Results

The following sections describe groundwater and sump water chemical analytical results. The laboratory report and a data validation report are included in Appendix B.

4.1 GROUNDWATER CHEMICAL ANALYTICAL RESUSLTS

Twelve groundwater samples, and one duplicate groundwater sample from AMW-01, were submitted to Eurofins Environment Testing Northwest (Eurofins) in Spokane Valley, Washington, for chemical analysis of the following contaminants of concern (COCs):

- GRPH using Northwest Method NWTPH-Gx;
- Benzene, toluene, ethylbenzene, and total xylenes (BTEX) using U.S. Environmental Protection Agency (EPA) Method 8260D.

Groundwater chemical analytical results are presented and compared to the MTCA Method A cleanup levels in Table 2, Chemical Analytical Results – Groundwater, and are summarized below:

- GRPH was detected at concentrations exceeding the MTCA Method A cleanup level (CUL) of 800 micrograms per liter (µg/L), applicable when benzene is present on the Site, in monitoring wells AMW-01, AMW-02, MW-2, MW-3, MW-5, and MW-6 during the March 2025 monitoring event. GRPH

concentrations exceeding the MTCA Method A CUL ranged from 910 µg/L in MW-2 to 39,000 µg/L in MW-5. GRPH was either not detected or was detected at concentrations less than the MTCA Method A cleanup level in the remaining groundwater samples analyzed.

- Benzene was detected at concentrations exceeding the MTCA Method A CUL of 5 µg/L in monitoring wells AMW-01, AMW-02, AMW-03, AMW-04, MW-2, MW-3, and MW-5 during the March 2025 monitoring event. Benzene concentrations exceeding the MTCA Method A CUL ranged from 12 µg/L in AMW-03 to 3,300 µg/L in AMW-01. Benzene was either not detected or was detected at concentrations less than the MTCA Method A cleanup level in the remaining groundwater samples analyzed.
- Toluene was detected at concentrations exceeding the MTCA Method A CUL of 1,000 µg/L in monitoring wells AMW-01, AMW-02, and MW-5 during the March 2025 monitoring event. Toluene concentrations exceeding the MTCA Method A CUL ranged from 3,200 µg/L in AMW-02 to 8,700 µg/L in AMW-01. Toluene was either not detected or was detected at concentrations less than the MTCA Method A cleanup level in the remaining groundwater samples analyzed.
- Ethylbenzene was detected at concentrations exceeding the MTCA Method A CUL of 700 µg/L in monitoring wells AMW-01 and MW-5 during the March 2025 monitoring event. Ethylbenzene concentrations exceeding the MTCA Method A CUL ranged from 970 µg/L in AMW-01 to 6,300 µg/L in MW-5. Ethylbenzene was either not detected or was detected at concentrations less than the MTCA Method A cleanup level in the remaining groundwater samples analyzed.
- Total xylenes were detected at concentrations exceeding the MTCA Method A CUL of 1000 µg/L in monitoring wells AMW-01, AMW-02, MW-3, MW-5, and MW-6 during the March 2025 monitoring event. Total xylenes concentrations exceeding the MTCA Method A CUL ranged from 1,100 µg/L in MW-3 to 8,200 µg/L in MW-5. total xylenes were detected at concentrations less than the MTCA Method A cleanup level in the remaining groundwater samples analyzed.

4.2 SUMP WATER CHEMICAL ANALYTICAL RESUSLTS

Two sump water samples, Marcus Whitman Sump and BLG 106 Sump, were submitted to Eurofins for the chemical analyses listed above

Sump water from both locations undergoes pretreatment prior to discharge to the Walla Walla POTW and these samples represent only pretreatment concentrations.

Sump water chemical analytical results are presented and compared to MTCA Method A cleanup levels and the Walla Walla POTW Discharge Limits in Table 3, Chemical Analytical Results – Sump Water, and are summarized below:

- GRPH was detected at a concentration exceeding the Walla Walla POTW Discharge Limit of 1,000 µg/L in the sump water sample from the Marcus Whitman Hotel during the March 2025 monitoring event. GRPH was detected at a concentration less than the MTCA Method A cleanup level of 800 µg/L, and less than Discharge Limit for the Walla Walla POTW, in the 106 Building sump water sample.
- Benzene was detected at concentrations exceeding the Walla Walla POTW Discharge Limit of 10 µg/L in the sump water samples from the Marcus Whitman Hotel and the 106 Building sumps during the March 2025 monitoring event.

