RE: 700 Dexter Project
Subject: Core Flex – Contaminants / Vapor

Dear Mr. Balbiani,

CoreFlex will be resistant to detrimental effects from contaminates cited in the various reports; specifically Tetrachloroethene: typically <100 mg/kg but localized areas of 5,000 to 16,000 mg/kg in the tested soils and Tetrachloroethene: 3.5 mg/L up to 16.5 mg/L in the tested ground water samples. CoreFlex will be an effective barrier to the contaminants as well as to groundwater ingress. CECTO has numerous Brown Field applications of the CoreFlex product, with the first being in 2009, without incident. To be clear, CoreFlex is the only product that provides both waterproofing and chemical vapor intrusion protection. Additionally, CoreFlex has welded seams and is terminated mechanically everywhere which enhances its ability to prevent vapors from entering a structure.

Regards,

CETCO

Robert Cisneros
Technical Services Manager

# MEMORANDUM

MORRISON HERSHFIELD

| | | | |
|---|---|---|---|
| TO: | Tom Milholland and Brian Dieterle – Kendall Heaton<br>Drew Graham and Brad Rock – OAC | ACTION BY: | |
| FROM: | Andy Lang | FOR INFO OF: | 700 Dexter project team |
| PLEASE RESPOND BY: | | PROJECT No.: | 170022600 |
| RE: | 700 Dexter – Below Grade Waterproofing and Vapor Control | DATE: | October 11, 2018<br>Revised Oct 11, 2018 |

\\MH.LOCAL\DATA\OFFICES\SEATTLE\PROJ\8170123 700 DEXTER - KHA\9. DESIGN\6. BELOW GRADE WATERPROOFING\700 DEXTER_BG WATERPROOFING AND VAPOR CONTROL_REV.DOCX

Morrison Hershfield (MH) is providing this memorandum to summarize the design for controlling water and vapor penetration into the below grade structure at the Dexter Yard project, located at 700 Dexter Ave N in Seattle, WA. This memo has been revised to include information related to quality control and quality assurance of the installation.

Due to the location of the water table, the bottom slab and lower floor level is anticipated to be subject to hydrostatic pressure, and a permanent foundation dewatering system will not be provided. We also understand that contaminates are present in the soil and/or groundwater that will require a gas/vapor barrier be used.

MH was informed that the foundation will be constructed using a matt slab with thickened footings. Foundation walls are likely to be one-sided formed, cast-in place concrete. Waterproofing membrane will be pre-applied below the matt slab and on the foundation walls prior to casting the concrete slab and foundation walls. Injection and monitoring wells will penetrate the bottom slab and waterproofing. These wells will each consist of a single steel casing that will be grouted and capped top provide a water and vapor tight seal within the wells. This work is outside MH's scope of services.

Cetco Coreflex 60 will be used as the foundation waterproofing and gas/vapor barrier. Attached is the technical data sheet for the Coreflex, along with the Product Manual, which includes the installation instructions and detailing. These documents are available on Cetco's website at http://www.cetco.com/en-us/Products/Building-Materials/Waterproofing.

The Coreflex membrane consists of a 60 mil thick thermoplastic membrane integrally bonded to a hydrophilic "Active Polymer Core" (APC), which swells when exposed to water to provide a secondary waterproofing barrier should water penetrate past the thermoplastic facer. The APC has a geotextile fabric on the interior surface, which achieves a mechanical bond to concrete that is cast against it, resulting in membrane that is fully bonded to the foundation structure. The thermoplastic membrane provides the primary waterproofing as well as the gas/vapor barrier. All laps in the membrane are heat welded to provide a durable seal. Site water samples had been sent to Cetco for compatibility testing, which confirmed that Coreflex 60 was suitable for use at this site.

The Coreflex will be installed underneath the slab and along all the foundation walls to provide a continuous barrier to water and gas/vapor entry into the below grade structure. Typical manufacturer-recommended details will be used to seal the Coreflex to penetrations, such as the steel casings containing the injection and monitoring wells. The project-specific installation and detailing will follow the procedures indicated for *Underslab/Property Line Walls* contained in the attached Product Manual. Additional project-specific details will be developed, as may be necessary, to account for any site

conditions that may vary from what is included in Cetco's published literature. All such details will be obtained from Cetco.

Various accessories will be used as part of the installation of the Coreflex waterproofing membrane. The specific materials that may be used will depend on project-specific detailing, and all such materials are listed in the attached Product Manual. Additional product information and/or technical data sheets are available for these accessories on Cetco's website. In addition to the continuous waterproofing and gas/vapor barrier membrane, waterstops will be installed at all cold joints in the concrete as an additional waterproofing/vapor migration protection.

A 15-year system warranty is available from Cetco and MH understands the owners intend to obtain Cetco's Hydroshield system warranty. To obtain this warranty, Cetco's HydroShield™ Quality Assurance Program will be followed. This Program includes the following requirements:

- Cetco's involvement in review of the design and detailing, providing additional project-specific details where required. This involvement will include periodic site review by a manufacturers' representative through the construction period to address site-specific conditions as may be needed.
- Installation of the membrane system by a manufacturer-approved applicator who has completed Cetco's Approved Applicator Program.
- Third-party independent inspection to confirm installation in accordance with the manufacturers' requirements. This includes review of all substrates prior to the membrane installation; review of all completed membrane and detailing work prior to the membrane being covered/concealed, and review of all waterstops at cold joints in the concrete. Written reports are issued following the visits to document all observations and any corrective action that may be required prior to covering the work.

When properly installed in accordance with the manufacturers' recommendations, the Coreflex will provide an effective and durable barrier to prevent water and gas/vapor penetration into the below grade structure.

# COREFLEX® 60

## THERMOPLASTIC WATERPROOFING MEMBRANE WITH ACTIVE POLYMER CORE

### DESCRIPTION

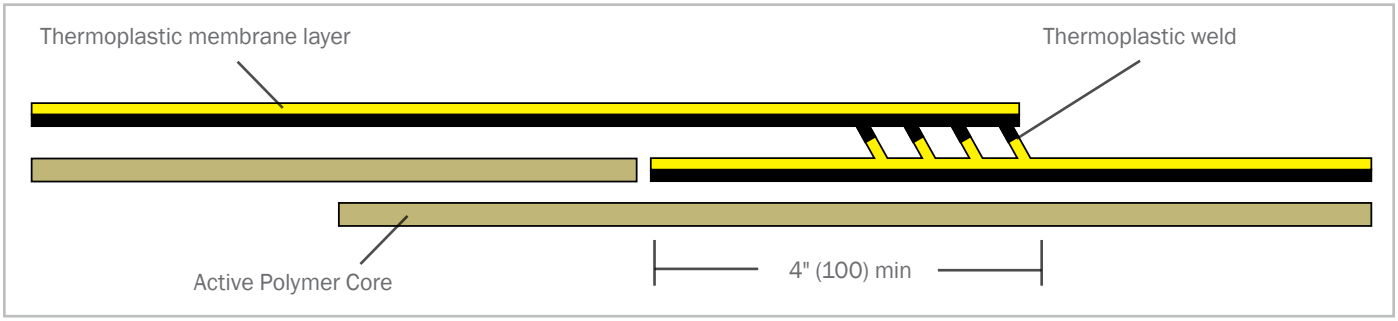
COREFLEX 60 is a 60 mil (1.5 mm) nominal thermoplastic membrane reinforced with a 5.0 oz weft inserted knit polyester fabric integrally bonded to an Active Polymer Core (APC). COREFLEX 60 offers the ultimate in waterproofing barrier protection technology. The barrier performance starts with a thermoplastic membrane with welded seams providing a monolithic watertight barrier layer. The thermoplastic membrane is reinforced with a weft inserted knit polyester reinforcement fabric and is produced with DuPont's Elvaloy-KEE® (Keytone Ethylene Ester), a solid phase high molecular weight ethylene interpolymer.

Unlike traditional liquid PVC plasticizers, the Elvaloy-KEE does not experience phase separation and migrate out; thus the membrane properties are maintained for long term performance. Elvaloy-KEE also provides superior chemical resistance properties. The Active Polymer Core layer is integrally bonded to the Elvaloy-KEE thermoplastic membrane. The APC layer is designed to activate with water to swell and form a positive seal. Thereby, at any unforeseen puncture or installation defect, the APC layer reacts at the breach, self-sealing to stop the water ingress. COREFLEX is the only welded thermoplastic membrane composite with this reactive, self-sealing performance feature.

### APPLICATIONS

The COREFLEX 60 waterproofing system provides waterproofing protection for structural concrete surfaces. Below-grade applications include backfilled cast-in-place concrete and masonry block foundation walls as well as property line shoring walls such as soldier pile and lagging. The membrane can be continued under the floor slab and up onto a horizontal deck to provide a continuous, uniform waterproofing system. COREFLEX 60 can be used to waterproof structures under continuous or intermittent hydrostatic pressure. COREFLEX 60 applications include: Plaza Decks, Split-Slab Deck Construction, Foundation Walls, Earth-Covered Structures, Property Line Construction, Under Slab, Tunnels and Greenroofs.

### INSTALLATION



General: Install COREFLEX 60 Waterproofing System in strict accordance with the manufacturer's installation guidelines and details using accessory products, protection and drainage layers, and overburden as specified or required. Install COREFLEX 60 with the grey APC geotextile side directly in contact with the concrete to be waterproofed. Division 3 Concrete Work should include WATERSTOP-RX® installed in all applicable horizontal and vertical concrete construction joints and around penetrations.

### PACKAGING

COREFLEX 60 is available in 54" x 50' (1.4 m x 15 m) rolls; 54" wide thermoplastic membrane with APC layer offset by 6" (150 mm) along the long roll edge.

### QUALITY INSURANCE PROGRAM

Rely on quality waterproofing products and the HydroShield Quality Assurance Program from CETCO. This program is designed to protect your building and its contents from water leaks through pre-installation planning, experienced craftsmanship, and onsite inspection backed by the strongest warranty in the industry. If it's worth building, it's worth protecting.

## LIMITATIONS

COREFLEX is designed for waterproofing applications where the product is properly covered and confined. COREFLEX should only be installed after substrate preparation has been properly completed and is suitable to receive the waterproofing system. COREFLEX should be used with structural grade reinforced cast-in-place concrete with conventional forms that produce a smooth surface. Use COREFLEX with reinforced shotcrete walls conforming to ACI 506 Core Grade 1 or 2; minimum 200 mm (8”) thick, applied from the bottom up in their full wall structural design thickness in a single application per shotcrete lift. Consult CETCO for guidelines for stay-in-place concrete forms.

COREFLEX should not be installed in standing water or over ice. Site groundwater samples should be submitted to CETCO for compatibility testing. COREFLEX is designed for use under reinforced concrete slabs 150 mm (6”) thick or greater with a mud slab substrate. COREFLEX is capable of bridging typical shrinkage cracks in concrete up to 1.5 mm (1/16”).

COREFLEX membranes are not designed to waterproof expansion joints. Consult with CETCO regarding all expansion joint applications and limitations.

North America: +1 847.851.1800 | +1 800.527.9948 | www.cetco.com

## PRODUCTION DESCRIPTION

***COREFLEX 60***

A dual component waterproofing membrane system that combines a modified PVC reinforced thermoplastic membrane with an Active Polymer Core (APC) layer into one high performance, easy to use product. This composite membrane provides both a fully welded thermoplastic membrane with an integrally bonded self-sealing active waterproofing layer to assure optimal performance. No other product fits the range of installation conditions that COREFLEX does; including underslab, property line walls, backfilled foundation walls, tunnels, earth covered structures, new and restoration plaza decks, split-slab construction and greenroofs.

***COREFLEX XP***

A dual-component waterproofing membrane system that combines a modified PVC reinforced thermoplastic membrane with an XP technology core layer in to one high performance, easy to use product. COREFLEX XP offers the same installation and performance benefits as COREFLEX 60, but features XP technology, the latest innovation in active waterproofing. This advanced polymer technology provides exceptional performance in a wide range of ground contaminates, including high-salinity conditions. ***COREFLEX XP should be used with other XP detailing products: CORETEX XP, SEAL-X XP, and WATERSTOP XP.***

## ACCESSORIES

***ADHESIVE SB-100:*** Adhesive for securing CoreFlash membranes to various substrates, including cured concrete, wood, metal and cementitious boards.

***AKWASWELL®:*** Hydrophilic polyurethane caulk used for detail work including pipe penetrations.

***CETSEAL®:*** A multipurpose UV stable single component polyether moisture cure sealant/adhesive. Primary applications are grade termination sealant, membrane lap sealant and waterstop adhesive.

***CORECAP® TIE-BACK COVERS:*** Preformed non-reinforced thermoplastic flashings, designed to provide a welded thermoplastic cover over tie-back heads on property line shoring walls; three preformed sizes available. CoreCap(s) used in conjunction with same size rigid TB-Boot.

***CORECLAD®:*** 24 ga. stainless steel sheet laminated on one side with thermoplastic polymeric coating for flashing applications and termination details.

***COREDISC®:*** CoreDisc is a nominal 100 mm (4") round x 1.5 mm (60 mil) non-reinforced thermoplastic disc. CoreDiscs are used for T-joint patches and to repair small punctures in the PVC membrane.

***COREFLASH:*** 1.5 mm (60 mil) thick reinforced thermoplastic membrane (yellow top coat and black bottom coat) used for non-exposed detail and flashing applications including curbs, walls, field wraps, butt-joints and patches.

***COREFLASH NR:*** 1.5 mm (60 mil) thick UV stable non-reinforced extruded white thermoplastic membrane used for detail and flashing applications including curbs, walls, field wraps and patches.

***COREFLASH UV:*** 1.5 mm (60 mil) thick UV stable reinforced thermoplastic membrane (white top coat and black bottom coat) used for flashing applications exposed to direct UV and or weathering conditions including curbs, walls, field wraps and patches

***CORETEX®:*** APC polymer impregnated geotextile for transition details, corners, butt-joints and protection from rough edges and surfaces.

***CORETEX XP®:*** Used with COREFLEX XP, CORETEX XP is a polymer impregnated geotextile featuring XP technology for transition details, corners, butt-joints and protection from rough edges and surfaces. Herein refered to in this manual as CORETEX.

***INDUCTION WELDING PLATE:*** 80 mm (3 1/4") diameter nominal metal plate with thermoplastic coating for attachement of COREFLEX membrane to shoring with induction welding machine.

***PF-150:*** Molded non-reinforced thermoplastic flashings, specially designed for round penetrations 50 mm (2") or less in diameter.

***PF-340:*** Pre-fabricated factory welded thermoplastic pipe penetration sleeve with open cut side for simple installation around 75 mm (3") to 100 mm (4") pipe penetrations; comprised of a non-reinforced 60 mil membrane stack and a 60 mil reinforced membrane base flange.

***SEAL-X XP:*** SEAL-X XP is trowel-grade detailing mastic designed for a variety of surface preparation and detailing work. It swells upon contact with water to form a watertight barrier, even in high-saline water conditions.

***TW-ANCHOR:*** Specially designed anchors that allow for rebar to be tied into and supported without creating membrane penetrations.

***UNIVERSAL CORNER:*** Molded non-reinforced thermoplastic flashings used to seal inside and outside corner details. Universal Corners come as one piece and are trimmed to fit the appropriate corner condition.

## ASSOCIATED PRODUCTS

***AQUADRAIN®:*** Foundation drainage composite consisting of a molded profile core and a filter fabric. System includes sheet drainage and base drain collection. CXJ-200/CXJ-400 EXPANSION JOINTS: Extruded thermoplastic dual-cell center gland expansion joint with integrated side flashings that are welded to the COREFLEX membrane for sealing expansion joints in below grade applications. Available in 50 mm (2") and 100 mm (4") wide joint glands.

***WATERSTOP-RX®:*** Hydrophilic, swelling concrete joint waterstop used around penetrations and applicable concrete joints. WATERSTOP-RX swells upon hydration to form a positive seal in concrete cold pour joints.

***WATERSTOP® XP:*** Featuring XP technology, WATERSTOP XP is proven effective in a wide range of environments including high-saline conditions. Effective for both horizontal and vertical joints, it expands upon contact with water to form a positive seal to stop water ingress through cast-in-place concrete construction joints and around pipe penetrations.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

# SECTION 1
# MEMBRANE WELDING PROCEDURES & EQUIPMENT

## 1.1 GENERAL MEMBRANE ORIENTATION AND OVERLAPS

All COREFLEX membrane overlaps require that both the thermoplastic membrane and the APC/XP layers (active layers) overlap a minimum 100 mm (4”) with all thermoplastic membrane edges continuously welded per CETCO guidelines.

Membrane overlaps shall be oriented to shed water (shingle style) wherever possible. Specific equipment, especially wedge welders, may require greater overlap dimensions to facilitate welding.

Welding equipment shall be approved by CETCO. Contact your local CETCO representative for an updated list of suitable welding equipment. CETCO recommends that the installer tests all new welding equipment with COREFLEX prior to purchase or prior to using it at the project site.

All welding shall be performed by CETCO Approved Applicator staff that have successfully completed a two day course of instruction provided by CETCO prior to project work. Successful course participants are provided a CETCO COREFLEX Certified Welder ID Card that is required to be in their possession on site while welding. For information on CETCO’s COREFLEX Training Class, contact your local CETCO representative.

The use of automated welding equipment is recommended for all COREFLEX and CoreFlash membrane overlap seams exceeding 3 m (10’) in length.

All thermoplastic welds shall be continuous and without interruption or defect.

Along the long roll edges, COREFLEX is produced with the active layer offset 150 mm (6”) from the PVC membrane layer to facilitate thermoplastic welding. Overlap the adjacent membrane edges, PVC to PVC, and maintain a uniform minimum overlap width of 100 mm (4”) for both the PVC layer and the active layer. Dependent on the membrane orientation for an application, COREFLEX may be welded with either the yellow thermoplastic side or the active layer side oriented toward the installer. In all applications the thermoplastic side shall be oriented outward, relative to the interior of the structure.

When welding with the active layer side up, it will be necessary to fold the Active layer selvedge edge back so that it is out of the way prior to running the welding equipment. Depending on the angle of the tip assembly, some welding equipment may scorch the edge of the folded acitve layer. In this orientation adjust the equipment so that the tip assembly is positioned slightly shallower in the overlap to avoid scorching the folded active layer.

In an application with the active layer side up, once the thermoplastic welding process is complete, fold back the active layer selvedge edge to its original position, whereas it overlaps the adjacent membrane active layer a minimum 100 mm (4”). Adhere the overlapped active layer selvedge edge in place with dabs of CETSEAL maximum 300 mm (12”) on center or a continuous bead of CETSEAL within the active layer overlap.

To facilitate thermoplastic welding along roll butt end edges or field cut roll dimensions where the active layer and PVC are trimmed flush at the edge, cut the ends straight and at a right angle to a long roll edge.

Place the butt ends (or field cut dimensions) of adjacent rolls aligned 25 mm (1”) of each other to accommodate a single welding pass. Best practice is to trim adjacent roll ends to form a common edge alignment. Sequencing of the welding and placement of the Coretex strip will depend on the orientation of the COREFLEX membrane. Both the PVC membrane and active layer will need to be spliced. Cut strips, a minimum of 225 mm (9”) of CoreFlash and Coretex respectively.

