**INTERIM REMEDIAL ACTION PLAN
NACHES INTERMEDIATE SCHOOL
AND ADJACENT FIELDS
NACHES, WASHINGTON**

June 19, 2006

**Prepared by Washington State Department of Ecology
Toxics Cleanup Program
Robert D. Swackhamer PE (509) 454-7840**

1.0 INTRODUCTION

1.1 PURPOSE OF THIS DOCUMENT

The purpose of this Interim Remedial Action Plan is to fulfill the requirements of Washington Administrative Code (WAC) 173-340-430, which include a requirement that, except in certain circumstances, a report be prepared before conducting an interim action under the Model Toxics Control Act.

1.2 SUMMARY OF PROPOSED INTERIM ACTION

The Department of Ecology proposes to excavate and haul away some soil contaminated with lead and arsenic for disposal at a permitted landfill, mix some of the remaining soil, import clean soil, and establish new grass in this clean soil. The plan includes installation of underground solid set sprinklers to maintain the turf cover.

The action will cover the following three adjacent sectors, listed from north to south:

- Intermediate School Playfields
- Ranger Field, the high school baseball field
- Soccer Field (also used for softball)

Cleanup techniques will vary from sector to sector. The Soccer Field will require the most excavation and off-site disposal, followed by deep mixing. The Intermediate School Playfields will require a small amount of excavation and off-site disposal followed by deep mixing. In the case of both the Soccer Field and Intermediate School Playfields, the existing irrigation system will be removed and a new irrigation system installed.

The work at Ranger Field will be non-destructive and will be limited to minor excavation using light equipment, which does not disturb the existing irrigation system, grade or drain system.

2.0 BACKGROUND

2.1 AREA-WIDE SOIL CONTAMINATION TASK FORCE

In response to increasing public concerns on lead/arsenic contamination, the 2001 Washington State Legislature requested that Ecology prepare a statewide strategy to address lead and arsenic soil contamination. The project's main focus was on areas with low to moderate levels of lead and arsenic that have been developed into residential neighborhoods, schools, daycares and parks.

Ecology's strategy includes the findings and recommendations of the Area-Wide Soil Contamination Task Force, a 17-person panel chartered by the Washington State Departments of Agriculture, Ecology, Health, and Community, Trade and Economic Development (the Agencies) to offer advice about a statewide strategy to respond to low- to moderate-level arsenic and lead soil contamination in Washington State. The completed report, **Area-Wide Soil**

Contamination Task Force Report, Ross & Associates Environmental Consulting, Ltd., Landau Associates, Inc., Hubbard Gray Consulting, Inc, was published June 30, 2003.

Task Force deliberations focused on understanding the nature and extent of area-wide soil contamination, making recommendations about effective, practical, and affordable steps individuals and organizations can take to reduce their potential for exposure to area-wide soil contamination, and on creating an alternate, more streamlined approach under MTCA for properties affected by area-wide soil contamination.

Specifically, the Task Force recommendations and Ecology's implementation strategy for schools affected by area-wide soil contamination include the following:

- implement individual protection measures
- maintain good soil cover in areas where children play
- conduct qualitative evaluations to increase their understanding of where exposure could occur
- test soils where qualitative evaluations indicate the potential for exposure to contaminated soil, and
- implement additional protection measures such as installing a geotextile fabric barrier between contaminated soils and surfacing materials in play areas if contamination is found.

Ecology has assembled a toolbox of information and materials designed to answer questions about area-wide soil contamination at the following web site

http://www.ecy.wa.gov/programs/tcp/area_wide/area_wide_hp.html

2.2 CONTAMINANTS OF CONCERN

The main contaminants of concern at these sites are the toxic metals, lead and arsenic. Long-term exposure to elevated levels of arsenic may cause cancer, whereas, long-term exposure to lead may affect and impair the human nervous system and proper brain function. More information on the effects of lead and arsenic can be found at the following chapter within the same Ecology project web site cited above

http://www.ecy.wa.gov/programs/tcp/area_wide/AW/toolbox_chap4.html

2.3 AREA SOIL TESTING AND INITIAL INTERIM ACTIONS

Between 2001 and 2005, Ecology assisted School Districts in conducting soil sampling for lead and arsenic contamination at school sites. A total of 35 schools located in Okanogan, Douglas, Chelan and Yakima Counties had soil contamination significantly higher than Washington State cleanup standards.

During summer 2002, Ecology began taking interim cleanup actions. Ecology provided funding to pay for cleanup projects at five schools, initially in conjunction with already-planned remodeling projects.

2.4 NACHES INTERMEDIATE SCHOOL SITE ASSESSMENT

Soil sampling was conducted by Ecology in July, 2005, with the following results in parts per million:

	Average Arsenic ¹	Highest Arsenic	Arsenic Cleanup Standard	Average Lead	Highest Lead	Lead Cleanup Standard
Intermediate School Grounds	43	105	20	276	670	250
Ranger Field	25	76	20	157	357	250
Soccer Field	36	86	20	334	622	250

Ecology completed a site hazard assessment of the property under the Model Toxics Control Act, which resulted in the site being added to the Washington State Hazardous Sites List on February 26, 2006, with a ranking of 5. The hazard ranking is an estimation of the potential threat to human health and/or the environment relative to all other sites assessed. A ranking of 1 represents the highest relative risk and 5 the lowest. Therefore the ranking of 5 for this site means its risk ranks among the lowest 20 percent of all the sites on the list.

