1.0 INTRODUCTION

PES Environmental, Inc. (PES) has prepared this report for Broadstone Capital Hill Venture LLC (BCH) to summarize the findings of environmental investigations conducted at the 11th & Union Development (Property) and to describe the cleanup action plan (CAP) that will be implemented concurrent with redevelopment of the property. The Property is currently addressed as 1406 and 1416 10th Avenue and 1401 and 1405 11th Avenue in Seattle, Washington (Property). As part of the development of the Property, the address will be changed to 1414 10th Avenue, Seattle, Washington. This CAP is being submitted concurrent with BCH's notification of a release and application to the Washington State department of Ecology (Ecology) requesting assistance under the voluntary cleanup program (VCP).

Previous environmental investigation results conducted at the Property have identified petroleum-impacted soil and groundwater beneath the Property and limited volatile organic compounds (VOCs) in groundwater in the southeastern portion of the Property. These impacts originated from a former leaking underground storage tank (LUST), which was removed from the property in1990, as well as from unknown sources potentially associated with historical automotive repair and manufacturing operations at the Property.

Petroleum hydrocarbon impacted soil has been detected at depths ranging from approximately 3 feet to 10 feet below current ground surface (or for borings located within buildings, below the basement floor surface). The investigations have also detected groundwater containing petroleum hydrocarbons and limited VOCs at depths of approximately 4-10 feet below existing finished floor grade in the southern portion of the Property. BCH's planned redevelopment of the Property will excavate soil to a planned excavation base elevation of approximately 282.5 feet above the 1988 North American Vertical Datum (NAVD 88) which is approximately 8 to 10 feet below the current grade elevation (approximately 288 – 291.5 feet NAVD88). The soil excavation depths will effectively remove all of the petroleum-impacted soil at the Property and including the upper 3 to 4 feet of the saturated zone which will effectively remove any residual source materials and allow for the natural attenuation of groundwater. The CAP describes the methods BCH's contractors will use to manage the petroleum-impacted soil and perched groundwater during redevelopment construction and specifies the testing required to demonstrate that the Property has been effectively remediated.

1.1 Property Description and History

The Property is located at 1406 and 1416 10th Avenue and 1401 and 1405 11th Avenue in Seattle, Washington (Figure 1). The Property consists of seven parcels totaling 1.02 acres (approximately 44,000 square feet) encompassing the southern half of the block bounded by East Pike Street to the north, East Union Street to the south, 10th Avenue to the west, and 11th Avenue to the east. The Property is currently developed with four commercial structures (Figure 2): One two-story 26,276 square foot building with a basement (1404 10th Avenue), constructed in 1915 occupies the southwest portion of the Property; two single-story commercial buildings with basements, equaling 33,530 square feet (1401 and 1405 11th Avenue) constructed in 1920 occupy the southeast portion of the Property; and a detached single-story 7,320 square foot building with basement (built in 1913) occupies the northwest corner of the Property. The remainder of the Property consists of asphalt and gravel surface drives and parking areas that are depressed up to

approximately 10-feet below the surrounding street grades. The current elevations of the parking areas, which are accessed via a paved drive from 10th Avenue, are at elevations within 1 to 2 feet of the basement floors of the surrounding buildings.

The following businesses have historically operated at the Property: auto body shop, paint shop, auto repair facility, machine shop, blacksmith and forging shop, automotive parts manufacturing facility, bakery, and various warehouse and office type businesses.

Environmental impacts to soil and groundwater related to the historical operations/activities have been reported beneath the Property in association with a former 6,000-gallon diesel underground storage tank (UST) that was removed from the southwestern portion of the Property in 1990. Remedial activities associated with the former UST have included the removal, disposal, and treatment of petroleum contaminated soils and groundwater around the former UST. Based on 1993 remedial actions and investigation results, a limited amount of residual petroleum impacted soil was determined to remain beneath the adjacent building. Ecology issued a No Further Action (NFA) determination for the associated UST cleanup in October, 1993.

A Phase I Environmental Property Assessment (ESA) conducted at the Property by ATC Associates, Inc. (ATC) in February 2012 (ATC, 2012a) identified several recognized environmental conditions (RECs) that were determined to require additional investigation. A follow-up limited Phase II subsurface investigation (ATC, 2012b) identified three potential release areas indicated by the presence of diesel and fuel hydrocarbons and related VOCs in concentrations above Ecology's Model Toxic Control Act (MTCA) Method A cleanup levels for soil and groundwater beneath the Property.

