Section 1: INTRODUCTION

DH Environmental, Inc. (DH Environmental) has prepared this Interim Action Completion Report (IACR) on behalf of Star Forge, LLC (Star Forge), the current owner of the former Jorgensen Forge Facility located at 8531 East Marginal Way South, in Tukwila, Washington (herein referred to as the Property) (Figure 1).

This report has been prepared in accordance with Agreed Order (AO) No. DE 21034 (Star Forge AO), entered into by Star Forge and the Washington State Department of Ecology (Ecology), pursuant to the Washington State Model Toxics Control Act (MTCA) and Cleanup Regulation established in Chapter 173-340 of the Washington Administrative Code (WAC).

1.1 SITE DESCRIPTION

The former Jorgensen Forge Property consists of approximately 21.6 acres located in an industrial area along the east bank of the Lower Duwamish Waterway (LDW). The Property is bordered to the north by Boeing Plant 2, and to the south by the Boeing Isaacson property. It is bordered to the west by the LDW, and to the east by East Marginal Way South and the King County Regional Airport.

The Property was used from 1942-1965 for fabrication of structural steel, tractor, and road equipment, including forging and heat-treating operations conducted for the U.S. Navy. It was owned and operated by Earle M. Jorgensen Co. (EMJ) from 1965 until 1992, when it was purchased by Jorgensen Forge Corporation (JFC). JFC manufactured specialized large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. JFC also processed nickel, titanium, and specialized alloys.

Historical industrial use of the Property has contaminated soil and groundwater, including in the vicinity of the USTs described in this report. Star Forge bought the Property out of bankruptcy in November 2016. As part of the bankruptcy proceeding, the bankruptcy court approved a settlement agreement pursuant to which EMJ was required to enter into an agreed order with Ecology to investigate and remediate contaminated soils and groundwater at the Property and any locations where hazardous substances released on the Property have come to be located (the Site). In fulfillment of that requirement, EMJ entered into Agreed Order No. DE 14143 (EMJ AO) with Ecology in 2017. At the time this document was originally submitted to Ecology, EMJ was conducting a Remedial Investigation (RI) of the Site. A draft version of this report and site assessment data were provided to EMJ and Ecology for reference in the RI.

1.2 INTERIM ACTION SCOPE

As required by Section VII.A of the Star Forge AO, the Interim Action included three specific tasks which are described in the following sections. This work was all conducted in conjunction with demolition of the facility structures and subsequent restoration of the Property.

1.2.1 Underground Storage Tank System Permanent Closure by Removal and Site Assessment Sampling

The Property had two Underground Storage Tank (UST) vaults, located in two separate concrete structures (North Tank Vault and South Tank Vault), with a total of 18 UST systems as defined in WAC 173-360A-0150(77). The North Tank Vault included 10 USTs designated as UST-26 through UST-35, and the South Tank Vault included 8 USTs designated as UST-15 through UST-22. All liquids were removed from the USTs in 2020, and all associated media was sampled and designated for disposal. However, at the request of Ecology, the decommissioning of the USTs could not be conducted until an Interim Action Work Plan and AO were approved. In addition, the City of Tukwila also required a demolition permit as structural decommissioning was required for removal. The USTs were all licensed with Ecology and covered under appropriate financial assurance mechanisms until final decommissioning and closure was completed. In accordance with the requirements of the Star Forge AO and WAC 173-360A, a Permanent Closure Report was submitted to Ecology under separate cover in May 2024 (DH Environmental, 2024). The UST Decommissioning and Site Assessment Report is included as Appendix A to this IACR.

1.2.2 Clean Closure of Dangerous Waste Management Units

DH Environmental prepared and submitted an interim Dangerous Waste Clean Closure Report to Ecology for the purpose of documenting the Clean Closure of Dangerous Waste Management Units (DWMUs) at the Property (DH Environmental, 2020a; 2020b, and 2020c) in accordance with WAC 173-303-610(2) and (5). The Clean Closure Report documented removal of Dangerous Waste from the Property and provided updated records of Dangerous Waste Designations of debris, slag, and the concrete and asphalt slabs in each DWMU. The interim Dangerous Waste Clean Closure Report included documentation of all Clean Closure work that could be conducted without obtaining a demolition permit which was ultimately tied to the Interim Action Work Plan (IAWP) and Star Forge AO. After Star Forge acquired all permits and IAWP approvals, the remaining Clean Closure work specified in the IAWP resumed in 2023 in conjunction with demolition of the Property structures. The remaining Clean Closure tasks included demolition of three DWMUs, removal of the underlying slabs, confirmation sampling of the underlying soil, and minor excavation below one of the units to achieve MTCA Method A cleanup standards.

The Final Clean Closure Report was delivered to Ecology under separate cover in May 2024. This report is included as Appendix B to this IACR.

1.2.3 Limited Exposed Soil Removal

Certain areas within the main buildings had exposed soil at grade (i.e. no stockpiles). Star Forge believed that this material was “track-in” from the former forging operations at the Property, or imported aggregate for base course, and/or paver base for equipment pads, walkways, or other in-plant facilities. Prior to demolition in 2019 and 2020, Star Forge, through its contractor Clean Harbors, removed and disposed of approximately 2,500,000-pounds (lbs) of “area wide dust”. The area wide dust “passed” toxicity characteristic leaching potential (TCLP) for RCRA 8 metals. However, the elevated total metals concentration caused the area-wide dust to “book designate” as a Toxic Criteria Dangerous Waste and was assigned Washington State Dangerous Waste number WT02. A fish bioassay was not conducted to refute the book designation by Clean Harbors. Therefore, the WT02 designation was assumed and approximately 2,500,000 lbs of the area wide dust was removed and disposed of as Washington State Toxic Criteria WT02 waste during 2019 and early 2020.

Although most of the area wide dust was removed from inside the buildings prior to demolition, residual dust did remain on some surfaces. Therefore, in June 2020, DH Environmental conducted an area wide statistical analysis of the dust, fine particles, and exposed soil to designate the remaining material so that it could be properly managed during the forthcoming demolition of the structures. Exposed soil, along with area-wide residual dust, was designated as non-dangerous waste if disposal was required (DH Environmental, 2020a). Exposed soil and dust were indistinguishable at the ground surface where pavement was not present or unknown to be present.

During planning for demolition and site stabilization, and at the request of Ecology, exposed soil was identified for potential removal to facilitate surface preparation for the application of asphalt pavement. If required, any soil removal was limited to less than 100 cubic yards, and removal would require consultation with Ecology among other requirements. The areas of unpaved surfaces were mapped by Sound Earth Strategies in 2020 and represented approximately 14,000 square feet within the main building. During demolition, these areas of exposed soil were covered with geomembrane liners to prevent stormwater from contacting the areas of exposed soil.

Through the demolition process, no exposed soil inside the buildings required removal as part of the Interim Action or site demolition work. Because the area wide dust was designated as non-Dangerous Waste, further removal from surfaces was not required and any remaining residual dust was disposed of with the general demolition debris as it was either adhered to structural surfaces or swept up and disposed of during general stormwater BMP maintenance.

Clean fill was imported across the footprint of the former Forge Shop and Melt Shop to restore the grade and achieve proper drainage.

Individual cases of soil removal outside of the building footprints were required for other tasks and are described in Section 4. No exposed soil inside the buildings required removal and off-site disposal, which was a communicated potential outcome.

Section 2: UNDERGROUND STORAGE TANK DECOMMISSIONING AND SITE ASSESSMENT

The purpose of a UST site assessment is to determine if there has been a release of a regulated substance from a UST system. Confirmed and suspected releases have been reported from both former UST vaults as early as 1990 when Dames & Moore first identified elevated levels of petroleum in soil west of the former Aluminum Heat Treat Building and South Tank Vault. Later findings by SEACOR in 1991 supported this when they reported that three USTs in the North Tank Vault failed tightness testing. An additional investigation conducted in 1991 by SEACOR also identified light non-aqueous phase liquid (LNAPL) west of the former South Tank Vault. LNAPL was again identified west of the former North Tank Vault in 1995, along with high concentrations of diesel-range organics (DRO) in soil west of the former South Tank Vault. More recent investigations by Shannon & Wilson also identified likely releases from both former UST vaults, including the presence of a significant LNAPL plume on groundwater west of the South Tank Vault. As described in the Underground Storage Tank Decommissioning and Site Assessment Report, multiple investigations conducted over a 30-year period have identified likely releases from the former North and South Tank vaults at the Site. The site assessment activities described in the UST Decommissioning and Site Assessment Report were conducted pursuant to the Star Forge AO following UST decommissioning by removal. In accordance with the requirements of WAC 173-360A-0730(8)(g)(iii), the results of the site assessment concluded there has been a release of a regulated substance from both the former North and South UST systems at the former Jorgensen Forge Site. The Star Forge AO and IAWP did not require Star Forge to remediate the known subsurface releases, as EMJ is responsible pursuant to the bankruptcy court settlement agreement and the EMJ AO for investigation and remediation of all legacy contamination on the Site.

We recommend the Site Assessment data be considered by Ecology and EMJ during the remedial investigation and final cleanup of the Site. The UST decommissioning and site assessment activities were reported to Ecology under separate cover in May 2024. The Underground Storage Tank Decommissioning and Site Assessment Report is included in Appendix A of this IACR. Financial assurance for the USTs was terminated upon authorization from the Ecology UST program in June 2024 and all 18 tanks have been listed as removed in Ecology's database.

Section 3: CLEAN CLOSURE OF DANGEROUS WASTE MANAGEMENT UNITS

DH Environmental was contracted by Star Forge to assist with facilitation and documentation of Dangerous Waste Clean Closure for the former Jorgensen Forge Facility. From 2020 – 2024, DH Environmental supported Star Forge with facility cleanouts from shops and work areas, DWMU designation and evaluation, DWMU cleaning and confirmation sampling, and overall documentation of Clean Closure activities occurring concurrently with demolition operations. As of May 10th, 2024, Star Forge has completed the required Clean Closure requirements under the Dangerous Waste Regulations (WAC 173-303-200(h)) and in accordance with the Star Forge AO. The 2023 Dangerous Waste Annual Report has been updated to include notification of closure of the three DWMUs described in in the Final Clean Closure Report and is included in Attachment 4 of the report.

The Final Clean Closure Report was delivered to Ecology under separate cover in May 2024. The report is included as Appendix B to this IACR.

Section 4: ADDITIONAL TASKS ASSOCIATED WITH DEMOLITION AND FACILITY CLOSURE

4.1 IMPORT FILL

The facility had multiple subsurface features, including a basement under the main office building, two UST excavations, and multiple equipment vaults. Concurrent with demolition, and with the exception of filling the -2 level of the 5,000 Ton Press Pit with control density fill (CDF) as described in Section 4.2, and the engineered pit covers addressed in Section 4.3, all subsurface features and excavation areas were filled with compacted fill material as specified by a licensed professional engineer and approved by Ecology and the City of Tukwila. All imported crushed rock was sampled in accordance with the Fill Material Sampling Work Plan (SoundEarth, 2020) which was included in the Demolition Plan and referenced in the IAWP.

A total of approximately 29,600 tons of 1-¾ minus crushed rock was imported to the property to fill UST excavations, basement structures, equipment vaults, and other subsurface features. All imported rock was sampled prior to import. The import fill samples were analyzed for chemicals of concern identified in Column B of the Washington State Department of Ecology's Lower Duwamish Waterway Preliminary Cleanup Levels (PCULs) Workbook, Soil Summary page, dated April 5, 2019. The sampling results were compared to the values for the "Most Stringent Soil PCUL Saturated Zone Non-potable GW". A total of 47 soil samples were collected from the fill source facility, ICON Materials, located at 4040 Kersey Way SE, in Auburn, Washington. All sample results confirmed the import fill met the approved specifications. The import fill analytical results summary table, laboratory analytical reports, and the import fill weight summary table are included in Appendix C.

4.2 5,000-TON PRESS PIT

In November 2023, after dewatering of the 5,000-ton press vault located in the Forge Shop area, Star Forge's contractor, Construction Group International (CGI) encountered two levels of subsurface "rooms" adjacent to the press pit that extended approximately 36-feet below ground surface (-1 and -2 levels). The subsurface characteristics of these levels were unknown because they were under water at the start of demolition. The source of the water was likely due to groundwater infiltration after power was cut off from the building and the pumps that had historically kept water out of these rooms ceased to operate in 2019. After evaluating the structural and safety risks of demolishing the floors of each level in order to apply crushed rock as fill, CGI requested to use CDF to fill the void spaces in the -2 level instead of crushed rock because the CDF would be less intrusive, more effective, and safer to apply. The floors were constructed of thick concrete slabs and beams, with primary and secondary reinforcements consisting of rebar up to 2-inches in diameter. The floors/ceilings would have required removal in order to fill and compact the voids with crushed rock. Demolition of these floors would have presented a risk of collapse of the vault sidewalls.

After requesting this IAWP and permit deviation from Ecology and the City of Tukwila, both parties approved use of CDF instead of crushed rock in this application. The CDF was applied to the subsurface rooms from 11/27/2023 - 11/28/2023. Approximately 612 cubic yards of CDF was pumped into the -2 level to bring it up to grade with the floor of the -1 level. The 5,000-ton press pit was still filled with crush rock, along with the -1 floor of the adjacent subsurface structure. Only the bottom, -2 level, of the adjacent rooms was filled with CDF.

The control density fill specifications are included in Appendix C.

4.3 ENGINEERED PIT COVERS

Most of the subsurface vaults/pits at the facility were filled with crushed rock or CDF/crushed rock during the facility demolition process as described in the Demolition Plan and IAWP. However, due to concerns about future access to four former process vaults where Aqueous Film Forming Foam (AFFF) may have been used at the facility, Star Forge met with, and discussed with Ecology an option to install engineered covers over these subsurface features. Star Forge agreed to install water-tight structural covers over four subsurface features at the property. The covers were designed by a licensed structural engineer and were installed over the following subsurface features formerly containing AFFF fire suppression systems, as described in the Ecology-approved, PFAS Investigation Work Plan (Shannon & Wilson, 2022b) prepared pursuant to the EMJ AO:

- 660-ton press control room
- 1,250-ton press control room
- 2,500-ton press control room
- Quench tank vault

These covers are meant to satisfy the City of Tukwila municipal code in the same manner as filling the pits with crushed rock, while also meeting the requirements of WAC 173-340-430(3)(b), a MTCA regulation that states: “If the cleanup action is not known, the interim action shall not foreclose reasonable alternatives for the cleanup action. This is not meant to preclude the destruction or removal of hazardous substances”.

The engineered pit covers have the following features:

- The covers are set on curbs surrounding the entire pit to prevent stormwater run-on/runoff.
- The covers have a waterproof membrane that will prevent direct rain from entering the pits.
- The covers are structurally designed for operational loading (snow loads, wind, personnel, and light equipment).

The pit cover approach was suggested by and was approved by Ecology as detailed in the Section 6 of the IAWP. The engineered pit cover design package was reviewed by Ecology and approved by the City of Tukwila as part of the permitting process for demolition. Photos of the completed and currently installed pit covers are provided in Appendix D – Photo Log of Current Site Conditions.

4.4 HEATING OIL TANK REMOVALS

Two heating oil tanks (HOTs) were removed from the property during the course of demolition and site restoration. The first was a small HOT located west of the former Administrative Building. This HOT was previously identified by Shannon & Wilson as “UST-6”, with a capacity of 600-gallons. The HOT was removed by CGI as part of the demolition of the adjacent Administrative Building in January 2024. The HOT was empty at the time of removal, and there was no visual or olfactory evidence of contamination in soil adjacent to or beneath the former HOT.

The second HOT was discovered on February 22, 2024, in an area formerly used for office space north of the former forge shop. This tank was full of red dyed diesel fuel (heating oil) at the time of discovery. The heating oil was sampled and submitted for analysis of hydrocarbon identification by Method NWTPH-HCID, and polychlorinated biphenyls (PCBs) by EPA Method 8082. The HCID results confirmed the fuel was diesel fuel, and PCBs were not reported in the sample at a concentration greater than the laboratory practical quantitation limit (PQL) of 1 milligram per kilogram (mg/kg). DH Environmental communicated the discovery of the tank to Ecology at the time of discovery, and the tank was pumped out and triple rinsed on February 28, 2024. The product and rinsate were transported for offsite disposal to Marine Vacuum Service on the same day. The laboratory analytical report for the heating oil, the disposal records, and a location map for the HOT are included in Appendix E. CGI removed the tank on February 28, 2024. The tank appeared to be in good condition at the time of removal and no breaches, holes or piercings were observed. No visual or olfactory evidence of contamination was observed in the soil adjacent to or beneath the HOT during removal.

4.5 ABOVE GROUND TANKS REMOVALS

Several above ground storage tanks or hydraulic oil equipment reservoirs were removed from the facility during demolition activities. The first was a 6,000-gallon former hydraulic oil tank located adjacent to the North UST vault. This tank was identified by Shannon & Wilson as “AST-6”. The aboveground storage tank (AST) was empty and was removed for offsite disposal at the same time as the USTs.

The second AST was an 11,000-gallon former lathe cutting oil tank. This tank was located in a subsurface vault in the drive lane between the former Lathe Shop and Administrative Building. This tank was identified by Shannon & Wilson as “UST-1”, however, it is important to note the tank was not a UST. Rather it was an AST, located in a subsurface vault, and subject to visual inspection. These details were communicated with Ecology on several occasions, including via letter to Mr. Drew Imke, a Senior UST Inspector for Ecology, in March 2020 (Marten Law, 2020). This AST was removed on October 11, 2023, after it had been pumped out and triple rinsed by Marine Vacuum Service.

In addition to the two ASTs described above, two hydraulic oil equipment reservoirs were also removed from equipment formerly located in the Arc Furnace Pit. These equipment reservoirs were identified by Shannon & Wilson as “UST-42” and “UST-43”. It is important to note they were

not USTs. Rather, they were reservoirs attached to operating equipment. The equipment and attached reservoirs were removed in October 2023 as part of the demolition and filling of the former Arc Furnace pit.

4.6 TRANSFORMER PCB SPILL CLEANUP

On September 16, 2020, personnel from DH Environmental discovered evidence of vandalism and theft from the facility, including damage to two large transformers in the former powerhouse structure (apparently resulting from an attempt by trespassers to scavenge metal). The damage to one of the transformers, designated TC-24, resulted in a small spill of transformer oil. Transformer TC-24 was located on the east half of the second floor of the former Powerhouse structure. It was estimated that approximately 3- to 5-gallons of transformer oil were spilled from transformer TC-24. PCBs were reported in a sample of the transformer oil at a concentration of 1,400 mg/kg. Assuming the maximum volume of 5-gallons was released, the total mass of PCBs from the spill was 0.05 pounds.

The spill occurred indoors inside the TC-24 transformer room. Some of the transformer oil dripped down through a hatch on the second floor and onto the first-floor slab directly beneath the TC-24 transformer room. No storm drains, sanitary sewers, or soil were impacted by the release. The spill only impacted the east half of the central powerhouse structure, on the first and second floors.

DH Environmental conducted an initial response on September 17th, 2020, and removed and disposed of all free liquid transformer oil and impacted debris that was removable. Due to the physical location of the transformers and the condition of the building in which they were located, the final cleanup actions had to be conducted concurrent with building demolition. As such, final cleanup was written into the facility Demolition Plan and IAWP. Initial notifications to Ecology were made at the time of the incident (Environmental Report Tracking System [ERTS] # 700704).

The final cleanup and disposal of the impacted media, as well as the transformers, was conducted in December 2023 as a Performance Based Cleanup in accordance with chapter 40 code of federal regulations (CFR) § 761.61(b). A Performance Based Disposal Report was delivered to the Environmental Protection Agency (EPA) Region 10 and Ecology on May 30th, 2024 (DH Environmental, 2024c). The report is included in Appendix F of this IACR.

4.7 POWERHOUSE VAULT DISCOVERY, EXCAVATION, AND BACKFILLING

A previously unknown subsurface vault was discovered during demolition activities west of the former Powerhouse structure on December 15, 2023. This vault was located west of the Powerhouse, between the Powerhouse and Lime Storage Hopper, and was subsequently referred to as the “Powerhouse Vault”. The discovery of the Powerhouse Vault was not related to the demolition of the Powerhouse structure itself, or the transformer cleanup described in Section 4.6.

The Powerhouse vault was located beneath an above ground concrete structure, which was sitting on a steel plate, supported by a steel I-beam. During demolition and cleanup of that area, the

equipment operator removed the steel plate and I-beam, exposing the vault underneath. The vault had concrete sidewalls and a concrete bottom and was partially filled with soil and water. An initial waste characterization soil sample was collected from the exposed soil at the west end of the vault and the results indicated the soil contained PCBs at a concentration of 50 mg/kg. A copy of lab report 2312-224 is included in Appendix G. The discovery of the Powerhouse Vault was communicated with Ecology following receipt of the analytical results. Water from the vault was removed by DH Environmental using a vacuum truck and temporarily stored in a frac tank on site. CGI removed all soil from the vault and shipped it for offsite disposal to Chemical Waste Management of Arlington, Oregon, a permitted Subtitle C / Toxics Substances Control Act (TSCA) landfill. Approximately 211.35-tons of soil were disposed of in accordance with the requirements of 40 CFR 761. Disposal records are included in Appendix G.

During excavation of the portion of the vault that extends towards the south, the soil type abruptly changed to a dense gravel material, and the vault appeared to end. As such, a new waste characterization soil sample was collected for PCB analysis, and PCBs were reported at a concentration of 0.14 mg/kg (lab report 2312-300, sample ID 'W. Pwrhouse Vault Soil-2'). Given the low concentration of PCBs at the south end of the vault, no further excavation was conducted, and the vault was backfilled with crushed rock as specified in the demolition plan for other subsurface features at the facility.

4.8 LIME HOPPER RELEASE INCIDENT

On 11/22/2023, an elevated (approximately 25-foot high) lime storage hopper located on the southwest side of the main structure was breached by Star Forge's demolition contractor while cutting into the structure for demolition. The breach resulted in an estimated 500-lbs of lime falling from the vessel onto the ground. No injuries or exposures were reported because of this release and no lime was released into the LDW. However, due to the lime designating as Dangerous Waste, the Washington State Emergency Management Division (1-800-258-5990) was notified in addition to the National Response Center (1-800-424-8802). Beau Johnson, the Ecology Site Manager, was also notified, in addition to the Boeing Environmental Health and Safety manager for the property to the south. The incident was assigned ERTS number 726905. Cleanup of the dispersed lime as well as removal of the existing lime in the storage hopper was completed on December 7, 2023. Further details about the release and cleanup are included in the Final Clean Closure Report included in Appendix B.

4.9 STORMWATER MANAGEMENT

Stormwater from the site drains to the LDW. All stormwater was managed under the requirements of Washington State Industrial Stormwater General Permit (ISGP) WAR003231, Administrative Orders 18074 and 18170, and King County Discharge Authorization # 1122-01 & 02. The Administrative Order required all stormwater to be treated on the site and retained until data is received confirming that the treated batch is in compliance with indicator levels and benchmarks included in the permit and Administrative Orders. Based on hydrology modeling, site rainfall history, and historic site data, Star Forge determined the required storage capacity to maintain an

appropriate volume in storage tanks to collect and retain treated stormwater while awaiting analytical results to determine if stormwater met the applicable water quality parameters.

4.9.1 Stormwater Treatment

The onsite stormwater treatment system included settling tanks, sand filters, enhanced chitosan treatment, and final polishing with a granular activated carbon/proprietary metals treatment media. Monitoring of water quality was conducted per batch of stormwater treated to verify compliance with discharge limits/indicator levels and to monitor treatment media effectiveness and prevent breakthrough prior to media replacement. 104 batches of stormwater were sampled since April 2020, and all batches met the discharge requirements of the ISGP, Administrative Orders and King County discharge authorization. The goal was to discharge all water to the LDW, however due to delays in receiving laboratory results for approval to discharge to LDW, approximately 8.6 million gallons were discharged to King County under discharge authorization 1122-01 and 02.

4.9.2 Post Demolition Stormwater Conveyance System Cleaning

Upon completion of all demolition activities and site paving, the stormwater conveyance system was cleaned as required by the City of Tukwila Demolition Permit and the ISGP. On March 25, 2024, the system cleaning was completed. The system was cleaned via jet rodding and pressure washing to the extent possible utilizing industry standard equipment. All conveyance system cleanout waste was collected, designated, and disposed offsite at properly permitted disposal facilities.

4.9.3 Stormwater Conveyance System Engineering Assessment

As required by the City of Tukwila demolition permit, a third-party engineer from PACLAND performed a site visit on March 15, 2024, to evaluate the condition of the existing site after demolition of buildings and stabilization of the disturbed areas, which consisted of paving/grading operations to direct stormwater runoff to existing storm drainage infrastructure. The evaluation concluded that the storm drainage system is functioning properly. The Engineer Certification Letter is included in Appendix H.

4.9.4 ISGP Termination

Because demolition has been completed and no industrial operations are active at the site, a Notice of Termination of the ISGP was filed by Star Forge and was received on June 10th, 2024. However, due to documented contamination in soil and groundwater at the site, a new Administrative Order (Docket # 22970) was issued on July 25th, 2024, that requires Star Forge to continue treating stormwater at the site to ensure discharges from the site meet Washington State Water Quality Standards. However, batch testing is no longer required as the treatment system has sufficiently demonstrated that the treated discharge meets all indicator levels. Administrative Docket Order # 22970 is included as Appendix I for reference.

4.10 CULTURAL RESOURCE MONITORING

In accordance with the IAWP and State Environmental Policy Act requirements, the demolition and Interim Action work required a Cultural Resources Inadvertent Discovery Plan (IDP) which required archeological monitoring during all ground disturbing activities. Archaeological monitoring pursuant to the IDP was provided by Stell Environmental Enterprises. No significant archaeological resources were discovered during any excavations requiring monitoring during demolition of the Property Structures, or completion of the IAWP. The final Cultural Resources Monitoring Report prepared by Stell Environmental Enterprises is included in Appendix J.

Section 5: CONCLUSIONS

Star Forge has completed all Interim Action work specified in Agreed Order No. DE 21034, and in accordance with the associated IAWP. The Permanent Closure requirements of the UST Systems have been met along with completion of the Clean Closure of the DWMU's. The Permanent Closure UST Site Assessment was prepared and submitted to Ecology in accordance with WAC 173-360A-0810(3) and WAC 173-360A-0730 and Ecology determined that the UST Systems were permanently closed by removal. A Final Dangerous Waste Clean Closure Report was prepared and submitted to Ecology to demonstrate compliance with WAC 173-303-200(h) and WAC 173-303-610 (2) and (5). No significant deviations from IAWP were required other than approved use of control density fill in the 5,000-ton press vault. All notable and/or unanticipated tasks associated with demolition and facility closure outside of the IAWP scope were disclosed to and coordinated with Ecology as well as all appropriate regulatory agencies in concurrence with demolition and property restoration.

Section 1: INTRODUCTION

DH Environmental, Inc. (DH Environmental) has prepared this Underground Storage Tank (UST) decommissioning and site assessment report on behalf of Star Forge, LLC (Star Forge), the current owner of the former Jorgensen Forge Facility located at 8531 East Marginal Way South, in Tukwila, Washington (herein referred to as the Property) (Figure 1).

This report has been prepared in accordance with Agreed Order No. DE 21034, entered into by Star Forge and the Washington State Department of Ecology (Ecology), pursuant to the Washington State Model Toxics Control Act (MTCA) and Cleanup Regulation established in Chapter 173-340 of the Washington Administrative Code (WAC).