When working with the active layer side up, the welding of the CoreFlash strip is typically carried out first (maintaining a minimum 100 mm (4”) overlap) followed by the placement of the Coretex strip. Overlap the COREFLEX 100 mm (4”) onto the CoreFlash strip at the butt ends of the rolls and create a continuous thermoplastic weld between the CoreFlash strip and the COREFLEX membrane. Repeat on the other side of the butt end or cut edge. Once welds are completed and verified on both edges place the 225 mm (9”) Coretex strip, centered, over the welded butt end splice and secure with dabs of CETSEAL maximum 300 mm (12”) on center or a continuous bead of CETSEAL.

When working with PVC thermoplastic side up, the 225 mm (9”) Coretex strip must be placed first with each adjacent COREFLEX edge overlapping the Coretex strip a minimum 100 mm (4”). In this instance it is not required to secure the Coretex strip with CETSEAL as the weight of the membrane will keep the Coretex strip in place.

Depending on site and detail specific conditions, alternate membrane overlap/weld methods may be required or desired. Consult CETCO for alternate membrane installation techniques, procedures, and details to properly provide a 100 mm (4”) membrane overlap with a continuous thermoplastic weld. Strictly adhere to CETCO’s membrane welding guidelines. All welds shall be continuous and without interruption or defect. All surfaces to be welded shall be clean and dry. No adhesives shall be present within the areas of the weld. Do not use chemical cleaners to remove dirt and debris. Use cotton rags to clean membrane; do not use synthetic rags.

North America: +1 847.851.1800 | +1 800.527.9948 | www.cetco.com

## 1.2 HAND WELDING

### 1.2.1 APPROPRIATE HOT-AIR HAND WELDER TEMPERATURE CALIBRATION

COREFLEX, CoreFlash and CoreFlash NR all require different temperature settings in order to weld the products efficiently. Other factors that can have an affect on temperature setting include, but are not limited to, power, ambient temperature, membrane storage and weather. In order to ensure that the hot-air hand welder is set to the correct temperature, each type of membrane shall be tested prior to installing field material for that day.

***COREFLEX:*** COREFLEX is a composite membrane consisting of an active layer and PVC layer rather than COREFLASH, which is just a PVC membrane. Due to the inclusion of the active layer, the welding process will be slower than welding COREFLASH and the temperature setting of the hot-air hand welder will need to be set lower. Set the hot-air hand welder to a setting of approximately 400° C (750° F) If using an analog model consult hot-air welder manufacture as to which temperature setting corresponds to 400° C (750° F). Using a scrap piece of COREFLEX, approximately 100 mm (4") x 100 mm (4"), hold the nozzle tip of the hot-air hand welder 12 mm (1/2") from the membrane face for a period of 8–10 seconds. At the end of the 8–10 seconds, remove the heat source and immediately press the handle edge of the silicon roller into the heated area and attempt to displace the heated PVC creating a visible displacement (smear) in the top surface of the PVC. This visible displacement of PVC confirms that the temperature of the hot-air hand welder is sufficient for welding the membrane together. There should be little to no discoloration of the membrane. If brown to black discoloration is present after removing the heat source, the temperature is too high and can cause burning of the membrane within the overlap when completing the welding process. If there is no visible displacement (smear) of the PVC membrane surface with the handle edge of the silicon roller after 8 – 10 seconds, then the temperature is too low. Increase or decrease the temperature of the hot-air hand welder until an appropriate temperature setting is reached.

***COREFLASH:*** Set the hot-air hand welder to a setting of approximately 427° C (800° F). If using an analog model consult hot-air welder manufacturer as to which temperature setting corresponds to 427° C (800° F). Using a scrap piece of CoreFlash approximately 100 mm (4") x 100 mm (4"), hold the nozzle tip of the hot-air hand welder 13 mm (1/2") from the membrane face for a period of approximately 5 seconds. At the end of the 5 seconds, remove the heat source, using the handle edge of the silicon roller immediately press into the heated area and attempt to displace or smear the molten PVC creating a visible displacement. This movement of PVC membrane allows the user to confirm that the temperature of the hot-air hand welder is sufficient for welding the membrane together. Upon removing the heat after 5 seconds there should be little to no discoloration of the membrane. If brown to black discoloration is present after removing the heat source, the temperature is too high and can cause burning of the membrane within the overlap when conducting the welding process. Should there be no movement of the PVC membrane with the handle edge of the silicon roller after 5 seconds then the temperature is too low. Increase or decrease the temperature of the hot-air hand welder until an appropriate temperature setting is reached.

***COREFLASH NR:*** CoreFlash NR is a non-reinforced membrane. This membrane can be welded at a lower temperature setting than both COREFLEX and CoreFlash, therefore a lower temperature should be utilized for CoreFlash NR. Set the hot-air hand welder to a setting of approximately 343° C (650° F). If using an analog model consult hot-air welder manufacture as to which temperature setting corresponds to 343° C (650° F). Using a gloved hand and a scrap piece of CoreFlASH NR, approximately 100 mm (4") x 100 mm (4"), quickly fold this scrap piece in half over the nozzle tip of the hot-air hand welder, pinch the membrane against either side of the nozzle tip and draw the piece of CoreFlash NR down the tip. This should transfer a white coating of PVC on the front and back flat areas of the nozzle tip. The PVC coating on the nozzle tip should maintain a white appearance for approximately 30 seconds. If the coating turns brown or burns within the 30 second period, the temperature is too high; decrease the temperature setting on the hot-air welder and retest. The 30-second period will allow for the scrap piece of CoreFlash NR to cool as well. Once the CoreFlash NR is cool, attempt to pull the welded sample apart; the membrane should tear around the welded area rather than separate at the weld. If the weld is pulled apart increase the temperature of the hot-air hand welder and retest.

### 1.2.2 HAND WELDING PROCESS

Once the temperature setting has been accurately tested, welding membrane overlap seams with a hot-air hand welder shall be completed per the following three step process:

#### STEP 1. TACK WELD

STEP 1. Tack Welding

Overlap the COREFLEX membrane ensuring that the PVC selvedge edge is overlapping the adjacent sheets' PVC layer a minimum of 100 mm (4"). Tack weld the overlap to hold both thermoplastic membranes together to maintain the minimum 100 mm (4") wide overlap by inserting the nozzle tip of the hand welder into the overlap seam approximately 50 mm – 75 mm (2"–3") depth. Apply pressure with 1 or 2 fingers over the nozzle tip, when you feel warmth telegraphing through the membrane pull out the nozzle and press firmly down on the membrane to set the tack weld. Repeat this tack weld process intermittently along the membrane overlap while maintaining the minimum 100 mm (4") overlap.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

### STEP 2. PRE-WELD

STEP 2. Pre Weld Placement

Insert the nozzle tip into the membrane overlap seam approximately 40 mm (1–1/2”) with the nozzle tip parallel to the sheet edge. Using a silicon roller, press both membranes together at the end of the membrane overlap to trap the hot-air and seal off the start of the pre-weld. Then using the crease in the nozzle as a depth guide, create a thin, continuous pre-weld approximately 25 mm (1”) inside the membrane overlap seam. Form a continuous thin pre-weld by moving the hand held hot-air welder while simultaneously pressing both membranes together just in front of the hot-air welding tip with the silicon roller for the length of the weld. The pre-weld will prevent the loss of hot-air and concentrate heat along the seam edge of the overlap during the final weld.

### STEP 3. FINAL WELD

STEP 3. Final Weld Placement

Insert the nozzle tip of the hand welder into the membrane overlap seam at a 45°angle relative to the membrane edge.

When welding COREFLEX/CoreFlash (overlaying layer) to COREFLEX (underlying layer) with the yellow PVC membrane side up (facing the installer) the hot-air hand welder should be held up at a 45° angle to the membrane, directing more heat to the underlying membrane to properly heat the underlying COREFLEX to a temperature sufficient to form a thermoplastic weld.

When welding COREFLEX (overlaying layer) to COREFLEX/CoreFlash (underlaying layer) with the active layer side up (facing the installer) hot-air hand welder should be held at the lowest angle possible, directing heat to the top membrane to properly heat the top COREFLEX-60 membrane to a temperature sufficient to form a thermoplastic weld.
With either of the above welding orientation conditions, once the proper welding temperature has been reached and the thermoplastic membrane surface begins to “flow”, apply light pressure with a hand roller, by rolling across the overlap seam with the hand roller running parallel to the nozzle tip (at an approximate 45° angle across the membrane overlap). As rolled, a small bead of molten material should extrude out of the seam edge.
When welding transitions from one plane to another (as in the horizontal to vertical plane change from slab to wall applications) begin the weld at the corner transition then work outward on both surfaces. Weld a COREDISC or COREFLASH NR patch over the seam at the transition.

### STEP 4. WELD WIDTH VERIFICATION

STEP 4. Weld width verification

Verify the weld width: Refer to Section 1.5 for weld testing procedures.

## 1.3 MANUAL WELDING EQUIPMENT

### HAND HELD HOT-AIR WELDERS

For all straight field seams use a 40 mm (1–1/2”) wide nozzle to create a nominal 40 mm (1–1/2”) wide homogeneous thermoplastic weld without interruption or defect. Use a minimum 20 mm (3/4”) wide nozzle for corners, T-joints, patches and other field detailing, maintaining a nominal 20 mm (3/4”) wide homogeneous thermoplastic weld. Some semi-automatic welding equipment utilize a 30 mm (1–1/4”) wide nozzle; which is also acceptable.

## 1.4 MACHINE WELDING

### AUTOMATED HOT-AIR WELDERS

Use a 40 mm (1–1/2”) wide nozzle to create a nominal 40 mm (1–1/2”) wide homogeneous thermoplastic weld without interruption or defect. In the absence of a working mud slab, a sheet metal or plywood substrate “track” should be placed under the membrane in order to run the welding equipment successfully. The width of the track will depend on the configuration and size of the welding equipment being used. The track can be either sacrificial or pulled out and leap-frogged in front of the welding equipment to provide a solid welding substrate for the entire length of overlap being welded. Welds shall be continu-

ous and without interruption or defect. Some automatic welding equipment utilize a 30 mm (1–1/4") wide nozzle; which is also acceptable.

### AUTOMATED WEDGE WELDERS

Automated hot-air welder

Use a minimum 50 mm (2") wide, solid wedge to create a nominal 50 mm (2") wide homogeneous thermoplastic weld without interruption or defect. Membrane overlap width may need to be increased according to the requirements of the equipment. Prior to wedge welding in an underslab application, fold the active layer selvedge edge of the bottom sheet back under and out of the way in order for the thermoplastic membrane of the bottom sheet to make contact with the wedge. After completing a thermoplastic weld, unfold the active layer selvedge edge to provide minimum 100 mm (4") active layer to active layer overlap at the membrane overlap assembly and apply a continuous bead of CETSEAL within the active layer. If the membrane is oriented yellow side up, lift up membrane or fold it back revealing the overlap in order to unfold the active layer selvedge edge. When using automated wedge welders, never tack weld membranes together prior to machine welding.

Automated wedge welder

## 1.5 QUALITY CONTROL/INSPECTION OF WELDED SEAMS

### 1.5.1 COREFLEX TRAINED INSTALLERS

All installers welding the COREFLEX system membranes must be in possession of a Certified CoreFlex Welder ID Card issued by CETCO. This card must be current and on the person welding. The card indicates that the individual welding the CoreFlex membrane has successfully completed the required CoreFlex training class. Individuals without a current Certified CoreFlex Welder ID Card may still assist with CoreFlex, but are not allowed to weld membranes on warranty eligible projects. Individuals without an active Certified CoreFlex Welder ID Card that are observed welding CoreFlex membrane may jeopardize the issuance and eligibility of the CETCO Warranty on that project. Contact your local CETCO sales representative with inquiries regarding the CoreFlex Training Class.

### 1.5.2 INSPECTING SEAMS

All welds shall be inspected by the waterproofing applicator's job foreman and/or supervisor on a daily basis. Inspection should take place only after the weld has had time to cool; probing a warm seam can damage the membrane. Weld continuity inspection shall include, but not be limited to, the probing of all field welds with a rounded flat head screwdriver or other dull pointed instrument (cotter pin puller). Drag the blunted tool along the cooled edge of the seam while applying gentle pressure. If any void or defect is found, immediately mark it so that it can be easily located and repaired. Prolonged use of a probing tool can restore an edge to the tool, so it will be necessary to occasionally re-round (dull) the probing tool.

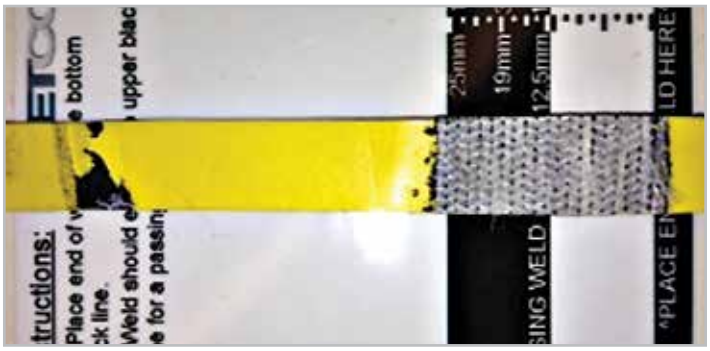
Ensure that all aspects of the installation (sheet layout, attachment, welding, flashing details, etc.) are in strict accordance with current CETCO installation guidelines and details. Excessive patching of field seams due to poor workmanship will not be accepted at time of FINAL INSPECTION FOR WARRANTY ACCEPTANCE. Deviations from the specification and/or details must be authorized in writing by CETCO, prior to execution. Deviations from this procedure may result in forfeiture of warranty eligibility.

### 1.5.2 DAILY CALIBRATING OF WELDING EQUIPMENT

The daily process of calibrating welding equipment and an applicator's technique for the day's conditions is part of quality assurance. This step should be performed on a scrap piece of the same type of membrane that you are intending to install/weld. Ambient conditions should also be similar (test outside if you will be welding outside) to the field welding conditions. Repeat the calibration process as many times as necessary to dial the welding equipment in to achieve a proper, successful weld. Additional tests should be performed if the equipment sits idle for long periods of time and has been cooled or if weather conditions change during the day.

Testing shall be conducted on each piece of equipment, each day, and after each cool down (morning, after break, after lunch, etc.) on the project. Adjust equipment speed and or heat/power settings as necessary to achieve a proper weld. Poor weld results may also indicate an inadequate power source. It may be necessary to change to a different power source in order to achieve acceptable weld results.

### 1.5.3 COREFLASH NR



CoreFlash NR is a non-reinforced product that must be seam tested in a slightly different manner than COREFLEX. Inspect CoreFlash NR only after the welded area has cooled; inspecting while the membrane is still warm may lead to damage of the seam or membrane. Once

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

cool, use a blunt instrument or finger to attempt to gently roll the edge of the CoreFlash NR away from the CoreFlash or COREFLEX that it is welded to. When welded appropriately, CoreFlash NR will not peel up or separate from the underlying membrane. If the CoreFlash NR peels up, apply additional heat and repeat the welding procedure to ensure a proper weld. After conducting the edge roll technique, still probe the entire weld with a blunt instrument to confirm weld continuity.

### 1.5.6 PROJECT TEST STRIPS AND DOCUMENTATION OF WELD

Each day, for each piece of equipment, cut out and retain a 50 mm–100 mm (2”–4”)wide welded seam sample; date it and retain for the independent inspector/owners representative. Additionally a successful test strip, already pulled for verification of the weld process must be included. Similarly date and submit a successful test “pull strip” for the independent inspector. The independent inspector for the project will photo document the test strips for submittal to the CETCO Field Services Unit. Further test strips may be required as conditions change during the day, as problems arise, or at the independent inspector/owners representative discretion.

Weld needs to be greater than 12 mm

Taking samples of completed waterproofing should be avoided whenever possible. If a test cut is conducted on installed membrane, it must be patched properly. Test cuts shall be filled with Coretex extending 100 mm (4”) beyond the edges of the cut opening (in order to provide a flush surface and replace the piece removed with the test sample. Next, patch the cut with CoreFlash extending 100 mm (4”) beyond the edges of the cut opening and completed with a continuous thermoplastic weld.

## 1.6 INSTALLATION

In plaza deck or back-filled insallation, install COREFLEX over properly prepared substrate with the active layer oriented in direct contact with the structural concrete. In a property-line wall/underslab application the active layer shall be facing the installer and the yellow thermoplastic portion of the COREFLEX membrane should be oriented down against the substrate. Overlap all adjoining edges a minimum of 100 mm (4”). All overlaps (factory long roll dimension edges, butt or short roll dimensions, and cut edges) require a minimum 100 mm (4”) overlap of both the thermoplastic membrane and the active layer. COREFLEX overlaps must be assembled by fabricating a minimum 12 mm (1/2”) wide continuous thermoplastic weld. (See Section 1.1 Membrane Welding Procedures for detailed instructions) If the slab is poured in sections, COREFLEX should extend a minimum 300 mm (12”) beyond the slab edge. This enables COREFLEX to be properly overlapped for subsequent slab section pours. WATERSTOP-RX/XP should be installed in all applicable slab construction joints.

### 1.6.1 T-JOINT WELDING

**Multiple thermoplastic membrane edge overlaps:**

A CoreDisc or circular cut piece of CoreFlash NR with a minimum 100 mm (4”) diameter is required, centered and hot-air welded at the T-Joint intersection using the following steps (COREFLASH, COREFLASH UV and COREFLEX are not acceptable T-Joint Patching materials.) CoreDiscs and CoreFlash NR conform better to the change in plane and efficiently seal the pinhole typically created when three reinforced membranes come together to form a T-Joint.

While hand welding the CoreDisc, use the edge of the hand roller to press in and conform the CoreDisc completely to the thermoplastic membrane overlaps.

# SECTION 2
# DETAILING

## 2.1 LARGE PENETRATIONS DETAIL SEQUENCING

### PROPERTY-LINE/UNDERSLAB:
Install field sheet followed by CORETEX AFTER completing the following details.

### BACK-FILLED WALLS/PLAZA DECK:
Install CORETEX followed by field sheet BEFORE completing the following details.

### STEP 1: CUT & PLACE TARGET PIECE

STEP 1A. Cut target piece

Cut a square target piece of CoreFLASH that will extend a minimum 200 mm (8”) radius around the penetration. Then cut an opening in the center of the target piece to fit tightly around the penetration.

STEP 1B. Place target piece

Slide the opening down the penetration to the substrate. The opening should be tight fitting and the COREFLASH will actually neck up onto the penetration approximately 6 mm (1/4”).

### STEP 2: CUT & POSITION NR
Cut a piece of CoreFlash NR wide enough to wrap around the penetration with an additional 50 mm (2”) of overlap. Ideally the CoreFlash NR piece should be tall enough to extend a minimum of 200 mm (8”) up the penetration from the substrate and flare out approximately 25 mm (1”) onto the CoreFlash target piece.Therefore a minimum sizing of a CoreFlash NR piece to wrap a 200 mm (4”) O.D. pipe will be approximately 375 mm x 225 mm (15” x 9”).Next round the two corners on bottom edge of the CoreFlash NR with a pair of scissors. With a handheld welder, heat the bottom edge of the CoreFlash NR to the point where it starts to curl towards the heat.