- Toluene, ethylbenzene, and total xylenes were either not detected or detected at concentrations less than their respective MTCA Method A cleanup levels and the Walla Walla POTW Discharge Limits in the samples analyzed.

5.0 Summary and Recommendations

Twelve monitoring wells and two sumps were sampled in March 2025 at the Stillwater Holdings Chevron Site in Walla Walla Washinton. Groundwater and sump water samples collected during the monitoring event were submitted for chemical analysis. Based on previous data collected by others, an increase was seen in GRPH and individual VOC concentrations in MW-3, and a decrease seen in concentrations measured in AMW-04, MW-6, and MW-8. Other wells showed relatively steady concentrations of GRPH between November 2024 and March 2025, with results of the same order of magnitude observed.

Laboratory analytical results indicate that petroleum contamination is present at this Site at concentrations greater than the MTCA Method A cleanup levels. The plume appears to be bounded by the current well sampling network, by MW-8 to the south and MW-4 to the north, and by MW-7 to the west and MW-9 to the east. We recommend continued quarterly sampling of Site wells throughout the assessment and implementation of the interim cleanup action.

Petroleum contamination is present at concentrations in the sumps in both the Marcus Whitman and the 106 Building at concentrations greater than the Walla Walla POTW Discharge Limits, necessitating the continued need for pretreatment of sump water prior to discharge.

6.0 Limitations

We have prepared this report for the exclusive use of Washington State Department of Ecology and their authorized agents.

Within the limitations of scope, schedule and budget, our services were executed in accordance with generally accepted environmental science practices in this area at the time this report was prepared. The conclusions and opinions presented in this report are based on our professional knowledge, judgment and experience. No warranty or other conditions, express or implied, should be understood.

Please refer to Appendix C, Report Limitations and Guidelines for Use, for additional information pertaining to this report.

Notes:

Samples collected by GeoEngineers and analyzed by Eurofins Environment Testing Northwest located in Spokane Valley, Washington during the March 2025 grounbdwater assessemnt are dated 03/27/25. Sample Locations are shown on Figure 2.

Results reported in micrograms per liter unless otherwise stated.

[1]Gasoline-range petroleum hydrocarbons (GRPH) analyzed using Northwest Method NWTPH-Gx.

[2]Volatile organic compounds analyzed using United States Environmental Protection Agency (EPA) Method 8260D.

[3]BTEX = Benzene, Toluene, Ethylbenzene and Xylenes (total).

[4]Model Toxics Control Act (MTCA) Method A/B Cleanup Levels (CUL) for Groundwater

Results in **bold** indicate TPH or VOCs were detected.

Results in **bold** and highlighted grey are detected above the MTCA Method A cleanup level.

Appendices

Appendix A
Field Assessment Procedures

Appendix A
Field Assessment Procedures

Standard Procedures

This section contains standard procedures for field data collection that were conducted during groundwater sampling activities at the Stillwater Holdings Chevron cleanup site located at 7 East Rose Street in Walla Walla, Washington.

MONITORING WELL SAMPLING

Groundwater samples were collected from groundwater monitoring wells AMW-01 through AMW-04, MW-2 through MW-9 and analyzed as described below. Depth to groundwater relative to the top of the polyvinyl chloride (PVC) well casing was measured to the nearest 0.01 foot using an electronic interface probe and recorded in the field notes.

Following depth to groundwater measurement, a groundwater sample was collected from each monitoring well consistent with the U.S. Environmental Protection Agency's (EPA's) low-flow groundwater sampling procedure, as described in EPA (2017) and Puls and Barcelona (1996). Dedicated tubing and a peristaltic pump was used for groundwater purging and sampling. During purging activities, water quality parameters, including pH, conductivity, dissolved oxygen (DO), oxidation-reduction potential (ORP), turbidity and temperature were measured using a multi-parameter meter equipped with a flow-through cell. Depth to water also was measured and recorded when groundwater quality parameters were recorded. Each monitoring well was purged until parameters stabilized, or a maximum of 30 minutes, whichever occurred first, before collecting the sample. Stability was defined as the following:

- pH: ± 0.1 pH units;
- Conductivity: ± 3 percent micro-Siemens per centimeter (µS/cm);
- ORP: ± 10 millivolts (mV);
- DO: ± 0.3 milligrams per Liter (mg/L);
- Turbidity: less than 10 nephelometric turbidity units (NTUs) or ± 10 percent NTUs when turbidity is greater than 10 NTUs; and
- Temperature: ± 3 percent degrees Celsius.