1.1 SITE DESCRIPTION

The former Jorgensen Forge Property consists of approximately 21.6 acres located in an industrial area along the east bank of the Lower Duwamish Waterway (LDW). The Property is bordered to the north by Boeing Plant 2, and to the south by the Boeing Isaacson property. It is bordered to the west by the LDW, and to the east by East Marginal Way South and the King County Regional Airport.

The Property was used from 1942-1965 for fabrication of structural steel, tractor, and road equipment, including forging and heat-treating operations conducted for the U.S. Navy. It was owned and operated by Earle M. Jorgensen Co. (EMJ) from 1965 until 1992, when it was purchased by Jorgensen Forge Corporation (JFC). JFC manufactured specialized large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. JFC also processed nickel, titanium, and specialized alloys.

Historical industrial use of the Property has contaminated soil and groundwater, including in the vicinity of the USTs described in this report. Star Forge bought the Property out of bankruptcy in November 2016. As part of the bankruptcy proceeding, the bankruptcy court approved a settlement agreement pursuant to which EMJ was required to enter into an agreed order with Ecology to investigate and remediate contaminated soils and groundwater at the Property and any locations where hazardous substances released on the Property have come to be located (the Site). In fulfillment of that requirement, EMJ entered into Agreed Order No. DE 14143 with Ecology in 2017. At this time, EMJ is conducting a Remedial Investigation (RI) of the Site. This report and site assessment data will be provided to EMJ and Ecology for reference in the RI.

1.2 UNDERGROUND STORAGE TANK SYSTEMS

At the time Star Forge and Ecology entered into Agreed Order No. DE 21034, the Property had 18 remaining USTs located in two separate concrete vaults. The tanks were emptied of liquids, licensed with Ecology, and covered under financial assurance mechanisms. The USTs were

associated with Ecology UST identification number 6163 and were grouped into a North Tank Vault (UST-26 through -35) and a South Tank Vault (UST-15 through -22), as shown in Figures 2 through 4.

To be consistent with previous naming conventions, the names of all tanks referenced in this report follow the naming convention presented by Shannon & Wilson in 2019 (Shannon & Wilson, 2019). A copy of Shannon and Wilson's 2019 figure and naming convention is provided for reference in Appendix A.

The USTs in each tank-bed were buried below grade but within concrete vault structures that extended above grade. Both tank nests were constructed within the basement of former buildings. Once the former buildings were demolished, the voids around the tanks were filled with sand and slag that was available from forging operations on-site. The North Tank Vault included a concrete base that was approximately 5-feet below the surrounding grade. The concrete walls of the South Tank Vault extended slightly deeper and did not contain a concrete bottom.

DH Environmental collected samples from the tank contents and surrounding fill-slag for waste designation purposes in 2020. The contents of the USTs and surrounding fill material was designated as non-hazardous waste (DH Environmental, 2020; DH Environmental, 2020b; DH Environmental 2020c).

1.3 LOCAL GEOLOGY AND HYDROGEOLOGY

The Property is located within the Duwamish/Cedar River valley, part of the Puget Lowland, a regional low-lying trough between the Cascade Range to the east and the Olympic Mountains to the west. The Puget Lowland has largely been filled with sediment deposits left behind by glaciers that advanced and retreated multiple times through the Puget Lowland within the last 2 million years. Sediment within the Duwamish Valley primarily consists of sand and silt which has washed down from Mt. Rainier. This material is often interbedded with layers of silt, clay, and organic soils from localized deposits associated with lakes and ponds that formed along the river valley, or mudflats that formed along Puget Sound. Fill materials were also placed throughout the River Valley since the early 20th century, including in portions of the Property when the Duwamish Waterway was straightened, dredged, and historical channels and embayments were filled.

Shallow subsurface soils at the Property generally consist of a mixture of sand, silty sand, and gravel, to depths up to 24 feet below grade. Fill materials tend to be thickest at the western end of the property along the LDW (Shannon & Wilson, 2022). Soils below the North Tank Vault primarily consisted of brown to gray, fine to medium sand with trace gravel. Shallow soils at the South Tank Vault were similar, while soils below the base of the excavation contained higher amounts of silt and organics, and appeared to be native soils.

Groundwater in the vicinity of the tank vaults, as measured in nearby monitoring wells MW-11, MW-14, and MW-15, has ranged from approximately 10.5- to 12-feet below grade (Shannon & Wilson, 2022). Groundwater flow at the Property generally moves west, but varies depending on the season and proximity to the LDW (Shannon & Wilson, 2022). Groundwater was not encountered during the UST decommissioning activities.

Section 2: UNDERGROUND STORAGE TANK DECOMMISSIONING

This section describes the UST decommissioning activities for the 18 USTs on the Property. The tanks and piping inside the concrete vaults were decommissioned and removed between August 9 and August 17, 2023. The piping outside of the North Tank Vault was removed on August 21 and October 11, 2023. The piping outside of the South Tank Vault was removed on October 11 and 12, 2023.

UST decommissioning activities were overseen by Mr. Brad Reilly with ECI Environmental Services (ECI), under subcontract to the demolition contractor for the project, Construction Group International, of Woodinville, Washington (CGI). Mr. Reilly is certified by the International Code Council for UST Decommissioning. A DH Environmental licensed hydrogeologist was also on site to observe the decommissioning and to perform site assessment activities.

2.1 PRELIMINARY ACTIVITIES

2.1.1 Ecology 30-day Notice

Prior to decommissioning the USTs, Star Forge submitted a 30-Day Notice of Intent to Decommission USTs form to Ecology, as required by WAC 173-360A-0810. A copy of the 30-Day Notice is included in Appendix B.

2.1.2 City of Tukwila Fire Department Permit

The City of Tukwila requires a permit for the permanent closure of USTs. Prior to decommissioning the USTs, Star Forge obtained a Fire Permit for Tank Removal from the City of Tukwila. A copy of Fire Permit F23-0135 is included in Appendix C.

2.1.3 Underground Storage Tank Cleaning

Prior to removal of the USTs, the tanks were cleaned and triple-rinsed by Marine Vacuum Services of Seattle, Washington (MarVac). Rinse certificates are provided in Appendix D.

2.2 UNDERGROUND STORAGE TANK REMOVAL

CGI removed the USTs in both tank vaults between August 9 and August 18, 2023. Once the tanks had been cleaned, the above-ground concrete vault structure and fill materials overlying the tanks were removed. Three USTs in the North Tank Vault, UST-26, -28, and -31, were previously filled with sand. The top of these three tanks were cut open and the sand was removed with an excavator. Residual sand was removed by tilting the tanks on end and dumping the loose sand out. Once the sand had been removed, the empty tanks were removed in the

same manner as the others, by lifting the tanks out of the ground using an excavator. Once removed from the ground, the tanks were scraped and brushed clean to remove any loose soil or debris prior to transport. They were then loaded onto trucks and shipped for recycling as described in Section 2.3. Removal and disposal of the concrete vault structures and backfill materials are also described in Section 2.3.

USTs -26 through -35, in the North Tank Vault, generally appeared in good condition at the time of removal. They were well protected with numerous sacrificial anodes surrounding each tank. The paint on the tank walls was still intact, and no holes or areas of significant corrosion were visible.

USTs -15 through -22, in the South Tank Vault, generally appeared in much worse condition than the tanks from the North Tank Vault. No sacrificial anodes were present on the South Tanks, and significant corrosion and pitting was visible on each tank. In some instances, corrosion holes were visible completely through the tank walls.

Photos of the tank removal work are included in a photo log in Appendix E. Decommissioning certificates are included in Appendix F.

Piping within the concrete vaults of each tank area was removed concurrently with the tanks. The piping was disconnected at each tank prior to the tanks being removed. ECI had a vacuum trailer on site for all piping removal work in the event liquids were present in the piping. No liquids were observed in any of the piping during removal. Removal of the product piping outside of the concrete vaults is described in Sections 2.2.1 and 2.2.2. Site assessment sampling activities are described in Section 3.

2.2.1 Piping Removal – North Tanks

At the North Tank Vault, a 4-inch diameter product pipe extended from the southeast corner of the concrete vault, due south towards the Aluminum Heat Treat Building (Aluminum Building), as shown on Figure 3. This is consistent with as-built drawings for the North Tank Vault. The pipe was exposed and removed on August 21, 2023. The pipe appeared to be a single length pipe without couplers. The pipe ran underneath the north foundation wall of the Aluminum Building where it was cut flush with the foundation wall. No liquids were observed in the pipe when it was cut. Soil from the piping trench was temporarily stockpiled for offsite disposal.

On October 11, 2023, after the Aluminum Building had been demolished, the remaining section of piping was removed. The piping was discovered to have been previously cut and capped approximately 1-foot north of the northern foundation wall of the Aluminum Building. The pipe was bent to form a 90-degree elbow and it had been cut and capped just past the elbow. Based on an interview with a former employee, this pipe had been removed to make room for the installation of the Aluminum Heat Treat Furnace Pit in the mid-1970s. At that time the building

use transitioned from the Powerhouse into use as the Aluminum Heat Treat Building. The product pipe is shown in Photo 7 in the Photo Log in Appendix E.

Soil generated during removal of the last segment of piping was added to the temporary soil stockpile, where it was covered until the product piping had been removed from the South Tank Vault. Disposal of the soil is described in Section 2.3.

2.2.2 Piping Removal – South Tanks

At the South Tank Vault, a single 2-inch diameter product pipe was observed to extend from inside the tank vault, west beneath the Aluminum Building. After the Aluminum Building had been demolished, the piping beneath the slab was exposed and removed on October 11 and 12, 2023. The product piping alignment is shown in Figure 4, and it appears to have been installed so that it was routed around the former Aluminum Heat Treat Furnace Pit.

Consistent with historical drawings of the area, a second pipe, believed to be a fuel return line, was visible in the same trench as the product pipe. A third pipe, believed to be a steam line, was also present. The second and third pipes appeared to have been previously cut approximately 15-feet south of where the first pipe entered the tank vault. A small electrical conduit was also present in the same trench, and all three pipes and the electrical conduit ran west underneath the former Aluminum Building. At the west edge of the Aluminum Building, the piping turned and ran north approximately 15-feet, where it entered a utilidor. The utilidor continued approximately 25-feet north, where it turned and ran west underneath the former drive lane between the main shop building and the aluminum building.

The top of the utilidor was constructed with a concrete slab approximately 12-inches thick. The portion of the slab underneath the drive lane was also covered with a layer of asphalt paving. The concrete lid was broken apart using a hydraulic hammer to expose the product piping in the utilidor. Once exposed, the product lines from the tank vault were observed to enter the utilidor where at least some of them appeared to have been cut and capped. Other lines of unknown purpose were also present in the utilidor, including portions of lines that had been cut or broken at some point prior to the utilidor being exposed. Most of the lines in the utilidor were not labeled, or the labeling was not legible. Some of the lines were still present where the utilidor entered the main shop building, and labeling on the shop ends of the pipes indicated at least two pipes labeled as “fuel oil”, one pipe labeled as “fuel oil return”, one pipe labeled “propane”, and another pipe labeled “compressed air”. More pipe segments were visible in the utilidor than were visible inside the shop building, and the original purpose or contents of these lines are unknown. Photos of the piping removal, including piping in the utilidor, are included in the Photo Log in Appendix E.

CGI cut the rebar from the top of the utilidor to allow access to the underlying piping. ECI had a vacuum trailer on site for the piping removal work in the event liquids were present in the piping. The piping was lifted out of the utilidor using an excavator to slope the piping away from portions that had to be cut with a demolition saw. No liquids were observed in any of the piping

during removal. After the rebar and piping had been cut and removed, the utilidor was emptied of debris in preparation for sampling and backfill.

Rainwater was observed to have accumulated in the utilidor prior to breaking open the concrete lid. The water was confirmed during an inspection of the utilidor by CGI on October 10, 2023, prior to demolition of the utilidor top. Additional rainwater may have also entered during rain events on October 11, 2023, when 0.39 inches of precipitation fell (NOAA, 2024). A slight sheen was present on the water along with a petroleum type odor. A sample of the water was collected using a disposable bailer on October 12, 2023, for waste designation purposes, and the water was removed from the utilidor by ECI using a vacuum trailer. Approximately 275-gallons of water was removed and temporarily stored in a Department of Transportation (DOT) rated shipping tote. Once the water had been removed, CGI crews removed the remaining pieces of concrete debris in preparation for soil sampling and backfilling.

Prior to the utilidor being backfilled, a soil sample was collected beneath the utilidor on October 13, 2023 as part of site assessment activities, as described in Section 3.2. Disposal of the soil, concrete and water generated during piping removal activities are described in Section 2.3

2.3 WASTE DISPOSAL

2.3.1 Underground Storage Tank and Product Piping Disposal

Each of the 18 USTs were loaded onto trucks for transportation to a metal recycling facility. Product piping was combined with rebar from the concrete vault structure and other recyclable materials generated from demolition activities. All scrap metal from the project was disposed of to Sutter Metals in Tacoma, Washington, or Seattle Iron and Metals Corporation, in Seattle, Washington.

2.3.2 Concrete and Soil Disposal

On August 14, 2023, the concrete vault structures were sampled for waste designation purposes. Sampling was conducted to confirm that petroleum or metals that may have leached into the concrete would not designate as hazardous or dangerous waste. The concrete was determined to be non-hazardous waste suitable for disposal to a subtitle D landfill. A copy of the waste designation package is included in Appendix G.

The backfill material consisting of slag, sand, and gravel surrounding the tanks was previously sampled and designated as non-hazardous waste (DH Environmental, 2020). As a result, no further sampling was conducted of the tank backfill, and it was loaded into trucks for offsite disposal. Because the South Tank Vault did not contain a concrete bottom, backfill materials were removed to the depth of the base of the tanks, approximately 8-feet below grade.

Once the tank backfill materials were removed, the concrete vault structures were also removed.

The concrete from the vault structures was processed within the footprint of the respective excavation areas to remove rebar and facilitate loading onto trucks. The rebar was segregated for recycling and the concrete was loaded into trucks for offsite disposal.

Soil and concrete generated during the product piping removal was temporarily stockpiled until all piping removal activities were complete. The soil was sampled for waste designation purposes and determined to be non-hazardous waste, suitable for disposal to a subtitle D landfill. A copy of the piping soil designation package is included in Appendix H.

A total of 4,082.59-tons of soil and concrete were transported for disposal to Roosevelt Regional Landfill, in Roosevelt, Washington. The Roosevelt Landfill is a permitted Subtitle D Landfill operated by Republic Services. A copy of the soil and concrete disposal records is included in Appendix I.

2.3.3 Water Disposal

Analytical results for the tote of water pumped from the South Tank Vault piping utilidor resulted in a waste designation determination that the water was non-hazardous waste. A copy of the waste designation package is included in Appendix J. The water was temporarily stored in a DOT-rated 275-gallon shipping tote until it was pumped out via vacuum truck by DH Environmental on December 4, 2023. Due to the small volume of water, it was combined with water generated during cleaning of several subsurface vaults on the property, unrelated to the UST decommissioning activities. This water was temporarily stored in a 20,000-gallon frac tank, before being disposed of to MarVac in Seattle, Washington in December 2023.

2.4 BACKFILL AND RESTORATION

Following the collection of site assessment samples, described in Section 3, the North and South Tank Vault excavations were backfilled between September 6 and 15, 2023. The base and sidewalls of the excavation were lined with plastic sheeting prior to backfilling. The backfill was placed in lifts and compacted to 95% compaction. Compaction testing was conducted by Krazan and Associates under subcontract to CGI.

Backfill of the product piping trenches and piping utilidor was conducted on October 13, 2023.

Backfill material consisted of 1-1/4" crushed rock sourced from the ICON Materials quarry in Auburn, Washington. Prior to being imported into the Site, all import backfill was tested at the quarry to confirm it met backfill requirements, as specified in the Interim Action Work Plan. Analytical results for the import backfill are reported under separate cover as part of the Interim Action Completion Report.

Paving of the excavation areas and piping trenches was conducted as part of final site restoration in March, 2024.

Section 3: SITE ASSESSMENT SAMPLING

Following removal of the USTs and product piping, site assessment soil samples were collected as described in the following sections. Sample locations are shown in Figures 3 and 4. All confirmation soil samples from the UST vaults were collected from the excavator bucket, with care taken to ensure the sample was not collected from soil in direct contact with the bucket. All soil samples were collected in general accordance with the Ecology-approved Interim Action Work Plan (IAWP; DH Environmental, 2023). Groundwater was not encountered during the tank removal or site assessment sampling activities.

3.1 NORTH TANK VAULT

Site assessment soil samples from the North Tank Vault and associated product piping were collected between August 21 – 30, 2023. Soil samples were collected from the base and sidewalls of the excavation following removal of the concrete vault surrounding the former USTs.

Soil samples from the base of the excavation were collected from an approximate depth of 6.5-feet below grade. This depth was approximately 0.5-feet below the base of the former concrete slab, at the interface with native soil. Soil samples from the sidewall of the excavation were collected from an approximate depth of 5-feet below grade, near the base of the sidewall.

A total of 27 soil samples were collected from the base and sidewalls of the North Tank Vault, including one duplicate sample. A total of three soil samples were collected beneath the piping run from the North Tank Vault. Piping samples were collected by hand, directly from the base of the piping trench following removal of the piping.

The majority of soil samples from the base of the North Tank Vault excavation were collected along the east side of the excavation, beneath the former fill ports of the tanks where releases were most likely to have occurred. One bottom sample, NT-SS-35, beneath the former tank UST-35, was moved to sample soil where a former sump was observed in the concrete vault. This sump was believed to be a feature associated with the former basement structure of the building that the tanks were installed in following building demolition.

Sidewall samples from the North Tank Vault were generally distributed equally around the perimeter of the excavation. Sidewall samples NT-SS-13, NT-SS-14, NT-SS-17, and NT-SS-18, were adjusted to focus on areas where staining was observed. Sidewall sample NT-SS-14 and bottom sample NT-SS-31 were collected near the former fill port for the USTs.

3.2 SOUTH TANK VAULT

Prior to collecting site assessment samples in the South Tank Vault, two test pits were advanced at the north and south ends of the South Tank Vault to investigate for the presence of a concrete

slab. Each test pit was advanced to a depth of 4-feet below the base of the tanks. The test pits confirmed that concrete was not present, which is consistent with as-built records for the South Tank Vault.

Site assessment soil samples from the South Tank Vault and associated product piping were collected between August 22 and October 13, 2023. Soil samples were collected from the base and sidewalls of the excavation following removal of the concrete vault surrounding the former USTs.

Soil samples from the base of the excavation were collected from an approximate depth of 8.5-feet below grade. This depth was approximately 0.5-feet below the base of the former tanks, at the interface with native soil. Soil samples from the sidewall of the excavation were collected from an approximate depth of 6.5-feet below grade, near the base of the sidewall.

A total of 23 soil samples were collected from the base and sidewalls of the South Tank Vault, including one duplicate sample. A total of three soil samples were collected beneath the piping run from the South Tank Vault. Piping samples ST-piping-SS-21 and ST-piping-SS-22 were collected by hand, directly from the base of the piping trench following removal of the piping. Piping sample ST-piping-SS-20 was collected from an excavator bucket, from a depth of 6.5-feet below grade, beneath a utilidor.

All of the soil samples from the base of the South Tank Vault excavation were collected along the west side of the excavation, beneath the former fill ports of the tanks where releases were most likely to have occurred. Sidewall samples from the South Tank Vault were generally distributed equally around the perimeter of the excavation. Sidewall sample ST-SS-15 was collected from stained soil near the former fill port for the USTs.

3.3 SAMPLE LOCATIONS

Site assessment soil sampling locations are shown on Figures 3 and 4. Sample locations were recorded using a mapping grade GPS unit capable of sub-meter accuracy (Trimble GeoXH or Trimble DA2). Where it was not safe to enter an excavation, the sample locations were recorded by surveying the corresponding northing or easting that lined up with each sample.

3.4 SITE ASSESSMENT ANALYTICAL RESULTS

All Site Assessment soil samples were analyzed for diesel-range organics (DRO) by Method NWTPH-Dx and gasoline-range organics (GRO) by Method NWTPH-Gx.

In accordance with the IAWP, and in consultation with Ecology, multiple soil samples were selected for follow-up analysis for the following compounds:

- 1-2, dibromoethane (EDB), 1-2, Dichloroethane (EDC), methyl tertiary-butyl ether (MTBE), benzene, toluene, ethylbenzene and xylenes (BTEX) and halogenated VOCs (HVOCs) by EPA Method 8260D,
- Polychlorinated biphenyls (PCBs) by EPA Method 8082, and,
- Carcinogenic Polyaromatic Hydrocarbons (cPAHs) and naphthalenes by EPA Method 8270E/Selected Ion Monitoring (SIM);
- Total RCRA 8 metals plus copper, nickel, and zinc, by EPA Methods 6010D (arsenic, barium, cadmium, chromium, lead, selenium, and silver) and 7471B (mercury).

The samples selected for follow-up analysis were chosen in consultation with Ecology, following review of the initial DRO and GRO data. Of the 15 samples selected for follow-up analysis, MTBE, EDB, EDC, and benzene were not reported in any of the soil samples at a concentration greater than or equal to the practical quantitation limit (PQL). Mercury, selenium and silver were also not reported in any of the soil samples at a concentration greater than or equal to the PQL. PCBs were reported in four samples at a concentration greater than or equal to the PQL, all at a total concentration of less than 1 milligram per kilogram (mg/kg). Naphthalene was reported in most follow-up samples at low concentrations, with the highest concentration reported at 2.9 mg/kg. A discussion of the results for select compounds is described in Sections 3.4.1 through 3.4.5.

The analytical results for DRO, GRO, Toluene, Ethylbenzene, and Xylenes, cPAHs, total metals, and PCBs are summarized in Tables 1 through 6. In each table, a compound was only listed if it was reported in at least one sample at a concentration greater than or equal to the PQL. A copy of the laboratory analytical reports is included in Appendix K.

3.4.1 Diesel- and Gasoline-Range Hydrocarbons

GRO and DRO were reported in soil samples from both the North and South Tank Vaults at elevated concentration.

GRO was reported at a maximum concentration of 480 mg/kg in the North Tank Vault, in sample NT-SS-17-5.0, which was collected along the south sidewall of the excavation. The highest concentration of DRO in the North Tank Vault was reported in the same sample at a concentration of 225,000 mg/kg.

GRO was reported at a maximum concentration of 1,300 mg/kg in the South Tank Vault, in sample ST-SS-8-8.5, which was collected from the base of the excavation at the south end. The highest concentration of DRO in the South Tank Vault was reported at a concentration of 18,000 mg/kg in sample ST-SS-17-6.5, located along the middle of the west sidewall of the excavation. The results for DRO and GRO for the North and South Tank vaults are summarized in Tables 1 and 2, respectively.

3.4.2 Toluene, Ethylbenzene, and Xylenes

Benzene was not reported in any of the site assessment samples at a concentration greater than the PQL. Toluene, ethylbenzene, and xylenes were reported at low concentrations in several samples. The results for Toluene, Ethylbenzene, and Xylenes are summarized in Table 3.

3.4.3 cPAHs

Each of the seven cPAH compounds was reported in one or more of the soil samples selected for follow-up analysis. Soil sample ST-piping-SS-22 contained the highest toxic equivalent concentration (TEC) of benzo(a)pyrene at 0.830 mg/kg. The results for cPAHs are summarized in Table 4.

3.4.4 Metals

Cadmium was only reported in one sample at a concentration greater than the PQL, sample ST-piping-SS-20-6.5, at a concentration of 0.85 mg/kg. This sample was collected beneath the product piping utilidor between the former Aluminum Building and the main shop building.

Arsenic was reported in three samples at a concentration greater than the PQL. The highest concentration of arsenic was reported in sample NT-SS-31-6.5, which was collected from the base of the North Tank Vault, near the midpoint along the east side, at a concentration of 39 mg/kg.

Nickel was elevated in one sample, NT-piping-SS-24, at a concentration of 910 mg/kg. This sample was collected beneath the northernmost product piping sample from the North Tank Vault. The results for total metals are summarized in Table 5.

3.4.5 PCBs

PCBs were reported in four of the follow-up soil samples at a concentration greater than the PQL. The highest concentration was reported in sample NT-piping-SS-24-2.0 at a concentration of 0.52 mg/kg. The results for PCBs are summarized in Table 6.

Section 4: CONCLUSIONS

The purpose of a UST site assessment is to determine if there has been a release of a regulated substance from a UST system. Confirmed and suspected releases have been reported from both former UST vaults as early as 1990 when Dames & Moore first identified elevated levels of petroleum in soil west of the former Aluminum Heat Treat Building (Dames & Moore, 1990). Later findings by SEACOR in 1991 supported this when they reported that three USTs in the North Tank Vault failed tightness testing. An additional investigation conducted in 1991 by SEACOR also identified light non-aqueous phase liquid (LNAPL) west of the former South Tank Vault (SEACOR, 1993 and 1993b). LNAPL was again identified west of the former North Tank Vault in 1995, along with high concentrations of DRO in soil west of the former South Tank Vault (Dames & Moore, 1999). More recent investigations by Shannon & Wilson also identified likely releases from both former UST vaults, including the presence of a significant LNAPL plume on groundwater west of the South Tank Vault (Shannon & Wilson, 2020).

As described above, multiple investigations conducted over a 30-year period have identified likely releases from the former North and South Tank vaults at the Jorgensen Site. The site assessment activities described in this report were conducted pursuant to Agreed Order No. DE 21034 following UST decommissioning by removal. In accordance with the requirements of WAC 173-360A-0730(8)(g)(iii), the results of this site assessment conclude there has been a release of a regulated substance from both the former North and South UST systems at the former Jorgensen Forge Site.

We recommend this information be considered by Ecology and EMJ during the remedial investigation and final cleanup of the Site.

Notes

1. Analytes are only shown if they were reported in at least one soil sample at a concentration greater than or equal to the laboratory practical quantitation limit (PQL).
2. "U" denotes analyte not reported at a concentration greater than or equal to the given laboratory PQL.
3. "--" indicates none of the individual PCB aroclors were reported at a concentration greater than or equal to the PQL.

Abbreviations

PCB = polychlorinated biphenyl
UST = Underground Storage Tank
mg/kg = milligrams per kilogram

III. CERTIFIED SERVICE PROVIDER(S)					
Check the appropriate boxes. If more than one service provider is required for this project, fill out both sections.					
Note: Individuals performing UST services MUST be ICC-certified or have passed another qualifying exam approved by the Department of Ecology.					
1) ☐ Installer ☒ Decommissioner ☐ Site Assessor					
Company Name: Construction Group International			Certification Type: UST Decommissioner		
Service Provider Name: Brad Reilly			Cert. No.: 8289423 Exp. Date: 3/4/2024		
Provider Phone: 425-487-2618			Provider Email: markm@cgius.net		
2) ☐ Installer ☐ Decommissioner ☒ Site Assessor (Mark Marcell, CGI Project Mgr)					
Company Name: DH Environmental, Inc.			Certification Type: WA State Site Assessor		
Service Provider Name: Nathan Moxley			Cert. No.: WA LHG 3024 Exp. Date: 6/7/2024		
Provider Phone: 509-332-9281			Provider Email: nathan.moxley@dhenviro.com		
IV. TANK AND/OR PIPING INFORMATION					
TANK ID	TANK CAPACITY	SUBSTANCE STORED	PIPING INSTALLATION OR REPLACEMENT ONLY (Y/N)	DATE PROJECT IS EXPECTED TO BEGIN	COMMENTS
					18 USTs identified on pg 3-6 of attached UST Addendum form. Tanks are empty, and work is approved by Ecology Agreed Order No. DE 21034. Expected start date pending permits from City of Tukwila. Start date will be confirmed 3-days before starting as required by WAC 173-360A-0810(1), and we will keep your office apprised of any scheduling updates.