STEP 2A. Heat edge and stretch NR

Heat a 200–300 mm (4–6”) section of the membrane. Stretch the membrane by pulling the edge of the CoreFlash NR in opposite directions along the heated edge of the membrane. Continue until the entire bottom edge of the CoreFlash NR and 75 mm (3”) up the vertical edges of the CoreFlash NR is stretched. When done properly, the stretched edge should have a scalloped appearance

STEP 2B. Scalloped edge

This scalloped edge will form the flange against the CoreFlash target piece. Wrap the CoreFlash NR around the pipe so that it fits tightly and has a 50 mm (2”) overlap running vertically on the penetration and a 25 mm (1”) flange on the CoreFlash target piece on the substrate.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

### STEP 3: TACK WELD NR

STEP 3. Tack weld NR

With a handheld welder (fitted with a 20 mm (3/4”) tip) place a tack weld at the back of the 50 mm (2”) overlap in two or three spots to hold the CoreFlash NR in place on the penetration. Be sure to keep the lowest tack weld up high enough to allow detailing the flange on the CoreFlash target piece first.

### STEP 4: WELD NR TO TARGET PATCH

STEP 4. Final weld NR to target piece

Insert the tip of the welder at the base of the penetration between the CoreFlash NR flange and the COREFLASH target piece. Weld the flange to the target piece going around the base of the penetration until the entire flange is welded in place. Stretch the CoreFlash NR membrane slowly and gently in order not to tear it (may require 2–3 revolutions around the pipe.)

### STEP 5: WELD VERTICAL NR STACK

STEP 5. Weld Vertical NR to target piece

Once the entire flange is welded in place, weld the vertical overlap seam up the penetration. Let the CoreFlash NR cool completely then probe the weld to verify the quality of the weld.

### STEP 6: INSTALL LOWER HOSE CLAMP

STEP 6. Install lower clamp

Install a stainless steel hose clamp around the penetration 50 mm (2”) down from the top edge of the CoreFlash NR and tighten it in place.

### STEP 7: APPLY AKWASWELL BEAD

STEP 7. Install AKWASWELL bead

Insert a 9 mm (3/8”) bead of AkwaSwell between the penetration and the CoreFlash NR tight to the stainless steel hose clamp.

### STEP 8: INSTALL SECOND HOSE CLAMP

STEP 8. Install second clamp

Install a second stainless steel hose clamp above the first clamp and flush with the top of the AkwaSwell bead; and tighten it in place.

### STEP 9: TRIM NR ABOVE TOP CLAMP

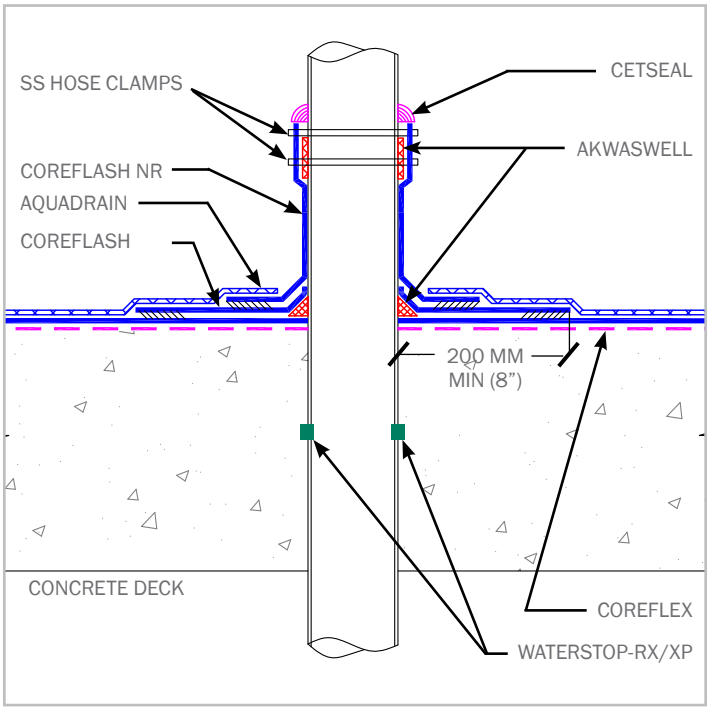
STEP 9. Trim NR above top clamp

With a utility knife trim the CoreFlash NR membrane tight to the top edge of the stainless steel hose clamp.

### STEP 10: APPLY CETSEAL BEAD

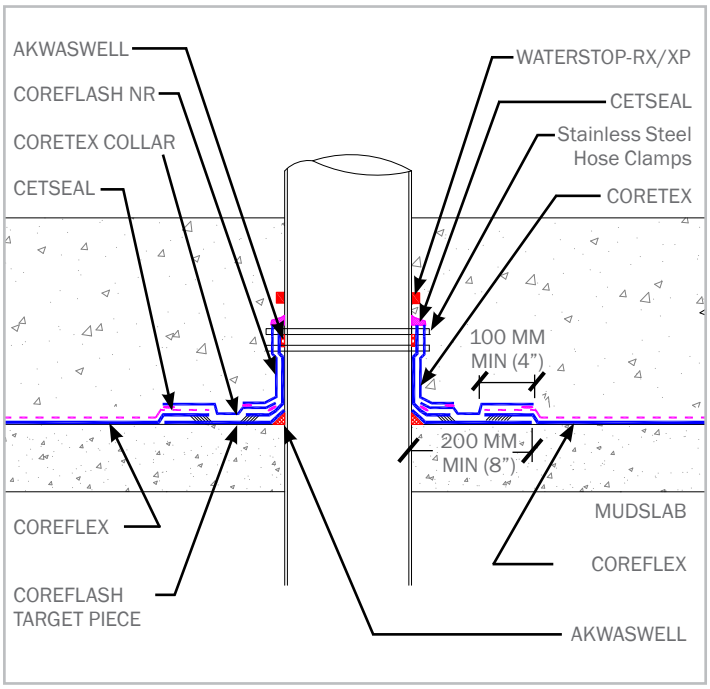
STEP 10. Install CETSEAL termination

To finish the detail place a 6 mm (1/4”) tooled bead of CETSEAL along the top edge of the CoreFlash NR.



### STEP 11: PLACE AKWASWELL BEAD

Lift the COREFLASH target piece and place a bead of AkwaSwell, minimum 9 mm (3/8”), tight to the base of the penetration.



### STEP 12: WELD TARGET PIECE

Weld the COREFLASH target piece to the COREFLEX field sheet with a minimum 12 mm (1/2”) wide continuous weld.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

2.1.1 LARGE PENETRATION – PLAZA DECK/BACKFILLED WALL

2.1.2 LARGE PENETRATION – UNDERSLAB/PROPERTY LINE WALL

## 2.2 ROUND PENETRATIONS

### Use PF-340 for penetrations between 75 mm – 100 mm (3" – 4") diameter

Ensure the pipe is secured in its final position and is clean and free of dirt, debris, mastics and other items that may inhibit an efficient detailing process.

## DETAIL SEQUENCING

**PROPERTY-LINE/UNDERSLAB:**
Install field sheet followed by CORETEX AFTER completing the following details.

**BACK-FILLED WALLS/PLAZA DECK:**
Install CORETEX followed by field sheet BEFORE completing the following details.

**STEP 1: PLACE PF340 AROUND PIPE**
Place the PF-340 tight around the pipe penetration with the base flange against the substrate.

STEP 1. Place PF340 around penetration

## STEP 2: TACK WELD BASE FLANGE

STEP 2. Tack weld PF340 to fit penetration

Tack-weld the base flange overlap. Move to the non-reinforced stack and tack weld the overlap in place. If any adjustments need to be made in order to get a tighter fit around the penetration, do so prior to beginning the pre-weld in the overlap.

## STEP 3: WELD PF-340

STEP 3. Weld PF340 overlap at base flange

With the reinforced base flange flush to the substrate complete a pre-weld and final continuous weld over the entire overlap seam of the PF-340 with a hot-air welder.

## STEP 4: WELD OVERLAP UP STACK

STEP 4. Weld vertical overlap seam up stack

Weld the vertical overlap seam of PF-340 with a hot-air welder.

## STEP 5: INSTALL FIRST HOSE CLAMP

STEP 5. Install lower clamp

Place the first stainless steel hose clamp around the pipe 50 mm (2”) from the top of the non-reinforced stack and tighten in place. Non-reinforced stack flashing height and hose clamp placement is dependent upon the thickness of the slab/wall to be poured and can be decreased as applicable.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

### STEP 6: APPLY AKWASWELL BEAD

STEP 6. Install AKWASWELL bead

Insert tip of AkwaSwell caulk tube between the non-reinforced stack and the pipe, placing a 9 mm (3/8”) diameter ring of AkwaSwell continuously around the pipe tight to the stainless steel hose clamp.

### STEP 7: INSTALL SECOND HOSE CLAMP

STEP 7. Install second hose clamp

Place a second stainless steel hose clamp over the non-reinforced stack and push the second stainless steel hose clamp down against the visible AkwaSwell bead and tighten the top hose clamp.

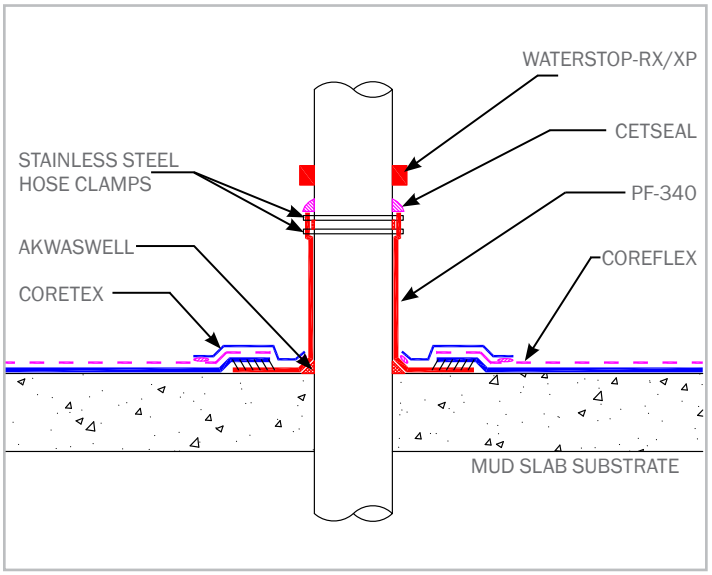
### STEP 8: TRIM EXCESS

STEP 8. Trim excess membrane flush with top edge of clamp

Use a utility knife to trim any excess non-reinforced stack membrane flush with the top edge of the top hose clamp.

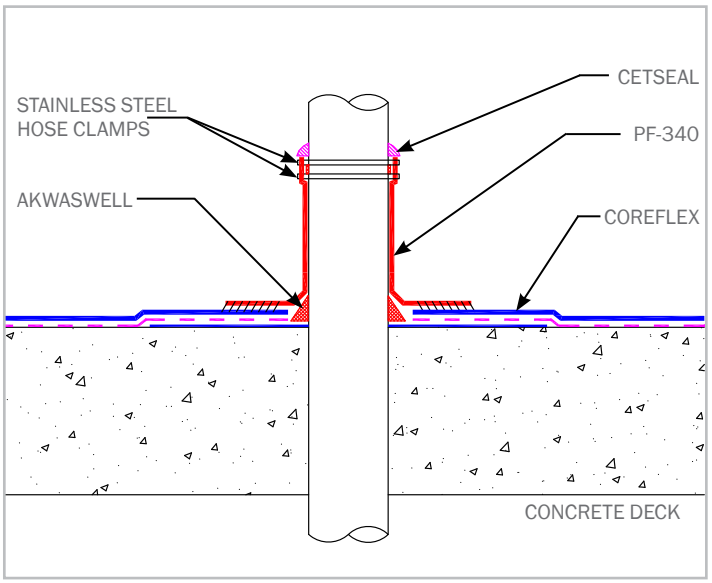
### STEP 9: APPLY CETSEAL BEAD

STEP 9. Apply CETSEAL bead at termination



Place a 6 mm (1/4”) tooled bead of CETSEAL where the top of the stainless steel hose clamp and non-reinforced stack meet.

### STEP 10: APPLY AKWASWELL BEAD



When the overlap is completely welded, apply a 9 mm (3/8”) bead of AkwaSwell under the reinforced base flange directly around the penetration at the substrate surface.

### STEP 11: WELD TARGET PIECE

Weld the COREFLASH target piece to the COREFLEX field sheet with a minimum 12 mm (1/2”) wide continuous weld.

2.2.1 ROUND PENETRATION – UNDERSLAB/PROPERTY LINE WALL

2.2.2 ROUND PENETRATION – PLAZA DECK/BACK FILLED WALL

## 2.3 ROUND PENETRATIONS

### Use PF-150 for round penetrations 50 mm (2") diameter or smaller

Use the PF-150 pre-molded penetration flashing for round penetrations with a diameter less than or equal to 50 mm (2") (small diameter pipes, nelson studs, rebar, all-threaded rod, etc). The PF-150 incorporates a molded stepped profile that is sized for round penetrations 9 mm (3/8") to 50 mm (2") penetrations. Ensure that the penetration to be flashed is clean and free of debris.

## DETAIL SEQUENCING

**PROPERTY-LINE/UNDERSLAB:**
Install field sheet followed by CORETEX AFTER completing the following details.

**BACK-FILLED WALLS/PLAZA DECK:**
Install CORETEX followed by field sheet BEFORE completing the following details.

### STEP 1: INSTALL TARGET PIECE

STEP 1. Install COREFLASH target piece

Begin by placing a CoreFlash target piece over the element to be flashed; pushing the CoreFlash target piece flush with the substrate (shoring system, mudslab, etc). CoreFlash Target piece should be a minimum of 250 mm x 250 mm (10" x 10") to ensure a 100 mm (4") overlap of PVC to PVC with the COREFLEX field sheet.

### STEP 2: AKWASWELL PLACEMENT

STEP 2. AKWASWELL placement

For penetrations smaller than 38 mm (1–1/2") place a bead of AkwaSwell on the first pre-molded "shelf" inside of the PF-150. Take care to keep the bead of AkwaSwell on this shelf only and not on the PF-150 flange that will be hot-air welded. For penetrations larger than 38 mm (1 1/2") place bead of AkwaSwell around the base of the element to be flashed.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

### STEP 3: CUT PF150

STEP 3. Cut PF150 to size

Using a pair of scissors, cut the PF-150 at the appropriate pre-molded stepped shelf (one segment smaller than the diameter of the element to be flashed).

### STEP 4: HEAT AND PLACE PF150

STEP 4A. Heat trimmed PF-150 cut end

With a hot-air hand welder heat the cut end of the PF-150 slightly and then slide the PF-150 over the protruding penetration until the flat flange is flush with the CoreFlash target piece.

STEP 4B. Placement of PF-150

Keep the PF-150 centered and AkwaSwell intact on interior shelf during placement.

### STEP 5: TACK WELD PF-150 TO FLANGE

STEP 5. Tack weld PF-150 flange

With a hot-air hand welder, tack weld the PF-150 flange to the Core-Flash target piece at the interior of the flange.

### STEP 6: LOOSLY PLACE HOSE CLAMP

STEP 6. Hose Clamp Loosely Installed

Place stainless steel hose clamp around the cut-end of the PF-150 and tighten the hose clamp to achieve a loose fit.

## STEP 7: APPLY HEAT AND COLLAPSE

STEP 7. Hot-air applied to stepped stack

With a hot-air hand welder, apply heat uniformly around the exterior surface of the PF-150 stepped stack. Gently push the heated stack of the PF-150 towards the base flange causing the PF-150 to collapse upon itself.

## STEP 8: SECURE THE HOSE CLAMP

STEP 8. Tightly secure hose clamp

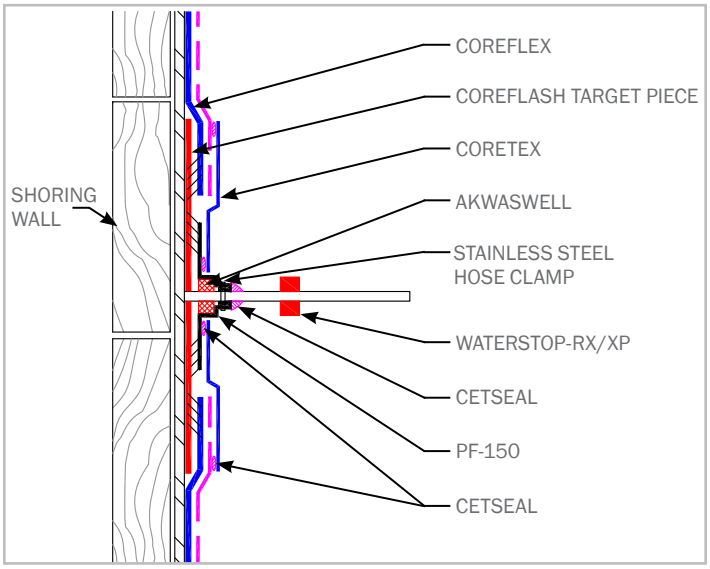
Secure the hose clamp tightly not allowing the collapsed PF-150 to slide back out to original position.

## STEP 9: WELD PF-150 TO COREFLASH

STEP 9. Weld the PF-150 flange to the COREFLASH

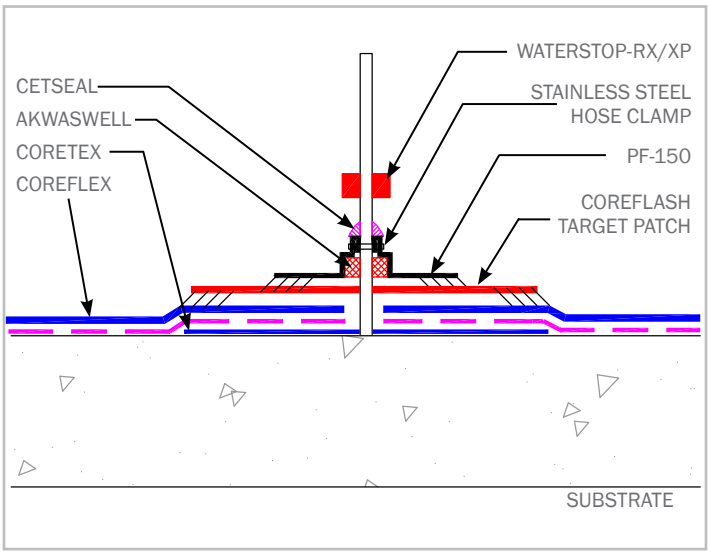
Working from the interior to the exterior of the flange edge, utilizing a hand held welder and silicon roller, weld the PF-150 flange to the CoreFlash target piece.

## STEP 10: APPLY CETSEAL BEAD



STEP 10. Apply CETSEAL at termination

Then tool a bead of CETSEAL around the cut end of the PF-150; covering the cut end and terminating onto the penetrating element.



