1.0 INTRODUCTION

This report presents the results of groundwater monitoring conducted by Golder Associates Inc. (Golder) at the Bear Creek Village Shopping Center during the month of September 2017.

1.1 Site Description

The site is currently developed as a shopping center known as the Bear Creek Village Shopping Center, located at 17100 - 17262 Redmond Way, in Redmond, King County, Washington (site). Figure 1 depicts the location of the site on a United States Geological Survey (USGS) topographic map. The existing shopping center development was constructed in phases in approximately 1969, 1977, and 1985. Before the existing shopping center, the site was agricultural land with several houses, outbuildings, and a small warehouse complex along the northern side. The shopping center includes two core building complexes, one stand-alone multi-tenant retail-strip building, and three pad buildings (Taco Time, Jiffy Lube [previously Q-Lube], and O'Reilly Auto Parts [previously Schuck's]). Paved parking areas and limited landscaped areas comprise the remaining area. A dry cleaning establishment known as Bear Creek Cleaners formerly operated in the site. Bear Creek Cleaners was located at the southeastern portion of the site and is the focus of this groundwater monitoring program. A brief background on the history of Bear Creek Cleaners and the resulting remedial investigations is provided below in Section 2.0.

1.2 Purpose and Scope

The purpose of this groundwater monitoring was to determine groundwater quality with respect to the presence of halogenated volatile organic compounds (HVOCs) as a result of the former Bear Creek Cleaners operations, and to obtain groundwater elevation data to determine the groundwater flow direction.

The scope of work for this groundwater monitoring included the following:

- Collection of groundwater samples from six on-site groundwater-monitoring wells (MW-2, MW-3, MW-4, MW-9, MW-10A, and MW-13).
- Collection of other data from these wells including groundwater level readings, pH, conductivity, dissolved oxygen, turbidity, oxidation-reduction potential, and temperature.
- Quality control procedures, including the analysis of a duplicate sample (duplicate collected from MW-4, which was identified with the sample number MW-44), an equipment blank, and a trip blank.
- Analysis of the groundwater and quality control samples for the presence of HVOCs using United States Environmental Protection Agency (EPA) Method 8260C.

2.0 BACKGROUND

2.1 Previous Environmental Investigations

Previous environmental investigations concerning the dry cleaner facility included the following:

- Letter Report – Additional Soil and Groundwater Investigation – Bear Creek Cleaners, Dames & Moore, November 20, 1996.
- Summary Letter of Field Activities at the Bear Creek Cleaners and Q-Lube, Versar Inc., May 21, 1997.
- Memorandum – Preliminary Summary of Results, Delta Environmental Consultants, Inc., September 3, 1997.

2.2 Independent Remedial Actions

An independent remedial action related to the release of perchloroethylene (PCE) from the former Bear Creek Cleaners was conducted in the latter part of 1997 and the early part of 1998. The remedial action is discussed in the following report:

- Report – Voluntary Soil Cleanup – Former Bear Creek Cleaners – Bear Creek Village Shopping Center – Redmond, Washington, Dames & Moore, February 25, 1998.

Previous investigations conducted in 1996 and 1997 indicated the presence of HVOCs, primarily PCE, in soil and groundwater beneath and behind the dry cleaning establishment (Dames & Moore 1996; Versar Inc. 1997; Delta Environmental Consultants, Inc. 1997). Subsequent remedial action and investigation by Dames & Moore during the latter part of 1997 included the excavation of PCE-impacted soil from beneath and behind the dry cleaning establishment and the installation of 12 groundwater-monitoring wells (Dames & Moore 1998). The monitoring wells were placed in various locations at the site for the following reasons:

- To determine the extent of HVOC-impacted groundwater around the dry cleaning establishment.
- To determine background groundwater quality to identify any HVOC-impacted groundwater coming from off-site sources or leaving the site.
- To assess the possible presence of petroleum hydrocarbons in groundwater near the Jiffy Lube facility.

Dames & Moore sampled groundwater from the monitoring wells on October 22, 1997 (Dames & Moore 1998). Analytical results for these samples (using EPA Method 8021B) indicated the presence of PCE and other HVOCs in groundwater along the eastern margin of the shopping center property. No petroleum hydrocarbons were detected in groundwater at the Jiffy Lube facility.