30-DAY NOTICE

FOR UNDERGROUND STORAGE TANK SYSTEMS

GENERAL INSTRUCTIONS

Under WAC 173-360A-0300, 173-360A-0810 and 173-360A-0820, owners and/or operators are required to notify the Department of Ecology (Ecology) **at least 30 days prior** to beginning underground storage tank (UST) and/or piping installation, decommissioning, or change-in-service projects by mailing this notice to the address below. A separate form must be used for each project type (e.g. install, removal). Once this form is received by Ecology, it is date-stamped and returned to the owner/operator listed on the form. Installation and decommissioning projects cannot begin within the first 30 days after the date stamped on this form unless the wait-period has been waived by a regional Ecology UST inspector. If a project cannot meet the deadlines described below, an additional 30-Day Notice may be required.

Department of Ecology
Underground Storage Tank Section
PO Box 47655
Olympia, WA 98504-7655

SITE AND OWNER/OPERATOR INFORMATION

Fill in the site/owner information completely. The contact person listed on this form must confirm the exact date an installation or decommissioning project will begin by contacting the regional UST inspector **at least 3 business days** before proceeding.

INSTALLATION/REPLACEMENT OF TANK AND/OR PIPING

Installation projects must begin within 90 days of the date stamped on this notice. Complete the Tank Information section by assigning Tank ID numbers that have not previously been used at the facility. Once processed, this form allows a one-time drop of product for UST system testing purposes only. The fuel drop is not required to occur within the 90-day period. Once your tank(s) store more than one inch of product, leak detection equipment and monitoring must be in place.

To receive additional deliveries and operate the new tanks/piping, you must submit the Business License application, UST Addendum, and the tank/piping Manufacturer's Installation Checklists to the Department of Revenue (DOR) **within 30 days** of completing the installation. This activates the mailing of your Business License with tank endorsement(s) from DOR and the facility compliance tag from Ecology.

If only piping is being installed or replaced piping, the ICC-certified installer must certify the installation by completing the Retrofit/Repair Checklist with the Manufacturer's Installation Checklist and submitting it to the owner/operator. The form packet must be submitted by the owner/operator to Ecology **within 30 days** of completing the piping installation.

PERMANENT CLOSURE OF TANK AND/OR PIPING

Decommissioning projects must be completed within 90 days after the date stamped on this returned notice. Complete the Tank Information section using Tank ID numbers listed on the Business License. Use the Comments box to include additional information, such as the date when product was removed from both the piping and the tank to less than one inch.

Contact your local fire marshal and planning department prior to tank closure to procure any permits required by county or other local jurisdictions. Compliance with the State Environmental Policy Act (SEPA) Rules, Chapter 197-11 WAC may also apply.

A site assessment is required at the time of closure. If contamination is not discovered, a site assessment report must be submitted to the above address **within 30 days**. If contamination is discovered or confirmed, it must be reported to the appropriate Ecology regional office **within 24 hours** and a site characterization report must be submitted to the above address **within 90 days**.

The following are some examples of tanks that are exempt from the UST regulations.

- ❖ Farm or residential tanks, 1,100 gallons or less, used to store motor fuel for personal or farm use only. The fuel must be used for farm purposes and cannot be for resale.
- ❖ Tanks used for storing heating oil that is used solely for the purpose of heating the premises.
- ❖ Tanks with a capacity of 110 gallons or less.
- ❖ Emergency overflow tanks, catch basins, or sumps.

If you need this document in a format for the visually impaired, call Toxics Cleanup Program at (360) 407-7170. Persons with hearing loss can call 711 for Washington Relay Service. Persons with speech disability, call (877) 833-6341.

All provisions of law and ordinances governing this work will be complied with, whether specified herein or not.

The granting of this permit does not presume to give authority to violate or cancel the provisions of any other state or local laws regulating construction or the performance of work.

This permit shall become null and void if the work is not commenced within 180 days for the date of issuance, or if the work is suspended or abandoned for a period of 180 days from the last inspection.

PERMIT CONDITIONS:

1: FIRE CONDITIONS

- A site investigation/assessment is required prior to taking a tank permanently out of service.
- TANKS MAY BE REMOVED ONLY AFTER FIRE DEPARTMENT INSPECTION.
- Two (2) 20 BC portable fire extinguishers are to be on site within 50 ft. of the operation.
- Work area shall be cordoned off or be enclosed in a fenced yard.
- "No Smoking" signs must be posted in readily visible locations.
- Remove all flammable or combustible liquids from tank and from connecting lines.
- Tanks shall be inerted and must be certified gas free by a Marine Chemist or Petroleum Industry Safety Engineer regularly engaged in that business, prior to removal.
- All exterior above-grade fill and vent piping shall be permanently removed.
- Tanks shall be disposed of in accordance with federal, state and local regulations.
- Call twenty-four (24) hours prior to removal to arrange the required fire department inspections.

PERMIT INSPECTIONS REQUIRED

Photo 1: North Tank Vault, exposing UST-26 in preparation for removal. View to the west.

Photo 2: North Tank Vault, exposing UST-28 in preparation for removal. View to the west.

Photo 3: North Tank Vault, last two tanks prepared for removal. View to the south southwest.

Photo 4: North Tank Vault, tanks staged for transport. The tank fragments on the left side were tanks previously filled with sand, which were cut open to empty. View to the north.

Photo 5: North Tank Vault, loading a tank for recycling. View to the southwest.

Photo 6: North Tank Vault, emptied of tanks and backfill, prior to removal of the concrete vault. View to the northwest.

Photo 7: North Tank Vault, product piping removal. View to the north northwest.

Photo 8: North Tank Vault, southernmost end of the product piping. The piping had been cut just inside the foundation wall of the aluminum building. A cap was still present on the end of the pipe.

Photo 9: North Tank Vault, removal of the concrete vault structure. View to the north.

Photo 10: North Tank Vault, backfilling the tank excavation. View to the west northwest.

Photo 11: North Tank Vault, following final paving and site restoration. View to the south southwest.

Photo 12: South Tank Vault, removal of UST-15. View to the southwest.

Photo 13: South Tank Vault, tank prepared for removal. View to the west.

Photo 14: South Tank Vault, tank staged for transport. Note the condition of the tanks from the South Tank Vault in comparison to those from the North Tank Vault. View to the west.

Photo 15: South Tank Vault, loading a tank for recycling. View to the west.

Photo 16: South Tank Vault, example of a pinhole caused by corrosion. These were visible on multiple tanks.

Photo 17: South Tank Vault, emptied of tanks and backfill, prior to removal of the concrete vault. View to the south southwest.

Photo 18: South Tank Vault, backfilling the excavation. View to the south southwest.

Photo 19: South Tank Vault, single product line visible entering the foundation underneath of the former Aluminum Building, along with a small electrical conduit. View to the north northeast.

Photo 20: South Tank Vault, product line running from left to right (north to south), where it joins two other lines that used to stub up through the concrete slab floor. Those lines appeared to have been cut and bent at some point in the past. View to the east.

Photo 21: South Tank Vault, product piping running north towards a utilidor. View to the north.

Photo 22: South Tank Vault, product piping in the utilidor following removal of the concrete top. Note there are more pipes visible in the utilidor than were visible running towards the former tanks. Several of the pipes had been cut and/or capped at some point in the past. View to the south southwest.

Photo 23: South Tank Vault, product piping in the utilidor following removal of the concrete top. Note there are more pipes visible in the utilidor than were visible running towards the former tanks. Several of the pipes had been cut and/or capped at some point in the past. View to the south southwest.

Photo 24: South Tank Vault, following final paving and site restoration. View to the south.

Underground Storage Tank Decommissioning Certification

This is a statement of Underground Storage Tank Decommissioning provided by EcoCon, Inc. (ECI). ECI states this decommissioning has occurred under the supervision of an ICC Certified UST Decommissioner following the local and state rules and regulations as defined by the Uniform Fire Code (UFC) and Washington Administrative Code (WAC). Following Puget Sound Regional Fire Department certification, the USTs were excavated and transported off site and disposed at a local recycling facility.

Project Client:	CGI, Inc.
Project Name:	Jorgensen Forge
Project Address:	8531 E. Marginal Way S, Tukwila, WA 98108
Type of Decommissioning:	Excavation and removal from sub-surface
UST Installation Date:	Unknown
UST Decommissioning Date:	August 14, 2023
Permit Issuance Date:	May 26, 2023
UST(s) Total Gallons:	10-13,500g Heating oil
UST(s) Construction:	Steel Single Wall Construction
Tank Numbers:	26, 27, 28, 29,30, 31, 32, 33, 34, 35

Certified UST Decommissioner:	Brad Reilly
Certification Number:	8289423– Exp: 03/04/2024

DANGEROUS WASTE DESIGNATION FORM

Former Jorgensen Forge Site – UST Vault Concrete

A. WASTE STREAM NAME AND GENERATION INFORMATION

Waste Stream Name: Tank Vault Concrete

Generation Process: Concrete Removal

RCRA ID Number that waste will be managed under:

NA

Total Quantity and/or Estimated Generation rate:

~ 300 cubic yards

Other Descriptions (i.e. Shop, Project, Etc.):

B. WASTE PROPERTIES, CHARACTERISTICS, and CONSTITUENTS:

Physical State: ☒ Solid (pass paint filter)
☐ Solid w/freestanding or absorbed liquid
☐ Liquid (If liquid, indicate if the liquid is:
☐ Single Layer
☐ Multi-layer

pH: ☐ < 2 [D002]
☐ > 2 but < 12.5
☒ N/A ☐ > 12.5 [D002]

Flashpoint: ☐ < 140 °F [D001]
☐ > 140 °F but < 200 °F
☒ N/A ☐ > 200 °F

Characteristic	PCB Content	TCLP Metals	Total Metals
			☒ mg/kg ☐ ug/kg ☐ mg/L ☐ ug/L
☐ Ignitable [D001]	☒ Not Detected	☐ Arsenic ≥ 5.0 mg/L [D004]	Arsenic: ☒ ND
☐ Corrosive [D002]	[non TSCA or State Regulated]	☐ Barium ≥ 100.0 mg/L [D005]	Barium: 70 ☐ ND
☐ Reactive [D003]	☐ Not Sampled	☐ Cadmium ≥ 1.0 mg/L [D006]	Cadmium: ☒ ND
☐ Toxic [D004 – D043]	☐ ≥ 2 ppm and < 50 ppm	☐ Chromium ≥ 5.0 mg/L [D007]	Chromium: 23 ☐ ND
List Here:	[Potentially TSCA Regulated or State Regulated PCB Waste-WPCB]	☐ Lead ≥ 5.0 mg/L [D008]	Copper: 75 ☐ ND
	☐ ≥ 50 ppm [TSCA Regulated]	☐ Mercury ≥ 0.2 mg/L [D009]	Lead: ☒ ND
	☐ < 1 ppm	☐ Selenium ≥ 1.0 mg/L [D010]	Mercury: ☒ ND
	Note:	☐ Silver ≥ 5.0 mg/L [D011]	Nickel: 430 ☐ ND
	IF WASTE STREAM IS BEING MANAGED AS TSCA WASTE, DO NOT USE WPCB STATE CODE PER WAC 173-303-071(3)(k)	Check if: ☐ Assumed	Selenium: ☒ ND
		☐ TCLP Conducted	Silver: 5 ☐ ND
		☒ TCLP Not Conducted	Zinc: 47 ☐ ND
		Comments:	Comments:

Physical Composition (list all constituents, including debris, any absorbents, liquid range, etc.).

Constituent	Volume (Range %)
Concrete	90-100
Misc debris	0 - 10

C. LISTED WASTE

- ☐ Discarded Listed Chemical Product (U or P List):
☐ Listed Source Waste (F or K List):
☒ Not Applicable:

D. WA STATE CRITERIA WASTE

☐ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

WA Toxic Criteria Equivalent Concentration (E.C):	WA Persistent Criteria Total HOC	WA Persistent Criteria Total PAH
☒ < 0.001 % [not a Toxic Criteria DW] ☐ 0.001 ≥ 1.0 % [WT02 – DW] ☐ ≥ 1.0% [WT01 – EHW]	☒ < 0.01 % [NOT APPLICABLE] ☐ 0.01 to 1.0% [WP02 – DW] ☐ > 1.0 % [WP01 – EHW]	☒ < 1.0% [NOT APPLICABLE] ☐ > 1.0% [WP03 – EHW]

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

A Washington State toxic criteria book designation was conducted in accordance with WAC 173-303-100. The calculated equivalent concentration value was greater than 0.001%, resulting in an initial criteria waste designation of WT02. A follow-up fish bioassay was performed in accordance with WAC 173-303-110(3)(b), *Biological Testing Methods for the Designation of Dangerous Waste Method 80-12*, which resulted in zero mortality, which refutes the initial WT02 designation. **This waste stream is therefore designated as non-dangerous waste.**

Attachments:

- ☐ Field Report
☐ Sample Log
☒ Laboratory Data (OnSite Environmental Lab Report 2308-161 and 2308-161B)
☒ Dangerous Waste Toxic Equivalent Concentration Calculation
☒ Biological Testing Method 80-12 (Fish Bioassay)
☐ Other:

F. WASTE DESIGNATION SUMMARY

- ☐ RCRA Hazardous Waste
USDOT Proper Shipping Name:
RCRA Waste Codes:
- ☐ TSCA Regulated Waste
TSCA Description:
- ☒ Non-Hazardous Solid Waste/RCRA Exempt/RCRA Excluded
Description: Non-hazardous waste, solid

Re: Analytical Data for Project Star Forge WO-1
Laboratory Reference No. 2308-161

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on August 15, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: August 17, 2023
Samples Submitted: August 15, 2023
Laboratory Reference: 2308-161
Project: Star Forge WO-1

Case Narrative

Samples were collected on August 14 and 15, 2023 and received by the laboratory on August 15, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D (Solid) Analysis

Method 5035A VOA vials were not provided for sample N. Tanks Concrete. The sample was therefore extracted from a 4-ounce jar. Some loss of volatiles may have occurred.

The percent recovery for surrogate Dibromofluoromethane is outside of the control limits for sample N. Tanks Concrete due to sample matrix effects. The sample was reanalyzed with similar results.

The percent recovery for Methylene Chloride is outside the control limits in the Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

Total Metals EPA 6010D/7471B Analysis

The sample result is reported on a wet weight basis.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge WO-1
Laboratory Reference No. 2308-161B

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on August 15, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Dangerous Waste Characterization

Sample ID: N. Tanks Concrete

Report date: August 28, 2023

Submitted to:

OnSite Environmental

14648 NE 95th Street

Redmond, WA 98052

Rainier Environmental
5013 Pacific Hwy East
Suite 20
Tacoma, WA 98424

1.0 INTRODUCTION

A dangerous waste characterization using the test organism *Oncorhynchus mykiss* (rainbow trout) was conducted on one sample submitted by OnSite Environmental to Rainier Environmental. Testing was conducted following the Washington State Department of Ecology Publication 80-12.

2.0 METHODS

The sample, N. Tanks Concrete, was received in the laboratory on August 23, 2023. Upon arrival at the laboratory the sample was inspected and contents verified against information provided on the chain-of-custody form. The sample was stored at 4°C in the dark until use. The test procedure is outlined in Table 1.

Table 1. Summary of Dangerous Waste Characterization Test Conditions

Parameter	Standard Fish Toxicity Test
Test number	2308-038
Sample ID	N. Tanks Concrete
Test initiation date; time	8/23/2023; 0945h
Test termination date; time	8/27/2023; 0945h
Endpoint	Mortality at 96-hours
Test chamber	7.5 L Plastic tank
Test temperature	12 ± 1°C
Dilution water	Moderately hard synthetic water
Test solution volume	6 L
Test concentrations (mg/L)	100, 10, 0
Number of organisms/chamber	10
Number of replicates	3
Test organism	<i>Oncorhynchus mykiss</i> (rainbow trout)
Feeding	No feeding during test
Photoperiod	16 hours light/ 8 hours dark
Extraction	Rotary agitation (30 +/- 2 rpm) for 18 hours
Reference Toxicant	Copper sulfate
Deviations	None

The test organisms used in the test are outlined in Table 2. The sample was tested using fish received on July 12, 2023.

Table 2. Test organisms (*Oncorhynchus mykiss*)

Test organism age	62 days post swim-up (hatch date 5/31/2023)
Mean weight	0.41 g
Mean length	41 mm
Ratio of longest to shortest	1.2
Loading	0.68 g/L
Test organism source	Trout Lodge; Sumner, WA

3.0 RESULTS

A summary of results for the dangerous waste characterization conducted on N. Tanks Concrete is contained in Table 3. There was no mortality during the test. Based on these results, the sample does not designate as either a dangerous or extremely hazardous waste. Copies of the laboratory bench sheets, statistical summaries of reference toxicant tests, and chain-of-custody form are provided in Appendices A through C.

Table 3. Summary of Results

Sample ID	Concentration (mg/L)	Survival (# fish, N=30)	Percent Mortality	Dangerous Waste Designation
Control	0	30	0	NA
N. Tanks	10	30	0	None
Concrete	100	30	0	

4.0 QUALITY ASSURANCE

The most recently completed reference toxicant test was initiated August 16, 2023. The LC₅₀ of 166 µg/L copper fell within the acceptable range of mean ± two standard deviations of historical test results indicating that the test organisms were of an appropriate degree of sensitivity. The coefficient of variation (CV) for the last 20 tests was 31.3 percent, which is considered excellent by the Biomonitoring Science Advisory Board.

C. LISTED WASTE

- ☐ Discarded Listed Chemical Product (U or P List):
☐ Listed Source Waste (F or K List):
☒ Not Applicable:

D. WA STATE CRITERIA WASTE

☐ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

WA Toxic Criteria Equivalent Concentration (E.C):	WA Persistent Criteria Total HOC	WA Persistent Criteria Total PAH
☒ < 0.001 % [not a Toxic Criteria DW] ☐ 0.001 ≥ 1.0 % [WT02 – DW] ☐ ≥ 1.0 % [WT01 – EHW]	☒ < 0.01 % [NOT APPLICABLE] ☐ 0.01 to 1.0% [WP02 – DW] ☐ > 1.0 % [WP01 – EHW]	☒ < 1.0% [NOT APPLICABLE] ☐ > 1.0% [WP03 – EHW]

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

A Washington State toxic criteria book designation was conducted in accordance with WAC 173-303-100, for each soil sample representative of the waste stream. Two samples had a calculated equivalent concentration (EC) value greater than 0.001%, resulting in an initial criteria waste designation of WT02. A follow-up fish bioassay was performed in accordance with WAC 173-303-110(3)(b), *Biological Testing Methods for the Designation of Dangerous Waste Method 80-12*, for the sample with the highest EC value. The fish bioassay test resulted in zero mortality, which refutes the initial WT02 designation. **This waste stream is therefore designated as non-dangerous waste.**

Re: Analytical Data for Project Star Forge Waste Designation
Laboratory Reference No. 2308-254

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on August 23, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'DB', with a long horizontal line extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: August 28, 2023
Samples Submitted: August 23, 2023
Laboratory Reference: 2308-254
Project: Star Forge Waste Designation

Case Narrative

Samples were collected on August 23, 2023 and received by the laboratory on August 23, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Date of Report: August 28, 2023
 Samples Submitted: August 23, 2023
 Laboratory Reference: 2308-254
 Project: Star Forge Waste Designation

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge Waste Designation
Laboratory Reference No. 2308-254B

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on August 23, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 5, 2023
Samples Submitted: August 23, 2023
Laboratory Reference: 2308-254B
Project: Star Forge Waste Designation

Case Narrative

Samples were collected on August 23, 2023 and received by the laboratory on August 23, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Dangerous Waste Characterization

Sample ID: NT-Piping-Soil-2

Report date: September 4, 2023

Submitted to:

OnSite Environmental

14648 NE 95th Street

Redmond, WA 98052

Rainier Environmental
5013 Pacific Hwy East
Suite 20
Tacoma, WA 98424

1.0 INTRODUCTION

A dangerous waste characterization using the test organism *Oncorhynchus mykiss* (rainbow trout) was conducted on one sample submitted by OnSite Environmental to Rainier Environmental. Testing was conducted following the Washington State Department of Ecology Publication 80-12.

2.0 METHODS

The sample, NT-Piping-Soil-2, was received in the laboratory on August 30, 2023. Upon arrival at the laboratory the sample was inspected and contents verified against information provided on the chain-of-custody form. The sample was stored at 4°C in the dark until use. The test procedure is outlined in Table 1.

Table 1. Summary of Dangerous Waste Characterization Test Conditions

Parameter	Standard Fish Toxicity Test
Test number	2308-063
Sample ID	NT-Piping-Soil-2
Test initiation date; time	8/31/2023; 1200h
Test termination date; time	9/4/2023; 1200h
Endpoint	Mortality at 96-hours
Test chamber	7.5 L Plastic tank
Test temperature	12 ± 1°C
Dilution water	Moderately hard synthetic water
Test solution volume	6 L
Test concentrations (mg/L)	100, 10, 0
Number of organisms/chamber	10
Number of replicates	3
Test organism	<i>Oncorhynchus mykiss</i> (rainbow trout)
Feeding	No feeding during test
Photoperiod	16 hours light/ 8 hours dark
Extraction	Rotary agitation (30 +/- 2 rpm) for 18 hours
Reference Toxicant	Copper sulfate
Deviations	None

The test organisms used in the test are outlined in Table 2. The sample was tested using fish received on July 12, 2023.

Table 2. Test organisms (*Oncorhynchus mykiss*)

Test organism age	70 days post swim-up (hatch date 5/31/2023)
Mean weight	0.42 g
Mean length	42 mm
Ratio of longest to shortest	1.2
Loading	0.70 g/L
Test organism source	Trout Lodge; Sumner, WA

3.0 RESULTS

A summary of results for the dangerous waste characterization conducted on NT-Piping-Soil-2 is contained in Table 3. There was no mortality during the test. Based on these results, the sample does not designate as either a dangerous or extremely hazardous waste. Copies of the laboratory bench sheets, statistical summaries of reference toxicant tests, and chain-of-custody form are provided in Appendices A through C.

Table 3. Summary of Results

Sample ID	Concentration (mg/L)	Survival (# fish, N=30)	Percent Mortality	Dangerous Waste Designation
Control	0	30	0	NA
NT-Piping-Soil-2	10	30	0	None
	100	30	0	

4.0 QUALITY ASSURANCE

The most recently completed reference toxicant test was initiated August 16, 2023. The LC₅₀ of 166 µg/L copper fell within the acceptable range of mean ± two standard deviations of historical test results indicating that the test organisms were of an appropriate degree of sensitivity. The coefficient of variation (CV) for the last 20 tests was 31.3 percent, which is considered excellent by the Biomonitoring Science Advisory Board.

Re: Analytical Data for Project Star Forge UST Site Assessment
Laboratory Reference No. 2310-177

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on October 13, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'DB', with a long horizontal line extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: October 17, 2023
Samples Submitted: October 13, 2023
Laboratory Reference: 2310-177
Project: Star Forge UST Site Assessment

Case Narrative

Samples were collected on October 13, 2023 and received by the laboratory on October 13, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for Chloroethane, 1,2,4-Trichlorobenzene and 1,2,3-Trichlorobenzene is outside the control limits in the Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

ST-piping-SS-22-2.0	10-177-03	9	10-13-23

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

DANGEROUS WASTE DESIGNATION FORM

Former Jorgensen Forge Site, UST Piping Utilidor Water

A. WASTE STREAM NAME AND GENERATION INFORMATION

Waste Stream Name: **Water**

Generation Process: **Pump out of UST Piping Utilidor**

RCRA ID Number that waste will be managed under:

NA

Total Quantity and/or Estimated Generation rate:

~ 275 gallons

Other Descriptions (i.e. Shop, Project, Etc.):

B. WASTE PROPERTIES, CHARACTERISTICS, and CONSTITUENTS:

Physical State: ☐ Solid (pass paint filter)
☐ Solid w/freestanding or absorbed liquid
☒ Liquid (If liquid, indicate if the liquid is:
☒ Single Layer
☐ Multi-layer

pH: ☐ < 2 **[D002]**
☒ > 2 but < 12.5
☐ N/A ☐ > 12.5 **[D002]**

Flashpoint: ☐ < 140 °F **[D001]**
☒ > 140 °F but < 200 °F
☐ > 200 °F

C. LISTED WASTE

- ☐ Discarded Listed Chemical Product (U or P List):
☐ Listed Source Waste (F or K List):
☒ Not Applicable:

D. WA STATE CRITERIA WASTE

☐ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

WA Toxic Criteria Equivalent Concentration (E.C):	WA Persistent Criteria Total HOC	WA Persistent Criteria Total PAH
☒ < 0.001 % [not a Toxic Criteria DW] ☐ 0.001 ≥ 1.0 % [WT02 – DW] ☐ ≥ 1.0% [WT01 – EHW]	☒ < 0.01 % [NOT APPLICABLE] ☐ 0.01 to 1.0% [WP02 – DW] ☐ > 1.0 % [WP01 – EHW]	☒ < 1.0% [NOT APPLICABLE] ☐ > 1.0% [WP03 – EHW]

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

Analysis has identified trace constituents listed in 40 CFR 261.31, *Wastes from Non-Specific Sources*. However, the original processes generating any of the trace constituents in question are unknown and therefore RCRA F Series is not applicable. This designation is consistent with USEPA interpretation of unknown F-Listed trace constituents: "Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not listed hazardous waste." - Management of Remediation Waste Under RCRA, EPA530-F-98-026

Analysis has also identified constituents potentially exhibiting toxicity characteristics. However, in accordance with 40 CFR 261.4 (b)(10), these compounds are not considered hazardous waste, because the impacted media was removed as part of a UST Corrective Action.

A Washington State toxic criteria book designation was conducted in accordance with WAC 173-303-100. The calculated equivalent concentration value was less than 0.001%, **this waste stream is therefore designated as non-dangerous waste.**

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2310-156

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on October 12, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'D. Baumeister', with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: October 13, 2023
Samples Submitted: October 12, 2023
Laboratory Reference: 2310-156
Project: Star Forge

Case Narrative

Samples were collected on October 12, 2023 and received by the laboratory on October 12, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

PCBs EPA 8082A Analysis

Sample matrix effects caused the percent recovery for the surrogate DCB in the sample UST Piping Utilidor (30%) to be below the quality control limits of 55-138%. All other QC associated with this sample batch was within limits. No further action was undertaken.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Jorgensen UST Site Assessment
Laboratory Reference No. 2308-250

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on August 22, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal line extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: August 31, 2023
Samples Submitted: August 22, 2023
Laboratory Reference: 2308-250
Project: Jorgensen UST Site Assessment

Case Narrative

Samples were collected on August 21 and 22, 2023 and received by the laboratory on August 22, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D (Water) Analysis

The percent recovery for 1,1,2,2-Tetrachloroethane is outside the control limits in the Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

Volatiles EPA 8260D (Soil) Analysis

The percent recovery for Dibromomethane is outside the control limits in the Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

The RPD for Dibromomethane is outside the control limits for the Spike Blank/Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Jorgensen UST Site Assessment
Laboratory Reference No. 2308-250B

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on August 22, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a long horizontal stroke.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 20, 2023
Samples Submitted: August 22, 2023
Laboratory Reference: 2308-250B
Project: Jorgensen UST Site Assessment

Case Narrative

Samples were collected on August 21 and 22, 2023 and received by the laboratory on August 22, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for 1,1-Dichloropropene and 1,2,4-Trichlorobenzene is outside the control limits in the Spike Blank and Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

The client requested the analysis of sample NT-piping-SS-24-2.0-082123 after the holding time had expired.