Field water quality measurements and depth-to-water measurements were recorded on a well purging-field water quality measurement form. Groundwater samples were transferred in the field to laboratory-prepared sample containers and kept cool during transport to the testing laboratory. Chain-of-Custody procedures were observed from the time of sample collection to delivery to the testing laboratory consistent with the Quality Assurance Project Plan (QAPP) included in the Work Plan (GeoEngineers 2024).

SUMP SAMPLING

Water samples were collected from sumps located in the Marcus Whitman sub-basement and the 106 Building basement, dedicated tubing and a peristaltic pump. Low flow (<200 milliliters per minute) were used to reduce degassing of VOC samples. Water samples were transferred in the field to laboratory-

prepared sample containers and kept cool during transport to the testing laboratory. Chain-of-Custody procedures were observed from the time of sample collection to delivery to the testing laboratory consistent with the QAPP.

Data Validation Report and Chemical Analytical Laboratory Report

GeoEngineers

Data Validation Report

523 East Second Avenue, Spokane, Washington 99202, Telephone: 509.363.3125 www.geoengineers.com

Project:	Stillwater Holdings Chevron – Environmental Services March 2025 Groundwater Samples
File:	0504-202-01
Date:	April 22, 2025

This report documents the results of a United States Environmental Protection Agency (USEPA)-defined Stage 2A data validation (USEPA Document 540-R-08-005; USEPA, 2009) of analytical data from the analyses of water samples collected as part of the March 2025 sampling event, and the associated laboratory and field quality control (QC) samples. The samples were obtained from the Stillwater Holdings Chevron facility located at 7 East Rose Street, in Walla Walla, Washington.

Objective and Quality Control Elements

GeoEngineers, Inc. (GeoEngineers) completed the data validation consistent with the USEPA Contract Laboratory Program National Functional Guidelines for Organic Superfund Methods Data Review (USEPA, 2020) (National Functional Guidelines) to determine if the laboratory analytical results meet the project objectives and are usable for their intended purpose. Data usability was assessed by determining if:

- The samples were analyzed using well-defined and acceptable methods that provide reporting limits below applicable regulatory criteria;
- The precision and accuracy of the data are well-defined and sufficient to provide defensible data; and
- The quality assurance/quality control (QA/QC) procedures utilized by the laboratory meet acceptable industry practices and standards.

The data validation included review of the following QC elements:

- Data Package Completeness
- Chain-of-Custody Documentation
- Holding Times and Sample Preservation
- Surrogate Recoveries
- Method and Trip Blanks
- Matrix Spikes/Matrix Spike Duplicates
- Laboratory Control Samples/Laboratory Control Sample Duplicates
- Field Duplicates
- Miscellaneous

Validated Sample Delivery Groups

This data validation included review of the sample delivery group (SDG) listed below in Table 1.

TABLE 1. SUMMARY OF VALIDATED SAMPLE DELIVERY GROUPS

LABORATORY SDG	SAMPLES VALIDATED
590-30157-1	AMW-01-032525, DUP-032525, AMW-2-032525, AMW-3-032525, AMW-4-032525, MW-2-032625, MW-3-032625, MW-4-032625, MW-5-032625, MW-6-032625, MW-7-032625, MW-8-032625, MW-9-032525, Marcus Whitman Sump Water, Bldg 106 Sump, Trip Blank

Chemical Analysis Performed

Eurofins Environment Testing, Inc. (Eurofins), located in Spokane, Washington, performed laboratory analyses on the samples using the following methods:

- Gasoline-range Hydrocarbons (NWTPH-Gx) by Method NWTPH-Gx; and
- Volatile Organic Compounds (VOCs) by Method EPA8260D

Data Validation Summary

The results for each of the QC elements are summarized below.

DATA PACKAGE COMPLETENESS

Eurofins provided the required deliverables for the data validation according to the National Functional Guidelines. The laboratory followed adequate corrective action processes and the identified anomalies were discussed in the relevant laboratory case narrative.

CHAIN-OF-CUSTODY DOCUMENTATION

Chain-of-custody (COC) forms were provided with the laboratory analytical reports. The COCs were accurate and complete when submitted to the laboratory.