1.2 Planned Redevelopment

The planned redevelopment of the 11th & Union property will include the demolition of all of the existing on-site structures, with the exception of the brick façades of the 1406 10th Avenue, 1401 11th Avenue, and 1405 11th Avenue buildings along East Union Street and 11th Avenue. Construction of an 8-story building will include street level retail units, approximately 248 residential units, and one floor of below-ground parking will be included. The top of the garage floor slab is at approximately elevation 283.75 feet. Based on the current redevelopment plans, the below-ground parking level will require excavation of the entire property to an elevation of approximately 282.5 feet, which is approximately 6 to 9 feet below the current basement floor surface elevations (288.07 – 290.59 feet) and approximately 14 feet below the adjacent East Union street grade (approximately elevation 297 feet).

1.3 Report Purpose

The purpose of this CAP is to describe the cleanup actions that will be implemented to address the soil and groundwater impacts identified at the Property, consistent with the MTCA and its implementing regulations, Chapter 173-340 WAC. BCH intends to submit this CAP to Ecology and request that Ecology provide an opinion on whether the proposed cleanup actions meet the substantive requirements of the MTCA.

1.4 Report Organization

The remainder of this report is organized as follows:

Section 2 – Summary of Environmental Conditions: Describes the previous investigations conducted at the Property and provides a brief summary of the environmental conditions at the Property.

Section 3 – Cleanup Action Plan: Summarizes the selected media cleanup standards and describes cleanup actions for soil and groundwater, describes environmental oversight activities, and defines confirmation sampling that will be performed to address the environmental impacts described in Section 2.0.

Section 4 – Reporting and Schedule: Describes the reporting requirements that will document the cleanup actions sufficient to obtain an NFA determination from Ecology and identifies the current schedule for implementing the cleanup.

Section 5 – References: Lists the sources of information referenced in the document.

2.0 SUMMARY OF ENVIRONMENTAL CONDITIONS

This section identifies the documents containing the results of environmental investigations that describe the soil and groundwater conditions at the Property. A brief summary of the soil and groundwater conditions is included to provide the basis for the cleanup actions described in Section 3.0. Additional details regarding the previous investigations can be found in the source documents.

2.1 Previous Investigations

The Property has been the subject of a number of environmental and geotechnical investigations beginning in 1990. The results of previous investigations conducted at the Property are presented in the following reports, which are included in this VCP application being submittal to Ecology:

- *Remediation of Subject Property: 1416 – 10th East, Seattle, Washington, Commonly Known as Ruth Ashbrook Bakery Property,* dated October 10, 1993 and prepared by Nurseryman Products, Inc. (NPI, 1993a);

- *Final Clean-Up Report for the Ruth Ashbrook Bakery Property, 1416 – 10th Avenue East (Between Union and Pike), Seattle, Washington,* dated October 13, 1993 and prepared by Nurseryman Products, Inc. (NPI, 1993b);

- *Phase I Environmental Site Assessment, Salvation Army Commercial Property, 1401 11th Avenue East, Seattle, Washington,* dated January 1994 and prepared by RZA AGRA, Inc. (RZA, 1994).

- *Phase I Environmental Site Assessment, 1415 11th Avenue, Seattle, Washington,* dated December 13, 1996 and prepared by Kleinfelder, Inc. (Kleinfelder, 1996).

- *Phase I Environmental Audit, Two Commercial Buildings, 1416 through 1418 – 10th Avenue, 1401 – 11th Avenue/1414 – 10th Avenue, Seattle, Washington,* dated August 16, 1999 and prepared by Environmental Associates, Inc. (EA, 1999).

- *Phase I Environmental Site Assessment of 11th & Union Proposed Development,* dated February 7, 2012 and prepared by ATC Associates Inc. (ATC, 2012a);

- *Geotechnical Report – Final Proposed Development, 11th Avenue & E. Union Street, Seattle, Washington,* dated July 9, 2012 and prepared by PanGEO Incorporated (PanGEO, 2012); and

- *Amended Limited Phase II Subsurface Investigation Report, 11th & Union Proposed Development,* dated October 1, 2012 and prepared by ATC Associates Inc. (ATC, 2012b).

The above environmental investigations performed in association with the Property documented the following activities:

In October 1990, a 6,000-gallon diesel underground storage tank (UST), located north-adjacent to the 1406 10th Avenue building (Figure 2) and approximately 100 cubic yards of surrounding petroleum contaminated soils (PCS) were removed from the Property (Nurseryman, 1993a). Confirmation soil sampling from the UST excavation bottom indicated that residual PCS was present beneath the excavation; however no additional excavation was done at the time.