2.3 Groundwater Monitoring Frequency

Groundwater monitoring occurred at the site on a quarterly schedule from February 1999 through September 2005. ATC Associates Inc. (ATC) performed quarterly monitoring during the following periods:

- February, June, September, and December 1999

■ March 2000

Two additional monitoring wells, MW-13 and MW-14, were installed by ATC in June 1999.

No sampling of groundwater was conducted during June 2000 due to changing consultants from ATC to Golder. Written notification of this change was submitted to the Washington State Department of Ecology (Ecology) in a letter dated September 7, 2000.

Golder resumed quarterly groundwater monitoring of MW-2, MW-3, MW-4, MW-9, MW-10A, and MW-13 (in addition to water level monitoring in MW-1, MW-5, MW-6, and MW-14) in September 2000 and has performed monitoring during the following periods:

- September and December 2000
- March, June, September, and December 2001
- March, June, September, and December 2002
- March, June, September, and December 2003
- March, June, September, and December 2004
- March, June, and September 2005

After the September 2005 sampling event, the sampling frequency was reduced from quarterly to semi-annually. On behalf of the property owner, Golder provided notice to Ecology regarding the change in sampling frequency (Golder 2005). The semi-annual sampling schedule has continued as follows:

- March and September 2006
- March and September 2007
- March and September 2008
- March and September 2009
- May and October 2010
- March and September 2011
- March and September 2012
- March and September 2013
- April and September 2014
- March and September 2015
- June and September 2016
- March 2017 and September 2017

The September 2017 analytical results are presented in Table 1. Historical analytical results for groundwater sampling conducted since 1999 are summarized in Table 2. A narrative of historical sampling activities was provided in previous monitoring reports.

3.0 GROUNDWATER SAMPLING

3.1 Groundwater Investigation Methods

On September 14, 2017, Golder sampled groundwater from four groundwater monitoring wells (MW-4, MW-9, MW-10A, and MW-13). MW-2 and MW-3 were not sampled because water levels were below the screens in both wells. Figure 2 depicts the location of all pertinent on-site monitoring wells. Sampling conditions and data collected during the monitoring event were recorded on the Sample Integrity Data Sheets (SIDS) contained in Appendix A. The following methods and procedures were used in collecting the groundwater samples:

- Depth to groundwater was measured in all on-site wells (MW-1, MW-2, MW-3, MW-4, MW-5, MW-6, MW-9, MW-10A, MW-13, and MW-14) prior to purging and sampling. Water levels were recorded on the SIDS. Table 3 presents depth to water measurements and elevations. Figure 3 depicts groundwater elevations and contours.
- Dedicated tubing is located in all groundwater-monitoring wells and is replaced as needed. New tubing was installed in all wells for the September 2017 event. After repositioning, each well was slowly purged of water at a rate of approximately 65 to 150 milliliters (mL) per minute using a peristaltic pump connected to the dedicated tubing.
- Field parameters of temperature, pH, conductivity, turbidity, dissolved oxygen, and oxidation-reduction potential were measured and recorded during purging at 5-minute intervals until parameters were stable. All field parameters were recorded on the SIDS (Appendix A).
- Upon completion of purging, groundwater samples were collected directly from the dedicated sample tubing into bottles.
- For quality control purposes, a duplicate sample and equipment blank were collected. The duplicate sample was collected from MW-4, which was identified with the sample label MW-44. The equipment blank was collected after sampling at MW-4.
- For each groundwater sample, three 40-mL vials of groundwater were collected and preserved with hydrochloric acid. The samples were placed into laboratory-provided containers, labeled, and placed in a cooler with ice.
- The collected samples were transported to OnSite Environmental Inc. in Redmond, Washington for analysis on the same day as sample collection, following chain-of-custody protocols.

All groundwater and quality control samples were analyzed for the presence of HVOCs using EPA Method 8260C. The results of the field duplicate (MW-44) performed at MW-4 and the equipment blank were within acceptable limits and no quality assurance/quality control concerns were indicated. Results for the duplicate are included in Table 2 as bracketed results associated with MW-4. Figure 4 depicts the detected HVOC concentrations for the sampled wells. Figures 5a through 9 depict the detected concentrations of HVOCs for each well over time.

3.2 Groundwater Flow Direction

For the September 2017 groundwater sampling event, static groundwater levels were measured in all on-site monitoring wells (including those that are not sampled for HVOCs) on September 14, 2017. The

groundwater levels found that day (as well as during historical sampling) are summarized in Table 3. Commonly, groundwater elevations are at their highest levels during the wetter winter/spring months and lower during the drier summer/fall months. This trend was true for the September 2017 sampling event. The groundwater levels measured that day were similar to previous years' September events.