Sampling taken by Ecology in March 2006, at additional locations on the property produced the following results, also in parts per million:

	Average Arsenic	Highest Arsenic	Arsenic Cleanup Standard	Average Lead	Highest Lead	Lead Cleanup Standard
Intermediate School Grounds	30	49	20	193	457	250
Ranger Field	31	80	20	132	288	250
Soccer Field	78	115	20	365	600	250

3.0 DESIGN CONSIDERATIONS

3.1 STATE CLEANUP REGULATION

¹In calculating the average, results below the detection level of the instrument were taken as zero.

According to the state cleanup regulation², an “interim action” is distinguished from a “cleanup action” in that an interim action only partially addresses the cleanup of a site. (The remediation conducted under an interim action may end up constituting the complete cleanup action for a site, however, if the interim action subsequently is shown to meet requirements in the rule for a complete cleanup action.) The state regulation defines three categories of interim actions.

The interim action proposed for the Naches Valley Intermediate School site qualifies under the following one of the three categories defined in the state rule. WAC 173-340-430 (a) defines an interim action as “A remedial action that is technically necessary to reduce a threat to human health or the environment by eliminating or substantially reducing one or more pathways for exposure to a hazardous substance at a facility.” By reducing the proximity of school children to the hazardous substances that will be hauled away from the site and by providing a better barrier preventing contact with the soil that remains, the Naches Valley Intermediate School interim action will reduce the threat to human health posed by the pathways of contact and ingestion.

WAC 173-340-430 (2) states that interim actions may:

- (a) Achieve cleanup standards for a portion of the site
- (b) Provide a partial cleanup, that is, clean up hazardous substances from all or part of the site, but not achieve cleanup standards; or
- (c) Provide a partial cleanup of hazardous substances and not achieve cleanup standards, but provide information on how to achieve cleanup standards for a cleanup; for example, an unproven cleanup technology demonstration project.

Additional requirements of an interim action, as stated in WAC 173-340-430, are that the interim action will be consistent with the cleanup action and that the interim action shall not foreclose reasonable alternatives for the cleanup action. (The rule provides the following qualifier to the latter requirement: “This is not meant to preclude the destruction or removal of hazardous substances.”) A Cleanup Action Plan has not yet been written for the Naches Valley Intermediate School site, but this interim action is consistent with the cleanup typical alternatives considered for lead/arsenic contaminated sites in Central Washington. The removal of some of the contaminated soil does foreclose the option of capping this same soil in place, but the qualifier quoted above clearly allows such a removal.

3.2 INTERIM ACTION ALTERNATIVES

The following cleanup action alternatives were considered for the Naches Valley Intermediate School Site:

- No action – This option was not selected because the situation has not been stabilized at a status that gives sufficient assurance of on-going isolation of the contaminated soil from school children.

²WAC 173-340-430(1)

- Institutional controls – Institutional controls do not address the contamination in the soil but rely on practices to control exposure to the contamination. Examples could include educating students and others about soil contamination, maintaining features such as existing grass which provide some barrier to contamination; preventing digging in the school yard; restricting access to the school yard; requiring students to wash hands following recess; having school maintenance staff wet-mop floors and use high efficiency particulate air (HEPA) filter vacuum cleaners; fencing; signage; and restrictive covenant limiting use of the land. Institutional controls was not selected as the sole option because it is not considered as effective as other alternatives due to the difficulty in enforcing 100 percent compliance with some of the practices. Also, one institutional control (restricting access to the school yard) would render a playfield useless as a playfield even if could be accomplished successfully. Despite these shortcomings, some institutional controls such as hand washing and prevention of digging do provide additional benefit when used in conjunction with more universally effective measures.
- Capping the contaminated soil with a cover such as a synthetic geotextile and clean imported soil – This option is considered effective and likely would be less expensive than the chosen option. Capping was not selected because a remedy existed that was more permanent, feasible, and did not require the on-going specialized maintenance of the cap.
- Deep Mixing – Contaminated soil would be mixed with underlying clean soils to a depth of four feet. Mixing of contaminated soils may reduce the overall soil contamination to a “clean” standard if area contaminant concentrations are not too high and do not extend too deep. Deep mixing is limited to areas where deep soils are present and relatively flat terrain. Deep mixing was selected as one component of the interim action at Naches Valley Intermediate School.
- Removal of Contaminated Soil – Physical removal entails excavating soil, then transporting it off-site by truck for disposal at a properly permitted landfill. Physical removal is a very effective and permanent remediation technique. Physical removal of contaminated soil was selected as one component of this interim action.

4.0 INTERIM CLEANUP ACTION PLAN

A qualified and experienced contractor will perform the following work during summer 2006:

Excavation of approximately the top 6 inches of existing turf and soil in the areas of highest contamination and disposal of this material at a properly permitted landfill meeting the requirements of RCRA Subtitle D; mixing the remaining soil; removal of the existing irrigation system and installation of a new irrigation system; and placement of clean imported topsoil and new turf.

The excavation would be accomplished by front-end loader, bulldozer, or similar mobile equipment. Deep mixing would be accomplished by a specialized piece of equipment capable of mixing soil down to a depth of four feet. This specialized piece of equipment works something like a large Rototiller.

4.1 SAFETY AND HEALTH

The site will be restricted to child access throughout the construction period. The Safety and Health Plan consists of measures to avoid construction hazards and good personal hygiene. No other known or special hazards exist at this site. The contractor will be required to provide a specific Safety & Health Plan for the site construction activities.

4.2 OPERATION AND MAINTENANCE PLAN

It is recommended that Naches Valley School District develop an operation and maintenance plan which describes work practices to limit child and employee exposure to lead and arsenic contaminated soil.