Follow-up environmental remedial activities, conducted in March and August 1993, included the over-excavation of the 1990 UST excavation area and on-site bioremediation of over-excavated soil and groundwater (volumes unspecified). Excavated contaminated soil was laid on-site in a layer of 8 to 10 inches and treated by bioremediation (NPI, 1993a). Additional information regarding the location and design of the bioremediation area were not provided in the report. Bioremediation stockpile samples reported initial total petroleum hydrocarbon levels (TPH) as high as 11,000 milligrams per kilogram (mg/kg) that were all bio-remediated down to levels below 10 mg/kg. Upon completion of the bioremediation, soil was returned to the excavation. Confirmation samples collected from the 1993 excavation indicated that residual diesel range PCS remained on the property beneath the building (1406 10th Avenue) south of the excavation and former UST area at levels ranging between 330 mg/kg and 3,800 mg/kg (ATC, 2012a). These soils were inaccessible due to the presence of the building.

At the time of 1993 excavation, the groundwater was "determined to be contaminated by diesel fuel and small levels of tetrachloroethylene (PCE)" (NPI, 1993a). Contaminated groundwater collected in the excavation was treated by pumping through a carbon filter unit and then reportedly re-circulated through the excavation until several rounds of confirmation sampling indicated that contaminants were below the specified regulatory levels (NPI, 1993a). Prior to backfilling of the 1993 excavation, a concrete containment wall between the former UST impacted soil and the existing building (1406 10th Avenue) was installed as well as a water collection system to treat petroleum and volatile VOCs detected in groundwater from the base of the UST excavation. Based on the 1993 remedial investigation results, a limited amount (approximately 75 cubic yards) of residual petroleum impacted soil was determined to remain beneath the adjacent building. Ecology issued an NFA determination dated October 22, 1993 for the associated UST (Ecology, 1993).

The Phase I ESA conducted at the Property by ATC in February 2012 (ATC, 2012a) identified several recognized environmental conditions (RECs) that were determined to require additional investigation. A follow-up limited Phase II subsurface investigation (ATC, 2012b) was performed in February and March 2012 that included the following activities:

- Drilling and sampling a total of 31 borings (26 direct-push borings, two hand auger borings, and three geotechnical borings,) ranging in depths from 1.5 feet to 30.3 ft bgs;
- Installation of 5 groundwater monitoring wells (MW-1 though MW-5) ranging in depths from 12 to 26 ft bgs;
- Collection of 90 soil samples, which were analyzed for one or more of the following analytes: petroleum hydrocarbons using Ecology Methods NWTPH-HCID and NWTPH-Dx/Dx Ext.; and VOCs using EPA Method 8021B or 8260B; and

- Collection and analysis of 24 groundwater samples from temporary wells within soil borings and 5 groundwater samples from monitoring wells. The groundwater grab samples were collected from "first free water encountered" within the soil borings, which ranged in depths from 8 to 20 to ft bgs, and the monitoring well samples were collected from screens set at depths ranging from 2 to 12 to 16 to 26 ft bgs (top of screen elevations ranging from 281.7 to 287.5 feet and bottom screen elevations ranging from 271.7 to 277.5 feet). The groundwater samples were analyzed for one or more of the following analytes: petroleum hydrocarbons using Ecology Methods NWTPH-HCID and NWTPH-Dx/Dx ext.; and VOCs using EPA Method 8260B.

The locations of the soil borings and monitoring wells are shown on Figure 2.

The results of the Limited Phase II subsurface investigation identified several areas where soil and/or groundwater contained petroleum hydrocarbons (diesel and heavy fuel oil) and several VOCs (benzene, PCE, trichloroethene [TCE] and vinyl chloride) at concentrations above Ecology's MTCA Method A cleanup levels for either or both soil and groundwater in the following areas (shown on Figures 3 and 4):

- Petroleum impacts in soil and groundwater below the 1406 10th Avenue building and limited PCE and TCE impacts in groundwater in a small area north of the 1406 10th Avenue building; and

- Petroleum impacts in soil and groundwater below the 1401 and 1405 11th Avenue buildings.

2.2 Subsurface Conditions

2.2.1 Geology

The Property is located within the Puget Lowland physiographic province, a broad, low-lying region situated between the Cascade Range to the east and the Olympic Mountains to the west. The Puget Sound Region is underlain by Quaternary sediments. The shallowest sediments consist primarily of inter-layered and/or sequential deposits of alluvial clays, silts, and sands that are typically situated over deposits of glacial till. According to the geologic map of the Seattle area compiled by Troost and others (2005), the Property is underlain by glacial recessional outwash deposits generally consisting of loose to dense, fine to coarse sand and gravel, with localized discontinuous silt, silty sand, and fine sand lenses.

