VC	vinyl chloride
VOCs	volatile organic compounds
WAC	Washington Administrative Code

1. Introduction

1.1 Site Information

Site Name: "1913 Marine View Drive"

Property Address: 1905 Marine View Drive, Tacoma, Washington

Project Consultant: Geosyntec Consultants, Inc. (Geosyntec).

Project Consultant Contact Information:

Rick Bieber
520 Pike Street, Suite 2600
Seattle, WA 98101
Cell: 253-993-0190

Current Owner/Operator: SRS Properties

1.2 Purpose and Report Organization

The Washington State Department of Ecology (Ecology) has determined that Leslie P. Sussman, Paula Rose, and Alan Sussman, a partnership, d/b/a Sussman, Rose and Sussman (referred to as SRS Properties), Occidental Chemical Corporation (OCC), General Metals of Tacoma (General Metals), and Don Oline are potentially liable persons (PLPs) for fill materials historically placed in the southern portion of a property located at 1905 Marine View Drive in Tacoma, Washington (the Property) and referred to as the "1913 Marine View Drive Site" (Site).

Ecology and the PLPs entered into Agreed Order (AO) No. DE 1679, effective date of July 6, 2007 (Ecology, 2007b), that requires the PLPs to complete a Remedial Investigation (RI) at the Site (the fill area within the Property), conduct a Feasibility Study (FS) to determine a preferred cleanup action, and develop a draft Cleanup Action Plan (CAP). An RI Report (GHD, 2015), prepared by GHD on behalf of the PLPs, was submitted to Ecology in 2015 that presented the results of the data collected during investigations completed at the Site through 2014. Ecology provided comments and a revised RI Report (GHD, 2016) was submitted to Ecology in 2016. In 2023, Ecology reached out to the PLPs and requested additional data collection and for the RI Report to be updated. In 2024, Geosyntec Consultants, Inc. (Geosyntec) collected additional groundwater and surface samples in accordance with an Ecology approved Scope of Work[1] (SOW) on behalf of the PLPs.

Figure 2.1 depicts the layout of the Site from the 2024 investigation and Figure 2.2 depicts a layout of the Site from the 2016 RI.

This Consolidated RI Report combines the data from the 2016 RI with the results of the 2024 sample collection activities and updates the data assessments for the Site. A list of documents reviewed in the preparation of this Consolidate RI Report is included in Appendix A.

The Consolidated RI Report is organized as follows:

Section 1 - Introduction: Presents an overview of the administrative background of the project.

[1] Bieber, Richard. "Re: Marine View Drive - Tasks." Received by Misuraca, Tia (Ecology), 2 Nov. 2023.

Section 2 - Site Description and Background: Presents summary descriptions of the location, land use, and ownership of the Site as well as previous environmental investigations.

Section 3 - Natural Conditions: Presents natural conditions at the Site.

Section 4 - Contaminant Occurrence and Movement: Presents both historical and recent (2024) data collected related to the Site.

Section 5 - Conceptual Site Model: Presents a detail discussion of physical and chemical conceptual site model and potential exposure pathways.

Section 6 - Cleanup Levels: Presents a detail discussion of applicable cleanup levels for all media determined based on the conceptual site model and used to compare to data collected related to the Site.

Section 7 - RI Conclusions and Recommendations: Presents conclusions and recommendations based on the discussions in the above sections.

Section 8 - References: Presents the references used for the development of this report.

2. Site Description and Background

2.1 Site Discovery and Regulatory Status

The Property (1905 Marine View Drive) on which the Site (the fill area within the Property) is located was deeded to Don E. Oline and Alba Oline in 1971 by Dillingham Corporation. The Property was subsequently purchased from Don E. Oline and Alba Oline under a real estate contract in 1975 by SRS Properties and later deeded to SRS Properties in 1982 following payment in full of the contract. The Property is vacant industrial land and currently recorded by the Pierce County Assessors' office as Parcel #0321362051 and is zoned 9167 (Vacant Land Major Problem). The City of Tacoma identifies the portion of the Property where the Site is located as zoned M-2 Heavy Industrial District.

At the request of Ecology, investigations of the Site were conducted between 1984 and 1988. The investigations were conducted voluntarily by an affiliate of OCC Tacoma, Inc. (OCCT) to evaluate the environmental impact of lime waste fill, which was placed at the Site. The results of the investigations were reported in "Tacoma Off-Plant Disposal Site Investigation" (Conestoga-Rovers & Associates Limited [CRA], 1984) and a November 1988 memorandum by OxyChem Special Environmental Programs (OSEP, 1988). Data for samples collected from soil/fill and groundwater indicated elevated concentrations of halogenated organics, metals, non-halogenated solvents, and polychlorinated biphenyls (PCBs). Some of these elevated concentrations were related to other fill materials (e.g., sand and shredder residue, cobbles, dredged material, and construction/demolition debris) placed at the Site. The Site was listed in Ecology's Cleanup Site Information database and assigned ID number 3671 under the Toxics Cleanup Program in 1990. Ecology lists the current status of the Site as "Cleanup Started."

In 1998, Ecology requested that the Site investigation data and current Site condition be reviewed to determine whether additional work should be considered to complete the evaluation. A data review and work plan entitled "Review of Site Conditions and Proposed Additional Work" (CRA Services, 1998) (Work Plan) was prepared and submitted to Ecology for review and comment in September 1998. The Work Plan presented the results of the previous investigations as well as a review of the data with recommendations for appropriate further investigative activities. The activities proposed in the Work Plan were designed to confirm the results of the earlier investigations and to determine whether there are any sources or volumes of impacted materials that were not previously identified. Comments dated September 23, 1998, were received from Ecology and responses were submitted on October 29, 1998. OCCT and Ecology were in agreement on the responses to the comments and the field activities were conducted between November 18, 1998, and January 12, 1999. Results of the Site investigation were reported in "Site Characterization Report" (CRA Services, 1999) and confirmed the conclusions from the previous investigations with some modification of the limits of the lime waste fill and other fill materials (e.g., sand and shredder residue, cobbles, dredged material, and construction/demolition debris).

Ecology issued potentially liable person status letters dated September 29, 2003, to OCC, General Metals, SRS Properties, and Don Oline, pursuant to Revised Code of Washington (RCW) 70 105D 040, 020(16) and Washington Administrative Code (WAC) 173-340-500. Subsequently, Ecology issued determinations that OCC, General Metals, SRS Properties, and Don Oline are PLPs under RCW 70 105D 040 and notified each PLP of this determination by separate letters dated February 2, 2004.

In July 2007, AO No. DE 1679 (Ecology, 2007b) was executed between the PLPs and Ecology to complete an RI at the Site, develop an FS to determine a preferred cleanup strategy, and develop a draft CAP.

In 2013, a 2013 Remedial Investigation/Feasibility Study Work Plan, (2013 RI/FS Work Plan) (CRA, 2013) was submitted to Ecology and subsequently approved by Ecology.

An RI Report, completed by GHD, was submitted to Ecology in August 2015. The 2015 RI Report outlined the extent of the buried fill materials, groundwater flow regime, and proposed steps to remediate and clean up the Site. In February 2016, Ecology provided comments and questions for the RI Report, which were further clarified in May 2016. GHD prepared responses to the comments and questions and submitted them and a revised RI Report to Ecology in November 2016.

In October 2023, Ecology notified OCC of a change to the Ecology Project Coordinator.

In 2024 at the request of Ecology, OCC collected additional groundwater and surface water samples in accordance with the approved SOW to update the 2016 RI Report. This Consolidated RI Report combines the data from the 2016 RI with the results of the 2024 sample collection activities and updates the data assessments for the Site.

2.2 Summary of Preliminary Cleanup Levels

Preliminary cleanup levels for soil and groundwater that were used for purposes of a comparative discussion of the investigation results are presented in Table 2.1. Cleanup levels are more fully developed and discussed in Section 6. Descriptions of the bases for the preliminary cleanup levels are below.

The preliminary cleanup levels were obtained from Ecology's Cleanup Levels and Risk Calculation (CLARC) database tables and WAC 173-204-562(2) Table III, Marine Sediment, Sediment Cleanup Objectives and Cleanup Screening Levels, Chemical Criteria.

Soil: The Site (the fill area within the Property) is vacant industrial land zoned 9167 (Vacant Land Major Problem) (Pierce County) or M-2 Heavy Industrial District (City of Tacoma)—see Subsection 2.4 for more details. Because the historical land use and current zoning of the Site has been and is industrial and the likely potential future use as an industrial property, preliminary cleanup levels for soil have been established consistent with Model Toxics Control Act (MTCA) (Ecology, 2007a) Method C cleanup levels for industrial land use. These cleanup levels are further described in Subsection 6.2.

Groundwater and Surface Water: Ecology has determined that groundwater at the Site is designated as non-potable[2] pursuant to WAC 173-340-720(2) and eventually discharges to the Hylebos Waterway (Hylebos). Consequently, groundwater cleanup levels may be based on protection of surface water. The surface water near the Property is designated marine water in the Hylebos. Accordingly, the preliminary cleanup levels for groundwater and surface water at the Site have been established consistent with MTCA Method B and Applicable or Relevant and Appropriate Requirements (ARARs) surface water cleanup levels for marine receptors. Using the surface water cleanup levels for direct comparison to groundwater concentrations is considered conservative

[2] Ecology comments and questions for the 2015 RI Report, received February 1, 2016, and clarified in May 2016.

because the values do not take into consideration attenuation. These cleanup levels are further described in Subsections 6.1 and 6.3.

Sediment: Sediment chemical criteria established by WAC 173-204-562(2). According to WAC 173-204-562(2), two chemical criteria are established, including sediment cleanup objectives and cleanup screening levels for marine sediment. These two criteria are further described in Subsections 4.1.2.2 and 6.4.

2.3 Site and Property Location/Definition

The Site is an area of approximately 2.62 acres containing historically placed fill materials that are within the southern portion of a 6.25-acre property located at 1905 Marine View Drive in Tacoma, Washington (the Property). Plans showing the Property boundaries, sampling locations, and estimated fill materials boundaries are presented on Figures 2.1 and 2.2. The Property legal description—from Exhibit B of the AO No. DE 1679—is provided in Appendix B.

The Site (the fill area within the Property) is vacant without structures and is located on the north side of Marine View Drive. A soil/gravel access road runs north-south through the Site from Marine View Drive. The Property is bound along its entire southern boundary by a thin parcel owned by Manke Timber Company Inc. running parallel to Marine View Drive.

In general, the Property surface cover varies from sparse grass to densely vegetated—thick brush and trees—on the majority of the Property. The southwest portion of the Property is sparsely covered with grass and/or small standing brush. Two small wet areas are present along the southern boundary of the Site. A majority of the wet areas are located on the Manke Lumber Company Inc. parcel between the Site and Marine View Drive. Two drainage swales run south from the base of the hill on the north side of the Property, and then further south along the western and eastern flanks of the fill materials (within the southern portion of the Property). The drainage swales are densely vegetated with brush and trees. In 2024, it was observed that the western drainage swale was blocked by a small landslide near up-gradient groundwater monitoring well GM-B-3R and water was not flowing within. The eastern drainage swale traverses the Property to the south to a small wet area between the Site and Marine View Drive further to the south. Another drainage swale enters the wet areas from the east, off the southeastern corner of the Site. All of the surface water discharges through a culvert off the southwestern edge of the Property, ultimately discharging to the Hylebos further to the southwest.

2.4 Neighborhood Setting

The Property is vacant industrial land zoned 9167 (Vacant Land Major Problem) per Pierce County and City of Tacoma identifies the Property as M-2 Heavy Industrial District. The Site (the fill area within the Property) is located in the southern portion of the Property as depicted on Figure 2.2. The northern and northeastern flanks of the Property are steep bluffs. These hillsides make up much of the portion of the Property north of the fill area.

Adjacent properties to the north, west, east, and northeast are all at higher elevations than the industrial zoned portion of the Property and therefore the Site—see Figure 2.1 and Subsection 3.1. Adjacent properties to the southeast, and south are zoned 9180 or PMI (Port Maritime and Industrial). The adjacent property to the west is zoned 9180 or M-2. The properties to the north, east, and northeast that are at a higher elevation are zoned 9100 (Vacant Land Undeveloped –

Residential), 1101 (Single Family Dwelling – Residential), and 7600 (Parks – Residential) or R-2. These residential zoned properties are physically separated from the Property by steep inclines and are up-gradient to the Site.

2.5 Past and Current Property Uses and Facilities

An area in the southern portion of the Property was used for the placement of fill materials, comprised of lime waste, shredder residue, sand, cobbles, dredged material, and construction/demolition debris. The lime waste fill is a by-product of the production of chlorinated solvents such as trichloroethene (TCE) and tetrachloroethene (PCE).

Shredder residue consists of by-products of scrap metal and automobile recycling, such as rubber, metal, and wire (auto fluff).

The former Property owner Don Oline indicated at a July 8, 2004 Site meeting with Ecology that, during the 1960s or 1970s, approximately 20,000-30,000 cubic yards of material dredged from the Hylebos at the General Metals "graving dock" was placed at the Site in a 6-foot-thick layer on top of the lime waste fill and auto fluff.

The Site was also used for the storage of automobile scrap parts and other metal items.

The Site is not currently in use and nearly all scrap materials and other surface debris have been removed.

2.6 Utilities and Water Supply

No subsurface utilities are present beneath the Site. All known utilities run parallel to Marine View Drive south of the Property.

Based on Ecology's database (Ecology, 2024a), there are no water supply wells within a 0.5-mile radius of the Site.

2.7 Potential Sources of Contamination from Neighboring Properties

There are several properties identified as "Facilities" and/or "Sites" in Ecology's Facility/Site Database (Ecology, 2024b). However, all of the properties identified are located down- to cross-gradient or at a distance greater than 0.25 mile. The closest property is the Oline Storage Yard site located to the west at 1915 Marine View Drive that is cross-gradient to the Site based on the Site groundwater contours—see Subsection 3.2—and at a significantly higher elevation—see Figure 2.1 and Subsection 3.1. The Oline Storage Yard site status is listed as No Further Action having complied with an agreed order. Therefore, there does not appear to be a potential for future contaminant migration in groundwater to the Site from neighboring properties.

As discussed in Subsection 2.3, water from a drainage swale to the east enters the wet area that is south of the Site. The surface water and sediment quality from this drainage swale, which could impact the wet areas south of the Site, have not been assessed. Therefore, there appears to be a potential for future contaminant migration in surface water (including water and suspended sediment), if present, to the wet areas south of the Site from neighboring properties.

3. Natural Conditions

3.1 Geology

Regionally, the Site (the fill area within the Property) and the Property, Puyallup River Valley, and surrounding area are part of the Puget Sound Lowlands, which are surrounded by the Puget Sound Bluffs (Bluffs). The Bluffs extend along the sides of the Puyallup River Valley and correspond to the north side of the Property. The slope of the southern half of the Site rises from an approximate elevation of 11 feet (ft) above mean sea level (AMSL) along Marine View Drive to an approximate elevation of 27 ft AMSL at the northernmost monitoring well—up-gradient well GM-B-3R. The northern half of the Property—north of up-gradient well GM-B-3R—rises more steeply to a bluff. The properties to the east and west of the Site are at higher elevations. The property to the east is approximately 160 ft AMSL and the property to the west is approximately 120 ft AMSL. Figure 2.1 depicts these elevation changes.

The shallow subsurface geology of the Site has been defined using data collected during the installation of 37 test pits, 15 drilled boreholes, 7 hand-augered boreholes, and 9 monitoring wells (7 existing and 2 abandoned). The logs of the monitoring wells, test pits, and boreholes are presented in Appendix C—for monitoring wells and Appendix D—for test pits and boreholes.

The shallow soils at the Site are divided into three stratigraphic units; topsoil, fill materials [sand and shredder residue, construction/demolition debris and lime waste], and native sediments. The alignments of stratigraphic cross-sections through the Site are depicted on Figure 3.1. Stratigraphic cross-sections are presented on Figures 3.2 and 3.3.

The topsoil unit is brown, clayey silt having low plasticity. The thickness of the topsoil ranges from 0 to 0.7 ft but generally is not more than 0.5 ft thick.

Below the topsoil, the Site consists of imported fill materials made up primarily of sand and shredder residue fill with varying amounts of silt, gravel, cobbles, lime waste fill, and construction debris. The imported fill materials cover approximately 40 percent of the Property and extends from land surface to a depth of as great as 20 ft below ground surface (ft bgs). At some locations along the flanks of the Property in close proximity to the drainage swales, the shredder residue is observed at or just below the surface. The lime waste fill, as encountered during the investigations, is a gray to beige fine-grained material with medium to high plasticity and is typically present as a defined single layer at depth within the sand and shredder residue fill. A portion of the lime waste fill to the east, between GM-B-6A and TP-34, is overlain by the sand and shredder residue fill and underlain by native sand, silty sand with peat. The thickness of the lime waste fill ranges from approximately 1.0 to 5.0 ft and is typically greater than 7.5 ft below the ground surface. The estimated areal limits of sand and shredder residue fill and lime waste fill are depicted on Figure 3.1.

The upper native sediments below the imported fill materials are brown, intermixed, silty sands, clayey silts, and peat, with plasticity ranging from low to high.

