

SCS FIELD SERVICES

April 10, 2013
File No. 07208104.13 Task 1

Mr. Dave Scurlock
Facilities Operation Specialist
City of Bellevue
P.O. Box 90012
Bellevue, Washington 98009-9012

Subject: 2012 Annual Summary Report for Operation and Monitoring of the Landfill Gas (LFG) Migration Control Facilities at the Eastgate Area Properties Landfill, Bellevue, Washington

Dear Mr. Shurlock:

This report provides a summary on operation and monitoring (O&M) activities performed by SCS Field Services (SCS) on the subject system from the months of January through December 2012. SCS performed O&M services at the Eastgate Area Properties landfill gas collection and control system (GCCS).

BACKGROUND

The Eastgate Area Properties Landfill site is a closed municipal solid waste landfill. The City of Bellevue (COB) owns the Eastgate Landfill, which is now used as a park on a parcel of property north of the Advanta office complex off of 160th Avenue SE. The closed landfill accepted household waste between 1951 and 1964 and occupies approximately 10 acres. In 1986 the original GCCS was designed and installed. The current site GCCS consists of 2 Lamson blowers, 1 blower/carbon vent system, 20 vertical landfill gas extraction wells, 14 subsurface gas migration monitoring probes, 13 condensate drain traps and below grade lateral and main header piping systems.

During the months of January and February 2012, SCS and City personnel completed final decommissioning of the enclosed flare, control panel integration and installation of components for the conversion and modification work for direct vent through carbon filtration including a daily automatic operation time controller. Throughout the 2012 year, when operating the LFG collection system through the carbon vent system, operations and monitoring was performed in accordance with the Discharge Confirmation Monitoring Program letter prepared by SCS Engineers, dated October 19, 2011.

Organic materials buried in a landfill decompose anaerobically (in the absence of oxygen) producing a combustible gas, which typically contains approximately 50 to 60 percent methane,

40 to 50 percent carbon dioxide, and trace amounts of various other gases, some of which are odorous. The Eastgate property contains a system to control the combustible gases generated in the landfill.

The gases produced in a landfill will either vent vertically to the atmosphere or migrate horizontally through subsurface soil to locations on adjacent properties. If the soil surrounding a landfill consists of permeable materials, there is a greater likelihood that the LFG will migrate to off-site locations. If the methane gas component of LFG is allowed to accumulate in a confined area (i.e., utility lines, irrigation valve boxes, vaults, basements, wall spaces, etc.) and is exposed to an ignition source, it can be explosive at concentrations between 5 and 15 percent by volume. At higher concentrations, methane is flammable. However, the presence of methane gas in site soil does not mean there is an immediate threat of explosion because flames cannot typically propagate through soil.

GAS TESTING

Testing for methane gas (the combustible component of LFG), oxygen gas, carbon dioxide gas, and pressure were performed using a Landtec GEM-2000 Gas Analyzer or comparable unit. This instrument measures combustible gas concentrations in air directly on either of two scales: the first as percent by volume of the lower explosive limit (LEL) of methane gas in air (5 percent); the second as percent by volume (0 to 100 percent) in the gas sampled. Additional pressure and temperature data were also collected utilizing the GEM-2000 Gas Analyzer. Testing for volatile organic compounds (VOC) at the blower vent station was performed using a MiniRAE 2000 portable VOC monitor.

Perimeter probe testing procedures are as follows:

- Connect sample tubing, observe pressure and record data.
- Turn on sample pump, extract a minimum of one probe volume, observe and record methane, oxygen, and carbon dioxide gas concentrations (when readings have stabilized).
- Disconnect sample equipment and secure sample location.

Extraction well and blower vent station testing procedures are as follows:

- Connect sample tubing; observe pressure, temperature, and record data.
- Turn on sample pump, observe and record methane, oxygen, and carbon dioxide gas concentrations (when readings have stabilized).
- For VOC monitoring, turn on sample pump, connect sample tubing, observe and record VOC concentrations (when readings have stabilized).

- Disconnect sample equipment and secure sample location.

LFG MONITORING PROBES

In accordance with the approved 2012 testing schedule, LFG monitoring probes were tested twice each month. During each month, all perimeter monitoring probes were tested for the presence of LFG. Results of this testing indicated that all monitoring probes exhibited methane gas concentration below 5 percent by volume or no methane gas was detected with the exception of Monitoring Probe Nos. MW-2, MW-3, MW-4 and MW-15. Test results for the entire year and locations are shown on attached data Table 1 and location Figure 1, respectively.

