PROJECT INFORMATION

Company: Conestoga-Rovers & Associates
Client: GSHI
Project: 009973
Location: 1913 Marine View Drive
Test Date: 12/19/14

SOLUTION

Aquifer Model: Unconfined
Solution Method: Bouwer-Rice

K = 5.963E-6 cm/sec
y0 = 0.3614 ft

AQUIFER DATA

Saturated Thickness: 12.49 ft

Anisotropy Ratio (Kz/Kr): 0.5

WELL DATA (GM-B-1)

Initial Displacement: 0.77 ft
Total Well Penetration Depth: 12.49 ft
Casing Radius: 0.0833 ft

Static Water Column Height: 12.49 ft
Screen Length: 5. ft
Well Radius: 0.354 ft

APPENDIX J

2024 Field Forms

TR0837J: 5/14/24 Marine View Drive (MVD) Field Notes
Glenn Springs Holdings – Monitoring Well Redevelopment
Geosyntec Staff: Stephen Strehl (SS)
Subcontractor: Holt Services

0700 Holt at the GSH GWTP for safety orientation
0745 SS at GWTP for H&S
0805 SS and Holt head to the MVD Site
0810 on site
815 walk site, H&S meeting – Holt begins bailing w/ stainless steel hand bailers on GM-B-1A and GM-B-1 into 5 gallon bucket. Sediment removed, water turbid. Once sediment removed, and well exhibited hard bottom, well screen was surged with surge block and then a downwell typhoon pump was installed and surged periodically until water cleared and was below <50. This process was repeated for every well. Each Jplug replaced with new.

0900: Begin on GM-B-2 and GM-B-2A. Bailed 5 gallons each of turbid water and sediment.
945 GM-B-2A switch to pump, hard bottom, continued to pump
1005: GM-B-2A, stopped to recharge, mostly clear
1030: finish GM-B-2A. 25 gallons purged. Clear.
1035 start pumping GM-B-2: purged 25 gallons, clear. <50
1100: start bailing on GM-B-1A, GM-B-1, 5 gals each via bailer, very turbid. No issues on getting to bottom. Observation: 1A pumping slower. 1B: pumping faster, very cloudy, silty @10 gal Bad recharge. 1A not clearing up. Moving to next and will return.
1300: Started on GM-B-6A: Pumping slow, bad recharge. GM-B-6R: pumping continuous
1415: 6R <50 (hard bottom). 6A @120NTU: still soft bottom, tapped and turbidity increased. Needs more pumping
1520: 6A at <50 NTU
1525 move to GM-B-3R
1540: start purge on 3R

Depth Measurements:

Well ID	**Total depth (ft)**	**Total Gallons Purged**
GM-B-1	13.88	30

1620: Move back to Back to GM-B-1A to pump. Bad recharge. Still turbid ~200 NTU. Pumped another 10 gallons for total of 25. NTU @ ~150.
1715: off site with Holt. Approximately 200 gallons total purged and disposed of at the GSH GWTP.
1730: SS off site for Aspect field annex to drop off equipment.
1830: SS at Aspect field annex.

Total depth measured from top of casing
Well redevelopment completed by Holt Drilling with Geosyntec oversight on 5/14/2024
All wells purged first by stainless steel hand bailer until sediment removed, then purged by electric down well pump until clear
Purge water containerized on property and transported to the Glenn Springs Holding Groundwater Treatment Plant in Tacoma, WA for proper disposal

Subject	Analytical Results and Data Verification of Report EV24040001 Surfacewater and Groundwater Sampling Tacoma Marine View Tacoma, Washington March 2024		

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

1. Introduction

This document details a data verification of analytical results for water samples collected in support of the Surfacewater and Groundwater Sampling at the Tacoma Marine View site in Tacoma, Washington during March 2024. Samples were submitted to ALS Environmental, located in Everett, Washington. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard GHD report deliverables were submitted by the laboratory. The analytical results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control data, matrix spikes and field QC data.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and applicable guidance from the documents entitled:

1. "National Functional Guidelines for Organic Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 540-R-20-005, November 2020
2. "National Functional Guidelines for Inorganic Superfund Methods Data Review", USEPA 542-R-20-006, November 2020

These items will subsequently be referred to as the "Guidelines" in this report.

2. Sample Holding Time and Preservation

The sample holding time criteria and sample preservation requirements for the requested parameters are summarized in the methods. The sample chain of custody document and analytical report were used to determine sample holding times. All samples were prepared and analyzed within the required holding times.

All sample containers were properly preserved, delivered on ice and stored by the laboratory at the required temperature (0-6°C).

3. Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation with the exception of a few analytes present at low concentrations. Several sample results were qualified as non-detect due to contamination as evidenced by the associated blank (see Table 4).

4. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for volatile organic compound (VOC), semi-volatile organic compound (SVOC), pesticide and polychlorinated biphenyl (PCB) analyses were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Surrogate recoveries were assessed against the control limits. All surrogate recoveries met the associated criteria.