3.2 Groundwater

Hydrographs from the 1998 hydraulic monitoring program indicate that there is no response in the monitoring wells to the tidal fluctuations in the Hylebos indicating a lack of hydraulic connection.

Water levels measured on August 12, 2014, during a groundwater sampling program, were used to prepare groundwater contour maps to determine groundwater flow direction within and below the imported fill materials. The 2014 groundwater contours presented on Figures 3.4 and 3.5 show that the groundwater flow direction at both depths is from northeast to southwest, the same direction that the ground surface slopes. As noted on Figure 3.5, well GM-B-6A was observed to be artesian when water levels were measured in 2014. The casing of GM-B-6A was temporarily extended to measure the hydraulic head at the well.

Water levels measured on June 10, 2024, during a groundwater sampling program, were used to prepare updated groundwater contour maps. The 2024 groundwater contours presented on Figures 3.6 and 3.7 show that the groundwater flow direction at both depths is from northeast to southwest, the same direction that the ground surface slopes, which is consistent with the 2014 contours. As noted on Figure 3.7, well GM-B-6A was observed to be artesian when water levels were measured in 2024. The casing of GM-B-6A was temporarily extended to measure the hydraulic head at the well.

On August 12, 2014, the horizontal flow gradient of the shallow groundwater ranged from 0.03 foot/foot (ft/ft) to 0.04 ft/ft. Horizontal flow gradients of the groundwater beneath the depth of the imported fill materials ranged from 0.03 ft/ft to 0.05 ft/ft.

On June 10, 2024, the horizontal flow gradient of the shallow groundwater ranged from 0.03 foot/foot (ft/ft) to 0.04 ft/ft. Horizontal flow gradients of the groundwater beneath the depth of the imported fill materials ranged from 0.02 ft/ft to 0.04 ft/ft. These gradients are consistent with the 2014 data.

In 2014, water level data between the shallow and deeper well pairs indicate upward vertical gradients that ranged from 0.18 ft/ft to 0.86 ft/ft. The average vertical gradient was calculated as 0.45 ft/ft upward.

Groundwater springs emerge from the base of the hill slope at the north side of the Property. During the 2014 investigation, the springs fed two small drainage swales that traversed the Property along the eastern and western flanks of the Property. During the 2024 investigation, it was observed that water was flowing within the eastern drainage swale—presumably from springs at or near the base of slope to the north—and the western drainage swale was blocked by a small landslide near up-gradient groundwater monitoring well GM-B-3R and water was not flowing within the swale.

3.3 Surface Water

Surface runoff on the Property is directed into a drainage swale running along the eastern flank of the Property and to a lesser extent across the Site as sheet flow, discharging to wet areas situated at the southern boundary of the Property generally between the southern property boundary and Marine View Drive. Previously, there was a drainage swale running along the western flank of the Property that is now blocked. A small surface water drainage swale enters the wet areas from the east, presumably consisting of surface runoff and/or spring water from properties to the east. The wet areas drain through a culvert off the southwestern corner of the Property and ultimately discharging to the Hylebos.

Two nearby surface water bodies, both marine waters, include Hylebos Waterway located approximately 700 ft southwest, and Commencement Bay located approximately 2.2 miles northwest.

3.4 Natural Resources and Ecological Receptors

A Terrestrial Ecological Evaluation (TEE) Form (Ecology, 2014) was completed for the Site. According to WAC 173-340-7492(2), a simplified TEE screening procedure includes exposure analysis, pathway analysis, and contaminants analysis. The simplified TEE screening steps are presented in the following documents that are included in Appendix E:

- Aerial Map showing a 500-ft radius surrounding the Site;
- TEE exposure analysis per Table 749-1 in WAC 173-340-900;
- TEE contaminants analysis per Table 749-2 in WAC 173-340-900; and
- TEE simplified evaluation documentation form.

The exposure analysis per Table 749-1 did not exclude the Site from further evaluation because of the impacted fill materials and undeveloped lands on and surrounding the Site. The contaminants analysis identified multiple concentrations on Site exceeding the hazardous substance concentrations listed in Table 749-2. Pathway analysis indicated that no physical barrier covering the imported sand and shredder residue fill is currently present on Site and therefore the terrestrial ecological protection pathway is currently complete. However, if a physical barrier were to be placed within a time frame acceptable to the Ecology as part of a remedy, this pathway would be considered incomplete according to WAC 173-340-7492(2)(b).

4. Contaminant Occurrence and Movement

The following subsections present a summary of investigations conducted, investigation results, and descriptions of contaminant occurrence and movement—as applicable—at the Site. The data from all investigations are presented in Tables 4.1, 4.2, 4.3, and 4.4. The subsections also compare concentrations in groundwater and surface water over time using the 2014 data—presented in the 2016 RI—and the 2024 data. The comparison appears to indicate that attenuation of organic contaminants in groundwater is occurring and there does not appear to be significant migration of contaminants from the Site (the fill area within the Property) as discussed in more detail below. Additionally, comparison of the 2024 metals data with the 1998/1999 metals data, groundwater quality appears to have improved at well locations GM-B-1A, GM-B-2A, GM-B-3R (up-gradient well), GM-B-6A, and GM-B-6R.

4.1 Summary of Investigations Conducted at the Site

Investigation conducted at the Site between 1984 and 2024 are summarized in the following Subsections:

Subsection 4.1.1 Investigations Prior to 2014

Subsection 4.1.2 2014 Investigation

Subsection 4.1.3 2024 investigation

4.1.1 Investigations Prior to 2014

Four investigations were conducted at the Site from 1984 to 2004. The 1984 to 2004 investigations include:

- **September 1984 Investigation:** This investigation included the installation of eight boreholes for geologic sampling, installation of four shallow groundwater monitoring wells to total depths ranging from 10 to 12 ft bgs and groundwater sampling, and the collection and analyses of two surface water samples. The sampling and well locations are depicted on Figure 2.2. The results of this investigation were previously reported in the Tacoma Off-Plant Disposal Site Investigation (CRA, 1984).
- **September 1988 Investigation:** This investigation included sampling groundwater from the four previously installed groundwater monitoring wells. The sampling and well locations are depicted on Figure 2.2. The results of this investigation were previously reported in the 1988 memorandum (OSEP, 1988).
- **November 1998 to January 1999 Investigation:** In 1998, Ecology requested that OCC review the existing Site investigation data and current Site conditions to determine whether additional work should be considered to complete the Site evaluation. Pursuant to Ecology's request, a data review and work plan entitled, Review of Site Conditions and Proposed Additional Work (CRA Services, 1998) was prepared and submitted to Ecology for review and comment in September 1998. The work plan presented the results of the previous investigations as well as a review of the data with recommendations for appropriate further investigative activities. The activities proposed in the work plan were designed to confirm the results of the earlier investigations and to determine whether there are any sources or volumes of impacted materials that were not previously identified. Comments dated September 23, 1998, were

received from Ecology and responses were submitted on October 29, 1998. OCC and Ecology were in agreement on the responses to the comments and field activities were conducted between November 18, 1998, and January 12, 1999. The sampling locations are depicted on Figure 2.2. The results of this investigation were previously reported in March 1999 in the Site Characterization Report (CRA Services, 1999). As presented in Table 4.1, elevated levels (concentrations above 2025 preliminary cleanup levels) of arsenic in shallow soils (up to 3.5 ft bgs), chromium and mercury in surface soils (0-0.5 ft bgs), and lead in surface soils and composited soils were present at a few 1998 investigation locations. Note that the preliminary screening levels for lead and mercury are based on MTCA Method A values for comparison purposes because there are no MTCA Method C values. Also, the chromium preliminary cleanup level is based on hexavalent chromium (CrVI). Chromium concentrations in soil are below the MTCA Method C industrial cleanup level for trivalent chromium (CrIII). The report confirmed the conclusions from the previous investigations with some modifications to the limits of the fill materials.

- **October 2004 Investigation:** This investigation included collecting four samples of the lime waste fill from four separate boreholes at the Site to characterize the lime waste fill for potential off-Site disposal purposes in anticipation of evaluating remedial alternatives for the Site. The sampling locations are depicted on Figure 2.2. The analytical results from this investigation were presented in Subsection 4.3 of the 2013 RI/FS Work Plan (CRA, 2013).

A summary of previous investigations conducted on Site is present in Appendix F. The logs of the monitoring wells, test pits, and boreholes are presented in Appendix C—for monitoring wells—and Appendix D—for test pits and boreholes.

4.1.2 2014 Investigation

The 2014 investigation was conducted pursuant to the 2007 Agreed Order No. DE 1679. CRA conducted an investigation between August and December 2014 based on CRA's approved 2013 RI/FS Work Plan. The investigation activities and results are discussed below.

4.1.2.1 2014 Site Activities

In order to determine the horizontal and vertical limits of the fill materials, delineate the horizontal and vertical extent of elevated parameter concentrations in soil/fill and groundwater, determine the physical properties of the soils and fill materials, and establish representative background concentrations for metals, the following field activities were conducted by CRA in 2014:

- inspected all existing groundwater monitoring wells GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6R, and GM-B-6A, and identified that well GM-B-6R had approximately 2 ft of sediments accumulated at the bottom;
- redeveloped well GM-B-6R to ensure hydraulic connection between the monitoring well and surrounding groundwater;
- sampled all existing groundwater monitoring wells using low-flow methods;
- oversaw advancement of seven borings, GP-1 through GP-7, to depths ranging from 20 to 30 ft bgs via direct push drilling technique, and collected three to four soil/fill samples from the drilling cores corresponding to depths ranging from 4 to 25 ft bgs;

- oversaw excavation of 14 test pits, TP-24 through TP-38 (except TP-37 that was not completed during this mobilization due to access limitations), to depths ranging from 8 to 16 ft bgs, and collected soil/fill samples associated with test pits TP-24, TP-28, and TP-38 at depths ranging from 2.5 to 11 ft bgs;
- completed a borehole using a hand auger at location TP-37 to a depth of 8.0 ft bgs and collected three soil/fill samples at 2, 5, and 7.5 ft bgs;
- collected eight sediment samples, SD-05 through SD-12, and five surface water samples, SW-01 through SW-05;
- completed six hand auger boreholes at locations HA-01 through HA-05B to a maximum depth of 8.0 ft bgs, to further delineate the lateral extent of the sand and shredder residue fill; and
- conducted slug tests in all existing monitoring wells.

4.1.2.2 2014 Investigation Results

Soil/Fill Analytical Results

Boring and test pit locations are depicted on Figure 2.2. Selected samples from the borings and test pits were collected and analyzed for the Target Compound List/Target Analyte List (TCL/TAL) parameters in 2014. These parameters include volatile organic compounds (VOCs,) semi-volatile organic compounds (SVOCs), pesticides, PCBs, and metals. The laboratory analytical reports are provided in Appendix G.

CRA collected 21 soil/fill samples from the seven borings GP-1 through GP-7, at depths ranging from 4 and 25 ft bgs in 2014. These soil/fill samples include soil below or within the fill materials and native soil samples. CRA also collected seven soil/fill samples from two test pits TP-24 and TP-38 and one hand-auger borehole TP-37 in 2014. Among these, TP-24 is located on the north end of the sand and shredder residue fill; TP-37 and TP-38 are located outside the fill materials and serve as background data points. All soil/fill samples were analyzed for TCL/TAL parameters. The soil/fill analytical results from this investigation along with historical soil/fill analytical data are included in Table 4.1. No concentrations in soil/fill samples from the 2014 investigation exceeded Ecology's MTCA Method C cleanup levels for industrial land. There are no MTCA Method C cleanup levels for industrial land for lead and mercury; however, there are values for Method A that are presented in Table 4.1 for comparison purposes. The 2014 soil/fill samples collected from the sand and shredder residue fill at 11 ft bgs from borings GP-1 and GP-2 and at 5 ft bgs from boring GP-4 contained elevated concentrations of lead—ranging from 1,230 milligrams per kilogram (mg/kg) in GP-1 to 2,310 mg/kg in GP-2. Elevated concentrations of mercury were present in GP-1 (23 ft bgs) and GP-2 (11 ft bgs)—ranging from 3.09 mg/kg in GP-2 to 4.63 J (estimated) mg/kg in GP-1. These lead and mercury concentrations exceed Ecology's MTCA Method A cleanup levels for industrial land. Prior to 2014, elevated concentrations of lead, mercury, arsenic, and chromium were detected—see Table 4.1. Figure 4.1 depicts the exceedances in soil.

Separate from the other imported fill materials (e.g., sand and shredder residue, cobbles, dredged material, and construction/demolition debris) is a layer of lime waste fill. During the 2014 field effort, the lime waste fill was encountered in borings GP-1 and GP-2 between approximately 9 and 10 ft bgs, and in test pit TP-28 between approximately 7.5 and 8.5 ft bgs. Lime waste fill was not encountered in other borings and test pits.

CRA collected soil/lime waste fill samples at 10 ft bgs from GP-1, 9 ft bgs from GP-2, and 8 ft bgs from TP-28 for Toxicity Characteristic Leaching Procedure (TCLP) analyses of VOCs, SVOCs and metals in 2014. The analytical results are presented in Table 4.1. TCE and PCE are the only two VOCs, lead the only metal, and 4-methylphenol and hexachlorobutadiene the only two SVOCs with detectable TCLP concentrations. These concentrations are all below United States Environmental Protection Agency (EPA) (EPA, 2006) and Ecology (Ecology, 2020) TCLP regulatory levels. A more detailed discussion of the TCLP analyses of lime waste fill samples collected during the historical borehole installations and sampling program (CRA, 2004) is presented in Subsection 4.2.2.

Groundwater Analytical Results

CRA collected groundwater samples from all existing monitoring wells GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R (up-gradient well), GM-B-6R, and GM-B-6A in 2014 (Figure 2.2). All 2014 groundwater samples were analyzed for TCL/TAL parameters. The laboratory analytical reports are provided in Appendix G. The analytical results from this investigation along with historical groundwater sampling data are included in Table 4.2. During the 2014 investigation, concentrations were detected above surface water cleanup levels for marine receptors (refer to Subsection 2.2) for the following parameters (locations shown in parentheses):

- arsenic (GM-B-1, GM-B-2, GM-B-6R);
- chromium (GM-B-1, GM-B-2A);
- copper (GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6R);
- lead (GM-B-1, GM-B-2, GM-B-6R);
- manganese (GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6R);
- mercury (GM-B-1, GM-B-6R);
- nickel (GM-B-1, GM-B-2, GM-B-6R);
- zinc (GM-B-1, GM-B-2);
- aroclor-1254 (GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6A);
- total cyanide (GM-B-1);
- bis(2-ethylhexyl)phthalate—B2EP or DEHP (GM-B-2, GM-B-2A, GM-B-6A, GM-B-6R);
- hexachlorobutadiene (GM-B-6R);
- benzene (GM-B-6R);
- PCE (GM-B-6R);
- TCE (GM-B-6R);
- vinyl chloride (VC) (GM-B-2, GM-B-6A, GM-B-6R); and
- hexachlorobenzene (GM-B-6A, GM-B-6R).

The parameters that exceed surface water cleanup levels for marine receptors at the up-gradient well GM-B-3R include copper, manganese, and aroclor-1254, which were present at all wells at the Site except aroclor-1254 in GM-B-6R. The other metals listed above were also detected at the up-gradient well GM-B-3R, but below the cleanup levels. Concentrations of organic parameters were most prevalent at well GM-B-6R.

Note that the above comparison does not take into account attenuation related to the groundwater to surface water pathway.

The exceedances for available groundwater data are depicted on Figures H.1 (VOCs/SVOCs), H.2 (metals), and H.3 (PCBs, pesticides and total cyanide) in Appendix H.

Surface Water Analytical Results

CRA collected five surface water samples, SW-01 through SW-05, from each of the drainage swales at the locations depicted on Figure 2.2 in 2014. Sample SW-01, SW-03, and SW-05 were collected in the up-drainage, down-drainage, and middle-drainage of the southern drainage swale, respectively. Sample SW-01 represents the quality of surface water up-drainage of the Site or the background condition. Sample SW-03 and SW-05, when compared to sample SW-01, represents the potential influence of surface water discharged from the Site. Sample location SW-02 was collected from the east drainage swale representing the quality of the water discharged from the eastern portion of the Site. Sample SW-04 was collected from the west drainage swale representing the quality of the water discharged from the western portion of the Site.

2014 surface water samples were analyzed for TCL/TAL parameters. The laboratory analytical reports are provided in Appendix G. The 2014 surface water analytical results from this investigation along with historical surface water analytical data are included in Table 4.3. As depicted in Table 4.3, the 2014 data indicate concentrations of the following parameters (locations shown in parentheses) were detected above the surface water cleanup levels for marine receptors:

- arsenic (SW-02, SW-05);
- copper (SW-02);
- manganese (SW-03, SW-04);
- aroclor-1254 (SW-01, SW-02, SW-03, SW-04, SW-05); and
- hexachlorobenzene (SW-01, SW-02, SW-05).

The data and exceedances are depicted on Figures H.4 (metals) and H.5 (PCBs and pesticides), in Appendix H, along with historical data.

Arsenic was detected at concentrations exceeding the surface water cleanup level for marine receptors at location SW-02 (duplicate— original sample and average of the two samples concentrations were below cleanup level) and SW-05 in 2014. These arsenic concentrations were marginally above the background concentration, but similar. These concentrations decrease to below the surface water cleanup level for marine receptors and background concentrations after merging with the west runoff and at the final outflow along the southwest corner of the Property (SW-03).