## STEP 11: WELD TO COREFLEX

Weld the COREFLASH target piece to the COREFLEX field sheet with a minimum 12 mm (1/2”) wide continuous weld.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

2.3.1 ROUND PENETRATION – UNDERSLAB/PROPERTY LINE WALL

2.3.2 ROUND PENETRATION – PLAZA DECK/BACK FILLED WALL

## 2.4 SQUARE/RECTANGULAR PENETRATIONS

### DETAIL SEQUENCING

**PROPERTY-LINE/UNDERSLAB:**
Install field sheet followed by CORETEX AFTER completing the following details.

**BACK-FILLED WALLS/PLAZA DECK:**
Install CORETEX followed by field sheet BEFORE completing the following details.

### STEP 1: TARGET FLASHING

STEP 1. Target flashing

Cut a target piece of CoreFlash that is a minimum 400 mm (16”) wide and long enough to entirely wrap the perimeter of the square penetration and overlap upon itself a minimum of 100 mm (4”). Wrap the CoreFlex target piece extending 200 mm (8”) up the square penetration. Slit the membrane, from each corner of the square penetration, perpendicular to the long edge, allowing for the Coreflash to extend onto the substrate.

### STEP 2: TACK WELD TARGET FLASHING

STEP 2. Target flashing tack weld

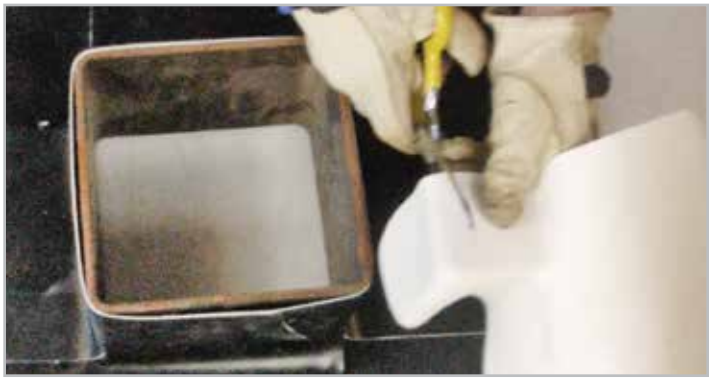
With the target piece of CoreFlash now extending 200 mm (8”) up the penetration and the remaining 200 mm (8”) onto the substrate, create an overlap a minimum 100 mm (4”). Tack weld the target piece in place, and form a continuous thermoplastic weld for the entirety of the seam.

North America: +1 847.851.1800 | +1 800.527.9948 | www.cetco.com

## STEP 3: PLACE CORNER TARGET PATCH

STEP 3. Place corner target patch

Cut four CoreFlash “L” shaped target patch pieces large enough to fill in the corners of the flanges so that there is a continuous flange around the penetration 300 mm (12”) from the base of the penetration out onto the substrate.



## STEP 4: WELD ALL OVERLAP SEAMS

STEP 4. Weld target patch in place

Weld all overlaps of COREFLASH flashing piece and “L” shaped target piece.

## STEP 5: PLACE UNIVERSAL CORNERS

STEP 5A. Cut inside outside corner to fit

Place a Universal Corner Cut to fit the outside corner at each corner of the penetration (5a) and secure with a continuous thermoplastic weld (5b).

STEP 5B. Fully Weld Performed Corners to fit

## STEP 6: REPEAT STEP 5 AT FOUR CORNERS

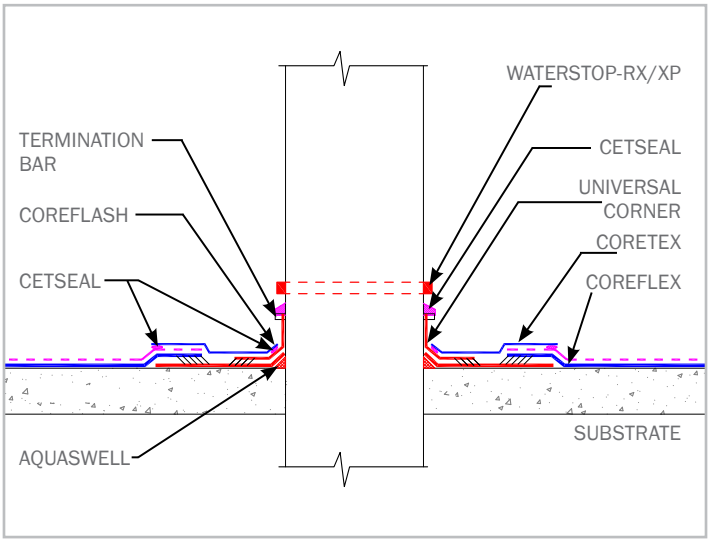
STEP 6. Install at all four corners

## STEP 7: APPLY AKWASWELL

Place a 9 mm (3/8”) bead of AkwaSwell 25 mm (1”) in from the edge of the CoreFlash; between the CoreFlash and the penetration.

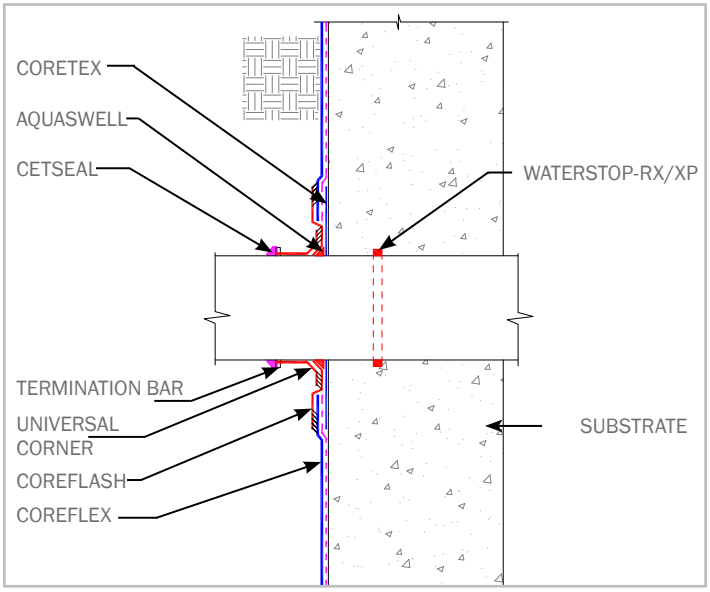
## STEP 8: SECURE TERMINATION BAR

Secure the termination bar by fastening 200 mm (8”) OC so that the fasteners penetrate the membrane over the bead of AkwaSwell.



## STEP 9: APPLY CETSEAL

Place a 6 mm (1/4”) tooled bead of CETSEAL at the outer edge of the termination bar.

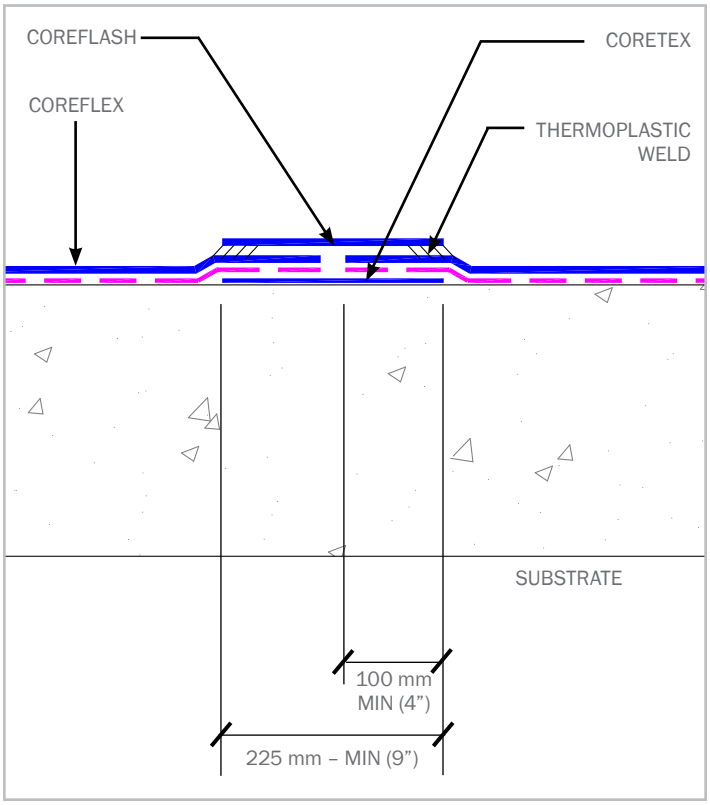


## STEP 10: CUT WINDOW AND PLACE

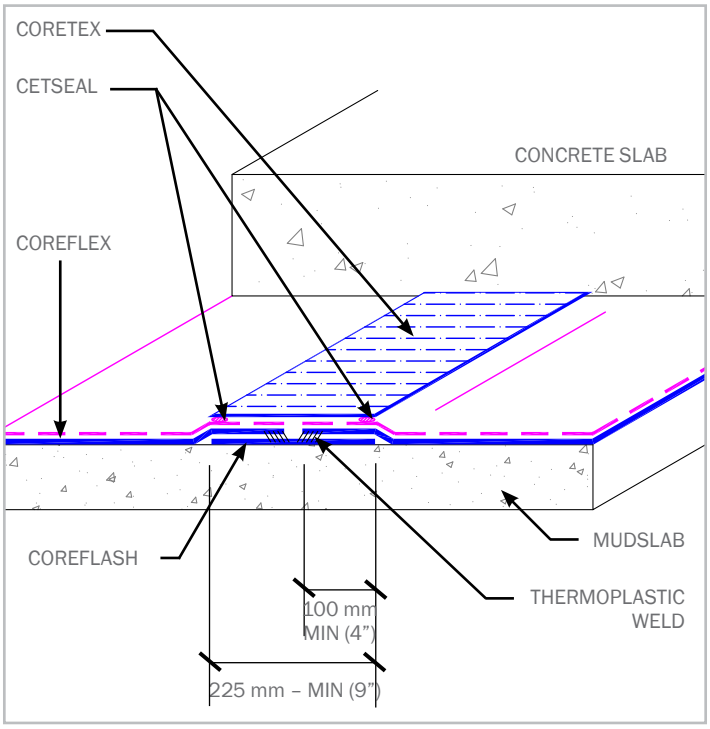
Cut a window in the CoreFlex that will fit over the penetration flashing overlapping the CoreFlash Flanges 100 mm (4”). Weld the COREFLEX to the CoreFlash flashing membrane with a thermoplastic weld. Install COREDISCs at all T-Joints. Cut a piece of Coretex and four square patches of Coretex the same dimensions as the pieces of CoreFlash described above and wrap it around the penetration securing it in place with beads of CETSEAL and as applicable wire ties.

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

2.4.1 SQUARE PENETRATION – UNDERSLAB/PROPERTY LINE WALL



2.4.2 SQUARE PENETRATION – PLAZA DECK/BACKFILLED WALL



## 2.5 BUTT-JOINT DETAILING

***BACK FILLED WALLS/PLAZA DECK:*** When joining two roll ends or cut ends of CORELEX membrane a butt splice constructed with COREFLASH and CORETEX is required. At both COREFLEX roll ends, install a minimum 450 mm (9”) wide strip of Coretex extending up the face of the concrete wall from top of the footing to the grade elevation detail. Tuck edge of Coretex strip a minimum 100 mm (4”) behind the trimmed/aligned COREFLEX roll edges and secure Coretex strip with washer-head fasteners along both edges maximum 900 mm (36”) on center. **Do not secure Coretex strip fastened through COREFLEX membrane.** As applicable, overlap Coretex strip edges a minimum 100 mm (4”) to provide continuous strip. Install adjacent COREFLEX membrane sheets overlapping exposed Coretex strip a minimum 100 mm (4”); leaving approximately 25 mm (1”) of exposed Coretex between the two stacks of COREFLEX roll ends. Closely match roll ends to 25 mm (1”) of adjacent COREFLEX roll end. Secure COREFLEX roll ends with washer-head fasteners placed through the Coretex strip. Install minimum 450 mm (9”) wide strip of CoreFlash flashing over the COREFLEX centered along the Coretex strip detail (yellow side facing installer). Hot-air weld both edges of the CoreFlash strip to the COREFLEX; both continuous welds must be outside of all fasteners (no exposed fasteners). CoreFlash strip shall extend a minimum 100 mm (4”) over both COREFLEX membrane edges. Finish CoreFlash strip by hot-air welding a CoreDisc or CoreFlash NR patch over all T-Joints.

***Underslab/Property Line Walls:***
Repeat the procedure outlined for backfilled walls/plaza deck; first install the COREFLASH with thermoplastic welds then adhere CORETEX with continuous beads of CETSEAL.

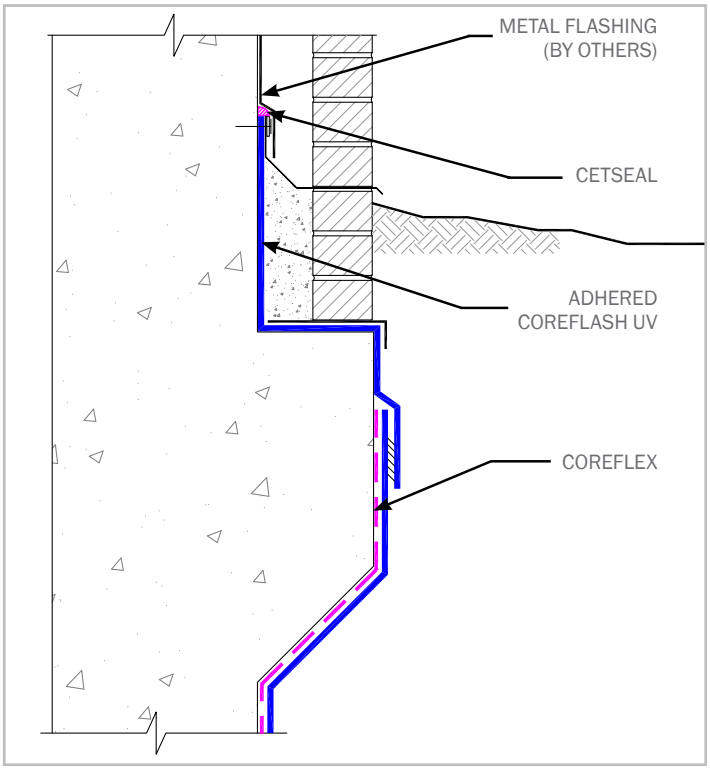
2.5.2 BUTT-JOINT DETAIL UNDERSLAB/PROPERTY LINE WALL

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER



### 2.6 GRADE TERMINATION

Coordinate work with excavation and backfill operations conducted by others to remove the top elements of the shoring retention wall per local building code or as specified in the contract documents. Identify and repair any waterproofing and/or drainage sheet damaged by excavation and removal of the top shoring retention wall elements. Fasten top edge of COREFLEX membrane 300 mm (12”) below finished grade elevation with washer-head fasteners maximum 300 mm (12”) on center. Install CoreFlash UV grade flashing membrane with bottom edge overlapping COREFLEX membrane a minimum 100 mm (4”); use Adhesive SB-100 to adhere CoreFlash UV flashing membrane continuously to substrate (except for top 50 mm (2”)). Roller apply Adhesive SB-100 to both the black side of the CoreFlash UV and the substrate area at a coverage rate of 1.2 m²/liter (50 ft² per gallon). This equates to 1.2 m²/0.5 liter (50 ft² per 1/2 gal.) to the substrate and 1.2 m²/0.5 liter (50 ft² per 1/2 gal) to the membrane. Actual adhesive coverage depends upon the porosity and smoothness of the surface and workmanship. To insure proper application and curing of the adhesive, outside air temperature should be 4 °C (40 ˚F) and rising. Roll or trowel a smooth, even coat of the adhesive over the black bottom side of the CoreFlash UV and the area of the substrate to receive the flashing, ensuring 100% coverage. Allow the adhesive to set to the point that the adhesive becomes stringy to the touch. When sufficiently set, carefully place the adhesive coated side of the CoreFlash UV membrane onto the adhesive coated substrate. Roll or hand press membrane to substrate to ensure full contact and a continuous bond. Secure bottom edge CoreFlash UV to COREFLEX with a continuous thermoplastic weld. Overlap adjacent CoreFlash UV roll ends a minimum 100 mm (4”) and seal with continuous thermoplastic weld. Terminate top edge of CoreFlash UV flashing membrane at elevation per project details and specifications. Apply CETSEAL 50 mm (2”) wide x 2.3 mm (90 mil) thick behind the top, non-adhered edge of CoreFlash UV grade flashing. Then secure top edge of CoreFlash UV with termination bar fastened into substrate maximum 300 mm (12”) on center. Complete grade termination detail with tooled bead of CETSEAL along the top edge and at all penetrations through the flashing. Counter flash or cover the termination per project specifications.

Backfill should consist of compactable soils, pea gravel, or crushed stone (19 mm (3/4”) or less). Avoid backfill with aggregate larger than 40 mm (1.5”). Backfill should be added in 150–300 mm (6” to 12”) lifts and compacted to a minimum 85% Modified Proctor density. If gravel backfill, specify angular aggregate <19 mm (3/4”) with fines.

2.6.1 GRADE TERMINATION – STANDARD

2.6.2 GRADE TERMINATION – THRU-WALL FLASHING

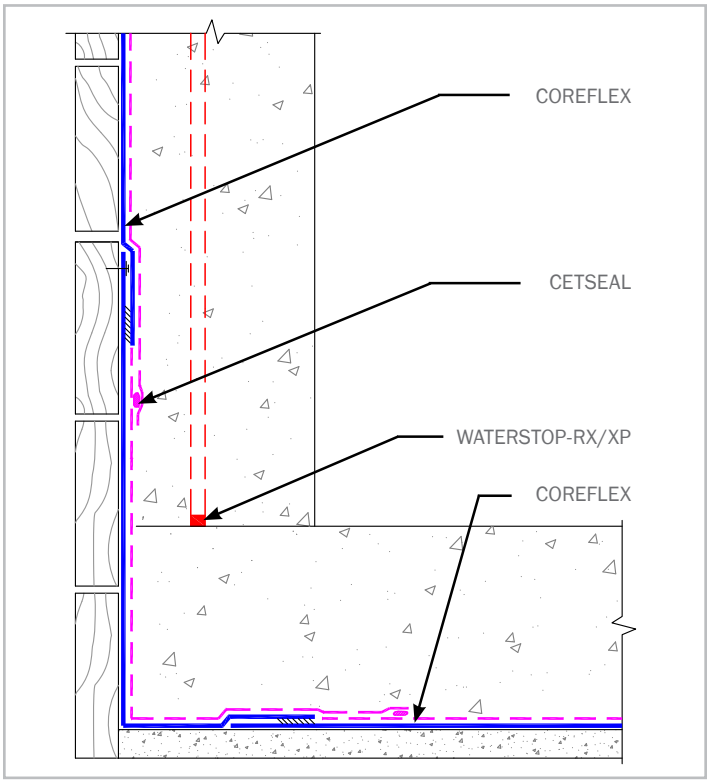
## 2.7 PROPERTY LINE SHORING WALL TO SLAB TRANSITION

### SLAB TO WALL TRANSITION:

Where property line retaining walls, such as soldier pile and lagging, are used as the outside form, it is very important to extend the waterproofing a minimum 300 mm (12”) above the top of the slab since there is no access to the outer edge of the slab after it is poured.