5. Laboratory Control Sample Analyses

Laboratory control samples (LCS)/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of one per analytical batch.

5.1 Organic Analyses

The LCS/LCSD contained all analytes of interest. All LCS/LCSD recoveries and RPD values were within associated control limits, demonstrating acceptable analytical accuracy and precision with a few exceptions. Where high recoveries or RPDs were found the associated sample results were non-detect and were not impacted. Where low aldrin recoveries were found the associated sample results were qualified as estimated due to the implied low bias (see Table 5).

5.2 Inorganic Analyses

The LCS and LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS and LCS/LCSD recoveries and RPD values were within the control limits, demonstrating acceptable analytical accuracy and precision (where applicable).

6. Matrix Spike Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as matrix spike (MS)/matrix spike duplicate (MSD) samples. The RPD between the MS and MSD is used to assess analytical precision. MS/MSD analyses were performed as specified in Table 1.

6.1 Organic Analyses

The MS/MSD samples were spiked with the analytes of interest. All percent recoveries and RPD values were within the associated control limits, demonstrating acceptable analytical accuracy and precision with the exception of two low acetone recoveries. The associated sample result was qualified as estimated due to the implied low bias (see Table 6).

6.2 Inorganic Analyses

The MS/MSD samples were spiked with the analyte of interest and the results were evaluated using the "Guidelines". All percent recoveries and the RPD value were within the control limits, demonstrating acceptable analytical accuracy and precision.

7. Field QA/QC Samples

The field QA/QC consisted of one trip blank sample and one field duplicate sample set.

7.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, one trip blank was submitted to the laboratory for analysis. All results were non-detect for the analytes of interest with the exception of methylene chloride present at a low concentration. The associated sample result with a concentration similar to the blank was qualified as non-detect due to contamination as evidenced by the blank (see Table 7).

7.2 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with the duplicate sample must be less than 50 percent. If the reported concentration in both the investigative sample and its duplicate are less than five times the reporting limit (RL), the evaluation criterion is one times the RL value.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision.

8. Analyte Reporting

Data were reported down to the laboratory's quantitation limit (QL), which is defined as the method detection limit (MDL) with sample-specific adjustments for dilutions, aliquot size, volumes, etc. Positive analyte detections less than the RL but greater than the QL were reported as estimated (J) in Table 3 unless qualified otherwise in this report. Non-detect results were presented as non-detect at the RL in Table 3.

If multiple QC results exhibit variability and/or high/low directional biases as related to a sample result, then any directional bias indicators are removed from the final sample result qualification.

9. Conclusion

Based on the assessment detailed in the foregoing, the summarized data are acceptable with the specific qualifications noted herein.

Subject	Analytical Results and Data Verification of Report EV24060108 Surfacewater and Groundwater Sampling Tacoma Marine View Tacoma, Washington June 2024		

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

1. Introduction

This document details a data verification of analytical results for water samples collected in support of the Surfacewater and Groundwater Sampling at the Tacoma Marine View site in Tacoma, Washington during June 2024. Samples were submitted to ALS Environmental, located in Everett, Washington. A sample collection and analysis summary is presented in Table 1. A summary of the analytical methodology is presented in Table 2. The validated analytical results are summarized in Table 3.

Standard GHD report deliverables were submitted by the laboratory. The analytical results and supporting quality assurance/quality control (QA/QC) data were assessed. Evaluation of the data was based on information obtained from the chain of custody form, finished report forms, method blank data, recovery data from surrogate spikes, laboratory control data, matrix spikes and field QC data.

The QA/QC criteria by which these data have been assessed are outlined in the analytical methods referenced in Table 2 and applicable guidance from the documents entitled:

1. "National Functional Guidelines for Organic Superfund Methods Data Review", United States Environmental Protection Agency (USEPA) 540-R-20-005, November 2020
2. "National Functional Guidelines for Inorganic Superfund Methods Data Review", USEPA 542-R-20-006, November 2020

These items will subsequently be referred to as the "Guidelines" in this report.

2. Sample Holding Time and Preservation

The sample holding time criteria and sample preservation requirements for the requested parameters are summarized in the methods. The sample chain of custody document and analytical report were used to determine sample holding times. All samples were prepared and analyzed within the required holding times with the exception of the samples for pesticide analysis. The associated sample results were qualified as estimated due to the implied low bias (see Table 4).

All sample containers were properly preserved, delivered on ice and stored by the laboratory at the required temperature (0-6°C).

3. Laboratory Method Blank Analyses

Method blanks are prepared from a purified matrix and analyzed with investigative samples to determine the existence and magnitude of sample contamination introduced during the analytical procedures.

For this study, laboratory method blanks were analyzed at a minimum frequency of one per analytical batch.

All method blank results were non-detect, indicating that laboratory contamination was not a factor for this investigation.

4. Surrogate Spike Recoveries

In accordance with the methods employed, all samples, blanks, and QC samples analyzed for organics are spiked with surrogate compounds prior to sample extraction and/or analysis. Surrogate recoveries provide a means to evaluate the effects of laboratory performance on individual sample matrices.