Copper was detected at a concentration marginally exceeding surface water cleanup level for marine receptors at location SW-02 (duplicate—original sample and average of the two samples concentrations were below cleanup level) in 2014. However, the down-drainage 2014 sample SW-03 contained a copper concentration that was lower than the 2014 background concentration at SW-01.

Manganese was detected at concentrations exceeding the surface water cleanup level for marine receptors in the 2014 samples collected from the west drainage swale (SW-04) and down-drainage of the Site (SW-03), ranging from 265 micrograms per liter (µg/L) (SW-04) to 276 µg/L (SW-03). The 2014 background manganese concentration in sample SW-01 was 62.4 µg/L.

Aroclor-1254 was detected at concentrations exceeding surface water cleanup level for marine receptors in all 2014 surface water samples, including the background sample. The 2014 concentrations of aroclor-1254 ranged from 0.0010 J (estimated) µg/L in the up-drainage sample

SW-01 to 0.017 J (estimated) µg/L in the east drainage swale sample SW-02. The concentrations decreased down-drainage from SW-02.

Hexachlorobenzene was detected at similar estimated concentrations in the 2014 samples from background location SW-01, the east drainage swale at SW-02, and the middle of the southern drainage swale at SW-05 at above the surface water cleanup level. Hexachlorobenzene was not detected down-drainage at SW-03.

Note that the above comparison does not take into account attenuation related surface water discharging to the Hylebos.

Sediment Analytical Results

CRA collected eight sediment samples, SD-05 though SD-12, at the locations depicted on Figure 2.2 in 2014. The 2014 samples were analyzed for TCL/TAL parameters. The laboratory analytical reports are provided in Appendix G. Samples SD-05 and SD-06 were collected from the east drainage swale and samples SD-09 and SD-10 were collected from the west drainage swale. Samples SD-07 and SD-08 were collected from the southern drainage swale. Sample SD-11 was collected on north end of the Site up-drainage of the east and west drainage swales. Sample SD-12 was collected up-drainage of the southern drainage swale representing the quality of sediments up-drainage of the Site or the background condition.

All 2014 analytical results were compared to the sediment chemical criteria established by WAC 173-204-562(2) Table III, Marine Sediment. According to WAC 173-204-562(2), two chemical criteria are established, including sediment cleanup objectives and cleanup screening levels. The sediment cleanup objectives establish a no adverse effects level; chemical concentrations at or below the sediment cleanup objectives correspond to sediment quality that results in no adverse effects to the benthic community. The sediment cleanup screening levels (SCSLs) establish a minor adverse effects level; chemical concentrations at or below the cleanup screening levels but greater than the sediment cleanup objectives correspond to sediment quality that results in minor adverse effects to the benthic community. The 2014 sediment analytical results from this investigation and historical investigation along with two chemical criteria are included in Table 4.4.

Concentrations of VOCs, SVOCs, PCBs, pesticides, and most metals reported in 2014 were detected below the corresponding sediment cleanup objectives, meaning these concentrations would not cause adverse effects.

Two metals—zinc and arsenic—were detected above the corresponding sediment cleanup objectives, but below the cleanup screening levels. Zinc in SD-05 from east drainage swale, and SD-07 and SD-08 from southern drainage swale was detected at concentrations ranging from 570 mg/kg (SD-05) to 947 mg/kg (SD-07). Arsenic in SD-08 from southern drainage swale was detected at a concentration of 66.3 mg/kg. These concentrations could potentially result in minor adverse effects. Mercury, a third metal, was detected at 0.846 mg/kg in sample SD-07 and at 3.03 mg/kg in sample SD-06 above the corresponding cleanup screening levels and could potentially result in greater adverse effect. Sample SD-06 was collected from east drainage swale and SD-07 was collected from the east portion of the southern drainage swale, indicating the mercury impact is present in the sediment on the eastern portion of the Site.

Note that the above comparison does not take into account attenuation related to potential sediment migration to the Hylebos.

The data and exceedances are depicted on Figures 4.2 (metals) along with historical data.

Slug Test Results

CRA conducted slug tests in 2014 to collect data for determining hydraulic conductivity at the Site for potential future use. The slug tests were conducted on all existing monitoring wells, GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6R, and GM-B-6A, on December 19 and 22, 2014. All test exhibit exponential-decay (over-damped) slug test response behavior indicative of low to intermediate permeability conditions. The calculated estimated average hydraulic conductivities (Ks) range between 0.0000257 centimeter per seconds (cm/s) to 0.000254 cm/s, or 0.073 to 0.72 ft per day. Based on the hydraulic conductivity values, the perched water unit on Site is semi-pervious and has low permeability. The slug test results are presented in Appendix I.

4.1.3 2024 Investigation

Geosyntec conducted an investigation between February and June 2024 based on the approved SOW. The investigation activities and results are discussed below.

4.1.3.1 2024 Site Activities

The objective of the 2024 investigation was to supplement the 2016 RI data with current conditions data for the purpose of confirming the conceptual site model (Section 5) and completing the RI. The following field activities were conducted in 2024:

- Prior to any field mobilization, a project specific Task Hazard Analysis (THA) was completed, reviewed, and signed by field staff and subcontractors in accordance with Geosyntec's Health and Safety program requirements.
- On February 21 and 22, 2024, Geosyntec conducted Site reconnaissance to observe Site conditions and oversight of vegetation clearing activities—conducted by Land Care (a Geosyntec subcontractor)—to provide access to the proposed sampling locations. During the Site reconnaissance, Geosyntec noted that the seven groundwater monitoring wells proposed to be sampled required redevelopment because of obstructions in the casings or buildup of silt in the bases of the monitoring wells.
- On March 28th, 2024, Geosyntec staff completed surface water sampling at 6 locations—SW-01, SW-02, SW-03, SW-05, SW-07 and SW-08—and quality control sampling that included one trip blank, one duplicate sample, and one method spike and method spike duplicate (MS/MSD) sample set. Samples were collected consistent with the methods outlined in the approved SOW. Sample locations are presented on Figure 2.1. Sample locations SW-01 through SW-05 were attempted to be collected at the same former locations sampled in 2014. Due to a drainage swale change, sample locations at SW-02 and SW-03 were minorly shifted from the original locations. Due to a small landslide near up-gradient groundwater monitoring well GM-B-3R (Figure 2.1), the drainage swale on the west side of the Site was blocked and water was not flowing within; therefore SW-04 (at the former SW-04 location) and SW-06 (a new proposed sample up-drainage of SW-04) were not capable of being sampled. Sample location SW-05 was sampled in approximately the same area as previous sampling. Sample

locations SW-07 and SW-08 were added to the surface water sampling program to provide a more comprehensive understanding of up-drainage surface water quality.

- On May 14th, 2024, based on the Site reconnaissance event, Geosyntec staff completed oversight of groundwater monitoring well redevelopment conducted by Holt Services (a Geosyntec subcontractor) at monitoring well locations depicted on Figure 2.1. Holt Services bailed silt material collected at the bottom of each well with a decontaminated stainless-steel bailer until a "hard" bottom was observed in the monitoring well. Holt then surged each monitoring well screen with a surge block to clear the screen. Holt then purged each well with a down-well electric pump until turbidity below 50 nephelometric turbidity units (NTUs) was achieved. All wells achieved below the target NTUs besides location GM-B-1A which exhibited slow recharge and remained slightly turbid (approximately 150 NTUs). Approximately 25 to 40 gallons of groundwater was purged from each well. No odors or sheens were observed. After the completion of redevelopment activities, monitoring wells were gauged to total depth with a water level meter, well caps were replaced with new caps, and wells were locked for security.
- On June 10 and 11, 2024, Geosyntec staff completed groundwater gauging and groundwater sampling activities at monitoring well locations depicted on Figure 2.1. During groundwater monitoring activities, one groundwater sample was collected from each of the seven existing monitoring wells, along with quality control samples including one trip blank, one duplicate sample, and one method spike and method spike duplicate (MS/MSD) set. Monitoring wells were sampled using low-flow sampling techniques following procedures in the approved SOW. During gauging, monitoring well location GM-B-6A was observed to be artesian, and a polyvinyl chloride (PVC) extender was added to the top of the casing to facilitate groundwater collection.

4.1.3.2 2024 Investigation Results

The groundwater and surface water sample locations are depicted on Figure 2.1. The laboratory analytical reports are provided in Appendix G. Field Forms are presented in Appendix J. Data Verification Reports (DVRs) for 2024 are presented in Appendix K.

Groundwater Analytical Results

Groundwater from seven monitoring wells within the fill area was sampled and analyzed for TCL/TAL parameters to determine groundwater quality at the Site in 2024. Table 4.2 provides an analytical summary of parameters detected in the groundwater and the chemical concentrations of these parameters at each well. During the 2024 investigation, concentrations were detected above surface water cleanup levels for marine receptors (refer to Subsection 2.2) for the following parameters (locations shown in parentheses):

- arsenic (GM-B-1, GM-B-2, GM-B-3R);
- chromium (GM-B-1, GM-B-6A);
- copper (GM-B-1, GM-B-2, GM-B-3R, GM-B-6A);
- lead (GM-B-1, GM-B-2, GM-B-6R);
- manganese (GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6R);
- nickel (GM-B-1, GM-B-2, GM-B-3R);
- silver (GM-B-1A, GM-B-2);
- zinc (GM-B-1, GM-B-2);
- aroclor-1254 (GM-B-1);
- B2EP (GM-B-1, GM-B-2);

- benzene (GM-B-1); and
- vinyl chloride (VC) (GM-B-2, GM-B-6A, GM-B-6R).

The exceedances and sample locations are depicted on Figure 4.3. As depicted on Figure 4.3, concentrations of parameters that were detected in the up-gradient well GM-B-3R exceeding the cleanup levels include four metals: arsenic, copper, manganese, and nickel. VOCs, SVOCs, and PCBs were not detected in up-gradient well GM-B-3R.

Surface Water Analytical Results

Surface water samples were collected from the drainage swales immediately west, north, and south of the fill area. Table 4.3 presents a summary of parameters detected in the surface water samples and the concentrations of these parameters. As depicted in Table 4.3, the 2024 data indicate concentrations of the following parameters (locations shown in parentheses) were detected above the surface water cleanup levels for marine receptors:

- copper (SW-07);
- manganese (SW-03);
- thallium (SW-05); and
- B2EP (SW-01).

The exceedances and sample locations are depicted on Figure 4.4. As depicted on Figure 4.4, the exceedances are sporadic. No VOCs or SVOCs were detected except for acetone, B2EP, and dimethyl phthalate. No pesticides or cyanide were detected in surface water samples.

4.2 Contaminant Occurrence in Soil/Fill

Soils and fill (soil/fill) at the Site were investigated between 1984 and 2014. During these investigations, the following scope of work was completed:

- A total of 37 test pits were excavated, including TP-1 through TP-23 in 1998 and TP-24 through TP-36 and TP-38 in 2014;
- A total of 17 borings were advanced, including BH-1 through BH-4 in 2004 and GP-1 through GP-7, HA-1 through HA-5B, and TP-37 in 2014;
- A total of 45 soil or fill (soil/fill) material (lime waste, shredder residue, sand, etc.) samples were collected from these borings and test pits and submitted for laboratory analyses; and
- One surficial soil sample was collected in 1998 representing background.

4.2.1 Sand and Shredder Residue Fill, and Lime Waste Fill Delineation

Delineation of Sand and Shredder Residue Fill

Delineation of sand and shredder residue fill (including gravel, sand, cobbles, and various debris) is well defined immediately surrounding the lime waste fill as illustrated by the cross-sections depicted on Figures 3.2 and 3.3 as a result of previous investigations prior to 2014 that were focused on delineation of the lime waste fill. However, the lateral extent of the sand and shredder residue fill within the Property was not as well defined. Consequently, fourteen additional test pits (TP-24 through TP-36 and TP-38) were completed in 2014 focused along the periphery of the known sand and shredder residue fill to better define the limits. Test pit location TP-37 was completed with a

hand auger due to limited access and permit restrictions. Thirteen test pits (TP-24 through TP-36) encountered sand and shredder residue fill. The limits of the sand and shredder residue fill extend across nearly all of the flat land between the hill slopes along the western and eastern flanks of the Property.

Locations TP-37 and TP-38 were completed on the north side of the drainage swales headwaters at locations of expected native material. The material observed was consistent with native soils and not the fill materials. Soil samples from locations TP-37 and TP-38 are considered background soil conditions for the Site. Limited access and steep terrain prevented the continuation of test pitting beyond the drainage swales on either the western or the eastern sides of the Property. To confirm the lateral extent of the sand and shredder residue fill, a series of six hand-auger boreholes were advanced as depicted on Figure 2.2. No sand and shredder residue fill were observed in the six hand-auger boreholes except at HA-05B. A review of the local topography and hand auger data (HA-01 to HA-05B) suggest portions of the drainage swales are flowing across sand and shredder residue fill. Figure 3.1 depicts an estimated limit of fill materials.

Delineation of Lime Waste Fill

Delineation of the lime waste fill was conducted through a combination of test pit excavations for horizontal delineation and borehole drilling for vertical delineation. Test pits were excavated on a grid pattern with a spacing of approximately 25 ft in order to delineate the horizontal extent of lime waste fill. Boreholes were then advanced to delineate the vertical extent of the lime waste fill. The defined areal extent of the lime waste fill is depicted on Figure 3.1 and is well defined. The vertical extent is depicted on the cross-sections presented on Figures 3.2 and 3.3 and also is well defined. As depicted on the figures, the lime waste fill is located at depth and typically within the sand and shredder residue fill. A portion of the lime waste fill to the west, between GM-B-6A and TP-34, is overlain by the sand and shredder residue fill and underlain by native sand, silty sand with peat.

4.2.2 Investigation Data

Table 4.1 presents a summary of the parameters detected in the soils/fill related to various fill materials along with the analyte concentrations of these parameters. The soil/fill exceedances and sample locations are depicted on Figure 4.1.

Lime Waste Fill Investigation Data

Samples collected from or immediately beneath the lime waste fill layer include: one 1998 composite sample from test pits TP1-98/TP3-98/TP-4-98/TP5-98/TP8-98; three 2004 discrete samples from boreholes BH-1, BH-2, and BH-4; two soil/fill samples from 2014 borings GP-1 and GP-2; and one soil/fill sample from 2014 test pit TP-28. The 1998 and 2004 samples were analyzed for the TCL/TAL parameters to determine their analyte composition. The four samples from boreholes BH-1 through BH-4 and three samples from boring GP-1, boring GP-2, and test pit TP-27 were analyzed by TCLP to characterize the material. The lime waste fill analytical data are presented in Table 4.1.

As depicted in Table 4.1, there were no parameters detected in the lime waste fill at concentrations that exceed MTCA Method C industrial soil cleanup levels. The results from the TCLP analyses completed in 2004 indicate one concentration (PCE in the sample from BH-4) that exceeded EPA's

and Ecology's TCLP regulatory level. Data from 2014 indicate no exceedances of the TCLP regulatory levels.

Sand and Shredder Residue Fill Investigation Data

A total of 15 soil/fill samples collected to date are associated with the sand and shredder residue fill. These samples were analyzed for TCL/TAL parameters. No metal concentrations were above MTCA Method C industrial soil cleanup levels in the sand and shredder residue fill samples. No concentrations of VOCs, SVOCs, PCBs, or pesticides were detected above MTCA Method C industrial soil cleanup levels in these samples.

As depicted in Table 4.1, five samples containing concentrations of lead and one sample containing a concentration of mercury exceeding MTCA Method A industrial soil cleanup levels (no MTCA Method C values are available for these metals) include

- lead: 1,230 mg/kg from GP-1 (11 to 11.5 ft bgs), 2,310 mg/kg from GP-2 (11 to 11.5 ft bgs), 1,280 mg/kg from GP-4 (5 to 5.5 ft bgs), 2,470 and 2,690 mg/kg from TP comp(A2) (1 to 8.5 ft bgs). As stated in Subsection 4.1.2, soil samples from TP-37 and TP-38 provide background data. The background lead concentrations are 6.6 mg/kg from 5 to 5.5 ft bgs (TP-37), 3.6 mg/kg from 11 to 11.5 ft bgs (TP-38), and 1.8 mg/kg from 7.5 to 8 ft bgs (TP-37); and
- mercury: 3.09/4.63 J (estimated) mg/kg from GP-1 (11 to 11.5 ft bgs). The background mercury concentration is 0.015 J (estimated) mg/kg from 11 to 11.5 ft bgs (TP-38).

Other Types of Fill Materials Investigation Data

Surficial and subsurface soil/fill samples were collected from fill materials within, or immediately below other types of fill materials encountered such as sand fill, debris, and "cobbles."

One composite subsurface soil/fill sample was collected from sand fill between the depths of 0.5 and 8.5 ft bgs and analyzed for TCL/TAL parameters. No concentrations were detected above MTCA Method C industrial soil cleanup levels in this sand fill sample.