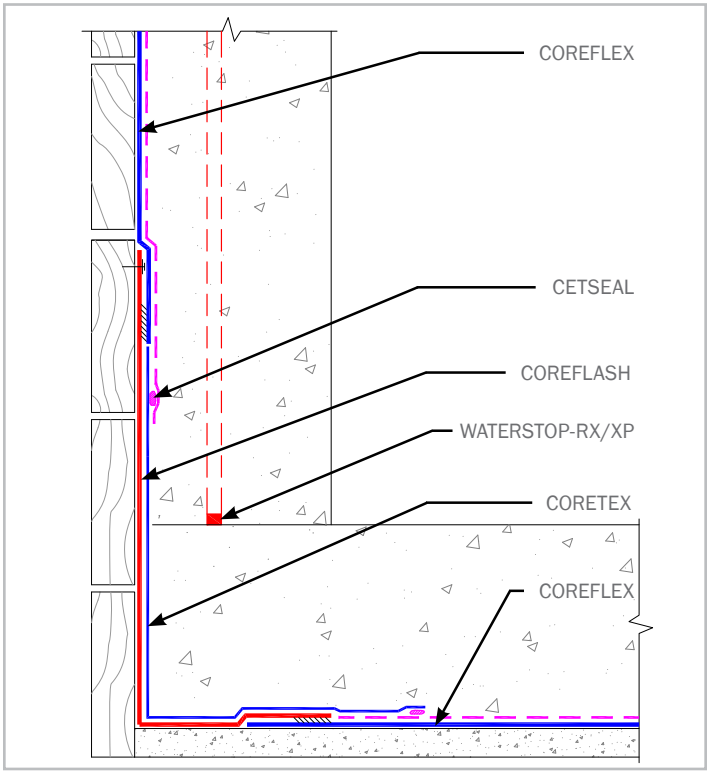
### SLAB TO WALL CORNER TRANSITION:

Install COREFLEX sheet horizontally oriented (active layer side facing installer), membrane PVC selvedge edge up with a minimum 300 mm (12”) of the sheet extending out onto the horizontal substrate. These dimensions may be increased to allow for securement of the COREFLEX membrane to fall outside of gaps in the lagging or to allow room for use of automated welding equipment.



Install COREFLEX sheet to shoring wall along the top edge of the thermoplastic selvedge edge, secure with washer-headed fasteners approximately 25 mm (1”) from the top edge of the membrane; maximum 900 mm (3’) on center. Adjacent edges of COREFLEX sheets should be overlapped and detailed per guidelines in Section 1.1 Membrane Welding Procedures.

If the slab thickness is greater than 750 mm (30”) install a second full sheet of COREFLEX, horizontally oriented, to meet the 300 mm (12”) requirement above the slab. Overlap top edge of previous sheet and edges of adjacent sheets for both the thermoplastic membrane and active layer a minimum of 10 mm (4”).



### SLAB TO WALL CORNER TRANSITION (ALTERNATIVE INSTALLATION METHOD):

Install a strip of COREFLASH horizontally oriented, with a minimum of 300 mm (12”) of the sheet extending out onto the horizontal substrate. These dimensions may be increased to allow for the securement of the membrane to fall outside of gaps in the lagging or two allow room for use of automated welding equipment. Place and secure the COREFLASH into the corner transition. Place COREFLEX on the horizontal substrate allowing for a minimum overlap of 100 mm (4”) over the horizontal flap of COREFLASH. Secure the COREFLEX to the COREFLASH with a continuous thermoplastic weld. Then secure COREFLEX, either vertically or horizontally, to the shoring wall so that it overlaps the COREFLASH a minimum of 100 mm (4”). Secure the top edge COREFLEX fastened to the shoring wall to the top edge of COREFLASH with a continuous thermoplastic weld.

To complete the slab to wall transistion, install CORETEX over all COREFLASH transition strips; overlap active layer of COREFLEX a minimum of 100 mm (4”) and secure CORETEX edges and sheet with continuous beads of CETSEAL.

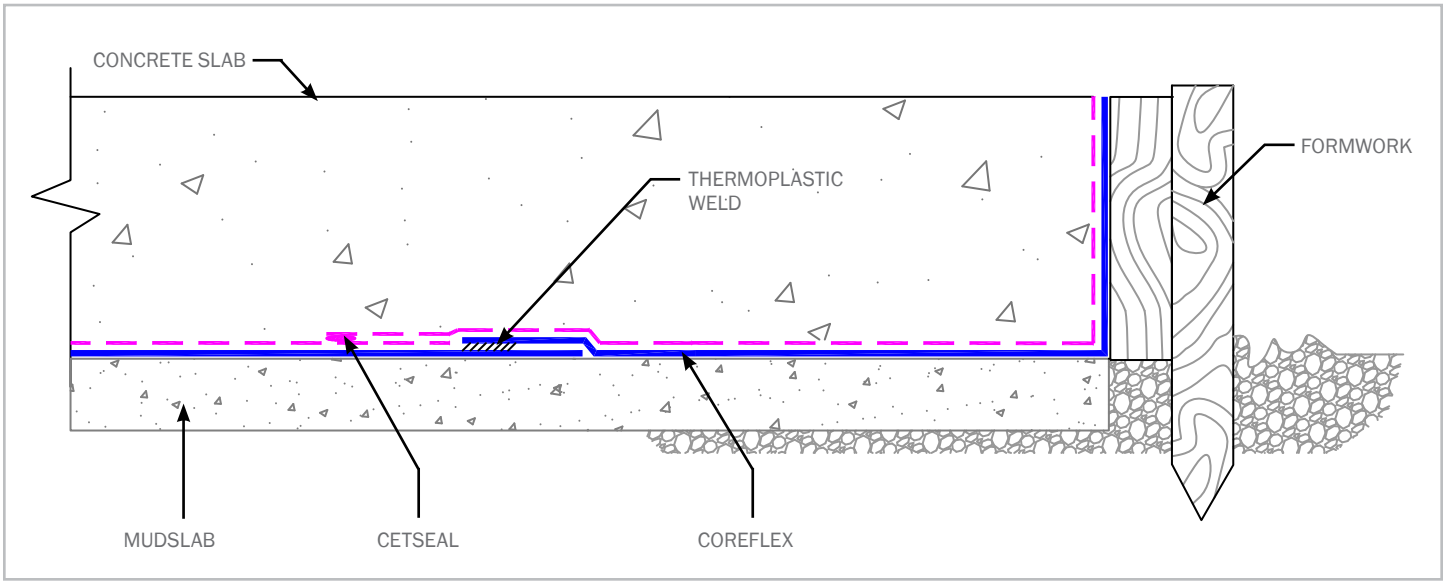
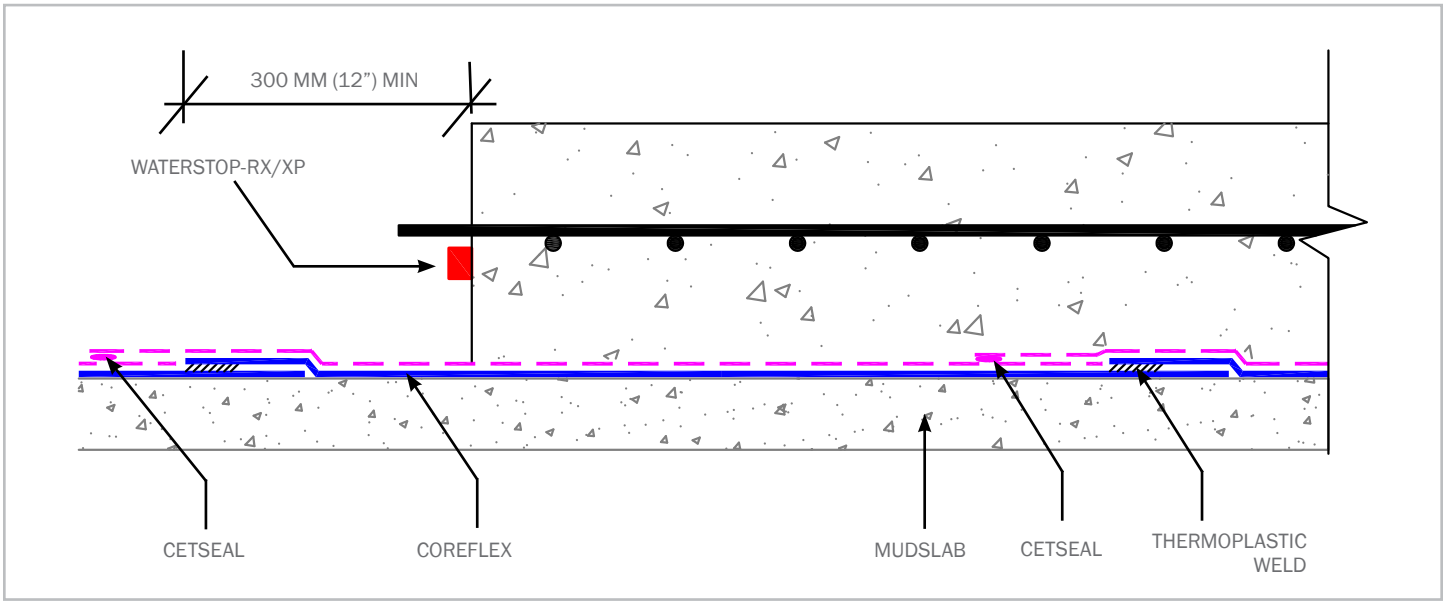
2.7.2 ALTERNATIVE METHOD SLAB TO WALL TRANSITION

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER



2.7.3A SLAB TO WALL TRANSITION – ALTERNATIVE METHOD SEQUENCING



2.7.3B SLAB TO WALL TRANSITION – ALTERNATIVE COMPOSITE

## 2.8 BACK FILLED WALL – EDGE OF SLAB

When the installation reaches the edge of the slab, extend the COREFLEX sheet out the top of the form a minimum of 300 mm (12”). At the slab edge, COREFLEX should remain in contact with the substrate and the inside surface of the concrete form conforming tightly to the change in plane. After concrete placement, position COREFLEX membrane to top of footing and secure with washer headed fasteners maximum 200 mm (8”) on center. Damaged material outside the form should be patched or cut off and disposed. Install SEAL-X XP cant at wall-to-footing transition prior to installing COREFLEX wall waterproofing overlapping the secured COREFLEX edge on top of the footing a minimum 100 mm (4”); secure with a continuous thermoplastic weld.

2.8.1 PERIMETER SLAB EDGE

2.8.2 SLAB SECTION TIE-IN

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

# SECTION 3
# UNDERSLAB INSTALLATION METHODS

## 3.1 GENERAL

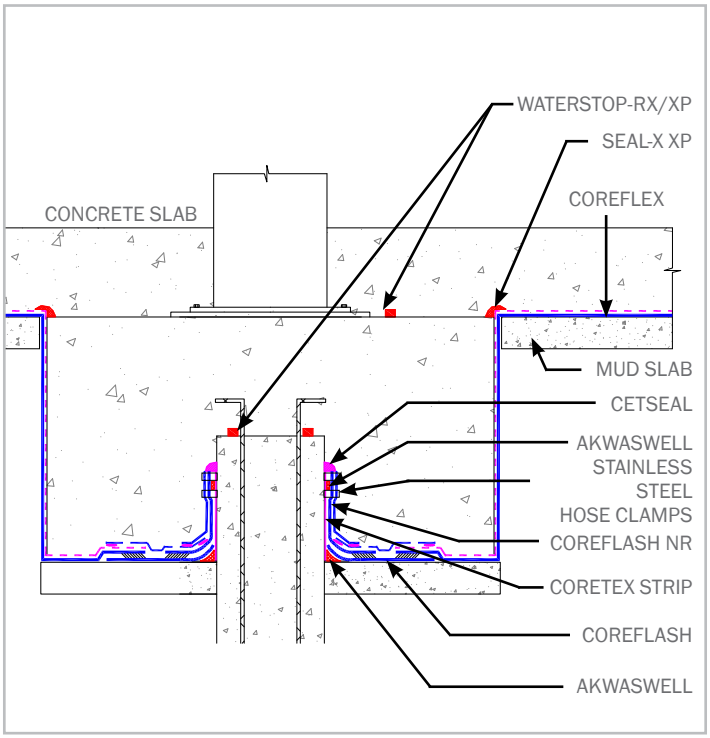
Best practice is to install COREFLEX on a smooth concrete mud slab with a float finish to provide a planar surface; without sharp angular depressions, voids or raised features. The COREFLEX system is intended for use under reinforced concrete slabs 150 mm (6") thick or greater with a mud slab substrate. COREFLEX can be used under reinforced concrete slabs 100 mm (4") thick or greater with a compacted earth/gravel substrate. For installation over compacted earth or gravel substrates, consult CETCO for additional steps required for the field fabrication of welded overlap seams. For hydrostatic conditions, install COREFLEX under footings and grade beams. For non-hydrostatic conditions, COREFLEX should be installed around footings and grade beams and completed with a termination bar and a tooled bead of CETSEAL.

Prior to installing COREFLEX the substrate must be properly prepared. Complete all required elevator pit, sump pit, cistern, grade beam and piling work prior to installing COREFLEX under the slab area. These areas shall be correctly tied into the underslab COREFLEX to form a monolithic system. How these items are formed, poured and finished are critical to proper detailing. Penetrations should be placed and secured in their final position prior to installing COREFLEX membrane so that they may be properly detailed. All corrective actions required to provide a suitable substrate must be completed prior to the installation of the COREFLEX waterproofing membrane and components.

## 3.2 SUBSTRATE PREPARATION

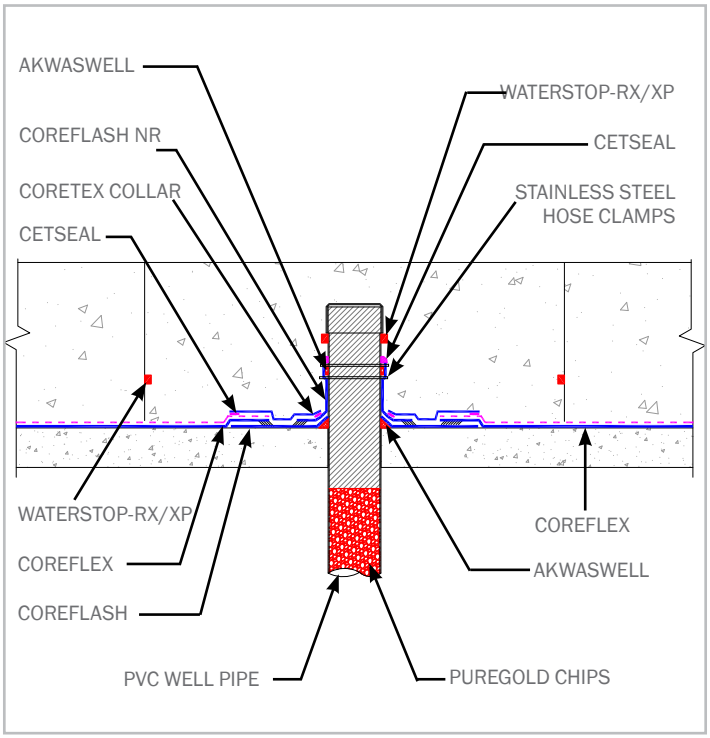
The preferred substrate is a working mud slab, but may also be compacted earth, sand, or crushed stone. Earth and sand substrates should be compacted to a minimum 85% Modified Proctor density. Crushed stone should be no larger than 19 mm (3/4") in size. Substrate should be smooth and without sharp deflections or pockets. Substrates other than a working mud slab require additional steps and components to properly complete the welded overlap assembly (See Section 1 Membrane Welding Procedures for detailed instructions). Earth formed elevator pits, grade beams and footers require soils that are stable enough to support the COREFLEX membrane and provide for adequate confinement. For piles, detailing is required prior to pouring the pile caps. When earth formed, the topmost 200 mm (8") minimum of the pile should be formed with a round cardboard tube type form to provide a smooth concrete surface for detailing.

## 3.3 GRADE BEAMS, FOOTINGS AND ELEVATOR PITS



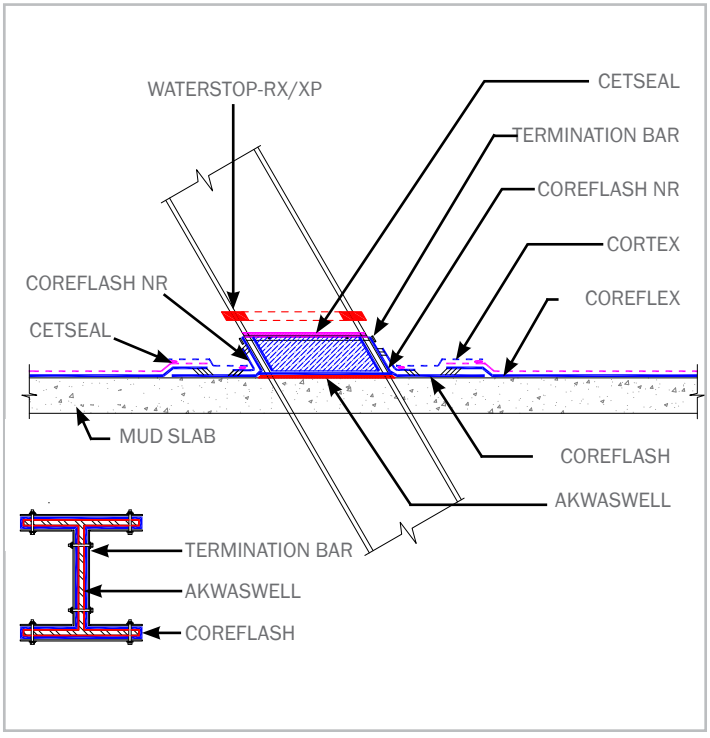
Grade beams, footings and elevator pits are typically lined and poured prior to pouring the working mud slab. Any unstable or non-compatible soils should be contained with a retaining wall. COREFLEX should be installed on the vertical surfaces and on the substrate below the slab to form a continuous envelope around the grade beam or elevator pit. Install COREFLEX membrane directly against the retaining wall. Substrate requirements for grade beams, footings and elevator pits are identical to the requirements for suitable substrate for all other surfaces to receive COREFLEX membrane waterproofing. The surface must be smooth and planar, and ridged enough to provide for proper confinement. The substrate must also provide adequate fastening grip, to support the membrane. Place the membrane into the grade beam, footing or elevator pit so that the active layer is facing the installer. In corners, apply the waterproofing using CoreFlash and Coretex separately then adhering them together with CETSEAL after welding the CoreFlash. This will allow for tighter conformity of the waterproofing to the changes in plane. It will also provide for easier welding, negating the need to peel the active layer from the thermoplastic membrane. Alternately, pre-fabricating a COREFLEX membrane liner, off-site or on-site but on a slab or other ridged planar substrate should be considered. Prefabricated pieces should then be placed and assembled in the grade beam, footing or elevator pit, greatly reducing the number of welds made on a compacted fill, sand or gravel surface requiring the use of a metal or wood track to accommodate the welding equipment.