PAHs EPA 8270E/SIM Analysis

Sample NT-SS-31-6.5-082223 had one surrogate recovery outside of control limits. This is within allowance of our standard operating procedure as long as the recovery is above 10%.

The client requested the analysis of sample NT-piping-SS-24-2.0-082123 after the holding time had expired.

Total Metals EPA 6010D/7471B Analysis

The duplicate RPD for Chromium is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results

The Matrix Spike/ Matrix Spike Duplicate recoveries for Chromium are outside control limits due to matrix inhomogeneity. The samples were re-extracted and re-analyzed with similar results. The Spike Blank recovery was 99%

Due to the high concentration of Nickel in the QC sample, the amount spiked was insufficient for meaningful MS/MSD recovery data. The Spike Blank recovery was 102%.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge UST Site Assessment
Laboratory Reference No. 2308-315

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on August 29, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'DB', with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 5, 2023
Samples Submitted: August 29, 2023
Laboratory Reference: 2308-315
Project: Star Forge UST Site Assessment

Case Narrative

Samples were collected on August 28, 2023 and received by the laboratory on August 29, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Date of Report: September 5, 2023

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge UST Site Assessment
Laboratory Reference No. 2308-315B

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on August 29, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 18, 2023
Samples Submitted: August 29, 2023
Laboratory Reference: 2308-315B
Project: Star Forge UST Site Assessment

Case Narrative

Samples were collected on August 28, 2023 and received by the laboratory on August 29, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for Methylene Chloride, Bromobenzene, 1,4-Dichlorobenzene, 1,2-Dichlorobenzene, 1,2,4-Trichlorobenzene and 1,2,3-Trichlorobenzene is outside the control limits in the Spike Blank and/or Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

Some MTCA Method A cleanup levels are non-achievable for sample NT-SS-17-5.0-082823 due to the necessary dilution of the sample.

The value reported for o-Xylene in sample NT-SS-18-5.0-082823 exceeds the calibration range and is therefore an estimate. The sample was re-analyzed at the lowest possible dilution allowed by Method 5035A with non-detect results for o-Xylene.

Total Metals EPA 6010D/7471B Analysis

The Matrix Spike/ Matrix Spike Duplicate recoveries for Nickel are outside control limits due to matrix inhomogeneity. The samples were re-extracted and re-analyzed with similar results. The Spike Blank recovery was 92%.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Jorgensen UST Site Assessment
Laboratory Reference No. 2308-357

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on August 31, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'DB', with a long horizontal stroke extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 8, 2023
Samples Submitted: August 31, 2023
Laboratory Reference: 2308-357
Project: Jorgensen UST Site Assessment

Case Narrative

Samples were collected on August 30, 2023 and received by the laboratory on August 31, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Date of Report: September 8, 2023

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Jorgensen UST Site Assessment
Laboratory Reference No. 2308-357B

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on August 31, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 22, 2023
Samples Submitted: August 31, 2023
Laboratory Reference: 2308-357B
Project: Jorgensen UST Site Assessment

Case Narrative

Samples were collected on August 30, 2023 and received by the laboratory on August 31, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

Some MTCA Method A cleanup levels are not achievable for samples ST-SS-15-6.5-083023 and ST-SS-17-6.5-083023 due to the necessary dilution of these samples.

PAHs EPA 8270E/SIM Analysis

Sample ST-SS-15-6.5-083023 had one surrogate recovery outside of control limits. This is within allowance of our standard operating procedure as long as the recovery is above 10%.

PCBs EPA 8082A Analysis

Sample matrix effects caused the percent recovery for the surrogate DCB in the sample NT-SS-13-5.0-083023 (49%) to be below the quality control limits of 50-127%. All other QC associated with this sample batch was within limits. No further action was undertaken.

Total Metals EPA 6010D/7471B Analysis

The Matrix Spike/ Matrix Spike Duplicate recoveries for Chromium and Nickel are outside control limits due to matrix inhomogeneity. The Spike Blank recovery was 108% for Chromium and 111% for Nickel.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge UST Site Assessment
Laboratory Reference No. 2310-177

Dear Nathan:

Enclosed are the analytical results and associated quality control data for samples submitted on October 13, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'DB', followed by a long horizontal line.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: October 17, 2023
Samples Submitted: October 13, 2023
Laboratory Reference: 2310-177
Project: Star Forge UST Site Assessment

Case Narrative

Samples were collected on October 13, 2023 and received by the laboratory on October 13, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for Chloroethane, 1,2,4-Trichlorobenzene and 1,2,3-Trichlorobenzene is outside the control limits in the Spike Blank Duplicate. The method allows for a percentage of the compounds to fall outside of the control limits due to the large number of analytes being spiked.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Final Clean Closure Report

Final Dangerous Waste Clean Closure Report

Former Jorgensen Forge Site
RCRA Site ID: WAD000602813

8531 East Marginal Way South
Tukwila, WA 98108

MAY 10th, 2024

Prepared for:

Star Forge, LLC
8531 East Marginal Way South
Tukwila, WA 98108

Prepared by:

DH Environmental, Inc.
1011 SW Klickitat Way, Suite 107
Seattle, WA 98134

Executive Summary

This Final Dangerous Waste Clean Closure Report has been prepared by DH Environmental, Inc. for the purpose of documenting efforts undertaken by Star Forge, LLC (Star Forge) to carry out Clean Closure of the Dangerous Waste Management Units at the Former Jorgensen Forge Site located at 8531 East Marginal Way South, Tukwila, WA. In addition, this report presents documentation of disposal of chemicals and other waste generated from demolition of the Former Jorgensen Forge Facility.

The facility is subject to Clean Closure because it was a Large Quantity Generator of Dangerous Waste and operated multiple Dangerous Waste Management Units. As of the date of this report, Star Forge has completed the required Clean Closure activities under the Dangerous Waste Regulations (WAC 173-303-200(h)) and in accordance with Agreed Order No. DE 21034 between the Washington State Department of Ecology and Star Forge, as well as the associated Interim Action Work Plan that incorporated final elements required for Clean Closure. This Final Dangerous Waste Clean Closure Report is a follow-up document to the Star Forge's interim Clean Closure Report submitted to Ecology in July 2022, which is attached for reference.

1.0 OVERVIEW

DH Environmental, Inc. (DH Environmental) has prepared this Report on behalf of Star Forge, LLC (Star Forge) to document final Clean Closure of the former Jorgensen Forge Facility located at 8531 East Marginal Way South, Tukwila, Washington (the “Facility”; Figure 2). The purpose of this document is to report the results of the efforts that have been undertaken by Star Forge to carry out Clean Closure of the applicable Dangerous Waste Management Units at the Facility in accordance with WAC 173-303-610(2) and (5) and in accordance with Agreed Order No. DE 21034 between the Washington State Department of Ecology and Star Forge LLC, as well as the associated Interim Action Work Plan that incorporated final elements required for Clean Closure. This Final Dangerous Waste Clean Closure Report is a follow-up document to Star Forge’s interim Clean Closure Report submitted to Ecology in July 2022, which is attached for reference.

1.1 Site Description¹

The former Jorgensen Forge Site is approximately 21.6 acres, located in an industrial area along the east bank of the Lower Duwamish Waterway. The site is bordered to the north by the Boeing Plant 2 property, and to the south by the Boeing Isaacson property. It is bordered to the west by the Lower Duwamish Waterway, and to the east-by-East Marginal Way South and the King County Regional Airport.

The Facility was used from 1942-1965 for fabrication of structural steel, tractor and road equipment. Operations at the site included forging and heat-treating by Isaacson Iron Works, which operated as a U.S. naval vessel manufacturer.

The Facility was owned and operated by Earle M. Jorgensen Company (EMJ) from 1965 until 1992, when it was purchased by the plant management group and became the Jorgensen Forge Corporation. Jorgensen manufactured specialized large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. They also processed nickel, titanium, and specialized alloys.

Contamination at the Facility is the result of heavy industrial use since the 1940’s, and possible contaminated groundwater migrating onto the property from off-site sources.

Contaminants of concern at the site include:

- Polychlorinated biphenyls (PCBs)
- Volatile organic compounds (VOCs)
- Halogenated volatile organic compounds (HVOCs)
- Metals (including but not limited to arsenic, cadmium, chromium, lead, nickel, copper, and zinc)
- Petroleum hydrocarbons

¹ Information in this section was derived from the Washington State Department of Ecology’s Jorgensen Forge Corp. Site Information webpage page: <https://apps.ecology.wa.gov/gsp/Sitepage.aspx?csid=3689>

1.2 Clean Closure Overview

Closure is the term used in the Dangerous Waste Regulations to refer to the process of taking a Dangerous Waste Management Unit (DWMU) out of service and properly cleaning up or decontaminating the DWMU and any areas affected by potential releases from the DWMU. When this process is finished, a unit is referred to as “closed.”²

Generators are required to meet closure performance standards at WAC 173-303-610(2) and (5). This means that when a DWMU is closed all Dangerous Waste must be removed, and DWMUs that managed or accumulated Dangerous Wastes must be removed or decontaminated.

After wastes and waste residues are removed and units have been inspected, facility owners and generators will manage two types of materials during closure: debris (such as unit parts, structures, piping, equipment, and unit containment systems) and environmental media (such as soil, groundwater, surface water, and sediments). In accordance with Ecology’s guidance for Clean Closure, if environmental media has been contaminated as a result of DWMU operations, and cleanup levels have not been established for a site, then by default, MTCA Method A or B unrestricted cleanup levels can be used to achieve Clean Closure of the associated DWMU.

The following sections describe the efforts taken to comply with the requirements for Clean Closure of the DWMUs. In addition, all chemical products, abated hazardous building materials, and industrial materials at the facility that could not be beneficially reused were designated in accordance with WAC 173-303-070 and disposed of off-site at a RCRA permitted Treatment, Storage, and Disposal Facility (TSDF), or other properly permitted disposal facility if the waste did not designate as Dangerous Waste. Table 1 summarizes the waste disposed of associated with the DWMU Clean Closures, and chemical products and industrial materials requiring disposal as dangerous waste for demolition and overall closure of the Facility. The initial Clean Closure Report submitted in July 2020 contains details about removal and disposal of other wastes not discussed in this final Clean Closure Report but are included in the disposal summary in Table 1.

²Ecology, 2005. *Guidance for Clean Closure of Dangerous Waste Units and Facilities*. Hazardous Waste and Toxics Reduction Program. Publication No. 94-111.

2.0 CLOSURE OF DANGEROUS WASTE MANAGEMENT UNITS

For the purpose of Clean Closure in accordance with the Dangerous Waste Regulations, DH Environmental evaluated various areas at the Facility that generated and/or stored Dangerous Waste through historical records and discussions with former staff. Some of these areas served as Dangerous Waste Central Accumulation Areas (CAAs), while others were locations where waste was generated and temporarily stored. Figure 2 shows the areas determined to be DWMU's subject to closure.

The following areas were determined to be DWMU's subject to closure because they either served as CAAs, or waste was generated and temporarily stored and handled in quantities greater than 55 gallons. The Clean Closure work summarized below was all conducted in conjunction with general demolition of the entire facility in 2023 and 2024, and in accordance with the Interim Action Workplan.

2.1 Central Accumulation Area DWMU

The Central Accumulation Area (CAA) was one of two 90/180-day Dangerous Waste accumulation areas. The CAA was located on the northwest corner of the Facility and the location is shown in Figure 2. The CAA was an approximately 1,000 square feet (SF) structure with aluminum siding, a concrete slab, and an approximately 1 ft. concrete base wall that served as secondary containment. The CAA stored Dangerous Waste in drums and small containers generated from facility maintenance and operations. Based on historical documents and interviews with facility staff, the structure at one time contained a 300 gallon above ground storage tank that serviced diesel fuel. Consequently, the structure was also known as the "diesel house". As discussed in the July 2020 Clean Closure Report, due to visual staining of the concrete inside the CAA, an attempt to decontaminate the concrete was made using high pressure steam and water sprays. However, subsequent sampling of the concrete slab revealed the concrete still exceeded MTCA Method A, Unrestricted, for Diesel Range Organics. Consequently, it was written into the Interim Action Workplan that the concrete would be removed, designated, and disposed of off-site, and the underlying soil would be sampled for Diesel Range Organics in accordance with the IAWP Sampling and Analysis Plan to determine if any excavation of underlying soil would be necessary to achieve Clean Closure of this DWMU. In August 2023, the CAA was demolished, and the underlying soil concentrations of Diesel Range Organics were confirmed to be less than the MTCA Method A unrestricted soil cleanup level of 2,000 milligrams per kilogram (mg/kg). After backfilling the footprint of the CAA with approved and tested clean fill (crushed rock), the CAA was determined to have met all Clean Closure standards in accordance with WAC 173-303-610(2) and (5). Further details about closure of the CAA, including data and photo documentation, are included in the individual CAA Clean Closure Package in Attachment 1.

2.2 Tote Storage Area DWMU

The Tote Storage Area was another 90/180-day Dangerous Waste accumulation area located on the west side of the Facility and the location is shown in Figure 2. The Tote Storage Area was an approximately 800 SF structure with wooden siding and an asphalt slab. The Tote Storage Area stored Dangerous Waste and used oil totes and drums generated from facility maintenance and operations. Based on historical documents and interviews with facility staff, the structure at one time was used to clean and etch product samples prior to laboratory testing.

Subsequently, the structure was also known as the “Acid House” or “Etch House” before it was used as a 90/180-day Dangerous Waste accumulation area in the 1990s.

Similar to the CAA, the Tote Storage Area slab was found to be visually impacted with staining and suspected historical releases. After the slab was treated in accordance with Clean Closure Performance standards using high-pressure steam and water sprays, the asphalt slab was sampled in June of 2020, and found to exceed MTCA Method A concentrations for Diesel Range Organics as well as PCBs. In addition, subsurface sampling in the Tote Storage Area was conducted by Shannon and Wilson in November 2020 and January 2021 to support a Remedial Investigation being conducted by the former owner of the facility (EMJ). The results of the subsurface sampling of the Tote Storage Area revealed that PCBs exceeded the MTCA Method A soil cleanup level of 1 mg/kg, at depths up to 1.5-feet below grade in two locations. Consequently, it was written into the IAWP that the concrete would be removed, designated, and disposed of off-site, and the underlying soil would be excavated to depths necessary to achieve cleanup levels. In addition, the IAWP required confirmation sampling to be conducted in accordance with the IAWP Sampling and Analysis Plan to demonstrate that cleanup levels for PCBs and diesel range organics were obtained.

In October 2023, the Tote Storage Area superstructure and slab were demolished, and excavation was conducted to maximum depth of 2 feet within the footprint of the structure (including the entrance ramp). This resulted in removal of approximately 98 tons of soil/debris from the Tote Storage Area footprint. After confirmation sampling confirmed all cleanup levels were met, the footprint of the Tote Storage Area was backfilled with approved and tested clean fill (crushed rock). As such, the Tote Storage Area was determined to have met all Clean Closure standards in accordance with WAC 173-303-610(2) and (5). Further details about closure of the Tote Storage Area, including data and photo documentation, are included in the individual Tote Storage Area Clean Closure Package in Attachment 2.

2.3 Baghouse DWMU

The baghouse and baghouse processing area were located north of the west end of the main building and north of the tote storage building. The baghouse building was approximately 4,000 SF, and housed equipment to capture and contain dust from the baghouse tunnel that conveyed air and dust from the former melt shop to the baghouse. The baghouse dust was designated as a K061 waste stream as it meets the definition of K061 Specific Source Waste from iron and steel sources in accordance with WAC 173-303-9904. The baghouse processing area and concrete slab were divided by a wall thereby creating two separate areas denoted as ‘Baghouse North’ and ‘Baghouse South’ for the purposes of cleaning and sampling. Only the Baghouse North slab exceeded Clean Closure cleanup levels for diesel range organics and hexavalent chromium. After the baghouse structure was demolished, the Baghouse North slab was excavated and disposed of offsite as K061 Hazardous Waste. The underlying soil was then sampled in accordance with the IAWP and found to meet MTCA Method A cleanup levels for diesel range organics and hexavalent chromium.

The baghouse tunnel was the baghouse dust conveyance duct connecting the former melt shop and the baghouse. Although significant dust removal was conducted in 2019 by Clean Harbors as contracted by Star Forge, some K061 dust remained in the duct that could not be safely removed until it was lowered to the ground and reduced to smaller sections. The baghouse tunnel was cut in place and carefully lowered to the ground using cranes onto

bermed exclusion zones where the ducting and all associated equipment was inspected again prior to further reduction. All remaining dust was removed using a combination of “wet wiping”, scraping, and the use of a vacuum with HEPA filters. All media generated from removing the residual dust inside the duct was managed as K061 Hazardous Waste. Once the Clean Debris performance standards were met in accordance with WAC 173-303-610(2) and (5), the tunnel sections were shipped off site for recycling. Where sections of the ducting could not meet the Clean Debris standard, for example, along expansion joints, those sections were disposed of as K061 waste.

In November 2023, the baghouse and associated equipment were effectively demolished. The decontamination of the baghouse media, along with disposal of materials that could not be reasonably decontaminated resulted in generation and disposal of approximately 106 tons of K061 Debris that was placed in 20-yard roll-off bins and shipped via rail to Chemical Waste Management in Arlington, OR for macroencapsulation and disposal. In addition, approximately 282 gallons (2,350 lbs) of K061 designated water was generated from decontamination efforts. This water was also disposed of at Chemical Waste Management in Arlington, OR.

On 11/18/2023, the underlying soil of the Baghouse North footprint was sampled in accordance with the IAWP SAP and was demonstrated to meet all cleanup levels. After the footprint of the baghouse was backfilled with approved and tested clean fill (crushed rock), the Baghouse DWMU was determined to have met all Clean Closure standards in accordance with WAC 173-303-610(2) and (5).

An individual DWMU Closure Package was developed for each of these areas and is provided in Attachments 1-3. Confirmation sampling laboratory data of underlying soil, photo logs, and disposal documentation (hazardous waste manifests) are included in the individual closure packages. The closure requirements for each DWMU have been met and are described in detail in the individual packages.

3.0 LIME HOPPER RELEASE INCIDENT

On the southwest side of the Facility, there was an elevated storage hopper approximately 25 feet above ground containing lime that was historically used in forging operations. This hopper was enclosed inside a structure and elevated, so it was not apparent to anyone that it contained any materials. This area of the facility, referred to as the “melt shop,” ceased operation in 2015, prior to Star Forge’s ownership of the facility. Therefore, the on-site presence of this lime was unknown to all parties.

On 11/22/2023, the lime hopper was breached by Star Forge’s demolition contractor while cutting into the structure for demolition. The breach resulted in an estimated 500-lbs of lime falling from the vessel onto the ground. Due to the northerly wind direction and location of the hopper being approximately 150 feet from the south property line, some of the lime crossed over onto Boeing’s property adjacent to the south. The lime did not impact the Duwamish River because the wind was blowing directly south. The wind was light to moderate at the time of the release.

All catch basins in the area of demolition were blocked prior to the incident occurring as a stormwater Best Management Practice. In addition, all stormwater drainage at the Facility is treated and batched tested before discharging the Lower Duwamish under two Administrative Orders with the WA State Department of Ecology.

No injuries or exposures were reported because of this release. Lime (calcium hydroxide/calcium oxide) is not highly toxic, but it does designate as Dangerous Waste in accordance with the WA State Dangerous Waste regulations because when mixed with an equal weight of water, the pH exceeds 12.5. This testing was conducted on-site by DH Environmental with a pH meter. Washington has a State-Only Dangerous Waste designation of WSC2 for corrosive solids. Due to this release qualifying as a “Dangerous Waste Release”, the Washington State Emergency Management Division (1-800-258-5990) was notified in addition to the National Response Center (1-800-424-8802). Beau Johnson, the Ecology Site Manager, was also notified, in addition to the Boeing EHS manager for the property to the south. The incident was assigned a Washington Statewide Environmental Tracking System (ERTS) number 726905.

After initial actions were taken to clean up the lime that was released to the ground and temporarily contain the lime inside the hopper to avoid further dispersion, Star Forge’s team assessed removal actions and began planning for removal of the remaining lime in the elevated hopper. From 11/22/2023 – 12/7/2023, Star Forge, through its demolition contractor, Construction Group International, deployed HAZMAT workers elevated on a scissor lift to remove the remaining lime from the elevated hopper using air movers and vacuum boxes to contain the lime without dispersion. The lime was successfully removed from the hopper and contained in DOT vacuum bins for off-site disposal. Impacted subsurface debris and gravel was loaded into roll off boxes for offsite disposal as well. All lime and impacted debris associated with the cleanup was designated as WA State Dangerous Waste Corrosive Solid (WSC2) and WA State Dangerous Waste, Toxic (WT02). This resulted in disposal of 95 tons of lime and impacted debris. All of the waste associated with the cleanup was disposed of at Chemical Waste Management in Arlington, OR. Attachment 5 is the Incident Report that was delivered to all authorities and parties notified of the incident.

5.0 HAZARDOUS BUILDING MATERIALS ABATEMENT AND DISPOSAL

In August 2019, SoundEarth Strategies contracted with Star Forge to complete the pre-demolition hazardous building materials survey of the Former Jorgensen Forge Facility in accordance with the Washington State Labor and Industries “Good Faith Inspection” requirements (WAC 296-62-07721) and the Puget Sound Clean Air Agency asbestos survey requirements.

From September 2019 to February 2020, Star Forge’s demolition contractor, Construction Group International (a licensed abatement contractor) conducted abatement activities of the hazardous building materials identified in the survey reports prior to demolition except for the Galbestos³ siding identified in the survey that was found to contain asbestos greater than one percent. Removal of the Galbestos siding was conducted in conjunction with demolition in 2023 and 2024 and was classified as Class 2 Asbestos Work⁴.

Abatement of the hazardous building materials identified in the pre-demolition survey resulted in removal and disposal of approximately 72 cubic yards of materials classifying as friable asbestos and 661 tons of materials classifying as non-friable asbestos which was primarily Galbestos siding. In addition, PCB Bulk Product Waste⁵ was identified in the Tote Storage Area paint on structural beams and was profiled and disposed of along with other PCB Remediation Waste associated with the Tote Storage Area DWMU closure (see Attachment 2 for further details).

³ Galbestos is the registered trademark for galvanized panels consisting of thick gauge, corrugated galvanized metal sheeting with thin, double-sided asbestos felt-like coatings.

⁴ *Class II asbestos work* means activities involving the removal of ACM which is not thermal system insulation or surfacing material. This includes, but is not limited to, the removal of asbestos-containing wallboard, floor tile and sheeting, roofing and siding shingles, and construction mastics.

⁵ PCB bulk product waste is waste derived from products manufactured to contain PCB in a non-liquid state at 50 parts per million or greater, such as paint and sealants.

6.0 SUMMARY

DH Environmental was contracted by Star Forge to assist with facilitation and documentation of Dangerous Waste Clean Closure for the former Jorgensen Forge Facility located at 8531 East Marginal Way South Tukwila, WA. From 2020 – 2024, DH Environmental supported Star Forge with Facility cleanouts from shops and work areas, DWMU designation and evaluation, DWMU cleaning and confirmation sampling, and overall documentation of Clean Closure activities occurring concurrently with demolition operations. As of the date of this report, Star Forge has completed the required Clean Closure requirements under the Dangerous Waste Regulations (WAC 173-303-200(h)) and in accordance with Agreed Order No. DE 21034 between the Washington State Department of Ecology and Star Forge, LLC. The 2023 Dangerous Waste Annual Report has been updated to include notification of closure of the three DWMUs described in in this Final Clean Closure Report and is included in Attachment 4.

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

1 Facility Information

Facility Name	Former Jorgensen Forge Facility
Address	8531 East Marginal Way South Tukwila, WA 98108
DWMU Name/Identifier	Central Accumulation Area (CAA)
RCRA ID Number	WAD000602813
Facility History, Function, Location and Layout	The Former Jorgensen Forge Facility was in operation by multiple owners from 1942-2017. The facility fabricated and manufactured structural steel, tractor, and road equipment, as well as large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. The facility also processed nickel, titanium, and specialized alloys.
Generator Status	Large Quantity Generator
Reason for Closure	Facility Operations Ceased Operations in 2018
DWMU Closure Date	August 31 st , 2023

2 Dangerous Waste Management Unit Information

Unit Description	The CAA was an approximately 1,000 SF structure with aluminum siding, a concrete slab, and an approximately 1 ft. concrete base wall that served as secondary containment. The CAA stored Dangerous Waste in drums and small containers generated from facility maintenance and operations.
Location	Figure 1 of shows a vicinity map, and Figure 2 shows the Site Map with locations of the Dangerous Waste Management Units.
Waste Managed at the DWMU	Although the entire history of waste operations at the CAA is unknown, based on statements from former facility staff and review of annual reports, the Dangerous Waste accumulated in the CAA DWMU was primarily facility maintenance waste such as paint related material, solvents, lubricants, and investigation derived waste from environmental investigations.
Applicable Waste Codes	D001, D035, D002, D007, D008, WT02, WP02 (not all inclusive)

3 Closure Performance Standard

WAC 173-303-200(h)

i) All dangerous waste and dangerous waste residues must be removed from the containment system. Remaining containers, liners, base, and soil containing or contaminated with dangerous waste or dangerous waste residues must be decontaminated or removed.

ii) In addition, such a generator is exempt from all the requirements in WAC 173-303-610 and 173-303-620, except for WAC 173-303-610(2) and (5).

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

4 Closure Activities

As discussed in the July 2020 interim Clean Closure Report, due to visual staining of the concrete inside the CAA, an attempt to decontaminate the concrete was made using high pressure steam and water sprays. However, subsequent sampling revealed the concrete still exceeded MTCA Method A, Unrestricted, for Diesel Range Organics. Consequently, it was written into the Interim Action Workplan that the concrete would be removed, designated, and disposed of off-site, and the underlying soil would be sampled for Diesel Range Organics in accordance with the IAWP Sampling and Analysis Plan to determine if any excavation of underlying soil would be necessary to achieve Clean Closure of this DWMU. August 2023, the CAA was demolished, and the underlying soil Diesel Range Organics concentrations were found to be below MTCA Method A unrestricted levels. After backfilling the footprint of the CAA with approved and tested clean fill (crushed rock), the CAA was determined to have met all Clean Closure standards in accordance with WAC 173-303-610(2) and (5). Figure CAA-1 shows the confirmation sample locations and Table CAA-1 provides the summary table of the confirmation results.

All samples were transported to OnSite Environmental of Redmond, WA for laboratory analysis following standard chain of custody procedures. OnSite Environmental is a WA State laboratory accredited in accordance with WAC 173-50. Each sample area was analyzed by the following test methods in accordance with the IAWP Sampling and Analysis Plan:

- Diesel Range Organics by NWTPH-Dx

4 Closure Status

The following closure criteria for the Central Accumulation Area DWMU have been met:

- ☒ All Dangerous Waste has been removed from the DWMU and disposed of off-site
- ☒ Remaining containers, liners, base, and soil containing or contaminated with dangerous waste or dangerous waste residues have been decontaminated or removed.
- ☒ The underlying soil has been sampled and evaluated against MTCA Method A or B unrestricted use exposure assumptions in accordance with WAC 173-303-610(2)(b), and the results indicate the contaminant concentrations are below action levels/cleanup levels.

As of 8/31/2023, the Central Accumulation Area Clean Closure requirements have been met.

The following attached documents support documentation of the Central Accumulation Area Clean Closure completion status.