Based on previous investigations conducted at the Property, the borings at the Property encountered discontinuous units of fine- and coarse-grained sediments consisting of mixtures of clay, silt, sand, and gravel. PanGeo geotechnical borings (BH-1 through BH-3) encountered the following units: fill unit consisting of silt with some sand and clay, ranging in thickness from 2.5 to 9 feet, underlain by ice contact deposits consisting of medium stiff sandy clayey silt and medium dense silty sand at approximate elevation of 287 to 290 feet, and glacial till consisting of dense to very dense silty fine to medium sand with gravel (PanGeo, 2012). Borings drilled by ATC encountered generally similar conditions; silty sands and clay fine sands near the surface

(to approximately 8 feet) underlain by silty sands and clayey sands to a depth of 25 feet bgs, the maximum drilled depth of the ATC borings.

2.2.2 Hydrogeology

The principal aquifers in the Puget Sound Region are in glacial drift that, along with finer grained interglacial sediments, underlies the basin lowland to depths of more than 1,000 feet and in alluvial deposits that underlie the major lowland and mountain river valleys. In the Puget Sound region, shallow groundwater flow direction often mimics the surface topography. Groundwater typically flows from areas of high elevation to areas of low elevation. In addition, shallow groundwater flow usually parallels or migrates toward nearby surface water bodies.

Groundwater was encountered in Property monitoring wells at depths ranging from 2.39 to 12.03 ft below the top of well casing which corresponds to groundwater elevations of 285.11 to 285.40 feet, respectively. Based on depth to water levels collected on April 3, 2012 by ATC groundwater flows to the northwest (ATC 2012b). PES measured the depth to groundwater in the monitoring wells on August 6, 2012 and confirmed groundwater flow was to the northwest (Figure 2). Depth to water measurements and calculated groundwater elevations for both monitoring events are presented on Table 3. The groundwater gradient is extremely flat (less than 0.006 ft/ft). Groundwater elevations may vary depending on seasonal fluctuations, local subsurface conditions, and other factors.

Groundwater yield within some of the borings and monitoring wells (MW-4 and MW-5) was reportedly very low, appeared to be associated with small lenses of fine sand with silt, and may be indicative of perched water conditions.

2.3 Summary of Nature and Extent of Contamination

2.3.1 Soil Conditions

The results of the soil samples analysis are summarized in Table 1 and results of selected compounds detected above cleanup levels are shown graphically on Figure 3. A summary of the findings of the soil investigations are provided below:

- Diesel-range hydrocarbons were detected in soil in three areas of the Property: (1) near the former UST located just north of the 1406 10th Avenue building; (2) in the southeastern portion of the Property (beneath buildings 1406 10th, 1401 11th, and 1405 11th); and (3) in the northern gravel parking lot. In areas 1 and 2, petroleum hydrocarbons were detected in samples ranging in depths from 3 to 10 ft bgs, with the highest concentrations detected in the 3 foot sample in boring B-2 adjacent to the former UST. Area 3 petroleum hydrocarbons were detected in one sample (HA-1) at 1.5 feet bgs at a very low concentration. The remaining samples in that area were non-detect for TPH to a depth of 15 feet bgs. In total for the Property, concentrations of diesel- and oil-range hydrocarbons exceeded the MTCA Method A cleanup level (CUL) of 2,000 mg/kg for unrestricted land use in seven of the 70 soil samples analyzed.

- Oil-range hydrocarbons were detected in soil in only one boring (B-18) within Area 2 of the Property (beneath the 1406 10th building). Samples collected at 4 and 8 feet within boring B-18 contained oil range hydrocarbons in exceedance of the MTCA Method A CUL of 2,000 mg/kg for unrestricted land use.

- Limited petroleum related VOCs were detected in soil samples from one boring (B-2) which included benzene, xylenes, ethylbenzene, and naphthalene. With the exception of benzene, these constituents were detected at concentrations below their respective MTCA Method A CULs. Benzene was detected in two soil samples (B-2 at 3 and 6 feet) at concentrations (0.273 and 0.122 milligrams per kilogram [mg/kg], respectively) which exceeded the MTCA Method A CUL of 0.03 mg/kg for unrestricted land use.

- Chlorinated VOCs (PCE, TCE and vinyl chloride) were not detected in any of the 66 soil samples analyzed for those constituents.

In summary, the soil sampling results indicate that there is one known source and potentially two unknown sources of soil contamination identified at the Property. The former UST appears to be the source of the petroleum hydrocarbons and VOCs in soil found at the north end of the 1406 10th Avenue building. The source area of the southern Property contamination is not known, but based on historical tenant information and soil data; it appears the source may be associated with historical automotive operations within the three southern buildings. The limited and low detection of petroleum hydrocarbons in Area 3 appears to be limited in extent both vertically and horizontally around boring HA-1 and is likely associated with the parking of automobiles in this area.