Porous orange to black rock-like fragments were encountered in test pits TP-17 and TP-23. These fragments are referred to in the test pit logs and this report as "cobbles." Since the source of the cobbles could not be determined from their appearance, one soil/fill sample was collected underlying the cobbles from TP-17 between 3 and 3.5 ft bgs and analyzed for TCL/TAL parameters to determine whether the cobbles may have contributed to elevated concentrations in soils/fill. The sample below the cobbles contained a concentration of arsenic of 422 mg/kg that exceeds the MTCA Method C industrial soil cleanup level. The background arsenic concentration at the Site is 4.3 mg/kg from 2.5 to 3 ft bgs (TP-38).

Surficial soil/fill sample SL-1 collected on the west side of the Site from another fill material containing debris, not consistent with sand and shredder residue fill, at depths between 0.5 and 1 ft bgs contained concentration of arsenic of 1,180 mg/kg exceeding the MTCA Method C industrial soil cleanup level. Surficial soil/fill sample TP-21 collected on the northern part of the Site from another fill material, not consistent with sand and shredder residue fill, at depths between 0 and 0.5 ft bgs contained concentrations of arsenic (103 mg/kg) and chromium (849 J [estimated] mg/kg) exceeding MTCA Method C industrial soil cleanup levels and lead (6,030 mg/kg) and mercury

(17.6 J [estimated] mg/kg) exceeding MTCA Method A industrial soil cleanup levels. The arsenic, chromium, lead and mercury concentrations in shallow soil from 2 to 2.5 ft bgs in background test pit TP-37 are 2.9 J (estimated), 23.5, 6.4 and 0.026 mg/kg, respectively.

A composite surficial soil/fill sample was also collected from the fill materials within the footprint of and above the lime waste fill at depths between 0 and 0.5 ft bgs. No concentrations were detected above MTCA Method C industrial soil cleanup levels in this surficial soil/fill sample.

The Site is located within the Tacoma Smelter Plume area. According to a data report prepared for Ecology in 2004 (Glass, 2004), arsenic concentrations in the background soils in this area range from non-detect to 20 mg/kg. The lead concentrations range from non-detect to 250 mg/kg. Arsenic and lead were detected on the Site at concentrations above these values.

Subsurface Native Soil Investigation Data

A total of 14 native soil samples were collected within the footprint of the fill materials between depths of 14 and 25.5 ft bgs. Additionally, six native soil samples were collected outside of fill materials between depths of 2 and 11.5 ft bgs. All these native soil samples were analyzed for TCL/TAL parameters. No concentrations were detected above MTCA Method C industrial soil cleanup levels in these samples.

4.3 Contaminant Occurrence and Movement in Groundwater

A total of nine groundwater monitoring wells were installed on Site—within the fill area on the Property. Wells GM-B-1, GM-B-2, GM-B-3, and GM-B-6 were installed in 1984. Wells GM-B-3R, GM-B-6R, GM-B-1A, GM-B-2A, and GM-B-6A were installed in 1998. Wells GM-B-3R and GM-B-6R were installed to replace decommissioned wells GM-B-3 and GM-B-6, respectively.

Therefore, a total of seven monitoring wells are present on Site that include GM-B-1, GM-B-1A, GM-B-2, GM-B-2A, GM-B-3R, GM-B-6R, and GM-B-6A. The construction details for these groundwater monitoring wells are presented in Table 4.5.

Wells GM-B-1, GM-B-2, and GM-B-3R, are located within the imported fill materials, but outside the areal limits of the lime waste fill. However, the screened intervals of these wells are at depths comparable to elevations of the lime waste fill layer. Well GM-B-3R is located within the defined extent of sand and shredder residue fill near the northern limit of the fill materials and up-gradient of the horizontal limits of the lime waste fill on Site. Wells GM-B-1 and GM-B-2 are located down-gradient of the lime waste fill and GM-B-6R.

Wells GM-B-6R and GM-B-6A are both located within the areal limits of the lime waste fill. Well GM-B-6R is screened within the lime waste fill and well GM-B-6A is screened within fill materials below the lime waste fill.

Wells GM-B-1A and GM-B-2A are screened within the fill materials at depths below elevations comparable to the lime waste fill layer, outside the areal limits of the lime waste fill, and down-gradient of GM-B-6A.

Six rounds of groundwater sampling were conducted in 1984, 1988, 1998, 1999, 2014, and 2024. Groundwater samples from monitoring wells were analyzed for TCL/TAL parameters to determine groundwater quality at the Site. Table 4.2 presents a summary of parameters detected in the

groundwater samples and the concentrations of these parameters at each well. As depicted in the table, groundwater concentrations of 12 parameters detected in groundwater samples from the 2024 investigation exceeded the surface water cleanup levels for marine receptors including two VOCs (benzene, and VC), one SVOC (B2EP), eight metals (arsenic, chromium, copper, lead, manganese, nickel, silver, and zinc), and one PCB (aroclor-1254)—see Subsection 4.1.3.2. The exceedances and sample locations for 2024 are depicted on Figure 4.3 for VOCs, SVOCs, Metals, and PCBs. The number of parameters with exceedances in 2024 is about half of the 23 parameters that had groundwater concentrations exceeding the surface water cleanup levels for marine receptors at some point in time. Overall, concentrations have decreased and there are fewer exceedances for the 2024 data when compared to historical data.

Well GM-B-3R is located within the defined extent of sand and shredder residue fill and up-gradient of the horizontal limits of the lime waste fill on Site. Parameters that were detected in up-gradient well GM-B-3R at concentrations exceeding the cleanup levels in 2024 include arsenic, copper, manganese, and nickel. Other parameters detected below the cleanup levels at this location include chromium, lead, and zinc.

Comparing 2024 data with 2024 surface water (see Subsection 4.4) and 2014 groundwater data, there does not appear to be significant migration of contaminants from the Site and water quality may have improved for organic parameters over time based on

- In 2024, well GM-B-6R exhibited exceedances of only one VOC (VC) and no VOCs were detected in surface water;
- Detected SVOC concentrations have decreased in some wells;
- PCBs concentrations in 2024 were not detected except at GM-B-1; however, the concentration at GM-B-1 in 2024 is lower than the 2014 concentration. No PCBs were detected in surface water; and
- No pesticides were detected in groundwater or surface water.

Additionally, comparison of the 2024 metals data with the 1998/1999 metals data, groundwater quality appears to have improved at well locations GM-B-1A, GM-B-2A, GM-B-3R, GM-B-6A, and GM-B-6R. Groundwater quality for metals does not appear to have improved at well locations GM-B-1 and GM-B-2.

4.4 Contaminant Occurrence and Movement in Surface Water

A total of 17 surface water samples were collected to date—two samples at locations SWS-1 and SWS-2 in 1984, four samples at locations SW-01 through SW-04 in 1998, five samples at locations SW-01 through SW-05 in 2014, and six samples at locations SW-01 through SW-03, SW-05, and SW-07 to SW-08 in 2024. These surface water samples were collected from the drainage swales at the edge or immediately east, west, north, and south of the mapped areal extent of the fill materials. Table 4.3 presents a summary of parameters detected in the surface water samples and the concentrations of these parameters. As depicted in Table 4.3, eight of the parameters detected in the surface water were present at concentrations that exceed the surface water cleanup levels for marine receptors, including one VOC (carbon tetrachloride in 1998), two SVOCs (B2EP in 2024 and hexachlorobenzene in 2014), nine metals (arsenic, chromium, copper, lead, manganese, mercury, nickel, thallium, and zinc), and one PCB (aroclor-1254 in 2014). No other concentrations were

detected in surface water samples above surface water cleanup levels for marine receptors. In 2024, no VOCs or SVOCs were detected except for acetone, B2EP, and dimethyl phthalate, which were all below their corresponding cleanup levels except B2EP at location SW-01 (up-drainage/background of Site), and no pesticides, PCBs, or cyanide were detected in surface water samples. In 2024, three metals (copper, manganese, and thallium) were detected above surface water cleanup levels for marine receptors. The exceedances and sample locations are depicted on Figure 4.4 and Table 4.3 and are discussed below.

As depicted on Figure 4.4:

- copper was detected above the cleanup level at up-drainage location SW-07. Copper was also detected at up-drainage location SW-01 but below the cleanup level;
- manganese was detected above the cleanup level at location SW-03, furthest down-drainage of the Site. Note that the 2024 concentration is lower than the 2014; and
- thallium was detected above the cleanup level at location SW-05, middle-drainage of the southern drainage swale. Thallium was also detected at locations SW-02 (up-drainage) and SW-03 (down-drainage) but below the cleanup level.

There were fewer metals exceedances in 2024 compared to 2014.

Comparing 2024 data with 2014 data, there does not appear to be significant migration of contaminants from the Site and water quality may have improved over time based on

- no PCBs were detected in the 2024 surface water samples;
- the number of exceedances for metals decreased between 2014 and 2024 even though there were more samples collected; and
- decreased concentrations were observed for a majority of metals at locations sampled over time since 1998.

4.5 Contaminant Occurrence in Sediment

A total of 12 sediment samples were collected to date—four samples at locations SD-01 through SD-04 in 1998, and nine samples at locations SD-04 through SD-12 in 2014. These sediment samples were collected from the drainage swales at the edge or immediately east, west, and south of the mapped areal extent of the fill materials. Table 4.4 presents a summary of parameters detected in the sediment samples and the concentrations of these parameters compared to chemical criteria established by WAC 173-204-562(2). As stated in Subsection 4.1.2.2, two chemical criteria are established per WAC 173-204-562(2), including sediment cleanup objectives ("no adverse effects" level) and cleanup screening levels ("minor adverse effects" level).

As depicted in Table 4.4, four of the parameters detected in the sediments were present at concentrations that exceed the sediment cleanup objectives, including one SVOC (4-methylphenol) and three metals (arsenic, mercury, and zinc).

4-Methylphenol was detected in sediment in 1998 at a concentration that marginally exceeds the sediment cleanup objective and cleanup screening level of 0.67 mg/kg at location SD-03 (1.1 J [estimated] mg/kg; 0 to 0.5 ft bgs), south of the Site. In 2014, sample SD-08 was collected nearby

and the concentration reported (0.027 J [estimated] mg/kg) is below the sediment cleanup objective and cleanup screening level.

Arsenic was detected in sediments at concentrations that marginally exceed the sediment cleanup objective of 57 mg/kg but not the SCSL of 93 mg/kg in 1998 at location SD-02 (59.9 J [estimated] mg/kg; 0 to 0.5 ft bgs) up-drainage of the Site, and in 2014 at location SD-08 (66.3 mg/kg) within southern drainage swale. Zinc was detected in sediments at concentrations that marginally exceed the sediment cleanup objective of 410 mg/kg but not the SCSL of 960 mg/kg in 1998 at location SD-03 (705 J [estimated] mg/kg; 0 to 0.5 ft bgs) and in 2014 at locations SD-05 (570 mg/kg), SD-07 (947 mg/kg), and SD-08 (690 mg/kg), all within the southern drainage swale. Mercury was detected in sediments at concentrations that exceed both criteria of 0.41 and 0.59 mg/kg in 2014 at locations SD-06 (3.03 mg/kg) in the east drainage swale and SD-07 (0.846 mg/kg) in the southern drainage swale, which is down-drainage of the east drainage swale. The exceedances and sample locations for metals are depicted on Figure 4.2.

In 2014, metals (arsenic, mercury, and zinc) were detected above marine sediment cleanup objectives ("no adverse effects" level) in the sediment samples collected from the east and southern drainage swales. The arsenic and zinc concentrations are below the marine SCSLs ("minor adverse effects" level). The mercury concentrations down-drainage are below both criteria. There does not appear to be significant migration of contaminants in sediment from the Site based on

- arsenic and zinc concentrations are below the marine SCSLs ("minor adverse effects" level); and
- mercury concentrations down-drainage are below both criteria.

No additional sediment sampling was conducted by Geosyntec during the 2024 investigation.

4.6 Air/Soil Vapor Assessment

Vapor assessment, for the purpose of human health risk, has not been conducted at the Site. Based on current use of the Property, the vapor intrusion pathway is incomplete because there are no occupants and therefore no vapor intrusion receptors are on the Property.

5. Conceptual Site Model

An area in the southern portion of the Site (the fill area within the Property) was used for the placement of fill materials, comprised of lime waste, shredder residue, sand, cobbles, dredged material, and construction/demolition debris. The lime waste fill is a by-product of the production of chlorinated solvents such as TCE and PCE. Shredder residue consists of by-products of scrap metal and automobile recycling, such as rubber, metal, and wire. The Site was also used for the storage of automobile scrap parts and other metal items. The Site is not currently in use and nearly all scrap materials and other surface debris have been removed.

The Site consists primarily of sand with varying amounts of silt, gravel, lime waste fill, shredder residue, and other refuse. Previous investigations observed the lime waste fill typically present as a single layer and always within the other fill materials, typically greater than 7.5 ft bgs. Imported fill materials have been observed from land surface extending to a depth of 20 ft. Observations during the 2014 and 2024 investigation activities support the findings from previous investigations. Subsurface work conducted in 2014 resulted in adjustments to the previously mapped boundaries of fill materials. The fill materials extend across the central portion of the Property from the base of the eastern and western hillsides. The entirety of the lime waste fill observed is at depth and within the southern portion of this footprint. At some locations along the flanks of the Property in close proximity to the drainage swales, the sand and shredder residue fill is observed at or just below the surface.

The lime waste fill is a gray to beige, fine-grained material with medium to high plasticity. The thickness of the lime waste fill ranges from 1.0 to approximately 5.0 ft. The estimated horizontal limits of sand and shredder residue fill and lime waste fill are depicted on Figure 3.1. The upper native sediments are brown, intermixed silty sands, clayey silts, and peat, with plasticity ranging from low to high. Cross-sections presented on Figures 3.2 through 3.3 depict the estimated depth of the observed fill materials.

The surficial and subsurface samples collected within the mapped areal extent of the sand and shredder residue fill contained elevated concentrations of lead and mercury exceeding MTCA Method A industrial cleanup levels (no MTCA Method C values are available for these metals) between ground surface (0 ft bgs) and 11.5 ft bgs. Groundwater beneath the Site is observed within the mixed fill materials in two distinct zones, a shallow zone at a depth consistent with the sand and shredder residue fill and lime waste fill layers and a deeper zone below the depth comparable to the lime waste fill layers. Therefore, groundwater within the wells is in direct contact with the fill materials within the two distinct zones. Groundwater generally flows towards the south-southwest in both zones based on the data collected in 2014 and 2024, aligning with the slope of the land and in the direction of Hylebos waterway. Figures 3.4 to 3.7 depict the groundwater contours in the shallow zone and deeper zone, respectively.

As discussed in Subsection 4.3, based on the historical and recent groundwater analytical data, the groundwater at the Site historically contained elevated concentrations of VOCs, SVOCs, metals, PCBs, and pesticides. Pesticides (4,4'-dichlorodiphenyldichloroethane [4,4'-DDE], alpha-hexachlorocyclohexane [a-BHC], endrin aldehyde, and gamma-hexachlorocyclohexane [g-BHC] [Lindane]) concentrations were historically elevated in the fill materials (wells GM-B-1 and GM-B-6A) but have attenuated based on the recent data collected in 2014 and 2024 that did not indicate the presence of elevated concentrations of pesticide in groundwater. One elevated VOC

(VC) concentration above 1 µg/L in 2024 appears to be confined within the shallow groundwater zone within the lime waste fill (well GM-B-6R). Another elevated VOC (benzene) concentration in 2024 is within the sand and shedder residue fill (well GM-B-1). Historically, VOC PCE concentrations appear to have migrated downward to deeper groundwater in well GM-B-6A; however, have attenuated over time based on the 2014 and 2024 data. The elevated SVOC (B2EP), PCB (aroclor-1254), and metals (arsenic, chromium, copper, lead, manganese, nickel, silver, and zinc), concentrations appear to be dispersed within the sand and shredder residue fill and/or lime waste fills in one or both groundwater zones, including metals in up-gradient well GM-B-3R. Comparison of the 2024 with the 2014 groundwater and 2024 surface water data appears to indicate attenuation of organic contaminants in groundwater and there does not appear to be significant migration of contaminants in groundwater from the Site. Comparison of 2024 metals data with historical data indicates groundwater quality appears to have improved at well locations GM-B-1A, GM-B-2A, GM-B-3R, GM-B-6A, and GM-B-6R. Groundwater quality for metals does not appear to have improved at well locations GM-B-1 and GM-B-2.

Surface runoff on the Property is either directed into the drainage swale running along the eastern flank of the Property or across the Site as sheet flow, discharging to wet areas situated at the southern boundary of the Property. A small surface water drainage swale enters the wet areas from the east. Surface water samples collected from the eastern drainage swale and southern drainage swale entering the wet area during the 2014 investigation indicated the presence of arsenic and copper) concentrations exceeding or marginally below the surface water cleanup levels for marine receptors. In 2014, manganese concentrations were above surface water cleanup levels for marine receptors in the west drainage swale and down-drainage of the Site. Follow up sampling of surface water in 2024 indicated the presence of copper at an up-drainage location north of the fill area, manganese down-drainage of the Site (at a lower concentration compared to 2014), and thallium in the southern drainage swale at concentrations exceeding the surface water cleanup levels for marine receptors. Comparison of the 2024 with historical surface water data appears to indicate attenuation of contaminants in surface water and there does not appear to be significant migration of contaminants in surface water from the Site.