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2308-281

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on August 24, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: August 31, 2023
Samples Submitted: August 24, 2023
Laboratory Reference: 2308-281

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

1 Facility Information

Facility Name	Former Jorgensen Forge Facility
Address	8531 East Marginal Way South Tukwila, WA 98108
DWMU Name/Identifier	Tote Storage Area
RCRA ID Number	WAD000602813
Facility History, Function, Location and Layout	The Former Jorgensen Forge Facility was in operation by multiple owners from 1942-2017. The facility fabricated and manufactured structural steel, tractor, and road equipment, as well as large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. The facility also processed nickel, titanium, and specialized alloys.
Generator Status	Large Quantity Generator
Reason for Closure	Facility Operations Ceased Operations in 2018
DWMU Closure Date	10/26/2023

2 Dangerous Waste Management Unit Information

Unit Description	The Tote Storage Area was a 90/180-day Dangerous Waste accumulation area located on the west side of the site. The Tote Storage Area was an approximately 800 SF structure with wooden siding and an asphalt slab. The Tote Storage Area stored Dangerous Waste and used oil totes and drums generated from facility maintenance and operations. Based on historical documents and statements from former facility staff, the structure at one time was used to clean and etch product samples prior to laboratory testing. Subsequently, the structure was also known as the "Acid House" or "Etch House" before it was used as a 90/180-day Dangerous Waste accumulation area in the 1990s.
Location	The Tote Storage was located on the west side of the property just south of the Baghouse. Figure 1 of the Final Clean Closure Report shows a vicinity map, and Figure 2 shows the Site Map with locations of the Dangerous Waste Management Units.
Waste Managed at the DWMU	Although the entire history of waste operations at the Tote Storage Area is unknown, based on statements from former facility staff and review of annual reports, the Dangerous Waste accumulated in the Tote Storage Area DWMU was primarily facility maintenance rinsewaters, oils, and investigation derived waste.
Applicable Waste Codes	D007, D008, K061, and TSCA Regulated Waste

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

3 Closure Performance Standard

WAC 173-303-200(h)

i) All dangerous waste and dangerous waste residues must be removed from the containment system. Remaining containers, liners, base, and soil containing or contaminated with dangerous waste or dangerous waste residues must be decontaminated or removed.

ii) In addition, such a generator is exempt from all the requirements in WAC 173-303-610 and 173-303-620, except for WAC 173-303-610(2) and (5).

4 Closure Activities

As discussed in the July 2020 interim Clean Closure Report, due to visual staining of the asphalt flooring inside the Tote Storage Area, an attempt to decontaminate the concrete was made using high pressure steam and water sprays. However, subsequent sampling revealed the concrete still exceeded MTCA Method A, Unrestricted, for Diesel Range Organics and PCBs. Consequently, it was written into the Interim Action Workplan that the concrete would be removed, designated, and disposed of off-site, and the underlying soil would be excavated down to applicable cleanup levels (2,000 mg/kg for Diesel Range Organics and 1 mg/kg for PCBs) and confirmation sampling would be conducted in accordance with the IAWP Sampling and Analysis Plan.

In October 2023, the Tote Storage Area DWMU was demolished. Due to PCBs detected in the Tote Storage Area structure paint, concrete, and underlying soil, all the demolition debris and underlying soil were designated as TSCA Remediation Waste (performance based) and was profiled into Chemical Waste Management in Arlington, OR for disposal. The structure and slab were demolished, and the underlying soil was excavated down to a maximum depth of approximately 2 feet below ground surface which resulted in off-site disposal of approximately 98 tons of soil/debris.

Confirmation samples of the underlying soil were collected in the areas shown in Figure TSA-1. All results confirmed that MTCA Method A cleanup levels for Diesel Range Organics and PCBs were achieved. The results are summarized in Table TSA-1. After backfilling the footprint of the Tote Storage Area with approved and tested clean fill (crushed rock), the Tote Storage Area was determined to have met all Clean Closure standards in accordance with WAC 173-303-610(2) and (5). The Tote Storage Area Photo Log provides additional closure documentation.

All samples were transported to OnSite Environmental of Redmond, WA for laboratory analysis following standard chain of custody procedures. OnSite Environmental is a WA State laboratory accredited in accordance with WAC 173-50. Each sample was analyzed by the following test methods in accordance with the IAWP Sampling and Analysis Plan:

- Diesel Range Organics by NWTPH-Dx
- PCBs by EPA 8082

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

4 Closure Status

The following closure criteria for the Tote Storage Area DWMU have been met:

- ☒ All Dangerous Waste has been removed from the DWMU and disposed of off-site
- ☒ Remaining containers, liners, base, and soil containing or contaminated with dangerous waste or dangerous waste residues have been decontaminated or removed.
- ☒ The underlying soil has been sampled and evaluated against MTCA Method A or B unrestricted use exposure assumptions in accordance with WAC 173-303-610(2)(b), and the results indicate the contaminant concentrations are below action levels/cleanup levels.

As of 10/26/2023, the Tote Storage Area Clean Closure requirements have been met.

The following attached documents support documentation of the Central Accumulation Area Clean Closure completion status.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

1 Facility Information

Facility Name	Former Jorgensen Forge Facility
Address	8531 East Marginal Way South Tukwila, WA 98108
DWMU Name/Identifier	Baghouse
RCRA ID Number	WAD000602813
Facility History, Function, Location and Layout	The Former Jorgensen Forge Facility was in operation by multiple owners from 1942-2017. The facility fabricated and manufactured structural steel, tractor, and road equipment, as well as large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. The facility also processed nickel, titanium, and specialized alloys.
Generator Status	Large Quantity Generator
Reason for Closure	Facility Operations Ceased Operations in 2018
DWMU Closure Date	11/21/23

2 Dangerous Waste Management Unit Information

Unit Description	The Baghouse building was primarily a steel structure with an approximately 4,000 SF footprint that housed equipment to capture and contain dust from the Baghouse tunnel that conveyed air and dust from the former melt shop to the Baghouse. The Baghouse processing area and concrete slab were divided by a wall thereby creating two separate areas denoted as 'Baghouse North' and 'Baghouse South' for the purposes of cleaning and sampling. For the purpose of Clean Closure, the Baghouse building, as well as approximately 550 feet of Baghouse duct (also referred to as the "Baghouse tunnel") which was comprised of steel duct, rubber gaskets, and flanges were subject to closure and the Clean Debris Standard as defined in the Alternative Treatment Standards for Hazardous Debris as established in 40 CFR 268.45 and described in Ecology's guidance ¹ . The duct diameter ranged from approximately 2 feet to 12 feet. All Baghouse dust and debris that could not be decontaminated to meet the clean debris standard was designated as a K061 waste stream as it meets the definition of K061 Specific Source Waste from iron and steel sources in accordance with WAC 173-303-9904.
Location	The Baghouse and Baghouse processing area were located north of the west end of the facility and north of the Tote Storage Area. Figure 1 of the Final Clean Closure Report shows a vicinity map, and Figure 2 shows the Site Map with locations of the Dangerous Waste Management Units.
Waste Managed at the DWMU	Although the entire history of waste operations at the Baghouse is unknown, based on statements from former facility staff and review of annual reports, the Dangerous Waste accumulated in the Baghouse DWMU was primarily

¹ Washington State Department of Ecology, *Guidance for Clean Closure of Dangerous Waste Units and Facilities*, Publication No. 94111, Revised May 2005.

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

	K061 dust and debris which was released from hoppers and placed in bulk containers (such as roll-off boxes) for off-site disposal.
Applicable Waste Codes	K061

3 Closure Performance Standard

WAC 173-303-200(h)

i) All dangerous waste and dangerous waste residues must be removed from the containment system. Remaining containers, liners, base, and soil containing or contaminated with dangerous waste or dangerous waste residues must be decontaminated or removed.

ii) In addition, such a generator is exempt from all the requirements in WAC 173-303-610 and 173-303-620, except for WAC 173-303-610(2) and (5).

4 Closure Activities

As discussed in the July 2020 interim Clean Closure Report, due to visual staining and suspected contamination of the Baghouse concrete slab, an attempt to decontaminate the concrete was made using high pressure steam and water sprays. However, subsequent sampling revealed the Baghouse North concrete slab still exceeded MTCA Method A, Unrestricted, for Diesel Range Organics and Hexavalent Chromium. Consequently, it was written into the Interim Action Workplan that the concrete would be removed, designated, and disposed of off-site, and the underlying soil would be sampled for Diesel Range Organics and Hexavalent Chromium in accordance with the IAWP Sampling and Analysis Plan to determine if any excavation of underlying soil would be necessary to achieve Clean Closure of this DWMU.

In November 2023, the Baghouse was demolished, and the Baghouse tunnel was cut by lift elevated crews with blowtorches and lowered to the ground using cranes and placed into exclusion zones for inspection and decontamination as described in the IAWP. All materials associated with the Baghouse were visually inspected to determine if the clean debris standards were met. If it was determined that the clean debris standards were not met, the ducting and other materials were decontaminated by a combination of “wet wiping”, scraping, and the use of a vacuum with HEPA filters. All media generated from removing the residual dust inside the duct was managed as K061 Hazardous Waste. The decontamination of the Baghouse media, along with disposal of materials that could not be reasonably decontaminated resulted in generation and disposal of approximately 106 tons of K061 Debris that was placed in 20-yard roll-off bins and shipped via rail Chemical Waste Management in Arlington, OR for macroencapsulation and disposal. In addition, approximately 282 gallons (2,350 lbs) of K061 designated water was generated from decontamination efforts.

As a conservative approach, prior to sampling the subsurface of the Baghouse slab, the top 6 inches of soil was “scraped” from the underlying soil from Baghouse slab footprint. Upon collection of samples of the underlying Baghouse North area, the soil Diesel Range Organics and Hexavalent Chromium concentrations were found to be below MTCA Method A unrestricted levels. After backfilling the footprint of the Baghouse with approved and tested clean fill (crushed rock), the Baghouse was determined to have met all Clean Closure standards in accordance with WAC 173-303-610(2) and (5). Figure BH-1 shows the confirmation sample locations and Table BH-1 provides the summary table of the confirmation results. The Baghouse Photo Log provides additional closure documentation.

Dangerous Waste Management Unit Closure Documentation Form

Dangerous Waste Generators

All samples were transported to OnSite Environmental of Redmond, WA for laboratory analysis following standard chain of custody procedures. OnSite Environmental is a WA State laboratory accredited in accordance with WAC 173-50. Each sample area was analyzed by the following test methods in accordance with the IAWP Sampling and Analysis Plan:

- Diesel Range Organics by NWTPH-Dx
- Hexavalent Chromium by EPA 7196A

4 Closure Status

The following closure criteria for the Baghouse DWMU have been met:

- ☒ All Dangerous Waste has been removed from the DWMU and disposed of off-site
- ☒ Remaining containers, liners, base, and soil containing or contaminated with dangerous waste or dangerous waste residues have been decontaminated or removed.
- ☒ The underlying soil has been sampled and evaluated against MTCA Method A or B unrestricted use exposure assumptions in accordance with WAC 173-303-610(2)(b), and the results indicate the contaminant concentrations are below action levels/cleanup levels.

As of 11/21/2023, the Baghouse DWMU Clean Closure requirements have been met.

The following attached documents support documentation of the Baghouse Clean Closure completion status.

- Figure BH-1
- Table BH-1
- Baghouse Photo Log
- OnSite Environmental Laboratory Report 2311-212
- Off-site disposal records from IAWP related Clean Closure efforts:

Re: Analytical Data for Project Star Forge Baghouse North
Laboratory Reference No. 2311-212

Dear David:

Enclosed are the analytical results and associated quality control data for samples submitted on November 20, 2023.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read 'D. Baumeister', with a long horizontal stroke extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: January 5, 2024
Samples Submitted: November 20, 2023
Laboratory Reference: 2311-212
Project: Star Forge Baghouse North

Case Narrative

Samples were collected on November 18, 2023 and received by the laboratory on November 20, 2023. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below. However the soil results for the QA/QC samples are reported on a wet-weight basis.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Date of Report: January 5, 2024
 Samples Submitted: November 20, 2023

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- X2 - Sample extract treated with a silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Y1 - Negative effects of the matrix from this sample on the instrument caused values for this analyte in the bracketing continuing calibration verification standard (CCVs) to be outside of 20% acceptance criteria. Because of this, quantitation limits and sample concentrations should be considered estimates.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

10. Type of Federal Regulated Waste Activity

10a. Dangerous Waste Activities

1. State Generator Category

LQG

2. Federal Generator Category

LQG

3. Short Term Generator

(This question is automatically reported as “no” to U.S. Environmental Protection Agency).

☐ **4. United States Importer of Dangerous Waste**
☐ **5. Mixed Waste (Dangerous and radioactive) Generator**
6. Transporter of Dangerous Waste
☐ a. HW Transporter

☐ b. HW Transfer Facility

☐ **7. Designated Facility of Dangerous Waste (TSD)**

(Requires an Ecology Part A or Part B permit for dangerous waste

8. Recycler of Dangerous Waste
☐ a. Stores Prior to Recycling

☐ b. Does Not Store Prior to Recycling
9. Exempt Boiler and / or Industrial Furnace
☐ a. Small Quantity On-site Burner Exemption

☐ b. Smelting, Melting, Refining Furnace Exemption

☐ **10. Underground Injection Control**

(Requires a registered underground injection well. See WAC 173-218).

☐ **11. Receives Dangerous Waste from Off-site**
12. Recognized Trader
☐ a. Importer ☐ b. Exporter
13. Importer/Exporter of Spent Lead Acid Batteries (SLABs)
☐ a. Importer ☐ b. Exporter

management).

10b. Universal Waste Activities

1. Large Quantity Handler of Universal Waste

☐ a. Batteries ☐ b. Lamps ☐ c. Mercury containing equipment

(Large quantity handlers accumulate 11,000 pounds or more total of universal waste (batteries, thermostats, and lamps calculated collectively) and/or accumulates more than maintain your LQHUW status through the end of the calendar year.)

(Between 2,200 and 10,999 lbs of universal waste lamps at any time in the calendar year. If you collected more than 10,999 pounds, select the box in 10b1b)

☐ 3. Destination Facility for Universal Waste

10c. Used Oil Activities

1. Off-Specification Used Oil Burner

- ☐ a. Utility Boiler
☐ b. Industrial boiler
☐ c. Industrial furnace

2. Used Oil Processor and/or Re-refiner - Indicate types of activities.

- ☐ a. Processor
☐ b. Re-refiner

3. Used Oil Transporter - Indicate types of activities.

- ☐ a. Transporter
☐ b. Transfer Facility

4. Used Oil Fuel Marketer - Indicate types of activities.

- ☐ a. Marketer Who Directs Shipment of Off-Specification Used Oil to Off-Specification Used Oil Burner
☐ b. Marketer Who First Claims the Used Oil Meets the Specifications

10d. Eligible Academic Entities with Laboratories

1. Yes, I am managing dangerous wastes under this rule.

- ☐ a. College or University
☐ b. Teaching Hospital that is owned by (or has a formal written affiliation agreement with) a college or university.
☐ c. Non-profit institute that is owned by (or has a formal written affiliation agreement with) a college or university.

☐ **Yes, I wish to withdraw from this rule. (If you were managing dangerous wastes under the State Academic Laboratory Rule and you no longer wish to participate, select this option.)**

10e. State Required Information. The following information is required by Washington State.

1. Washington State Tax Registration Number (UBI number): 813682678

2. How Frequently do you generate dangerous waste?

☐ a. Monthly ☒ b. Batch ☐ c. Spill Event ☐ d. Clean-Up

☐ **3. Generator of Special Waste (Regulated under WAC 173-303-073)**

☐ **4. Recycler of On-Site Waste (i.e. on-site use, reuse, or reclamation of a waste after it was generated)**

☐ **5. Permit-by-Rule (PBR)**

☐ **6. Treatment by Generator (TBG)**

☐ **7. Transport your own waste**

8. Dangerous Waste Fuel Activity

☐ a. Generator of dangerous waste fuel

☐ b. Generator marketing to burner

☐ c. Other marketers (i.e. blender, distributor etc)

d. Burner (indicate type of combustion unit)

☐ 1. Utility boiler ☐ 2. Industrial Boiler ☐ 3. Industrial Furnace

11. Federal Waste Codes

D002,D008,K061

12. State Waste Codes

WSC2,WT02

13. Episodic Generator

No Episodic Waste Exists

14. LQG Receiving Waste for Consolidation

☐ Are you an LQG notifying of consolidating SQG Hazardous Waste Under the Control of the Same Person following to WAC 173-303-171(1)(e)(IX)

15. Notification of LQG Site Closure for a Central Accumulation Unit (CAU) (optional) OR Entire Facility

☒ LQG Site Closure of a Central Accumulation Unit (CAU) or Entire Facility. WAC 173-303-200(12)

Closure Type	Expected Closure Date	Requesting New Closure Date	Date Closed	Meets Compliance Standards
--------------	-----------------------	-----------------------------	-------------	----------------------------

Entire Facility		No
Entire Facility	8/31/2021	Yes
Entire Facility	12/31/2024	No

16. Notification of Hazardous Secondary Material (HSM) Activity

☐ A. Are you notifying under WAC 173-303-017(8) that you will begin managing, are managing, or will stop managing hazardous secondary material under WAC 173-303-017(5)?

No HSM Activity reported

17. Manifest Broker

☐ Are you a Manifest Broker?

18. Pharmaceutical Activities

If you manage dangerous waste under the Pharmaceutical Requirements WAC 173-303-555, indicate the facility type in question a. If these requirements no longer apply, check the box in question b to withdraw.

I am managing dangerous wastes under the requirements as a:

- ☐ Healthcare facility
- ☐ Reverse distributor

☐ I wish to withdraw from this rule.

Note: If you are a Reverse Distributor, you may only withdraw from these requirements if you are also withdrawing your EPA/State Id number.

19. Comments

Waste is generated from activities related to site demolition and closure. Final clean closure will be complete in 2024. Amended Clean Closure was completed on individual Dangerous waste management units on the dates listed: CAA – 8/31/2023; Tote Storage Area – 10/26/2023; Baghouse – 11/21/2023.

SPILL / RELEASE REPORT FORM

FILE NAME:
Star Forge Lime Release Report 11-22-23.

LOCATION OF SPILL/RELEASE:

8531 E Marginal Way S
Tukwila, WA 98108

DATE OF SPILL/RELEASE:
11/22/2023

ESTIMATED TIME OF SPILL/RELEASE:

12:30 PM

WA STATE ERTS #
726905

REPORT PREPARED BY:

David Hill, PE, CHMM
Principal – DH Environmental, Inc.
Phone: (206) 293-3126
Email: davehill@dhenviro.com

MATERIAL(S) RELEASE:

Lime (calcium hydroxide / calcium oxide
ratio unknown)

**ESTIMATED QUANTITY OF
SPILL/RELEASE:**

500 lbs

AGENCIES NOTIFIED:

- WA State Emergency Management Division
- WA State Department of Ecology
- National Response Center

SITE CONTACT:

James Robertson
Star Forge, LLC
Phone: (281) 785-7875

WEATHER:

No Rain, Moderate Northerly Wind
(heading directly south)

WATER BODY IMPACTED:

None

SUMMARY OF INJURIES OR EXPOSURES: No injuries or exposures were reported as a result of the release.

Summary of Spill/Release Incident

The former Jorgensen Forge facility located at 8531 E. Marginal Way S. in Tukwila, WA is currently undergoing permitted demolition of all structures on the property. The site is currently under an Agreed Order between the Washington State Department of Ecology and the current property owner (Star Forge, LLC) for a MTCA Interim Action Cleanup (Cleanup Site ID 3689). The site is also under an Agreed Order between the WA State Department of Ecology and a former owner (Earle M. Jorgensen Company) for a MTCA Remedial Investigation and Feasibility Study. The property was used from 1942 to 2018 to manufacture structural steel, tractor and road equipment, and large-scale metal parts for the aircraft and marine industries. The demolition contractor is Construction Group International (CGI). DH Environmental, Inc. is contracted with Star Forge to provide environmental compliance oversight for the Interim Action work.

On the southwest side of the site, there is an elevated storage hopper approximately 25 feet above ground (see attached map showing the approximate vessel location) containing lime. This hopper was enclosed inside a structure and elevated, so it was not apparent to anyone that it contained any materials. This area of the facility, referred to as the "melt shop," ceased operation in 2015, prior to Star Forge's ownership of the facility. The on-site presence of this lime was unknown to all parties.

On Wednesday 11/22/2023 at approximately 12:30 PM, the lime hopper was breached as CGI was cutting into the structure for demolition. The breach resulted in an estimated 500-lbs of lime falling from the vessel onto the ground. Due to the northerly wind direction and location of the hopper being approximately 150 feet from the south property line, some of the lime crossed over onto Boeing's property adjacent to the south. We do not believe that the lime impacted the Duwamish River because the wind was blowing directly south. The wind was light to moderate at the time of the release.

All catch basins in the area of demolition were blocked prior to the incident occurring as a stormwater Best Management Practice. In addition, all stormwater drainage at the facility is treated and batched tested before discharging the Lower Duwamish under two Administrative Orders with the WA State Department of Ecology.

No injuries or exposures were reported because of this release. Lime is not highly toxic, but it is an irritant to skin, eyes, gastrointestinal tracts, and respiratory tracts. The lime designated as Dangerous Waste in accordance with the WA State Dangerous Waste regulations because when mixed with an equal weight of water, the pH exceeded 12.5. This testing was conducted on-site by DH Environmental with a pH meter. WA state has a State-Only Dangerous Waste designation of WSC2 for corrosive solids. Due to this release qualifying as a "Dangerous Waste Release", the WA State Emergency Management Division (1-800-258-5990) was notified in addition to the National Response Center (1-800-424-8802). These notifications were made from approximately 1:30 – 2:30PM. Beau Johnson, the Ecology Site Manager, was also notified, in addition to the Boeing EHS manager for the property to the south. Because Boeing's

ATTACHMENTS:

- ☒ Site Photos ☐ Sketch ☐ Chain of Custody ☐ Other:
☐ Sample Log ☒ Drawing(s) ☐ Calibration Records

property is a military operations facility, we were not allowed to take any action on Boeing's property due to their security protocol. The Boeing EHS representative informed us that they blocked their stormwater conveyance lines in the area and planned to bring out a spill response contractor to recover the spilled lime from their property.

Actions taken on-site to contain the release:

- CGI used a boom lift to raise an employee near the breach and "plugged" it with sheet metal and adhesive foam to stop further release and dispersion of lime from the source (see Photo – 01)
- The lime on the ground on the Star Forge property was scraped (by CGI) into a pile with equipment and covered with plastic sheeting/visqueen (see photo 02).
- The area was demarcated with Danger Tape.

The lime in the source hopper is currently contained and lime on the ground has been consolidated and covered with plastic pending disposal.

Due to the height of the hopper and potential structural risks, the remaining lime (estimated 10-15 tons) could not be immediately removed as specialized equipment is required to be deployed. As of the date of this report, Star Forge and its contractors and consultants are assessing all options for safe removal of the lime to avoid further release and dispersion.

Prepared by:

DH Environmental, Inc.
1011 SW Klickitat Way, Suite 107
Seattle, WA 98134

EXECUTIVE SUMMARY

This Dangerous Waste Clean Closure Report has been prepared by DH Environmental, Inc. (“DH Environmental”) for the purpose of documenting the Clean Closure of Dangerous Waste Management Units at the former Jorgensen Forge Facility located at 8531 E Marginal Way S., Tukwila, Washington 98108. This report also presents the waste designation of materials within the buildings which will be demolished at the facility following issuance of a demolition permit by the City of Tukwila.

The facility is subject to Clean Closure because it was a generator of Dangerous Waste and operated Dangerous Waste Management Units throughout its history, which extends back to the 1940s. Star Forge, LLC (“Star Forge”) is the current owner of the property and is conducting this Clean Closure prior to the sale and redevelopment of the property. Earle M. Jorgensen (“EMJ”), a former owner of the facility, bought the plant from the original owner, Isaacson Steel and operated an industrial operation on the site for many years. EMJ is investigating and remediating the legacy contamination on the Property under an Agreed Order it entered into with the Washington State Department of Ecology in 2017.

Star Forge has completed the Clean Closure activities that can be accomplished under the Dangerous Waste Regulations with the buildings still intact, and without interfering with the work being undertaken by EMJ. Final closure of some of the Dangerous Waste Management Units subject to Clean Closure will be accomplished once cleanup levels are established under the site-wide Agreed Order being conducted by EMJ. Star Forge and EMJ are cooperating to make sure that each entity can carry out the work for which it is responsible.

1.0 OVERVIEW

DH Environmental has prepared this Report on behalf of Star Forge, to document Clean Closure of the former Jorgensen Forge Facility located at 8531 E Marginal Way S., in Tukwila, Washington 98108 (the “Facility”; Figure 2). The purpose of this document is to report the results of work undertaken by Star Forge to carry out Clean Closure of the applicable Dangerous Waste Management Units (“DWMUs”) at the Facility in accordance with WAC 173-303-610(2) and (5). In addition, this report presents the waste designation of materials within the buildings located on the Facility in accordance with WAC 173-303-070.

Star Forge has conducted the required Clean Closure activities that can be accomplished under Washington’s Dangerous Waste regulations with the structures still intact, and without interfering with the work being undertaken by EMJ.

DH Environmental has prepared a Sampling and Analysis Plan (SAP) to describe the sampling and analysis protocols that were followed during sampling at the Facility. These protocols meet the requirements of WAC 173-303-070, the technical requirements of EPA publication SW-846, *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods*, Washington State Department of Ecology (Ecology) Publication #97-407, *Chemical Testing Methods for Designating Dangerous Waste (2014)*, and Ecology Publication 94-111, *Guidance for Clean Closure of Dangerous Waste Units and Facilities (2005)*. The SAP is included as Appendix 1. Appendix 2 is the Health and Safety plan developed for the work associated with this report.

1.1 Site Description¹

The former Jorgensen Forge Facility consists of approximately 21.6 acres, located in an industrial area along the east bank of the Lower Duwamish Waterway. The site is bordered to the north by Boeing Plant 2, and to the south by the Boeing Isaacson property. It is bordered to the west by the Lower Duwamish Waterway, and to the east by East Marginal Way South and the King County Regional Airport (“Boeing Field”).

The property was used from 1942-1965 to fabricate structural steel, tractor, and road equipment. Operations at the site included forging and heat-treating operations conducted for the U.S. Navy.

The property was developed first by Isaacson Steel, from 1942-1965. It was owned and operated by Earl M. Jorgenson Co. (“EMJ”) from 1965 until 1992, when it was purchased by Jorgensen Forge Corporation (“JFC”). JFC manufactured specialized large-scale metal parts for the aircraft and marine industries, including open die steel forgings and rolled aluminum rings. JFC also processed nickel, titanium, and specialized alloys.

¹ Information in this section was derived from the Washington State Department of Ecology’s Jorgensen Forge Corp. Site Information webpage: <https://apps.ecology.wa.gov/gsp/Sitepage.aspx?csid=3689>

Industrial use by Isaacson, EMJ and JFC since the 1940's has left a legacy soil and groundwater contamination documented in previous studies. Contaminated groundwater may have also migrated onto the property from off-site sources.

Contaminants of concern at the site include:

- Polychlorinated biphenyls (PCBs)
- Volatile organic compounds (VOCs)
- Halogenated volatile organic compounds (HVOCs)
- Metals (including but not limited to arsenic, cadmium, chromium, lead, nickel, copper, and zinc)

1.2 Work Performed by Others

Star Forge purchased the facility in bankruptcy from the estate of JFC on November 28, 2016. It operated the Facility for less than two years before ceasing operations in 2018.