HOLDING TIMES AND SAMPLE PRESERVATION

The sample holding time is defined as the time that elapses between sample collection and sample analysis. Maximum holding time criteria exist for each analysis to help ensure that the analyte concentrations found at the time of analysis reflect the concentration present at the time of sample collection. Established holding times were met for each analysis. The sample coolers arrived at the laboratory within the appropriate temperatures of between two and six degrees Celsius.

SURROGATE RECOVERIES

A surrogate compound is a compound that is chemically similar to the organic analytes of interest, but unlikely to be found in an environmental sample. Surrogates are used for organic analyses and are added to the samples, standards, and blanks to serve as an accuracy and specificity check of each analysis. The surrogates are added to the samples at a known concentration and percent recoveries are calculated following analysis. The surrogate percent recoveries for field samples were within the laboratory control limits.

METHOD AND TRIP BLANKS

Method Blanks

Method blanks are analyzed to ensure that laboratory procedures and reagents do not introduce measurable concentrations of the analytes of interest. A method blank was analyzed with each batch of samples, at a frequency of 1 per 20 samples. For each sample batch, method blanks for the applicable methods were analyzed at the required frequency. None of the analytes of interest were detected in the method blanks.

Trip Blanks

Trip blanks are analyzed to provide an indication as to whether volatile compounds have cross-contaminated other like samples within the transportation process to the laboratory. None of the analytes of interest were detected in the trip blank, with the following exception:

SDG 590-30157-1: (VOCs) There was a positive result for toluene detected above the method detection limit, but below the reporting limit in the trip blank, Sample Trip Blank. The positive results for toluene were qualified as non-detected (U) in Samples MW-4-032625, MW-8-032625, and MW-9-032525.

MATRIX SPIKES/MATRIX SPIKE DUPLICATES

Since the actual analyte concentration in an environmental sample is not known, the accuracy of a particular analysis is usually inferred by performing a matrix spike (MS) analysis on one sample from the associated batch, known as the parent sample. One aliquot of the sample is analyzed in the normal manner and then a second aliquot of the sample is spiked with a known amount of analyte concentration and analyzed. From these analyses, a percent recovery is calculated. Matrix spike duplicate (MSD) analyses are generally performed for organic analyses as a precision check and analyzed in the same sequence as a matrix spike. Using the result values from the MS and MSD, the relative percent difference (RPD) is calculated. The percent recovery control limits for MS and MSD analyses are specified in the laboratory documents, as are the RPD control limits for MS/MSD sample sets.

There were no MS/MSD sample sets performed on the associated GeoEngineers' field samples.

LABORATORY CONTROL SAMPLES/LABORATORY CONTROL SAMPLE DUPLICATES

A laboratory control sample (LCS) is a blank sample that is spiked with a known amount of analyte and then analyzed. An LCS is similar to an MS, but without the possibility of matrix interference. Given that matrix interference is not an issue, the LCS/LCSD control limits for accuracy and precision are usually more rigorous than for MS/MSD analyses. Additionally, data qualification based on LCS/LCSD analyses would apply to all samples in the associated batch, instead of just the parent sample. The percent recovery control limits for LCS and LCSD analyses are specified in the laboratory documents, as are the RPD control limits for LCS/LCSD sample sets.

One LCS/LCSD analysis should be performed for every analytical batch or every 20 field samples, whichever is more frequent. The frequency requirements were met for each analysis and the percent recovery and RPD values were within the proper control limits.

FIELD DUPLICATES

In order to assess precision, field duplicate samples were collected and analyzed along with the reviewed sample batches. The duplicate samples were analyzed for the same parameters as the associated parent samples. Precision is determined by calculating the RPD between each pair of samples. If one or more of the sample analytes has a concentration less than five times the reporting limit for that sample, then the absolute difference is used instead of the RPD. The RPD control limit for water samples is 30 percent.

SDG 590-30157-1: One field duplicate sample pair, AMW-01-032525 and DUP-032525, was submitted with this SDG. The precision criteria for the target analytes were met for this sample pair.

MISCELLANEOUS

SDG 590-30157-1: (NWTPH-Gx) The positive result for gasoline-range hydrocarbons in Sample MW-8-032625 appears to be due to the presence of discrete peaks (tetrachloroethene) in the sample concentration. For this reason, the positive result for this target analyte was qualified as estimated (J) in this sample.