In 2014, metals (arsenic, mercury, and zinc) were detected above marine sediment cleanup objectives ("no adverse effects" level) in the sediment samples collected from the east and southern drainage swales. The arsenic and zinc concentrations are below the marine SCSLs ("minor adverse effects" level). The mercury concentrations down-drainage are below both criteria. Therefore, there does not appear to be significant migration of contaminants in sediment from the Site. Sediment samples were not collected in 2024.

The Site (the fill area within the Property) is currently zoned for industrial use (see Subsection 2.4), and future zoning is not anticipated to change. In accordance with MTCA, potential exposure pathways for human and environmental receptors that may need to be addressed include the following:

- Human health protection from soil to groundwater (drinking water);
- Human health protection from direct soil contact and fugitive dust;
- Human health protection from groundwater (direct contact);
- Human health protection from soil and groundwater vapor inhalation;
- Human health protection from soil to sediment/surface water;

- Human health protection from groundwater to surface water; and
- Terrestrial/aquatic ecological protection.

Based on information acquired during the RI and based on the current and planned land use identified, the following conclusions can be made:

- soil and groundwater vapor inhalation are incomplete human health exposure pathways due to lack of receptors based on the current and future Site use and the lack of VOC concentrations in surface soils; and
- soil to groundwater (drinking water) and groundwater direct contact are incomplete human health exposure pathways due to a current lack of receptors and future expected non-use of groundwater based on the determination by Ecology that groundwater at this Site is non-potable.

Per MTCA, potential exposure pathways requiring additional evaluation and management include the following:

- Human health protection from direct soil contact;
- Human health protection from soil to sediment/surface water;
- Human health protection from groundwater to surface water; and
- Terrestrial/aquatic ecological protection.

Figure 6.1 presents the human health conceptual site model for potential exposure pathways. Cleanup standards addressing the aforementioned pathways are presented below.

6. Cleanup Levels

According to the MTCA, "The purpose of a remedial investigation/feasibility study (RI/FS) is to collect, develop and evaluate sufficient information regarding a site to select a cleanup action under WAC 173-340-360 through 173-340-390." In order to evaluate data from the previous investigations and determine the need for additional remedial investigation, preliminary groundwater and soil cleanup levels have been identified for the Site (the fill area within the Property) as described in Subsection 2.1.

The preliminary cleanup levels for are presented for reference in Table 2.1. These cleanup levels for the Site may be refined during the FS and will be presented in the FS report.

6.1 Groundwater Cleanup Levels

As noted in Subsection 2.2, Ecology has determined that groundwater at the Site is designated as non-potable. Therefore, the groundwater is not expected to be used as a drinking water source and the groundwater cleanup level will be driven by the next stringent pathway, which is groundwater to surface water pathway. The groundwater at the Site eventually discharges into the Hylebos Waterway, which is marine water. As such, groundwater cleanup levels should be based on protection of applicable marine surface water beneficial uses. Accordingly, the preliminary cleanup levels for groundwater at the Site have been established consistent with MTCA Method B surface water cleanup levels for marine receptors.

6.2 Soil Cleanup Levels

As stated above, the groundwater is not used as a drinking water source. Therefore, the soil to groundwater (drinking water) pathway is incomplete. As stated in Subsection 3.4, exposure to terrestrial ecological receptors pathway can be considered incomplete if a physical barrier were to be placed within a time frame acceptable to the Ecology per WAC 173-340-7492(2)(b). The PLPs will propose remedial actions to eliminate the terrestrial ecological pathway as well as the surficial soil to surface water pathway. Therefore, the soil cleanup levels will be driven by soil direct contact pathway. The Property is industrial and zoned 9167 (Vacant Land Major Problem) per Pierce County and City of Tacoma identifies the portion of the Property where the Site (the fill area within the Property) is located as zoned M-2 Heavy Industrial District (see Subsection 2.4). Considering the historical land use and zoning of the Site, MTCA Method C industrial soil cleanup levels for direct contact are appropriate. Depending on the selected cleanup action, institutional controls (ICs) may be required to restrict the future land use of the Site to "industrial." Accordingly, MTCA Method C industrial soil cleanup levels have been established for use as preliminary cleanup levels.

6.3 Surface Water Cleanup Levels

Surface water from the Site eventually discharges into Hylebos Waterway, which is marine water. Therefore, MTCA Method B cleanup levels for marine receptors have been established for use as surface water preliminary cleanup levels.

6.4 Sediment Cleanup Levels

According to WAC 173-204-562(2), two chemical criteria are established: sediment cleanup objectives, which establish a no adverse effects level; and SCSLs, which establish a minor adverse

effects level. To ensure Site sediment quality resulting in no adverse effects to the benthic community in the Hylebos, marine sediment cleanup objectives could be used as sediment cleanup levels for the Site. Alternatively, if it can be shown that the marine SCSLs would not likely cause an adverse effect in the Hylebos, these values may be used as sediment cleanup levels. Preliminary cleanup levels for sediment have been established for use that include both levels.

7. RI Conclusions and Recommendations

The 2024 groundwater data indicate concentrations of benzene, VC, B2EP, metals (arsenic, chromium, copper, lead, manganese, nickel, silver, and zinc), and aroclor-1254 exceeding MTCA Method B cleanup levels for surface water impacting marine receptors in one or both groundwater zones. Surface water also exhibited elevated levels of metals (copper, manganese, and thallium) exceeding cleanup standards. These concentrations are generally just above the cleanup standards.

Comparison of the 2024 with the 2014 groundwater and 2024 surface water data appears to indicate attenuation of organic contaminants in groundwater and there does not appear to be significant migration of contaminants in groundwater from the Site (the fill area within the Property). Comparison of 2024 metals data with historical data indicates groundwater quality appears to have improved at well locations GM-B-1A, GM-B-2A, GM-B-3R (up-gradient well), GM-B-6A, and GM-B-6R. Groundwater quality for metals does not appear to have improved at well locations GM-B-1 and GM-B-2.

Comparison of the 2024 with historical surface water data appears to indicate attenuation of contaminants in surface water and there does not appear to be significant migration of contaminants in surface water from the Site.

In 2014, metals (arsenic, mercury, and zinc) were detected above marine sediment cleanup objectives ("no adverse effects" level) in the sediment samples collected from the east and southern drainage swales. The arsenic and zinc concentrations are below the marine SCSLs ("minor adverse effects" level). The mercury concentrations down-drainage are below both criteria. Therefore, there does not appear to be significant migration of contaminants in sediment from the Site. Sediment samples were not collected in 2024.

Investigations prior to 2024 indicate soils/fill materials with metals (arsenic and chromium) concentrations exceeding MTCA Method C industrial cleanup levels are present at shallow depths in fill materials from surface to 3.5 ft bgs. The chromium preliminary cleanup level is based on CrVI. Chromium concentrations in soil are below the MTCA Method C industrial cleanup level for CrIII.

Per MTCA, potential exposure pathways requiring additional evaluation and management include the following:

- Human health protection from direct soil contact;
- Human health protection from soil to sediment/surface water;
- Human health protection from groundwater to surface water; and
- Terrestrial/aquatic ecological protection

To address potential exposure pathways, proposed remedial actions include:

1. Excavation and Relocation: Near-surface fill materials from drainage swales and adjacent areas would be relocated to the center of the Site, consolidated with other fill materials. The excavated areas would be graded, and clean fill would be added to restore the habitat around the drainage swales;

2. Containment and Cover: A cover layer of clean fill and vegetation would be installed to contain the remaining fill materials, prevent direct contact with receptors, limit contaminant migration, and support plant growth. This cover would also prevent future re-contamination; and

3. Institutional Controls and Monitoring: Deed restrictions and surface water monitoring would be implemented to manage potential surface water runoff. The seven on-Site monitoring wells would be decommissioned.

This plan is designed to guide stakeholder discussions, with a detailed evaluation and comparison of alternatives to follow in a Feasibility Study after Ecology reviews the Consolidated RI Report and provides comments.

Notes:

(a) Preliminary Cleanup Levels for soil established consistent with MTCA Method C industrial soil cleanup levels.
(b) Preliminary Cleanup Levels for sediment established consistent with WAC 173-204-562(2) Table III Marine sediment - Chemical criteria.
(c) Preliminary Cleanup Levels for groundwater established consistent with MTCA Method B surface water cleanup levels for marine water.
(d) Preliminary Cleanup Levels for surface water established consistent with MTCA Method A (default) industrial value shown because no value is available for MTCA Method C.
NV No published value.
aa WAC 173-201A Table 240 Acute or Chronic Marine Water, or Human Health—consumption of organisms only.
bb Surface Water ARAR National Toxics Rule 40 CFR 131 Marine Water Human Health.
cc Ecology TPH - Concentrations Protective of Aquatic Receptors in Surface Water, Implementation Memo #23 (IM 23).
dd MTCA Method B Surface water calculated from MTCA equations 730-1 and/or 730-2.
ee Surface Water ARAR USEPA Clean Water Act §304 Marine Acute Aquatic, Chronic Aquatic or Human Health, consumption of organisms only.
ff Ecology background value.
CLARC Ecology's Cleanup Levels and Risk Calculation database tables.
CLARC Tables: https://ecology.wa.gov/Regulations-Permits/Guidance-technical-assistance/Contamination-clean-up-tools/CLARC.
* Criteria is for total PCBs.
** Value for Chromium VI. The value for Chromium III is 5,300,000 (5.30E+06).
*** Value for Chromium VI. WQC adjusted to a lower concentration so that the excess cancer risk is one in one hundred thousand (1 x 10-5). See WAC 173-340-730(5)(b). The value for Chromium III is 243,000 (2.43E+05).

Table 4.1

Summary of Soil Analytical Data
1913 Marine View Drive
Tacoma, Washington

Notes:

[1]	Preliminary Cleanup Levels for soil established consistent with MTCA Method C Cleanup Levels for Industrial Land are from Washington State Department of Ecology, Cleanup Levels and Risk Calculation (CLARC) database, (detected parameters).
[2]	TCLP regulatory levels are from 40 CFR 261.24 Toxicity characteristic, Table 1 —Maximum Concentration of Contaminants for the Toxicity Characteristic, as amended by 71 FR 40259, July 14, 2006; and WAC 173-303-090 Dangerous waste characteristics, Maximum Concentration of Contaminants for the Toxicity Characteristic, per 70.105, 70.105D RCW effective 10/31/20.
	TCLP - Toxicity Characteristic Leaching Procedure, test Method 1311 in "Test Methods for Evaluating Solid Waste, Physical/Chemical Methods," EPA Publication SW-846.
ft BGS	feet below ground surface.
mg/kg	milligrams per kilogram.
µg/L	micrograms per liter.
Deg C	Degrees Celsius.
Deg F	Degrees Fahrenheit.
s.u.	Standard pH unit.
%	Percent.
39.0	Concentration detected above the cleanup level.
-	Not applicable.
NV	No published value.
J	Estimated concentration.
ND or U	Not detected at the associated concentration.
UJ	Not detected; associated concentration is estimated.
R or REJ	Rejected.
TR	Trace amount detected at less than 0.25%.
**	Value for Chromium VI. The value for Chromium III is 5,300,000 (5.30E+06).
(d)	MTCA Method A (default) industrial value shown because no value is available for MTCA Method C.

Table 4.2

Summary of Groundwater Analytical Data
1913 Marine View Drive
Tacoma, Washington

Notes:

[1]	Preliminary Cleanup Levels for groundwater established consistent with MTCA Method B surface water cleanup levels for marine water.
µg/L	micrograms per liter.
39.0	Concentration detected above the cleanup level.
-	Not applicable.
NV	No published value.
J	Estimated concentration.
J-	Estimated concentration, implied low bias.
J+	Estimated concentration, implied high bias.
U	Not detected at the associated concentration.
UJ	Not detected; associated concentration is estimated.
***	Value for Chromium VI. WQC adjusted to a lower concentration so that the excess cancer risk is one in one hundred thousand (1 x 10-5). See WAC 173-340-730(5)(b). The value for Chromium III is 243,000 (2.43E+05).

Table 4.3

Summary of Surface Water Analytical Data
1913 Marine View Drive
Tacoma, Washington

Notes:

[1]	Preliminary Cleanup Levels for surface water established consistent with MTCA Method B surface water cleanup levels for marine water.
µg/L	micrograms per liter.
11.0	Concentration detected above the cleanup level.
-	Not applicable.
NV	No published value.
J	Estimated concentration.
U	Not detected at the associated concentration.
UJ	Not detected; associated concentration is estimated.
***	Value for Chromium VI. WQC adjusted to a lower concentration so that the excess cancer risk is one in one hundred thousand (1 x 10-5). See WAC 173-340-730(5)(b). The value for Chromium III is 243,000 (2.43E+05).

Location SW-04 was buried and no surface water was present during the 2024 event.
Location SW-07 and SW-08 were added for the 2024 event.

Table 4.4

Summary of Sediment Analytical Data
1913 Marine View Drive
Tacoma, Washington

Notes:

1	Preliminary Cleanup Levels for sediment established consistent with WAC 173-204-562(2) Table III Marine sediment - Chemical criteria.
a	Cleanup Objective. The sediment cleanup objectives establish a no adverse effects level, including no acute or chronic adverse effects, to the benthic community. Chemical concentrations at or below the sediment cleanup objectives correspond to sediment quality that results in no adverse effects to the benthic community.
b	Cleanup Screening Level. The cleanup screening levels establish a minor adverse effects level, including acute or chronic effects, to the benthic community. Chemical concentrations at or below the cleanup screening level, but greater than the sediment cleanup objective correspond to sediment quality that could result in minor adverse effects to the benthic community.
ft BGS	feet below ground surface.
mg/kg	milligrams per kilogram.
1.1 J[ab]	Concentration exceeds level identified by superscript.
-	Not analyzed
NV	No published value.
J	Estimated concentration
U	Not detected at the associated concentration
UJ	Not detected; associated concentration is estimated
*	Criteria is for total PCBs.

Washington State Department of Ecology
Toxics Cleanup Program

Table 749-1

Simplified Terrestrial Ecological Evaluation-Exposure Analysis Procedure

Estimate the area of contiguous (connected) undeveloped land on the site or within 500 feet of any area of the site to the nearest 1/2 acre (1/4 acre if the area is less than 0.5 acre).	
1) From the table below, find the number of points corresponding to the area and enter this number in the field to the right.	
Area (acres) / Points 0.25 or less / 4 0.5 / 5 1.0 / 6 1.5 / 7 2.0 / 8 2.5 / 9 3.0 / 10 3.5 / 11 4.0 or more / 12	12
2) Is this an industrial or commercial property? If yes, enter a score of 3. If no, enter a score of 1	3
3)[a] Enter a score in the box to the right for the habitat quality of the site, using the following rating system[b]. High=1, Intermediate=2, Low=3	1
4) Is the undeveloped land likely to attract wildlife? If yes, enter a score of 1 in the box to the right. If no, enter a score of 2.[c]	1
5) Are there any of the following soil contaminants present: Chlorinated dioxins/furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, pentachlorobenzene? If yes, enter a score of 1 in the box to the right. If no, enter a score of 4.	1
6) Add the numbers in the boxes on lines 2-5 and enter this number in the box to the right. If this number is larger than the number in the box on line 1, the simplified evaluation may be ended.	6

Notes for Table 749-1

[a] It is expected that this habitat evaluation will be undertaken by an experienced field biologist. If this is not the case, enter a conservative score of (1) for questions 3 and 4.

[b] **Habitat rating system.** Rate the quality of the habitat as high, intermediate or low based on your professional judgment as a field biologist. The following are suggested factors to consider in making this evaluation:

> **Low:** Early successional vegetative stands; vegetation predominantly noxious, nonnative, exotic plant species or weeds. Areas severely disturbed by human activity, including intensively cultivated croplands. Areas isolated from other habitat used by wildlife.

High: Area is ecologically significant for one or more of the following reasons: Late-successional native plant communities present; relatively high species diversity; used by an uncommon or rare species; priority habitat (as defined by the Washington Department of fish and Wildlife); part of a larger area of habitat where size or fragmentation may be important for the retention of some species.

Intermediate: Area does not rate as either high or low.

[c] Indicate "yes" if the area attracts wildlife or is likely to do so. Examples: Birds frequently visit the area to feed; evidence of high use b mammals (tracks, scat, etc.); habitat "island" in an industrial area; unusual features of an area that make it important for feeding animals; heavy use during seasonal migrations.

[TEE Home]

009973 (14) - APPE TEE Contaminant Analysis

Priority Contaminant	*Maximum Dected Concentration (mg/kg)*	*Protective TEE Concentration for Industrial or Commercial Use* (mg/kg)*
Arsenic	**1,180**	20
Barium	**1,530**	1,320
Cadmium	**94.9**	36
Chromium	**137**	135
Copper	**10,000**	550
Lead	**6,030**	220
Manganese	3,070	23,500
Mercury	4.63	9/0.7 a
Nickel	1,580	1,850
Selenium	**2.8**	0.8
Zinc	**13,900**	570
Benzo(a)pyrene	22	300
heptachlor/heptachlor epoxide(tota	**29.2**	0.6
Hexachlorobenzene	<22	31
Pentachlorophenol	0.183	11
PCB mitures (total)	**13.6**	2
4,4'-DDD	0.067	1

Notes/Abbreviations

* Protective TEE Concentration is obtained from Table 749-2 for Industrial or Commercial Site, Model Toxics Control Act Cleanup Regulation, chapter 173-340 WAC, revised November 2007.

mg/kg = milligrams per kilogram

Bold indicate the concentration is above the protective TEE concentration for industrial or commerical use.

a = the first value is for inorganic mercury and the second value is for organic mercury.