Pursuant to a Settlement Agreement reached in the bankruptcy, EMJ entered into an Agreed Order with Ecology in 2017 to complete a remedial investigation and feasibility study (RI/FS) and conduct remediation under a Cleanup Action Plan to be prepared by Ecology. Since 2017, EMJ has been negotiating a draft Remedial Investigation Work Plan with Ecology's Toxic Cleanup Program. The most recent draft, dated April 15, 2020, is being reviewed by Ecology's Toxics Cleanup Program (TCP). TCP's Project Manager has asked EMJ to provide a copy of this closure report when it becomes available, and has informed EMJ that additional sampling may be required as part of the remedial investigation to address issues raised by the data provided in this Report. Star Forge will provide a copy of this report directly to the TCP and to EMJ to facilitate their work under the Agreed Order.

From October 2018 to April 2020, SoundEarth Strategies of Seattle, WA ("SES") conducted hazardous building materials surveys, dangerous waste designations, and oversaw abatement and removal of hazardous building materials and Dangerous Waste from the site. Table 2 summarizes the waste shipped off-site associated with Clean Closure efforts. DH Environmental was engaged by Star Forge in April 2020 to complete all remaining Clean Closure activities, and to carry out other environmental work.

1.3 Clean Closure Target Areas and Materials

"Closure" refers to the process of taking a DWMU out of service and properly cleaning up or decontaminating the DWMU and any areas affected by releases from the DWMU. When this process is finished, a unit is referred to as "closed."²

Generators are required to meet closure performance standards at WAC 173-303-610(2) and (5). When a DWMU is closed, all Dangerous Waste generated at the facility must be removed, and DWMUs that managed or accumulated Dangerous Wastes must also be removed or decontaminated. Legacy contamination of environmental

²Ecology, 2005. *Guidance for Clean Closure of Dangerous Waste Units and Facilities*. Hazardous Waste and Toxics Reduction Program. Publication No. 94-111.

media is being investigated and remediated by EMJ. To facilitate EMJ's cleanup, however, and a condition of sale, Star Forge has undertaken the Clean Closure of the structures on the Property, leveling the site so that it can be fully investigated, remediated, and redeveloped.

The Clean Closure work that has been conducted by Star Forge includes decontamination, designation, and/or removal of debris, containers, and above ground materials potentially designating as Dangerous Waste. Residual slag or significant accumulations of dust on structural elements have been designated and, in some cases, have been removed and disposed of off-site to prepare the structure for demolition. Groundwater is being investigated by EMJ, as is soil contamination, pursuant to the Agreed Order.

The following sections describe the areas identified as DWMUs subject to closure, and additional areas/materials of concern identified across the facility where Dangerous Waste may remain in soil. The sampling schemes are also summarized along with the results of sampling efforts.

2.0 DANGEROUS WASTE MANAGEMENT UNITS

DH Environmental has identified three DWMUs subject to Clean Closure. These areas include two Dangerous Waste Central Accumulation Areas and the baghouse structure and associated equipment that contacted K-listed waste. These areas have been identified by physical inspection, review of historical documents, and interviews with staff that worked at the facility when it was operational. Figure 2 shows the locations of the DWMUs.

Each of the DWMUs have been emptied and sampled. The concrete floors of each unit were cleaned by high pressure steam and water sprays. Concrete wash water was contained and captured using a vacuum truck. The concrete floors were sampled by drilling into the slab to shallow depths of approximately 3-4 inches with a roto-hammer concrete drill and capturing the tailings for analysis. The specific sampling scheme for each DWMU is summarized below and detailed in the attached SAP.

2.1 Clean Closure Performance Standards

The sampling and analysis conducted on the DWMUs was designed with the following objectives in order of precedence:

1. Determine if the DWMU containment or ancillary equipment meets the definition of “hazardous debris” defined as debris that is contaminated with listed dangerous waste or which itself exhibits a dangerous waste characteristic or criteria. If the DWMU containment or ancillary equipment meets the definition of “hazardous debris”, it will be designated and removed accordingly. If the hazardous debris cannot be removed prior to demolition of the superstructure, it will be protected from cross contamination during demolition and addressed after the superstructure is demolished.
2. Determine if the DWMU debris requires further decontamination or removal to meet site cleanup levels or if investigation of surrounding environmental media is warranted based on contaminants detected in the debris. Because site-wide cleanup levels, feasibility analysis, and the Cleanup Action Plan to be implemented under the Agreed Order have not yet been completed, further decontamination, removal, or investigation of environmental media cannot be carried out at this time. All Clean Closure activities that can be done at this time have been completed and are documented herein.

2.2 Former Dangerous Waste Central Accumulation Areas

2.2.1 Central Accumulation Area

The Central Accumulation Area (CAA) is one of two 90/180-day Dangerous Waste accumulation areas. The CAA is located on the northwest corner of the site and is shown in Photo 1 below. The CAA is an approximately 1,000 SF structure with aluminum siding, a concrete slab, and an approximately 1 ft. concrete base wall that served as secondary containment. The CAA stored Dangerous Waste in drums and small containers generated from facility maintenance and operations. Based on historical documents and interviews with facility staff, the structure at one time contained a 300 gallon above ground storage tank that serviced diesel fuel. Consequently, the structure was also known as the “diesel house”.

Sample locations from the concrete floor of the CAA were determined in the field by dividing the area into quadrants. Each sample was collected from areas of staining, if present. If no areas of staining were observed, the sample from the respective quadrant was collected from the center of the quadrant. Samples were collected using a roto-hammer concrete drill and drilling into the concrete surface approximately 3-4 inches and then extracting the drill bit. The drill tailings were collected and placed into laboratory supplied sampling containers. Multiple drill holes were required to obtain sufficient sample volume, obtained from drill holes in close proximity to each other. Photo 1 below shows the location of the CAA and Photos 2 and 3 show the concrete containment and collection of the samples on 29 May 2020. Figure 3 shows the approximate locations of the sample locations on the slab.

Photo 1: CAA Dangerous Waste Management Unit, Facing North, Adapted from Google Earth, 2018 Imagery

Photo 2: CAA Containment, SE Quadrant, 29 May 2020

Photo 3: CAA Containment, NW Quadrant, 29 May 2020

Each sample, consisting of a composite of several drill hole tailings, was analyzed for gasoline range organics by NWTPH-Gx, diesel range organics by NWTPH-Dx, volatile organic compounds by EPA 8260C, PCBs by EPA Method 8082A, Total RCRA Metals + copper, nickel, and zinc, and TCLP for RCRA 8 Metals. The results are summarized in Table 3 and the Washington State Equivalent Calculations are summarized in Table 4. Based on the results, DH

Environmental has concluded that the CAA containment does not designate as a characteristic waste, listed waste, or a Washington State criteria waste. Therefore, the CAA containment does not meet the definition of hazardous debris. One of the four samples from the CAA containment did exceed the MTCA Method A unrestricted cleanup level for diesel range organics.

2.2.2 Tote Storage Area

The Tote Storage Area is the other 90/180-day Dangerous Waste accumulation area located on the west side of the site and is shown in Photo 4 below. The Tote Storage Area is an approximately 800 SF structure with wooden siding and an asphalt slab. The Tote Storage Area stored Dangerous Waste and used oil totes and drums generated from facility maintenance and operations. Based on historical documents and interviews with facility staff, the structure at one time was used to clean and etch product samples prior to laboratory testing. Consequently, the structure was also known as the “Acid House” or “Etch House” before it was used as a 90/180-day Dangerous Waste accumulation area in the 1990s.

Similar to the CAA, sample locations from the asphalt floor of the Tote Storage Area were determined in the field in accordance with the SAP by dividing the area into quadrants, as shown in Figure 4. Each sample was collected from areas of staining, if present. If no areas of staining were observed, the sample from the respective quadrant was collected from the center of the quadrant. Samples were collected by using a roto-hammer drill and drilling into the asphalt surface approximately 3-4 inches and extracting the drill bit and tailings in a manner similar to the CAA sampling. Photos 5 and 6 below show the asphalt slab and collection of the samples on 03 June 2020.

Each sample, consisting of a composite of several drill hole tailings, was analyzed for gasoline range organics by NWTPH-Gx, diesel range organics by NWTPH-Dx, volatile organic compounds by EPA 8260C, PCBs by EPA Method 8082A, Total RCRA Metals + copper, nickel, and zinc, and TCLP for RCRA 8 Metals. The results are summarized in Table 3. Based on the results, the Tote Storage Area containment does not designate as a characteristic waste, listed waste, or a Washington State criteria waste. PCBs were detected in the asphalt slab in concentrations up to 40 mg/kg. However, the original source of the PCBs is unknown and Star Forge is not aware of any PCBs stored, released, or otherwise managed at this location during the time it has owned the Property, which dates only to 2016. The Washington State WPCB source code listing should not apply to the concrete as the listing applies when the source is from the following, or residues thereof, in accordance with WAC 173-303-9904:

Discarded transformers, capacitors or bushings containing polychlorinated biphenyls (PCB) at concentrations of 2 parts per million or greater (except when drained of all free flowing liquid) and the following wastes generated from the salvaging, rebuilding, or discarding of transformers, capacitors or bushings containing polychlorinated biphenyls (PCB) at concentrations of 2 parts per million or greater: Cooling and insulating fluids and cores, including core papers.

The Tote Storage Area containment does not meet the definition of hazardous debris. However, the Tote Storage Area containment does exceed MTCA Method A unrestricted cleanup levels for diesel range hydrocarbons as well as PCBs.

Photo 4: Tote Storage Area Dangerous Waste Management Unit, Facing North, Adapted from Google Earth, 2018 Imagery

Photo 5: Tote Storage Area Facing West, 03 June 2020

Photo 6: Tote Storage Area NW Quadrant, 03 June 2020

2.3 Baghouse

The baghouse is located in the western portion of the property and was constructed in late 1977 to early 1978. For the purpose of Clean Closure, the baghouse has been designated as a DWMU that includes the approximately 4,000 SF baghouse building and related equipment, including the baghouse tunnel, that conveyed air and dust from the melt shop to the baghouse. The baghouse dust was designated as a K061 waste stream as it meets the definition of K061 - Specific Source Waste from iron and steel sources in accordance with WAC 173-303-9904:

Emission control dust/sludge from the primary production of steel in electric furnaces.

In addition, an electrical utility trench that runs along the eastern perimeter of the baghouse was found to have significant sediment accumulation presumably contaminated with K061 dust.

From December 2019 to March 2020, Clean Harbors Environmental Services, on behalf of Star Forge, conducted extensive dust removal and cleaning of the baghouse equipment. The baghouse equipment, including the baghouse tunnel was cleaned to Alternative Treatment Standards using a combination of high-pressure steam and water sprays, and physical scrubbing. Approximately 119,000 lbs. of K061 dust and debris was removed and disposed of off-site from the baghouse tunnel and the baghouse structures.

The baghouse processing area and concrete slab is divided by a wall thereby creating two separate areas denoted as Baghouse North and Baghouse South. Photo 7 below is an aerial photo showing the baghouse areas designated as the DWMU. Photo 8 shows the baghouse facing west and the division of the structure for the purpose of the sampling and cleaning.

Photo 7: Baghouse Dangerous Waste Management Unit, Facing North, Adapted from Google Earth, 2008 Imagery

Photo 8: Baghouse Dangerous Waste Management Unit, Facing West, Adapted from Google Earth, 2008 Imagery

The utility trench and concrete slab of the baghouse were cleaned using high pressure steam and water sprays in June 2020 by DH Environmental as part of the baghouse DWMU evaluation. Photos 9 and 10 below show the baghouse utility trench while being cleaned, and after cleaning, respectively.

**Photo 9: Baghouse Utility Trench, Facing North,
16 June 2020**

**Photo 10: Baghouse Utility Trench, Facing South,
16 June 2020**

The sampling design for the baghouse consisted of gridding each area. The southern portion of the baghouse was gridded into six equal sized areas due to its larger size and the northern portion was divided into quadrants. The concrete utility trench east of the baghouse was divided into three equally spaced intervals along the length of the trench. See Figure 5 for the sample location detail.

Each sample was collected from areas of staining, if present. If no areas of staining were observed, the sample from the respective grid area was collected from the center of the grid area. Samples were collected by using a roto-hammer concrete drill and drilling into the concrete surface approximately 3-4 inches and extracting the drill bit. The drill tailings were then collected and placed into laboratory supplied sampling containers. Multiple drill holes were required to obtain sufficient sample volume. The drill holes were drilled in close proximity to each other.

Each sample, consisting of a composite of several drill hole tailings, was analyzed for gasoline range organics by NWTPH-Gx, diesel range organics by NWTPH-Dx, volatile organic compounds by EPA 8260C, PCBs by EPA Method

8082A, Total RCRA Metals + copper, nickel, and zinc, and TCLP for RCRA 8 Metals. The results are summarized in Table 3 and the Washington State Equivalent Calculations are summarized in Table 4.

Based on the results, the “Baghouse North” concrete slab designates as a K061 listed waste and should be considered hazardous debris subject to further investigation, decontamination or removal.

Pursuant to 40 CFR Appendix VII to Part 261 - Basis for Listing Hazardous Waste, K061 is listed for hexavalent chromium, lead, and cadmium. Therefore, we propose that the basis for listing and/or delisting the concrete debris associated with the Baghouse DWMU should be a demonstration that the concrete concentrations of hexavalent chromium, lead, and cadmium are below MTCA Method A levels for unrestricted land use. As shown in Table 3, the concentrations of lead and cadmium are below the MTCA Method A levels of 250 mg/kg and 2 mg/kg, respectively. The concentration of trivalent chromium is well below the MTCA Method A level of 2,000 mg/kg. However, hexavalent chromium was found in one location in the Baghouse North at 24 mg/kg, which is above the 19 mg/kg, MTCA Method A cleanup level. The Baghouse concrete containment also exceeds MTCA Method A unrestricted cleanup levels for diesel range hydrocarbons.

2.4 Summary of DWMUs Closure Status

Three DWMUs have been identified for closure in accordance with WAC 173-303-200(h). Table 1 below summarizes the current status of each DWMU in accordance with the Dangerous Waste Regulations.

DWMU Name	Media Designation	Performance Standard	Status of Numeric Clean Closure Levels
Central Accumulation Area	The DWMU concrete slab and superstructure are Non-Hazardous Debris.	High Pressure Steam and Water Sprays	Exceeds MTCA Method A, Unrestricted, for Diesel Range Organics
Tote Storage Area	The DWMU asphalt slab and superstructure are Non-Hazardous Debris.	High Pressure Steam and Water Sprays	Exceeds MTCA Method A, Unrestricted, for Diesel Range Organics and PCBs
Baghouse North	- The DWMU concrete slab is K061 Hazardous Debris. - The DWMU superstructure and baghouse tunnel is Non-Hazardous Debris.	High Pressure Steam and Water Sprays, Physical Abrasion and Scrubbing	Exceeds MTCA Method A, Unrestricted, for Diesel Range Organics and Hexavalent Chromium
Baghouse South	- The DWMU concrete slab is Non-Hazardous Debris. - The DWMU superstructure and baghouse tunnel is Non-Hazardous Debris.	High Pressure Steam and Water Sprays, Physical Abrasion and Scrubbing	Exceeds MTCA Method A, Unrestricted, for Diesel Range Organics
Baghouse Utility Trench	The Baghouse Utility Trench is Non-Hazardous Debris	High Pressure Steam and Water Sprays, Physical Abrasion and Scrubbing	Contaminant levels are below MTCA Method A

Table 1: Summary of DWMUs Closure Status

3.0 WASTE DESIGNATION OF SUSPECT MATERIALS

The following sections discuss the waste designation of materials remaining on-site that were either previously designated as Dangerous Waste, suspected of being Dangerous Waste, or required designation for off-site disposal.

3.1 Melt Shop / Forge Shop Slag

Previous sampling and analysis of slag and sludge in the melt shop and forge shop indicated this material contained high levels of chromium and other metals. Based on total metals only, the slag was designated as characteristic for chromium Toxicity. In addition, some of the slag and sludge removed from the pits was designated as characteristic for chromium, lead, and cadmium however no TCLP analysis was conducted on the slag waste stream. The previous D007, D006, and D008 designation was assumed based on total metals analysis.

On 28 May 2020, DH Environmental conducted additional sampling to thoroughly designate the remaining slag and solids in three different pits including the “AOD Pit”, “AFD Pit”, and the “HE Pit”. These locations are shown in Figure 6. Representative samples were collected from each pit and initially analyzed for VOCs by EPA 8260C, PAHs by EPA 8270D, PCBs by EPA 8082, and Total RCRA 8 Metals + Copper, Nickel, and Zinc as well as TCLP for RCRA 8 metals.

The slag exhibited high total concentrations of chromium, copper, and nickel consistent with previous total metals analysis. However, despite the high total concentrations, all samples “passed” the TCLP for RCRA 8 metals. In addition, the total analysis of volatiles by EPA 8260C and PAHs by EPA 8270D did not indicate the slag should designate as characteristic for any TCLP volatile or semi-volatile compounds.

Analysis has identified low level trace constituents listed in 40 CFR 261.31 (and WAC 173-303-9904), Wastes from Non-Specific Sources. For example, acetone was detected in the “AFP Pit” at a concentration of 0.0091 mg/kg as well as benzene at 0.0059 mg/kg. However, the original processes generating any of the trace constituents in question are unknown and therefore RCRA F Series is not applicable. This designation is consistent with USEPA interpretation of unknown F-Listed trace constituents:

Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not listed hazardous waste.³

After it was determined that no characteristic or listed waste designations should apply to the slag, Toxic Equivalent Concentration calculations were conducted on each sample in accordance with WAC 173-303-100(5). Samples exhibiting the highest Equivalent Concentrations calculated from the total metals analysis from each pit were then sent to Rainier Environmental of Fife, WA for analysis by Ecology Method 80-12, Dangerous Waste Fish Bioassay. The samples submitted for the fish bioassay study represented a worst-case sample from all the samples collected.

³ Management of Remediation Waste Under RCRA, EPA Publication 530-F-98-026

Subsequently, all of the samples submitted for Dangerous Waste Fish Bioassay testing resulted in zero mortality of the fish population exposed to the slag. The slag was then designated as Non-Dangerous Solid Waste. Attachment 4 is a waste designation package that serves as the designation record for the slag remaining in the Forge Shop and Melt Shop.

3.2 Concrete Stockpile

During the course of Clean Closure and equipment disposal activities, approximately 500 tons of concrete debris was generated to expose and repair underground piping that conveyed stormwater. The origin of the concrete was the “Heat Treat Area”. The concrete pile was previously sampled by Sound Earth Strategies on 03 March 2020. DH Environmental conducted additional sampling on 01 May 2020 to confirm the designation with additional data, and to collect a representative sample for a Dangerous Waste Fish Bioassay. The pile varied from large pieces of broken concrete to small granular sized particles. In addition, some soil overburden was commingled and removed with the concrete as was necessary to remove the concrete from the work area.

After the concrete stockpile was determined not to be a characteristic or listed waste, a Washington State Toxic Criteria book designation was conducted in accordance with WAC 173-303-100(5)(b)) on the highest levels detected for RCRA 8 Metals plus copper, nickel, and zinc, along with PAH values. The book designation resulted in an equivalent concentration of 0.0052 which designates as Dangerous Waste, Toxic, WT02. This book designation was refuted by a follow-up fish bioassay in accordance with WAC 173-303-110(3)(b), Biological Testing Methods for the Designation of Dangerous Waste, Method 80-12. The fish bioassay resulted in zero fish mortality therefore the waste stream was designated as Non-Dangerous Solid Waste. The concrete pile was shipped off-site and disposed of at the Roosevelt Regional Landfill from 10 June 2020 – 12 June 2020. Attachment 5 is a waste designation package that serves as the designation record for the concrete stockpile.

3.3 Underground Storage Tank Liquids, Sand, and Fill Slag

On 21 April 2020, DH Environmental sampled ten partially buried underground storage tanks (USTs) located within two locations on the east side of the site near E Marginal Way South as shown in Figure 2, with detail shown in Figure 8. The individual USTs are partially buried below grade but are within above grade structures consisting of concrete walls with the space between the tanks filled primarily with slag. Based on a review of historical documents and interviews with individuals that worked at the facility when it was operational, the USTs serviced metal cutting oil, diesel fuel, and various fuel oils including bunker oil.

Out of a total of eighteen USTs, eight of the tanks were empty, three contained sand from previous closure efforts, six contained oily water, and one contained diesel fuel. For each of the tanks that contained media, all were sampled and analyzed for volatile organic compounds by EPA Method 8260C, semi-volatile analysis by 8270D, PCBs by EPA Method 8082A, total metals, and follow up TCLP if warranted. In addition, the slag that surrounds the tanks in the tank system was sampled and analyzed for the same analytes with follow-up analysis for TCLP arsenic and chromium along with a Dangerous Waste Fish Bioassay. Sample locations for the slag are shown on Figure 8.

Based on the analysis of the UST liquids, sand, and surrounding fill slag, all the media designated as Non-Dangerous Solid Waste. The UST liquids were removed and disposed of or recycled off-site at appropriately permitted facilities

during the week of 12 May 2020. The fill-slag remains on-site along with the empty USTs which are, as of the date of this report, in the process of being licensed and registered so that they may be closed in accordance with WAC 173-360A. A UST plan to close the USTs in place, as permitted by Ecology's UST rules, has been submitted to the UST program. The designation packages for the UST liquids, sand, and slag are included as Attachment 6.

3.4 Area Wide Statistical Sampling

The interior of the main structure comprising the former melt shop, forge shop, and the heat treat area is shown in Figure 2. Star Forge conducted extensive removal of dust, fine particles, and exposed soil (henceforth "area wide dust") from the floor, trusses, and other structural surfaces during 2019 to early 2020. The area wide dust has been referred to as process waste in previous documents and correspondence. This material is a mixture of dust, fine particulates, soil "track-in" and exposed soil that accumulated throughout the facility over many years of operation. The material is not a waste stream that was generated from any one process or unit operation.

Previous designation of this material is based on total metals, TCLP metals and total PCBs. This waste stream previously "passed" TCLP for RCRA 8 metals. However, the total metals content caused the area-wide dust to "book designate" as a Toxic Criteria Dangerous Waste and was assigned WA State Dangerous Waste number WT02. A fish bioassay was not conducted to refute the book designation. Therefore, the WT02 designation was assumed and approximately 2,500,000 lbs. of the area wide dust were removed and disposed of as WA State Toxic Criteria WT02 waste during 2019 and early 2020.

Although most of the area wide dust has been removed from inside the buildings, some of this material remains on the floor of the facility and has possibly comingled with areas of exposed soil. Therefore, an area wide statistical analysis of the dust, fine particles, and exposed soil was conducted to designate the remaining material so that it can be properly managed during the forthcoming demolition of the structures.

The statistical evaluation of the area wide dust was conducted using Visual Sample Plan (VSP); a statistical software package developed by the Pacific Northwest National Laboratory. VSP integrates data quality objectives into a defensible sampling design and conducts the required calculations for sample size and sample location. The required sample size estimated by VSP is based on several variables including the constituent estimated concentration standard deviation, regulatory threshold, and desired confidence level.

The sample design for the area wide sampling incorporated 22 sample locations chosen randomly on a grid generated by VSP. The sampling locations are shown on Figure 9. All samples were analyzed for Volatiles by EPA Method 8260C, PCBs by EPA Method 8082A, Total RCRA Metals + Copper, Nickel, and Zinc, and TCLP RCRA 8 metals.

Based on the statistical analysis, the mean TCLP concentration of all RCRA 8 metals was below the respective thresholds for the toxicity characteristic. In addition, the mean PCB concentration of the area wide dust was shown to be 0.83 mg/kg. Analysis did identify low level trace VOCs listed in 40 CFR 261.31 (and WAC 173-303-9904), Wastes from Non-Specific Sources. The concentration of VOCs did not approach TCLP volatiles characteristic levels and none of the original processes generating any of the trace constituents in question are known therefore RCRA F Series is not applicable.

After the laboratory results were received, a Washington State Toxic Criteria book designation calculation was performed for each of the 22 samples taken throughout the facility. All samples had an Equivalent Concentration (EC) between 0.001% and 1.0%, resulting in a book designation of Washington State Toxic Criteria WT02. This book designation was refuted by a follow-up fish bioassay in accordance with WAC 173-303-110(3)(b). The two area wide samples with the highest EC calculations were selected for fish bioassay analysis. Both fish bioassays resulted in zero fish mortality and therefore the WT02 designation was refuted.

Based on the statistical analysis of total metals, TCLP metals, PCBs and VOCs, the area wide dust has been designed as Non-Dangerous Solid Waste. Further details about the sampling plan design are included in the SAP. In addition, the designation package for the area wide dust is included in Attachment 7. This designation is meant to apply to dust, fine particles, and above ground exposed soil remaining in the forge Shop, melt shop, and heat treat shop areas in the main facility structure. During the course of demolition and site stabilization, this media may need to be removed and disposed of off-site for several reasons including stormwater pollutant source control, dust control, and surface preparation for asphalt application to stabilize areas of exposed soil. This designation is not meant to apply to any subsurface environmental media.

4.0 SUMMARY AND RECOMMENDATIONS

Star Forge has conducted the required Clean Closure activities that can be accomplished under Washington's Dangerous Waste regulations with the structures still intact, and without interfering with the work being undertaken by EMJ. The concrete and asphalt slabs associated with the DWMU's, along with the soil and groundwater under the DWMUs, may require remediation following the completion of the Cleanup Action Plan for the Site.

Central Accumulation Area

The Central Accumulation Area concrete slab has been designated as Non-Hazardous Debris. The concrete slab does exceed MTCA Method A cleanup levels for diesel range organics. We recommend the slab should be either removed or scarified to meet site-wide cleanup levels once they have been established, after the superstructure has been demolished, and the CAP has been finalized. Further, we recommend additional investigation of the environmental media under the slab to ensure compliance with WAC 173-303-610(2) and (5). The slab should be protected during demolition to avoid cross contamination or further contamination of environmental media.

Tote Storage Area

The Tote Storage Area concrete slab has been designated as Non-Hazardous Debris. The concrete slab does exceed MTCA Method A cleanup levels for diesel range organics and PCBs. We recommend the slab should be either removed or scarified to meet site-wide cleanup levels once they have been established, after the superstructure has been demolished, and the CAP has been finalized. Further, we recommend additional investigation of the environmental media under the slab to ensure compliance with WAC 173-303-610(2) and (5). The slab should be protected during demolition to avoid cross contamination or further contamination of environmental media.

Baghouse

The Baghouse concrete slab has been designated as Hazardous Debris for K061 Listing. The concrete slab also exceeds MTCA Method A cleanup levels for diesel range hydrocarbons and hexavalent chromium. We recommend the slab should be either removed or scarified to meet site-wide cleanup levels once they have been established, after the superstructure has been demolished, and the CAP has been finalized. Further, we recommend additional investigation of the environmental media under the slab to ensure compliance with WAC 173-303-610(2) and (5). The slab should be protected during demolition to avoid cross contamination or further contamination of environmental media. The baghouse tunnel and all baghouse equipment should also be visually inspected once they have been brought to ground level so they can be safely and more thoroughly evaluated prior to off-site disposal or recycling.

Melt Shop / Forge Shop Slag

The slag remaining in the melt shop / forge shop has been designated as Non-Dangerous Solid Waste and is not subject to Clean Closure or the Dangerous Waste regulations. The slag does not present an impediment to demolition. However, the slag does contain high concentrations of heavy metals and should be targeted for evaluation under the RI/FS.