The groundwater elevation contour map for September 14, 2017 is depicted in Figure 3. There is some variability in groundwater flow direction across the site, but the inferred groundwater flow direction is generally west or northwesterly, away from Bear Creek. The groundwater gradient measured on September 14, 2017 is generally consistent with all prior monitoring periods. This suggests that Bear Creek loses water to the aquifer. A steep hydraulic gradient is inferred just to the east of the former dry cleaner facility as evidenced by the groundwater contours between MW-3 and MW-4. A similar inferred steep gradient was also present in this general area on all previous groundwater elevation contour maps. This feature is unexpected in shallow alluvial aquifers such as the type present below the site.

3.3 Groundwater Quality

The groundwater analytical data for PCE, trichloroethene (TCE), cis-1,2-dichloroethene (cis-1,2-DCE), and vinyl chloride detected in this round of sampling are summarized in Table 1. Table 2 contains the historical sampling results. Appendix B contains a copy of the laboratory analytical data report. The HVOC concentrations detected during this round of sampling are depicted in Figure 4. Groundwater HVOC concentrations and elevations with respect to time for MW-2, MW-3, MW-4, MW-10/10A, and MW-13 are depicted in Figures 5a, 6, 7, 8a, and 9 for the last 18 years.

PCE or its degradation compounds were detected in three of the four monitoring wells sampled during this period. All three wells with PCE or degradation compound detections (TCE, cis-1,2-DCE, and vinyl chloride) were located on the eastern side of the former dry cleaner facility (MW-4, MW-10A, and MW-13).

3.3.1 Perchloroethylene

PCE was detected in MW-4 and MW-13 at concentrations of 1.4 micrograms per liter ($\mu\text{g/L}$), and 1.2 $\mu\text{g/L}$, respectively. The practical quantitation limit, or PQL, is 0.20 $\mu\text{g/L}$. PCE concentrations did not exceed the Model Toxics Control Act (MTCA) Method A Cleanup Level of 5.0 $\mu\text{g/L}$ in any wells during the September 2017 sampling event. PCE has not been detected in MW-9 for period of record. Concentrations of PCE in MW-4 have seasonal variation and have been less than the MTCA cleanup level since 2003. Figure 10 depicts the PCE detections for all of the routinely sampled wells since 1999. This figure shows an overall decline of PCE concentrations over time across the site. The PCE trend of MW-13 has shown a slight decline since 2014 and the September 2017 concentration was the lowest result measured in this well.

3.3.2 Trichloroethene

TCE was detected at concentrations greater than or equal to the PQL (0.20 µg/L) in two of the four wells sampled (MW-4 and MW-13) at concentrations of 3.0 µg/L, and 5.1 µg/L, respectively. TCE concentrations did not exceed the MTCA Method A Cleanup Level of 5.0 µg/L in any of the sampled wells except for MW-13. TCE has never been detected in MW-9. Figure 11 depicts the TCE detections for MW-2, MW-3, MW-4, MW-10A, and MW-13 since 1997. This figure shows an overall decline of TCE concentrations over time across the site. MW-13 has a slight increasing TCE trend since 2011 and the September concentration was above cleanup level for the first time since 2005. MW-4 is also showing increasing TCE trend since 2016.

3.3.3 Cis-1,2-Dichloroethene

Cis-1,2-DCE was detected at concentrations greater than the PQL (0.20 µg/L) in three of the four sampled wells (MW-4, MW-10A, and MW-13) at concentrations of 8.0, 2.3, and 1.5 µg/L, respectively. The concentrations of cis-1,2-DCE detected during the September 2017 sampling event were less than the current MTCA Method B Cleanup Level of 16 µg/L in all wells. Cis-1,2-DCE has never been detected at a concentration exceeding the current or historical (80 µg/L) MTCA Method B Cleanup Level in effect in any of the wells. Cis-1,2-DCE was detected in MW-9 during the 2002 sampling periods, but not during previous or subsequent sampling periods.