The areas with the highest TPH concentrations are generally located within the middle of the former UST (Area 1) and southern contamination area (Area 2); however, diesel was detected at a concentration above the MTCA Method A CUL in the 10-foot sample in the southeastern corner of the property (MW-5). The soil results generally indicate that soil impacts do not appear to extend beyond the property boundaries.

2.3.2 Groundwater Conditions

The results of the groundwater sample analysis are summarized in Tables 2 and 3, and selected results of the most frequently detected compounds are shown graphically on Figure 4. A summary of the findings of the groundwater investigations are provided below:

- Groundwater in the southern portion of the Property contains concentrations of diesel-range hydrocarbons above the MTCA Method A CUL (500 micrograms per liter [µg/l]) similar to the distribution of diesel found in soil. The highest concentrations of diesel in groundwater were detected in grab samples from borings B-21 (961,000 µg/L), B-12 (547,000 µg/L), and B-25 (121,000 µg/L) in the southeast central portion of the Property. Groundwater sample results from temporary wells or borings are commonly assumed to be biased high, mainly due to insufficient development of the temporary sampling points prior to groundwater sample collection and from the incorporation of impacted sediments into the samples. The groundwater samples collected from the

monitoring wells has lower diesel concentrations ranging from 202 to 94,700 µg/L. MW-5 (located in the southeastern corner of the Property) contained the highest detected diesel concentration (94,700 µg/L) collected from the groundwater monitoring wells.

- Oil-range hydrocarbons (as heavy fuel oil fraction) were detected above the MTCA Method A CUL (500 µg/L) in one groundwater grab sample (B-18) and below the CUL in one groundwater monitoring well (MW-2).

- Benzene, ethylbenzene, and xylenes were detected in the grab groundwater sample from one temporary boring (B-2). With the exception of benzene, these constituents were detected at low concentrations below their respective MTCA Method A CULs. Benzene was detected at a concentration of 12.5 µg/L, which exceeded the MTCA Method A CUL of 5 µg/L for unrestricted land use. Benzene was not detected in groundwater samples collected from monitoring wells.

- PCE, TCE, and vinyl chloride were detected in groundwater beneath the central portion of the Property near B-8 and MW-1 located northeast of the former UST area. TCE was also detected south of the 1406 10th Avenue building (BH-1/MW-3 co-located sampling points) and vinyl chloride was detected in B-21 located in the southwest corner of the 1405 11th Avenue building. The distribution of these VOCs appears to be discontinuous and limited in extent to the three areas. The areas where one or more of these constituents exceed their respective cleanup levels is limited to the central portion of the Property (i.e., MW-1, B-8 and B-21).

3.0 CLEANUP ACTION PLAN

This section describes the remedial actions that BCH will implement during redevelopment construction to address the contamination identified at the Property (Section 2.0). The CAP is described in the following sections and has been prepared consistent with the requirements of the MTCA Cleanup Regulation (Chapter 173-340 WAC). The remedial actions will be performed as an independent action, and the results will be reported to Ecology under the VCP.

3.1 Chemicals of Concern and Cleanup Levels

Based on the analytical results, the chemicals of concern (COCs) at the Property are as follows:

- **Soil.** COCs for soil include diesel- and oil-range hydrocarbons and benzene. These COCs were detected either the most frequently and/or at the highest concentrations. Other VOCs (ethylbenzene and xylenes) detected at the Property were infrequently detected (i.e., once or twice) and found at low concentrations below MTCA cleanup levels. PCE, TCE and vinyl chloride were not detected in any of the samples analyzed.

- **Groundwater.** COCs for groundwater include diesel- and oil-range hydrocarbons, benzene, PCE, TCE, and vinyl chloride. These COCs were detected the most frequently and at higher concentrations. Other VOCs (ethylbenzene, xylenes, and naphthalene) detected at the Property were infrequently detected (i.e., once) and found at low concentrations below MTCA cleanup levels.

Method A cleanup levels were selected for use in this cleanup because the remedial actions are straightforward and only involve a limited number of contaminants. Cleanup levels for groundwater and soil COCs are shown in Tables 1 though 3.

The cleanup levels for groundwater COCs were established as the lowest value of the following: (1) Method A groundwater cleanup level for protection of human health presented in Table 720-1 of WAC 173-340-900, and (2) concentrations established under applicable federal or state laws including maximum contaminant levels (MCLs) established under the Safe Drinking Water Act (CFR 141) and MCLs established by the state board of health (Chapter 296-290 WAC).

The cleanup levels for soil COCs were selected as the Method A cleanup level for unrestricted land use presented in Table 740-1 of WAC 173-340-900.

3.2 Areas Exceeding Cleanup Levels

The following summarizes the areas where concentrations of COCs exceed cleanup levels in soil and/or groundwater.