Concrete Stockpile

The concrete stockpile was designated as Non-Dangerous Solid Waste and was shipped off-site and disposed of at the Roosevelt Regional Landfill from 10 June 2020 – 12 June 2020. No further action is required for this waste stream other than to maintain designation records for five years in accordance with WAC 173-303-210.

Underground Storage Tank Liquids, Sand, and Fill Slag

All media associated with the USTs was designated as Non-Dangerous Solid Waste. The liquids in the USTs were disposed of off-site on during the week of 12 May 2020. The fill-slag remains on-site along with the empty USTs which are, as of the date of this report, in the process of being licensed and registered so that they may be closed in accordance with WAC 173-360A. The fill-slag does not present an impediment to demolition of the larger structures at the facility. However, the slag does contain high concentrations of heavy metals. Further study of the UST area has been targeted by EMJ for evaluation as part of the RI/FS.

Area Wide Dust

The area wide dust has been designated as Non-Dangerous Solid Waste. During the course of demolition and site stabilization, this media may need to be removed and disposed of off-site for several reasons including stormwater pollutant source control, dust control, and surface preparation for asphalt application to stabilize areas of exposed soil. Drums and/or solid waste containers should be available to contain the area wide dust before, during, and after demolition. The area wide dust may be removed through sweeping, vacuum truck, or by heavy equipment if necessary. The designation of the area wide dust does not apply to any subsurface environmental media.

			Passed ³	

Notes:

1. Equivalent Concentration Calculation as per WAC 173-303100
2. Fish Bioassay conducted per Ecology Publication 80-12.
3. For the purposes of refuting WA Toxic Criteria Book Designation, two area-wide samples (AW-8 and AW-16) with the highest E.C. values were selected for follow-up fish bioassay.

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

For the purposes of Clean Closure in accordance with the Dangerous Waste Regulations, we have identified all of the Dangerous Waste Management Units subject to Clean Closure. The Central Accumulation Area had been identified by historical documents and interviews with facility staff that worked at the facility when it was operational. The CAA been emptied of all Hazardous and Dangerous Waste and cleaned. The concrete berm and floors of the CAA were then cleaned using a hot water pressure washer. Concrete wash water was contained and captured using a vacuum truck. All waste generated from cleaning activities was designated and the designation information is included as a separate waste designation package. For reference waste generated from cleaning of the CAA was non-hazardous.

On 29 May 2020, DH Environmental conducted a sampling effort to determine if containment area of the CAA is considered Clean under WAC 173-303-200(12). The sampling design for the Central Accumulation Area consisted of gridding each area into four quadrants. A minimum of one sample was collected from the concrete floor surface in each of the sampling grids. Some minor staining was present and samples were collected from this area. In grind areas where staining was not present, the sample was collected from the center of each grid as described in the Sampling and Analysis Plan. Samples were collected by using a roto-hammer concrete drill and drilling into the concrete surface approximately 4-inches and extracting the drill bit. The drill cuttings were scraped up onto a dedicated piece of cardstock and placed into laboratory supplied sampling containers. Multiple drill holes were required to obtain sufficient sample volume, in which case the drill holes were located in close proximity to each other.

Representative samples were collected analyzed for total RCRA 8 metals by EPA Methods 6010D (arsenic, barium, cadmium, chromium, copper, lead, nickel, selenium, silver, and zinc) and 7471B (mercury); TCLP RCRA 8 metals by EPA methods 1311 (extraction), 6010D (all except mercury), and 7471B (mercury); PCBs by EPA method 8082; VOCs by EPA Method 8260. Even though they were not considered contaminants of concern, PAHs by EPA 8270D was conducted on one of the samples. Some samples exhibited total lead concentrations above 20 times the federal regulatory limit. However, despite the high total concentrations, all samples “passed” the TCLP. In addition, the total analysis of volatiles by EPA 8260C and PAHs by EPA 8270D did not indicate the concrete should designate as characteristic for any RCRA volatiles or semi volatile compounds. Analysis has identified low level trace constituents listed in 40 CFR 261.31 (and WAC 173-303-9904), Wastes from Non- Specific Sources. For example, acetone was detected at a highest concentration of 0.26 mg/kg as well as 2-butanone at 0.045 mg/kg and Tetrachloroethene at 0.0032 mg/kg. However, the original processes generating any of the trace constituents in question are unknown and therefore RCRA F Series is not applicable. This designation is consistent with USEPA interpretation of unknown F-Listed trace constituents: Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not listed hazardous waste. After it was determined that no characteristic or listed waste designations should apply to the concrete dust, toxic equivalent concentration calculations were conducted on each sample in accordance with WAC 173-303-100(5). A Washington state toxic criteria book designation calculation was performed for each of the 4 samples taken throughout the floor of the CAA. All samples had an Equivalent Concentration (EC) less than 0.001%, therefore the waste stream has been designated as a non-dangerous waste.

Project:
Star Forge – Waste Designation Sampling

Date:
05/29/2020

Owner:
Star Forge

Time of Arrival:
0900

Report Number:
1

Prepared by:
Nathan Moxley

Location:
CAA & Baghouse-North

Time of Departure:
1430

Page:
Page 1 of 1

Purpose of Site Visit:
Waste Designation Sampling

Weather:
Clear, ~70-deg F

Travel/Prep. Time:
2.5 hr.

Project/Contract Number:
Work Order 03 - Clean Closure

Upon arrival to the site I assessed personal safety hazards: ☒ Yes or ☒ Referred to Site Safety Plan and Safety Tailgate if applicable
Safety Hazards Were Addressed by : ☐ Performing toolbox safety meeting ☒ Donning PPE, and observing safety standards

Site Visit Purpose and Details:

To collect samples of the concrete in the CAA and N. end of the baghouse. Samples were collected in accordance with the Clean Closure Sampling Analysis Plan.

Summary of Field Activities:

Nathan Moxley and Brian Johnson of DH Environmental arrived onsite at approximately 0900. Upon arrival we conducted a health and safety tailgate meeting and unloaded sampling equipment. The CAA and Baghouse-N were both divided into quadrants and samples were collected from each quadrant. Samples were collected from areas where staining was observed on the concrete. Samples were collected as prescribed in the SAP, by drilling 8-10 holes in the concrete with a roto-hammer. The dust from each hole was collected on a dedicated piece of cardstock and placed directly into laboratory supplied sampling containers.

Following the collection of each sample, a photo was taken. Photos are provided in the attached photo log.

The samples were hand delivered to Onsite Environmental, in Redmond, WA following chain of custody protocols.

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-232

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on May 29, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 2, 2020
Samples Submitted: May 29, 2020
Laboratory Reference: 2005-232
Project: Star Forge

Case Narrative

Samples were collected on May 29, 2020 and received by the laboratory on May 29, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for surrogate Dibromofluoromethane is outside of the control limits for all samples due to matrix effects.

Total Metals EPA 6010D/7471B Analysis

The duplicate RPD for Nickel is outside control limits due to sample inhomogeneity.

Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

DANGEROUS WASTE DESIGNATION FORM – Tote Storage Area Clean Closure Designation Sampling

Star Forge, Former Jorgenson Forge Property

A. WASTE STREAM NAME AND GENERATION INFORMATION

Waste Stream Name: Tote Storage Area (TSA) Clean Closure Designation Sampling

Generation Process: Asphalt dust generated from core samples collected from the containment floor of the TSA performed as part of site Clean Closure activities.

RCRA ID Number that waste will be managed under:

Star Forge LLC, DBA Jorgenson Forge:
WAD000602813

Total Quantity and/or Estimated Generation rate:

No waste will be generated during site demolition.

Other Descriptions (i.e. Shop, Project, Etc.):

B. WASTE PROPERTIES, CHARACTERISTICS, and CONSTITUENTS:

Physical State:

- ☒ Solid (pass paint filter)
☐ Solid w/freestanding or absorbed liquid
☐ Liquid (If liquid, indicate if the liquid is:
 ☐ Single Layer
 ☐ Multi-layer

pH:

- ☐ < 2 [D002]
☐ > 2 but < 12.5
☒ N/A ☐ > 12.5 [D002]

Flashpoint:

- ☒ N/A ☐ < 140 °F [D001]
☐ > 140 °F but < 200 °F
☐ > 200 °F

Characteristic	PCB Content	TCLP Metals	Total Metals		
			mg/kg	ug/kg	ug/L
☐ Ignitable [D001]	☐ Not Detected	☐ Arsenic ≥ 5.0 mg/L [D004]	Arsenic:	24	☐ ND
☐ Corrosive [D002]	[non TSCA or State Regulated]	☐ Barium ≥ 100.0 mg/L [D005]	Barium:	86	☐ ND
☐ Reactive [D003]	☐ Not Sampled	☐ Cadmium ≥ 1.0 mg/L [D006]	Cadmium:		☒ ND
☐ Toxic [D004 – D043]	☒ ≥ 2 ppm and < 50 ppm [Potentially TSCA Regulated or State Regulated PCB Waste-WPCB]	☐ Chromium ≥ 5.0 mg/L [D007]	Chromium:	200	☐ ND
List Here:	☐ ≥ 50 ppm [TSCA Regulated]	☐ Lead ≥ 5.0 mg/L [D008]	Lead:	26	☐ ND
	☐ < 1 ppm	☐ Mercury ≥ 0.2 mg/L [D009]	Mercury:		☒ ND
	Note: Results ranged from 15.1 - 40 mg/kg total PCB's. The original source is unknown, and Star Forge is not aware of any PCBs stored, released, or otherwise managed at this location. WPCB code does not apply	☐ Selenium ≥ 1.0 mg/L [D010]	Selenium:		☒ ND
		☐ Silver ≥ 5.0 mg/L [D011]	Silver:		☒ ND
		Check if: ☐ Assumed	Copper:	44	☐ ND
		☒ TCLP Conducted	Nickel:	53	☐ ND
		☐ TCLP Not Conducted	Zinc:	85	☐ ND
		Comments: TCLP analysis was conducted on all samples.	Comments: Total metals data represents the highest metals concentration across all 4 samples.		

Physical Composition (list all constituents, including debris, any absorbents, liquid range, etc.).

Constituent	Volume (Range %)
Asphalt Dust	100

C. LISTED WASTE

☐ Discarded Listed Chemical Product (U or P List):

- ☐ Listed Source Waste (F or K List):
☒ Not Applicable:

D. WA STATE CRITERIA WASTE

☐ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

WA Toxic Criteria Equivalent Concentration (E.C):	WA Persistent Criteria Total HOC	WA Persistent Criteria Total PAH
☒ < 0.001 % [not a Toxic Criteria DW]	☒ < 0.01 % [NOT APPLICABLE]	☒ < 1.0% [NOT APPLICABLE]
☐ 0.001 ≥ 1.0 % [WT02 – DW]	☐ 0.01 to 1.0% [WP02 – DW]	☐ > 1.0% [WP03 – EHW]
☐ ≥ 1.0% [WT01 – EHW]	☐ > 1.0 % [WP01 – EHW]	

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

For the purposes of Clean Closure in accordance with the Dangerous Waste Regulations, we have identified all of the Dangerous Waste Management Units subject to Clean Closure. The Tote Storage Area(TSA) had been identified by historical documents and interviews with facility staff that worked at the facility when it was operational. The TSA been emptied of all Hazardous and Dangerous Waste and cleaned. The concrete berm and asphalt floor of the TSA were then cleaned using a hot water pressure washer. Wash water was contained and captured using a vacuum pump. All waste generated from cleaning activities were designated and the designation information is included as a separate waste designation package. For reference waste generated from cleaning of the TSA was non-hazardous.

On June 3, 2020, DH Environmental conducted a sampling effort to determine if containment area of the TSA is considered Clean under WAC 173-303-200(12). The sampling design for the TSA consisted of gridding the area into four quadrants. A minimum of one sample was collected from the asphalt floor surface in each of the sampling grids. Some minor staining was present, and samples were collected from that area. In grind areas where staining was not present, the sample was collected from the center of each grid as described in the Sampling and Analysis Plan. Samples were collected by using a roto-hammer drill and drilling into the asphalt surface approximately 4-inches and extracting the drill bit. The drill cuttings were scraped up onto a dedicated piece of cardstock and placed into laboratory supplied sampling containers. Multiple drill holes were required to obtain sufficient sample volume, in which case the drill holes were located in close proximity to each other.

Analytical results indicated that some samples exhibited total metals concentrations above 20 times the federal regulatory limit. However, despite the high total concentrations, all samples “passed” the TCLP. In addition, the total analysis of volatiles by EPA 8260C did not indicate the asphalt should designate as characteristic for any RCRA volatiles or semi volatile compounds. Analysis has identified low level trace constituents listed in 40 CFR 261.31 (and WAC 173-303-9904), Wastes from Non-Specific Sources. For example, acetone was detected at a highest concentration of 0.26 mg/kg, benzene at 0.0014 mg/kg, 1,1,1-Trichloroethane at 0.0018, as well as 2-butanone at 0.081 mg/kg and Xylene at 0.0025 mg/kg. However, the original processes generating any of the trace constituents in question are unknown and therefore RCRA F Series is not applicable. This designation is consistent with USEPA interpretation of unknown F-Listed trace constituents: Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not listed hazardous waste. Concentrations of PCB’s were detected in each of the 4 samples. The levels ranged from 15.1 mg/kg - 40 mg/kg total PCB’s. However, the original source of the PCBs is unknown, and Star Forge is not aware of any PCBs stored, released, or otherwise managed at this location. Therefore, the Washington State WPCB source code listing should not apply to the concrete as the listing applies when the source is from the following, or residues thereof, in accordance with WAC 173-303-9904:

After it was determined that no characteristic or listed waste designations should apply to the dust, toxic equivalent concentration calculations were conducted on each sample in accordance with WAC 173-303-100(5). A Washington state toxic criteria book designation calculation was performed for each of the 4 samples taken throughout the floor of the TSA. All samples had an Equivalent Concentration (EC) less than 0.001%, therefore the waste stream has been designated as a non-dangerous waste.

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2006-050

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on June 3, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 9, 2020
Samples Submitted: June 3, 2020
Laboratory Reference: 2006-050
Project: Star Forge

Case Narrative

Samples were collected on June 3, 2020 and received by the laboratory on June 3, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for surrogate Dibromofluoromethane is outside of the control limits for samples BH-S-SE, BH-S-SW, BH-S-M-E, BH-S-M-W, BH-S-NE, and BH-S-NW due to sample matrix effects.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

DANGEROUS WASTE DESIGNATION FORM – Baghouse Clean Closure Designation Sampling

Star Forge, Former Jorgenson Forge Property

A. WASTE STREAM NAME AND GENERATION INFORMATION

Waste Stream Name Baghouse Area(BHA) Clean Closure Designation Sampling

Generation Process: Concrete dust generated from concrete core samples collected from floor of the Baghouse Area performed as part of site Clean Closure activities.

RCRA ID Number that waste will be managed under:

Star Forge LLC, DBA Jorgenson Forge:
WAD000602813

Total Quantity and/or Estimated Generation rate:

No waste will be generated during site demolition.

Other Descriptions (i.e. Shop, Project, Etc.):

B. WASTE PROPERTIES, CHARACTERISTICS, and CONSTITUENTS:

Physical State:

- ☒ Solid (pass paint filter)
☐ Solid w/freestanding or absorbed liquid
☐ Liquid (If liquid, indicate if the liquid is:
☐ Single Layer
☐ Multi-layer

pH:

- ☐ < 2 [D002]
☐ > 2 but < 12.5
☒ N/A ☐ > 12.5 [D002]

Flashpoint:

- ☐ < 140 °F [D001]
☐ > 140 °F but < 200 °F
☒ N/A ☐ > 200 °F

Characteristic	PCB Content	TCLP Metals	Total Metals
			mg/kg ug/kg mg/L ug/L
☐ Ignitable [D001]	☒ Not Detected	☐ Arsenic ≥ 5.0 mg/L [D004]	Arsenic: 22 ☐ ND
☐ Corrosive [D002]	[non TSCA or State Regulated]	☐ Barium ≥ 100.0 mg/L [D005]	Barium: 72 ☐ ND
☐ Reactive [D003]	☐ Not Sampled	☐ Cadmium ≥ 1.0 mg/L [D006]	Cadmium: 1.2 ☐ ND
☐ Toxic [D004 – D043]	☐ ≥ 2 ppm and < 50 ppm	☐ Chromium ≥ 5.0 mg/L [D007]	Chromium: 150 ☐ ND
List Here:	[Potentially TSCA Regulated or State Regulated PCB Waste-WPCB]	☐ Lead ≥ 5.0 mg/L [D008]	Lead: 130 ☐ ND
	☐ ≥ 50 ppm [TSCA Regulated]	☐ Mercury ≥ 0.2 mg/L [D009]	Mercury: ☒ ND
	☐ < 1 ppm	☐ Selenium ≥ 1.0 mg/L [D010]	Selenium: ☒ ND
	Note:	☐ Silver ≥ 5.0 mg/L [D011]	Silver: ☒ ND
	IF WASTE STREAM IS BEING MANAGED AS TSCA WASTE, DO NOT USE WPCB STATE CODE PER WAC 173-303-071(3)(k)	Check if: ☐ Assumed ☒ TCLP Conducted ☐ TCLP Not Conducted	Copper: 40 ☐ ND
		Comments: All samples passed TCLP	Nickel: 29 ☐ ND
			Zinc: 220 ☐ ND
			Comments: Total metals data represents the highest metals concentration across all samples.

Physical Composition (list all constituents, including debris, any absorbents, liquid range, etc.).

Constituent	Volume (Range %)
Concrete Dust	100

C. LISTED WASTE

☐ Discarded Listed Chemical Product (U or P List):

☒ Listed Source Waste (F or K List): **K061**

☐ Not Applicable:

D. WA STATE CRITERIA WASTE

☐ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

For the purposes of Clean Closure in accordance with the Dangerous Waste Regulations, we have identified all of the Dangerous Waste Management Units subject to Clean Closure. The Baghouse had been identified by historical documents and interviews with facility staff that worked at the facility when it was operational and includes the approximately 4,000 SF baghouse building and related equipment, including the baghouse tunnel, that conveyed air and dust from the melt shop to the baghouse. In addition, the baghouse processing area and concrete slab is divided by a wall thereby creating two separate areas denoted as Baghouse North and Baghouse South and electrical utility trench that runs along the eastern perimeter of the baghouse was found to have significant sediment accumulation presumably contaminated with baghouse dust. The baghouse dust was designated as a K061 waste stream as it meets the definition of K061 Specific Source Waste from iron and steel sources in accordance with WAC 173-303-9904.

The BHA has been emptied of all Hazardous and Dangerous Waste and cleaned. From December 2019 to March 2020, Clean Harbors Environmental Services conducted extensive dust removal and cleaning of the baghouse equipment. The baghouse equipment, including the baghouse tunnel was cleaned to Alternative Treatment Standards using a combination of high-pressure steam and water sprays and physical scrubbing. The utility trench and concrete slab of the baghouse was cleaned using high pressure steam and water sprays in June 2020 by DH Environmental as part of the baghouse DWMU evaluation. Approximately 119,000 lbs of dust and debris was removed and disposed of off-site from the baghouse tunnel and the baghouse structures. Since K061 Listed Hazardous Waste Code, all waste generated from cleaning activities was designated as K061 and managed as such offsite.

On June 3, 2020, DH Environmental conducted a sampling effort to determine if containment area of the BHA is considered Clean under WAC 173-303-200(12). The sampling design for the BHA consisted of gridding each area into four quadrants. A minimum of one sample was collected from the concrete floor surface in each of the sampling grids. Some minor staining was present, and samples were collected from this area. In grind areas where staining was not present, the sample was collected from the center of each grid as described in the Sampling and Analysis Plan. Samples were collected by using a roto-hammer concrete drill and drilling into the concrete surface approximately 4-inches and extracting the drill bit. The drill cuttings were scraped up onto a dedicated piece of cardstock and placed into laboratory supplied sampling containers. Multiple drill holes were required to obtain sufficient sample volume, in which case the drill holes were located in close proximity to each other.

Some representative samples exhibited total metals concentrations above 20 times the federal regulatory limit. However, despite the high total concentrations, all samples “passed” the TCLP. In addition, the total analysis of volatiles by EPA 8260C and PAHs by EPA 8270D did not indicate the concrete should designate as characteristic for any RCRA volatiles or semi volatile compounds. Analysis has identified low level trace constituents listed in 40 CFR 261.31 (and WAC 173-303-9904), Wastes from Non- Specific Sources. For example, acetone was detected at a highest concentration of 0.05 mg/kg. However, the original processes generating any of the trace constituents in question are unknown and therefore RCRA F Series is not applicable. This designation is consistent with USEPA interpretation of unknown F-Listed trace constituents: Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not an F-listed hazardous waste.

Based on the results, we have concluded that the "Baghouse North" concrete slab designates as a K061 listed waste and should be considered hazardous debris subject to further contamination or removal.

Pursuant to 40 CFR Appendix VII to Part 261 - Basis for Listing Hazardous Waste, K061 is listed for hexavalent chromium, lead, and cadmium. Therefore, we propose that the basis for listing and/or delisting the concrete debris associated with the Baghouse DWMU should be demonstration that the concrete concentrations of hexavalent chromium, lead, and cadmium are below MTCA Method A levels for unrestricted land use. The concentrations of lead and cadmium are below the MTCA Method A levels of 250 mg/kg and 2 mg/kg, respectively. The concentration of trivalent chromium is well below the MTCA Method A level of 2,000 mg/kg. However, hexavalent chromium was found in one location in the Baghouse North at 24 mg/kg, which is above the 19 mg/kg, MTCA Method A cleanup level. The Baghouse concrete containment also exceeds MTCA Method A unrestricted cleanup levels for diesel range hydrocarbons.

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-232

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on May 29, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 2, 2020
Samples Submitted: May 29, 2020
Laboratory Reference: 2005-232
Project: Star Forge

Case Narrative

Samples were collected on May 29, 2020 and received by the laboratory on May 29, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for surrogate Dibromofluoromethane is outside of the control limits for all samples due to matrix effects.

Total Metals EPA 6010D/7471B Analysis

The duplicate RPD for Nickel is outside control limits due to sample inhomogeneity.

Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2006-050

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on June 3, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 9, 2020
Samples Submitted: June 3, 2020
Laboratory Reference: 2006-050
Project: Star Forge

Case Narrative

Samples were collected on June 3, 2020 and received by the laboratory on June 3, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for surrogate Dibromofluoromethane is outside of the control limits for samples BH-S-SE, BH-S-SW, BH-S-M-E, BH-S-M-W, BH-S-NE, and BH-S-NW due to sample matrix effects.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2006-184

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on June 17, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 19, 2020
Samples Submitted: June 17, 2020
Laboratory Reference: 2006-184
Project: Star Forge

Case Narrative

Samples were collected on June 17, 2020 and received by the laboratory on June 17, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

The percent recovery for surrogate Dibromofluoromethane is outside of the control limits due to sample matrix effects.

Total Metals EPA 6010D/7471B Analysis

The duplicate RPD for Barium, Chromium, Copper And Zinc are outside control limits due to sample inhomogeneity.

The Matrix Spike/ Matrix Spike Duplicate recoveries for Cadmium, Lead and Nickel are outside control limits due to matrix effects. The Spike Blank recovery was 90% for Cadmium, 96% for Lead and 98% for Nickel

The Matrix Spike/ Matrix Spike Duplicate recoveries for Zinc are outside control limits due to matrix inhomogeneity.. The Spike Blank recovery was 104%.

The Matrix Spike/Matrix Spike Duplicate RPD for Zinc is outside control limits due to matrix inhomogeneity.

The practical quantitation limit for Silver is elevated due to interferences present in the sample BH-SE-Trench-WC - 02, (06-184-02).

Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-232B

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on May 29, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 29, 2020
Samples Submitted: May 29, 2020
Laboratory Reference: 2005-232B
Project: Star Forge

Case Narrative

Samples were collected on May 29, 2020 and received by the laboratory on May 29, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

- ☐ Discarded Listed Chemical Product (U or P List):
☐ Listed Source Waste (F or K List):
☒ Not Applicable:

D. WA STATE CRITERIA WASTE

☐ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

WA Toxic Criteria Equivalent Concentration (E.C):	WA Persistent Criteria Total HOC	WA Persistent Criteria Total PAH
☐ < 0.001 % [not a Toxic Criteria DW]	☒ < 0.01 % [NOT APPLICABLE]	☒ < 1.0% [NOT APPLICABLE]
☒ 0.001 ≥ 1.0 % [WT02 – DW]	☐ 0.01 to 1.0% [WP02 – DW]	☐ > 1.0% [WP03 – EHW]
☐ ≥ 1.0% [WT01 – EHW]	☐ > 1.0 % [WP01 – EHW]	

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

On 28 May 2020, DH Environmental conducted a sampling effort to thoroughly designate the remaining slag and solids in three different pits including the “AOD Pit”, “AFD Pit”, and the “HE Pit”. These locations are shown in the field report for the attached slag designation package. Although slag from each pit was designated individually, the slag designation package represents all of the visible slag remaining in pits at the site as of the date of this letter. Representative samples were collected from each pit and initially analyzed for volatiles by EPA 8260C, PAHs by EPA 8270D, PCBs by EPA 8082, and Total RCRA 8 Metals + Copper, Nickel, and Zinc as well as TCLP for RCRA 8 metals.

The slag exhibited high total concentrations of chromium, copper, and nickel consistent with previous total metals analysis. However, despite the high total concentrations, all samples “passed” the TCLP for RCRA 8 metals. In addition, the total analysis of volatiles by EPA 8260C and PAHs by EPA 8270D did not indicate the slag should designate as characteristic for any RCRA volatiles or semi volatile compounds.

Analysis has identified low level trace constituents listed in 40 CFR 261.31 (and WAC 173-303-9904), Wastes from Non-Specific Sources. For example, acetone was detected in the “AFP Pit” at a concentration of 0.0091 mg/kg as well as benzene at 0.0059 mg/kg. However, the original processes generating any of the trace constituents in question are unknown and therefore RCRA F Series is not applicable. This designation is consistent with USEPA interpretation of unknown F-Listed trace constituents:

Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not listed hazardous waste.¹

After it was determined that no characteristic or listed waste designations should apply to the slag, toxic equivalent concentration calculations were conducted on each sample in accordance with WAC 173-303-100(5). Samples exhibiting the highest equivalent concentration calculated from the total metals analysis from each pit were then sent to Rainier Environmental of Fife, WA for analysis by Ecology Method 80-12, Dangerous Waste Fish Bioassay. The samples submitted for fish the bioassay study represented a worst-case sample from all the samples collected. Subsequently, all of the samples

¹ Management of Remediation Waste Under RCRA, EPA530-F-98-026

submitted for Dangerous Waste Fish Bioassay testing resulted in zero mortality of the fish population exposed to the slag. The slag was then designated as non-dangerous solid waste.

Project/Contract Number:
Work Order 03 – Clean Closure

Upon arrival to the site I assessed personal safety hazards: ☒ Yes or ☒ Referred to Site Safety Plan and Safety Tailgate if applicable
Safety Hazards Were Addressed by : ☒ Performing tool box safety meeting ☒ Donning PPE, and observing safety standards

Site Visit Purpose and Details:

A site visit was conducted to collect samples of metal slag-like material observed in several subsurface process pits. Samples are to support waste designation of the material.

Summary of Field Activities:

Nathan Moxley and Brian Johnson of DH Environmental arrived onsite at approximately 0900. Upon arrival we unloaded confined space equipment, tools, and sampling equipment, and set up near the work areas. A tailgate Health and Safety meeting was conducted, and notifications were made to Seattle Fire Dept. of confined space entry work. Pre-entry air monitoring was conducted and a confined space entry permit was filled out. Then ladders were set up and anchored as needed to safely access process pits.