Voluntary Cleanup Program

Washington State Department of Ecology
Toxics Cleanup Program

TERRESTRIAL ECOLOGICAL EVALUATION FORM

Under the Model Toxics Control Act (MTCA), a terrestrial ecological evaluation is necessary if hazardous substances are released into the soils at a Site. In the event of such a release, you must take one of the following three actions as part of your investigation and cleanup of the Site:

1. Document an exclusion from further evaluation using the criteria in WAC 173-340-7491.
2. Conduct a simplified evaluation as set forth in WAC 173-340-7492.
3. Conduct a site-specific evaluation as set forth in WAC 173-340-7493.

When requesting a written opinion under the Voluntary Cleanup Program (VCP), you must complete this form and submit it to the Department of Ecology (Ecology). The form documents the type and results of your evaluation.

Completion of this form is not sufficient to document your evaluation. You still need to document your analysis and the basis for your conclusion in your cleanup plan or report.

If you have questions about how to conduct a terrestrial ecological evaluation, please contact the Ecology site manager assigned to your Site. For additional guidance, please refer to www.ecy.wa.gov/programs/tcp/policies/terrestrial/TEEHome.htm.

Step 1: IDENTIFY HAZARDOUS WASTE SITE	
Please identify below the hazardous waste site for which you are documenting an evaluation.	
Facility/Site Name: 1913 Marine View Drive	
Facility/Site Address: 1913 Marine View Drive, Tacoma, Washington	
Facility/Site No: 1213	VCP Project No.:

Step 2: IDENTIFY EVALUATOR			
Please identify below the person who conducted the evaluation and their contact information.			
Name: Rick Bieber		Title: Project Manager	
Organization: Conestoga-Rovers & Associates			
Mailing address: 732 Broadway			
City: Tacoma		State: WA	Zip code: 98036

Step 3: DOCUMENT EVALUATION TYPE AND RESULTS

A. Exclusion from further evaluation.

1. Does the Site qualify for an exclusion from further evaluation?

☐ Yes *If you answered **"YES,"** then answer **Question 2**.*

☒ No or Unknown *If you answered **"NO" or "UKNOWN,"** then skip to **Step 3B** of this form.*

2. What is the basis for the exclusion? *Check all that apply. Then skip to **Step 4** of this form.*

Point of Compliance: WAC 173-340-7491(1)(a)

☐ All soil contamination is, or will be,* at least 15 feet below the surface.

☐ All soil contamination is, or will be,* at least 6 feet below the surface (or alternative depth if approved by Ecology), and institutional controls are used to manage remaining contamination.

Barriers to Exposure: WAC 173-340-7491(1)(b)

☐ All contaminated soil, is or will be,* covered by physical barriers (such as buildings or paved roads) that prevent exposure to plants and wildlife, and institutional controls are used to manage remaining contamination.

Undeveloped Land: WAC 173-340-7491(1)(c)

☐ There is less than 0.25 acres of contiguous[#] undeveloped[±] land on or within 500 feet of any area of the Site and any of the following chemicals is present: chlorinated dioxins or furans, PCB mixtures, DDT, DDE, DDD, aldrin, chlordane, dieldrin, endosulfan, endrin, heptachlor, heptachlor epoxide, benzene hexachloride, toxaphene, hexachlorobenzene, pentachlorophenol, or pentachlorobenzene.

☐ For sites not containing any of the chemicals mentioned above, there is less than 1.5 acres of contiguous[#] undeveloped[±] land on or within 500 feet of any area of the Site.

Background Concentrations: WAC 173-340-7491(1)(d)

☐ Concentrations of hazardous substances in soil do not exceed natural background levels as described in WAC 173-340-200 and 173-340-709.

* An exclusion based on future land use must have a completion date for future development that is acceptable to Ecology.

[±] "Undeveloped land" is land that is not covered by building, roads, paved areas, or other barriers that would prevent wildlife from feeding on plants, earthworms, insects, or other food in or on the soil.

[#] "Contiguous" undeveloped land is an area of undeveloped land that is not divided into smaller areas of highways, extensive paving, or similar structures that are likely to reduce the potential use of the overall area by wildlife.

B. Simplified evaluation.

1. Does the Site qualify for a simplified evaluation?

☒ Yes *If you answered **"YES,"** then answer **Question 2** below.*

☐ No or Unknown *If you answered **"NO"** or **"UNKNOWN,"** then skip to **Step 3C** of this form.*

2. Did you conduct a simplified evaluation?

☒ Yes *If you answered **"YES,"** then answer **Question 3** below.*

☐ No *If you answered **"NO,"** then skip to **Step 3C** of this form.*

3. Was further evaluation necessary?

☒ Yes *If you answered **"YES,"** then answer **Question 4** below.*

☐ No *If you answered **"NO,"** then answer **Question 5** below.*

4. If further evaluation was necessary, what did you do?

☒ Used the concentrations listed in Table 749-2 as cleanup levels. *If so, then skip to **Step 4** of this form.*

☐ Conducted a site-specific evaluation. *If so, then skip to **Step 3C** of this form.*

5. If no further evaluation was necessary, what was the reason? *Check all that apply. Then skip to **Step 4** of this form.*

Exposure Analysis: WAC 173-340-7492(2)(a)

☐ Area of soil contamination at the Site is not more than 350 square feet.

☐ Current or planned land use makes wildlife exposure unlikely. Used Table 749-1.

Pathway Analysis: WAC 173-340-7492(2)(b)

☐ No potential exposure pathways from soil contamination to ecological receptors.

Contaminant Analysis: WAC 173-340-7492(2)(c)

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 15 feet at concentrations that exceed the values listed in Table 749-2.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 6 feet (or alternative depth if approved by Ecology) at concentrations that exceed the values listed in Table 749-2, and institutional controls are used to manage remaining contamination.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 15 feet at concentrations likely to be toxic or have the potential to bioaccumulate as determined using Ecology-approved bioassays.

☐ No contaminant listed in Table 749-2 is, or will be, present in the upper 6 feet (or alternative depth if approved by Ecology) at concentrations likely to be toxic or have the potential to bioaccumulate as determined using Ecology-approved bioassays, and institutional controls are used to manage remaining contamination.

C. Site-specific evaluation. A site-specific evaluation process consists of two parts: (1) formulating the problem, and (2) selecting the methods for addressing the identified problem. Both steps require consultation with and approval by Ecology. *See* WAC 173-340-7493(1)(c).

1. Was there a problem? *See* WAC 173-340-7493(2).

☐ Yes *If you answered **"YES,"** then answer **Question 2** below.*

☐ No *If you answered **"NO,"** then identify the reason here and then skip to **Question 5** below:*

- ☐ No issues were identified during the problem formulation step.
- ☐ While issues were identified, those issues were addressed by the cleanup actions for protecting human health.

2. What did you do to resolve the problem? *See* WAC 173-340-7493(3).

☐ Used the concentrations listed in Table 749-3 as cleanup levels. *If so, then skip to **Question 5** below.*

☐ Used one or more of the methods listed in WAC 173-340-7493(3) to evaluate and address the identified problem. *If so, then answer **Questions 3 and 4** below.*

3. If you conducted further site-specific evaluations, what methods did you use?
Check all that apply. See WAC 173-340-7493(3).

- ☐ Literature surveys.
- ☐ Soil bioassays.
- ☐ Wildlife exposure model.
- ☐ Biomarkers.
- ☐ Site-specific field studies.
- ☐ Weight of evidence.
- ☐ Other methods approved by Ecology. If so, please specify:

4. What was the result of those evaluations?

- ☐ Confirmed there was no problem.
- ☐ Confirmed there was a problem and established site-specific cleanup levels.

5. Have you already obtained Ecology's approval of both your problem formulation and problem resolution steps?

☐ Yes If so, please identify the Ecology staff who approved those steps:

☒ No

Step 4: SUBMITTAL

Please mail your completed form to the Ecology site manager assigned to your Site. If a site manager has not yet been assigned, please mail your completed form to the Ecology regional office for the County in which your Site is located.

APPENDIX F

Summary of Previous Investigations

Appendix F Summary of Previous Investigations

September 1984 Investigation: Conestoga-Rovers & Associates (CRA) conducted an investigation in September 1984. CRA advanced eight boreholes for geologic sampling. CRA also installed four shallow groundwater monitoring wells, namely GM-B-1, GM-B-2, GM-B-3, and GM-B-6, to total depths ranging from 10 to 12 feet below ground surface (bgs). CRA collected groundwater samples from the monitoring wells as well as two surface water samples for laboratory analysis of the Target Compound List/Target Analyte List (TCL/TAL) parameters. These parameters include volatile organic compounds (VOCs), semi-volatile organic compounds (SVOCs), pesticides, polychlorinated biphenyls (PCBs), and metals. The investigation results indicated that no VOCs were present in the groundwater monitoring wells located outside the areal extent of the lime sludge fill, lateral discharge of shallow groundwater is controlled by the surface water drainage system, and detectable concentrations of parameters associated with the lime sludge fill were not being discharged into the surface drainage system. The results of this investigation were reported in CRA's *Tacoma Off-Plant Disposal Site Investigation* report, dated December 1984.

September 1988 Investigation: Occidental Chemical Corporation (OCC) conducted an investigation in September 1988. OCC collected groundwater samples from the four previously installed groundwater monitoring wells and submitted the samples for laboratory analysis. Concentrations of tetrachloroethene (PCE) and trichloroethene (TCE) were detected above Ecology's Model Toxics Control Act (MTCA) Method B cleanup levels. The results of this investigation were reported in OCC's *Sampling Memorandum,* Dated November 1988.

1998 and 1999 Investigation: In 1998, Ecology requested that OCC review the existing Site investigation data and current Site conditions to determine whether additional work should be considered to complete the Site evaluation. Pursuant to Ecology's request, a data review and work plan entitled, *Review of Site Conditions and Proposed Additional Work* was prepared and submitted to Ecology for review and comment in September 1998. The work plan presented the results of the previous investigations as well as a review of the data with recommendations for appropriate further investigative activities. The activities proposed in the work plan were designed to confirm the results of the earlier investigations and to determine whether there are any sources or volumes of impacted materials that were not previously identified. Comments dated September 23, 1998 were received from Ecology and responses were submitted on October 29, 1998. OCC and Ecology were in agreement on the responses to the comments and the field activities were conducted by CRA between November 18, 1998 and January 12, 1999. The results of this investigation were previously reported in March 1999 in the Site Characterization Report, Marine View Drive Site (CRA, 1999). The report confirmed the conclusions from the previous investigations with some modification of the limits of the fill. More details of the results are discussed below.

CRA inspected previous installed monitoring wells GM-B-1, GM-B-2, GM-B-3, and GM-B-6. Monitoring well GM-B-3 was not found and monitoring well GM-B-6 was damaged beyond repair. CRA therefore decommissioned monitoring well GM-B-6. CRA redeveloped the other two previous installed monitoring wells GM-B-1, GM-B-2 to ensure hydraulic communication between the monitoring wells and the aquifer.

CRA installed five new monitoring wells. Two monitoring wells GM-B-3R and GM-B-6R were installed as replacement wells for GM-B-3 and GM-B-6, respectively. Three monitoring wells GM-B-1A, GM-B-2A, and GM-B-6A were installed within approximately 5 feet of wells GM-B-1, GM-B-2, and GM-B-6R, respectively, and deeper. The Site monitoring wells were sampled during two separate events between November 30

and December 1, 1998, and January 11 and 12, 1999. All groundwater samples were analyzed for the TCL/TAL parameters.

Four surface water samples were collected from each of the drainage swales and analyzed for TCL/TAL parameters. One sediment sample composited from four sediment samples collected from each of the four swales and one discrete sediment sample collected from the southern ditch upstream of the Site were analyzed for the TCL/TAL parameters.

Seven soil samples were collected from test pits excavated across the southern portion of the Site. Test pits were excavated from approximately 9 feet bgs to a maximum depth of 11.5 feet bgs. The seven soil samples were collected at various depths. All samples were analyzed for the TCL/TAL parameters.

In addition, a composite sample of the lime sludge fill was collected and analyzed for the TCL/TAL parameters. The analytical results indicated the lime sludge fill contained primarily VOCs and various metals analytes (calcium and magnesium, etc.).

A specific analytical parameter list for lime sludge fill was developed from review of an analytical database compiled during investigations of other sites where lime sludge fill from the Tacoma Plant was present. This Specific Parameter List (SPL) was approved by Washington State Department of Ecology (Ecology) and United States Environmental Protection Agency (USEPA). The SPL includes VOCs such as PCE, TCE, trans-1,2-dichloroethene (trans-1,2-DCE), cis-1,2-dichloroethene (cis-1,2-DCE), 1,1-dichloroethene (1,1-DCE), vinyl chloride, and methylene chloride, etc.

No lime sludge fill specific parameters were detected in the surficial soils (fill) overlying the lime sludge fill. Four of the lime sludge fill specific parameters (trans-1,2-DCE, methylene chloride, PCE and TCE) were detected in the subsurface soils (fill) within the areal extents of the lime sludge fill. These detections occurred in the soils associated with the sand and shredder residue fill and the concentrations were lower than MTCA Method B cleanup levels.

Two lime sludge fill specific parameters (methylene chloride and carbon tetrachloride) were detected in surface water. Carbon tetrachloride was detected only in the background sample and, therefore, is not due to the presence of lime sludge fill on Site. Methylene chloride was detected only in one duplicate sample at a low concentration suggesting that it is a potential laboratory artifact.

Only two monitoring wells GM-B-6A and GM-B-6R contained lime sludge fill specific parameters. Well GM-B-6R is a shallow well screened in the lime sludge fill and contained elevated concentrations of trans-1,2-DCE, cis-1,2-DCE, 1,1-DCE, PCE, TCE, and vinyl chloride. Well GM-B-6A is a deep well screened over the five-foot interval in fill above the lower permeability soils and below the lime sludge fill. The sample from well GM-B-6A contained significant lower concentrations of PCE (three orders of magnitude lower) and no detectable concentrations of other lime sludge fill specific parameters. The significant decrease in the concentration of PCE between GM-B-6R and GM-B-6A and the absence of the other lime sludge fill specific parameters in GM-B-6A demonstrates that there is very little vertical transport of chemicals out of the lime sludge fill. Well GM-B-1, GM-B-1A, GM-B-2, and GM-B-2A are all located down-gradient from the lime sludge fill, and did not contain detectable lime sludge fill specific parameters, demonstrating that there is no detectable lateral migration of chemicals in groundwater from the lime sludge fill towards the southwest. Additionally, the concentrations of PCE and TCE at GM-B-6/GM-B-6R from 1998/1999 investigation decreased significantly from 1984/1988 investigation, indicating that natural attenuation of the lime sludge fill specific parameters occurred at the Site.

October 2004 Investigation: CRA conducted an investigation in October 2004, which consisted of collecting four samples of the lime sludge fill from four separate boreholes BH-1 through BH-4 to characterize the lime sludge fill for waste disposal purposes in anticipation of evaluating remedial alternatives for the Site. The samples were analyzed for TCL/TAL parameters. There were no parameters detected in the lime sludge fill at concentrations that exceeded MTCA Method C industrial soil cleanup levels. Additionally, the four samples were analyzed by the Toxicity Characteristic Leaching Procedure (TCLP) to characterize the lime sludge fill for potential waste disposal purposes. The results indicated the concentration of PCE in the sample from BH-4 exceeded the corresponding TCLP regulatory limit. The remaining concentrations in the sample from BH-4 and concentrations in the three samples from BH-1, BH-2, and BH-3 were below the corresponding TCLP regulatory limits. The results of this investigation were reported in CRA's *Remedial Investigation/Feasibility Study Work Plan*, dated September 2013.

2014 Investigation: CRA conducted an investigation between August and December 2014. The investigation activities included redevelopment of well GM-B-6R, collection of low-flow groundwater samples from all existing monitoring wells, advancement of seven direct-push soil borings, GP-1 through GP-7, to depths ranging from 20 to 30 feet bgs with soil sampling, excavation of 14 test pits, TP-24 through TP-36 and TP-38, and hand auger of 1 test pit, TP-37, to depths ranging from 8 to 16 feet bgs with soil sampling, collection of eight sediment samples SD-05 through SD-12, collection of five surface water samples, SW-01 through SW-05, completion of six hand auger boreholes at locations HA-01 through HA-05B to further delineate the lateral extent of the sand and shredder residue fill, and completions of slug tests in all existing monitoring wells. The results of this investigation are presented in this report.

APPENDIX G

Laboratory Analytical Results

July 3, 2024

Mr. Rick Bieber
Geosyntec Consultants
520 Pike St, Suite 2600
Seattle, WA 98101

Dear Mr. Bieber,

On June 12th, 10 samples were received by our laboratory and assigned our laboratory project number EV24060108. The project was identified as your GSHDM: Tacoma Marine View Data Mgmt . The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Rob Greer
Laboratory Director

U - Analyte analyzed for but not detected at level above reporting limit.
SUR06 -One or more base/neutral surrogate recoveries were below the lower control limits. The base/neutral sample results may be biased low.