3.3.4 Vinyl Chloride

Vinyl chloride was detected at concentrations greater than or equal to the PQL of 0.2 µg/L in one of the four sampled wells (MW-10A) at a concentration of 0.29 µg/L during the September 2017 sampling event. The concentration of vinyl chloride detected during the September 2017 sampling event was greater than the MTCA Method A Cleanup Level of 0.2 µg/L. Vinyl chloride has never been detected in MW-9. Figure 12 depicts the vinyl chloride detections for MW-2, MW-3, MW-4, MW-10A, and MW-13 since 1997. This figure shows an overall site-wide decline of vinyl chloride concentrations.

3.3.5 1,3-Dichlorobenzene

1,3-Dichlorobenzene was not detected in any of the groundwater samples, or equipment blank samples, collected during the September 2017 event. During the September 2007, March 2008, and more recently in the September 2011 event, 1,3-Dichlorobenzene was detected at concentrations greater than the PQL (0.20 µg/L) in groundwater samples. The detection of this compound during the 2007, 2008, and 2011 events is attributed to the degradation of the dedicated tubing located in the monitoring wells at that time. In all events, the concentrations of 1,3-Dichlorobenzene in the samples ranged from 0.24 to 0.32 µg/L. The dedicated tubing in all wells was replaced before the September 2008 and March 2012 events and as a result, 1,3-Dichlorobenzene was not detected in any of the groundwater samples or equipment blank samples in subsequent sampling events.

3.3.6 Seasonal Fluctuation

Figures 5a, 6, 7, 8a, and 9 depict the groundwater levels along with the detected HVOC concentrations for each well over time. These figures show that groundwater levels fluctuate seasonally and some of the HVOC concentrations appear to fluctuate as well. For example, concentrations of TCE and cis-1,2-DCE in MW-2 appear to be inversely proportional to the groundwater levels such that when the groundwater is at its lowest point (typically during the September sampling events) the TCE and cis-1,2-DCE concentrations are at their highest (Figure 5a). During high groundwater levels, the concentrations of TCE and cis-1,2-DCE appear to be below detection limits. This trend was also occurring in MW-4 for cis-1,2-DCE until the September 2007 sampling event when a potential increase in degradation of PCE seems to have occurred, as indicated by the drop in PCE accompanied by an increase in TCE and cis-1,2-DCE concentrations (Figure 7). The degradation rate seems to have leveled off around March 2011 and the seasonal fluctuations seen before have returned.

PCE concentrations appear to be directly proportional to the seasonal variations in groundwater levels such that when groundwater levels are high, the PCE concentrations are high, and when groundwater levels decrease, the PCE concentrations decrease as well. This seasonal fluctuation is most notable in wells MW-13 (Figure 9) and until recently MW-4 (Figure 7). PCE and TCE concentrations in MW-4 have been high during low groundwater levels since 2016. Evaluation is ongoing.

4.0 CONCLUSIONS AND RECOMMENDATIONS

4.1 Findings and Conclusions

The findings and conclusions of this Groundwater Monitoring Report are summarized as follows:

- During the September 2017 sampling event, only MW-10A had a detection of vinyl chloride exceeding the MTCA Method A Cleanup Level. MW-13 exceeded the MTCS Method A Cleanup Level for TCE. The remaining wells had no detections of any of the constituents of concern (COCs) exceeding MTCA Method A Cleanup Levels.
- The current results indicate an overall decrease in PCE concentrations has occurred in MW-2, MW-4, MW-10A, and MW-13 since March 2007. PCE has not exceeded the MTCA cleanup level in any of the wells since 2012. PCE has not been detected in MW-10A since the March 2007 sampling event.
- A general leveling of HVOC concentrations in the wells, particularly MW-2 and MW-13, is indicated over the last five years of groundwater monitoring.

4.2 Recommendations

Based on the findings and conclusions of the September 2017 groundwater monitoring period, the following recommendations are made:

- The sampling program at the site will continue on the semi-annual sampling schedule (typically March and September) until two consecutive "clean" monitoring events are achieved at which time the frequency will be increased to quarterly sampling to confirm that results are clean during all seasons of the year. Thus, the next routine semi-annual monitoring event should be scheduled for March 2018.
- The wells sampled during the next groundwater monitoring event should include MW-2, MW-3, MW-4, MW-9, MW-10A, and MW-13, for the following reasons:
 - Sampling of all six wells should continue in order to confirm trends in HVOC concentrations and to support the goal of four consecutive sampling periods with HVOC concentrations that are less than MTCA Method A Cleanup Levels.
 - Sampling of MW-9 should continue because it represents the nearest down-gradient well from the former dry cleaner facility.