3.2.1 Soil

Figure 3 graphically depicts the areas where COCs (petroleum hydrocarbons and/or VOCs) have been detected in soil at concentrations greater than cleanup levels based on the previous

sampling results shown in Table 1. As shown on Figure 3, the areas exceeding cleanup levels are located primarily beneath the former UST area north of the 1406 10th Avenue building and in the southeastern portion of the Property. Boring B-2 near the former UST area contains diesel-range hydrocarbons and benzene above cleanup levels to at least 6 ft below the basement floor (approximately elevation 282 ft). Diesel-range hydrocarbons are also found beneath the 1401 and 1405 11th Avenue buildings at depths of 3 to 10 ft below the basement floors (approximately elevations 280 to 287 ft) Heavy fuel oil is present above its cleanup level in an isolated area around B-18 at a depth 8 ft below the basement floor (approximately elevation 280).

3.2.2 Groundwater

Figure 4 graphically depicts the areas where COCs (diesel-range hydrocarbons and intermittent detections of PCE and related VOCs) have been detected in groundwater at concentrations greater than cleanup levels. In general, the area exceeding groundwater cleanup levels for diesel range hydrocarbons is very similar to the area where soil exceeds cleanup levels, with minor differences along the northeastern and southeastern plume boundaries. The areas where groundwater concentrations exceed CULs for PCE, TCE, vinyl chloride, and/or benzene (B-2, MW-1, B-8, and B-21) are contained within the two areas where groundwater exceeds cleanup levels for diesel.

Diesel-range hydrocarbons were detected at concentrations exceeding the diesel CULs in at least one location near the former UST area (B-2) and at ten locations (MW-4, MW-5, B-12, B-13, B-18, B-19, B-20, B-21, B-22, and B-24) in the southeastern portion of the Property. These samples were collected from either temporary wells or groundwater monitoring wells with 10-foot screens set from depths ranging from 2 to 26 feet.

One or more of the following VOCs (PCE, TCE, VC, or benzene) were detected at four locations (MW-1, MW-3/BH-1, B-8, and B-21) at concentrations exceeding the respective cleanup levels. Benzene was detected only once (B-2) and vinyl chloride twice (B-2 and B-21) but at concentrations that exceeded the respective CULs (5 µg/L and 0.2 µg/L). PCE was detected in two samples (B-8 and MW-1) at concentrations (35.5 µg/L and 20.1 µg/L, respectively), exceeding the CUL of 5 µg/L. Three of four TCE detections (B-8, BH-1, MW-1) exceeded the CUL (5 µg/L). BH-1 contained the highest detected concentration of TCE at 24.7 µg/L; however, this result was not confirmed by the results for well MW-3 that was installed immediately adjacent to the location of boring BH-1. The TCE result for MW-3 (1.09 µg/L) was well below the TCE cleanup level of 5 µg/L, indicating groundwater in this area does not exceed cleanup levels.

3.3 Overview and Rationale for Remedial Actions

The results of the Property investigations indicate that soil containing diesel or heavy fuel at concentrations exceeding CULs is limited to the areas below portions of the 1406 10th Avenue and 1401 and 1405 11th Avenue buildings and is located between approximately elevations 280 and 288 ft. The two areas where groundwater exceeds cleanup levels for COCs are co-located with the soil contamination but extend beyond the limits of the soil exceeding cleanup levels (i.e.

the area exceeding groundwater CULs encompasses all of the area exceeding soil CULs). Groundwater is encountered at approximately elevation 285 ft.

The planned development includes excavation of the entire property to an elevation of approximately 282.5 ft to accommodate one level of sub-grade parking. The Property development excavation will remove all of the soil exceeding CULs except for at three locations: near B-18, B-24, and MW-5 where soil exceeding CULs extends to elevations at or below elevation 281 to 280 ft. The development excavation will also remove the upper 2.5 ft of the saturated zone.

Based on the distribution of COCs in soil and groundwater and the planned development excavation, the most cost effective method for cleanup of soil and groundwater is to excavate the soil both above and below the water table within the two areas exceeding groundwater cleanup levels (Figure 5). PES's experience indicates that the removal of the upper 4 feet of the saturated zone (or to approximately elevation 281ft) is an effective method to remove the source of the petroleum groundwater impacts as well as removing the entrained groundwater contaminants. Once the source has been removed, the remaining dissolved contaminants will attenuate naturally and relatively quickly. The area surrounding MW-5 will require additional over excavation to remove the soil exceeding cleanup levels (to approximately elevation 279 ft or possibly lower).