Overall Assessment

As was determined by this data validation, the laboratory followed the specified analytical methods. Accuracy was acceptable, as demonstrated by the surrogate and LCS/LCSD percent recovery values. Precision was acceptable, as demonstrated by the LCS/LCSD and field duplicate RPD values.

The data are acceptable for the intended use, with the following qualifications listed below in Table 2.

TABLE 2. SUMMARY OF QUALIFIED SAMPLES

SAMPLE ID	ANALYTE	QUALIFIER	REASON
MW-4-032625	Toluene	U	Trip Blank Contamination
MW-8-032625	Gasoline-range hydrocarbons Toluene	J U	See Miscellaneous Trip Blank Contamination
MW-9-032525	Toluene	U	Trip Blank Contamination

Job Narrative
590-30157-1

Analytical test results meet all requirements of the associated regulatory program listed on the Accreditation/Certification Summary Page unless otherwise noted under the individual analysis. Data qualifiers and/or narrative comments are included to explain any exceptions, if applicable.

- Matrix QC may not be reported if insufficient sample is provided or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD may be performed, unless otherwise specified in the method.
- Surrogate and/or isotope dilution analyte recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in the narrative.

Regulated compliance samples (e.g. SDWA, NPDES) must comply with the associated agency requirements/permits.

Receipt
The samples were received on 3/27/2025 1:30 PM. Unless otherwise noted below, the samples arrived in good condition, and, where required, properly preserved and on ice. The temperature of the cooler at receipt time was 5.0°C.

Gasoline Range Organics
Method NWTPH_Gx_MS: The Gasoline Range Organics (GRO) concentration reported for the following sample is due to the presence of discrete peaks(Tetrachloroethene): MW-8-032625 (590-30157-11). Gasoline

No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

GC/MS VOA
No additional analytical or quality issues were noted, other than those described above or in the Definitions/ Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
☼	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CFU	Colony Forming Unit
CNF	Contains No Free Liquid
DER	Duplicate Error Ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL	Detection Limit (DoD/DOE)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision Level Concentration (Radiochemistry)
EDL	Estimated Detection Limit (Dioxin)
LOD	Limit of Detection (DoD/DOE)
LOQ	Limit of Quantitation (DoD/DOE)
MCL	EPA recommended "Maximum Contaminant Level"
MDA	Minimum Detectable Activity (Radiochemistry)
MDC	Minimum Detectable Concentration (Radiochemistry)
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
MPN	Most Probable Number
MQL	Method Quantitation Limit
NC	Not Calculated
ND	Not Detected at the reporting limit (or MDL or EDL if shown)
NEG	Negative / Absent
POS	Positive / Present
PQL	Practical Quantitation Limit
PRES	Presumptive
QC	Quality Control
RER	Relative Error Ratio (Radiochemistry)
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
TNTC	Too Numerous To Count

Client Sample ID: AMW-01-032525

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	N/A	
Sample custody seals, if present, are intact.	N/A	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time (excluding tests with immediate HTs)	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	

Appendix C
Report Limitations and Guidelines for Use

Appendix C
Report Limitations and Guidelines for Use[1]

This appendix provides information to help you manage your risks with respect to the use of this report.

ENVIRONMENTAL SERVICES ARE PERFORMED FOR SPECIFIC PURPOSES, PERSONS AND PROJECTS

This report has been prepared for the exclusive use of the Washington State Department of Ecology (Ecology). This report is not intended for use by others, and the information contained herein is not applicable to other sites.

GeoEngineers structures our services to meet the specific needs of our clients. For example, an environmental site assessment study conducted for a property owner may not fulfill the needs of a prospective purchaser of the same property. Because each environmental study is unique, each environmental report is unique, prepared solely for the specific client and project site. No one except Ecology should rely on this environmental report without first conferring with GeoEngineers. This report should not be applied for any purpose or project except the one originally contemplated.

THIS ENVIRONMENTAL REPORT IS BASED ON A UNIQUE SET OF PROJECT-SPECIFIC FACTORS

This report has been prepared for the Stillwater Holdings Chevron cleanup site located at 7 East Rose Street in Walla Walla, Washington (the "Site"). GeoEngineers considered a number of unique, project-specific factors when establishing the scope of services for this project and report. Unless GeoEngineers specifically indicates otherwise, do not rely on this report if it was:

- not prepared for you,
- not prepared for your project,
- not prepared for the specific site explored, or
- completed before important project changes were made.