5.0 CLOSING

Golder Associates Inc. is pleased to continue working on the Bear Creek Village Shopping Center project. If you have any questions regarding this report, please feel free to contact Eric Adams at (425) 883-0777.

Groundwater Elevation		ft amsl	Dry	Dry	29.63	30.87	29.59	35.5	29.63

Notes:

cis-1,2-DCE = cis-1,2-Dichloroethene

PCE = Perchloroethylene = Tetrachloroethylene

1,3-DCB = 1,3-Dichlorobenzene

TCE = Trichloroethene

VC = Vinyl Chloride

ND = indicates sample was not detected above the laboratory analytical detection limit.

(A) = MTCA Method A Cleanup Level (Model Toxics Control Act Cleanup Regulation - Chapter 173-340 WAC).

(B) = MTCA Method B formula value (Model Toxics Control Act Cleanup Regulation - Chapter 173-340 WAC and Model Toxics Control Act Cleanup Levels and Risk Calculations - February 1996).

Analytical results in parentheses represent duplicate samples.

Bold Italic = indicates the analytical result exceeds the MTCA Method A or B Cleanup Level.

* Duplicate sample collected at MW-4.

Groundwater elevation determined using the surveyed elevation (NAVD 88 datum) of the top of each well casing.

Elevations given in feet above mean sea level.

¹ Current (2014) MTCA Method B value. Historical value was 80 µg/L.

MTCA Cleanup Levels		5.0 A	5.0 A	0.2 A	16 B¹

Notes:

Analytical results in parentheses represent duplicate samples.

Bold Italic = indicates the analytical result exceeds the MTCA Method A or B Cleanup Level.

ND = indicates sample was not detected above the laboratory analytical detection limit.

A = MTCA Method A Cleanup Level (Model Toxics Control Act Cleanup Regulation - Chapter 173-340 WAC).

B = MTCA Method B formula value (Model Toxics Control Act Cleanup Regulation - Chapter 173-340 WAC and Model Toxics Control Act Cleanup Levels and Risk Calculations - February 1996).

¹ Current (2014) MTCA Method B value. Historical value was 80 µg/L.

* Groundwater elevation resided beneath the well screen. Sample could not be collected.

cis -1,2-DCE = *cis* -1,2-Dichloroethene

PCE = Perchloroethylene = Tetrachloroethylene

TCE = Trichloroethene

VC = Vinyl Chloride

Table 3: Historical Groundwater Elevations

Notes:

* These elevations are of the top of the PVC well casing measured in feet above mean sea level (MSL).

** MW-5 was not accessible for the 1/14/98 measurement.

***Wells re-surveyed November 2007 and reported in NGVD29 datum.

****Wells re-surveyed in July 2013 and reported in NAVD88 datum.

1 Anomalous groundwater elevation reading. Value was not used in contouring.

† No water was observed in the well. Bottom of the well was tagged at 12.41 feet below TOC on 9/18/2009. Well was jet-routed on 11/13/2012 and bottom of well tagged at 18.41 feet below TOC.

TOC = top of PVC well casing.

NC = Not Collected due to damaged well monument.

bgs = below ground surface.

APPENDIX B
LABORATORY ANALYTICAL REPORTS

14648 NE 95th Street, Redmond, WA 98052 • (425) 883-3881

September 18, 2017

Eric Adams
Bear Creek Village
Golder Associates Inc.
18300 NE Union Hill Road
Suite 200
Redmond, WA 98052-3333

Re: Analytical Data for Project 1525393-17.200
Laboratory Reference No. 1709-167

Dear Eric:

Enclosed are the analytical results and associated quality control data for samples submitted on September 14, 2017.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal line extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 18, 2017
Samples Submitted: September 14, 2017
Laboratory Reference: 1709-167
Project: 1525393-17.200

Case Narrative

Samples were collected on September 14, 2017 and received by the laboratory on September 14, 2017. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Toluene	9.62	9.38	10.0	10.0	96	94	82-120	3	13	
Chlorobenzene	9.67	9.41	10.0	10.0	97	94	80-120	3	14	
Surrogate:										
Dibromofluoromethane					103	103	77-129			
Toluene-d8					103	102	80-127			
4-Bromofluorobenzene					99	97	78-125			

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1- Sample extract treated with a Sulfuric acid/Silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in method 8260C, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Chain of Custody

Company: Golden Associates

Project Number: 1525393-17.200

Project Name: Bear Creek Village

Project Manager: Eric Adams