In summary, the approach for cleanup actions at the Property includes the following actions:

- Decommission existing monitoring wells within the planned excavation areas;
- Excavate and dispose of contaminated soil exceeding CULs concurrent with the excavation for Property development to an elevation of 282.5 ft;
- Over-excavate soil within the areas exceeding groundwater cleanup levels to an elevation of approximately 281 feet, approximately 1.5 feet deeper than proposed development excavation base, and approximately 8-10 feet below the current building base to remove soil containing residual contaminated groundwater within the saturated soil pore space;
- Off-site disposal of contaminated soil at a permitted facility;
- Collection and analysis of soil samples from the excavation bottom and sidewalls to demonstrate soil cleanup levels have been achieved;
- Backfill over excavated areas with clean imported fill material to bring elevation to proposed development grade (282.5 feet);
- Management and proper disposal of impacted groundwater or incident precipitation collected during excavation activities; and

- Installation of three new groundwater monitoring wells around the excavation perimeter and quarterly sampling of four total monitoring wells to confirm that groundwater cleanup levels have been achieved.

The approach defined above is the most cost-effective approach given the planned redevelopment, eliminates the need for post-development engineering controls and recording restrictive covenants on the property deed, is protective of human health and the environment, and meets the requirements of the MTCA.

3.4 Description of Cleanup Action Elements

The following sections describe the actions that will be taken during construction to address the soil and groundwater exceeding cleanup levels at the Property.

3.4.1 Decommission Monitoring Wells

Prior to the start of construction, monitoring wells MW-1, MW-2, MW-4, and MW-5 will be decommissioned by a Washington State licensed well driller. These wells are located in areas that will be excavated during the cleanup and/or property development (Figure 5). The well decommissioning will be conducted consistent with the requirements of the Washington Minimum Standards for Construction and Maintenance of Wells (WAC 173-160-460) by filling the casing from bottom to land surface with bentonite, cement grout, or neat cement. Monitoring well MW-3 will be kept and used in the new monitoring well network.

3.4.2 Excavation and Disposal of Contaminated Soil

3.4.2.1 Extent of Cleanup Action Excavation

The planned extent of the remedial excavations is shown on Figure 5. The limits of the excavation encompass all of the sampling locations where the concentration of one or more COCs in soil and groundwater exceeds the applicable CULs. Figure 5 also shows the proposed elevation of the planned excavation base by area, which was determined based on the following data and assumptions:

- Area 1: Area near the former UST and beneath the 1406 10th Avenue building (includes sampling locations B-2, B-8, and MW-1). The bottom of the excavation immediately in Area 1 is planned to extend to approximately 7 ft bgs or elevation 280 feet. The excavation depth is 1 ft below the deepest soil sampling exceeding cleanup levels (6 feet). In addition, this excavation depth is intended to remove the saturated soil (upper 4 feet) that contains elevated concentrations of COCs found in groundwater at this location.

- Area 2: Area east of former UST and beneath portions of the 1406 10th Avenue and 1401/1405 11th Avenue buildings. The bottom of the excavation immediately south of the former UST is planned to a depth of approximately 8 ft bgs or elevation 281 feet. In addition, this excavation depth is intended to remove the saturated soil that contains elevated concentrations of COCs (diesel and PCE) found in groundwater at this location.

- Area 3: Southeast portion of the Property beneath portions of the 1406 10th Avenue and 1401/1405 11th Avenue buildings. The average bottom of the excavation in the southeastern portion of the Property is to approximately 8 ft bgs or elevation 281 feet. The base of the excavation will be extended to at least 11 feet bgs (elevation 279) in an area around MW-5, which is 1 foot below the deepest soil sample exceeding CULs. In addition, this excavation depth is intended to remove the saturated soil (upper 4 feet) that contains elevated concentrations of COCs found in groundwater in this area.

Once the planned excavations limits (laterally and vertically) have been achieved, confirmation samples will be collected at the base and sidewalls of the planned excavations to determine if cleanup levels have been achieved (see Section 3.5). The results of the confirmation soil samples will be used to guide additional excavation required to meet CULs at the limits of the excavation.

Based on the excavation limits and depths shown on Figure 5, a total of approximately 3,700 cubic yards of contaminated soil will be excavated and disposed of off-site

3.4.2.2 Excavation and Handling Contaminated Soil

Soil excavated from the areas with detected concentrations of petroleum hydrocarbons (Figure 3) will be directly loaded into containers or trucks, and transported to off-site for disposal at a permitted petroleum contaminated soil (PCS) disposal facility. Soil excavated from areas where analytical data are not available but that exhibit one or more of the following physical characteristics will be designated as suspected PCS: (1) visible staining; (2) strong petroleum hydrocarbon odors; and/or (3) signification concentrations of organic vapors measured with a photo ionization detector (PID).