In response to more reliable and increased daily operation of the blower vent station and on-going monthly GCCS and extraction well adjustments methane gas concentrations detected at MW-2, MW-3, MW-4 and MW-15 gradually decreased to below 5 percent by volume or no methane gas detected (at all locations) by July 10, 2012. The initial dates that methane gas concentrations decreased below 5 percent by volume for MW-4 was February 14, MW-15 was May 22, MW-2 was June 22 and MW-3 was July 10, 2012. Methane gas concentrations previously detected at all these probe locations remained below 5 percent by volume throughout the remainder of the 2012 reporting year.

Historically, during winter, spring and fall months, as previously reported by the COB and other consulting firms, SCS believes that the elevated gas concentrations are attributed to shallow water infiltration into the condensate drain traps and the gas collection piping system, restricting the amount of available vacuum to the LFG extraction wells. Also, during previous years after high water table elevations within the landfill subsided, the length of time the system could effectively be operated was limited due to the age of the landfill and oversize/capacity of the existing LFG blowers and flare. Decomposition of the waste had steadily decreased each year and again in 2011 resulting in lower available flow and gas quality to the flare. As a result, the length of time the GCCS and flare system could be operated had become increasingly more limited. From November 2011 through March 2012 the decommissioning of the enclosed LFG flare and conversion modification work for direct vent of LFG through carbon filtration was completed by a combined effort of SCS and City personnel. This conversion and modification work allowed for increased daily operational run time on the system throughout the remainder of the 2012 reporting year.

On June 22, 2012, SCS observed that the protective security monument for MW-10 had been removed/ stolen. On July 26, 2012, SCS installed a new protective security monument at MP-10.

During this reporting period, January through December 2012, no additional repairs or modifications were needed or required on the LFG monitoring probe network.

LFG EXTRACTION WELLS

In accordance with the approved 2012 monitoring schedule, perimeter and interior LFG extraction wells were monitored and vacuum/flow adjustments made twice each month. Test results are shown in attached data Table 2 and locations on Figure 1, respectively. System adjustments were performed when a LFG extraction well exhibited an unacceptable change in methane and/or oxygen gas concentration (which could be due to an overpull or underpull condition).

In addition, each month all perimeter and interior LFG extraction well vacuum and flow adjustments were performed to help decrease and then maintain methane gas concentrations detected at Monitoring Probe Nos. MW-2, MW-3, MW-4 and MW-15 to below 5 percent by volume.

Twice each month, LFG temperatures at all perimeter and interior LFG extraction wells were monitored (see attached data Table 2). The observed temperatures for the 2012 reporting year are considered to be in the low to normal range for anaerobic decomposition. No indication (high temperatures in excess of 130 degrees) or subsurface oxidation was detected or observed during any of the monthly monitoring events.

On September 12, 2012, SCS observed and replaced age deteriorated sample test ports on LFG Extraction Well No. EW-5R.

During this reporting period, January through December 2012, no other repairs or modifications were needed or required on the LFG extraction well network.

LFG COLLECTION SYSTEM

In accordance with the approved 2012 monitoring schedule, visual observation of the LFG collection system was conducted at a minimum of twice each month. During these visits, observations were made to verify no pipe breakages had occurred and condensate drainage systems are working properly. Minor repairs if observed were completed as required.

During monthly LFG extraction well monitoring activities SCS conducts a pressure drop survey (i.e., measurement of pipeline pressure at various points throughout the LFG collection system). The results of this survey (where applicable) indicated that several partial below grade pipeline condensate restrictions within the LFG collection system existed during winter months and were causing decreased or no available vacuum to several extraction wells. SCS understands that historically (during winter/rain months) that groundwater levels at the site increase which inhibits liquid to drain from some of the below grade pipeline condensate drain traps. A result of this occurrence is decreased or no available vacuum to some of the LFG extraction wells.

Following startup of the blower vent station resulting in more reliable and continuous daily operation and rebalancing and adjustment of the LFG extraction well field, SCS has been able to

better evaluate the entire collection system vacuum profile. Review of vacuum profile data (during winter months) continues to indicate and SCS believes that Condensate Drain Trap Nos. CT-1 and CT-5R become inundated with liquid inhibiting condensate to drain freely from the main LFG pipelines. The results of this occurrence has historically been reduced vacuum to LFG Extraction Well Nos. EW-02R, EW-03R, and EW-10 through EW-15 and then subsequent increased LFG migration to perimeter Monitoring Probe Nos. MW-2, MW-3, MW-4 and MW-15. Following the startup and more continuous daily operation of the blower vent station LFG collection system vacuum decreases were observed to be less during the 2012 winter months resulting in maintaining all perimeter monitoring well locations to below 5 percent by volume methane gas concentrations throughout the remainder of the 2012 reporting year.