Mr. Rick Bieber
Geosyntec Consultants
520 Pike St, Suite 2600
Seattle, WA 98101

Dear Mr. Bieber,

On March 29th, 8 samples were received by our laboratory and assigned our laboratory project number EV24040001. The project was identified as your GSHDM: Tacoma Marine View Data Mgmt / SSOW: ENV229-402-D02-2100. The sample identification and requested analyses are outlined on the attached chain of custody record.

No abnormalities or nonconformances were observed during the analyses of the project samples.

Please do not hesitate to call me if you have any questions or if I can be of further assistance.

Sincerely,

ALS Laboratory Group

Rob Greer
Laboratory Director

SAMPLE DATA RESULTS

J - Analyte was positively identified. Reported result is an estimate below the associated reporting limit but above the MDL.
UT - Analyte analyzed for but not detected at level above the MDL.

SAMPLE DATA RESULTS

UT - Analyte analyzed for but not detected at level above the MDL.
J - Analyte was positively identified. Reported result is an estimate below the associated reporting limit but above the MDL.

SAMPLE DATA RESULTS

J - Analyte was positively identified. Reported result is an estimate below the associated reporting limit but above the MDL.
UT - Analyte analyzed for but not detected at level above the MDL.

September 12, 2014 Analytical Report for Service Request No: K1408631

Susan Scrocchi
Conestoga-Rovers & Associates, Inc.
2055 Niagara Falls Blvd., Suite 3
Niagara Falls, NY 14304

RE: Marine View Drive RI/FS/009973-D21101-403

Dear Susan:

Enclosed are the results of the samples submitted to our laboratory on August 14, 2014. For your reference, these analyses have been assigned our service request number K1408631.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3364. You may also contact me via Email at Howard.Holmes@alsglobal.com.

Respectfully submitted,

ALS Group USA Corp. dba ALS Environmental

Howard Holmes
Project Manager

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Conestoga-Rovers & Associates, Incorporated	**Service Request No.:**	K1408631
Project:	Marine View Drive RI/FS/ 009973-D21101-403	**Date Received:**	08/14/14
Sample Matrix:	Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Surrogate recoveries have been reported for all applicable organic analyses. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), Matrix/Duplicate Matrix Spike (MS/DMS), Laboratory Control Sample (LCS), and Laboratory/Duplicate Laboratory Control Sample (LCS/DLCS).

Sample Receipt

Eleven water samples were received for analysis at ALS Environmental on 08/14/14. The samples were received in good condition and consistent with the accompanying chain of custody form, except where noted on the cooler receipt and preservation form included in this report. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Total Metals

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Calcium, Iron, Manganese and Sodium for sample G-081314-RB-GMB3R-004 were not applicable. The analyzed concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

No other anomalies associated with the analysis of these samples were observed.

Organochlorine Pesticides by EPA Method 8081

Elevated Detection Limits:
The detection limit was elevated for a few analytes in most samples. The chromatogram indicated the presence of non-target background components. The matrix interference prevented adequate resolution of the target compounds at the normal limit. The results were flagged to indicate the matrix interference.

Matrix Spike Recovery Exceptions:
The control criteria for the matrix spike recovery of Endrin Aldehyde for sample G-081314-RB-GMB3R-04 was not applicable. The chromatogram indicated non-target matrix background components contributed to the reported matrix spike concentrations. Thus, the reported recoveries contained a high bias. Based on the magnitude of background contribution, the interference appeared to be minimal.

Approved by_____ Howard B. Holmes _____

Calibration Verification Exceptions:
The analysis of Chlorinated Pesticides by EPA 8081B requires the use of dual column confirmation. When the Continuing Calibration Verification (CCV) criterion is met for both columns, the lower of the two sample results is generally reported. The primary evaluation criteria were not met on the confirmation column for a few analytes. The results were reported from the column with an acceptable CCV. The data quality was not affected. No further corrective action was necessary.

Surrogate Exceptions:
The upper control criterion was exceeded for Decachlorobiphenyl in samples G-081314-RB-GMB6R-004. No target analytes were detected in the sample. The error associated with an elevated recovery equated to a high bias. The quality of the sample data was not significantly affected. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

PCB Aroclors by EPA Method 8082

Lab Control Sample Exceptions:
The lower control criterion was exceeded for Aroclor 1016 in Laboratory Control Sample (LCS) KWG1412023-5. The extracts in the associated preparation batch required additional cleanups due to the presence of sulfur and other non-target matrix interferences that prevented accurate identification/quantitation of the target analytes. The analysis of the LCS prior to the additional cleanups indicated that spike recovery of Aroclor 1016 was within the control criteria. The error associated with reduced recovery in the post-cleanup LCS indicated the additional cleanups may have introduced a low bias to the sample results reported for the associated target analytes (Aroclors 1016, 1221, 1232, 1242, and 1248). The data was flagged to indicate the problem. No further corrective action was taken at the request of the Project Chemist.

Elevated Detection Limits:
Sample G-081314-RB-GMB1-005 required dilution due to the presence of elevated levels of target analyte. The reporting limits were adjusted to reflect the dilution.

The detection limit was elevated for all target Aroclors in sample G-081314-RB-GMB6R-008. The chromatogram indicated the presence of Aroclor 1262 and other non-target background components. The matrix interference prevented adequate resolution of the target compounds at the normal limit. The results were flagged to indicate the matrix interference.

Sample Notes and Discussion:
Multiple Aroclors were identified in several field samples: Aroclor 1242, Aroclor 1254, and/or Aroclor 1260. When mixtures of PCB Aroclors are present in a sample, correct identification and quantitative analysis of the individual Aroclors can be subjective. In particular, when mixtures are present, differentiating Aroclor 1242 from Aroclor 1248 can be difficult.

A review of the sample chromatograms indicated the presence of PCB patterns or matrix components that spanned the entire elution range from Aroclor 1242 through the end of Aroclor 1254/Aroclor 1260. Based on individual PCB peaks in the early portion of the chromatogram, Aroclor 1242 was identified and quantitated. Although the presence of Aroclor 1248 could not be ruled out, Aroclor 1242 appeared to be the best match based on the early eluting peaks in the PCB chromatogram. Aroclors 1254 and/or 1260 were identified based on the presence of later eluting PCB peaks in the chromatogram.

When Aroclor mixtures are present in a sample, care is taken to minimize the possibility of double-counting PCBs. Analytical peaks are selected based on the best resolution possible for that particular sample. However, when a mixture of Aroclors 1242, 1254, and/or 1260 is present in a sample, the potential exists for a high bias from contribution of one Aroclor to another due to common peaks or peaks that cannot be completely resolved.

No other anomalies associated with the analysis of these samples were observed.

Approved by_____ Howard B. Holmes _____

Volatile Organic Compounds by EPA Method 8260

Calibration Verification Exceptions:
The following analytes were flagged as outside the control criterion for Continuing Calibration Verification (CCV) J:\MS18\0819F005.D: Bromoform. In accordance with the EPA Method, 80% or more of the CCV analytes must pass within 20% of the true value. The ALS SOP allows for 40% difference for the remaining analytes. The CCV met these criteria. The quality of the sample data was not significantly affected. No further corrective action was required.

Matrix Spike Recovery Exceptions:
The matrix spike recovery of Vinyl Chloride for sample G-081314-RB-GMB3R-004 was outside control criteria. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicated the analytical batch was in control. No further corrective action was appropriate.

Elevated Detection Limits:
Sample G-081314-RB-GMB1-005 required dilution due to foaming matrix. The reporting limits were adjusted to reflect the dilution.

No other anomalies associated with the analysis of these samples were observed.

Semivolatile Organic Compounds by EPA Method 8270

Lab Control Sample Exceptions:
The advisory criterion was exceeded for Bis(2-ethylhexyl) Phthalate in Duplicate Laboratory Control Sample (DLCS) KWG1411665-6. As per the ALS/Kelso Standard Operating Procedure (SOP) for this method, this compound is not included in the subset of analytes used to control the analysis. The recovery information reported for these analytes is for advisory purposes only (i.e. to provide additional detail related to the performance of each individual compound). No further corrective action was required.

Relative Percent Difference Exceptions:
The Relative Percent Difference (RPD) for Hexachlorobutadiene in the replicate matrix spike analyses of sample G-081314-RB-GMB3R-004 was outside control criteria. In general, the RPD was relatively high for all spiked compounds, which indicates a low bias in the Matrix Spike (MS) and Matrix Spike Duplicate (MSD). All spike recoveries for the analyte in question were within acceptance limits in the MS, DMS, and associated Laboratory Control Sample (LCS), indicating the analytical batch was in control. No further corrective action was appropriate.

The Relative Percent Difference (RPD) for Bis(2-ethylhexyl) Phthalate in the replicate Laboratory Control Sample (LCS) analyses (KWG1411665-5 and KWG1411665-6) was outside control criteria. The data was flagged to indicate the problem. The results indicated potential contamination of the DLCS. .

Elevated Detection Limits:
The detection limits were elevated in sample G-081314-RB-GMB1-005. The sample extract was diluted prior to instrumental analysis due to relatively high levels of non-target background components. The extract was highly colored, which indicated the need to perform a dilution prior to injection into the instrument.

Sample Notes and Discussion:
The result reported for Phenol in sample G-081314-RB-GMB1-005 may contain a slight bias. The chromatogram indicated the presence of non-target background components. The matrix interference may have resulted in a slight high bias in the affected samples. The results were flagged with "X" to indicate the issue.

The result reported for 4-Methylphenol in sample G-081314-RB-GMB6R-008 may contain a slight bias. The chromatogram indicated the presence of non-target background components. The matrix interference may have resulted in a slight high bias in the affected samples. The results were flagged with "X" to indicate the issue.

No other anomalies associated with the analysis of these samples were observed.

LABORATORY CONTROL SAMPLE

Client: Conestoga-Rovers & Associates, I **Service Request:** K1408631

Project No.: 009973-D21101-403

Project Name: Marine View Drive RI/FS

Aqueous LCS Source: **ALS MIXED** **Solid LCS Source:**

Analyte	Aqueous (ug/L)			Solid (mg/kg)				
	True	Found	%R	True	Found	C	Limits	%R
Aluminum	5000	5520	110.4					
Antimony	50	49.6	99.2					
Arsenic	50	49.3	98.6					
Barium	5000	4830	96.6					
Beryllium	2.5	2.60	104.0					
Cadmium	25	25.1	100.4					
Calcium	12500	12000	96.0					
Chromium	10	10.2	102.0					
Cobalt	25	25.1	100.4					
Copper	12.5	12.7	101.6					
Iron	2500	2470	98.8					
Lead	50	50.2	100.4					
Magnesium	12500	12600	100.8					
Manganese	1250	1190	95.2					
Nickel	25	24.9	99.6					
Potassium	12500	12300	98.4					
Selenium	50	49.5	99.0					
Silver	12.5	12.5	100.0					
Sodium	12500	12100	96.8					
Thallium	50	51.6	103.2					
Vanadium	25	23.9	95.6					
Zinc	25	25.1	100.4

Surrogate Recovery Control Limits (%)

Sur1 = Decachlorobiphenyl 39-140

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

September 19, 2014 Analytical Report for Service Request No: K1409260

Susan Scrocchi
Conestoga-Rovers & Associates, Inc.
2055 Niagara Falls Blvd., Suite 3
Niagara Falls, NY 14304

RE: Marine View Drive RI/FS/009973-D21101

Dear Susan:

Enclosed are the results of the samples submitted to our laboratory on August 29, 2014. For your reference, these analyses have been assigned our service request number K1409260.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3364. You may also contact me via Email at Howard.Holmes@alsglobal.com.

Respectfully submitted,

ALS Group USA Corp. dba ALS Environmental

Howard Holmes
Project Manager

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Conestoga-Rovers & Associates, Incorporated	**Service Request No.:**	K1409260
Project:	Marine View Driver RI/FS/ 009973-D21101	**Date Received:**	08/29/14
Sample Matrix:	Soil and Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Surrogate recoveries have been reported for all applicable organic analyses. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), Matrix/Duplicate Matrix Spike (MS/DMS), Laboratory Control Sample (LCS), and Laboratory/Duplicate Laboratory Control Sample (LCS/DLCS).

Sample Receipt

Five soil and one water sample was received for analysis at ALS Environmental on 08/29/14. The samples were received in good condition and consistent with the accompanying chain of custody form. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

TCLP Metals

No anomalies associated with the analysis of these samples were observed.

Total Metals

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike and matrix spike duplicate recoveries of Aluminum, Iron and Magnesium for sample S-082814-RB-TP38-2.5 were not applicable. The analyzed concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

Antimony recoveries are generally low for soil and sediment samples when digested using EPA Method 3050B. Despite anticipated low recoveries, the method is still generally prescribed because of its versatility for general metals analysis. Antimony results (in conjunction with the matrix spike recovery) from this procedure should only be used as indicators to estimate concentrations. The matrix spike and matrix spike duplicate recoveries of Antimony for sample S-082814-RB-TP38-2.5 was below the Method control criterion. Since low recoveries resulted from a method defect and were possibly magnified by certain matrix components, no corrective action was appropriate. Alternative procedures that specifically target Antimony are available but were not specified for this project. The associated QA/QC results (e.g. control sample, calibration standards, etc.) indicated the analysis was in control.

The matrix spike recovery of Calcium for sample S-082814-RB-TP38-2.5 was outside control criteria. Recovery in the Laboratory Control Sample (LCS) was acceptable, which indicated the analytical batch was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Approved by_ Howard B. Holmes _____

Organochlorine Pesticides by EPA Method 8081

Second Source Exceptions:
The analysis of Chlorinated Pesticides by EPA 8081 requires the use of dual column confirmation. When the Initial Calibration Verification (ICV) criteria are met for both columns, the lower of the two sample results is generally reported. The data quality was not affected. No further corrective action was necessary.

Calibration Verification Exceptions:
The analysis of Chlorinated Pesticides by EPA 8081 requires the use of dual column confirmation. When the Continuing Calibration Verification (CCV) criterion is met for both columns, the lower of the two sample results is generally reported. The primary evaluation criteria were not met on the confirmation column for a few analytes. The results were reported from the column with an acceptable CCV. The data quality was not affected. No further corrective action was necessary.

Elevated Detection Limits:
The detection limit was elevated for several analytes in sample S-082714-NH-TP24-8.5. The chromatogram indicated the presence of non-target background components. The matrix interference prevented adequate resolution of the target compounds at the normal limit. The results were flagged to indicate the matrix interference.

Matrix Spike Recovery Exceptions:
The control criteria for the matrix spike recovery of beta-BHC and 4,4'-DDT for sample S-082714-NH-TP24-8.5 were not applicable. The chromatogram indicated non-target matrix background components contributed to the reported matrix spike concentrations. Thus, the reported recoveries contained a high bias. Based on the magnitude of background contribution, the interference appeared to be minimal.

No other anomalies associated with the analysis of these samples were observed.

PCB Aroclors by EPA Method 8082

Sample Notes and Discussion:
Three Aroclors were identified in S-082714-NH-TP24-8.5: Aroclor 1242, Aroclor 1254, and Aroclor 1260. When mixtures of PCB Aroclors are present in a sample, correct identification and quantitative analysis of the individual Aroclors can be subjective. In particular, when mixtures are present, differentiating Aroclor 1242 from Aroclor 1248 can be difficult.

A review of the sample chromatograms indicated the presence of PCB patterns that spanned the entire elution range from Aroclor 1242 through the end of Aroclor 1260. Based on individual PCB peaks in the early portion of the chromatogram, Aroclor 1242 was identified and quantitated. Aroclor 1260 was identified based on the presence of late eluting PCB peaks in the chromatogram. The remainder of the PCB pattern was identified as Aroclor 1254 because PCB peak height in the middle of the chromatogram was larger than could be attributed to either Aroclor 1242, Aroclor 1248, or Aroclor 1260.

When Aroclor mixtures are present in a sample, care is taken to minimize the possibility of double-counting PCBs. Analytical peaks are selected based on the best resolution possible for that particular sample. However, when a mixture of Aroclors 1242, 1254 and 1260 are present in a sample, the potential exists for a high bias from contribution of one Aroclor to another due to common peaks or peaks that cannot be completely resolved.

No other anomalies associated with the analysis of these samples were observed.

TCLP Volatiles by EPA Method 1311/8260

No anomalies associated with the analysis of these samples were observed.

Approved by__ Howard B. Holmes _____

Volatile Organic Compounds by EPA Method 8260

No anomalies associated with the analysis of these samples were observed.

Semivolatile Organic Compounds by EPA Method 8270

No anomalies associated with the analysis of these samples were observed.

TCLP Semivolatiles by EPA Method 1311/8270

No anomalies associated with the analysis of these samples were observed.

S-082714-NH-TP24-8.5DMS	KWG1412476-2	65
Lab Control Sample	KWG1412476-3	56

Surrogate Recovery Control Limits (%)

Sur1 = Decachlorobiphenyl 43-148

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

October 14, 2014 Analytical Report for Service Request No: K1409921

Susan Scrocchi
Conestoga-Rovers & Associates, Inc.
2055 Niagara Falls Blvd., Suite 3
Niagara Falls, NY 14304

RE: Marine View Drive RI/FS/009973-021101

Dear Susan:

Enclosed are the results of the samples submitted to our laboratory on September 16, 2014. For your reference, these analyses have been assigned our service request number K1409921.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

Please call if you have any questions. My extension is 3364. You may also contact me via Email at Howard.Holmes@alsglobal.com.