All samples submitted for volatile organic compound (VOC), semi-volatile organic compound (SVOC), pesticide and polychlorinated biphenyl (PCB) analyses were spiked with the appropriate number of surrogate compounds prior to sample extraction and/or analysis.

Each individual surrogate compound is expected to meet the associated control limits with the exception of SVOC analyses. It is generally acceptable for SVOC analyses that one outlying surrogate in the base/neutral or acid fractions is acceptable as long as the recovery is at least 10 percent.

Surrogate recoveries were assessed against the control limits. All surrogate recoveries met the associated criteria with the exception of a few low SVOC surrogate recoveries. The associated sample results were qualified as estimated due to the implied low bias (see Table 5).

5. Laboratory Control Sample Analyses

Laboratory control samples (LCS)/laboratory control sample duplicates (LCSD) are prepared and analyzed as samples to assess the analytical efficiencies of the methods employed, independent of sample matrix effects. The relative percent difference (RPD) of the LCS/LCSD recoveries is used to evaluate analytical precision.

For this study, LCS or LCS/LCSD were analyzed at a minimum frequency of one per analytical batch.

5.1 Organic Analyses

The LCS/LCSD contained all analytes of interest. All LCS/LCSD recoveries and RPD values were within associated control limits, demonstrating acceptable analytical accuracy and precision.

5.2 Inorganic Analyses

The LCS and LCS/LCSD contained all analytes of interest. LCS recoveries were assessed per the "Guidelines". All LCS and LCS/LCSD recoveries and RPD values were within the control limits, demonstrating acceptable analytical accuracy and precision (where applicable) with the exception of one high sodium recovery. The associated sample results were qualified as estimated due to the implied high bias (see Table 6).

6. Matrix Spike Analyses

To evaluate the effects of sample matrices on the preparation process, measurement procedures, and accuracy of a particular analysis, samples are spiked with a known concentration of the analyte of concern and analyzed as matrix spike (MS)/matrix spike duplicate (MSD) samples. The RPD between the MS and MSD is used to assess analytical precision. MS/MSD analyses were performed as specified in Table 1. If only the MS or MSD was outside of the control limits, no qualification of the data was performed based on the acceptable recovery of the companion spike and the acceptable RPD.

6.1 Organic Analyses

The MS/MSD samples were spiked with the analytes of interest. All percent recoveries and RPD values were within the associated control limits, demonstrating acceptable analytical accuracy and precision with a few exceptions. Where high recoveries were found the associated sample results were non-detect and were not impacted. No qualification of the data was deemed necessary.

6.2 Inorganic Analyses

The MS/MSD samples were spiked with the analyte of interest and the results were evaluated using the "Guidelines". All percent recoveries and the RPD value were within the control limits, demonstrating acceptable analytical accuracy and precision with a few exceptions. Where a high copper RPD was found the associated non-detect results were not impacted and the associated sample detections were qualified as estimated due to variability. Where low manganese recoveries were found the associated sample results were qualified as estimated due to the implied low bias (see Table 7).

7. Field QA/QC Samples

The field QA/QC consisted of one trip blank sample, one equipment blank and one field duplicate sample set.

7.1 Trip Blank Sample Analysis

To evaluate contamination from sample collection, transportation, storage, and analytical activities, one trip blank was submitted to the laboratory for analysis. All results were non-detect for the analytes of interest.

7.2 Equipment Blank Sample Analysis

To assess field decontamination procedures, ambient conditions at the site, and cleanliness of sample containers, one equipment blank was submitted for analysis, as identified in Table 1. All results were non-detect for the analytes of interest with the exception of a few analytes present at low concentrations. Several sample results with concentrations similar to the blank were qualified as shown in Table 8 due to contamination as evidenced by the blank.

7.3 Field Duplicate Sample Analysis

To assess the analytical and sampling protocol precision, one field duplicate sample was collected and submitted "blind" to the laboratory, as specified in Table 1. The RPDs associated with the duplicate sample must be less than 50 percent. If the reported concentration in both the investigative sample and its duplicate are less than five times the reporting limit (RL), the evaluation criterion is one times the RL value.

All field duplicate results were within acceptable agreement, demonstrating acceptable sampling and analytical precision with a few exceptions. The associated sample results and their duplicates were qualified as estimated due to variability (see Table 9).

8. Analyte Reporting

Data were reported down to the laboratory's quantitation limit (QL), which is defined as the method detection limit (MDL) with sample-specific adjustments for dilutions, aliquot size, volumes, etc. Positive analyte detections less than the RL but greater than the QL were reported as estimated (J) in Table 3 unless qualified otherwise in this report. Non-detect results were presented as non-detect at the RL in Table 3.

If multiple QC results exhibit variability and/or high/low directional biases as related to a sample result, then any directional bias indicators are removed from the final sample result qualification.

9. Conclusion

Based on the assessment detailed in the foregoing, the summarized data are acceptable with the specific qualifications noted herein.