Field prefabrication can be accomplished by building a mockup of the same dimensions of the grade beam, footing or elevator pit and constructing it so that the COREFLEX is placed on the outside of the mockup allowing the welding to be completed on the yellow thermoplastic side of the membrane. The prefabricated piece then can be pulled off the mockup and placed into the grade beam, footing or elevator pit. When transitioning to a mud slab, allow a long enough membrane (tails) to extend out onto the mud slab and tie into the underslab COREFLEX membrane; typically 300 mm (12").



When tying into a column from a grade beam, it is necessary to wrap the COREFLEX membrane coming up the sides of the grade beam and onto the top of the grade beam bringing the COREFLEX membrane up to and cut tight to the column. Flash the corners per the site specific detail at the juncture of the grade beam to the column. A secondary (upside down) flashing at the corners needs to be placed prior to pouring the mud slab in order to flash the underslab COREFLEX membrane to the column flashing membrane. Due to various elevator piston plunger designs, consult CETCO for specific installation and detailing recommendations for piston plungers that penetrate the pit slab.

## 3.4 PILE CAPS



The pile portion of a pile cap is typically earth formed and may not provide a suitable smooth substrate to install the flashing components. When earth formed, the top 200 mm (8") minimum portion of the pile should be formed with a round cardboard tube form in order to provide a smooth substrate for detailing. This top, smooth portion of the pile is then detailed as a round or square penatration per section 2.

3.1.3 UNDERSLAB GENERAL – RAKER

3.3.4 UNDERSLAB GENERAL – ELEVATOR PIT

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

# SECTION 4
# PROPERTY LINE CONSTRUCTION

## 4.1 GENERAL

The use of construction techniques described in this section allow the exterior building dimensions to coincide with a shoring wall at the property line, thereby maximizing use of available land for building. COREFLEX has been proven to be one of the most effective means for waterproofing property line construction. Property line construction methods include soldier pile & lagging, metal sheet piling, earth formed shotcrete retention walls, and auger cast caisson walls.

For all property line construction methods, install COREFLEX with the APC/XP layer (active layer) side oriented inward (facing the installer) so that the concrete will be poured against the active layer side.
Aquadrain sheet and 100BD base drain composite system should be connected to an operative water discharge system (sump pump or gravity to daylight discharge).

Protect waterproofing products from damage before material is contained with concrete or backfill. After any precipitation, standing water should be pumped off of the waterproofing as soon as possible.

## 4.2 SHORING WALL PREPARATIONS

Excavation work should provide a shoring wall in good condition to receive waterproofing system. Appropriate preparation can vary per shoring wall type. Verify the substrate preparation work has been completed for the applicable shoring wall system. Then install COREFLEX following the “Property Line Wall Installation” Guidelines in Section 4.3.

### 4.2.1 SOLDIER PILE & LAGGING SHORING WALL

Gaps between wood lagging timbers should be no wider than 25 mm (1”). If the gaps between lagging timbers are in excess of 25 mm (1”), the gaps should be completely filled with cementitious grout, wood, extruded polystyrene 0.138 MPa (20 psi) min. spray foam or compacted soil. If water is flowing through the lagging, thin polyethylene sheeting can be installed over the area before COREFLEX is installed.

In areas with large gaps of up to 63 mm (2–1/2”) between lagging, Aquadrain sheet drainage composite can be installed over the lagging to provide a uniform surface to mount COREFLEX. Securely fasten Aquadrain to the lagging surface with washer-head fasteners before installing COREFLEX. Gaps larger than 63 mm (2–1/2”) between lagging should be completely filled with grout, wood, extruded polystyrene 0.138 MPa (20 psi) minimum spray foam or compacted soil even if Aquadrain is installed prior to COREFLEX. Do not use plywood or other surface treatment over large lagging gaps that leave the cavity void. Wood lagging shoring should extend to the lowest level of the waterproofing installation without any voids or cavities exterior of or underneath the lagging filled with compacted soil or cementitious grout. Voids or cavities at tie-backs should be filled with grout or compacted soil prior to COREFLEX installation.

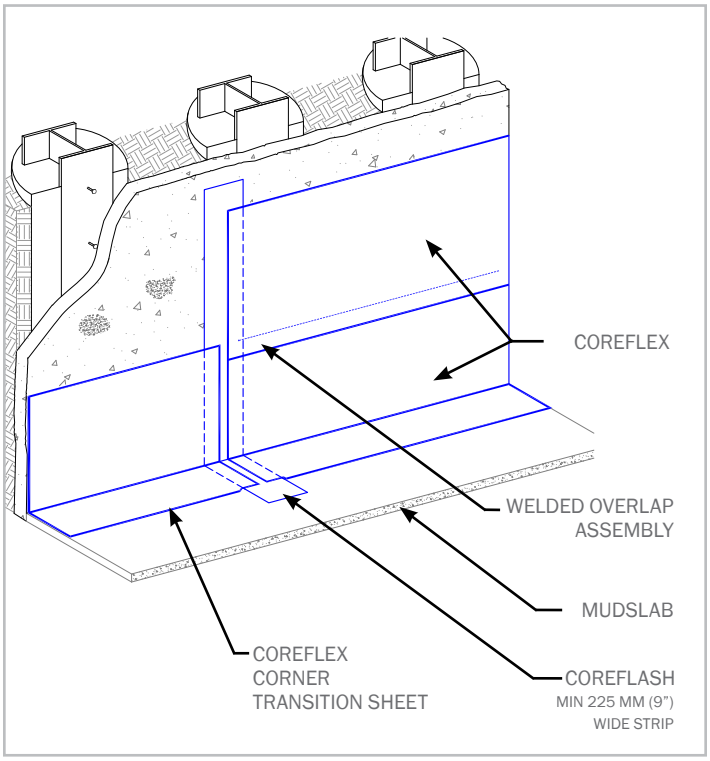
***SOLDIER PILE STRIPPING:*** Install a protective material strip of CoreFlash over all soldier piles with raised lagging hanger bolts, form tie rods, or other irregular surfaces to provide a suitable substrate that will not puncture the COREFLEX. The CoreFlash strip should extend a minimum 100 mm (4”) to both sides of the piling.

***CEMENTITIOUS BOARD:*** Prior to installing membrane to Grade Termination detail at finished grade, install 12 mm (1/2”) thick cementitious wall board centered over steel soldier pile from finished grade elevation to past thespecified depth that the top of steel soldier pile and wood lagging will be removed.

### 4.2.2 METAL SHEET PILING SHORING WALL

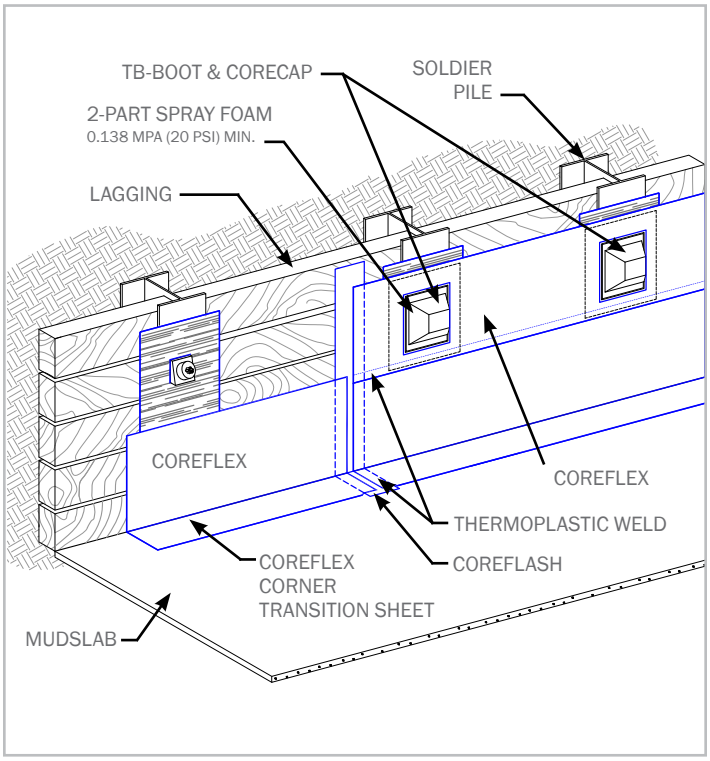
PLYWOOD OR CEMENTITIOUS WALL BOARD METHOD (RECOMMENDED METHOD)
Use 12 mm (1/2”) plywood or cementitious wall board fastened to the sheet piling to create a flat surface upon which COREFLEX can be installed. All void spaces between the plywood/cement board and sheet piling must be filled with compacted earth or concrete.

Installation of COREFLEX directly to and contouring the sheet metal piling requires special knurled powder-actuated fasteners to secure COREFLEX to the metal sheet piling. All fasteners must be positioned to be outside of all thermoplastic welds.



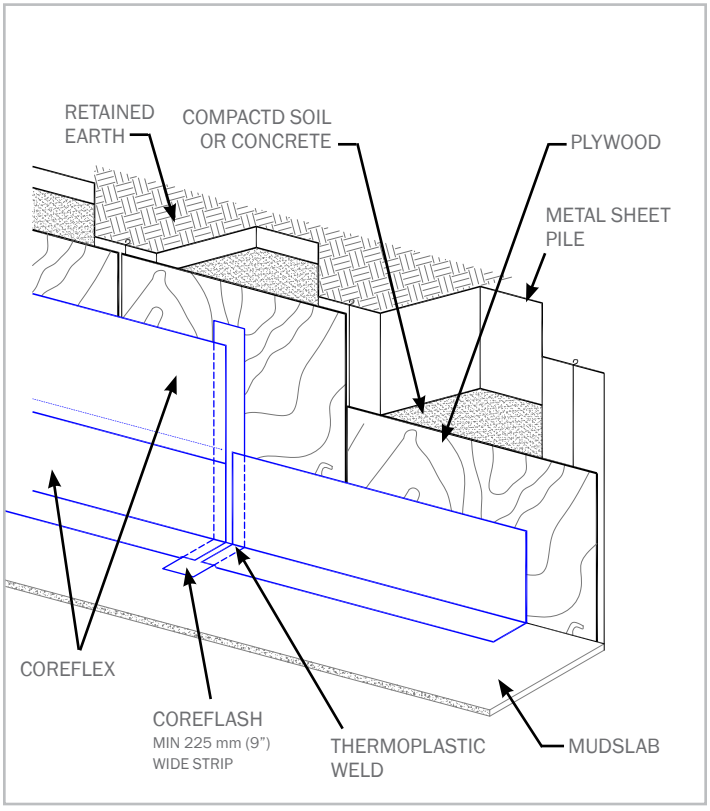
Fill voids or cavities at tieback plates with cementitious grout or compacted soils. If excessive water is penetrating the sheet piling knuckles, Bentogrout can be injected to the outside of the knuckle to stop water flow. Consult CETCO for Bentogrout application and installation guidelines.

For metal sheet pile shoring wall place a continuous band of cementitious board at the point where the sheet pile and or piles are to be burned off. The cementitious board should extend a minimum 450 mm (18”) below the point where the sheet pile and or piles are to be burned off.

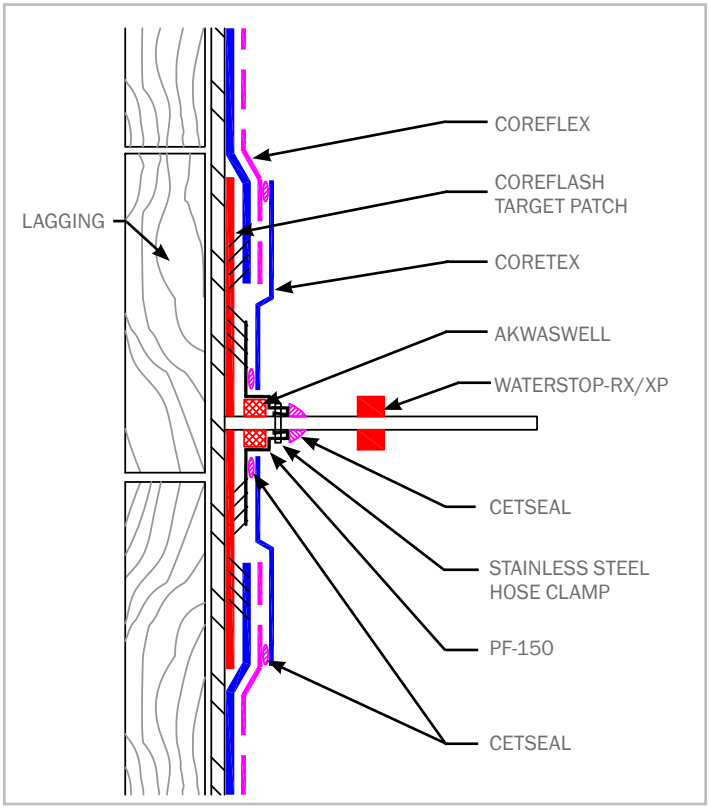


### 4.2.3 EARTH-FORMED DIAPHRAGM SHORING WALL

The surface of the earth-formed diaphragm wall must be sufficiently planar to provide an adequately smooth surface to apply COREFLEX. COREFLEX can be applied over large, relatively shallow indentations. The surface should not contain voids or sharp protrusions in excess of 25 mm (1”). Fill all voids with cementitious grout or shotcrete and remove protrusions prior to installing COREFLEX.



Shotcrete must be well consolidated and contain no honeycombed areas or voids. These types of defects must be corrected prior to installing the COREFLEX membrane.



4.2.4 PROPERTY LINE WALL – AUGER CAST CAISSON

4.2.4 PROPERTY LINE WALL – SOLDIER PILE & LAGGING

4.2.4 PROPERTY LINE WALL – SHEET PILE

4.2.4 PROPERTY LINE WALL – NELSON STUD FLASHING

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

### 4.2.4 AUGER CAST CAISSON AND CUT ROCK EXCAVATION SHORING WALLS

The surface of auger cast caisson and cut rock excavation walls must be sufficiently planar to provide a proper substrate surface to apply COREFLEX. Auger cast caisson and cut rock excavation walls typically require shotcrete or grout work to provide planar surface to install COREFLEX. COREFLEX can be applied over large, relatively shallow indentations in plane where it can conform tight against the surface. The surface should not contain sharp surface depressions or protrusions in excess of 25 mm (1”). Fill all large recesses between caissons or cut rock with cementitious grout or shotcrete prior to installing COREFLEX.

An alternative substrate correction method is to construct a planar substrate surface such as a plywood wall erected over irregular caisson or cut rock walls. Any erected walls shall be approved by project engineer and meet all safety and building code requirements. Any void space between the erected substrate wall and the caisson or cut rock excavation wall shall be completely filled with compacted backfill, concrete, or engineered fill per project requirements.

Employ construction methods to stop water from flowing through the shoring wall prior to waterproofing installation. If only water seepage, install thin polyethylene sheeting over the seepage area prior to installing COREFLEX. Polyethylene sheeting should extend from seepage elevation to base of wall to protect entire waterproofing installation at that area.

## 4.3 PROPERTY LINE WALL INSTALLATION

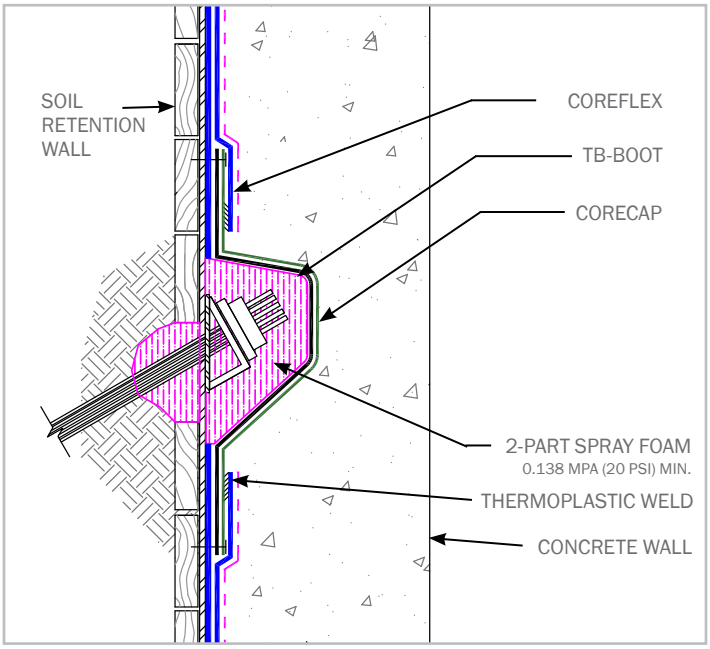
At base of the shoring wall, install a COREFLEX corner transition sheet horizontally oriented and placed at the corner transition from underslab to shoring wall with the PVC thermoplastic membrane offset edge placed on the shoring wall (active layer inward, facing installer; yellow side toward shoring wall), or install in place corner transition with COREFLASH and Coretex. Position the bottom PVC membrane edge extending out onto the horizontal substrate a minimum 300 mm (12”). Approximately 25 mm (1”) down from the top edge, secure the thermoplastic membrane offset to the shoring wall with washer-head mechanical fasteners spaced a maximum of 900 mm (36”) on center; refrain from placing a fastener within 150 mm (6”) of each roll end. Install adjacent membrane sheets with both the thermoplastic membrane and active layers overlapped a minimum 100 mm (4”). Assemble and weld laps, secure any loose active layer material with dabs of CETSEAL maximum 200 mm (8”) on center or a continuous bead of CETSEAL. When welding the PVC overlap seams on the corner transition sheet start the weld at the corner and work outward from the corner along both seams. Any T-Joints created require a welded CoreDisc or CoreFlash NR patch.

Once the corner transition sheet has been installed, COREFLEX sheets can be installed either vertically or horizontally oriented on the wall. Fasten the COREFLEX into position with washer-head fasteners maximum 900 mm (36”) on center; 25 mm (1”) from the top of the thermoplastic membrane selvedge edge. Overlap adjacent sheet edges a minimum 100 mm (4”). (Note: Shingle lap seams so that the bottom edge of the upper sheet is over and inward of the top fastened edge of the lower sheet to facitate welding that results with all fasteners positioned outside of the welds). Continue installation up wall until 300 mm (12”) below finished grade elevation. Terminate at grade detail as described in section 2.6 to complete the waterproofing membrane installation. This may require the removal of soldier piles and lagging after the concrete wall is poured, see section 4.2.1 or instructions for installing cementitious board, and grade termination detail installation instructions.

Apply COREFLEX membrane in standard roll size or longest workable cut length. Install COREFLEX sheets horizontally oriented with the thermoplastic membrane offset edge side up (active layer side inward facing installer; yellow side toward shoring wall). Approximately 25 mm (1”) down from the top edge, secure the thermoplastic membrane offset to the shoring wall with washer-head mechanical fasteners spaced maximum 900 mm (36”) on center; refrain from placing a fastener within 150 mm (6”) of each roll end. Install subsequent COREFLEX sheets in vertical sequence up wall with membrane roll ends matched to within 25 mm (1”); trim roll ends as applicable to meet the 25 mm (1”) alignment. Assemble and weld membrane overlap; secure any loose active layer material with bead of CETSEAL. Extend membrane installation minimum 300 mm (12”) above concrete pour joints to provide access.