Three pits were identified with slag-like material in them. The pits and sample locations are identified below. All samples were slag-like material unless identified otherwise.

AOD Pit

1. AOD-WC-1, collected from the sloping base of the AOD pit in the northwest corner.
2. AOD-WC-2, collected from the west wall of the AOD pit, approximately 6-ft above the base, and approximately 5-ft north of the south wall.
3. AOD-WC-3, collected from the south wall of the AOD pit, approximately 3-ft above grade, and 1-ft east of the west wall. This sample was collected beneath a white colored, fibrous, insulation-like material
4. AOD-WC-4, sample from the white, fibrous, insulation-like material over sample AOD-WC-3
5. AOD-WC-ACM-01, split sample of AOD-WC-4, submitted separately to NVL Labs for analysis of asbestos

Arc Furnace Pit

6. AFP-WC-1, collected from the south wall of the Arc Furnace Pit, approximately 2-ft east of the centerline and approximately 2-ft below grade
7. AFP-WC-2, collected from the base of the Arc Furnace Pit, just east of AFP-WC-1
8. AFP-WC-3, collected from the north wall of the Arc Furnace Pit, approximately along the centerline, and approximately 7-ft above the base of the pit

HE-18-Pit (Ingot Mold Pit)

This pit was identified in the field based on its location adjacent to, and between columns HE-17, HE-18, and HE-19. This pit is identified by Shannon and Wilson as the Ingot Mold Pit.

9. HE-18-Pit-WC-1, collected from the base of the pit in the southwest corner.
10. HE-18-Pit-WC-2, collected from multiple areas across the northern wall of the pit

All samples were submitted to OnSite Environmental following chain of custody protocol and submitted for analysis of VOCs, PCBs, total RCRA 8 metals, plus copper, nickel, and zinc, and TCLP RCRA 8 Metals. In addition, two samples were selected at random for analysis of SVOCs. Samples were collected by breaking off loose material using a rock hammer and placing it into a clean 1-gal zip-lock bag. The sample was then crushed inside the bag to the extent possible using a rock hammer, before being placed into sampling jars. Samples 'AOD-WC-2', 'AOD-WC-4', and 'HE-18-Pit-WC-1' could not be easily crushed and were submitted directly to the lab inside the zip-lock bags. The lab was asked to break down and process the samples as needed prior to analysis.

- Photos are included in a separate photo log.
- Sample locations are shown on attached site map.

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-208

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on May 28, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DB", with a long horizontal flourish extending to the right.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: June 2, 2020
Samples Submitted: May 28, 2020
Laboratory Reference: 2005-208
Project: Star Forge

Case Narrative

Samples were collected on May 28, 2020 and received by the laboratory on May 28, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all Solid sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Volatiles EPA 8260D Analysis

Method 5035A VOA vials were not provided for samples AOD-WC-2, AOD-WC-4, and HE-18-Pit-WC-2. The samples were therefore extracted from one-gallon Ziploc bags and analyzed. In addition, the bag for sample HE-18-Pit-WC-2 was received by the lab unzipped (open). Samples AOD-WC-2 and HE-18-Pit-WC-2 had to be hammered outside of the bag to break up the samples for analysis. Due to all of these factors, some loss of volatiles may have occurred.

Some MTCA Method A cleanup levels are non-achievable for sample AOD-WC-4 due to the sample matrix.

Sample HE-18-Pit-WC-1 had one surrogate that was low after the first analysis. The second VOA vial containing a stir bar was prepped for reanalysis but broke during vortexing. Method 5035A states that for low-level VOC analysis the purge-and-trap system employed must be capable of agitating the sealed sample during the purging process. The purge-and-trap system that OnSite Environmental utilizes for the analysis of low-level VOCs has a stir motor that spins a magnetic stir bar within the sample thereby agitating the sample and providing more efficient purging. Due to the aforementioned failed analyses, a VOA vial without a stir bar was analyzed and reported for the low-level VOC analysis.

Total Metals EPA 6010D/7471B Analysis

Due to the high concentration of Chromium, Copper, Nickel in the QC sample, the amount spiked was insufficient for meaningful MS/MSD recovery data. The Spike Blank recovery was 97 % for Chromium, 101% for Copper and 105% for Nickel.

The duplicate RPD for Copper is outside control limits due to sample inhomogeneity.

The Matrix Spike/ Matrix Spike Duplicate recoveries for Barium, Cadmium, Lead, Selenium and Zinc are outside control limits due to matrix effects. The Spike Blank recovery was 97% for Barium, 93% for Cadmium, 95% for Lead, 101% for Selenium and 102% for Zinc.

The Matrix Spike/Matrix Spike Duplicate RPD for Selenium is outside control limits due to matrix effect,

The practical quantitation limit was elevated for Arsenic, Cadmium, Selenium and Silver due to interferences present in the sample.

The samples AOD-WC-2 (05-208-02), AOD-WC-4(05-208-04), HE-18-Pit-WC-1 (05-208-07) and HW-18-Pit-WC-2 (05-208-09) were reported on a wet weight basis.

Please note that any other QA/QC issues associated with these extractions and analyses will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-208B

Dear Dave:

Enclosed are the analytical results and associated quality control data for samples submitted on May 28, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Dangerous Waste Characterization

Sample ID's: AOD-WC-1; AFP-WC-2; HE-18-Pit-WC-1

Report date: June 15, 2020

Suite 20
Tacoma, WA 98424

1.0 INTRODUCTION

A dangerous waste characterization using the test organism *Oncorhynchus mykiss* (rainbow trout) was conducted on three samples submitted by Onsite Environmental to Rainier Environmental. Testing was conducted following the Washington State Department of Ecology Publication 80-12.

2.0 METHODS

The samples, identified as AOD-WC-1, AFP-WC-2 and HE-18-Pit-WC-1 were received in the laboratory on June 8, 2020. Upon arrival at the laboratory the samples were inspected and contents verified against information provided on the chain-of-custody form. The samples were stored at 4°C in the dark until use. The test procedure is outlined in Table 1.

Table 1. Summary of Dangerous Waste Characterization Test Conditions

Parameter	Standard Fish Toxicity Test
Test number's	2006-009; 2006-010; 2006-011
Sample ID's	AOD-WC-1; AFP-WC-2; HE-18-Pit-WC-1
Test initiation date; time	6/10/2020; 0855h
Test termination date; time	6/14/2020; 0910h
Endpoint	Mortality at 96-hours
Test chamber	7.5 L plastic tank
Test temperature	12 ± 1°C
Dilution water	Moderately hard synthetic water
Test solution volume	6 L
Test concentrations (mg/L)	100, 10, 0
Number of organisms/chamber	10
Number of replicates	3
Test organism	<i>Oncorhynchus mykiss</i> (rainbow trout)
Feeding	No feeding during test
Photoperiod	16 hours light/ 8 hours dark
Extraction	Rotary agitation (30 +/- 2 rpm) for 18 hours
Reference Toxicant	Copper sulfate
Deviations	None

The test organisms used in the test are outlined in Table 2. The samples were tested using fish received on April 22, 2022.

Table 2. Test organisms (*Oncorhynchus mykiss*)

Test organism age	52 days post swim-up (hatch date 4/1/2020)
Mean weight	0.36 g
Mean length	35 mm
Ratio of longest to shortest	1.2
Loading	0.59 g/L
Test organism source	Trout Lodge; Sumner, WA

3.0 RESULTS

A summary of results for the dangerous waste characterization conducted on samples AOD-WC-1, AFP-WC-2 and HE-18-Pit-WC-1 are contained in Table 3. There was no mortality in the control or in any of the samples. Based on these results, the samples do not designate as either dangerous or extremely hazardous waste. Copies of the laboratory bench sheets, statistical summaries of reference toxicant tests, and chain-of-custody form are provided in Appendices A through C.

Table 3. Summary of Results

Sample ID	Concentration (mg/L)	Survival (# fish, N=30)	Percent Mortality	Dangerous Waste Designation
Control	0	30	0	NA
AOD-WC-1	10	30	0	None
	100	30	0	
AFP-WC-2	10	30	0	None
	100	30	0	
HE-18-Pit-WC-1	10	30	0	None
	100	30	0	

4.0 QUALITY ASSURANCE

The most recently completed reference toxicant test was initiated June 4, 2020. The LC₅₀ of 138 g/L copper fell within the acceptable range of mean $\pm$ two standard deviations of historical test results indicating that the test organisms were of an appropriate degree of sensitivity. The coefficient of variation (CV) for the last 20 tests was 29.8 percent, which is considered excellent by the Biomonitoring Science Advisory Board.

DANGEROUS WASTE DESIGNATION FORM – Concrete Debris

Star Forge, Former Jorgenson Forge Property, Concrete Debris

A. WASTE STREAM NAME AND GENERATION INFORMATION

Waste Stream Name: Concrete Debris

Generation Process: Concrete pile generated from repair of stormwater piping conveyance.

RCRA ID Number that waste will be managed under:

Star Forge LLC, DBA Jorgenson Forge:
WAD000602813

Total Quantity and/or Estimated Generation rate:

Approximately 500 tons.

Other Descriptions (i.e. Shop, Project, Etc.):

B. WASTE PROPERTIES, CHARACTERISTICS, and CONSTITUENTS:

Physical State: ☒ Solid (pass paint filter) ☐ Solid w/freestanding or absorbed liquid ☐ Liquid (If liquid, indicate if the liquid is: ☐ Single Layer ☐ Multi-layer		pH: ☐ < 2 [D002] ☐ > 2 but < 12.5 ☒ N/A ☐ > 12.5 [D002]

☐ ≥ 1.0% [WT01 – EHW]	☐ > 1.0 % [WP01 – EHW]	

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

A Washington State toxic criteria book designation was conducted in accordance with WAC 173-303-100(5)(b)) on the highest levels detected for RCRA 8 Metals + Cu, Ni, and Zn along with PAH values. The book designation resulted in an equivalent concentration of 0.0052 which designates as Dangerous Waste, Toxic, WT02. This book designation was refuted by a follow-up fish bioassay in accordance with WAC 173-303-110(3)(b), Biological Testing Methods for the Designation of Dangerous Waste, Method 80-12. The fish bioassay resulted in zero fish mortality and this waste stream is therefore designated as non-dangerous waste.

FR-1 Star Forge Site Waste
Sampling 5-1-20

Project:
Star Forge, LLC

Date:
5/1/2020

Owner:
Star Forge, LLC

Time of Arrival:
1000

Report Number:
1

Prepared by:
Stacy Fox, CHMM

Location:
8531 East Marginal Way

Time of Departure:
1130

Page:
Page 1 of 2

Purpose of Site Visit:
Waste Characterization Sampling

Weather:
Clear, sunny, ~65 deg F

Travel/Prep. Time:
1 hr

Project/Contract Number:
WO-01 – General Compliance and
Coordination

Upon arrival to the site I assessed personal safety hazards: ☒ Yes or ☐ Referred to Site Safety Plan and Safety Tailgate if applicable
Safety Hazards Were Addressed by: ☐ Performing tool box safety meeting ☒ Donning PPE, and observing safety standards

Site Visit Purpose and Details:

A site visit was conducted to collect samples from a concrete debris pile currently staged in the “Machine Shop” area at the Former Jorgensen Forge Site. Samples were collected for laboratory analysis for: VOCs, SVOCs, PCBs, & Total Metals (RCRA 8 + Cu, Ni, & Zn), and follow-on analysis for TCLP RCRA 8 Metals and Dangerous Waste Fish Bioassay, if necessary. The concrete pile was previously sampled by Sound Earth Strategies on 3/27/20. The purpose of this sampling event was to confirm the designation with additional data, and to collect a representative sample for a Dangerous Waste Fish Bioassay. We understand the concrete was generated to expose and repair underground piping that conveyed stormwater. The origin of the concrete was the “Heat Treat Area”.

Summary of Field Activities:

Concrete Pile Sample - A composite waste characterization sample was collected from the concrete pile. Due to the fact that the concrete pile was previously sampled by Sound Earth Strategies on 3/27/20, only one composite sample was collected to represent and complement the sampling already conducted. The composite sample consisted of six grab samples from the pile (three grab samples were collected from two opposite sides of the pile). The pile varied from large pieces of broken concrete to small granular sized particles. In addition, some soil overburden was commingled and removed with the concrete as was necessary to remove the concrete from the work area.

Photos of the Concrete Pile

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-008

Dear Stacy:

Enclosed are the analytical results and associated quality control data for samples submitted on May 1, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

Enclosures

OnSite Environmental, Inc. 14648 NE 95th Street, Redmond, WA 98052 (425) 883-3881

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: May 6, 2020
Samples Submitted: May 1, 2020
Laboratory Reference: 2005-008
Project: Star Forge

Case Narrative

Samples were collected on May 1, 2020 and received by the laboratory on May 1, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Date of Report: May 6, 2020

% MOISTURE

Client ID	Lab ID	% Moisture	Date Analyzed
Star-Concrete-Pile	05-008-01	5	5-4-20

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-008B

Dear Stacy:

Enclosed are the analytical results and associated quality control data for samples submitted on May 1, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

David Baumeister
Project Manager

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: May 8, 2020
Samples Submitted: May 1, 2020
Laboratory Reference: 2005-008B
Project: Star Forge

Case Narrative

Samples were collected on May 1, 2020 and received by the laboratory on May 1, 2020. They were maintained at the laboratory at a temperature of 2°C to 6°C.

Please note that any and all soil sample results are reported on a dry-weight basis, unless otherwise noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Data Qualifiers and Abbreviations

- A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.
- B - The analyte indicated was also found in the blank sample.
- C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.
- E - The value reported exceeds the quantitation range and is an estimate.
- F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.
- H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.
- I - Compound recovery is outside of the control limits.
- J - The value reported was below the practical quantitation limit. The value is an estimate.
- K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.
- L - The RPD is outside of the control limits.
- M - Hydrocarbons in the gasoline range are impacting the diesel range result.
- M1 - Hydrocarbons in the gasoline range (toluene-naphthalene) are present in the sample.
- N - Hydrocarbons in the lube oil range are impacting the diesel range result.
- N1 - Hydrocarbons in diesel range are impacting lube oil range results.
- O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.
- P - The RPD of the detected concentrations between the two columns is greater than 40.
- Q - Surrogate recovery is outside of the control limits.
- S - Surrogate recovery data is not available due to the necessary dilution of the sample.
- T - The sample chromatogram is not similar to a typical _____.
- U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.
- U1 - The practical quantitation limit is elevated due to interferences present in the sample.
- V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.
- W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.
- X - Sample extract treated with a mercury cleanup procedure.
- X1 - Sample extract treated with a sulfuric acid/silica gel cleanup procedure.
- Y - The calibration verification for this analyte exceeded the 20% drift specified in methods 8260 & 8270, and therefore the reported result should be considered an estimate. The overall performance of the calibration verification standard met the acceptance criteria of the method.
- Z -
- ND - Not Detected at PQL
- PQL - Practical Quantitation Limit
- RPD - Relative Percent Difference

Re: Analytical Data for Project Star Forge
Laboratory Reference No. 2005-008C

Dear Stacy:

Enclosed are the analytical results and associated quality control data for samples submitted on May 1, 2020.

The standard policy of OnSite Environmental, Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

A handwritten signature in black ink, appearing to read "DeB" followed by a stylized flourish.

Dangerous Waste Characterization

Sample ID: Star-Concrete-Pile

Report date: May 18, 2020

Submitted to:

OnSite Environmental
14648 NE 95th Street
Redmond, WA 98052

Rainier Environmental
5013 Pacific Hwy East
Suite 20
Tacoma, WA 98424

1.0 INTRODUCTION

A dangerous waste characterization using the test organism *Oncorhynchus mykiss* (rainbow trout) was conducted on one sample submitted by OnSite Environmental to Rainier Environmental. Testing was conducted following the Washington State Department of Ecology Publication 80-12.

2.0 METHODS

The sample Star-Concrete-Pile, was received in the laboratory on May 12, 2020. Upon arrival at the laboratory the sample was inspected and contents verified against information provided on the chain-of-custody form. The sample was stored at 4°C in the dark until use. The test procedure is outlined in Table 1.

Table 1. Summary of Dangerous Waste Characterization Test Conditions

Parameter	Standard Fish Toxicity Test
Test number	2005-024
Sample ID	Star-Concrete-Pile
Test initiation date; time	5/14/2020; 0915h
Test termination date; time	5/18/2020; 1010h
Endpoint	Mortality at 96-hours
Test chamber	7.5 L Plastic tank
Test temperature	12 ± 1°C
Dilution water	Moderately hard synthetic water
Test solution volume	6 L
Test concentrations (mg/L)	100, 10, 0
Number of organisms/chamber	10
Number of replicates	3
Test organism	<i>Oncorhynchus mykiss</i> (rainbow trout)
Feeding	No feeding during test
Photoperiod	16 hours light/ 8 hours dark
Extraction	Rotary agitation (30 +/- 2 rpm) for 18 hours
Reference Toxicant	Copper sulfate
Deviations	None

The test organisms used in the test are outlined in Table 2. The sample was tested using fish received on March 25, 2020.

Table 2. Test organisms (*Oncorhynchus mykiss*)

Test organism age	80 days post swim-up (hatch date 2/3/2020)
Mean weight	0.44 g
Mean length	44 mm
Ratio of longest to shortest	1.2
Loading	0.73 g/L
Test organism source	Trout Lodge; Sumner, WA

3.0 RESULTS

A summary of results for the dangerous waste characterization conducted on sample Star-Concrete-Pile is contained in Table 3. There was no mortality during the test. Based on these results, the sample does not designate as either a dangerous or extremely hazardous waste. Copies of the laboratory bench sheets, statistical summaries of reference toxicant tests, and chain-of-custody form are provided in Appendices A through C.

Table 3. Summary of Results

Sample ID	Concentration (mg/L)	Survival (# fish, N=30)	Percent Mortality	Dangerous Waste Designation
Control	0	30	0	NA
Star-Concrete-Pile	10	30	0	None
	100	30	0	

4.0 QUALITY ASSURANCE

The most recently completed reference toxicant test was initiated May 1, 2020. The LC₅₀ of 132 µg/L copper fell within the acceptable range of mean ± two standard deviations of historical test results indicating that the test organisms were of an appropriate degree of sensitivity. The coefficient of variation (CV) for the last 20 tests was 30.6 percent, which is considered excellent by the Biomonitoring Science Advisory Board.

Dear Mr League:

Included are the results from the testing of material submitted on March 27, 2020 from the SOU_0995-002_ 2020, F&BI 003445 project. There are 14 pages included in this report. Any samples that may remain are currently scheduled for disposal in 30 days, or as directed by the Chain of Custody document. If you would like us to return your samples or arrange for long term storage at our offices, please contact us as soon as possible.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

CASE NARRATIVE

This case narrative encompasses samples received on March 27, 2020 by Friedman & Bruya, Inc. from the SoundEarth Strategies SOU_0995-002_ 2020, F&BI 003445 project. Samples were logged in under the laboratory ID's listed below.

<u>Laboratory ID</u>	<u>SoundEarth Strategies</u>
003445 -01	SP02-01-20200327
003445 -02	SP02-02-20200327
003445 -03	SP02-03-20200327
003445 -04	SP02-04-20200327
003445 -05	SP02-05-20200327

A 6020B internal standard failed the acceptance criteria for several samples. The sample was diluted and reanalyzed with acceptable results. Both data sets were reported.

Selenium in the 6020B matrix spike and matrix spike duplicate failed the acceptance criteria. The laboratory control sample passed the acceptance criteria, therefore the results were due to matrix effect.

All other quality control requirements were acceptable.

ENVIRONMENTAL CHEMISTS

Data Qualifiers & Definitions

a - The analyte was detected at a level less than five times the reporting limit. The RPD results may not provide reliable information on the variability of the analysis.

b - The analyte was spiked at a level that was less than five times that present in the sample. Matrix spike recoveries may not be meaningful.

ca - The calibration results for the analyte were outside of acceptance criteria. The value reported is an estimate.

c - The presence of the analyte may be due to carryover from previous sample injections.

cf - The sample was centrifuged prior to analysis.

d - The sample was diluted. Detection limits were raised and surrogate recoveries may not be meaningful.

dv - Insufficient sample volume was available to achieve normal reporting limits.

f - The sample was laboratory filtered prior to analysis.

fb - The analyte was detected in the method blank.

fc - The analyte is a common laboratory and field contaminant.

hr - The sample and duplicate were reextracted and reanalyzed. RPD results were still outside of control limits. Variability is attributed to sample inhomogeneity.

hs - Headspace was present in the container used for analysis.

ht - The analysis was performed outside the method or client-specified holding time requirement.

ip - Recovery fell outside of control limits due to sample matrix effects.

j - The analyte concentration is reported below the lowest calibration standard. The value reported is an estimate.

J - The internal standard associated with the analyte is out of control limits. The reported concentration is an estimate.

jl - The laboratory control sample(s) percent recovery and/or RPD were out of control limits. The reported concentration should be considered an estimate.

js - The surrogate associated with the analyte is out of control limits. The reported concentration should be considered an estimate.

lc - The presence of the analyte is likely due to laboratory contamination.

L - The reported concentration was generated from a library search.

nm - The analyte was not detected in one or more of the duplicate analyses. Therefore, calculation of the RPD is not applicable.

pc - The sample was received with incorrect preservation or in a container not approved by the method. The value reported should be considered an estimate.

ve - The analyte response exceeded the valid instrument calibration range. The value reported is an estimate.

vo - The value reported fell outside the control limits established for this analyte.

x - The sample chromatographic pattern does not resemble the fuel standard used for quantitation.

Corey League, Project Manager
SoundEarth Strategies
2811 Fairview Ave. East, Suite 2000
Seattle, WA 98102

Dear Mr League:

Included are the additional results from the testing of material submitted on March 27, 2020 from the SOU_0995-002_ 20200327, F&BI 003445 project. There are 9 pages included in this report.

We appreciate this opportunity to be of service to you and hope you will call if you should have any questions.

Sincerely,

FRIEDMAN & BRUYA, INC.

Michael Erdahl
Project Manager

Table 1
UST Waste Designation Summary Table
Former Jorgenson Forge Property
Tukwila, Washington

Tank ID	Contents	Designation Status	Comments
UST-15	empty	NA	
UST-16	empty	NA	
UST-17	empty	NA	
UST-18	empty	NA	
UST-19	empty	NA	
UST-20	empty	NA	
UST-21	red dyed diesel fuel	exempt, fuels recycling	
UST-22	empty	NA	
UST-26	sand	non-hazardous	Sand may remain in place during change in service
UST-27	oily water	non-hazardous	
UST-28	sand	non-hazardous	Sand may remain in place during change in service
UST-29	oily water	non-hazardous	
UST-30	oily water	non-hazardous	
UST-31	sand	non-hazardous	Sand may remain in place during change in service
UST-32	oily water	non-hazardous	
UST-33	oily water	non-hazardous	
UST-34	oily water	non-hazardous	
UST-35	empty	NA	
N. Tanks Slag		non-hazardous	Slag material overlying the USTs in the N. Tank Farm
S. Tanks Slag		non-hazardous	Slag material overlying the USTs in the S. Tank Farm

Notes:

UST sampling conducted April 21 & 22, 2020

See waste designation packages for analytical details and laboratory analytical reports

DANGEROUS WASTE DESIGNATION FORM – Product (diesel)

Star Forge, Former Jorgenson Forge Property, UST-21

A. WASTE STREAM NAME AND GENERATION INFORMATION

Waste Stream Name: Product (diesel fuel)

Generation Process: Pump out of UST-21

RCRA ID Number that waste will be managed under:

Star Forge LLC, DBA Jorgenson Forge:
WAD000602813

Total Quantity and/or Estimated Generation rate:

Approximately 3,000 gal.

Other Descriptions (i.e. Shop, Project, Etc.):

B. WASTE PROPERTIES, CHARACTERISTICS, and CONSTITUENTS:

Physical State: ☐ Solid (pass paint filter) ☐ Solid w/freestanding or absorbed liquid ☒ Liquid (If liquid, indicate if the liquid is: ☒ Single Layer ☐ Multi-layer	pH: ☐ < 2 [D002] ☐ > 2 but < 12.5 ☒ N/A ☐ > 12.5 [D002]
	Flashpoint: ☐ < 140 °F [D001] ☐ > 140 °F but < 200 °F ☐ N/A ☒ > 200 °F

Characteristic	PCB Content	TCLP Metals	Total Metals
			☐ mg/kg ☐ ug/kg ☐ mg/L ☐ ug/L
☐ Ignitable [D001]	☒ Not Detected	☐ Arsenic ≥ 5.0 mg/L [D004]	Arsenic: -- ☐ ND
☐ Corrosive [D002]	[non TSCA or State Regulated]	☐ Barium ≥ 100.0 mg/L [D005]	Barium: -- ☐ ND
☐ Reactive [D003]	☐ Not Sampled	☐ Cadmium ≥ 1.0 mg/L [D006]	Cadmium: -- ☐ ND
☐ Toxic [D004 – D043]	☐ ≥ 2 ppm and < 50 ppm	☐ Chromium ≥ 5.0 mg/L [D007]	Chromium: -- ☐ ND
List Here:	[Potentially TSCA Regulated or State Regulated PCB Waste-WPCB]	☐ Lead ≥ 5.0 mg/L [D008]	Lead: -- ☐ ND
	☐ ≥ 50 ppm [TSCA Regulated]	☐ Mercury ≥ 0.2 mg/L [D009]	Mercury: -- ☐ ND
	☐ < 1 ppm	☐ Selenium ≥ 1.0 mg/L [D010]	Selenium: -- ☐ ND
	Note: IF WASTE STREAM IS BEING MANAGED AS TSCA WASTE, DO NOT USE WPCB STATE CODE PER WAC 173-303-071(3)(k)	☐ Silver ≥ 5.0 mg/L [D011]	Silver: -- ☐ ND
		Check if: ☐ Assumed	Copper: -- ☐ ND
		☐ TCLP Conducted	Nickel: -- ☐ ND
		☒ TCLP Not Conducted	Zinc: -- ☐ ND
		Comments:	Comments:

Physical Composition (list all constituents, including debris, any absorbents, liquid range, etc.).

Constituent	Volume (Range %)
Liquid	95-100
Misc. solids	0-5

C. LISTED WASTE

- ☐ Discarded Listed Chemical Product (U or P List):
☐ Listed Source Waste (F or K List):
☒ Not Applicable:

D. WA STATE CRITERIA WASTE

☒ Not applicable per WAC 173-303-070(5): Further designation will not change the generator status or change the way the waste must be managed.

WA Toxic Criteria Equivalent Concentration (E.C):	WA Persistent Criteria Total HOC	WA Persistent Criteria Total PAH
☐ < 0.001 % [not a Toxic Criteria DW] ☐ 0.001 ≥ 1.0 % [WT02 – DW] ☐ ≥ 1.0% [WT01 – EHW]	☒ < 0.01 % [NOT APPLICABLE] ☐ 0.01 to 1.0% [WP02 – DW] ☐ > 1.0 % [WP01 – EHW]	☒ < 1.0% [NOT APPLICABLE] ☐ > 1.0% [WP03 – EHW]

DW: Dangerous Waste EHW: Extremely Hazardous Waste HOC: Halogenated Organic Compounds PAH: Polycyclic Aromatic Hydrocarbons

E. ADDITIONAL INFORMATION (Describe any additional information about the waste (e.g. process knowledge statement, regulatory exemptions, assumptions made, etc.)

This material is being managed as a product/fuel for its originally intended purpose and therefore is not solid waste and not subject to WAC 173-303.

Attachments:
