1 INTRODUCTION

This Supplemental Investigation Memorandum describes the findings of testing performed as part of the Sediments Remedial Investigation and Feasibility Study (RI/FS) for the I & J Waterway Site (Site) in Bellingham. The work described herein was conducted pursuant to Agreed Order No. DE1090, which requires completion of an RI/FS for the Site. The Agreed Order was signed in January 2005 by the Washington State Department of Ecology (Ecology) and the Port of Bellingham (Port). The First Amendment to the Agreed Order was signed in October 2005, which incorporated the *Sediments RI/FS Work Plan* (Work Plan; RETEC 2005) into the Agreed Order. Based on discussions between the Port and Ecology, additional work was determined to be necessary to complete the RI/FS. This additional work was conducted under a Second Amendment to the Agreed Order, which provided a revised schedule for completion of the RI/FS and required additional investigation activities to be conducted.

The testing described in this memorandum was performed in accordance with the Ecology-approved *RI/FS Study Work Plan Addendum* (Addendum; Anchor QEA 2012). The Addendum focused on supplemental activities needed to complete the RI/FS and support identification of a preferred remedial alternative for the Site. Historical data has also been referenced in this memorandum, which are available in reports previously conducted under Ecology oversight, including the final Work Plan (RETEC 2005), the *Preliminary Sediment Data Summary* (RETEC 2006), and the Addendum (Anchor QEA 2012).

1.1 Site Background

RI/FS data collection was conducted during 2005 and 2006, consistent with the Ecology approved Work Plan (RETEC 2005). Activities included surface sediment chemical and biological testing and subsurface sediment chemical testing. Results of the 2005/2006 sampling event were summarized in the *Preliminary Sediment Data Summary* (RETEC 2006) that was submitted to Ecology. Subsurface sediment concentrations indicated that levels of dioxin/furans would be unlikely to meet Dredged Material Management Program (DMMP) guidelines for unconfined open-water disposal.

Updates to the DMMP suitability guidelines for dioxin/furans were initiated in 2006. As part of a separate process, advisory committees started development of a Model Toxics Control Act rule revision (the MTCA rule) and MTCA/Sediment Management Standards (SMS) integration. In February 2007, the Port and Ecology agreed that technical, scientific, and policy elements associated with the MTCA rule revision, the MTCA/SMS integration, and changes to the DMMP suitability guidelines had the potential to affect FS evaluation and decisions at the I & J Waterway Site.

In December 2010, the DMMP approved interim guidelines for dioxin/furan compounds. Proposed revisions to SMS were developed by the Sediment Cleanup Advisory Committee in late 2011, with draft rule language for revisions to SMS proposed by Ecology in August 2012.

Following DMMP updates and progress on SMS rule development in 2011, the Port and Ecology agreed to the collection of additional information to finalize the RI/FS for the Site. The Addendum (Anchor QEA 2012) described the supplemental sampling activities to be conducted at the Site to complete the RI/FS and support the identification of a preferred remedial alternative for the Site. The Addendum (Anchor QEA 2012) was prepared consistent with the process defined under MTCA and SMS, as outlined in the Agreed Order and its amendments. The work described in the Addendum (Anchor QEA 2012) was performed by Anchor QEA on behalf of the Port. This memorandum summarizes the supplemental data collection activities and associated results.

2 SUPPLEMENTAL INVESTIGATION OVERVIEW

This section presents an overview of the sampling design for the supplemental RI/FS sampling. Figures 1 and 2 present the supplemental investigation sediment and storm drain solids sampling locations. Details of the sampling methodology are provided in the Work Plan (RETEC 2005) and the Addendum (Anchor QEA 2012). Any deviations from the Work Plan or the Addendum are provided in the applicable methodology section below. Quality control measures implemented during the data collection efforts are summarized in Section 3.

2.1 Site Surveys

Site survey work was performed to support project remedial design activities. The work included updated surveys for bathymetry and condition surveys of structures in the waterway. The specific Site survey tasks performed are described below.

- **Bathymetric survey:** An updated bathymetric survey was conducted within the project area by eTrac Engineering, Inc. on April 5, 2012 using multi-beam survey methods. The bathymetric survey was conducted to assess any elevation changes that have occurred since the 2005 investigation and to fill bathymetry data gaps in the underpier areas.
- **Floating dock, wharf, and bulkhead condition surveys:** Condition surveys of wooden bulkheads, docks, and wharf structures were conducted to support RI/FS cleanup evaluations at the Site. A condition survey of the pile-anchored floating dock was conducted by Ashton Engineering, Inc. on May 16, 2012. A condition survey of Bornstein Seafoods' wharf and associated bulkheads was conducted by Echelon Engineering between May 21 and June 1, 2012. Survey results are included in Appendix A.

2.2 Surface Sediment Sampling

As described in the Addendum (Anchor QEA 2012), surface sediment sampling and testing at the Site was performed to support the following objectives:

- Confirm the lateral boundary of the Site
- Assess impact of solids discharging from stormwater outfalls

- Characterize dioxin/furan concentrations at the Site
- Conduct additional bioassay testing
- Assess sediment quality that is more representative of the general Bellingham Bay condition

Eleven surface sediment samples were collected from on-site areas on April 24 and 25, 2012. Table 1 presents a summary of surface sediment physical observations. Additional discussion of surface sediment sampling and testing results are included in Section 4.

2.3 Subsurface Sediment Sampling

As part of a separate study performed by the U.S. Army Corps of Engineers (USACE) in September 2011, seven sediment cores were collected within the I & J Waterway with selected samples tested for dioxin/furan concentrations. The sediment cores were collected according to a Sampling and Analysis Plan developed by the USACE (USACE 2011) using sampling and analysis methods comparable to those in the Work Plan (RETEC 2005). USACE sediment core sample locations I-1, I-2, and I-3 are in the vicinity of the Site and shown in Figure 1. Locations I-4 through I-7 were located beyond the vicinity of the Site.

As detailed in the Addendum (Anchor QEA 2012), the USACE study included collection and testing or archiving of several samples for approximately -20 to -22 feet mean lower low water (MLLW), representing the Z-layer for a potential maintenance dredge event in the federal navigation channel. These Z-layer samples (z samples) can be useful in assessing the thickness of potential dredging for certain RI/FS remedial alternatives. Archived z samples I-1 and I-2 were tested for SMS constituents and nickel, and sample I-2 was additionally tested for dioxin/furans in accordance with the Addendum (Anchor QEA 2012). Table 2 presents a summary of the USACE I & J Waterway subsurface sediment locations and field collection in the Waterway. Appendix B provides core logs associated with each sediment core. Subsurface testing results are discussed in Section 6.

2.4 Storm Drain Solids Inspection and Sampling

Each of the four storm drains discharging to the I & J Waterway were surveyed as part of this investigation to support the discussion of source control in the RI/FS. On April 20 and May 2, 2012, a storm drain reconnaissance survey was conducted with the City of

Bellingham to identify possible solids sampling locations within the each storm drainage and to verify the presence of solids. Surveyed storm drain locations are included in Figure 2. A summary of storm drain reconnaissance survey observations and chemical results are discussed in Section 7.

3 CHEMICAL, PHYSICAL, AND BIOLOGICAL DATA QUALITY

This section provides a summary of project quality assurance objectives for chemical and physical testing data, and provides the findings of data validation activities.

3.1 Testing Labs and Methods

Chemical and physical testing was performed by Analytical Resources Inc. (ARI), an Ecology-certified laboratory located in Tukwila, Washington.

All analyses conformed to procedures described in the approved Addendum (Anchor QEA 2012). Appendix C provides the supporting quality control information and data validation reports.

Chemical and physical testing adhered to the methods presented in the Addendum (Anchor QEA 2012). In some cases, equivalent methods were used. Total solids and total preserved solids were analyzed by Standard Method (SM) 2540B. Sulfide was analyzed by Environmental Protection Agency (EPA) 376.2. Total organic carbon was analyzed by Plumb (1981). Grain size was analyzed by the Puget Sound Estuary Protocols (PSEP) method.

3.2 Data Quality Objectives

The Addendum (Anchor QEA 2012) was written to ensure that data of sufficiently high quality were generated to support additional work required for completion of the RI/FS. The quality of the laboratory data is assessed by precision, accuracy, representativeness, comparability, and completeness. Each parameter is discussed below.

- **Precision:** Laboratory precision was measured with laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) analyses; matrix spike (MS)/matrix spike duplicate (MSD) analyses; and replicate analyses. Generally, precision goals were met and, in cases where they were not, data were qualified as estimated per EPA's National Functional Guidelines (EPA 1999, 2004). Field precision was evaluated by the collection of blind field duplicates. Precision goals were generally met. Data were not qualified based solely on field precision results.

- **Accuracy and bias:** Accuracy was measured with LCSs, MS samples, and standard reference materials (SRMs). Generally, accuracy goals were met and, in cases where they were not, data were qualified as estimated per EPA's National Functional Guidelines (EPA 1999, 2004). In these instances, the usability of the data was determined by the extent of the exceedance. The validation reports submitted in Appendix C specify the specific outliers and whether the bias was high or low.
- **Representativeness:** The list of analytes has been identified to provide a comprehensive assessment of the known and potential contaminants at the Site.
- **Comparability:** The laboratory used common traceable calibration standards, spiking standards, and reference materials. Specific information can be found in the laboratory data packages included in Appendix D.
- **Completeness:** The completeness goal of 90 percent was met.

3.3 Quality Assurance/Quality Control Findings

The overall data quality assurance/quality control (QA/QC) program for the Addendum (Anchor QEA 2012) followed procedures presented in detail in the Work Plan (RETEC 2005). Measures taken to ensure data quality used current EPA, Ecology, and American Society for Testing and Materials (ASTM) protocols. Specific actions are described below.

3.3.1 Field Quality Assurance/Quality Control

One field equipment wipe blank sample (IJ12-RB-01) was collected on April 25, 2012, and submitted to ARI to be archived. A field duplicate was used to evaluate homogenization accuracy. Relative percent differences (RPDs) were screened against 50 percent. All of the dioxin and several of the polycyclic aromatic hydrocarbon (PAH) RPD values were greater than 50 percent. There were a few grain-size RPD values that exceeded 50 percent. Overall, the field duplicate quality objectives were met for 50 percent of the data, indicating heterogeneity of the sample matrix.

3.3.2 Chain of Custody

Chain-of-custody forms were used to track sample custody and to document the proper handling and integrity of the samples. All containerized samples were shipped to the analytical laboratory after preparation according to appropriate sample handling procedures

(i.e., transported at 4 degrees Celsius [°C]). Samples were transported to ARI by FedEx or hand delivered according to appropriate sample shipping procedures relinquished under signature by both Anchor QEA and laboratory receiving staff. All shipped samples arrived within the temperatures of 1.4 to 5.3 °C. Chain-of-custody documentation is included with the associated laboratory reports in Appendix D.

3.3.3 Laboratory Quality Assurance/Quality Control

The individual analytical methods prescribe specific quality control criteria for initial calibrations, continuing calibration verifications, internal standard area counts, and relative retention times. The laboratories followed the associated method criteria to evaluate their data and narrated any data that was outside of these control limits. These exceedances were also qualified in the validation process.

For sediment tests, PSEP action limits were used to assess the precision and accuracy of method blanks, laboratory control samples, matrix spikes, standard reference materials, and replicate samples. The control limits (data quality objectives) and frequencies of these quality control samples are listed in Table 2. Any quality control results that exceeded these criteria were qualified in the validation process.

For bioassay tests, standard QA/QC procedures were in place to ensure the validity of test results and were evaluated based on SMS and PSEP (1997) performance criteria as described previously in the Work Plan (RETEC 2005). Standard QA/QC procedures included the use of negative controls, reference sediment samples, and replication; measurement of water quality during testing; and reference toxicant tests.

3.3.4 Data Validation

All chemical and physical data submitted in this report were validated by Laboratory Data Consultants, Inc. (LDC) of Carlsbad, California. Data validations were performed at 90 percent level 3 and 10 percent level 4. LDC performed a level 4 data validation by randomly selecting 1 out every 10 sample results within an analytical method. Data validation reports are provided in Appendix C. Samples are listed with their corresponding laboratory data package and validation report number in Appendix D, Table D-1. The data

validation was performed under EPA guidelines, as described in the Addendum (Anchor QEA 2012) and the EPA's National Functional Guidelines (EPA 1999, 2004).

Data validation verified the accuracy and precision of chemical and physical determinations performed during this investigation. Data qualifiers assigned as a result of the data validation and their definitions are shown on each of the respective analytical results tables. Data may have been qualified as biased or estimated for a particular analysis based on method or technical criteria. Data qualified with a "J" indicates that the associated numerical value is the approximate concentration of the analyte. Data qualified with a "UJ" indicates the approximate reporting limit below which the analyte was not detected. Consequently, these data qualifications are not expected to impact the data quality objectives.

All RI/FS data were determined to be useable as reported from the laboratory or as qualified in the RI/FS Data Report for the purposes of completing the RI/FS. None of the data results were rejected during the data validation process.

Biological test conditions and methods were in compliance with PSEP (1995), Ecology's Sampling and Analysis Plan Appendix (SAPA; Ecology 2008), and the various updates presented during the Sediment Management Annual Review Meeting (SMARM). Details of the biological testing methods and results are presented in Section 4.2 and Appendix E.

4 SURFACE SEDIMENT INVESTIGATION

This section summarizes the results of surface sediment chemical, physical, and biological testing performed during the supplemental investigation. Eleven surface sediment samples were collected from on-site areas on April 24 and 25, 2012. Additional sampling was performed from Carr Inlet by NewFields, LLC as reference locations for biological testing on May 17, 2012. Surface sediment samples were collected from the top 12 centimeters (cm) at each location. Table 1 presents a summary of surface sediment physical observations. A summary of sediment sampling and testing is presented in Table 3.

Proposed sample location IJ12-08 could not be sampled due to refusal at the proposed location. Sample location IJ12-08 was intended to assess the impact of potential solids discharging from the stormwater outfall Bornstein 001. Riprap extended down the slope below the outfall and prevented acquisition of a sample on the target location. Six sediment grabs were attempted offshore and adjacent to the riprap slope, which were rejected due to poor recovery and winnowing. An acceptable sediment sample was collected from IJ12-08a southwest of the target location IJ12-08. One field duplicate was collected at location IJ12-08a (sample IJ12-58).

4.1 Surface Sediment Chemical Testing

Table 4 presents results of surface sediment chemical and physical testing. SMS chemical concentrations were compared to SMS criteria. For those samples with total organic carbon (TOC) greater than 3.5 percent (IJ12-01, -08a and -58a), SMS chemicals with organic-carbon normalized standards were compared to the marine lowest apparent effects threshold (LAET) value (PSEP 1988). Nickel concentrations were compared to the former DMMP Screening Level (SL) and Bioaccumulation Trigger/Maximum Level (BT/MT). Exceedances of SMS or DMMP SL (nickel) criteria for 2012 and 2005/2006 sampling locations are shown on Figure 3. Bioassay test results are shown in Figure 4. The 2012 surface sediment chemical data reports are included in Appendix D.

4.1.1.1 Sediment Management Standards Parameters

Site samples were tested for SMS constituents including metals, semivolatile organic compounds (SVOC), and total polychlorinated biphenyls (PCB). SMS chemical

concentrations were below Sediment Quality Standards (SQS) criteria in all samples, except for fluoranthene in sample IJ12-04. Fluoranthene was not measured above SQS in the 2005/2006 co-located sample location.

4.1.1.2 9Nickel

Nickel concentrations were equivalent to or below the former DMMP SL (140 milligrams per kilogram [mg/kg]) in all samples, except for samples IJ12-01 and -02 (337 mg/kg and 148 mg/kg, respectively). Sample IJ12-03 contained a nickel concentration equivalent to the former DMMP SL. The 2012 results generally indicate declining surface sediment nickel concentrations, compared to co-located 2005/2006 sample results (RETEC 2006), as shown in Chart 1. The 2012 and 2005/2006 surface sediment nickel testing results are summarized in Figure 3.

Chart 1
Comparison of Co-located 2005/2006 and 2012 Surface Sediment Nickel Testing Results

2005/2006 (mg/kg)	2012 (mg/kg)
192 (IJW-SS-09)	148 (IJ12-02)
174 (IJW-SS-07)	140 (IJ12-03)
152 (IJW-SS-12)	116 (IJ12-04)

4.1.1.3 Dioxin/Furans

There are currently no SMS numeric criteria for dioxin/furans in sediment, which tend to be present in urban areas in Puget Sound. Dioxin/furan concentrations expressed as toxicity equivalents (TEQ) in surface sediments ranged between 9.5 TEQ (IJ12-11) and 36.5 TEQ (IJ12-04). Samples located within the area exceeding chemical and biological SMS criteria tended to have higher TEQs than sample IJ12-07 (11.7 TEQ), which is located outside the area exceeding SMS criteria, and sample IJ12-11 (9.5 TEQ), which is intended to characterize chemical concentrations generally representative of Bellingham Bay. Results of the duplicate samples collected from station IJ12-08 were 15.2 TEQ and 33.3 TEQ. Chart 2 below summarizes Site sample TEQs. Measured dioxin/furan concentrations in surface sediment, subsurface sediment, and storm drain solids are summarized in Figure 5.

Chart 2
Surface Sediment Dioxin/Furan Testing Results

Station ID	Reported Concentrations (ng/kg as TEQ; ND = 1/2 RL)[1]
I & J Waterway Samples	
IJ12-01	25.96
IJ12-02	20.62
IJ12-03	10.45
IJ12-04	36.46
IJ12-05	20.23
IJ12-06	15.09
IJ12-07	11.67
IJ12-08a	33.32
IJ12-58a[2]	15.23
IJ12-11[3]	9.52

Notes:
1. TEQs were calculated using the 2005 World Health Organization toxicity equivalency factors developed for mammalian receptors.
2. Sample IJ12-58a is a field duplicate of sample IJ12-08a.
3. Sample collected to assess chemical composition at a station representative of Bellingham Bay.

4.2 Surface Sediment Biological Testing

Biological testing was required for samples IJ12-05 and -07 and was selected for the three additional sample stations (IJ12-01, -02 and -03) with nickel concentrations equivalent to or greater than the former DMMP SL. Site biological testing results were compared to the results from an appropriate reference sample for comparison to SMS criteria. The reference samples consisted of Carr Inlet samples CR-12 and CR-023, which contained 4.5 and 97.2 percent fines, respectively. Site samples were compared to reference CR-023[1].

Sediment toxicity was evaluated using three standard PSEP bioassays:

- 10-Day Acute Toxicity Amphipod Test (*Ampelisca abdita*)
- Larval Development Test (*Mytilus galloprovincialis*)
- 20- Day Juvenile Polychaete Chronic Toxicity Test (*Neanthes arenaceodentata*)

[1] While the percentage of fines in sample IJ12-01 was more similar to CR-12 than CR-023, photographs and lab observations indicated that this sample appeared to be composed of a higher percentage of finer sediment based on the presence of woody debris, which seemed to bias the grain-size analysis toward a coarser fraction.

This section provides a summary of bioassay test results. SMS biological effects criteria are presented in Table 5. The results of bioassay testing are presented in Tables 6, 7, and 8. Table 9 provides an assessment of performance criteria for control and reference samples. Table 10 presents the biological endpoint evaluation. Samples IJ12-01, -02, -03, and -05 failed SQS biological criteria for the larval development test, as summarized in Chart 1 and Figure 4. All samples passed the amphipod and juvenile polychaete tests. The complete biological laboratory report, chain of custody, and laboratory data are provided in Appendix E.

Chart 3
Surface Sediment Chemical Criteria Exceedances and Biological Testing Results

Station ID	Criteria Exceedances	SQS/CSL Biological Criteria (Pass/Fail)[1]
I& J Waterway		
IJ12-01	Nickel	SQS Fail (larval)
IJ12-02	Nickel	SQS Fail (larval)
IJ12-03	Nickel	SQS Fail (larval)
IJ12-05	None	SQS Fail (larval)
IJ12-07	None	Pass

Notes:
SQS – Sediment Quality Standards
CSL – Cleanup Screening Levels
LAET – Lowest apparent effects threshold (marine)
1. Bioassays conducted included *E. estuarius*, *M. galloprovincialis*, and *N. arenaceodentata*.

4.2.1 10-Day Acute Toxicity Amphipod Test

Results of the 10-day acute toxicity test using *Ampelisca abdita* (*A. abdita*) are presented in Table 6. Bioassay testing was initiated within designated hold times for test and reference samples on May 29, 2012. Test conditions and methods were in compliance with PSEP (1995), SAPA (Ecology 2008), and the various updates presented during the SMARM in 2009. The test met SMS quality control requirements for the control and reference samples, as shown in Tables 11 and 12. Bioassay endpoint evaluations were determined using statistical testing and SMS criteria. All samples passed SQS and Cleanup Screening Levels (CSL) biological criteria. A detailed summary of results is provided in Tables 2 through 5 of Appendix E.

4.2.2 Larval Development Test

Results of the larval development test using *Mytilus galloprovincialis* (*M. galloprovincialis)* are presented in Table 7. Bioassay testing was initiated within designated hold times for test and reference samples on June 7, 2012. Test conditions and methods were in compliance with PSEP (1995), SAPA (Ecology 2008), and the various updates presented during the SMARM in 2009. The test met SMS quality control requirements for the control and reference samples, as shown in Table 7. Bioassay endpoint evaluations were determined using statistical testing and SMS criteria. As indicated in Table 10, all samples failed SQS criteria, except for sample IJ12-07. A detailed summary of results is provided in Tables 10 through 13 of Appendix E.

4.2.3 20-Day Juvenile Polychaete Chronic Toxicity Test

Results of the 20-day juvenile polychaete chronic toxicity test using *Neanthes arenaceodentata* (*N. arenaceodentata)* are presented in Table 8. Bioassay testing was initiated within designated hold times for test and reference samples on May 23, 2012. Test conditions and methods were in compliance with PSEP (1995), SAPA (Ecology 2008), and the various updates presented during the SMARM in 2009. The test met SMS quality control requirements for the control and reference samples, as shown in Table 10. Bioassay endpoint evaluations were determined using statistical testing and SMS criteria. All samples passed SQS and CSL biological criteria. A detailed summary of results is provided in Tables 6 through 9 of Appendix E.

4.2.4 Comparison to 2005/2006 Bioassay Testing

Figure 4 illustrates areas above SMS criteria for 2012 and 2005/2006 biological testing results. The 2012 biological results generally indicate improved conditions compared to the 2005/2006 results for those sample stations co-located during the two sampling events. The 2005/2006 samples IJW-SS-07, -09 and -13 formerly failed CSL criteria for the larval development test, but each co-located 2012 sample (IJ12-03, -02 and -05, respectively) passed CSL criteria (failing only SQS criteria).

5 SUBSURFACE SEDIMENT TESTING

This section summarizes chemical testing of subsurface samples that were collected as part of the USACE study within the Site. USACE subsurface samples chemical and physical results are summarized in Table 11. The subsurface sample chemical results are included in Appendix D.

As part of the supplemental investigation, archived Z-layer material from station I-1 (I-1-Z) was tested for SMS constituents and nickel, and archived Z-layer material from station I-2 (I-2-A-Z) was tested for SMS constituents, nickel, and dioxin/furan concentrations. These Z-layer samples represent sediment collected from approximately -20 to -22 feet MLLW, representing the potential exposed sediment surface in the event maintenance dredging occurs to the federally authorized depth in the federal navigation channel.

As shown in the core logs (Appendix B), Z-layer material from cores at stations I-1 and I-2 were not collected from the native clay layer, suggesting that z samples were comprised of sediment deposited since the last dredge event (e.g., recent sediment). However, the native clay layer was observed in each sediment core, which provides information on the vertical extent (i.e., elevation) of recently deposited sediment since the deepest historical dredge event. This physical information, along with elevations of the native clay layer from other 2006 cores, will be used in the RI/FS to establish the deepest extent of potential contamination.

Samples I-1-A and I-2-A-Z each contained TOC greater than 3.5 percent. SMS chemicals with organic-carbon normalized standards were compared to the marine LAET value (PSEP 1988). Nickel concentrations were compared to the former DMMP criteria.

5.1.1.1 Sediment Management Standards Parameters

USACE z samples I-1-Z and I-2-A-Z were below SMS or LAET criteria, except for the following:

- Mercury in sample I-2-A-Z (above CSL)
- 2,4-dimethylphenol in samples I-1-Z and I-2-A-Z (above CSL)
- 4-methylphenol in I-1-Z (above CSL)

- Dimethyl phthalate (160 micrograms per kilogram [µg/kg]) in sample I-1-Z (above SQS)
- N-nitrosodiphenylamine in sample I-1-Z (above SQS)
- Total PCBs in I-2-A-Z (above LAET); total PCBs were equal to the LAET in I-1-Z

5.1.1.2 Nickel

Nickel concentrations in I-1-Z and I-2-A-Z were below the DMMP SL.

5.1.1.3 Dioxin/Furans

Samples I-1-Z, I-2-A-Z, and I-3-Z contained dioxin/furan concentrations of 29.4, 41.8, and 5.7 TEQ, respectively. At locations I-1 and I-3, samples were collected for both the Z-layer and the overlying sediments (DM samples). Dioxin/furans in z samples were lower than the upper composite DM sample for both I-1 (I-1-DM was 38.2 TEQ) and I-3 (I-3-DM was 28.6 TEQ). Dioxin/furan testing results are summarized in Figure 5.

6 STORM DRAIN SOLIDS INSPECTION AND SAMPLING

This section summarizes the observation from the stormwater drainage basin reconnaissance survey and the testing results of storm drain CB-002. A reconnaissance survey was conducted to identify the presence of stormwater solids within each of four stormwater drainage basins for the Site. Stormwater outfalls at the Site included Bornstein Outfall 001, Port of Bellingham Outfall 002, City of Bellingham Outfall – Roeder, and City of Bellingham Outfall – Bellwether, as shown on Figure 2.

Table 12 describes reconnaissance survey observations. Information collected during the survey included the total depth below ground surface, depth to the base of the outflow pipe, depth to water, time measurement (to determine tidal influence), presence of and orientations of connection pipes, and approximated thickness of storm drains solids, if present.

Two Port of Bellingham catch basins were identified within Port of Bellingham Outfall 002 that contained sufficient solids material to sample (≥2.5 inches of material). These catch basins are part of the Port of Bellingham storm drain basin that discharges northeast of, and adjacent to, the Bornstein Seafoods building. Port of Bellingham Catch Basin-2 (CB-002) was selected for solids sampling due to its location nearest to the outfall. A grab sample was collected from the CB-002 storm drain maintenance hole using methods described in the Addendum (Anchor QEA 2012) on June 22, 2012.

Storm drain solid sample CB-002 was tested for SMS constituents, nickel, and dioxin/furan compounds. SMS chemical concentrations were compared to SMS criteria (SQS and CSL), and nickel concentrations were compared to the former DMMP criteria. The storm drain solid sample chemical results are summarized in Table 13 and are included Appendix D.

6.1.1 Sediment Management Standards Parameters

All metals, PCBs, and SVOCs were below SMS criteria, except for butylbenzylphthalate, which was above SQS.

6.1.2 Nickel

The sample nickel concentration (826 mg/kg) exceeded both the former DMMP SL (140 mg/kg) and former BT/ML (370 mg/kg).

6.1.3 Dioxin/Furans

Sample CB-002 contained a dioxin/furan concentration of 13.2 TEQ.

7 NEXT STEPS

Chemical, physical, and biological testing data has been uploaded to Ecology's Environmental Information Management (EIM) system. This memorandum and the associated attachments complete the transmittal of the testing data from the I & J Waterway RI/FS Supplemental Investigation testing program. Following receipt of Ecology's comments on this memorandum, the Port anticipates meeting with Ecology to discuss the comments and discuss the components of the FS. The Draft RI/FS will be submitted within 150 calendar days of receipt of Ecology comments.

Station ID	Actual Coordinates[1,2]		Date	Water Depth[3] (feet)	Tide Height[4] (feet)	Penetration (feet)	Core Recovery (%)	Collection and Drive Notes
	Easting	Northing						
I-1	1240052	644516	9/8/2011	15.6	0.5	9.0	93.0	2 of 2 attempts. Easy coring 0 to 5 feet, very hard coring 5 to 9 feet. Core driven to refusal.
I-2	1239675	644165	9/8/2011	17.6	1.3	9.0	93.0	2 of 2 attempts. Easy coring 0 to 7 feet, very hard coring 7 to 9 feet.
I-3	1239248	643767	9/8/2011	19.8	2.6	8.0	80.0	1 of 1 attempts. Easy coring 0 to 3 feet, very hard coring 3 to 8 feet, refusal at 8 feet.
I-4	1238882	643410	9/8/2011	25.1	7.4	9.5	82.0	3 of 3 attempts. Easy coring 0 to 2 feet, hard coring 2 to 9.5 feet.
I-5	1238607	643124	9/8/2011	21.2	4.6	10	98.0	1 of 1 attempts. Smooth, easy coring 0 to 10 feet.
I-6	1238319	642844	9/8/2011	22.2	6.0	10	84.0	1 of 1 attempts. Smooth, easy coring 0 to 10 feet; 0.5-foot of sediment fell off core bottom during retrieval.
I-7	1237949	642487	9/7/2011	24.2	7.9	10	83.0	1 of 1 attempts. Smooth, easy coring 0 to 10 feet.

Notes:

1. Subsurface sediment samples were collected by vibratory core sampler. Actual coordinates are presented for accepted cores only.
2. Horizontal datum is Washington State Plane North, NAD 83.
3. Water depth presented is at the time of sample collection. Water levels in Bellingham Bay are tidally influenced. Water depth was determined by lead line.
4. Tides heights are predicted. Source: Tides and Currents Pro.

Notes:

Detected concentration is greater than Sediment Management Standards (SMS) Sediment Quality Standards (SQS)

Detected concentration is greater than SMS Cleanup Screening Level (CSL)

Detected concentration is greater than Puget Sound Estuary Program lowest apparent effects threshold (LAET) screening level (SL)

Non-detected concentration is above one or more identified SLs

Detected concentration is greater than the former Dredged Material Management Program (DMMP) SL[b]

Concentration not compared to indicated criteria value

Bold = Detected result

J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
-- Results or values not reported or not applicable

mg/kg = milligrams per kilogram
mg/kg-OC = milligrams per kilogram organic carbon normalized
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
pct = percent
µg/kg = micrograms per kilogram

a. Only samples with TOC > 3.5% were screened against the PS LAET SL.
b. The former DMMP SL and Bioaccumulation Trigger/Maximum Level (BT/ML) for nickel is 140 mg/kg dry wt and 370 mg/kg dry wt, respectively.

U.S. Environmental Protection Agency (USEPA) Stage 2B data validation was completed by Laboratory Data Consultants (LDC).
Results are reported in dry weight basis and as OC-normalized basis.

Totals are calculated as the sum of all detected results (U=0). If all results are not detected, the highest method detection limit value is reported as the sum.
Total LPAH (Low PAH) are the total of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene and Anthracene. 2-Methylnapthalene is not included in the sum of LPAHs.
Total HPAH (High PAH) are the total of Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzofluoranthenes, Benzo(a)pyrene, Indeno(1,2,3-c,d)pyrene, Dibenzo(a,h)anthracene and Benzo(g,h,i)perylene.
Total PAH are the total of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzofluoranthenes, Benzo(a)pyrene, Indeno(1,2,3-c,d)pyrene, Dibenzo(a,h)anthracene and Benzo(g,h,i)perylene. 2-Methylnapthalene is not included.
Benzo(j)fluoranthene is included in the total of benzo(b&k)fluoranthenes.
Dioxin TEQ values were calculated with 2005 World Health Organization (WHO) TEF values for mammals.

Table 5
SMS Biological Effects Criteria

Biological Test	SQS Biological Criteria	CSL Biological Criteria
Amphipod	The test sediment has a significantly higher (t-test, p = 0.05) mean mortality than the reference sediment, and the test sediment mean mortality is more than 25 percent (M_T>25%), on an absolute basis, than the reference sediment	The test sediment has a significantly higher (t-test, p = 0.05) mean mortality than the reference sediment, and the test sediment mean mortality is more than 30 percent greater (M_T-M_C>30%), on an absolute basis, than the reference sediment mean mortality
Larval	The test sediment has a mean survivorship of normal larvae that is significantly less (t-test, p = 0.05) than the mean normal survivorship in the reference sediment, and the mean normal survivorship in the test sediment is less than 85 percent of the mean normal survivorship in reference sediment (N_T/N_R<0.85)	The test sediment has a mean survivorship of normal larvae that is significantly less (t-test, p = 0.05) than the mean normal survivorship in the reference sediment, and the mean normal survivorship in the test sediment is less than 70 percent of the mean normal survivorship in the reference sediment (N_T/N_R<0.70)
Juvenile Polychaete	The mean individual growth rate of the polychaetes in the test sediment is less than 70 percent of the mean individual growth rate in the reference sediment (MIG_T/MIG_R<0.70), and the test sediment mean individual growth rate is statistically different (t-test, p = 0.05) from the reference sediment mean individual growth rate	The mean individual growth rate of polychaetes in the test sediment is less than 50 percent of the mean individual growth rate in the reference sediment (MIG_T/MIG_R<0.50), and the test sediment mean individual growth rate is statistically different (t-test, p = 0.05) from the reference sediment mean individual growth rate

Notes:
C = negative control
CSL = Cleanup Screening Level
M = mortality
MIG = mean individual growth rate
N = normal counts
R = reference sediment
SQS = Sediment Quality Standard
T = test sediment

Notes:

Detected concentration is greater than Sediment Management Standards (SMS) Sediment Quality Standards (SQS)

Detected concentration is greater than SMS Cleanup Screening Level (CSL)

Detected concentration is greater than Puget Sound Estuary Program lowest apparent effects threshold (LAET) screening level (SL)

Non-detected concentration is above one or more identified screening levels

Detected concentration is greater than the former Dredged Material Management Program (DMMP) SL[b]

Bold = Detected result

J = Estimated value
U = Compound analyzed, but not detected above detection limit
UJ = Compound analyzed, but not detected above estimated detection limit
-- Results or values not reported or not applicable

mg/kg = milligrams per kilogram
mg/kg-OC = milligrams per kilogram organic carbon normalized
ng/kg = nanograms per kilogram
PAH = polycyclic aromatic hydrocarbons
PCB = polychlorinated biphenyls
pct = percent
µg/kg = micrograms per kilogram

U.S. Environmental Protection Agency (USEPA) Stage 2B data validation was completed by Laboratory Data Consultants (LDC).
Results are reported in dry weight basis and as OC-normalized basis.

Totals are calculated as the sum of all detected results (U=0). If all results are not detected, the highest method detection limit value is reported as the sum.
Total LPAH (Low PAH) are the total of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene and Anthracene. 2-Methylnapthalene is not included in the sum of LPAHs.
Total HPAH (High PAH) are the total of Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzofluoranthenes, Benzo(a)pyrene, Indeno(1,2,3-c,d)pyrene, Dibenzo(a,h)anthracene and Benzo(g,h,i)perylene.
Total PAH are the total of Naphthalene, Acenaphthylene, Acenaphthene, Fluorene, Phenanthrene, Anthracene, Fluoranthene, Pyrene, Benzo(a)anthracene, Chrysene, Benzofluoranthenes, Benzo(a)pyrene, Indeno(1,2,3-c,d)pyrene, Dibenzo(a,h)anthracene and Benzo(g,h,i)perylene. 2-Methylnapthalene is not included.
Benzo(j)fluoranthene is included in the total of benzo(b&k)fluoranthenes.
Dioxin TEQ values were calculated with 2005 World Health Organization (WHO) TEF values for mammals.

a. Only samples with TOC > 3.5% were screened against the PS LAET SL.
b. The former DMMP SL and Bioaccumulation Trigger/Maximum Level (BT/ML) for nickel is 140 mg/kg dry wt and 370 mg/kg dry wt, respectively.

Table 12
Summary of Storm Drain Reconnaissance Survey

Catchment ID	Catchment Type	Total Depth (ft bgs)	DT base of outlet pipe (ft bgs)	DTW (ft bgs)	Time	Date	Water flowing? (Y/N)	Solids present?	Thickness of solids (in)	Notes
City of Bellingham Bellwether Catch Basin-1	Catch basin	9.25	6.75	6.7	1027	4/20/2012	Y	Minimal	< 0.5	Closest catchment to outfall west of Coast Guard facility on Bellwether Way (south side of road). Minimal solids present, scraped bottom of basin - minor solids in corners. Had to remove drain "sock" prior to measurement - sock had minor runoff sediment. One inflow pipe, one outflow pipe.
City of Bellingham Bellwether Catch Basin-2	Catch basin	8.2	6.65	6.6	1040	4/20/2012	Y	Minimal	< 0.5	Across the street from Bellwether Catch Basin-1 on Bellwether Way (north side of road). Minimal solids present, scraped bottom of basin - minor solids in corners. Had to remove drain "sock" prior to measurement - sock had minor runoff sediment. One inflow pipe, one outflow pipe.
City of Bellingham Bellwether Catch Basin-3	Catch basin	3.95	2.55	2.55	1048	4/20/2012	N	Minimal	~ 0.5	West of Bellwether Catch Basin-1 and Catch Basin-2 along Bellwether Way (north side of road). Minimal solids present, slightly more than at Bellwether Catch Basin-1 or Catch Basin-2. Would be easier to sample than Bellwether Catch Basin-1 or Catch Basin-2. No sock. No inflow pipe, one outflow pipe.
City of Bellingham Roeder Catch Basin-1	Catch basin	3.55	1.45	1.45	1110	4/20/2012	--	Minimal	~ 0.5	Closest catch basin to outfall at head of I&J. In center of Redden Marine's parking lot. Minimal solids present, typically accumulated in corners of basin. One inflow and one outflow pipe.
City of Bellingham Roeder Storm Drain-1	Storm drain	11.1	10.2	9.75	1125	4/20/2012	Y	None	--	In Redden Marine's parking lot, adjacent to Roeder Catch Basin-1. Closest storm drain to outfall at head of I&J. Large volume of water flowing quickly through line. Large inflow and outflow pipes (one of each).
City of Bellingham Roeder Storm Drain-2	Storm drain	11.0	--	7.6	1145	4/20/2012	Y	None	--	On the east side of Roeder Avenue, across from Redden Marine and up-line from Roeder Catch Basin-1. Hard to tell which way/how water is flowing out. Three inlet pipes - two parallel to Roeder Avenue, one from the east (from the rail-side).
Port of Bellingham (002) Catch Basin-1	Catch basin	3.55	2.15	2.1	940	5/2/2012	N	Yes	~ 3.5	On the south side of Hilton Ave., across (SE) from Bornstein Seafoods. Removed sock and drain plug (floating) prior to measurements. Stagnant water had moderate rainbow sheen. Solids are sandy with some silt and minor gravel. Two inflow pipes, one outflow pipe. Accumulated sand and gravel solids on small shelf.
Port of Bellingham (002) Catch Basin-2 (CB-002)	Catch basin	5.5	3.6	3.72	955	5/2/2012	N	Yes	~ 2.5	On the north side of Hilton Ave., adjacent (SE) to Bornstein Seafoods building. Closest catchment to outfall NE of Bornstein. Stagnant water is cloudy with moderate rainbow florets and minor foam. No sock. Solids are gritty - mostly sand with some gravel and finer material (e.g., silt).

Table 12
Summary of Storm Drain Reconnaissance Survey

Catchment ID	Catchment Type	Total Depth (ft bgs)	DT base of outlet pipe (ft bgs)	DTW (ft bgs)	Time	Date	Water flowing? (Y/N)	Solids present?	Thickness of solids (in)	Notes
Bornstein (001) Catch Basin-1	Catch basin	3.55	--	1.4	1015	5/2/2012	Unclear	Solids (silt) present in screen basket but not in basin	0.5	In storage/parking lot area west of Bornstein Seafoods property. Closest catchment to outfall west of Bornstein. Blue plastic screen basket structure in catchment - screen basket has tiny holes and appears to collect fines. Fabric around the outside of the screen basket. Small "peek-through" hole in plastic fitting next to the screen basket provides minimal access to catch basin. Solids present in the screen basket, but not in the catch basin below. This basin is up-line from an oil-water separator system (OWS), which may also collect solids. Cannot access enough of basin to see inflow/outflow pipes.

Notes:
ft = feet
bgs = below ground surface
in = inches
All depths measured from top of grate (street/ground level)
Total depth measured from base of catchment structure to the top of the grate (street/ground level)

Memo:

To:	Dan Berlin Anchor QEA, LLC 720 Olive Way, Suite 1900 Seattle, WA 98101	Date: Project: Project Number: File Topics:	5.18.12 I & J Waterway Floating Dock 21210.02 Dock Observation 5.16.12
From:	Bill Haynes, P.E.		

In accordance with our agreement, Ashton Engineering Inc. (AEI) visited the Bornstein Seafood facility on Hilton Avenue to observe the existing pile anchored floating dock in the I & J Waterway, Bellingham, WA.

Above water observations were made by William Haynes on 16 May, 2012 between approximately 2:30 and 3:30 p.m. Mr. Rich Griffith at the Bornstein plant was informed of our arrival and departure. Weather conditions during the visit were as follows: light and variable wind, sunny, and temperature in the high 60's. According to Tides & Currents software, the tide for Bellingham at 3:15 p.m. was about +5.9 feet above mean lower low water datum (MLLW = 0.0') and rising to a high of +6.4' at about 4:15 p.m.

The existing floating dock consists of concrete float modules held together with structural timber wales that are in turn through bolted to the concrete modules. The dock is held in place by creosote treated timber piles driven into the underlying soils at five locations along the dock's length. All but the southern single pile are three-pile dolphins. Access to the dock is via a steel gangway hinged at its upper end near the top of the existing timber bulkhead. The lower end of the gangway is supported by steel wheels that bear upon steel plate that has been secured to the dock. The attached drawing provides a plan and section view of the dock. A damaged float segment roughly 30 feet long is moored alongside the northeastern end of the longer dock.

Photo 1, Floating Dock looking north

Gangway

Observations of the floating structure's freeboard, measured from the deck to the still water surface, indicate the dock has rolled. The roll is likely due to moment resulting from the offset weight of the steel gangway and bearing plate on the bulkhead side of the dock.

The gangway bearing plate extends outboard of the dock most likely to prevent the gangway from rolling off the float edge at low tides. Given the piles remain in their positions, possible remedies include using a slightly longer gangway constructed out of aluminum in order to reduce its weight and/or the addition of an adjacent alongside float. Lengthen the gangway would unfortunately reduce the run off room at its lower end. An adjacent float would provide additional buoyancy to counter roll forces and provide support for the gangway wheels. In addition, removal of the abandoned plate north of the gangway will reduce the roll moment somewhat.

Existing water depths in the vicinity of the gangway landing are about -6.0' and maybe too shallow for an adjacent float during extreme low tide events. In fact, a depth of -5.3' was measured opposite pile location 2. With an extreme low tide of -3.5' (observed 12.30.1974) and a float draft of about 20", the float bottom at that location will just clear the -5.3' mudline given still water conditions.

Pile Guides

Pile hoops consisting of approximately 3" diameter bent galvanized pipe are utilized at locations 1, 2 and 3, see photographs below. The hoops in turn plug into steel weldments that are thru-bolted to the floats. At pile location1, the hoop's vertical plate next to the wale has been bent suggesting a downward load was applied to the outboard end of the hoop. Such a load may have occurred during a high tide when the hoop possibly came into contact with adjacent piles in the three pile dolphin arrangement.

At location 2, the south side plug-in connection is heavily rusted. At the south side connection of location 3, the hoop has broken. In its place a relatively light chain hoop has been installed as the pile attachment. The ends of the chain are attached to the inside timber wale with vertical lag screws. One of the piles in the dolphin at location 3 has evidence of repeated contact with the pipe guide. Any replacement of the pile hoops should consider the potential limited space between piles in a dolphin group, especially at high tides.

Pile locations 4 and 5 do not have pipe hoops. Both places have piles that have worn into the outside wale. Location 4 has no pile connection at all. Location 5 has a chain hoop similar to that at 3.

An existing timber pile is also located on the opposite side of the dock from pile 5. It has been cut off at an approximate elevation of +7.0' (mllw) and has no attachment to the float.

Given that the piles at 4 & 5 are in contact with the wale and pile 1 is at least a foot off the wale, it may be possible to rotate the overall dock length about location 3 to reduce the gap at north end (1) and increase the gaps at 4 & 5. In this way, new pile hoops may be installed at the locations 4 & 5. The remaining damaged pipe hoops should be replaced after verifying any new dimensional requirements.

During our observations, the south end of the floating dock was located only 5 inches away from a fixed ladder attached to the nearby timber pier structure. Based on the condition of the pile guides, it is somewhat surprising that there is no evidence that the dock has come into contact with the ladder. Any pile guide replacement should also consider the close proximity of the pier structure and ladder.

Concrete Modules

In general, the concrete modules appeared to be in good condition. As discussed below, the 7/8 size floats may be older than the larger module units.

Limited cracking was observed in a few of the 7/8 sized modules only. One such location is along the top southern edge of the southernmost module. Such cracking commonly results from corrosion of the underlying concrete rebar. Placing a concrete sealant into the crack to coat the corroding rebar might reduce the corrosion rate and the resulting cracking. No de-icing salts should be used on the dock.

A worn surface depression about ½ to ¾" deep is located in the module located immediate north of the gangway landing module. The curved nature of the depression suggests it was created by a steel gangway wheel when the gangway was previously positioned there. There does not appear to be any damage otherwise or cracking as a result of the worn depression.

Timber Wales

The wales consist of double 4x12 sawn lumbers on each side of the float. The wales are presumably pressure treated. Double ¾" diameter thru-rods connect the wales to the concrete float modules. At each end of the thru-rods there is a plate washer that bears on the outside wale and a hex nut. A timber rub board is nailed to the outside wale in order to cover the otherwise exposed bolt ends and prevent damage to vessels that moor alongside the floating dock. The typical layout of the rods is shown on the plan and section drawing.

Wale splices are created by staggering the wale joints at the middle of a float module. This is typical for all of the joints except for one at the transition between the 7/10 and 7/8 sized modules. As noted on the plan, the north side of the dock has as outside wale joint at the gap between two modules. This in effect means that rather than having four wales acting as the structural spine, there are only three at this location. Immediately adjacent to this location, the outside wale has rotted, split, or otherwise been damaged by contact with the pile. Replacement of the outside wale should include the proper lengths to achieve the correct staggered wale joint locations.

The heavily damaged dock segment tied to the northeast side of the dock is also a concrete module and timber wale system. The condition of the floats was such that it was deemed unsafe to board and take any measurements of. While about one to three of the individual float modules might by on some value and reuse, in general the float was considered by AEI to be debris.

There is no fendering currently installed between the pile anchored dock and the broken float segments. As a result, abrasion has destroyed the 2x12 rub board and is currently removing wood material from the outside wale. The dock segment should be removed or fendering installed to prevent further damage. The 2x12 rub should then be replaced. Replacement of the outside wale may also be necessary.

The timber rub board size varies from 2x12's along the 7/10 modules to 3x12's along the 7/8 modules. The hex nuts of the some thru-rods at the 7/8 modules appear to be severely corroded and are likely in need of replacement. In doing so, the entire associated thru-rod may need replacement as a result. Thru-rods at the 7/10 modules were not observed to have the same degree of rusting as those at the 7/8 modules. This along with the different rub board size and improper wale joint location, suggests the 7/8 module portion of the float may be older or least was not originally constructed with the 7/10 portion of the floating dock.

A small length of outside wale is in need of replacement next to pile location 5. The wale has pile abrasion damage and appears to have broken at a nearby knot.

We trust this memorandum meets your needs. If you have any questions or comments, please contact me.

Best Regards,

William (Bill) A. Haynes, PE

RE: Inspection and Assessment of Bornstein Wharf and Bulkhead Bellingham, Washington

Dear Mr. Berlin:

This report documents the findings of our recent inspection of the Bornstein Seafood Wharf and associated bulkheads on the I & J Waterway in Bellingham, Washington. The structures are owned the Port of Bellingham and operated by Bornstein Seafood Company. The inspection was carried out to obtain quantitative data on the existing condition of the structural components in the wharf and bulkhead prior to planned dredging of the waterway, as well as to support any structural condition assessment of the facility. Additionally, it can be utilized as a basis for the development of restorative or preventative maintenance options to the ensure the structural adequacy and longevity of the facility.

The scope of Echelon's component of the project included underwater and topside investigation of the piles, intertidal zone brace timbers and the associated superstructure members which support the Bornstein Seafood Wharf. Additionally the investigation included the timber piles that secure the mooring float located at the eastern end of the wharf, as well as the timber piles and horizontal lagging in the adjacent soldier pile bulkhead. The work was conducted under an Agreement for Subconsultant Services with Anchor QEA, LLC dated May 8, 2012.

INTRODUCTION

The I & J Waterway is located to the south of the Port of Bellingham's Squalicum Harbor Marina. The Bornstein Seafood Wharf is located on the south shore of the waterway, across from the US Coast Guard Station. The structure is currently used as a transfer platform for the offloading of fish. The structure also supports an ice plant that is located at its eastern

21027 61st Avenue West
Lynnwood, Washington 98036
Tel: 425 / 672.8924
E-mail: Echelon@echelonengineering.com

end. This section of the structure is used to produce and deliver ice to fishing vessels and for use in the plant.

The structure is a rectangular wharf connected to the shore by two access ramps. The berth face of the wharf is protected by a fender pile system. The wharf members are identified in a standard bent/row grid system. Bents within the main wharf are identified numerically 1 – 16 from the west, with the pile rows identified alphabetically A - D from the north edge. In the two approach ramps the bents are oriented perpendicular to the main wharf bents and are designated numerically 17 – 20 with the rows are identified alphabetically A – D from the west. The piles in Bents 19 and 20 serve a dual function, acting as structural piles for the wharf and also functioning as soldier piles for the adjacent soldier pile bulkhead. Fender piles along the berth face are numbered consecutively 1 – 21 beginning at Bent 1 in the northwest corner of the Wharf.

The wharf is braced by a network of transverse diagonal 4x12 brace timbers that span the width of the structure. These members are identified relative to the piles to which they are secured; for example the 2A – 2D, West Diagonal, is a diagonal brace member located on the west side of Bent 2. It is secured to the top of the Bent 2 Row A pile and extends downwards to the intertidal zone of the Bent 2, Row D pile.

The superstructure is comprised of 12x12 timber caps, 4x12 interior stringers, 8x14 perimeter stringers and 3x4 timber decking on edge with an asphalt and concrete overlay. All of the timber superstructure members are creosote treated with the exception of the cap on Bent 1, which is a Chemonite treated timber.

The ice making machinery covers much of the deck area between Bents 14 and 16. The structure also has a lower elevation deck area that supports a large vacuum fish transfer system. This support platform is located between the wharf and the shore. It is supported by the wharf Row D piles in Bents 4 – 6 and on a timber ledger attached to piles 15 – 18 of the bulkhead. The support piles are spanned by 4x12 stringers and the area is decked with 4x12 timber planks. All of these timbers are creosote treated.

A mooring float is located to the east of the wharf and provides approximately 130 feet in length by 8 feet wide. Access to the float is via a tidally adjustable ramp that is hinged off the adjacent bulkhead. The float is secured by a total of 13 dolphin piles.

A soldier pile bulkhead provides shore protection and bank stabilization along the southern shore of the I & J Waterway. The inspected portion of the bulkhead begins at the western end of the Bornstein Seafood Wharf and extends east to the beach at the end of the waterway. The bulkhead is separated into two distinct portions by an outfall which enters the

waterway between the two sections of bulkhead. The western bulkhead section is approximately 330 feet in length, the outfall section is approximately 50 feet wide and the eastern bulkhead section is approximately 300 feet in length. The height of the bulkhead was found to range from 6 to 15.5 feet.

Both sections of the bulkhead are constructed using creosote treated piles and 4x12 horizontal timber lagging. The piles in the western bulkhead are numbered 1 – 53. The numbering of the piles in both sections is consecutive with the piles in the eastern section numbered 54 – 99. The western bulkhead has an apparent tie back system composed of diagonal timber members. Although drawings were not available at the time of the inspection it is assumed that these diagonal timbers are a tie-back system consisting of timber 3x10's connected to a timber deadman located in the backfill. Investigation noted that these tie-backs extend out through notches in the horizontal bulkhead lagging, approximately 3 – 4 feet below the top of the bulkhead, where they are attached with bolts to the timber piles. Additionally, several of the western bulkhead soldier piles were also noted to have a steel tie rod, also assumed to be a tie-back system, drilled through the center of the pile, approximately 5 to 6 feet below the top of the wall at ~El. +10 feet (MLLW). The eastern bulkhead section was found to have a steel rod tie back system at each pile, with no evidence of any timber diagonals. The steel tie rods are approximately 1 inch in diameter.

For a detailed layout of the facility refer to the Appendix B, Pile Plan.

The scope of the project included the inspection and assessment of 86 structural piling and 21 fender piles in the wharf; 13 float anchor piles that secure the mooring float located off the east end of the wharf; and 99 bulkhead piles. Additionally, all intertidal zone braces and associated superstructure caps, stringers and deck members in the wharf and the horizontal lagging timbers in the bulkheads were inspected. Inspection of the mooring float was not included in the project.

The results of the investigation are discussed in the Observed Inspected Conditions section of this report. Photographs illustrating typical conditions and items of note are presented in Appendix A. Appendix B provides a pile plan showing the location, identification and condition of the inspected piles. Details on the condition and damage for the inspected members are presented in tabular format in Appendix C.

QUALIFICATIONS OF INSPECTORS

The project was conducted by a crew composed of professional and technical personnel capable and experienced in both the underwater and topside inspection and assessment of

structural members. The personnel utilized on this project included the following Echelon Engineering staff:

S.D. Sommerfeld, P.E.	Project Manager/Engineer - Diver Licensed Professional Engineer, WA, Guam 29 Years Experience in Marine Structures Inspection and Design
E.B. Vegsund, B.Sc.	Marine Specialist/Biologist - Diver B.Sc. in Marine Biology - Emphasis on Marine Biological Studies 39 Years Experience in Marine Structures Inspection
S. A. Vegsund	Inspection Technician 13 Years Experience in Marine Structures Inspection
T.R. Seigal	Inspection Technician - Diver 1 Year Experience in Marine Structures Inspection

INSPECTION METHODOLOGY AND RATING SYSTEM

The inspection was carried out under the three-tiered inspection protocol developed by the US Navy and endorsed by the American Society of Civil Engineers (ASCE). The scope of work included investigation of all accessible structural, fender and float anchor piling, the timber brace members, and the associated superstructure in Bornstein Seafood Wharf, as well as the timber bulkhead piles and the timber lagging in the bulkheads. All members received Level I visual examination for their accessible length. Level II examination, including spot cleaning and close visual examination, was also conducted at representative and suspect areas along the length of the inspected members. Level III inspection including hammer sounding, probing and coring/drilling of suspect timber members was also carried out to assess the extent of internal damage. Areas of damage were recorded, including the location and quantification of specific deterioration encountered.

Throughout the discussion the overall condition of the facility and of the members is described as good, fair or poor in accordance with the following definitions:

- A member in **good condition** has no damage or only minor damage.
- A member in **fair condition** has sustained minor to moderate damage, but has no evidence of overstressing.
- A member in **poor condition** has sustained major to severe damage that affects the member's load capacity. This damage may be evident as advanced deterioration, overstressing or breakage.

Piling

Structural Piles

The condition of the piles is based on the overall damage noted along the length of the member using visual inspection and as augmented by the various testing techniques. The pile condition has been expressed as a percentage of the remaining cross-sectional area of the member. A breakdown of the rating classifications is as follows:

- **100%** Remaining Cross-sectional Area / Rating Classification
  (No damage or deterioration)
- **90%** Remaining Cross-sectional Area / Rating Classification
  (Minor damage or deterioration; 90-99% remaining area)
- **75%** Remaining Cross-sectional Area / Rating Classification
  (Moderate damage or deterioration; 75-89% remaining area)
- **50%** Remaining Cross-sectional Area / Rating Classification
  (Moderate-Major damage or deterioration; 50-74% remaining area)
- **25%** Remaining Cross-sectional Area / Rating Classification
  (Major damage or deterioration; 25-49% remaining area)
- **0%** Remaining Cross-sectional Area / Rating Classification
  (Destroyed; 0-24% remaining area)

Fender Piles

The condition of the fender piling that protect the structures have been rated depending on the severity of the defects found. A breakdown of the rating classifications is as follows:

Undamaged	No significant damage or deterioration (0-5% loss of section)
Functional	Minor damage that does not significantly impact serviceability (6-25% loss of section and no significant damage to connection may include significant localized damage in the top foot of the pile)
Damaged	Moderate to major damage that significantly impacts serviceability (>25% loss of section and/or damage to connection)

Timber Bracing

The condition of the brace timbers has been determined and the individual members rated depending on the severity of the defects found. A breakdown of the rating classifications is as follows:

Undamaged (UD)	No significant damage or deterioration (0% loss of section)
Functional (F)	Minor damage that does not significantly impact serviceability (1-25% loss of section and no significant damage to connection)
Damaged (D)	Moderate to major damage that significantly impacts serviceability (>25% loss of section and/or damage to connection)

Timber Superstructure and Bulkhead Lagging

All accessible timber superstructure caps, stringers and decking in the wharf as well as the timber lagging members in the West and East Bulkheads were inspected. The condition of these members has been determined and the member rated dependent upon the severity of the defects found. Specifically with respect to the bulkhead lagging, the timbers are continuous over 2-3 pile spans. Level I data for these members has been presented for the length of the lagging, (i.e. if lagging spans from pile 6-8, data has been presented for the members within the area from pile 6-8 and from the top of the wall to the mudline). A breakdown of the superstructure rating classifications is as follows:

Undamaged	No significant damage or deterioration (0 – 4% loss of cross section)
Light Damage	Minor defects, No significant loss of capacity, No observed overstressing (5 – 24% loss of cross section)
Moderate Damage	Moderate defects, Moderate loss of capacity, No observed overstressing (25 - 49% loss of cross section)
Heavy Damage	Advanced deterioration, Significant loss of capacity, Possible areas of overstressing observed (50 – 100% loss of cross section)

Concrete / Asphalt Deck Overlay

All accessible portions of the concrete and asphalt overlay on the wharf were visually inspected. The overall condition of the decking is described as good, fair or poor in accordance with the definitions presented above.

OBSERVED INSPECTED CONDITIONS

The field investigation was conducted during the interval of May 21 to June 1, 2012. Weather conditions varied with periods of rain showers and times of partial clearing. The tide fluctuated between a low of −1.9 feet (MLLW) and a high of +6.2 feet (MLLW) during the inspection. No significant currents were noted during the investigation. Underwater visibility was poor and estimated at approximately one foot or less. Water depth along the north face of the wharf was approximately -15 feet (MLLW). The composition of the mudline was noted to be primarily soft silt and sand with shell and small rock.

Wharf

Structural Piles

Inspection of the structural piling showed them to be in generally good condition. Specific results of the inspection are as follows:

1. The piles are creosote treated D. Fir piles. A treatment manufacturing date stamp was noted on several of the piles that indicate that they date back to 1962. The mudline to cap length was found to range from approximately 15 to 30 feet and the pile diameters were found to be approximately 12-14 inches.
2. The majority of the piles have a treated cover or cap which is assumed to have been installed during the original construction. The piles in Bents 1, 14.5, and 15.5 were noted to not have caps at their tops. In the case of Bent 1, this is most likely a result of maintenance, as this cap is a newer Chemonite treated timber, likely installed to repair fungal damage in the original creosote timber. In the instances of Bents 14.5 and 15.5, the bents appear to have been added at some time following the original wharf construction, likely when the ice machine equipment was installed on the wharf.
3. Of the 86 structural piles inspected, 80 (93.0%) were found to be undamaged and have been rated at 100% of their original cross-sectional area. Refer to Appendix A, Photos No. 3 and 4.
4. Four piles (4.7%) were found to have sustained minor mechanical or marine borer damage and have been rated in the 90% remaining area category.
5. Two piles (2.3%) piles have been rated in the 0% remaining area category. One of these piles located in Bent 1, Row C, was found to have sustained 90% loss of cross section due to a combination of mechanical and fungal damage at its top. Refer to Photo No. 6 in Appendix A. The second pile located at Bent 7, Row A, was found to have sustained a 90% marine borer cavity in the submerged zone. Refer to Appendix A, Photo No. 5.

Fender Piles

Inspection of the fender piles found them to be in generally poor condition. Specific results of the inspection are as follows:

1. Inspection found the fender piles to be D. Fir piles, approximately 12 – 14 inches in diameter. They are secured to the north face of the wharf at the elevation of the perimeter stringer and have a timber chock, or spacer, between each pile.
2. A total of 21 fender piles were inspected.
3. One pile (4.8%) was found to be undamaged.
4. Eight piles (38.1%) were found to have sustained minor mechanical impact or abrasion damage in the intertidal zone and/or fungal damage at their tops. As these piles are still able to perform their intended function they have been rated in the functional category.
5. Twelve piles (57.1%) have rated in the damaged category. These piles were found to have sustained heavy mechanical impact, fungal or marine borer damage or are missing. Refer to Appendix A, Photos No. 17 and 18.

Intertidal Zone Bracing

Inspection of the intertidal zone bracing found them to be in fair to poor condition. Specific results of the inspection are as follows:

1. The intertidal zone braces are 4x12 diagonal timbers that span from the Row A to D piles.
2. Of the 36 intertidal zone braces inspected, 15 braces (41.7%) are undamaged.
3. Four braces (11.1%) have been rated in the functional category. These braces have sustained from up to 20% section loss due to marine borer infestation but are still serviceable at this time. The damage to these members will most probably continue leading to greater damage as time goes on.
4. Seventeen braces (47.2%) are rated in the damaged category. These braces have sustained heavy mechanical or marine borer damage or are no longer connected to the piles due to corroded and failed connectors. In several instances the braces were found to be missing. Refer to Appendix A, Photos No. 3 and 4.

Superstructure

Caps

Inspection of the caps found them to be in fair to good condition. Specific results of the inspection are as follows:

1. The cap timbers within the wharf are 12x12 timbers. The majority of the caps were found to be a creosote treated. One cap, located at Bent 1, is a newer replacement timber treated with Chemonite. The bents are spaced at ~12 foot on center.
2. Of the 22 individual caps inspected, 16 (72.8%) were found to be undamaged. Refer to Appendix A, Photos No. 7 and 8.
3. Three caps (13.6%) were found to have sustained minor mechanical and/or fungal damage and have been rated in the Light damage classification. The damage on these members is limited to the northern end of the cap, at the berth face that has been caused primarily by mechanical impact. One cap, located at Bent 14, was found to have sustained Light fungal damage most likely due to the very moist environment caused by the presence of the ice machine that is located above Bent 14 - 16.
4. Three caps (13.6%) were found to have sustained heavy damage. These caps are all located at the east end of the structure under the north edge of the ice machine. The caps in Bents 14.5, 15, and 15.5 have sustained significant fungal damage with loss of internal cross section ranging from 50% to 90% . This damage also appears to be related to the excessive moisture leaking onto the timbers from the ice machine. Refer to Photos No. 11 – 13 in Appendix A.

Stringers

The overall condition of the stringers is generally good. Specific results of the inspection are as follows:

1. The majority of the interior stringers are 4x12, creosote treated timbers set at ~18 inches on center. Refer to Appendix A, Photos No. 7 and 8. The perimeter stringers were noted to be larger 8x14 timbers which have been notched at the bearing point over the caps in order to retain the same deck elevation.
2. With the exception of the western most span from Bent 1 – 2 and the eastern most span from Bent 15 – 16, the interior 4x12 stringers were found to be in generally good condition with no evidence of significant fungal damage or other deterioration encountered. In the two end spans (i.e. Bents 1 – 2 and Bent 15 – 16), evidence of significant on-going fungal decay and subsequent localized maintenance was found.

   Many of the original stringers in these two areas were noted to have sustained heavy fungal damage from their ends in past the bearing point over the cap timbers. Investigation of these areas found that newer replacement stringers have been installed adjacent to the damaged interior members (i.e. sistered alongside the damaged member). These newer stringers were found to be in good condition. Refer to Photos No. 9 and 10 of Appendix A.

3. Larger 8x14 stringers are located around the perimeter of the structure. These perimeter stringers are notched over the caps to allow for a constant deck elevation. With two exceptions these members were noted to be in good condition. Investigation of the north perimeter stringer between Bents 12 and 13 found that it has sustained heavy fungal damage with the loss of 50%-90% of its cross section. Refer to Appendix A, Photo No. 15.

   Additionally, the stringer located on the south perimeter of the wharf spanning Bents 15 and 16 beneath the east approach was also noted to have sustained heavy fungal decay. Inspection identified ~90% loss of the cross-section in this member at the eastern end and extending in over the Bent 16 cap. Due to the proximity of the piles and superstructure members in this area there is very limited access and it was not possible to determine how far in the damage extended. Refer to Photo No. 14 of Appendix A.

Deck

The overall condition of the deck was found to be fair to good. Specific results of the inspection are as follows:

1. The deck is composed of 3x4 creosote treated boards on edge with a dual overlay of 2 inches of asphalt and an additional 6 inches of concrete.
2. Inspection found evidence of minor mechanical damage and/or light fungal decay in several individual boards along the north edge of the structure. Similar minor damage was found to the deck boards along the majority of the south edge of the wharf. One area of significant damage to the deck boards was found between Bents 10 – 11. In this span approximately 50% of the boards have sustained heavy fungal damage that extends from the south end of the boards in approximately one foot.
3. Inspection found the structure to have two layers of wear surface above the timber deck boards. The original wear surface was an approximate two inch asphalt overlay. A second newer wear surface has been installed over the asphalt. This lift is an approximate six inch concrete deck slab. The concrete deck was found to extend from Bents 1 – 14 and also over both of the two approach trestles. The concrete wear surface was found to be in good condition with no significant deterioration or damage found. Refer to Appendix A, Photo No. 16.

Miscellaneous Observations

1. Inspection noted a lower elevation platform located off the south side of the wharf between Bents 4 and 6. This platform supports a vacuum fish transporter and was found to be in fair to poor condition. The platform is secured to the row D piles in these three bents and to a ledger connected to bulkhead piles No. 15 – 18. Both the framing

members and the decking for the platform are 4x12 creosote treated timbers. These members were noted to be in good condition with no evidence of any significant deterioration or damage found. However the bulkhead piles to which the south edge of the platform is secured, have all sustained significant fungal damage that extends from the tops of the piles down to the vicinity of the attachment bolts which secure the ledger. Refer to Appendix A, Photo No. 25.

Float Anchor Piles

The overall condition of the float anchor piles or dolphin piles that secure the mooring float is fair to good. Specific results of the inspection are as follows:

1. The piles were found to be creosote treated D. Fir piles with diameters ranging from 12-14 inches. Refer to Photo No. 17 in Appendix A.
2. Of the 13 piles inspected, 4 (30.8%) were found to be undamaged and have been rated at 100% of their original cross-sectional area.
3. Five piles (38.4%) were found to have sustained minor damage and have been rated in the 90% remaining area category. All five of these piles were found to have sustained minor mechanical abrasion in the intertidal zone from moored vessels. No evidence of marine borer damage was found in any of these piles.
4. Two piles (15.4%) have been rated in the 75% remaining area category. One of these piles was found to have sustained 5% abrasion and 20% marine borer section loss in the intertidal zone. The second pile has sustained 20% abrasive section loss from the intertidal zone to the mudline with no marine borer damage evident at this time.
5. Two piles (15.4%) have been rated in the 0% remaining area category. Both of these piles have sustained heavy marine borer damage in the submerged zone and one of these piles has broken at the elevation of the marine borer section loss.

Bulkheads

The timber bulkhead that runs along the southern shore of the I & J Waterway consists of two separate sections, identified as the East and West Bulkheads. The findings of the inspection are as follows:

<u>West Bulkhead</u>

1. The overall condition of the West Bulkhead is poor. Significant damage was found to the piles, the horizontal lagging timbers and to the timber tie-back system.
2. A total of 53 timber soldier piles provide support for the West Bulkhead. Eight of these piling provide a dual purpose of supporting the bulkhead, as well as functioning as a

structural pile for the wharf approaches. The condition of these eight piles has been presented under the section above that discusses the wharf piling.

3. Of the remaining 45 piles inspected in the West Bulkhead, 12 piles (26.7%) were found to be undamaged and have been rated in the 100% remaining cross-sectional area category.
4. One pile (2.2%) has been rated in the 90% remaining area category. This pile has sustained minor mechanical damage at its top that has resulted in the loss of approximately 2% of its cross section.
5. Three piles (6.7%) have been rated in the 50% category. These piles have sustained moderate to heavy fungal damage at their tops.
6. Two piles (4.4%) piles are rated in the 25% category and 27 (60.0%) piles are rated in the 0% category. The piles in these two classifications have sustained heavy fungal decay ranging from 75-90% section loss that typically extends from the top of the piles down approximately 4 feet. Evidence of past maintenance in an attempt to prevent the progress of fungal damage down the piles was observed. This maintenance included the filling of the decay pocket at the top of the piles with a concrete grout and then covering the pile with a metallic top cover to prevent moisture accumulation. Refer to Appendix A, Photo No. 21. The grout plugs are typically 6 – 18 inches in height and in the majority of instances has not been able to halt the progression of fungal decay down the piles.
7. Investigation of the timber tie-back system for this portion of the bulkhead found the visible portion of the timber 3x10's to be in poor condition. Many of these members have split or broken at the pile connection. Refer to Photos No. 22 and 24 in Appendix A.
8. Several of the piles in the northwest corner of the bulkhead were noted to have a second tie-back system consisting of steel rods that extend through the piles and are secured with a steel bearing plate and nut. The exposed ends of these rods appears to be in fair to good condition with minor surface corrosion observed.
9. The overall condition of the horizontal timber lagging is also poor. There are a total of 47 spans in this section of the bulkhead. The timbers typically span three soldier piles, and at some locations the piles are in close proximity.
10. Inspection of the timber lagging identified only three spans (6.4%) that are in good condition and rated in the undamaged category. No evidence of significant deterioration or damage was found to the boards in these spans.
11. Two spans (4.2%) have been rated in the light damage category as a result of two individual boards identified to have sustained ~ 5% marine borer section loss.

12. Two spans (4.2%) have been rated in the moderate damage category. Inspection of these boards identified three mid-level boards to have sustained marine borer damage with the loss of ~25% of their cross sectional area.
13. The remaining 40 spans (85.2%) were found to have sustained significant damage and have been rated in the heavy damage category. As shown by Appendix A, Photos No. 23 and 27, the damage to the lagging timbers was found to range from near the top of the bulkhead to the mudline. The majority of the damage has occurred as a result of fungal decay near the top of the bulkhead. However, several locations of significant marine borer damage were also found near the base of the bulkhead.
14. In the majority of the spans, the damage to the lagging is located approximately 3 – 4 feet below the top of the bulkhead, at the elevation of the timber tie-backs. In order to install the timber tie-backs, the lagging boards were cut or notched to facilitate the passage of the tie-back timbers through the wall. This notching has breached the preservative treatment shell of the lag timbers at this elevation, allowing fungal organisms access to the untreated core of these members. With time significant fungal section loss has developed and the majority of these lagging timbers have sustained 75% - 90% section loss. In some instances the decay is so severe that the members have deformed/compressed. Refer to Appendix A, Photo No. 26.
15. Evidence of significant marine borer damage was also found in a number of the lagging timbers. As shown in Photo No. 27 of Appendix A, the lower elevation lagging members in the spans from Pile 22 to 24 have sustained severe marine borer damage such that they are nearly perforated.
16. In the span from Pile 7 to 11, the lower half of the wall has a concrete face wall that appears to be a maintenance repair at a location that previously sustained heavy marine borer damage to the members. Refer to Appendix A, Photo No. 24. It should be noted that approximately 3 feet above the concrete repair, the two notched lagging boards have been destroyed by internal fungal damage such that this section of lagging has been rated in the major damage category.
17. The onshore or southern end of the condenser unit of the ice machine is supported by two poured in place concrete footings. These footings bear directly on the top of the bulkhead between Piles 30 – 31. As shown in Photos No. 29 and 30 of Appendix A, the two uppermost lagging members in this panel have sustained heavy fungal damage and are visibly compressed by the load imposed by the condenser.
18. The access ramp to the mooring float is also supported on top of the bulkhead. The ramp is secured to the top of the bulkhead between Piles 36 – 37. The top two lagging members in this span have sustained heavy fungal damage with the loss of

approximately 75 - 90 % of their cross section. Refer to Photos No. 31 and 32 in Appendix A.

East Bulkhead

1. Overall, the East Bulkhead is in generally fair condition. A significant number of piling were found to have sustained extensive damage, however, the damage in most cases is confined to the upper foot of the pile that is located above the top of the wall. The remaining piles, the majority of the timber lagging and the steel rod tie-back system were found to be in generally good condition.
2. The majority of the piles have no protective cap or cover and subsequently these members have sustained significant fungal damage that that was found to be confined to the top foot of the pile.
3. A total of 46 piles were examined in the East Bulkhead. Fifteen of these piles (32.6%) were found to be undamaged and have been rated in the 100% remaining cross sectional area category.
4. One pile (2.2%) has been rated in the 90% remaining area category. This pile has sustained minor mechanical damage at its top with the loss of ~1% of its cross section.
5. Six piles (13.0%) have been rated in the 75% rating category. These piles have sustained moderate fungal damage at their tops with the loss of ~25% of their cross section.
6. Fourteen piles (30.4%) have been rated in the 50% rating category and 10 (21.8%) piles have been rated in the 25% remaining area category. These piles have sustained heavy fungal decay but at this time the damage remains confined to the top foot of the member.
7. Inspection of the piles noted them to have a steel rod tie back system located approximately six feet below the top of the bulkhead. The tie-backs are ~one inch diameter rods which have been placed through the center of the piles and secured with a steel bearing plate and nut. As shown in Appendix A, Photo 36, the exposed ends of these tie rods appear to be in good condition with only minor surface corrosion. Excavation of the site was beyond the scope of this investigation so no information on the condition of the buried portion of the rods or the deadman is known.
8. The overall condition of the horizontal timber lagging is good. There are a total of 44 spans in this section of bulkhead. The timbers typically span three soldier piles.
9. Inspection of the timber lagging noted 35 of the 44 spans (79.5%) to be in good condition with no deterioration or damage noted. These spans have been rated in the undamaged category.

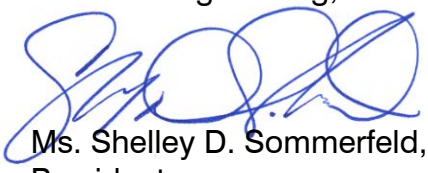
10. Four spans (9.1%) were noted to have minor damage and have been rated in the light damage category. One individual board in each of these spans was found to have sustained minor marine borer damage with the loss of 5% or less of their cross section.
11. Four additional spans (9.1%) have been rated in the moderate damage category. One or more boards in each of these spans has sustained significant fungal and/or marine borer damage with the loss of approximately 20% of their cross section.
12. The lagging in one span (2.3%) was found to have sustained significant damage and has been rated in the heavy damage category. In this span, which is located at the NW corner of the bulkhead between Piles 54 – 55.5, the lower elevation timber is split and there is a gap of approximately one foot below the bottom board. Examination of the fill material visible through the void showed the remaining fill to be approximately one foot diameter rock. As shown in Photo No. 35 of Appendix A, the fill appears to be stable. Although it is apparent that the fines have been washed out by wave action, there is no evidence of sloughing of the lager fill through the void or of a depression in the ground level above the area. A similar but lesser void was also noted in the adjacent span between piles 55.5 – 58.
13. The bulkhead between piles 83 – 88 was noted to have a slight bow to the north resulting in the top of the bulkhead listing out towards the waterway. Examination of the piles in this area found them to be undamaged. Based on the prevalence of fungal decay found in the tops of the majority of the piles in this section of bulkhead, it appears that these piles may be of a newer vintage. Given the slight northwards list of the wall in this span, it may be that some form of localized failure of the wall or some specific construction or maintenance item impacted the bulkhead in this area. The piles, lagging, and tie rods in this area all appear to be in good condition at this time.

CONCLUSIONS AND RECOMMENDATIONS

This inspection has shown that the overall condition of the Bornstein Seafood Wharf is fair to good. The majority of the structural piles were found to be in good condition with only two piles found to have sustained significant damage. We recommend that these two piles be evaluated for maintenance. The fender system was found to be in poor condition with slightly over half of the piles noted to have been heavily damaged or destroyed. The intertidal zone braces were also found to be in poor condition. Approximately half of the timbers are heavily damaged or missing. Inspection of the superstructure caps, stringers, and decking found them to be in overall fair to good condition with localized areas of significant damage found in the cap timbers supporting the north edge of the ice machine and several of the perimeter stringers. These defective members should be evaluated for maintenance.

The Float Anchor or Dolphin piles that secure the Mooring Float are in fair to good condition. Two piles were found to have sustained heavy marine borer damage and several additional piles were noted to have sustained minor to moderate deterioration primarily due to abrasion damage. We recommend that the two heavily damaged piles be evaluated for maintenance. The piles that have sustained minor to moderate damage will likely provide several more years of service without any maintenance at this time. We recommend that these piling be monitored in future inspections.

The condition of the two sections of soldier pile bulkhead varied. The West Bulkhead was found to be in poor condition with significant damage to the majority of the piles, the lagging timbers, and to the timber tie-backs. Inspection of the steel rod tie-back system found it to be in generally good condition. Given the overall severity and extent of the damage encountered throughout this section of bulkhead, we recommend that the defective members be evaluated for maintenance or replacement on a priority basis.



Inspection of the East Bulkhead found it to be in overall fair condition. Many of the piles were found to have sustained significant fungal damage, but at this time the damage is localized to the top foot of the piles which extends above the upper most lagging timber and ground elevation. Given that the damage is located above the ground, restorative maintenance does not appear to be necessary at this time due to structural considerations. However, some form of preventative maintenance such as a fungicide treatment and installing caps or covers on the tops of the piles to prevent further exposure to moisture may help to extend the service life of these piles. Inspection of the horizontal timber lagging and the steel tie-backs found them to be in generally good condition with the majority of the members found to be undamaged. One localized area at the NW corner of the bulkhead (i.e. Pile No's 54 – 58) was noted to have sustained damage that has resulted in two voids beneath the lowest elevation lagging timber. Although there has been an apparent loss of fines from the backfill due to wave action, no evidence of sloughing or movement of the larger 1 foot diameter fill materials behind the wall was noted. Although maintenance may not be warranted at this time, the area will most likely continue to deteriorate. We recommend that consideration be given to the placement of rip rap along the bottom of the bulkhead in this localized area to prevent further loss of fines and possible sink holes in the area behind the bulkhead.

We understand that our findings will be combined with the results of other types of field investigations and that this collective information will be utilized in the analysis and planning for the structures. We recommend that this planning include consideration for conducting periodic inspections of the structures as part of the Port of Bellingham's preventative maintenance program for the structures. Based on the material type(s), ages and exposure

conditions, we recommend periodic repeat inspections be conducted on a three to six year cycle as recommended by the American Society of Civil Engineers. Such inspections will help monitor the condition of the facility and will, as in the case of the current inspection, identify specific members that may require maintenance. Such an approach will help to ensure the structural integrity and longevity of the structures, as well as the personal safety of those using the facility.

It has been a pleasure to have assisted you with this project. Should you have any questions concerning this report, or if we can assist you further in your evaluation of the facility, please do not hesitate to contact our office.

Yours Truly,
Echelon Engineering, Inc.

Ms. Shelley D. Sommerfeld, P.E.
President

Enclosures

PHOTO No. 1: Bornstein Seafood Wharf and West Bulkhead, Looking East – Note the wharf is constructed primarily with creosote treated timber piles, braces and superstructure members. The bulkhead is also constructed with creosote treated soldier piles and timber lagging.

PHOTO No. 2: Bornstein Wharf and Bulkhead, Looking West – Note the east end of the West Bulkhead at left of photo and the Mooring Float with timber pile dolphins along it's north edge. Also note the ice machine located at the east end of the wharf.

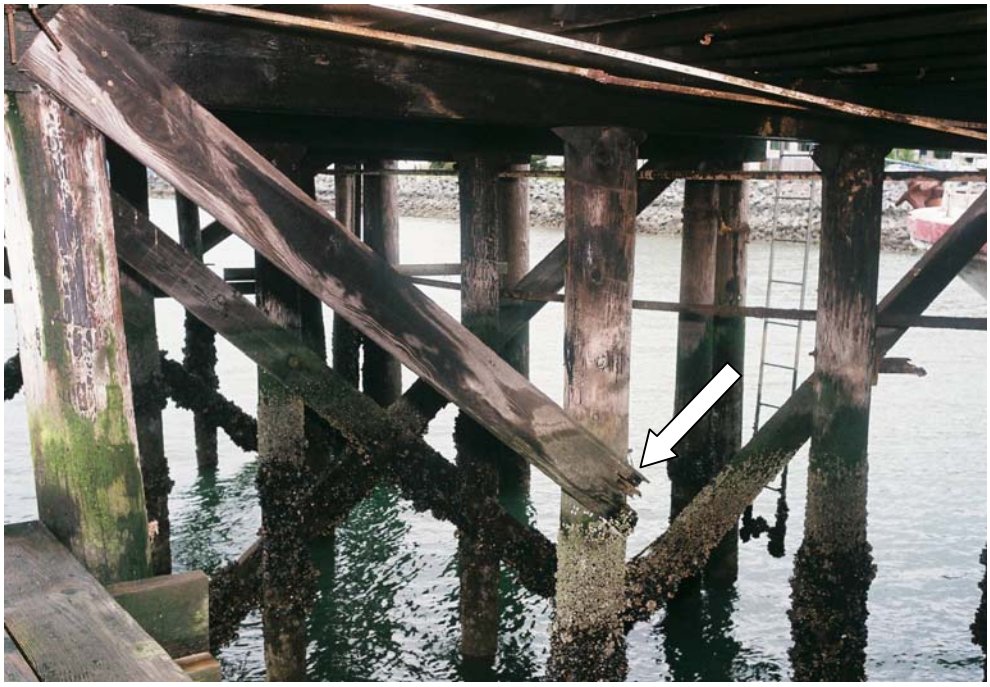

PHOTO No. 3: Bent 4, Looking Northwest – Note the good condition of the creosote treated piles from the top to the intertidal zone. Also note the damaged diagonal braces on Bent 4 in the foreground. The diagonal braces were typically found to be in poor condition throughout the wharf.

PHOTO No. 4: Bent 15.5, Looking North – Note the good condition of the piles in the intertidal zone. Also note the diagonal brace on the east side of the piles is destroyed.

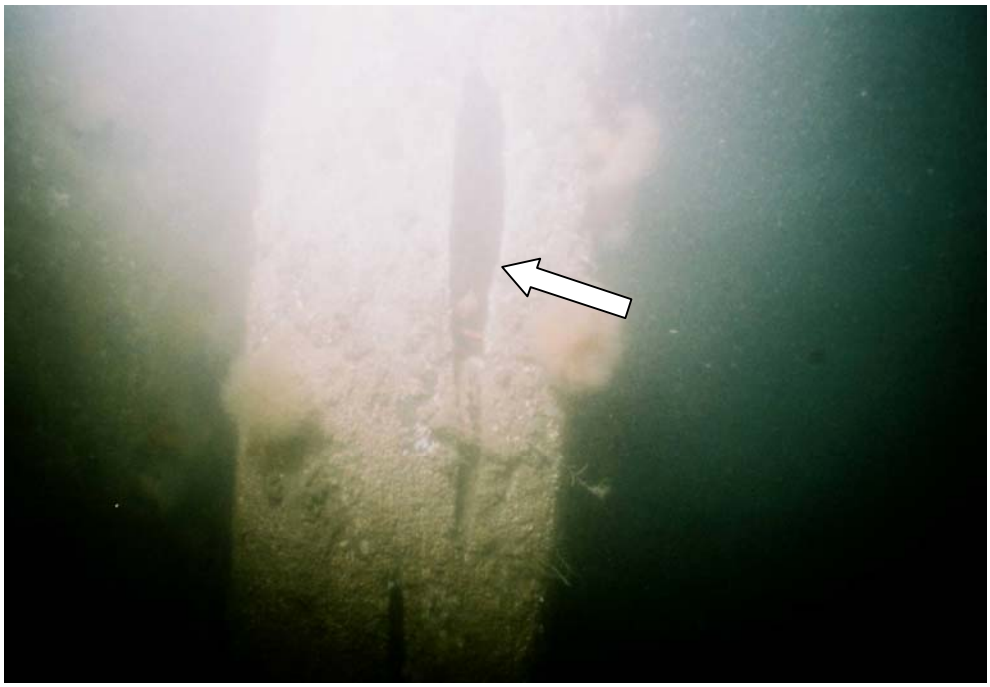

PHOTO No. 5: Bent 7, Row A Pile – Note the entrance to a marine borer cavity that was estimated to be 90% of the cross sectional area of the pile. The damage was found at El. –5' (MLLW) on this pile.

PHOTO No. 6: Bent 1, Row C Pile – Note the pile is split at the top. Level III drilling found 90% loss of the internal cross section due to mechanical and fungal damage.

PHOTO No. 7: Bents 11-12, Row B Superstructure – Note the good condition of the caps and stringers in this area. The majority of the caps and stringers throughout the structure were found to be in good condition. Also note the bituminous covers which have been placed on the piles as a preventative measure against fungal decay.

PHOTO No. 8: Bent 12, Row B Superstructure – Note the good condition of the 12x12 caps, 4x12 stringers and 3x4 deck planks. This is typical of the condition of these members throughout the wharf structure. All members exhibit good preservative retention.

PHOTO No. 9: Bent 1, Rows C-D, Superstructure – Note the Bent 1 cap is a newer, Chemonite treated member. Also note many of the original creosote treated stringers have sustained heavy fungal damage at their west end at Bent 1. Supplemental stringers have been installed adjacent to the damaged ones.

PHOTO No. 10: Bent 1-2, Supplemental Stringers – Note the light brown preservative treated supplemental stringers that have been sistered along side the damaged original members shown in Photo No. 9. A similar damage and repair method was also noted at Bent 15-16 at the east end of the wharf.

PHOTO No. 11: East End of Wharf, Looking West – The ice machine / tower is located between Bents 14 and 16. Two supplemental bents have been added at Bent 14.5 and 15.5 to increase structural capacity for the machinery and ice load.

PHOTO No. 12: Bent 15.5, North End – Note this cap, which is under the ice machine tower has sustained heavy fungal decay resulting in loss of 90% of its cross sectional area. The damage is located from the north end of the cap in past the first bearing pile at Row A.5.

PHOTO No. 13: Bent 15, North End – Note the drill used for Level III testing. Testing of this cap found it to have sustained a loss of ~90% of its cross sectional area at this location above the Row A pile.

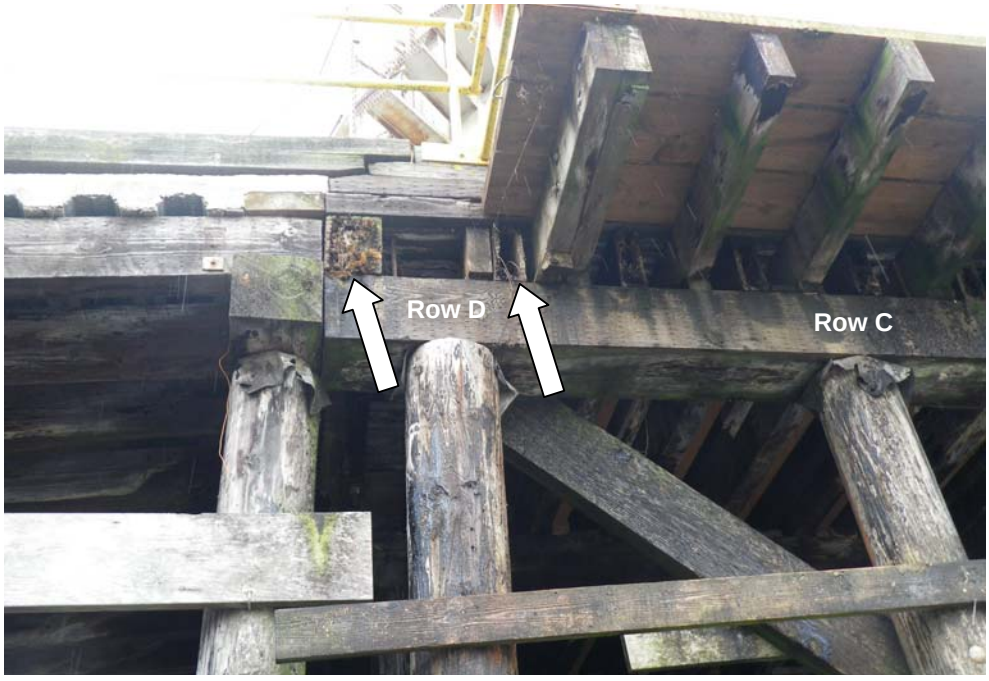

PHOTO No. 14: Bent 16, Row C - D – Note the original stringers spanning from Bent 15 (background) to Bent 16 are hollow at their east ends. Supplemental stringers have been sistered alongside. Also note the heavy damage to the perimeter stringer south of Row D (left arrow) which does not have a newer stringer sistered alongside.

PHOTO No. 15: Bent 12 - 13, North Perimeter Stringer – Note the screwdriver and drill inserted into an area of heavy fungal damage in this perimeter stringer. Also note the typical good condition of the ends of the timber decking above.

PHOTO No. 16: Bent 10 - 11, Composite Deck – Note the good condition of the 6" thick concrete deck surface that covers the majority of the wharf. A two inch lift of asphalt was found beneath the concrete. The lowest tier of deck members is comprised of 3x4" treated timber boards on edge.

PHOTO No. 17: Bent 10 - 16, Fender System – Note Fender Pile No. 17 (right arrow) is missing. The left arrow indicates Fender Pile No. 21 which was found to have sustained heavy mechanical and fungal damage to its top. Also note the multi-pile dolphins that secure the Mooring Float in the background.

PHOTO No. 18: Fender Pile No. 6 – Inspection found the pile to be broken ~4 feet below the top, at the location where the pile has been notched to accommodate the fender chock. Also note the good condition of the ends of the timber deck boards and the cap timber at this location.

PHOTO No. 19: West Bulkhead, West End – Note the typical construction with timber soldier piles, horizontal timber lagging. This section of wall was also noted to have what appears to be diagonal timber tie backs located ~4 feet below the top of the wall. Also note the poured concrete repair at the base of the wall between Piles No. 7-11.

PHOTO No. 20: West Bulkhead, East End – This section of bulkhead that runs through the Bornstein facility terminates in the area of a buried outfall.

PHOTO No. 21: West Bulkhead, Pile No. 47 – Note the concrete plug and the newer metal cap which has been installed in past maintenance. Despite the repair, fungal decay has continued and the top ~4 feet of the pile has sustained 90% fungal section loss. Similar damage was found throughout the piles in the West Bulkhead.

PHOTO No. 22: West Bulkhead, Piles 44 to 48 – The technician is inspecting Pile No. 47, which was found to have 90% loss of cross section from the top down ~4 feet. Also note what appears to be diagonal timber tie backs at the piles. Inspection found a number of these members to be split through their connections (Refer to arrows).

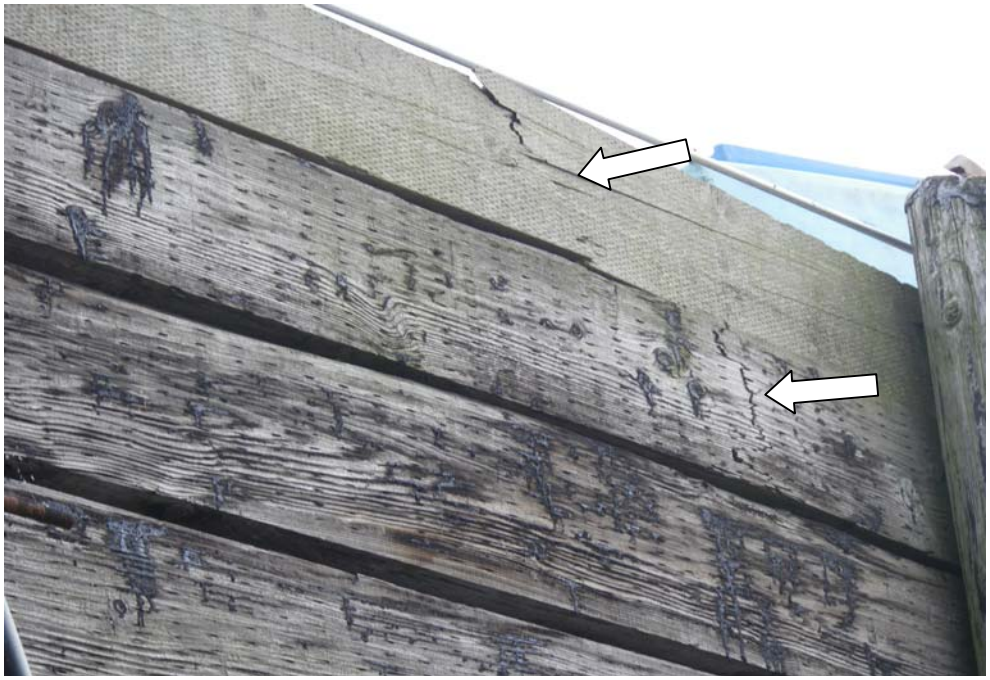

PHOTO No. 23: West Bulkhead, Piles No. 6 - 7 Lagging Timbers – Note the top two lagging timbers have failed and are broken.

PHOTO No. 24: West Bulkhead, Piles No. 7 to 11 – Note the poured in-place concrete repair to the bottom ~5 feet of the bulkhead at this location. Also note the split diagonal tie back timbers. Additionally, many of the horizontal lagging timbers at the elevation of the tie backs were found to have heavy fungal damage.

PHOTO No. 25: West Bulkhead, Piles No. 15-18 – Note the stringers (upper right) that are supported by a ledger bolted to the side of the bulkhead piles. These stringers support a lower deck service platform. All of these piles have sustained heavy fungal damage from the top down to near the elevation of the support ledger.

PHOTO No. 26: West Bulkhead, Piles No. 24 - 28, Lagging – Note the deformation of the two lagging timbers at the elevation of the diagonal tie back timbers. These members have been notched to accommodate the diagonals and thus been suceptible to accelerated fungal decay. Similar heavy internal fungal damage was found in the lagging boards at this elevation throughout the West Bulkhead.

PHOTO No. 27: West Bulkhead, Piles No. 22 - 25 – Note the screwdriver inserted into an area of heavy marine borer damage near the bottom of the bulkhead. Also note the marine borer damage evident as surface etching in the lower 3 - 4 boards.

PHOTO No. 28: West Bulkhead, Piles No. 22-23, Lagging – This is a close up of the marine borer damage shown in Photo No. 27 above. Note the small diameter rock which makes up the fill material behind the wall.

PHOTO No. 29: East Edge of Ice Machine / Tower Support – Note the two concrete footings that support the condensing tower for the ice making system. These footings are located between Piles No. 30 and 31 of the West Bulkhead. Inspection found Pile No. 30 to have sustained ~75% fungal damage in the top two feet.

PHOTO No. 30: West Bulkhead Lagging Timbers, Between Piles 30 and 31 – Note the concrete tower footing that bears directly on top of the bulkhead at this location. Inspection found he upper 3 lagging boards to have sustained heavy fungal damage with ~90% loss of section. The drill is inserted in the top board, which has failed and is visibly compressed.

PHOTO No. 31: West Bulkhead, Piles 35 - 38 – The mooring float access ramp is hinged off the top of the bulkhead between Piles 36 and 37. Inspection found the top two lagging timbers used to secure the ramp have sustained heavy fungal damage, with ~90% loss of cross section.

PHOTO No. 32: West Bulkhead, Piles No. 36-37, Ramp Connection – The access ramp attachment bracket is secured to the upper lagging timbers between Piles No. 36 and 37. The technician is hammer sounding the upper two lagging timbers. Level II and Level III testing found these timbers to be heavily damaged.

PHOTO No. 33: East Bulkhead, Looking East – Note the top of the soldier piles visible at the top of the bulkhead. Also note the uplands area behind the bulkhead is undeveloped.

PHOTO No. 34: East Bulkhead, Looking East from Outfall Area – Note the piles in this section of wall typically extend 1 foot above the uppermost lagging timbers. Measurements found the maximum bulkhead height for this section to be at Pile No. 75 and was measured at 15.5 feet from the top of the lagging to the mudline.

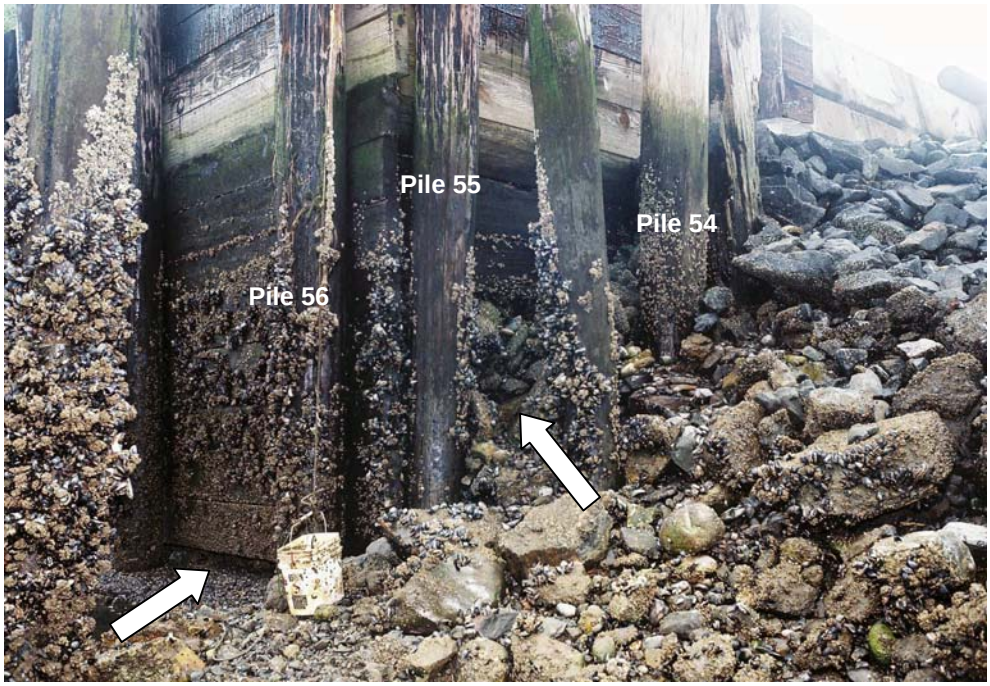

PHOTO No. 35: East Bulkhead, Northwest Corner at Outfall – Note the arrows indicating two locations where voids were identified beneath the timber lagging. These voids are in the spans between Pile No. 54 to 55 and from Pile No. 55 to 58. No evidence of active migration of fill material from behind the bulkhead was found.

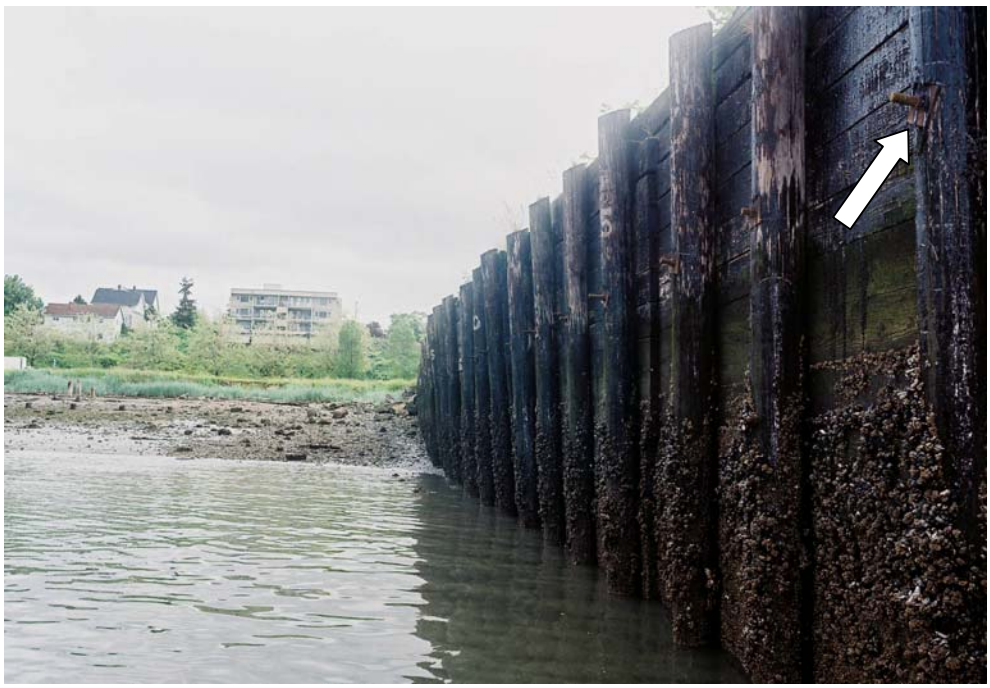

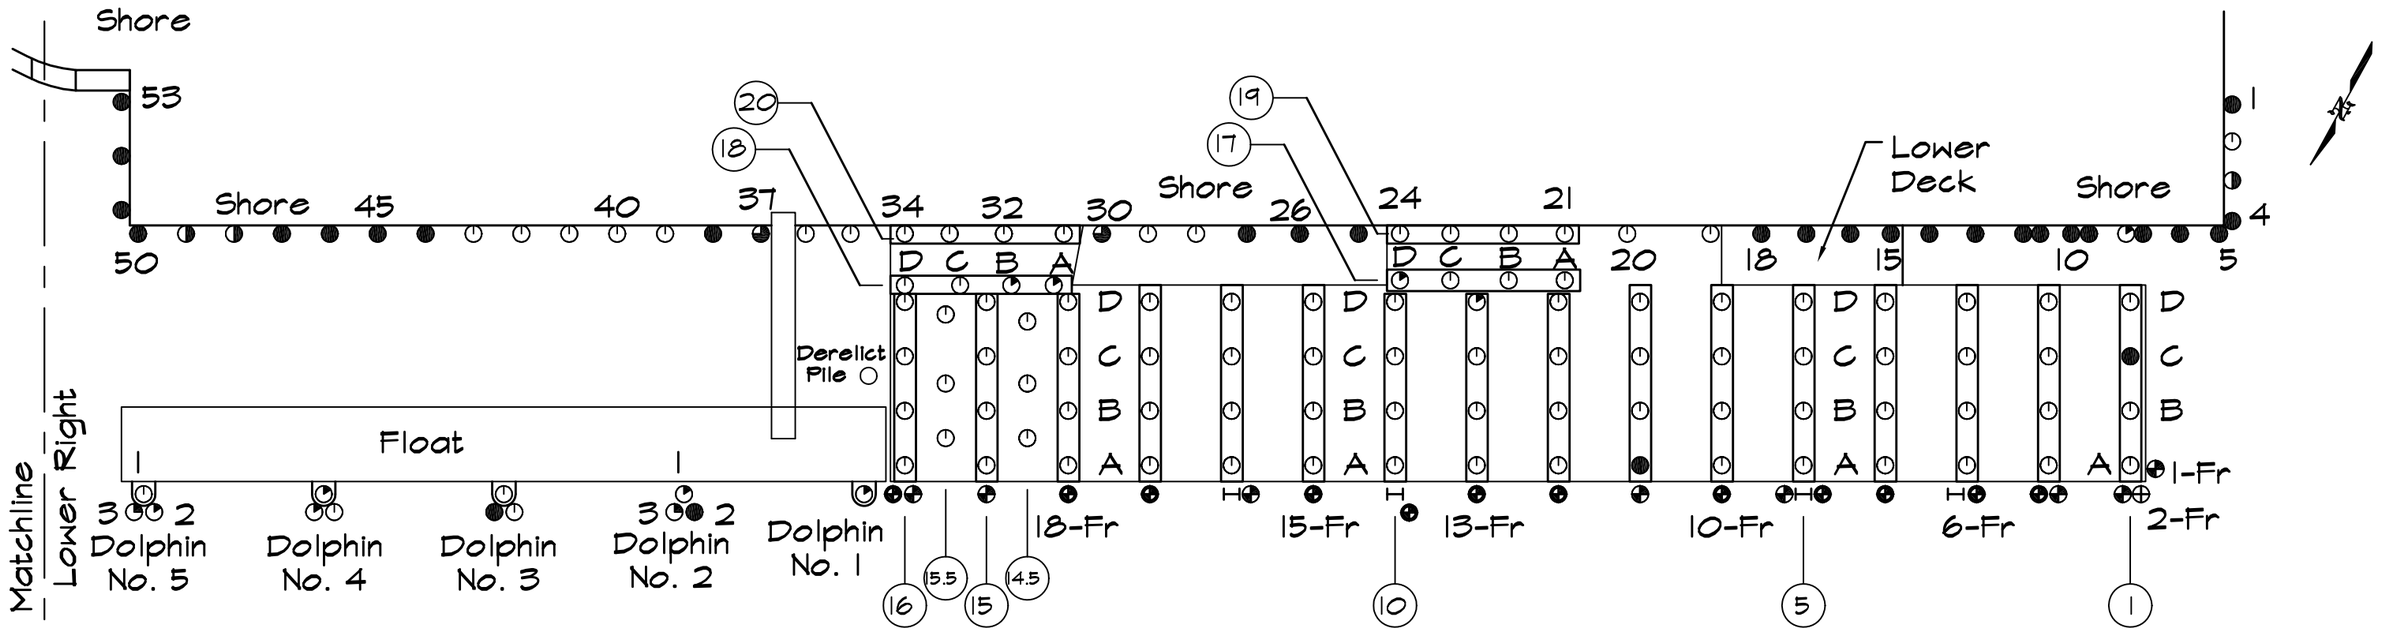

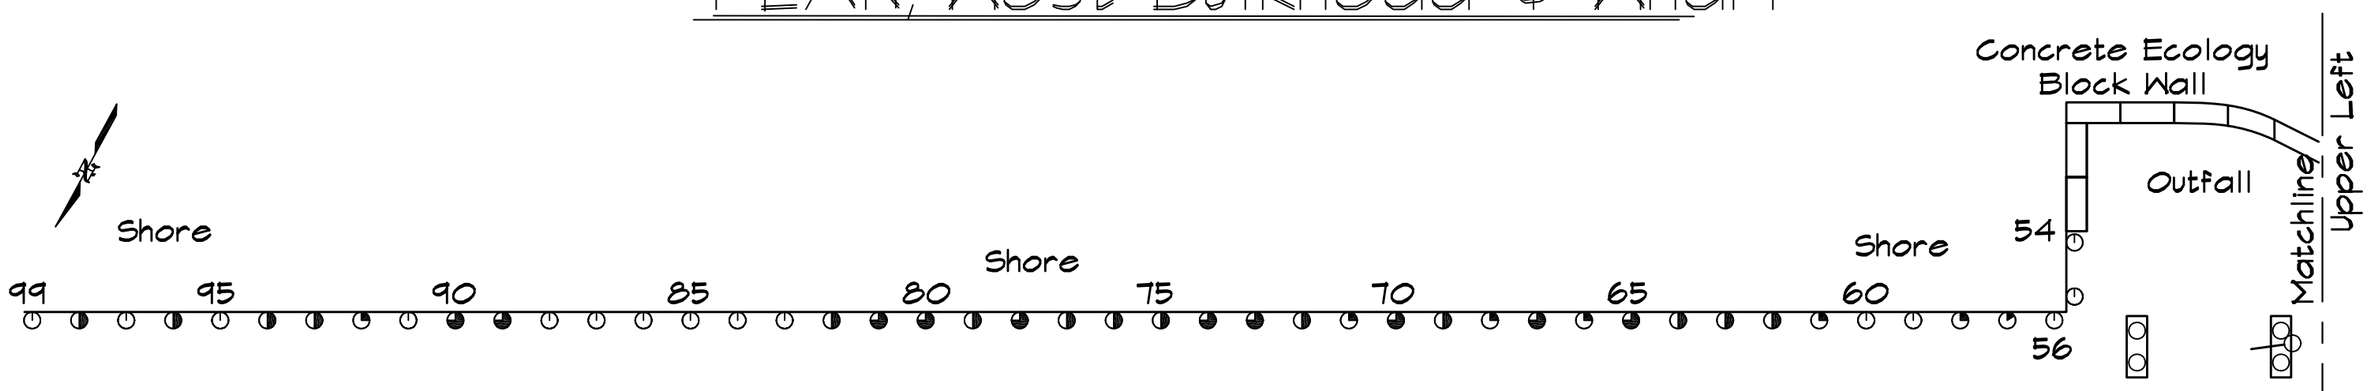

PHOTO No. 36: East Bulkhead, Looking East from Pile No. 72 – Note the steel tie backs located at each pile ~5-6 feet below the top of the wall. Level I visual inspection found these all to be in generally good condition. Also note the good condition of the timber piles and lagging.

C.1 CHEMICAL AND PHYSICAL DATA VALIDATION RESULTS.....C-2
C1.1 Surface Sediment Data C-2
C1.2 Subsurface Sediment Data C-3
C1.3 Storm Drain Solid Data C-3
REFERENCES C-3

C.1 CHEMICAL AND PHYSICAL DATA VALIDATION RESULTS

All data submitted in this report were validated by Laboratory Data Consultants, Inc. (LDC) of Carlsbad, California. Data validation reports are provided on DVD as part of Appendix D. Samples are listed with their corresponding laboratory data package validation report number in Appendix D, Table D-1. The data validation was performed under EPA guidelines, as described in the QAPP and the National Functional Guidelines for Data Review (EPA, 1999; EPA, 2004).

Data validation verified the accuracy and precision of chemical and geotechnical determinations performed during this investigation. Data qualifiers assigned as a result of the data validation and their definitions are shown on each of the respective analytical results tables. Data may have been qualified as biased or estimated for a particular analysis based on method or technical criteria. Data qualified with a "J" indicates that the associated numerical value is the approximate concentration of the analyte. Data qualified with a "UJ" indicates the approximate reporting limit below which the analyte was not detected. Consequently, these data qualifications are not expected to impact the data quality objectives and all data were determined to be useable as reported from the laboratory or as qualified in this Data Report, for the purposes of forthcoming remedial design with some minor exceptions.

C1.1 Surface Sediment Data

No results were qualified for ammonia, sulfide, total organic carbon, grain size, total solids, and metals. Twenty-three dioxin results were qualified as estimated possible maximum concentrations. Two dioxin results were qualified as estimated due to matrix interference. Four PCB results in one sample were reported at an estimated RL due to low MS %R values, and high MS/MSD RPD values. Results from the full scan semivolatiles (SVOC) analysis of fluorene were qualified as estimated due to a high continuing calibration verification (CCV) percent difference (%D) value. The reporting limits for bis(2-ethylhexyl) phthalate and diethyl phthalate were elevated due to method blank contamination. Results for 1,4-dichlorobenzene, benzo(g,h,i)perylene, benzoic acid and bis(2-ethylhexyl) phthalate were qualified as estimated in one sample due to low MS/MSD %R values. Results for 2-methylnaphthalene, acenaphthene, benzo(b,j,k)fluoranthenes, dibenzofuran, fluorene, and

naphthalene were qualified as estimated in one sample due to a high MS and/or MSD %R value, or a high MS/MSD RPD value. All sample results were qualified as estimated for 2,4-dimethylphenol and 2-methylphenol due to low LCS/LCSD %R values.

C1.2 Subsurface Sediment Data

These samples were collected on September 9, 2011 and stored frozen until analysis in April, 2012. No data were qualified for grain size or PCBs. Results for total solids, ammonia, and mercury were qualified as estimated due to a hold time exceedance. Five dioxin results were qualified as estimated possible maximum concentrations. The 2,4-dimethylphenol results from the SVOC and selective ion monitoring (SIM) SVOC analysis were qualified as estimated due to low LCS/LCSD %R values. Results from the full scan analyses of fluorene were qualified as estimated due to a high continuing calibration verification (CCV) percent difference (%D) value. The reporting limits for bis(2-ethylhexyl) phthalate and diethyl phthalate were elevated due to method blank contamination. The 2-methylphenol results in the SIM SVOC analyses were estimated due to low LCS/LCSD %R values.

C1.3 Storm Drain Solid Data

No data were qualified for ammonia, sulfide, total organic carbon, grain size, total solids, or PCBs. Copper and chromium were qualified due to low MS recoveries. Mercury was qualified as estimated due to a high duplicate RPD value. The reporting limits for bis(2-ethylhexyl)phthalate and diethyl phthalate were elevated due to method blank contamination. The result for 2,4-dimethylphenol was qualified due to a low LCS %R. Five dioxin results were qualified as estimated maximum possible concentrations.

ATTN: Ms. Cindy Fields

June 20, 2012

SUBJECT: I & J Waterway, Data Validation

Dear Ms. Fields,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on May 31, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 27745:

SDG #	Fraction
UR81/US18 UL83	Semivolatiles, Dioxins/Dibenzofurans, Polychlorinated Biphenyls, Metals, Wet Chemistry

The data validation was performed under Stage 2B/4 guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Introduction

This data review covers 15 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270D for Semivolatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
5/9/12	Pentachlorophenol	20.7	IJ12-04DL	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
5/7/12	Fluorene	44.36	All samples in SDG UR81/US18	J (all detects) UJ (all non-detects)	A

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MB-050212	5/2/12	Bis(2-ethylhexyl)phthalate	28 ug/Kg	All samples in SDG UR81/US18

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
IJ12-03	Bis(2-ethylhexyl)phthalate	100 ug/Kg	100U ug/Kg
IJ12-06	Bis(2-ethylhexyl)phthalate	71 ug/Kg	71U ug/Kg
IJ12-02	Bis(2-ethylhexyl)phthalate	100 ug/Kg	100U ug/Kg
IJ12-04DL (5X)	Bis(2-ethylhexyl)phthalate	320 ug/Kg	320U ug/Kg
IJ12-07	Bis(2-ethylhexyl)phthalate	51 ug/Kg	51U ug/Kg
IJ12-58A	Bis(2-ethylhexyl)phthalate	160 ug/Kg	160U ug/Kg
IJ12-11	Bis(2-ethylhexyl)phthalate	37 ug/Kg	37U ug/Kg
IJ12-08A	Bis(2-ethylhexyl)phthalate	100 ug/Kg	100U ug/Kg
I-1-Z	Bis(2-ethylhexyl)phthalate	74 ug/Kg	74U ug/Kg
I-2-A-Z	Bis(2-ethylhexyl)phthalate	79 ug/Kg	79U ug/Kg

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
IJ12-04MS/MSD (IJ12-04)	1,4-Dichlorobenzene	49.4 (50-150)	-	-	J (all detects) UJ (all non-detects)	A
	Benzoic acid	41.7 (50-150)	47.4 (50-150)	-		
	Bis(2-ethylhexyl)phthalate	44.2 (50-150)	-	-		
	Benzo(g,h,i)perylene	-	46.3 (50-150)	-		
IJ12-04MS/MSD (IJ12-04)	Naphthalene	-	162 (50-150)	89.3 (≤35)	J (all detects)	A
	2-Methylnaphthalene	-	-	70.7 (≤35)	J (all detects)	
	Acenaphthene	-	-	41.8 (≤35)	J (all detects)	
	Dibenzofuran	-	159 (50-150)	81.6 (≤35)	J (all detects)	
	Fluorene	-	-	55.4 (≤35)	J (all detects)	
	Total Benzofluoranthene	250 (50-150)	161 (50-150)	-	J (all detects)	

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
LCS/D-050212 (All samples in SDG UR81/US18)	2,4-Dimethylphenol	42.7 (50-150)	37.7 (50-150)	-	J (all detects) UJ (all non-detects)	P

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Finding	Criteria	Flag	A or P
IJ12-04	Phenanthrene Fluoranthene Pyrene Chrysene	Sample result exceeded calibration range.	Reported result should be within calibration range.	J (all detects) J (all detects) J (all detects) J (all detects)	A

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

The analysis was conducted within all specifications of the method.

In the case where more than one result was reported for an individual sample, the least technically acceptable results were rejected as follows:

Sample	Compound	Flag	A or P
IJ12-04	Phenanthrene Fluoranthene Pyrene Chrysene	R R R R	A
IJ12-04DL	All TCL compounds except Phenanthrene Fluoranthene Pyrene Chrysene	R	A

Due to calibration %D, MS/MSD %R and RPD, and LCS/LCSD %R problems, data were qualified as estimated in twelve samples.

Due to method blank contamination problems, data were qualified as not detected in nine samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be rejected (R) are unusable for all purposes. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples IJ12-58A and IJ12-08A were identified as field duplicates. No semivolatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/Kg)		RPD
	IJ12-58A	IJ12-08A	
Phenol	39	27	36
Benzyl alcohol	46	14	107
2-Methylphenol	13	38	98
4-Methylphenol	94	45	71
2,4-Dimethylphenol	26	12	74
Benzoic acid	120	380U	200
Naphthalene	76	28	92
2-Methylnaphthalene	68	19	113
Dimethylphthalate	9.8	54	139
Acenaphthylene	35	11	104

Dibenzofuran	130	19	149
Fluorene	110	19	141
Phenanthrene	1300	95	173
Anthracene	110	38	97
Fluoranthene	1100	210	136

Compound	Concentration (ug/Kg)		RPD
	IJ12-58A	IJ12-08A	
Pyrene	800	230	111
Benzo(a)anthracene	170	76	76
Bis(2-ethylhexyl)phthalate	160	100	46
Chrysene	430	170	87
Benzo(a)pyrene	110	60	59
Indeno(1,2,3-cd)pyrene	46	24	63
Dibenzo(a,h)anthracene	21	11	63
Benzo(g,h,i)perylene	46	25	59
Total Benzofluoranthene	400	190	71

XVII. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 14 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Semivolatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MB-050212	5/2/12	Diethylphthalate	3.4 ug/Kg	All samples in SDG UR81/US18

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
IJ12-03	Diethylphthalate	14 ug/Kg	14U ug/Kg
IJ12-05	Diethylphthalate	17 ug/Kg	17U ug/Kg
IJ12-06	Diethylphthalate	9.1 ug/Kg	9.1U ug/Kg
IJ12-02	Diethylphthalate	6.6 ug/Kg	6.6U ug/Kg
IJ12-07	Diethylphthalate	19 ug/Kg	19U ug/Kg
IJ12-01	Diethylphthalate	7.3 ug/Kg	7.3U ug/Kg
IJ12-58A	Diethylphthalate	6.8 ug/Kg	6.8U ug/Kg
IJ12-11	Diethylphthalate	7.0 ug/Kg	7.0U ug/Kg
IJ12-08A	Diethylphthalate	8.0 ug/Kg	8.0U ug/Kg
I-1-Z	Diethylphthalate	12 ug/Kg	12U ug/Kg
I-2-A-Z	Diethylphthalate	4.2 ug/Kg	4.8U ug/Kg

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Flag	A or P
IJ12-04MS/MSD (IJ12-04)	1,4-Dichlorobenzene 1,2,4-Trichlorobenzene Hexachlorobutadiene 2-Methylphenol 1,2-Dichlorobenzene	46.9 (50-150) 49.4 (50-150) 49.6 (50-150) 49.8 (50-150) 48.3 (50-150)	- - - - -	- - - - -	J (all detects) UJ (all non-detects)	A

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
LCS/D-050212 (All samples in SDG UR81/US18)	2-Methylphenol	-	49.8 (50-150)	-	J (all detects) UJ (all non-detects)	P
	2,4-Dimethylphenol	41.5 (50-150)	36.9 (50-150)	-	J (all detects) UJ (all non-detects)	

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to MS/MSD and LCS/LCSD %R problems, data were qualified as estimated in twelve samples.

Due to method blank contamination problems, data were qualified as not detected in eleven samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples IJ12-58A and IJ12-08A were identified as field duplicates. No semivolatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/Kg)		RPD
	IJ12-58A	IJ12-08A	
Dibenzo(a,h)anthracene	18	9.6	61
Dimethylphthalate	16	52	106
Diethylphthalate	6.8	8.0	16
Butylbenzylphthalate	12	6.1	65
2-Methylphenol	11	5.2	72
2,4-Dimethylphenol	25	12	70
Pentachlorophenol	34	48U	200

XVII. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 14 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8082 for Polychlorinated Biphenyls.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/ECD Instrument Performance Check

Instrument performance was acceptable unless noted otherwise under initial calibration and continuing calibration sections.

III. Initial Calibration

Initial calibration of multicomponent compounds was performed for the primary (quantitation) column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

IV. Continuing Calibration

Continuing calibration was performed at required frequencies.

The percent differences (%D) of calibration factors in continuing standard mixtures were within the 20.0% QC limits.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyl contaminants were found in the method blanks.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Compound	MS (%R) (Limits)	MSD (%R) (Limits)	RPD (Limits)	Affected Compound	Flag	A or P
IJ12-01MS/MSD (IJ12-01)	Aroclor-1260	48.9 (50-150)	-	39.8 (≤35)	Aroclor-1260 Aroclor-1254 Aroclor-1242 Aroclor-1248	J (all detects) UJ (all non-detects)	A
IJ12-01MS/MSD (IJ12-01)	Aroclor-1016	-	-	36.9 (≤35)	Aroclor-1016 Aroclor-1221 Aroclor-1232	J (all detects) J (all detects) J (all detects)	A

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Florisil Cartridge Check

Florisil cleanup was not required and therefore not performed in this SDG.

XI. GPC Calibration

GPC cleanup was not required and therefore not performed in this SDG.

XII. Target Compound Identification

Raw data were not reviewed for this SDG.

XIII. Compound Quantitation and Reported RLs

Raw data were not reviewed for this SDG.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to MS/MSD %R and RPD problems, data were qualified as estimated in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XV. Field Duplicates

Samples IJ12-58A and IJ12-08A were identified as field duplicates. No polychlorinated biphenyls were detected in any of the samples.

XVI. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 16 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010C and 7471A for Metals. The metals analyzed were Arsenic, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Silver, and Zinc.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Analyte	Total Days From Sample Collection Until Analysis	Required Holding Time (in Days) From Sample Collection Until Analysis	Flag	A or P
I-1-Z I-2-A-Z I-2-A-ZMS I-2-A-ZDUP	Mercury	238	28	J (all detects) R (all non-detects)	P

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

The initial and continuing calibrations were performed at the required frequency.

The calibration standards criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No metals contaminants were found in the initial, continuing and preparation blanks.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike Analysis

Matrix spike (MS) samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VII. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution was not performed for this SDG.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to holding time problems, data were qualified as estimated in two samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples IJ12-58A and IJ12-08A were identified as field duplicates. No metals were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/Kg)		RPD
	IJ12-58A	IJ12-08A	
Cadmium	1.2	1.0	18
Chromium	85	80	6

Analyte	Concentration (mg/Kg)		RPD
	IJ12-58A	IJ12-08A	
Copper	86.0	87.0	1
Lead	16	15	6
Mercury	0.29	0.26	11
Nickel	120	113	6
Zinc	152	146	4

XV. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 19 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 350.1M for Ammonia as Nitrogen, Standard Method 2540B for Total Solids and Preserved Total Solids, EPA Method 376.2 for Sulfide, Plumb Method, 1981 for Total Organic Carbon, and PSEP Method for Grain Size.

The review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Analyte	Total Time From Sample Collection Until Analysis	Required Holding Time From Sample Collection Until Analysis	Flag	A or P
I-1-Z I-2-A-Z I-1-ZDUP	Total solids	235 days	6 months	J (all detects) UJ (all non-detects)	P
I-1-Z I-2-A-Z I-1-ZMS I-1-ZDUP	Ammonia as N	335 days	7 days	J (all detects) R (all non-detects)	P

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration of each method were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met for each method when applicable.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VI. Duplicates/Triplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

Triplicate (TRP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to holding time problems, data were qualified as estimated in two samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples IJ12-58A and IJ12-08A were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration		RPD
	IJ12-58A	IJ12-08A	
Total solid	38.00 %	39.40 %	4
Preserved total solids	33.80 %	32.40 %	4
Ammonia as N	23.4 mg/Kg	18.0 mg/Kg	26
Sulfide	2630 mg/Kg	2090 mg/Kg	23
Total organic carbon	4.31 %	3.76 %	14

Analyte	Percent Finer		RPD
	IJ12-58A	IJ12-08A	
Gravel (4750 microns)	100	99.1	1
Gravel (2000 microns)	99.8	98.8	1
Very coarse sand (1000 microns)	98.3	97.1	1
Coarse sand (500 microns)	96.8	95.3	2
Medium sand (250 microns)	95.2	93.6	2
Fine sand (125 microns)	93.4	91.7	2
Very fine sand (63 microns)	90.6	88.8	2
Silt (31.00 microns)	87.0	78.4	10
Silt (15.60 microns)	72.5	58.0	22
Silt (7.80 microns)	46.9	36.9	24
Silt (3.90 microns)	35.9	28.1	24
Clay (2.00 microns)	27.7	22.1	22
Clay (1.00 microns)	18.1	14..6	26

XI. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 11 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

PFK and static resolving power data were not provided, therefore not reviewed.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

The minimum S/N ratio was greater than or equal to 10 for each unlabeled compound and labeled compound.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration results were within the QC limits for unlabeled compounds and labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MB-050212	5/2/12	2,3,7,8-TCDD 1,2,3,7,8-PeCDD OCDD Total HxCDD Total HpCDF Total HpCDD	0.0374 pg/g 0.101 pg/g 0.389 pg/g 0.0502 pg/g 0.101 pg/g 0.118 pg/g	All samples in SDG UR81/US18

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

All target compound identifications were within validation criteria.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG UR81/US18	The Polychlorinated Diphenyl Ether (PCDPE) interferences were above the S/N ratio of 2.5. (All compounds flagged "X" by the laboratory)	J (all detects) UJ (all non-detects)	A

Sample	Compound	Flag	A or P
All samples in SDG UR81/US18	All compounds reported as estimated maximum possible concentration (EMPC)	J (all detects)	A

XII. System Performance

The system performance was acceptable.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to compound quantitation problems, data were qualified as estimated in eleven samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 4 data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples IJ12-58A and IJ12-08A were identified as field duplicates. No polychlorinated dioxins/dibenzofurans were detected in any of the samples with the following exceptions:

Compound	Concentration (pg/g)		RPD
	IJ12-58A	IJ12-08A	
2,3,7,8-TCDF	2.28	5.26	79
2,3,7,8-TCDD	0.266	0.629	81

Method: Dioxins/Dibenzofurans (EPA SW 846 Method 1613B)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. GC/MS Instrument performance check				
Was PFK exact mass 380.9760 verified?	✓			
Were the retention time windows established for all homologues?	✓			
Was the chromatographic resolution between 2,3,7,8-TCDD and peaks representing any other unlabeled TCDD isomers ≤ 25% ?	✓			
Is the static resolving power at least 10,000 (10% valley definition)?	✓			
Was the mass resolution adequately check with PFK?	✓			
Was the presence of 1,2,8,9-TCDD and 1,3,4,6,8-PeCDF verified?	✓			
III. Initial calibration				
Was the initial calibration performed at 5 concentration levels?	✓			
Were all percent relative standard deviations (%RSD) ≤ 20% for unlabeled compounds and ≤ 35% for labeled compounds ?	✓			
Did all calibration standards meet the Ion Abundance Ratio criteria?	✓			
Was the signal to noise ratio for each target compound ≥ 2.5 and for each recovery and internal standard ≥ 10?	✓			
IV. Continuing calibration				
Was a routine calibration performed at the beginning and end of each 12 hour period?	✓			
Were all the concentrations for the unlabeled compounds and labeled compounds within the QC limits (Method 1613B, Table 6)?	✓			
Did all routine calibration standards meet the Ion Abundance Ratio criteria?	✓			
V. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was a method blank performed for each matrix and concentration?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet?	✓			
VI. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.			✓	
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?			✓	
VII. Laboratory control samples				
Was an LCS analyzed for this SDG? OPR	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			

LDC #: 27745 A2 1

VALIDATION FINDINGS CHECKLIST

Validation Area	Yes	No	NA	Findings/Comments
VIII. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?			✓	
Were the performance evaluation (PE) samples within the acceptance limits?			✓	
IX. Internal standards				
Were internal standard recoveries within the ~~25-150~~ QC criteria% criteria?	✓			
Was the minimum S/N ratio of all internal standard peaks ≥ 10?	✓			
X. Target compound identification				
For 2,3,7,8 substituted congeners with associated labeled standards, were the retention times of the two quantitation peaks within -1 to 3 sec. of the RT of the labeled standard?	✓			
For 2,3,7,8 substituted congeners without associated labeled standards, were the relative retention times of the two quantitation peaks within 0.005 time units of the RRT measured in the routine calibration?	✓			
For non-2,3,7,8 substituted congeners, were the retention times of the two quantitation peaks within RT established in the performance check solution?	✓			
Did compound spectra contain all characteristic ions listed in the table attached?	✓			
Was the Ion Abundance Ratio for the two quantitation ions within criteria?	✓			
Was the signal to noise ratio for each target compound and labeled standard ≥ 2.5?	✓			
Does the maximum intensity of each specified characteristic ion coincide within ± 2 seconds (includes labeled standards)?	✓			
For PCDF identification, was any signal (S/N ≥ 2.5, at ± seconds RT) detected in the corresponding PCDPE channel?	✓	✓		
Was an acceptable lock mass recorded and monitored?	✓			
XI. Compound quantitation/CRQLs				
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and CRQLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XII. System performance				
System performance was found to be acceptable.	✓			
XIII. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XIV. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target compounds were detected in the field duplicates.	✓			
XV. Field blanks				
Field blanks were identified in this SDG.		✓		
Target compounds were detected in the field blanks.			✓

METHOD: HRGC/HRMS Dioxins/Dibenzofurans (EPA Method 1613B)

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$ — A_x = Area of compound, A_{is} = Area of associated internal standard
average RRF = sum of the RRFs/number of standards — C_x = Concentration of compound, C_{is} = Concentration of internal standard
$\%RSD = 100 * (S/X)$ — S = Standard deviation of the RRFs, X = Mean of the RRFs

Y N N/A Were all reported results recalculated and verified for all level IV samples?
Y N N/A Were all recalculated results for detected target compounds agree within 10.0% of the reported results?

Concentration = $\frac{(A_x)(I_s)(DF)}{(A_{is})(RRF)(V_o)(\%S)}$

A_x = Area of the characteristic ion (EICP) for the compound to be measured

A_{is} = Area of the characteristic ion (EICP) for the specific internal standard

I_s = Amount of internal standard added in nanograms (ng)

V_o = Volume or weight of sample extract in milliliters (ml) or grams (g).

RRF = Relative Response Factor (average) from the initial calibration

Df = Dilution Factor.

%S = Percent solids, applicable to soil and solid matrices only.

Example:

Sample I.D. #1, 2,3,7,8 TCDF

Conc. = $\frac{(39500)(100)(20)}{(3980164)(0.866)(10.1)(\quad)}$

= 2.27 pg/g

Data Validation Report

Project/Site Name: I & J Waterway

Collection Date: September 8, 2011

LDC Report Date: June 5, 2012

Matrix: Sediment

Parameters: Wet Chemistry

Validation Level: Stage 2B

Laboratory: Analytical Resources, Inc.

Sample Delivery Group (SDG): UL83

Sample Identification

I-1-Z
I-2-A-Z
I-1-ZMS
I-1-ZDUP
I-1-ZTRP

Introduction

This data review covers 5 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA 160.3 for Total Solids and Plumb Method, 1981 for Total Organic Carbon.

The review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met with the following exceptions:

Sample	Analyte	Total Time From Sample Collection Until Analysis	Required Holding Time From Sample Collection Until Analysis	Flag	A or P
I-1-Z I-2-A-Z I-1-ZDUP I-1-ZTRP	Total solids	186 days	6 months	J (all detects) UJ (all non-detects)	P
All samples in SDG UL83	Total organic carbon	193 days	6 months	J (all detects) UJ (all non-detects)	P

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration of each method were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met for each method when applicable.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VI. Duplicates/Triplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

Triplicate (TRP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to holding time problems, data were qualified as estimated in two samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

No field duplicates were identified in this SDG.

XI. Field Blanks

No field blanks were identified in this SDG.

SUBJECT: I & J Waterway, Data Validation

Dear Ms. Fields,

Enclosed is the final validation report for the fractions listed below. This SDG was received on July 27, 2012. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 28089:

SDG #	Fraction
UZ99	Semivolatiles, Dioxins/Dibenzofurans, Polychlorinated Biphenyls, Metals, Wet Chemistry

The data validation was performed under Stage 2B guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- USEPA, Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review, Septemeber 2005

Sample Identification

CB-002-06222012

Introduction

This data review covers one sediment sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270D for Semivolatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990 .

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
5/26/12	Benzyl alcohol	31.12	All samples in SDG UZ99	J (all detects)	A

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MB-062812	6/28/12	Bis(2-ethylhexyl)phthalate	23 ug/Kg	All samples in SDG UZ99

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
CB-002-06222012	Bis(2-ethylhexyl)phthalate	51 ug/Kg	51U ug/Kg

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

No data was qualified due to high calibration %D, the associated result was non-detected.

Due to method blank contamination problems, data were qualified as not detected in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

No field blanks were identified in this SDG.

Compound	Blank ID	Sample Identification								

CIRCLED RESULTS WERE NOT QUALIFIED. ALL RESULTS NOT CIRCLED WERE QUALIFIED BY THE FOLLOWING STATEMENT:
Common contaminants such as the phthalates and TICs noted above that were detected in samples within ten times the associated method blank concentration were qualified as not detected, "U". Other contaminants within five times the method blank concentration were also qualified as not detected, "U".

Sample Identification

CB-002-06222012

Introduction

This data review covers one sediment sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8270D using Selected Ion Monitoring (SIM) for Semivolatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990 .

Average relative response factors (RRF) for all compounds were within method and validation criteria.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No semivolatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
MB-062812	6/28/12	Diethylphthalate	17 ug/Kg	All samples in SDG UZ99

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
CB-002-06222012	Diethylphthalate	14 ug/Kg	14U ug/Kg

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits with the following exceptions:

LCS ID (Associated Samples)	Compound	LCS %R (Limits)	LCSD %R (Limits)	RPD (Limits)	Flag	A or P
062812LCS/D (All samples in SDG UZ99)	2,4-Dimethylphenol	49.6 (50-150)	-	-	J (all detects) UJ (all non-detects)	P

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to calibration LCS/LCSD %R problems, data were qualified as estimated in one sample.

Due to method blank contamination problems, data were qualified as not detected in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

XVII. Field Blanks

No field blanks were identified in this SDG.

Laboratory Data Consultants, Inc.
Data Validation Report

Project/Site Name: I & J Waterway

Collection Date: June 22, 2012

LDC Report Date: August 13, 2012

Matrix: Sediment

Parameters: Polychlorinated Biphenyls

Validation Level: Stage 2B

Laboratory: Analytical Resources, Inc.

Sample Delivery Group (SDG): UZ99

Sample Identification

CB-002-06222012

Introduction

This data review covers one sediment sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8082 for Polychlorinated Biphenyls.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/ECD Instrument Performance Check

Instrument performance was acceptable unless noted otherwise under initial calibration and continuing calibration sections.

III. Initial Calibration

Initial calibration of multicomponent compounds was performed for the primary (quantitation) column as required by the method.

The percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

IV. Continuing Calibration

Continuing calibration was performed at required frequencies.

The percent differences (%D) of calibration factors in continuing standard mixtures were within the 20.0% QC limits.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyl contaminants were found in the method blanks.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Florisil Cartridge Check

Florisil cleanup was not required and therefore not performed in this SDG.

XI. GPC Calibration

GPC cleanup was not required and therefore not performed in this SDG.

XII. Target Compound Identification

Raw data were not reviewed for this SDG.

XIII. Compound Quantitation and Reported RLs

Raw data were not reviewed for this SDG.

XIV. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

The quality control criteria reviewed were met and are considered acceptable. Based upon the Stage 2B data validation all results are considered valid and usable for all purposes.

XV. Field Duplicates

No field duplicates were identified in this SDG.

XVI. Field Blanks

No field blanks were identified in this SDG.

Sample Identification

CB-002-06222012
CB-002-06222012MS
CB-002-06222012DUP

Introduction

This data review covers 3 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Methods 6010C and 7471A for Metals. The metals analyzed were Arsenic, Cadmium, Chromium, Copper, Lead, Mercury, Nickel, Silver, and Zinc.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

ICP-MS was not utilized in this SDG.

III. Calibration

The initial and continuing calibrations were performed at the required frequency.

The calibration standards criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No metals contaminants were found in the initial, continuing and preparation blanks.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike Analysis

Matrix spike (MS) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits with the following exceptions:

Spike ID (Associated Samples)	Analyte	%R (Limits)	Flag	A or P
CB-002-06222012MS (All samples in SDG UZ99)	Chromium	52.2 (75-125)	J (all detects) UJ (all non-detects)	A
	Copper	73.0 (75-125)	J (all detects) UJ (all non-detects)	

VII. Duplicate Sample Analysis

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits with the following exceptions:

DUP ID (Associated Samples)	Analyte	RPD (Limits)	Difference (Limits)	Flag	A or P
CB-002-06222012DUP (All samples in SDG UZ99)	Mercury	-	0.07 mg/Kg (≤0.06)	J (all detects) UJ (all non-detects)	A

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

ICP-MS was not utilized in this SDG.

X. Furnace Atomic Absorption QC

Graphite furnace atomic absorption was not utilized in this SDG.

XI. ICP Serial Dilution

ICP serial dilution was not performed for this SDG.

XII. Sample Result Verification

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to MS %R and Duplicate difference problems, data were qualified as estimated in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

No field blanks were identified in this SDG.

CB-002-06222012
CB-002-06222012MS
CB-002-06222012DUP
CB-002-06222012TRP

Introduction

This data review covers 4 sediment samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 350.1M for Ammonia as Nitrogen, Standard Method 2540B for Total Solids and Preserved Total Solids, EPA Method 376.2 for Sulfide, Plumb Method for Total Organic Carbon, and PSEP Method for Grain Size.

The review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration of each method were met.

III. Calibration Verification

Calibration verification frequency and analysis criteria were met for each method when applicable.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VI. Duplicates/Triplicates

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

Triplicate (TRP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

The quality control criteria reviewed were met and are considered acceptable. Based upon the Stage 2B data validation all results are considered valid and usable for all purposes.

X. Field Duplicates

No field duplicates were identified in this SDG.

XI. Field Blanks

No field blanks were identified in this SDG.

Sample Identification

CB-002-06222012

Introduction

This data review covers one sediment sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration results were within the QC limits for unlabeled compounds and labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MB-070912	7/9/12	2,3,7,8-TCDF 2,3,7,8-TCDD 1,2,3,7,8-PeCDF 1,2,3,6,7,8-HxCDF 2,3,4,6,7,8-HxCDF 1,2,3,7,8,9-HxCDF 1,2,3,4,6,7,8-HpCDF 1,2,3,4,6,7,8-HpCDD OCDD	0.0214 pg/g 0.0440 pg/g 0.0266 pg/g 0.0290 pg/g 0.0290 pg/g 0.0218 pg/g 0.0440 pg/g 0.0748 pg/g 1.54 pg/g	All samples in SDG UZ99

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks.

No field blanks were identified in this SDG.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria.

Sample	Compound	Flag	A or P
All samples in SDG UZ99	All compounds reported as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to compound quantitation problems, data were qualified as estimated in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Stage 2B data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

No field blanks were identified in this SDG.

METHOD: HRGC/HRMS Dioxins/Dibenzofurans (EPA SW 846 Method 8290)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Were the correct internal standard (IS), quantitation ions and relative response factors (RRF) used to quantitate the compound?
Y N N/A Compound quantitation and CRQLs were adjusted to reflect all sample dilutions and dry weight factors (if necessary).

#	Date	Sample ID	Finding	Associated Samples	Qualifications
		All	All compounds reported by the lab as estimated maximum possible concentration (EMPC)		J/Adet

Comments: See sample calculation verification worksheet for recalculations

RE: USACE Federal Channels, 080202-01
ARI Job: UL83

Dear Leslie:

Please find enclosed the Chain-of-Custody (COC) records, sample receipt documentation, and the final data package for samples from the project referenced above.

Sample receipt and details of these analyses are discussed in the Case Narrative.

An electronic copy of this package will remain on file with ARI. Should you have any questions or problems, please feel free to contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Subject: FW: I & J Waterway RI/FS Work Plan Addendum
From: Delaney Peterson <dpeterson@anchorqea.com>
Date: 3/12/2012 12:21 PM
To: "sue@arilabs.com" <sue@arilabs.com>

Hi Sue,
We need to trigger the analyses of a couple of samples from the I & J Waterway work from last September. The TS and TOC expired on Friday so we need these to be done as soon as possible.
The samples are I-1-Z and I-2-A-Z. They were originally logged in under TL65.

Will you please trigger these ASAP?

Thanks!
Delaney

From: Dan Berlin
Sent: Monday, March 12, 2012 11:44 AM
To: Delaney Peterson; Joy Dunay
Cc: Leslie McKee
Subject: FW: I & J Waterway RI/FS Work Plan Addendum

Delaney and Joy,
Did either of you work on the I&J waterway sampling project? We collected cores from the Corps in September 2011. We are also working for the Port of Bellingham, and need to trigger a few samples that are just at their hold time limits. Specifically, I-1-Z and I-2-A-Z. Please see Table 1 in the attached file. We need to trigger total solids and TOC from these samples (see Table 2 for hold time expiration dates). Are there any other tests that we could also trigger to be most efficient with volumes? We will be a bit tight on volumes, so don't want to waste any sediment, and we'll do all of the sediment tests in Table 1/3 anyway.
If you are familiar with this, can you coordinate with the lab (ARI I think) to trigger these samples? We have received approval from the Corps to test them, but they have to be billed under the Port of Bellingham (090007-01.02 task 2).
Give me a call on my cell phone to discuss if you can. Leslie's out today, and I'd like to get this rolling since we probably should have triggered them before Friday J.
Thanks
Dan

To: 'McInerney, Lucy (ECY)'
Cc: Stoner, Mike (MikeS@portofbellingham.com)
Subject: RE: I & J Waterway RI/FS Work Plan Addendum

Lucy,
Attached is the revised I&J Work Plan Addendum. A complete pdf is included, along with a redline version with brief responses to each of your comments. This version incorporates the edits summarized in my email on February 24, which was based on our previous discussion. Since then, per your request, we modified the background text, and we added a sample to be archived at IJW-SS-02 (IJ12-10), which would be tested if sample IJ12-07 failed.

UL83 : 00008/2012 12:39 PM

We also modified the reporting requirements such that the Supplemental Investigation Memorandum will include the results of this sampling, but also the historical data. This Memo would be akin to an RI, and would support discussions between the Port and Ecology to assess the results and confirm the path forward. This terminology and approach is consistent with the draft AO amendment that Frank and Phyllis have worked on, which requires the RI/FS report be submitted 150 days after receipt of final Ecology comments on the Memo.
Thanks
Dan

Subject: I & J Waterway RI/FS Work Plan Addendum

Mike:

Ecology has reviewed the memorandum from Anchor QEA regarding the I & J Waterway RI/FS Work Plan Addendum, dated December 21, 2011. Our comments are in the attached document.

In addition, I am working with the new Ecology AAG assigned to the site, Phyllis Barney, to determine if the memorandum format is appropriate. The outcome of my discussions with her, plus coordination with you and your attorney, may result in additional required changes to the document.

Sincerely,

Lucy

Case Narrative, Data Qualifiers, Control Limits

ARI Job ID: UL83

Case Narrative

Client: Anchor QEA
Project: USACE Federal Channels, 080202-01
ARI Job No.: UL83

Sample receipt

Two sediment samples were removed from frozen archive on March 12, 2012 and logged under ARI job UL83. The samples were analyzed for TOC and Total Solids as requested. For details regarding sample receipt, please refer to the Cooler Receipt Form.

Conventional Parameters

The samples and associated laboratory QC were prepared and analyzed outside the method recommended holding times.

The method blanks were clean at the reporting limits. The LCS percent recovery was within limits.

The SRM percent recovery was within limits.

The matrix spike percent recovery and replicate RSDs were within control limits.

RE: Client Project: I & J Waterway RI/FS, 090007-01
ARI Job Nos.: UR81 & US18

Dear Cindy:

Please find enclosed the Chain of Custody (COC) records, sample receipt documentation, and the final data package for samples from the project referenced above.

Sample receipt and details of these analyses are discussed in the Case Narrative.

An electronic copy of this package will remain on file with ARI. Should you have any questions or problems, please feel free to contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Cheronne Oreiro

Cooler Receipt Form

ARI Client: Anchor QEA
Project Name: HJ Waterway RI/FS

COC No(s): NA
Delivered by: Fed-Ex UPS Courier Hand Delivered Other:

Assigned ARI Job No: UR81
Tracking No. 7983 2700 0003/7983 2699 9945 NA
7983 2700 0069/7983 2700 0183

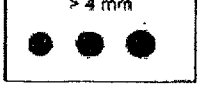
Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES (NO)
Were custody papers included with the cooler? (YES) NO
Were custody papers properly filled out (ink, signed, etc) (YES) NO
Temperature of Cooler(s) (°C) (recommended 2 0-6.0 °C for chemistry): 3.3 2.1 1.4 5.2
If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: 90944619
Cooler Accepted by: JM Date: 4/26/12 Time: 700

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES (NO)
What kind of packing material was used? (Bubble Wrap) (Wet Ice) Gel Packs (Baggies) Foam Block Paper Other:
Was sufficient ice used (if appropriate)? NA (YES) NO
Were all bottles sealed in individual plastic bags? YES (NO)
Did all bottles arrive in good condition (unbroken)? (YES) NO
Were all bottle labels complete and legible? (YES) NO
Did the number of containers listed on COC match with the number of containers received? (YES) NO
Did all bottle labels and tags agree with custody papers? (YES) NO
Were all bottles used correct for the requested analyses? (YES) NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs) (NA) YES NO
Were all VOC vials free of air bubbles? (NA) YES NO
Was sufficient amount of sample sent in each bottle? (YES) NO
Date VOC Trip Blank was made at ARI (NA)
Was Sample Split by ARI (NA) YES Date/Time Equipment: Split by:



Samples Logged by: JM Date: 4/26/12 Time: 914

U518 Relog samples under Project: I+J Waterway RI/FS
Project#: 090007-01

Subject: RE. I&J Sediment Samples
From: Dan Berlin <dberlin@anchorqea com>
Date: 8 14 AM
To: Cheronne Oreiro <cheronneo@arilabs com>, Leslie McKee <lmckee@anchorqea com>
CC: Julia Labadie <jlabadie@anchorqea com>

per WO# CF-040512

Cheronne,
Please perform the analyses with the priority listed below. Dioxins, SVOC, and metals (including nickel) are highest priority.

2 SVOC/SIM SVOC
1 Dioxins (I-2-Z only)
4 PCB
3 Metals (including nickel)
5 Ammonia/TS - we'll redo the TS since it can change if samples are frozen for too long...
6 Grain Size - we typically need a full 16oz jar for this analysis.
Sulfide? - The samples are expired already for sulfide and we do not have any preserved volume. Do you still want to do this analysis?

Let's cancel the sulfide analyses since they're outside of hold time and not preserved.
Thanks
Dan

Subject: Re: I&J Sediment Samples

Thanks Leslie. Can you send me a priority list for samples I-1-Z and I-2-Z. These samples only have one container (16oz jar) so we may not have enough volume to do everything.

Here is a list of the analyses....

SVOC/SIM SVOC
Dioxins,
PCB
Metals
Ammonia/TS - we'll redo the TS since it can change if samples are frozen for too long...
Grain Size - we typically need a full 16oz jar for this analysis.
Sulfide? - The samples are expired already for sulfide and we do not have any preserved volume. Do you still want to do this analysis?

Thanks,
-Cheronne

Cheronne-

Thanks for checking in. The answers to your questions include:

1. Use the Plumb method for Grain Size analysis.
2. The SRM is not needed for this project, please remove analysis of this.
3. Log samples I-1-Z, I-2-A-Z, and I-3-Z for the following analyses:
   I-1-Z: SMS parameters (except TOC and TS) and Nickel
   I-2-Z: SMS parameters (except TOC and TS), Nickel, and Dioxin/Furans
   I-3-Z: archive only

Best,

Leslie

Subject: I&J Sediment Samples

Hi Leslie,

We received the I&J sediment samples this morning and I just have a couple of quick questions for you since Cindy is out of the office.

- Everything in the tables and quote indicates samples should follow Plumb or SMS however, the ASTM method for Grain Size is listed. Should this be changed to the Plumb required method (PSEP - sieve/pipette)?

- Please confirm that an SRM is needed for Dioxin/Furans only
- I noticed in the sub-agreement that samples I-1-Z, I-2-A-Z, and I-3-Z (which were under ARI job TL70) should be re-logged under this project, but re-logged for what analysis? Or should they just stay in archive?
Please advise.

Thanks,
-Cheronne

Case Narrative

Client: Anchor QEA
Project: I & J Waterway RI/FS, 090007-01
ARI Job Nos.: UR81 & US18

Sample receipt

Twelve sediment samples and one wipe sample were received on April 26, 2012 under ARI job UR81. Select samples were archived upon receipt. The cooler temperatures measured by IR thermometer following ARI SOP were between 1.4 and 5.3°C. For further details regarding sample receipt, please refer to the Cooler Receipt Form.

Per Workorder CF-040512, three sediment samples were removed from frozen archive and logged under ARI job US18. One sample was re-archived after login. Two samples were analyzed as per email instructions from Anchor QEA on April 27, 2012. For details regarding sample receipt, please refer to the Cooler Receipt Form.

Semivolatiles by SW8270

The samples and associated laboratory QC for ARI job UR81 were extracted and analyzed within the method recommended holding times. The samples for ARI job US18 were extracted and analyzed within the method recommended holding times for samples stored frozen.

Initial calibrations were within method requirements.

The continuing calibration on 5/9/12 fell outside the 20% control limit low for Pentachlorophenol. Associated sample results were undetected for this compound. No corrective action was taken.

Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

Bis(2-Ethylhexyl)phthalate was present in **MB-050212** at a level that was greater than the reporting limit. All detected results for this compound have been flagged with a "B" qualifier. No further corrective action was taken.

The LCS and LCSD percent recoveries were within control limits.

Several matrix spike and matrix spike duplicate percent recoveries were outside advisory control limits with wide RPDs for sample **IJ12-04**. No corrective action is required for matrix QC.

UR81 : 090815

SIM Semivolatiles by SW8270

The samples and associated laboratory QC for ARI job UR81 were extracted and analyzed within the method recommended holding times. The samples for ARI job US18 were extracted and analyzed within the method recommended holding times for samples stored frozen.

Initial and continuing calibrations were within method requirements. Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

Diethylphthalate was present in **MB-050212** at a level that was greater than ½ the reporting limit. All detected results for this compound have been flagged with a "B" qualifier. No further corrective action was taken.

The LCS and LCSD percent recoveries were within control limits.

The matrix spike and matrix spike duplicate percent recoveries were within advisory control limits.

Dioxins/Furans by 1613B

The samples and associated laboratory QC were extracted and analyzed within the method recommended holding times.

Analysis was performed using the application specific RTX-Dioxin 2 column, which has a unique isomer separation for the 2378-TCDF, eliminating the need for second column confirmation.

Initial and continuing calibration results were within method requirements.

Both extraction and cleanup surrogates had recoveries within control limits.

The method blank contained reportable responses below the reporting limit for TCDD and OCDD. "B" qualifiers were applied to associated results that were less than ten times the levels found in the method blank. No qualifiers were applied to associated sample results that were greater than ten times the levels found in the method blank. No further corrective action was taken.

The OPR (Ongoing Precision and Accuracy or LCS) percent recoveries were within control limits.

Specific results have been "EMPC"-flagged indicating a response not meeting requirements of positive identification. The EMPC values are treated as undetects under some programs and as hits under programs with more conservative protocols.

Select results have has been flagged with an "X" on the Form I's due to indication of a co-eluting PDBE.

The TEQ is presented with WHO2005 with ND=0 for undetects and ND=1/2 for undetects, with EMPCs included as hits.

Aroclor PCBs by SW8082

The samples and associated laboratory QC for ARI job UR81 were extracted and analyzed within the method recommended holding times. The samples for ARI job US18 were extracted and analyzed within the method recommended holding times for samples stored frozen.

Initial and continuing calibrations were within method requirements. Internal standard areas were within limits.

The surrogate percent recoveries were within control limits.

The method blank was clean at the reporting limit. The LCS and LCSD percent recoveries were within control limits.

The matrix spike and matrix spike duplicate percent recoveries were within advisory control limits.

Metals and Mercury by SW6010C/7471A

The samples and associated laboratory QC for ARI jobs UR81 were digested and analyzed within recommended holding times. The samples and associated laboratory QC for ARI job US18 were digested and analyzed for metals within the recommended holding times and were analyzed for mercury outside recommended holding times.

The method blanks were clean at the reporting limits. The LCS percent recovery was within control limits.

The matrix spike percent recoveries and duplicate RPDs were within control limits.

General Chemistry Parameters

The samples and associated laboratory QC for ARI job UR81 were prepared and analyzed within the method recommended holding times. The samples for ARI job US18 were prepared and analyzed outside the method recommended holding times.

The method blanks were clean at the reporting limits. The LCS percent recoveries were within control limits.

The SRM percent recoveries were within limits.

The matrix spike percent recoveries and replicate RPD/RSDs were within control limits.

Geotechnical Parameters

A laboratory-specific case narrative follows this page.

Analytical Resources, Incorporated
Analytical Chemists and Consultants

Client: Anchor QEA, LLC	**ARI Job No.:** UR81
Client Project: I&J Waterway RI/FS	**Client Project No.:** 090007-01

Case Narrative

1. Ten samples were submitted for grain size analysis according to Puget Sound Estuary Protocol (PSEP) methodology on April 26, 2012.
2. The samples were run in a single batch and one sample from this job was chosen for triplicate analysis. The triplicate data is reported on the QA summary.
3. Some samples contained some shell fragments.
4. The data is provided in summary tables and plots.
5. There were no other noted anomalies in this project.

Data Reporting Qualifiers

Effective 2/14/2011

Inorganic Data

U	Indicates that the target analyte was not detected at the reported concentration
*	Duplicate RPD is not within established control limits
B	Reported value is less than the CRDL but ≥ the Reporting Limit
N	Matrix Spike recovery not within established control limits
NA	Not Applicable, analyte not spiked
H	The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
L	Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

Organic Data

U	Indicates that the target analyte was not detected at the reported concentration
*	Flagged value is not within established control limits
B	Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
J	Estimated concentration when the value is less than ARI's established reporting limits
D	The spiked compound was not detected due to sample extract dilution
E	Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
Q	Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).

URG1 : 000023

S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte

NA The flagged analyte was not analyzed for

NR Spiked compound recovery is not reported due to chromatographic interference

NS The flagged analyte was not spiked into the sample

M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses

M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"

Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.

EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" **(Dioxin/Furan analysis only)**

C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column

P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference

X Analyte signal includes interference from polychlorinated diphenyl ethers. **(Dioxin/Furan analysis only)**

Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. **(Dioxin/Furan analysis only)**

Geotechnical Data

A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.

F Samples were frozen prior to particle size determination

SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations

SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis

W Weight of sample in some pipette aliquots was below the level required for accurate weighting

(1) Detection Limit (DL), Limit of Detection (LOD) & Limit of Quantitation (LOQ) are defined in ARI SOP 1018S.
(2) Highlighted control limits (**bold font**) are adjusted from the calculated values to reflect that ARI does not use control limits < 10 for the lower limit or < 100 for the upper limit.
(3) 30 – 160 are default limits used when there is insufficient data to calculate historic control limits
(4) Acceptance criteria for the relative percent difference (RPD) between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then

$$RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$$

(6) LOQ determined by lowest concentration used to calibrate the GC-ECD instrument.
(7) MDL Study PC66 6/24/09
(8) Control Limits calculated using all data generated between 1/1/11 and 11/30/11

Quality Control Parameters for Metals Analysis using ICP-OES

	Aqueous Samples[2]			Spike Recovery		RPD[5]	Solids[3]	Tissue[4]
Analyte	DL[1] µg/L	LOD[1] µg/L	LOQ[1] µg/L	Matrix Spike	LCS		LOQ mg/kg	LOQ mg/kg
Aluminum	7.57	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Antimony	6.28	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Arsenic	3.33	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Barium	1.33	1.5	**3.0**	75 – 125	80 – 120	≤ 20	**0.3**	**0.06**
Beryllium	0.16	0.5	**1.0**	75 – 125	80 – 120	≤ 20	**0.1**	**0.02**
Boron	7.39	10	**20**	75 – 125	80 – 120	≤ 20	**2.0**	**0.4**
Cadmium	0.18	0.5	**2.0**	75 – 125	80 – 120	≤ 20	**0.2**	**0.04**
Calcium	11.27	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Chromium	1.24	2.5	**5.0**	75 – 125	80 – 120	≤ 20	**0.5**	**0.1**
Cobalt	0.27	1.5	**3.0**	75 – 125	80 – 120	≤ 20	**0.3**	**0.06**
Copper	0.92	1.0	**2.0**	75 – 125	80 – 120	≤ 20	**0.2**	**0.04**
Iron	7.50	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Lead	1.55	10	**20**	75 – 125	80 – 120	≤ 20	**2.0**	**0.4**
Magnesium	9.61	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Manganese	0.28	0.5	**1.0**	75 – 125	80 – 120	≤ 20	**0.1**	**0.02**
Molybdenum	0.79	2.5	**5.0**	75 – 125	80 – 120	≤ 20	**0.5**	**0.1**
Nickel	3.86	5.0	**10**	75 – 125	80 – 120	≤ 20	**1.0**	**0.2**
Potassium	65.70	250	**500**	75 – 125	80 – 120	≤ 20	**50**	**10**
Selenium	4.99	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Silicon	8.17	30	**60**	75 – 125	80 – 120	≤ 20	**(6)**	**(6)**
Silver	0.43	1.5	**3.0**	75 – 125	80 – 120	≤ 20	**0.3**	**0.06**
Sodium	11.35	250	**500**	75 – 125	80 – 120	≤ 20	**50**	**10**
Strontium	0.09	1.0	**1.0**	75 – 125	80 – 120	≤ 20	**0.1**	**0.02**
Thallium	3.10	25	**50**	75 – 125	80 – 120	≤ 20	**5.0**	**1.0**
Tin	1.41	5.0	**10**	75 – 125	80 – 120	≤ 20	**1.0**	**0.2**
Titanium	2.11	2.5	**5.0**	75 – 125	80 – 120	≤ 20	**0.5**	**0.01**
Vanadium	0.27	1.5	**3.0**	75 – 125	80 – 120	≤ 20	**0.3**	**0.06**
Zinc	1.45	5.0	**10**	75 – 125	80 – 120	≤ 20	**1.0**	**0.2**

(1) Detection Limit (DL), Limit of Detection Limit (LOD) and Limit of Quantitation (LOQ) as defined in ARI SOP 1018S
(2) 50 mL sample and 50 mL final volume
(3) Solids LOQ based on 100% solids using 1.0 g sample with 100 mL final volume.
(4) Tissue is reported on an "as received" (wet weight) basis using 2.5 g sample with 50 mL final volume.
(5) Relative Percent Difference between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then

$$RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$$

(6) ARI does not analyze for Silicon in solids or tissue samples

Quality Control Parameters for Mercury Analysis using CVAA

	Aqueous Samples[2]			Spike Recovery		RPD[5]
	DL[1] µg/L	LOD[1] µg/L	LOQ[1] µg/L	Matrix Spike	LCS	
Mercury	0.0069	0.05	**0.10**[2]	75 – 125	80 – 120	≤ 20
Mercury (low level)	0.0026	0.01	**0.02**[3]	75 – 125	80 – 120	≤ 20
	Soil / Sediment / Tissue[4] Samples			**Spike Recovery**		**RPD[5]**
	DL[1] mg/kg	**LOD[1] mg/kg**	**LOQ[1] mg/kg**	**Matrix Spike**	**LCS**	
Mercury	0.0021	0.0125	**0.025**[3,4]	75 – 125	80 – 120	≤ 20

(1) Detection Limit (DL), Limit of Detection Limit (LOD) and Limit of Quantitation (LOQ) as defined in ARI SOP 1018S
(2) 20 mL sample with 20 mL final volume
(3) 0.2 g sample with 50 mL final volume assuming 100% dry weight. Soil and sediment are reported on a dry weight basis.
(4) Tissue LOQ is 0.005 mg/kg as received (wet weight) based on 1 g sample with 50 mL final volume.
(5) Relative Percent Difference between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then $RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$

SEMIVOLATILE ORGANIC INSTRUMENT PERFORMANCE CHECK
DECAFLUOROTRIPHENYLPHOSPHINE (DFTPP)

Lab Name: ANALYTICAL RESOURCES INC Client: ANCHOR QEA

Instrument ID: NT10 Project: I&J WATERWAY RI/FS

DFTPP Injection Date: 05/09/12 DFTPP Injection Time: 1554

m/e	ION ABUNDANCE CRITERIA	% RELATIVE ABUNDANCE
51	10.0 - 80.0% of mass 198	27.5
68	Less than 2.0% of mass 69	0.6 (1.4)1
69	Mass 69 relative abundance	44.4
70	Less than 2.0% of mass 69	0.2 (0.4)1
127	10.0 - 80.0% of mass 198	51.7
197	Less than 2.0% of mass 198	0.0
198	Base Peak, 100% relative abundance	100.0
199	5.0 to 9.0% of mass 198	6.9
275	10.0 - 60.0% of mass 198	24.4
365	Greater than 1.0% of mass 198	3.10
441	0.0 - 24.0% of mass 442	11.2 (15.4)2
442	50.0 - 200.0% of mass 198	72.4
443	15.0 - 24.0% of mass 442	14.1 (19.4)2

1-Value is % mass 69 2-Value is % mass 442

1) Place a check mark in this column if samples have dried > 12 but < 24 hours. When samples have been at 104°C < 12 hours, constant weight must be verified as described in SOP 10023S. Use a 2nd bench sheet for additional weightings.

Extraction Time: 1620 Balance ID: B392980802

SPECIAL INSTRUCTIONS: 1. Weigh into beakers-lightly dry with Sodium Sulfate. 2. Transfer to microwave vessel. Note: do not fill vessel more than 2/3rd full. Some samples may require two vessels). 3. Add 1:1 DCM/ACE to the vessels (until solvent is 3" above soil layer after homogenization). 4. Add surr/spike. 5. Microwave on appropriate power setting determined by # of samples. 6. After microwave-rehomogenize while hot then let cool 15 min in cold water. 7. Decant 1:1 DCM/ACE into Erlenmeyer flask with sodium sulfate in the bottom and funnel containing pre-deactivated glasswool. 8. Rinse with DCM 9. Microwave a 2nd time using DCM only (until solvent is 3" above soil layer after homogenization). 10. Let cool and decant the solvent then empty the soil into the funnel and rinse with DCM. 11. KD ~~(small~~ or large drying column with pre-deactivated glasswool-Blanks=5g sulfate)) to 5mL at 80- 85°C. 12. GPC Req. 13. (After GPC): KD at 80-85°. 14. TurboVap. 15. Vial in DCM.

76 Benzo(a)pyrene

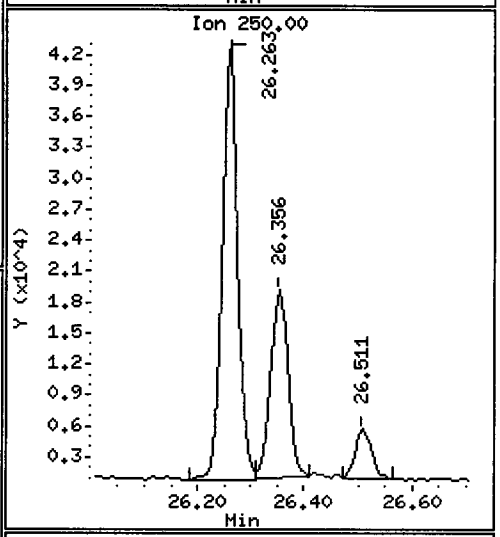
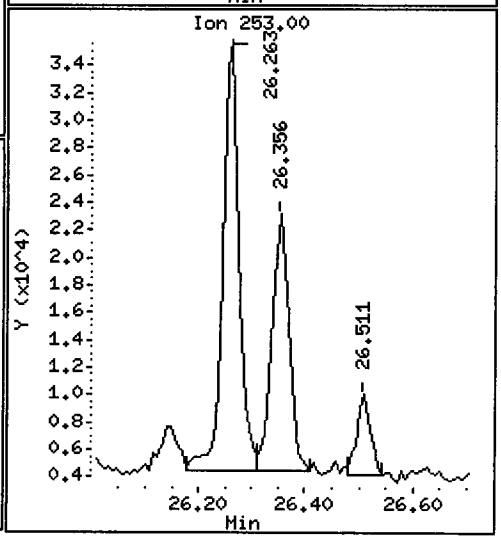
Concentration: 400.6 ug/kg