Respectfully submitted,

ALS Group USA Corp. dba ALS Environmental

Howard Holmes
Project Manager

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable. See case narrative.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

ALS ENVIRONMENTAL

Client:	Conestoga-Rovers & Associates, Incorporated	**Service Request No.:**	K1409921
Project:	Marine View Drive RI/FS/ 009973-021101	**Date Received:**	09/16/14
Sample Matrix:	Soil, Sediment, and Water		

Case Narrative

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples designated for Tier II data deliverables. When appropriate to the method, method blank results have been reported with each analytical test. Surrogate recoveries have been reported for all applicable organic analyses. Additional quality control analyses reported herein include: Laboratory Duplicate (DUP), Matrix Spike (MS), Matrix/Duplicate Matrix Spike (MS/DMS), Laboratory Control Sample (LCS), and Laboratory/Duplicate Laboratory Control Sample (LCS/DLCS).

Sample Receipt

Nineteen samples were received for analysis at ALS Environmental on 09/16/14. The samples were received in good condition and consistent with the accompanying chain of custody form, except where noted on the cooler receipt and preservation form included in this report. The samples were stored in a refrigerator at 4ºC upon receipt at the laboratory.

General Chemistry Parameters

No anomalies associated with the analysis of these samples were observed.

Total Metals (Sediment/Soil)

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Aluminum, Iron, and Magnesium for sample SO-091514-RB-TP-37-2 were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

Antimony recoveries are generally low for soil and sediment samples when digested using EPA Method 3050B. Despite anticipated low recoveries, the method is still generally prescribed because of its versatility for general metals analysis. Antimony results (in conjunction with the matrix spike recovery) from this procedure should only be used as indicators to estimate concentrations. The matrix spike recovery of Antimony for sample SO-091514-RB-TP-37-2 was below the ALS control criterion. Since low recoveries resulted from a method defect and were possibly magnified by certain matrix components, no corrective action was appropriate. Alternative procedures that specifically target Antimony are available but were not specified for this project. The associated QA/QC results (e.g. control sample, calibration standards, etc.) indicated the analysis was in control.

The matrix spike recovery of Calcium for sample SO-091514-RB-TP-37-2 was outside control criteria The associated QA/QC results (e.g. control sample, calibration standards, etc.) indicate the analysis was in control. No further corrective action was appropriate.

No other anomalies associated with the analysis of these samples were observed.

Approved by_ Howard B. Holmes _____

Total Metals (Water)

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Manganese, Calcium, Magnesium, Potassium, and Sodium for the Batch QC sample were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

No other anomalies associated with the analysis of these samples were observed.

Organochlorine Pesticides by EPA Method 8081

Second Source Exceptions:
The analysis of Chlorinated Pesticides by EPA 8081 requires the use of dual column confirmation. When the Initial Calibration Verification (ICV) criteria are met for both columns, the lower of the two sample results is generally reported. The criteria were not met for Endrin Aldehyde in CAL 13214. The data quality was not affected. No further corrective action was necessary.

Elevated Detection Limits:
The detection limit was elevated for at least one analyte in a few samples. The chromatogram indicated the presence of non-target background components. The matrix interference prevented adequate resolution of the target compounds at the normal limit. The results were flagged to indicate the matrix interference.

Sample Confirmation Notes:
The confirmation comparison criteria of 40% difference for 4,4'-DDD was exceeded in sample SE-091514-RB-SD0. The lower of the two values was reported when no evidence of a matrix interference was observed.

Sample Notes and Discussion:
Organochlorine Pesticides (O-C Pesticides) determined by EPA Method 8081B or equivalent gas chromatography-electron capture detector (GC/ECD) procedures are subject to interference from polychlorinated biphenyls (PCBs). The interference stems from the inability of the GC/ECD to differentiate selected PCB congeners from certain O-C Pesticides. This method limitation can result in false positive detections and/or high bias to pesticide values.

The magnitude of the interference is directly proportional to the concentration of PCBs in the sample. In addition, the affect on selected O-C Pesticides is complicated by the type PCB Aroclor(s) present in the sample. The presence of multiple Aroclors can result in contribution to the apparent concentration of O-C Pesticides by PCB congeners common to two or more Aroclors.

Some field samples in this delivery group contained PCB Aroclors at concentrations high enough to impact the O-C Pesticide results. Note that the results for the O-C Pesticides were reported as per the protocol defined in SW-846 regarding dual column confirmation. In some instances, certain PCB congeners were suspected of being detected on both columns simultaneously within the retention time window of the target pesticide. When the resulting chromatographic peaks met the criteria of a detection as defined in the method, the values were reported.

Results for 4,4-DDT have contribution from confirmed PCB interferences on both columns within the established retention time window, resulting in reported values with a significant high bias.

No other anomalies associated with the analysis of these samples were observed.

Approved by Howard B. Holmes

Organochlorine Pesticides by EPA Method 8081-ULL

Calibration Verification Exceptions:
The analysis of Chlorinated Pesticides by EPA 8081 requires the use of dual column confirmation. When the Continuing Calibration Verification (CCV) criterion is met for both columns, the lower of the two sample results is generally reported. The primary evaluation criteria were not met on the confirmation column for Decachlorobiphenyl. The results were reported from the column with an acceptable CCV. The data quality was not affected. No further corrective action was necessary.

The upper control criterion was exceeded for a few analytes in Continuing Calibration Verification (CCV) KWG1413270-3. The field samples analyzed in this sequence did not contain the analytes in question above the reporting limit. Since the apparent problem indicated a potential high bias, the data quality was not affected. No further corrective action was required.

Elevated Detection Limits:
The detection limit is elevated for alpha-BHC in sample Method Blank KWG1413165-5. The chromatogram indicated the presence of non-target background components, which were apparently introduced as laboratory artifacts. The contamination prevented adequate resolution of the target compounds at the detection limit. Note the level of background was relatively low compared to the detection limit, so the affect on the results was minimal. The results are flagged to indicate the problem.

The detection limit was elevated for at least a couple analytes in some field samples. The chromatogram indicated the presence of non-target background components. The matrix interference prevented adequate resolution of the target compounds at the normal limit. The results were flagged to indicate the matrix interference.

Matrix Spike Recovery Exceptions:
Insufficient sample volume was received to perform a Matrix Spike/Matrix Spike Duplicate (MS/MSD). A Laboratory Control Sample/Duplicate Laboratory Control Sample (LCS/DLCS) was analyzed and reported in lieu of the MS/MSD for these samples.

No other anomalies associated with the analysis of these samples were observed.

PCB Aroclors by EPA Method 8082

Lab Control Sample Exceptions:
The upper control criterion was exceeded for Aroclor 1260 in Laboratory Control Sample (LCS) KWG1413166-1 and Duplicate Laboratory Control Sample (DLCS) KWG1413166-2. The associated target Aroclors (Aroclor 1254 and Aroclor 1260) were detected above the Method Reporting Limit (MRL) in associated samples WS-091514-RB-SW05 and WS-091514-RB-SW02. The error associated with elevated recovery indicated a potential high bias to the results reported for these Aroclors in the associated samples. Insufficient sample volume was available to perform a re-extraction and re-analysis of the affected samples. The results were flagged to indicate the problem. No further corrective action was feasible.

Sample Confirmation Notes:
The confirmation comparison criterion of 40% difference was exceeded for Aroclor 1242 in sample SE-091514-RB-SD07. The lower of the two values was reported when there was an apparent interference on the alternate column that produced the higher value.

Elevated Detection Limits:
The detection limit was elevated for Aroclors 1016, 1221, 1232, 1242, and 1248 in sample SE-091514-RB-SD06. The chromatogram indicated the presence of non-target background components. The matrix interference prevented adequate resolution of the target compounds at the normal limit. The results were flagged to indicate the matrix interference.

Approved by___ Howard B. Holmes ____

Sample Notes and Discussion:
Insufficient sample volume was received to perform a Matrix Spike/Matrix Spike Duplicate (MS/MSD) for extraction lot KWG1413166. A Laboratory Control Sample/Duplicate Laboratory Control Sample (LCS/DLCS) was analyzed and reported in lieu of the MS/MSD for this extraction batch.

Three Aroclors were identified in several field samples: Aroclor 1242, Aroclor 1254, and Aroclor 1260. When mixtures of PCB Aroclors are present in a sample, correct identification and quantitative analysis of the individual Aroclors can be subjective. In particular, when mixtures are present, differentiating Aroclor 1242 from Aroclor 1248 can be difficult.

A review of the sample chromatograms indicated the presence of PCB patterns or matrix components that spanned the entire elution range from Aroclor 1242 through the end of Aroclor 1260. Based on individual PCB peaks in the early portion of the chromatogram, Aroclor 1242 was identified and quantitated. Although the presence of Aroclor 1248 could not be ruled out, Aroclor 1242 appeared to be the best match based on the early eluting peaks in the PCB chromatogram. Aroclors 1254 and 1260 were identified based on the presence of later eluting PCB peaks in the chromatogram.

When Aroclor mixtures are present in a sample, care is taken to minimize the possibility of double-counting PCBs. Analytical peaks are selected based on the best resolution possible for that particular sample. However, when a mixture of Aroclors 1242, 1254, and/or 1260 is present in a sample, the potential exists for a high bias from contribution of one Aroclor to another due to common peaks or peaks that cannot be completely resolved.

No other anomalies associated with the analysis of these samples were observed.

Volatile Organic Compounds by EPA Method 8260

Calibration Verification Exceptions:
The following analytes were flagged as outside the control criterion for Continuing Calibration Verification (CCV) MS24\0919F004.D: Chloromethane and Vinyl Choloride. In accordance with the EPA Method, 80% or more of the CCV analytes must pass within 20% of the true value. The ALS SOP allows for 40% difference for the remaining analytes. The CCV met these criteria. The quality of the sample data was not significantly affected. No further corrective action was required.

Surrogate Exceptions:
The control criteria were exceeded for 4-Bromofluorobenzene in samples SE-091514-RB-SD07 and SE-091514-RB-SD05 due to matrix interference. A re-analysis was performed, but produced similar results. The results of the original analysis were reported. No further corrective action was required.

Matrix Spike Recovery Exceptions:
The control criteria for matrix spike recovery of Trichloroethene for sample Batch QC were not applicable. The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.

No other anomalies associated with the analysis of these samples were observed.

Semivolatile Organic Compounds by EPA Method 8270

Elevated Detection Limits:
The detection limits for various samples were elevated due to less than optimal sample mass extracted for analysis. The samples contained low percent solids which prevented extraction of the sample mass necessary to achieve target detection limits.

No other anomalies associated with the analysis of these samples were observed.

Approved by_ Howard B. Holmes _____

Semivolatile Organic Compounds by EPA Method 8270-LL

Calibration Verification Exceptions:
The following analytes were flagged as outside the control criterion for Continuing Calibration Verification (CCV) MS06\0925F003.D: 2-Methylphenol, Nitrobenzene-d5. In accordance with the EPA Method, 80% or more of the CCV analytes must have passed within 20% of the true value. The remaining analytes are allowed a 40% difference as per the ALS SOP. The CCV met these criteria with the exception listed below. No further corrective action was taken.

The upper control criterion was exceeded for 4-Methylphenol in Continuing Calibration Verification (CCV) MS06-0925F003.D. The field samples analyzed in this sequence did not contain the analyte in question. Since the apparent problem indicated a potential high bias, the data quality was not affected. No further corrective action was required.

Method Blank Exceptions:
The Method Blank KWG1412928-3 contained low levels of Bis(2-ethylhexyl) phthalate above the Method Reporting Limit (MRL). In accordance with ALS QA/QC policy, all sample results less than twenty times the level found in the Method Blank were flagged as estimated. The samples were not re-extracted and re-analyzed because insufficient sample remained for additional testing.

Lab Control Sample Exceptions:
The upper control criterion was exceeded for Bis(2-ethylhexyl) phthalate in Duplicate Laboratory Control Sample (DLCS) KWG1412928-2. The problem indicated a potential bias for results reported from this analytical batch. Sample RINSE BLANK 9-15 had detections for the analyte in question at levels greater than the MRL. Reanalysis was not performed because insufficient sample remained for additional testing. The data was flagged to indicate the problem.

Sample Notes and Discussion:
Insufficient sample volume was received to perform a Matrix Spike/Matrix Spike Duplicate (MS/MSD). A Laboratory Control Sample/Duplicate Laboratory Control Sample (LCS/DLCS) was analyzed and reported in lieu of the MS/MSD for these samples.

No other anomalies associated with the analysis of these samples were observed.

QA/QC Results

Client: Conestoga-Rovers & Associates, Incorpora
Project: Marine View Drive RS/FS/009973-021101
Sample Matrix: Water

Service Request: K1409921
Date Extracted: 09/19/2014

Extraction Prep Log
Organochlorine Pesticides

Extraction Method: EPA 3535A
Analysis Method: 8081B

Extraction Lot: KWG1413165
Level: Low

Lab Control Sample	KWG1413166-1	97
Duplicate Lab Control Sample	KWG1413166-2	104

Surrogate Recovery Control Limits (%)

Sur1 = Decachlorobiphenyl 39-140

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Lab Control Sample	KWG1413412-3	69

Surrogate Recovery Control Limits (%)

Sur1 = Decachlorobiphenyl 43-148

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?	yes/no/NA
2.	Holding times met for all analyses and for all samples?	yes/no/NA
3.	Are calculations correct?	yes/no/NA
4.	Is the reporting basis correct? (Dry Weight)	yes/no/NA
5.	All quality control criteria met?	yes/no
6.	Is the calibration curve correlation coefficient ≥ 0.995?	yes/no/NA
7.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	yes/no/NA
8.	Are ICVs, CCVs, and CCBs all within acceptance limits?	yes/no/NA
9.	Are results for methods blanks all ND?	yes/no/NA
10.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/no/NA
11.	Are all exceptions explained?	yes/no/NA
12.	Have all applicable service requests been reviewed?	yes/no/NA
13.	Are all samples labeled correctly?	yes/no/NA
14.	Have all instructions on the service request been followed? (e.g. Special MRLs, QC on a specific sample, Form V)	yes/no/NA
15.	Are detection limits and units reported correctly?	yes/no/NA
16.	Is the unused space on the benchsheet crossed out?	yes/no/NA
17.	Was analysis turned in by the due date? (n-2) (If not record SR#)	yes/no/NA

DATA QUALITY REPORT
INORGANICS

Explain any "no" responses to questions below, and any corrective actions in the comments section below.

1.	Is the method name and number correct and appropriate?	yes/no/NA
2.	Holding times met for all analyses and for all samples?	yes/no/NA
3.	Are calculations correct?	yes/no/NA
4.	Is the reporting basis correct? (Dry Weight)	yes/no/NA
5.	All quality control criteria met?	yes/no
6.	Is the calibration curve correlation coefficient ≥ 0.995?	yes/no/NA
7.	MBs, CCVs, CCBs, LCSs, Dups, and Spikes, analyzed at proper frequency?	yes/no/NA
8.	Are ICVs, CCVs, and CCBs all within acceptance limits?	yes/no/NA
9.	Are results for methods blanks all ND?	yes/no/NA
10.	Are all QC samples within acceptance criteria? (LCS % rec, MS/DMS % rec, DUP or MS/DMS RPDs, etc.)	yes/no/NA
11.	Are all exceptions explained?	yes/no/NA
12.	Have all applicable service requests been reviewed?	yes/no/NA
13.	Are all samples labeled correctly?	yes/no/NA
14.	Have all instructions on the service request been followed? (e.g. Special MRLs, QC on a specific sample, Form V)	yes/no/NA
15.	Are detection limits and units reported correctly?	yes/no/NA
16.	Is the unused space on the benchsheet crossed out?	yes/no/NA
17.	Was analysis turned in by the due date? (n-2) (If not record SR#)	yes/no/NA

COMMENTS: 10.) K10151-ins/lmsd Low Rec's for 335.4 method. Suspect Matrix interference.

17.) K9812 Due 9.24.14

Final Approved by: _____ Date: 9/23/14

Service Request # K1409921 *1-11
Instrument ID# K-ICP-AES-03

ICP-OES 6010 Data Review Form

		Yes	No
1.	Standardization completed	X	
2.	ICV within 10 % of true value	X	
3.	ICB below MRL	X	
4.	CRI/LLICV standard analyzed.	X	
5.	ICS standards within 20% of true value	X	
6.	All preceding CCVs within 10 % of true value	X	
7.	Following CCV within 10 % of true value	X	
8.	Bracketing CCBs below MRL	X	
9.	Method Blank below MRL		X①
10.	MS (75-125), Dup (20) and LCS (80-120) within control limits		X②
11.	All analytes within instrument linear range	X	
12.	Adequate rinse out time allowed between samples to eliminate memory effect	X	
13.	Run terminated early		X

Comments:
StarLIMS Run 412614 Saved under 092314AICP03
6010C: Non DOD work: OK
DOD work: MRL=2X for As.
① MB: Cs=0.023, samples>20X
② IS: Sb=65%, Cs=50%, post spike okay Non-homogeneous samples