LFG BLOWER VENT SYSTEM (BVS)

In accordance with the 2012 monitoring schedule, visual observation and testing of the LFG BVS was conducted at a minimum of twice each month. During these visits, operating parameters were monitored and mechanical and electrical components were checked for functionality.

During the months of January, February and until March 19, 2012 (each week) the BVS was manually operated intermittently by COB or SCS personnel. Throughout the 2012 reporting year, SCS, City personnel or the automatic daily operation time controller started the BVS prior to well field and gas probe monitoring activities. BVS test port monitoring results are shown in data Table 3. Based on monthly operational runtime information provided in data Table 4 the BVS operated a total of approximately 3,022 hours during the 2012 reporting year.

Twice per month during 2012, SCS performed carbon vent system VOC breakthrough field monitoring and results are provided in Table 3. The carbon vent system (while in operation) maintained the outlet VOC concentrations below the prescribed operating criteria with the exception that on May 22, August 17, and November 14, 2012, SCS detected a substantial increase in VOC concentrations on the outlet of the BVS primary carbon drum. This observed substantial increase in VOC concentrations indicated that the carbon media and VOC removal efficiency within the primary drum was depleted and in need of replacement. On each of these days, the BVS was shut down and the secondary carbon drum was relocated as the primary drum and a new secondary carbon drum was installed. Following the carbon drum relocation and replacement work the BVS was restarted and the primary and secondary outlet VOC concentrations were retested and results indicated to be within the prescribed operating criteria.

On May 22, 2012, SCS observed and repaired an age/weather deteriorated flex hose between the primary and secondary carbon drums.

On October 17, 2012, SCS observed and repaired air leaks on the carbon vent drums.

On November 14, 2012, SCS observed and repaired an age/weather deteriorated flex hose on the discharge of the secondary carbon drum.

During this reporting period, January through December 2012, no other repairs or modifications were needed or required on the BVS.

SITE SURFACE OBSERVATION

In accordance with the 2012 monitoring schedule, visual observation of the landfill surface along the extent of the LFG extraction system is performed at a minimum of twice per month. Observations for erosion, surface cracks (that might allow LFG to escape or promote air intrusion) and settlement around wells, laterals, and pipelines are conducted.

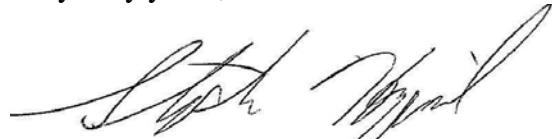

During this 2012 reporting year, SCS observed additional indications of surface settlement/low spot at and around LFG Extraction Well No. EW-20. Options for additional topsoil placement at and around EW-20 are being evaluated and are expected to be implemented during spring/summer 2012.

During this reporting period, no other additional significant/major settlement, erosion or surface cracks that could adversely impact the LFG collection system operation was observed. Other minor surface erosion and cracks were repaired as needed.

CLOSING

The information provided in this 2012 summary report was conducted in accordance with the COB and SCS contract work scope. We hope you find this information of value. Should you have any questions, do not hesitate to contact either of the undersigned.

Very truly yours,

Stephan Harquail

Table 4. LFG Blower Vent Station Operational Runtime Data
January through December 2012
Eastgate Area Properties Landfill

Month	Manual or Automatic Operation	Total Monthly Runtime (Hours)	Comments
Jan-12	Manual	210	Operated 21 days for 10 hours each day
Feb-12	Manual	210	Operated 21 days for 10 hours each day
Mar-12	Manual/ Automatic	220	Operated 22 days for 10 hours each day
Apr-12	Automatic	300	Operated 30 days for 10 hours each day
May-12	Automatic	310	Operated 31 days for 10 hours each day
Jun-12	Automatic	300	Operated 30 days for 10 hours each day
Jul-12	Automatic	248	Operated 31 days for 8 hours each day
Aug-12	Automatic	248	Operated 31 days for 8 hours each day
Sep-12	Automatic	240	Operated 30 days for 8 hours each day
Oct-12	Automatic	248	Operated 31 days for 8 hours each day
Nov-12	Automatic	240	Operated 30 days for 8 hours each day
Dec-12	Automatic	248	Operated 31 days for 8 hours each day
Total Operational Runtime for 2012:		3022.00