Alternately, install COREFLEX sheets vertically oriented (active layer side inward facing installer; yellow side toward shoring wall). Approximately 25 mm (1”) from the edge, secure the thermoplastic membrane offset to the shoring wall with washer-head mechanical fasteners spaced maximum 900 mm (36”) on center; refrain from placing a fastener within 150 mm (6”) of each roll end. Install subsequent COREFLEX sheets in vertical sequence along wall. Trim roll ends as applicable to meet the 100 mm (4”) overlap onto the membrane selvedge edge of the horizontal transition sheet. Assemble and weld membrane overlaps; secure any loose active layer material with dabs of CETSEAL maximum of 200 mm (8”) on center or a continuous bead of CETSEAL. Extend membrane installation minimum 300 mm (12”) above concrete pour joints to provide access. Detail all T-Joints with a CoreDisc or CoreFlash NR welded patch. Secure any loose or peeled active layer material with continuous bead of CETSEAL. Continue membrane installation up shoring wall to project grade detail elevation. Secure top membrane edge with washer-head mechanical fasteners maximum 300 mm (12”) on center.

Inside and outside corner transitions can also be constructed using CoreFlash and Coretex rather than installing COREFLEX membrane through these changes in plane. Cut and install CoreFlash extending on both substrates of the corner a minimum 300 mm (12”); maintain a minimum 100 mm (4”) overlap of all adjacent PVC membrane sheets for proper welded seam. After welding all PVC seams install a cut sheet of Coretex that covers all the installed CoreFlash in the corner and extends a minimum 100 mm (4”) overlapping the active layer of all adjacent COREFLEX sheet. Adhere the cut Coretex sheet to both the CoreFlash and the adjacent active layers with continuous beads of CETSEAL placed throughout the area of installation to tightly secure the Coretex.



## 4.4 REBAR SUPPORTS

CETCO recommends non-penetrating reinforcement systems. When that is not possible use the TW-ANCHOR with weldable flange to support the rebar on concrete/shotcrete shoring walls or on sheet pile with a plywood facing that is backfilled with lean-mix concrete. The TW-ANCHOR can be installed prior to placement of the COREFLEX membrane. The TW-ANCHOR must be installed in sound substrates. Installation requires the drilling of a 28 mm (1 1/8") diameter by 225 mm (9") deep hole, appropriate clean out measures, and epoxying into place. Field verification with the site specific substrate is necessary to determine maximum allowable loads per each unique site condition. Drill a 28 mm (1–1/8") diameter by 225 mm (9") deep hole into the substrate. Care should be taken during the drilling process to eliminate lateral movement of the drill bit, as this will create an oversized hole which can reduce the pull-out load capacity of the installed TW-ANCHOR. Clean out the hole with a long reach air gun to blow debris out of, and away from, the hole. Brush the inside of the hole with 32 mm (1–1/4") stiff bristled pipe brush. After brushing in the hole, repeat blowing out debris with air gun a second time. Repeat this process, as needed, until all dust and debris has been removed from the hole. Starting at the bottom/back of the hole, fill 125 mm (5") of the hole with CETCO approved epoxy. Insert the TW-ANCHOR; twist the anchor into place rather than pushing straight into the hole; back pressure can prevent full insertion if air gets trapped behind the threads. Twisting the TW-ANCHOR during installation also promotes full epoxy coverage around the TW-ANCHOR and hole perimeter. The TW-ANCHOR MUST BE FULLY EMBEDDED; back surface of the rigid flange must be flush against substrate.

Secure the TW-ANCHOR in place until epoxy reaches its initial set. Once the TW-ANCHOR is in place allow for the epoxy to set for the recommended cure time (typically 24 hours, consult epoxy manufacturer if hot, cold or wet conditions exist as this will affect cure time). Thread allthread rod (M16 x 20) into the rigid PVC sleeve until full threaded depth of 196 mm (7 3/4") is achieved. Install COREFLEX waterproofing membrane by cutting around the rigid PVC sleeve base; take care to not cut the flexible TW-ANCHOR membrane flange. With a hot-air hand welder and a 20 mm (3/4") tip, weld the COREFLEX membrane (yellow thermoplastic side) to the TW-ANCHOR flexible membrane flange. Complete the entire weld and test for continuity with a mechanical probing device (blunt tip screwdriver or similar). Cut a round 500 mm (20") patch of Coretex with a 16 mm (5/8") hole in the center and place over the all-thread rod. Use dabs of CETSEAL maximum of 200 mm (8") on center or a continuous bead of CETSEAL adhere the Coretex in place.

## 4.5 TIE-BACKS

Select the appropriate size TB-Boot and CoreCap weldable thermoplastic flange to fit over tieback plate and allow proper concrete coverage per project requirements.The TB-Boot is a rigid backing piece (white) and the CoreCap is a flexible, weldable PVC component (black). TB-Boot should fit entirely over tie-back head without the tie-back plate or cables in direct contact with the TB-Boot. Prior to TB-Boot installation, fill voids in retention wall substrate and tie-back head assembly

4.5 TIE-BACK BOOT

with spray foam, 0.138 MPa (20 psi) minimum or non-shrink grout. Fill pre-formed shape of the rigid TB Boot with 2-part urethane foam 0.138 MPa (20 psi) minimum and place over the tie-back head before foam sets up. Overlay the CoreCap weldable PVC component over the TB-Boot. With the CoreCap PVC component nested over the TB-Boot, secure both components to the soil retention wall using washer head fasteners along the outside edge of the flat flange base. Begin by placing two fasteners at the top two corners. Then fasten the two bottom corners and follow up by placing a fastener at each midpoint of the 4 edges. All fasteners should be placed a within 75 mm (3") of the TB-BOOT perimeter edge. Once the TB Boot and CoreCap are secured to the soil retention wall cut a window in COREFLEX membrane so that it overlaps the CoreCap weldable flange 100 mm (4") on all four sides. Weld the COREFLEX to the CoreCap on the flat flange with a continuous thermoplastic weld around the tie-back head; all fasteners shall be located outside of the weld. Weld should be verified for continuity to ensure a complete continuous weld. For soil nail rod and plate assemblies, install applicable TB-Boot & CoreCap (typically the TB-Boot 6SN & CoreCap 6) over assembly and fasten to shoring wall and install COREFLEX per TB-Boot & CoreCap installation guidelines herein.

**NOTE:**
For irregular or oversize tie-back heads, site specific field fabricated stainless steel CoreClad covers may be required in lieu of TB-BOOTs and CORECAPS. CoreClad field fabricated covers per project design will need to be used over large tie-back heads and where irregular (non-planar) shoring wall conditions exist. Consult CETCO for alternate detail for specific project condition(s).

# COREFLEX®
## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

# SECTION 5
# BACKFILLED WALLS

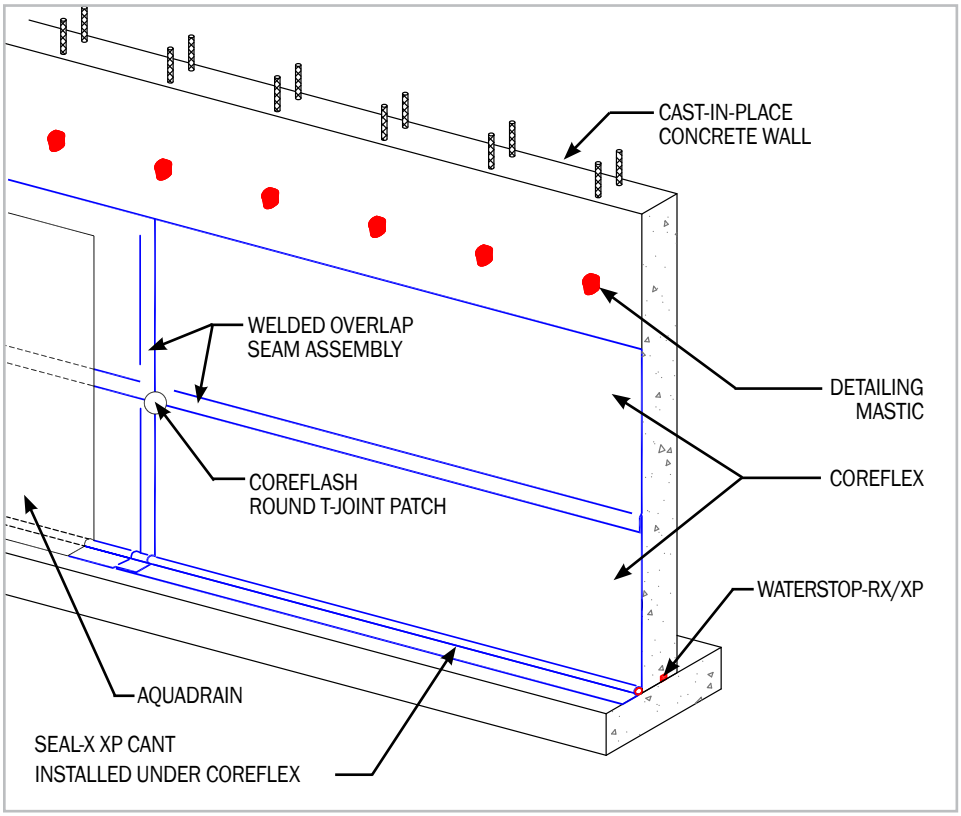
## 5.1 SURFACE PREPARATION

The wall surface must be properly prepared before COREFLEX is installed. Cast-in-place concrete to receive waterproofing shall be of sound structural grade with a smooth finish, free of debris, oil, grease, laitance, dirt, dust, or other foreign matter which will impair the performance of the waterproofing. Form fins, ridges, and other protrusions over 6 mm (1/4") shall be made level and smooth with concrete surface. Honeycombing, aggregate pockets, tie-rod holes and other voids shall be completely filled with non-shrink cementitious grout and level with concrete surface. Concrete work should include completely filling taper-tie holes with non-shrink cementitious grout and a piece of WATERSTOP-RX/XP centered in the wall. Apply CETSEAL or Bentoseal over exterior grouted surface of all form tie holes.

Footings should be swept clean of dirt, rocks and debris to provide COREFLEX with direct contact to the concrete.

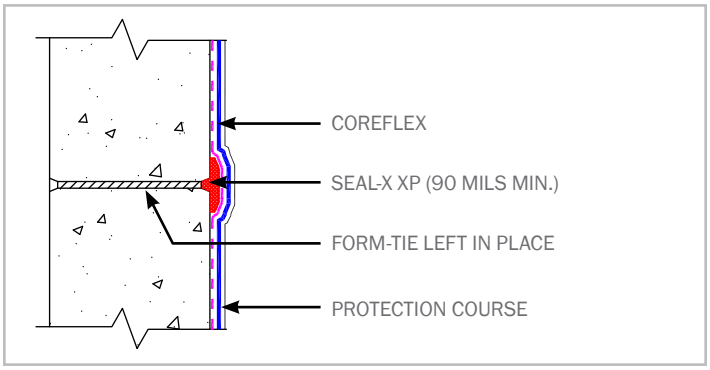
## 5.2 INSTALLATION

### 5.2.1 FOOTING TO WALL CORNER TRANSITION



At the wall/footing intersection, install continuous line of SEAL-X XP cant prior to the placement of the COREFLEX membrane. At any vertical inside corners, apply a 19 mm (3/4") cant of SEAL-X XP prior to the placement of the COREFLEX membrane. Apply COREFLEX membrane in standard roll size or longest workable cut length. Install membrane in a flat, relaxed position avoiding wrinkles and stretching. Install bottom course of COREFLEX membrane horizontally oriented (active layer side against concrete; yellow side facing installer); with the active layer selvedge edge at the top and with the bottom edge extending out onto the footing minimum 200 mm (8") or further as required to overlap leading edge of COREFLEX membrane previously installed under the footing as part of underslab work a minimum 100 mm (4") or to allow for membrane termination detail. Approximately 25 mm (1") down from the top edge of the yellow thermoplastic membrane mechanically attach membrane to the concrete wall with washer-head fasteners spaced maximum 900 mm (36") on center; refrain from placing a fastener within 150 mm (6") of each roll end. 75 mm – 100 mm (3"– 4") intermittent dabs of CETSEAL may be used to adhere the 150 mm (6") active layer selvedge edge to the concrete. Install subsequent COREFLEX sheets in horizontal orientation sequenced up wall with membrane roll ends matched to within 25 mm (1"); trim roll ends as applicable to meet the 25 mm (1") alignment. Assemble and weld membrane overlaps and secure any loose active layer material with bead of CETSEAL.

### ALTERNATE MEMBRANE INSTALLATION:



Install COREFLEX membrane sheets vertically oriented. Approximately 25 mm (1") from the edge, secure the thermoplastic membrane offset to the concrete wall with washer-head mechanical fasteners spaced maximum 900 mm (36") on center; refrain from placing a fastener within 150 mm (6") of each roll end. Install subsequent COREFLEX sheets in vertical sequence along wall. Trim roll ends to meet the 100 mm (4") overlap onto the PVC membrane of the horizontal oriented corner transition sheet. As applicable, install a minimum 450 mm (9") wide strip of Coretex extending a minimum 100 mm (4") over the active layer on the horizontal corner transition sheet active layer selvedge edge and behind the trimmed vertical courses of COREFLEX on the wall. Install adjacent COREFLEX membrane sheets overlapping Coretex strip with rolls ends closely matched to 25 mm (1") of adjacent COREFLEX roll end. Install minimum 450 mm (9") wide strip of CoreFlash centered over Coretex strip detail (yellow side facing installer). The bottom of the vertically oriented CoreFlash strip should overlap 100 mm (4") the horizontally oriented corner transition sheet and extend 100 mm (4") on the ends of the vertically oriented rolls of COREFLEX that continue up the wall. Hot-air weld the termination strip of CoreFlash to the COREFLEX; both continuous welds must be outside of all fasteners (no exposed fasteners). Finish CoreFlash strip by hot-air welding a CoreDisc or CoreFlash NR patch over all T-Joints. Assemble and weld all COREFLEX overlaps and secure any loose active layer material with bead of CETSEAL. Continue membrane installation up concrete wall to project grade detail elevation.

## THERMOPLASTIC WATERPROOFING WITH AN ACTIVE LAYER

### 5.2.2 GRADE TERMINATIONS
SEE SECTION 2.6 GRADE TERMINATIONS.

5.2.2 SLAB EDGE TERM AT FOOTER (NON-HYDROSTATIC CONDITION)

5.2.3 SLAB EDGE (HYDROSTATIC CONDITION)

# SECTION 6
# SPECIAL CONDITIONS

## 6.1 PRECAST CONCRETE CONSTRUCTION

Consult CETCO regarding recommended products and special installation guidelines for precast concrete plank decks, precast earth covered roofs, and precast wall construction.

## 6.2 CONTAMINATED CONDITIONS

For compatibility testing, provide two (2) liter sample of site groundwater in a clean, unbreakable container. Ship water sample to: CETCO 2870 Forbs Avenue, Hoffman Estates, IL 60192, ATTN: BMG Field Services. Upon analysis, CETCO will provide a written report evaluating the water's compatibility with COREFLEX.

## 6.3 HYDROSTATIC/ NON-HYDROSTATIC CONDITIONS

Hydrostatic conditions exist when the elevation of the below-grade foundation is lower than the project site ground water level or historical high water table. Hydrostatic conditions are typically continual but may be intermittent with the fluctuation of the natural ground water table.

Non-hydrostatic conditions exist when site soil testing has determined that no ground water table exists or the elevation of the below-grade foundation is above the expected historical high water table elevation. Intermediate temporary hydrostatic pressure conditions may exist after precipitation or irrigation but is not a continual or prolonged condition.

## 6.4 EXPANSION JOINTS

COREFLEX membrane is not designed for waterproof expansion joints. Consult with CETCO regarding all expansion joint applications and limitations.

## 6.5 MISCELLANEOUS

Use CoreFlASH UV where membrane will be exposed to prolonged direct sunlight at grade terminations. Plywood or cementitious wall board may be used to provide a flat surface mount for installation of the COREFLEX membrane. For underslab or on property line shoring walls, install COREFLEX so that the active layer side is in direct contact with the concrete to be waterproofed. Use WATERSTOP-RX/XP at all (horizontal and vertical) cold concrete joints.

## IT'S OUR BUSINESS TO PROTECT YOUR STRUCTURE

Nothing threatens the structural integrity and interior environmental quality of a building like water ingress. That's why waterproofing is so important in protecting the structure and the valuable assets inside—people, furnishings, equipment, and inventory. With the pervasiveness of today's construction litigation, rely on CETCO and the HydroShield™ Quality Assurance Warranty Program to protect your structure from water ingress with sound guidance, quality waterproofing products, and proper installation, overseen by a certified independent inspection program.

## SYSTEM APPROACH PROVIDES COMPREHENSIVE PROTECTION

CETCO's systematic approach to managing water protection has proven to be an effective means for providing design assistance and quality installation, which are the hallmarks of a dry structure. CETCO's waterproofing systems are known for providing superior long-term performance and installation versatility at an outstanding value. With a proven track record that exceeds 50 years, CETCO has demonstrated the dependability of its products and its commitment to quality.

## THE HYDROSHIELD QUALITY ASSURANCE PROGRAM PROVIDES

***Design Assistance:*** System support and specification recommendations to your design team regarding what type of waterproofing system is best suited to your project's site conditions and construction methodology.

***System Review:*** CETCO's technical staff can provide a thorough review of the specification and waterproofing details for constructability and completeness.

***Complete Product Offering:*** Including membranes, waterstops, drainage products and detailing accessories.

***Project-Specific CAD Details:*** CAD-generated details to minimize field decisions and ensure both design and construction teams have the same understanding.

***Quality Assurance:*** Mandatory pre-construction meeting for review of waterproofing installation with all involved parties.

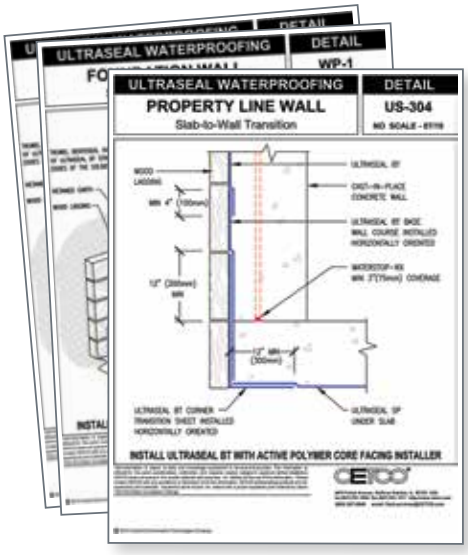
***Material Installation by Experienced Approved Applicator:*** For assurance on proper material installation, within manufacturer's guidelines, by professionally trained waterproofing applicators.

***Independent Inspection:*** Verification of proper installation and materials free of damage prior to coverage.

***Contractual Accountability:*** The warranty is a direct contract between building owner and CETCO manufacturer. There is no second or third-party involvement.

***Financial Assurance:*** HydroShield Quality Assurance Program is backed by the strongest insurance in the industry.

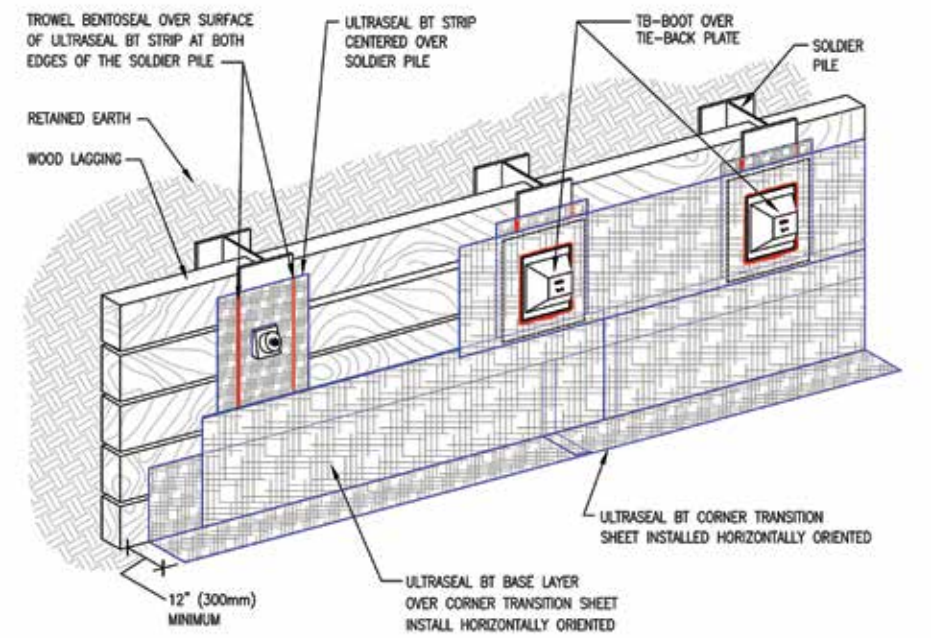
## OUR COMMITMENT TO QUALITY



Successful waterproofing installations are the result of solid design, quality products, proper installation, and on-site inspection. As a part of your team, CETCO makes it easier for you to achieve the long-term performance you expect from your waterproofing system by providing:

1. ***World-Class Research and Development***
2. ***Design Assistance***
3. ***Experienced Approved Applicators***
4. ***Independent Inspection Services***
5. ***Labor and Material Warranty***
6. ***Recurrent Training Programs***

# DESIGN ASSISTANCE



CETCO provides a wide range of value-added assistance and technical expertise to your design team.

*Our staff can provide quality AutoCAD®drawings based on your project design and field conditions.*

## LET US WORK FOR YOU

As an industry leader, we have the resources and take the time to focus on your specific project needs. We offer extensive experience with knowledge in material selection and application, specification preparation, and reliable solutions for your project. Our professionals will work with you hand in hand to ensure your project's success from pre-design through completion of construction. CETCO's application manuals provide sound fundamental installation details for hydrostatic or non-hydrostatic conditions from the most basic to stringent projects. Another value-added service our staff offers is to efficiently provide quality AutoCAD®drawings based on your project design and field conditions to help your design team create their project specification.

# APPLICATOR PROGRAM

To ensure the best results for a successful project, the best solution is to have a trained, experienced applicator install a properly designed waterproofing system.

## APPROVED APPLICATOR PROGRAM EXPERIENCED, PROFESSIONAL CRAFTSMANSHIP

Since 1981, CETCO has maintained and managed an Approved Applicator program wherein experienced, professional contractors have the ability to perform quality installations. This long term commitment to applicator quality cannot be matched by any other prominent waterproofing manufacturer. Today, after decades of success, CETCO remains fully committed to its preeminent applicator program, working with the most highly skilled professionals to protect your assets, providing you with installation confidence and peace of mind.

## APPLICATOR PROGRAM ADVANTAGES

- Ensures installation quality for maximum performance
- Experienced professionals who are knowledgeable about waterproofing applications install the materials
- Only installations by CETCO Approved Applicators are eligible for the HydroShield Quality Assurance Program
- Minimizes risk of moisture damage and long-term repair costs

# INDEPENDENT INSPECTION

Be sure what you specify is what you get. Third-party independent inspection.

## WATER INGRESS IS EXPENSIVE AND DIFFICULT TO RESOLVE

When it comes to waterproofing, problems can be difficult and expensive to resolve. The materials usually are difficult to access. In many cases, repair costs can quickly escalate to many times the cost of the initial installation. The substantial repair costs do not include interior finish repair, lost revenues due to decreased building space use, or in some circumstances, litigation. One cannot overemphasize the value of getting it done right the first time. Be sure what you specify is what you get.

## THIRD-PARTY INDEPENDENT INSPECTION

Waterproofing in new construction is typically one percent or less of the building cost, yet water intrusion is the leading cause for construction defect litigation.

Statistics reveal that the top causes of water intrusion are construction errors, inappropriate product application, and damaged materials—even the best efforts can have an off day. Historically, the integrity of foundation waterproofing has been left up to field construction personnel. Even with well-intended efforts and good design, construction flaws and damages have sometimes not been detected or corrected. Effective waterproofing inspections require a well-coordinated field effort and direct communication amongst the construction and design team members. Compliance with project requirements during installation and subsequent work by other trades can be monitored by third-party independent inspection hired by the owner. With this quality control measure in place, the HydroShield™ Quality Assurance Program affords a true performance warranty.

### Most water ingress occurs not because the materials were defective, but because of these primary causes*

***Poorly Prepared Substrates:***
One cannot expect a waterproofing membrane to perform correctly when applied to an improperly prepared substrate.

***Improper Installation and Detailing:*** Ingress often results from human errors in installation and detailing. Even a minor mistake can lead to significant damage.

***Damage after Installation:***
Waterproofing is routinely damaged by subsequent construction traffic, operations and weather.

***"Field" Solutions to Specific Jobsite Needs:***
Incomplete or faulty installations to keep the project on schedule and keep the initial expense down can raise questions about quality.

CETCO HYDRO-SHIELD QUALITY ASSURANCE PROGRAM

*The HydroShield program is designed to eliminate the primary causes of water ingress through pre-installation planning, experienced craftsmanship, and on-site inspection, resulting in superior waterproofing performance.*

# LONG-TERM PERFORMANCE

Four “fine-print” factors to consider when evaluating a warranty program.

## WHAT DOES THE FINE PRINT REALLY MEAN?

After all, it’s what’s in the fine print that often matters most. Knowing that your investment in waterproofing is protected by an extensive warranty program can bring great peace of mind. But warranties can be very different in what they cover. For example, warranties for our waterproofing systems are performance warranties covering both materials and labor—not merely product warranties like other manufacturers provide.

Warranty documents often contain restrictive provisions that significantly limit the warrantor’s liability and owner’s remedies in the event that problems develop. The warranty document may also contain other restrictions and limitations, such as a prohibition against assignment or transfer of the warranty. Be sure to consider and compare these factors when evaluating a warranty offer:

### *Length of Coverage*

This is the main feature that most warranties tout, and what many owners don’t look beyond. Though important, length of coverage should not be the primary criterion in the selection of a waterproofing system. The selection should be based on the product’s qualities and suitability for the prospective project. A long-term warranty may be of little value to an owner if the waterproofing does not perform satisfactorily. Don’t let the warranty fail you too.

### *Financial Coverage*

Combined with the length of coverage, this attribute defines a warranty’s true strength. What’s the maximum financial limit allowed to correct problems? A warranty may offer a lengthy period of coverage but minimal allowances for actual cost. Many warranties limit the manufacturer’s monetary responsibility. CETCO’s HydroShield Quality Assurance Program provides a “**NO FINANCIAL LIMIT**” warranty, which has NO limitations on monetary responsibility.

Some warranties are pro-rated, meaning the coverage is reduced proportionately depending on how many years it has been since installation. CETCO stands behind its waterproofing systems with a 100 percent non-prorated warranty. You get full protection for the full term of the warranty.

### *Terms of Coverage*

What claims does the warranty offer to correct? Merely more of the same product that failed? Material and labor for replacement? CETCO’s warranty covers both labor and material. Fully understanding what a warranty covers helps owners make the right decision—*HydroShield Quality Assurance Program from CETCO.*

### *Source of Coverage*

A warranty is only as good as the company that stands behind it. It helps little to have “lifetime” coverage from a company that’s dissolved two years later. CETCO is a financially stable company that has built a solid reputation in the industry since 1963. CETCO is backed by the assets of its parent company, Minerals Technologies, trading on the NYSE under the symbol MTX.

CETCO

# HYDRO·SHIELD™

QUALITY ASSURANCE PROGRAM

## QUALITY PRODUCTS—PROVEN PERFORMANCE

Since 1963, more than a billion square feet of CETCO waterproofing products have been installed around the world, becoming the standard by which all other waterproofing membranes are measured.

By specifying CETCO products, you are assured of optimum waterproofing performance from products specifically engineered to be integrated and installed as a complete waterproofing system. CETCO manufactures a complete line of quality waterproofing membranes, waterstops, and drainage composites as well as a complete line of installation accessories—everything you need from the bottom of the excavation up to your green roof.

## SINGLE-SOURCE WATERPROOFING

Our broad product range of waterproofing systems provides installation versatility, allowing you to work with a single manufacturer to cover all of your waterproofing needs. From zero-lot property line construction to backfilled foundation walls to under-slab, green roof and plaza deck applications, CETCO is the complete waterproofing solution.

# CETCO HYDROSHIELD WARRANTY

**W -** 9089

**Project Owner:**
Biomed Realty

**Project Name:**
Dexter Yard

**Project Address:**
700 Dexter Avenue N, Seattle WA 98109

**Warranty Start Date:**
01/11/2022

**Approved Applicator:**
Sound Waterproofers, Inc

**Independent Inspection Firm:**
OAC Services

**HydroShield Warranty:** Colloid Environmental Technologies Company, LLC. (CETCO) warrants to Owner that its CETCO Waterproofing System (defined as CETCO interrelated products and accessories), installed by the Approved Applicator per CETCO installation guidelines, as incorporated into the Project's contract documents and specifications, including relevant scopes of work ("Project Specifications") on the above referenced construction Project is free from defects in material components and product construction ("Defects"), and has been installed to specification, as confirmed by CETCO Certified Inspection process ("Installation") for a Warranty Period of 15-Fifteen years from the above referenced Warranty Start Date. Subject to the following terms and conditions, CETCO agrees to remediate the portion(s) of the CETCO Waterproofing System during the Warranty Period determined by CETCO after reasonable investigation to be caused by Defects or defective Installation and covered within this warranty.

**Limitations:** THE FOREGOING WARRANTY IS IN LIEU OF AND EXCLUDES ALL OTHER WARRANTIES NOT EXPRESSLY SET FORTH HEREIN, WHETHER EXPRESSED OR IMPLIED BY OPERATION OF LAW OR OTHERWISE, INCLUDING, BUT NOT LIMITED TO, ANY IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS.

This warranty is void if subsequent work is done on the CETCO Waterproofing System without CETCO's prior written approval of the methods and materials used. In addition, as a condition to this warranty, Waterstop-RX must be installed in all areas applicable per Project Specifications. Independent third party inspection services in accordance with CETCO Warranty Program must be obtained by Owner for regular, complete inspections of the CETCO Waterproofing System during all phases of installation.

CETCO SHALL NOT BE LIABLE FOR INCIDENTAL OR CONSEQUENTIAL LOSSES, DAMAGES OR EXPENSES, DIRECTLY OR INDIRECTLY ARISING FROM THE SALE, HANDLING OR USE OF THE CETCO WATERPROOFING SYSTEM OR FROM, OR IN CONNECTION WITH, ANY FAILURE OR INGRESS, OR FROM ANY OTHER CAUSE RELATING THERETO WHETHER SUCH CLAIM IS BASED ON BREACH OF WARRANTY, BREACH OF CONTRACT, NEGLIGENCE, STRICT ABILITY IN TORT OR ANY OTHER LEGAL THEORY. CETCO SHALL NOT BE LIABLE FOR LOSSES, DAMAGES, OR EXPENSES DIRECTLY OR INDIRECTLY ARISING FROM ACTIVITIES OF OTHER TRADES THAT AFFECT THE PERFORMANCE OF THE CETCO WATERPROOFING SYSTEM. CETCO shall have no liability for damage to other components of the Project or contents therein. CETCO shall have no liability for any and all components of the CETCO Waterproofing System where it is determined the CETCO Waterproofing System was not installed in accordance with the Project Specifications. CETCO's liability hereunder in any case is expressly limited to the cost of repair of any affected area determined by CETCO to be the fault of the CETCO Waterproofing System. The foregoing states the sole and exclusive liability of CETCO and the sole and exclusive remedy of the Owner.

**Claims:** Any claim by Owner for any claimed defects hereunder for any cause shall be deemed waived by Owner unless submitted to CETCO in writing within thirty (30) days from the date Owner discovered, or should have discovered, any claimed defect. Owner must provide CETCO full and reasonable opportunity to investigate and determine whether any water ingress is covered under this Warranty and, if so, to undertake remedial activities prior to taking any action against CETCO. Owner shall permit CETCO to conduct reasonable destructive or non-destructive testing in carrying out its investigation.

**Coverage:** CETCO's warranty shall not cover, and CETCO shall not be obligated to repair, any affected area caused by events beyond its control, including but not limited to structural defects, cracks in excess of one-sixteenth of an inch, incomplete construction including but not limited to substandard and unconsolidated concrete, building alterations, damage to the installation by subcontractors or others, the failure of or improper preparation or application of any material or component underlying or adjacent to the CETCO Waterproofing System, explosions, earthquakes or other natural phenomena or acts of God.

**Access:** Any Defect covered by this warranty may at CETCO's discretion be repaired from the inside of the structure base and the Owner of the Project shall be responsible for removing any equipment, furniture or non-structural interior construction from the area which would hinder the remedial operations at Owner's sole expense. Owner shall give CETCO, its agents and employees reasonable access to the waterproofed area during business hours during the term of this warranty.

Hoffman Estates, IL 60192

Attn: Field Services

Re: 700 Dexter – Hydroshield Warranty No. **W-9089**

To Whom It May Concern:

As Owner's 3rd party, independent certified inspector, I hereby confirm that all work observed and inspected under the W-9089 Hydroshield Warranty (Coreflex system) has been completed. All work is compliant with CETCO's detail standards and all inspection reports have been submitted to Field Services. There are no outstanding action items or issues on site.

Sincerely,

Kerry May, AIA
Sr. Director – Building Enclosure Design

Notes:

Petroleum hydrocarbons analyzed by NWTPH-Gx.

VOCs analyzed by EPA Method 8260D.

PCE = perchloroethylene (tetrachloroethene)

TCE = trichloroethene

tDCE = trans-1,2-dichloroethene

cDCE = cis-1,2-dichloroethene

VC = vinyl chloride

Approximate well screen elevations are indicated by treatment zones.

U = not detected at or above the laboratory method detection limit (MDL).

Detected results shown in **bold**, detections above the screening level highlighted in gray.

J = the identification of the analyte is acceptable; the reported value is an estimate.

(duplicate) = field duplicate.

**Notes:**
Alkalinity analyzed by EPA Method 2320.
Anions analyzed by EPA Method 9056A.
Total Organic Carbon (TOC) analyzed by EPA Method 9060A.
Metals Analyzed by EPA Method 6020B.
Ferrous Iron measured during field sampling using a Hach field kit.
Dissolved gases analyzed by EPA Method RSK175.
Ferric iron = total iron minus ferrous iron; if total iron < ferrous iron, ferric iron is reported as zero ("0").
mg$CaCO_3$/L= milligrams of calcium carbonate per liter.
mg/L = milligrams per liter.
ug/L = micrograms per liter.
U = Not detected at or above the laboratory method detection limit (MDL).
Detected results shown in bold.
J = The identification of the analyte is accetable; the reported value is an estimate.
– = Not sampled or results not available.
(dup) = field duplicate.
Evaluation of total screening score:

| | | | |
|---|---|---|---|
| 0 - 5 | Inadequate evidence for anaerobic biodegradation of CVOCs. | 15 - 20 | Adequate evidence for anaerobic biodegradation of CVOCs. |
| 6 - 14 | Limited evidence for anaerobic biodegradation of CVOCs. | >20 | Strong evidence for anaerobic biodegradation of CVOCs. |

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J3 | The associated batch QC was outside the established quality control range for precision. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

Project Manager

Results relate only to the items tested or calibrated and are reported as rounded values. This test report shall not be reproduced, except in full, without written approval of the laboratory. Where applicable, sampling conducted by Pace Analytical National is performed per guidance provided in laboratory standard operating procedures ENV-SOP-MTJL-0067 and ENV-SOP-MTJL-0068. Where sampling conducted by the customer, results relate to the accuracy of the information provided, and as the samples are received.

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J3 | The associated batch QC was outside the established quality control range for precision. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

## Sample Delivery Group (SDG) Narrative

**pH outside of method requirement.**

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J3 | The associated batch QC was outside the established quality control range for precision. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| C5 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded high. Data is likely to show a high bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J4 | The associated batch QC was outside the established quality control range for accuracy. |
| J6 | The sample matrix interfered with the ability to make any accurate determination; spike value is low. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J3 | The associated batch QC was outside the established quality control range for precision. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |
| Q | Sample was prepared and/or analyzed past holding time as defined in the method. Concentrations should be considered minimum values. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| T8 | Sample(s) received past/too close to holding time expiration. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| T8 | Sample(s) received past/too close to holding time expiration. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |
| T8 | Sample(s) received past/too close to holding time expiration. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| P1 | RPD value not applicable for sample concentrations less than 5 times the reporting limit. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C3 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Method sensitivity check is acceptable. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J3 | The associated batch QC was outside the established quality control range for precision. |
| J5 | The sample matrix interfered with the ability to make any accurate determination; spike value is high. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager

# GLOSSARY OF TERMS

## Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

## Abbreviations and Definitions

| | |
|---|---|
| MDL | Method Detection Limit. |
| RDL | Reported Detection Limit. |
| Rec. | Recovery. |
| RPD | Relative Percent Difference. |
| SDG | Sample Delivery Group. |
| (S) | Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media. |
| U | Not detected at the Reporting Limit (or MDL where applicable). |
| Analyte | The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported. |
| Dilution | If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor. |
| Limits | These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges. |
| Original Sample | The non-spiked sample in the prep batch used to determine the Relative Percent Difference (RPD) from a quality control sample. The Original Sample may not be included within the reported SDG. |
| Qualifier | This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable. |
| Result | The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte. |
| Uncertainty (Radiochemistry) | Confidence level of 2 sigma. |
| Case Narrative (Cn) | A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report. |
| Quality Control Summary (Qc) | This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material. |
| Sample Chain of Custody (Sc) | This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis. |
| Sample Results (Sr) | This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported. |
| Sample Summary (Ss) | This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis. |

| Qualifier | Description |
|---|---|
| B | The same analyte is found in the associated blank. |
| C4 | The reported concentration is an estimate. The continuing calibration standard associated with this data responded low. Data is likely to show a low bias concerning the result. |
| E | The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL). |
| J | The identification of the analyte is acceptable; the reported value is an estimate. |
| J3 | The associated batch QC was outside the established quality control range for precision. |
| J6 | The sample matrix interfered with the ability to make any accurate determination; spike value is low. |
| V | The sample concentration is too high to evaluate accurate spike recoveries. |

# CASE NARRATIVE

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jared Starkey
Project Manager