Data File: /chem1/nt10.i/20120509.b/ur81e5.d

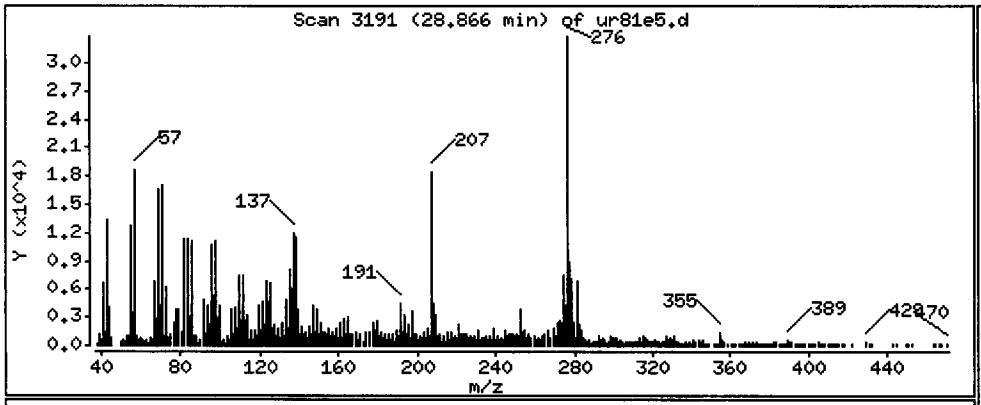
Date : 09-MAY-2012 16:46

Client ID: IJ12-04

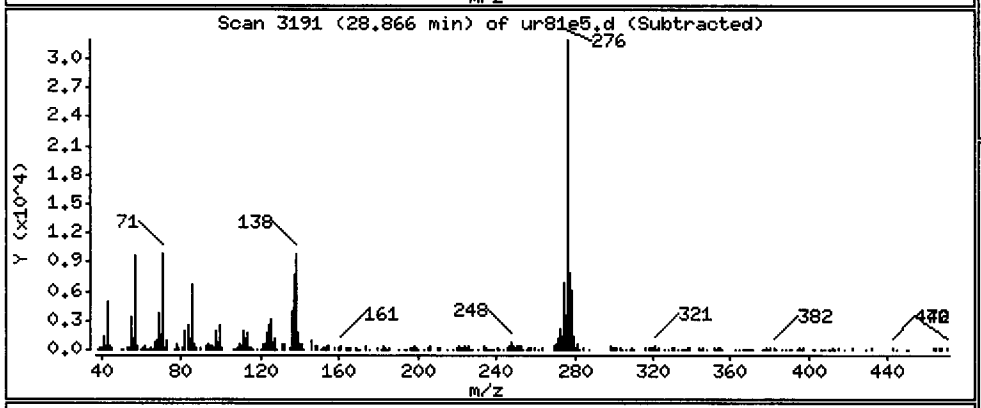
Instrument: nt10.i

Sample Info: UR81E,5

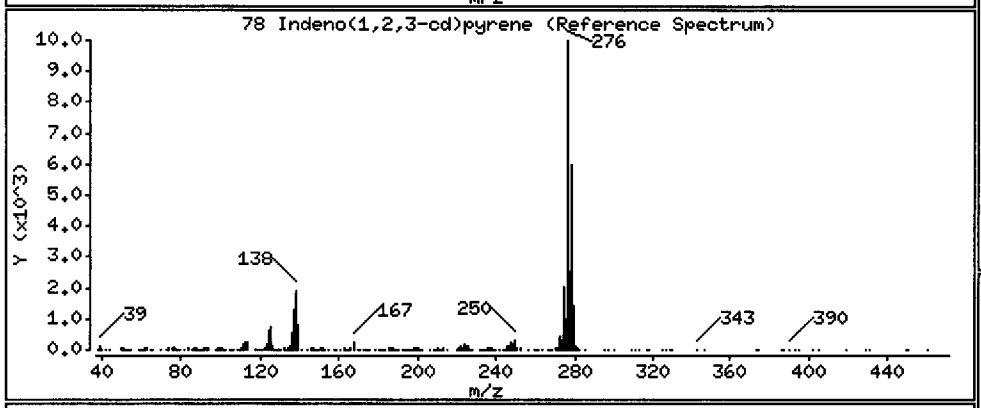
Volume Injected (uL): 1.0



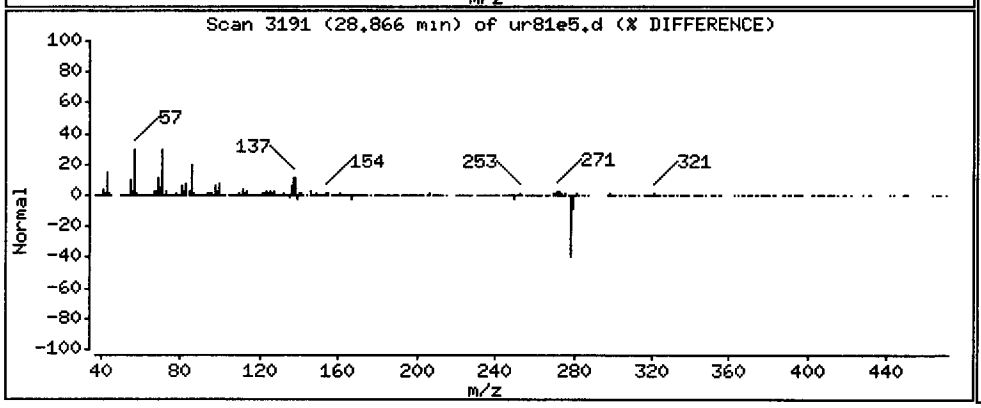
Operator: VTS/YZ



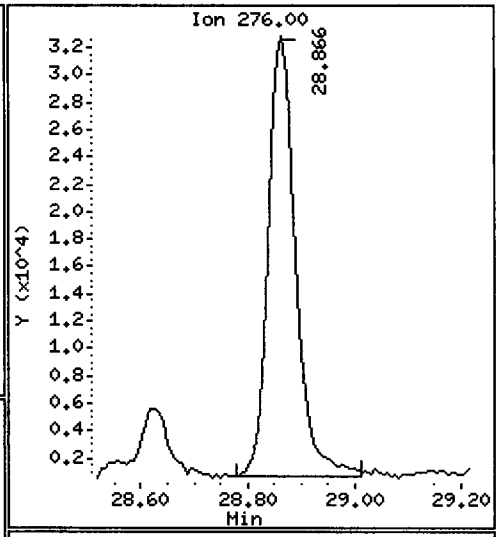
Column phase: ZB-5msi



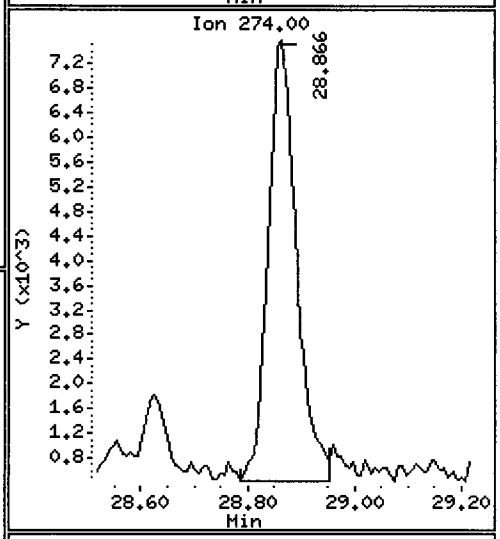
Column diameter: 0.25

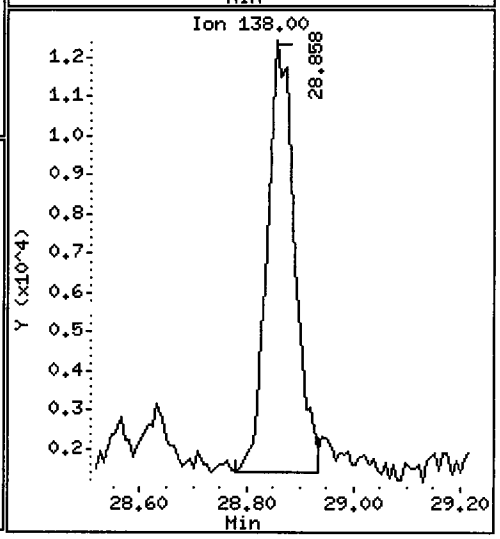


78 Indeno(1,2,3-cd)pyrene



Concentration: 243.1 ug/kg





Data File: /chem1/nt10.i/20120509.b/ur81e5.d

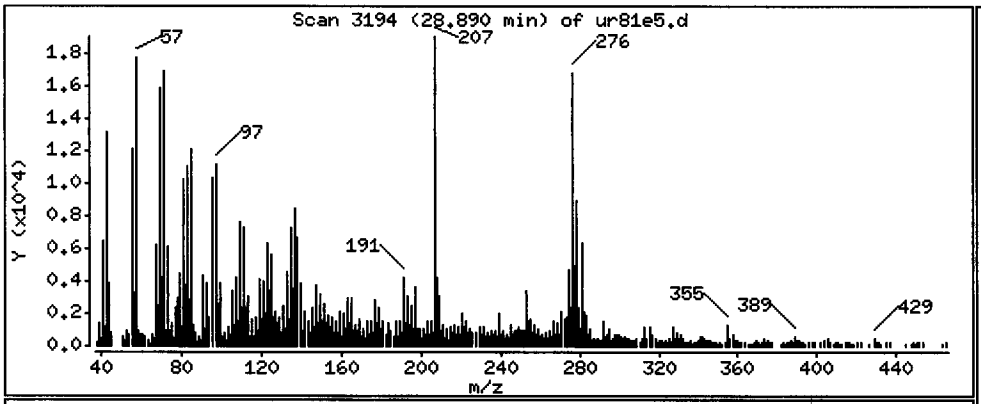
Date : 09-MAY-2012 16:46

Client ID: IJ12-04

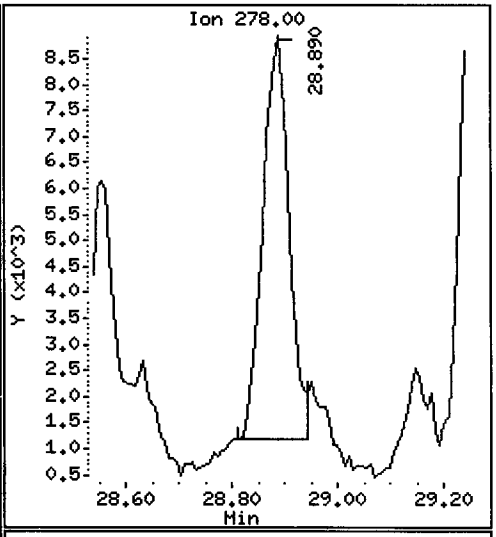
Instrument: nt10.i

Sample Info: UR81E,5

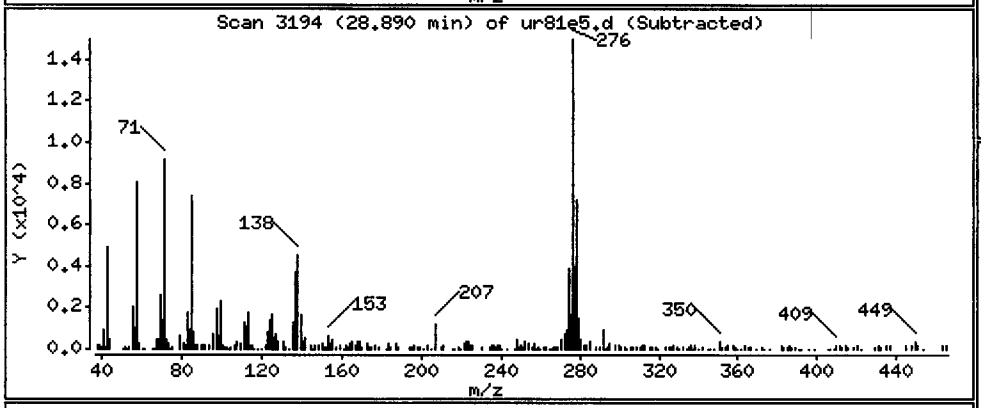
Volume Injected (uL): 1.0



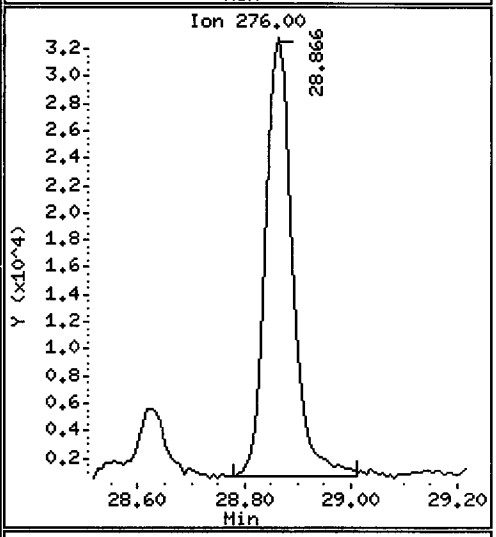
Operator: VTS/YZ



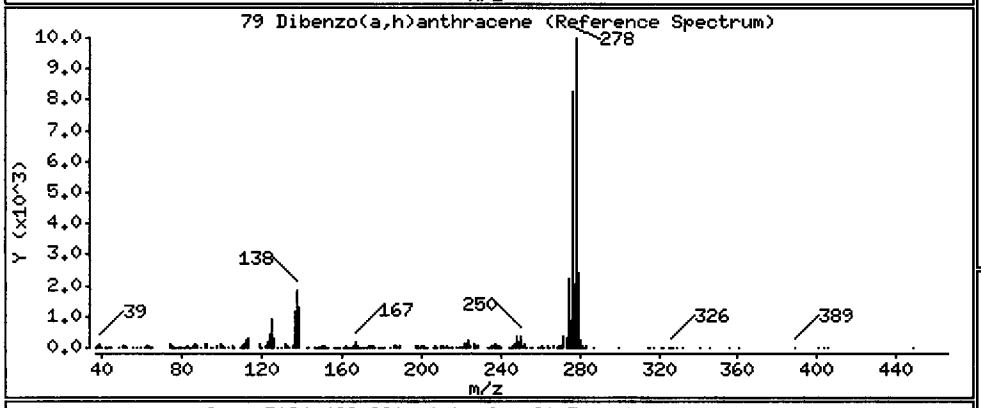
Column phase: ZB-5msi



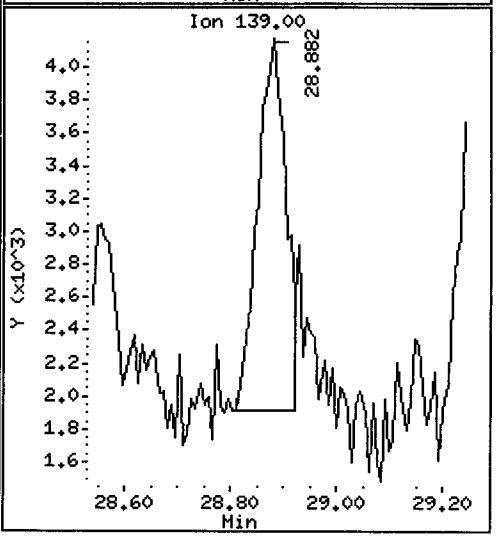
Column diameter: 0.25

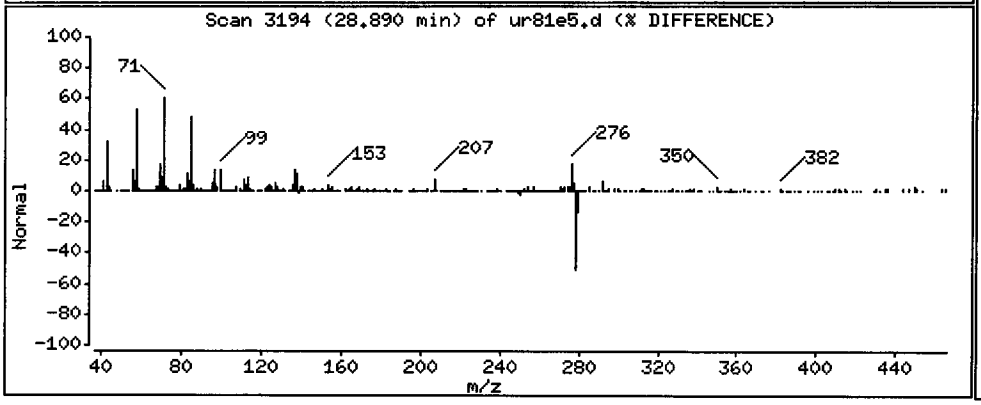


79 Dibenzo(a,h)anthracene



Concentration: 75.38 ug/kg





Data File: /chem1/nt10.i/20120509.b/ur81e5.d

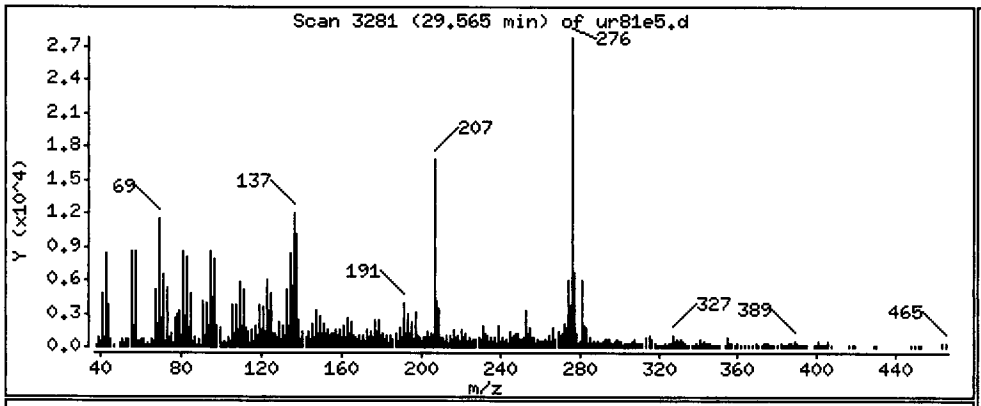
Date : 09-MAY-2012 16:46

Client ID: IJ12-04

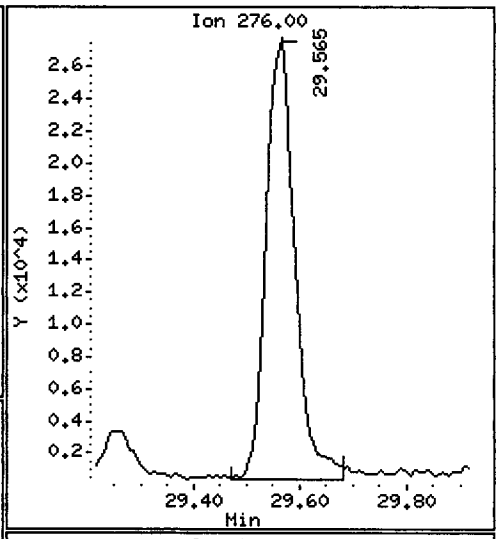
Instrument: nt10.i

Sample Info: UR81E,5

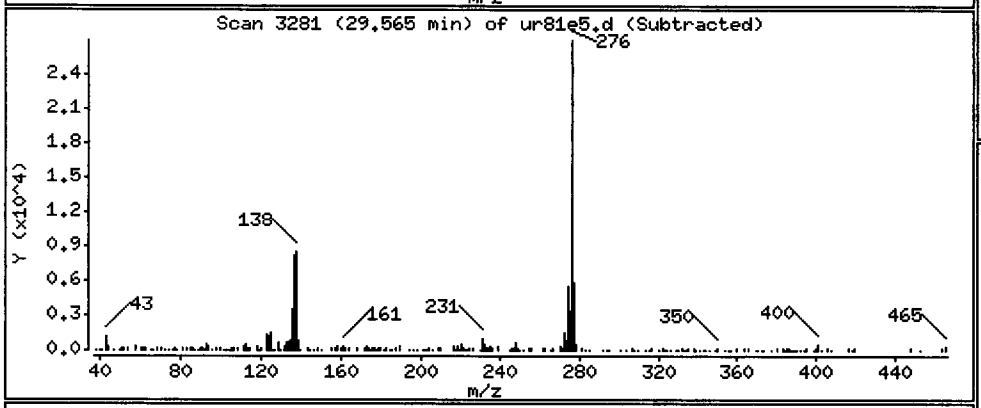
Volume Injected (uL): 1.0



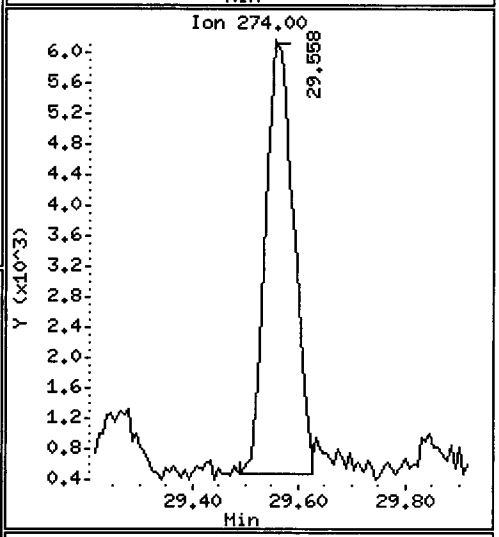
Operator: VTS/YZ



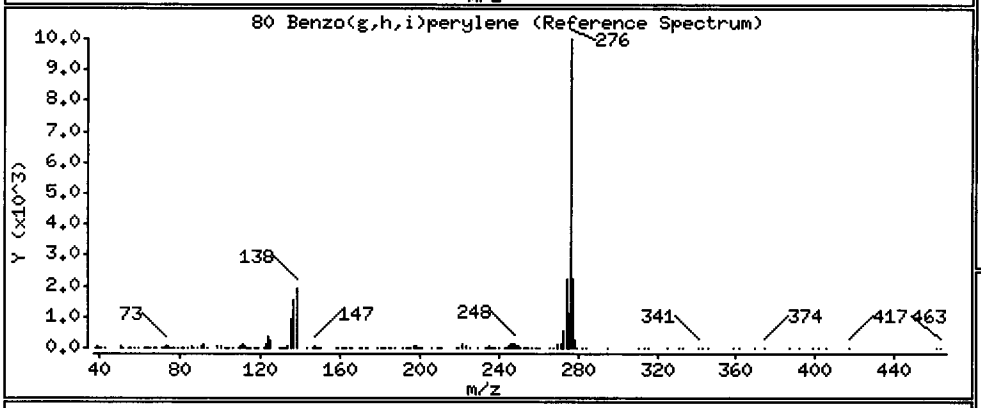
Column phase: ZB-5msi



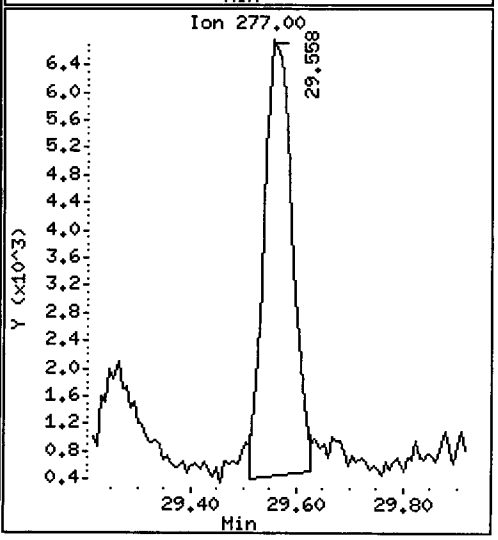
Column diameter: 0.25

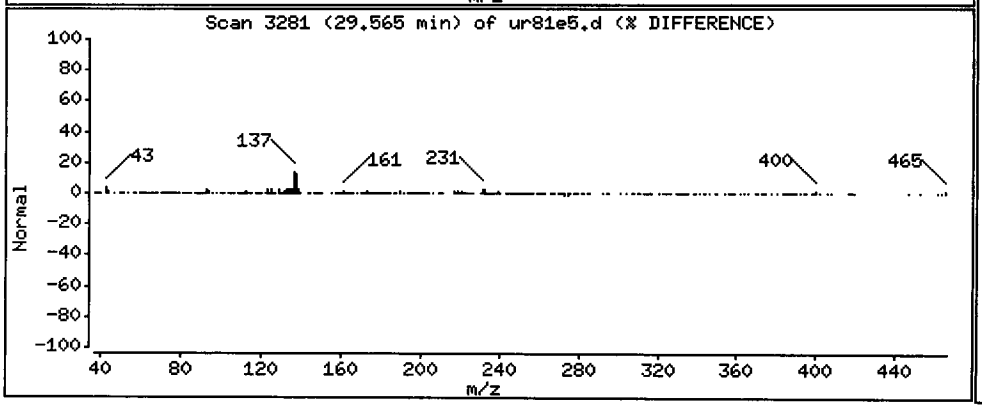


80 Benzo(g,h,i)perylene



Concentration: 257.1 ug/kg





Data File: /chem1/nt10.i/20120509.b/ur81e5.d

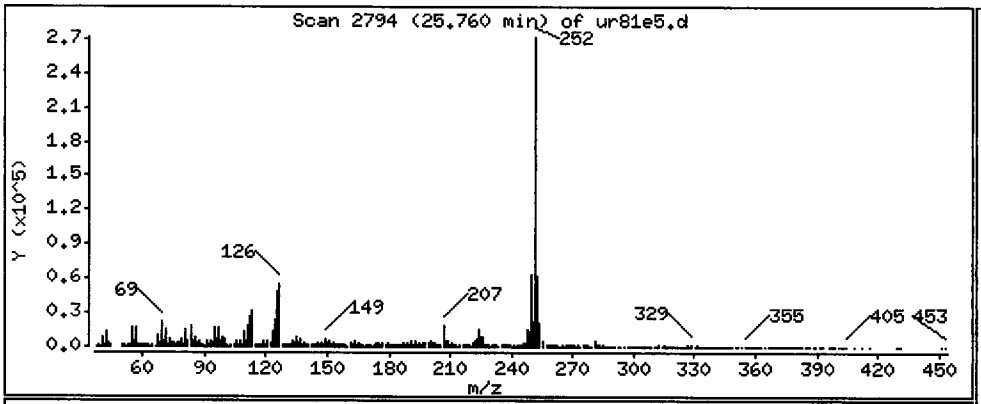
Date : 09-MAY-2012 16:46

Client ID: IJ12-04

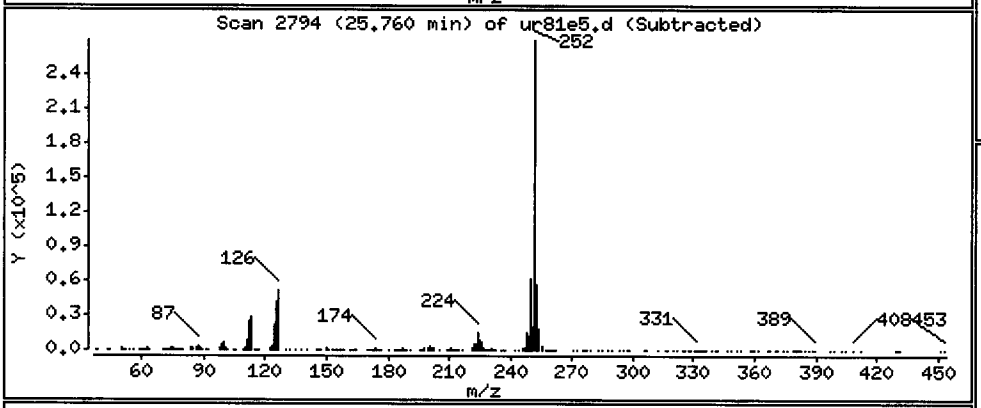
Instrument: nt10.i

Sample Info: UR81E,5

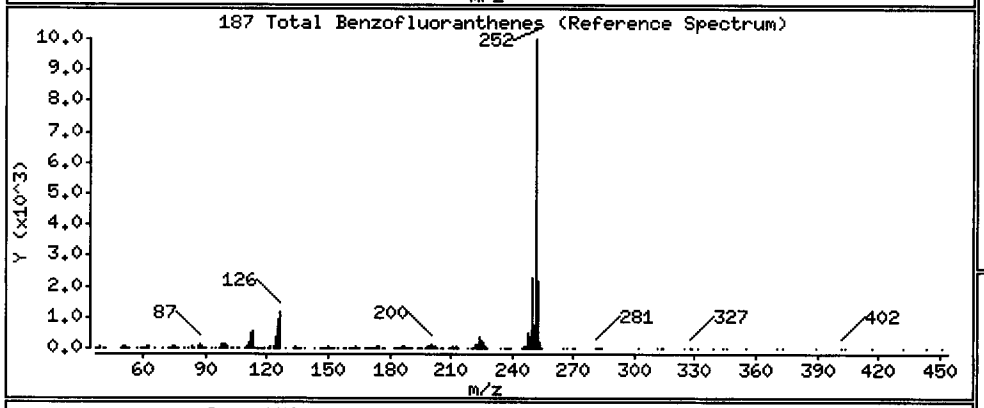
Volume Injected (uL): 1.0



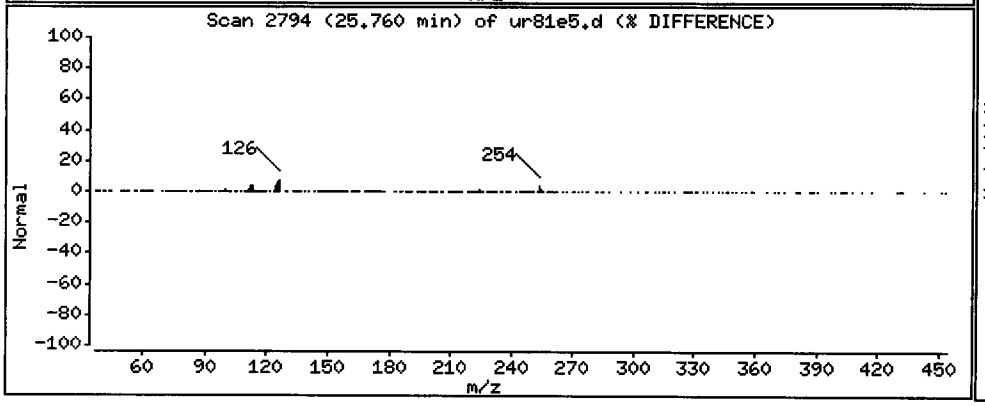
Operator: VTS/YZ



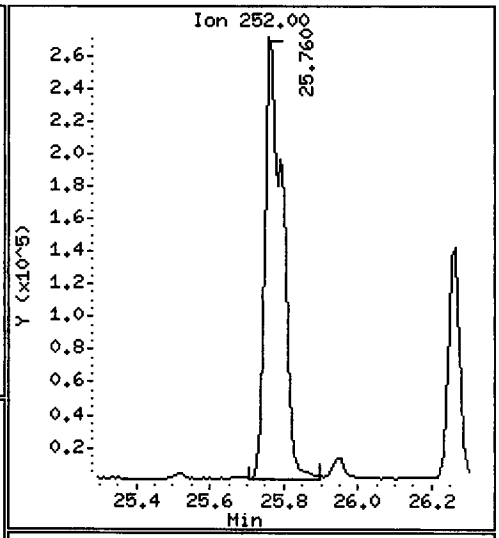
Column phase: ZB-5msi



Column diameter: 0.25



187 Total Benzofluoranthenes



Concentration: 1975 ug/kg