If important changes are made after the date of this report, GeoEngineers should be given the opportunity to review our interpretations and recommendations and provide written modifications or confirmation, as appropriate.

RELIANCE CONDITIONS FOR THIRD PARTIES

Our report was prepared for the exclusive use of Ecology. No other party may rely on the product of our services unless we agree in advance to such reliance in writing. This is to provide our firm and Ecology with reasonable protection against open-ended liability claims by third parties with whom there would otherwise be no contractual limits to their actions. Within the limitations of scope, schedule and budget, our services

have been executed in accordance with our Agreement with Ecology and generally accepted environmental practices in this area at the time this report was prepared.

ENVIRONMENTAL REGULATIONS ARE ALWAYS EVOLVING

Some substances may be present in the Site vicinity in quantities or under conditions that may have led, or may lead, to contamination of the subject Site, but are not included in current local, state or federal regulatory definitions of hazardous substances or do not otherwise present current potential liability. GeoEngineers cannot be responsible if the standards for appropriate inquiry, or regulatory definitions of hazardous substance, change or if more stringent environmental standards are developed in the future.

UNCERTAINTY MAY REMAIN EVEN AFTER THIS PHASE II ESA IS COMPLETED

No environmental site assessment can wholly eliminate uncertainty regarding the potential for contamination in connection with a property. Our interpretation of subsurface conditions in this study is based on field observations and chemical analytical data from widely spaced sampling locations. It is always possible that contamination exists in areas that were not explored, sampled or analyzed.

SUBSURFACE CONDITIONS CAN CHANGE

This environmental report is based on conditions that existed at the time the study was performed. The findings and conclusions of this report may be affected by the passage of time, by manmade events such as construction on or adjacent to the site, by new releases of hazardous substances, or by natural events such as floods, earthquakes, slope instability or groundwater fluctuations. Always contact GeoEngineers before applying this report to determine if it is still applicable.

MOST ENVIRONMENTAL FINDINGS ARE PROFESSIONAL OPINIONS

Our interpretations of subsurface conditions are based on field observations and chemical analytical data from widely spaced sampling locations at the Site. Site exploration identifies subsurface conditions only at those points where subsurface tests are conducted, or samples are taken. GeoEngineers reviewed field and laboratory data and then applied our professional judgment to render an opinion about subsurface conditions throughout the Site. Actual subsurface conditions may differ – sometimes significantly – from those indicated in this report. Our report, conclusions and interpretations should not be construed as a warranty of the subsurface conditions.

DO NOT REDRAW THE EXPLORATION LOGS

Environmental scientists prepare final boring and testing logs based upon their interpretation of field logs and laboratory data. To prevent errors or omissions, the logs included in an environmental report should never be redrawn for inclusion in other design drawings. Only photographic or electronic reproductions are acceptable but recognize that separating logs from the report can elevate risk.

READ THESE PROVISIONS CLOSELY

Some clients, design professionals and contractors may not recognize that the geoscience practices (geotechnical engineering, geology and environmental science) are far less exact than other engineering and natural science disciplines. This lack of understanding can create unrealistic expectations that could

lead to disappointments, claims and disputes. GeoEngineers includes these explanatory "limitations" provisions in our reports to help reduce such risks. Please confer with GeoEngineers if you are unclear how these "Report Limitations and Guidelines for Use" apply to your project or site.

GEOTECHNICAL, GEOLOGIC AND GEOENVIRONMENTAL REPORTS SHOULD NOT BE INTERCHANGED

The equipment, techniques and personnel used to perform an environmental study differ significantly from those used to perform a geotechnical or geologic study and vice versa. For that reason, a geotechnical engineering or geologic report does not usually relate any environmental findings, conclusions or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. Similarly, environmental reports are not used to address geotechnical or geologic concerns regarding a specific project.

BIOLOGICAL POLLUTANTS

GeoEngineers' Scope of Work specifically excludes the investigation, detection, prevention or assessment of the presence of Biological Pollutants. Accordingly, this report does not include any interpretations, recommendations, findings, or conclusions regarding the detecting, assessing, preventing or abating of Biological Pollutants and no conclusions or inferences should be drawn regarding Biological Pollutants, as they may relate to this project. The term "Biological Pollutants" includes, but is not limited to, molds, fungi, spores, bacteria and viruses, and/or any of their byproducts.

If Ecology desires these specialized services, they should be obtained from a consultant who offers services in this specialized field.