An environmental professional will observe the excavation of contaminated soil and conduct field screening to determine if unexpected conditions are encountered. Field screening will include observation of the soil for discoloration and organic vapor monitoring using a PID. Excavation of soil will continue until the lateral and vertical limits of the excavation shown on Figure 5 are reached. Confirmation samples will be collected at the base and sidewalls of these excavations as directed by the environmental professional, to determine if cleanup levels have been achieved. The results of the confirmation soil samples will be used to guide any additional excavation required to meet cleanup levels at the excavation limits. Confirmation soil sampling procedures are discussed further in Section 3.5.

Once the confirmation sample results indicate that a portion of the excavation meets cleanup levels, the area will be backfilled with clean, compacted fill material that meets the geotechnical requirements of the re-development project.

3.4.2.3 Management of Groundwater and Stormwater During Excavation

Portions of the remedial excavation will extend below the water table, and it is possible that contaminated groundwater will be encountered in the excavation. Given the relatively low permeability of the silt underlying the Property, groundwater entering the excavation can likely be managed using ditching and sumping methods. In addition, incidental precipitation that

accumulates within the excavation prior to backfilling could become contaminated and require special handling. Therefore, precipitation and/or groundwater that accumulate within the excavation prior to backfilling will be collected, temporarily stored on-site in a Baker tank or other appropriate containers, and tested to determine the appropriate handling/disposal methods. The containerized water will be sampled and analyzed for petroleum hydrocarbons, VOCs, and other parameters as needed to obtain disposal approval. Depending on the volume and chemical concentrations, the containerized water may be disposed of at an off-site permitted disposal facility or in the sanitary sewer under a discharge authorization from the King County Industrial Waste Program (KCIW).

3.4.2.4 Management of Under-Slab and Footing Drainage after Development Construction

The proposed garage floor slab and garage wall footings will be located at approximately elevation 283.75 feet or below, which is below the elevation of the groundwater surface (approximately elevation 285). Therefore, the development will incorporate an under-slab and footing drainage system to prevent seepage of perched water into the garage. There is a potential that this water may contain residual concentrations of COCs initially after construction of the garage slab and perimeter walls have been completed and the system is activated. If this water contains COCs it will require appropriate disposal. Once activated and during the remaining construction period, the under-slab and footing drainage water will be discharged to a temporary holding tank and tested for COCs to determine its appropriate disposal method. The under-slab and footing drainage water testing results obtained during construction will be used to select how this water will be managed after the development construction has been completed. Options for management of the under-slab and footing drainage water include discharge to the storm sewer (with or without pretreatment depending on the results) and to the sanitary sewer under a waste discharge authorization from KCIW. Whichever method is selected to manage this drainage water, the appropriate permits and approvals will be obtained prior to discharge.

3.5 Confirmation Sampling

3.5.1 Soil

Soil samples will be collected and analyzed during the soil excavation activities to determine whether soil cleanup levels have been achieved at the base and lateral limits of the cleanup excavation (confirmation sampling).

Confirmation soil samples will be collected from the bottom and sidewalls of the excavation created during removal of the contaminated soil. The minimum number and/or frequency of samples to be collected and analyzed from each area is described below; however, additional samples may be collected based on conditions observed in the field:

- General Excavation – Confirmation samples will be collected from the excavation bottom at a frequency of 1 per 625 square ft (i.e., on a 25-ft-square grid) and from the excavation sidewalls at a frequency of 1 sample every 50 lineal ft. The sidewall samples may be collected from multiple depths, depending on the field screening conducted during excavation activities.

Confirmation soil samples will be collected from areas where the visual observations and/or field instrument readings indicate contamination is most likely present. The confirmation soil samples collected from the excavation will be analyzed for diesel-range hydrocarbons using Ecology Method NWTPH-Dx and oil-range hydrocarbons using Ecology Method NWTPH-Dx/Ext.

3.5.2 Groundwater

Groundwater monitoring will be conducted to assess the effectiveness of the cleanup actions and to demonstrate compliance with groundwater cleanup levels. The groundwater monitoring network will include a total of four groundwater monitoring wells. Monitoring well MW-3 will be retained, and three new monitoring wells will be installed at the locations shown on Figure 5, after the excavation has been backfilled and redevelopment has progressed sufficiently such that construction activities are unlikely to damage the wells. Two of the compliance monitoring wells will be located near two former locations with the highest concentrations of diesel-range hydrocarbons and/or VOCs in groundwater (near former MW-1 and MW-5), and the remaining two (including MW-3) will be located along the edges of the property (one upgradient and two downgradient).

The compliance monitoring wells will extend to depths similar to previous groundwater sampling zones. The wells will be constructed using 2-inch diameter Schedule-40 PVC 2-slot well screen and threaded blank PVC casing. The screened intervals will be set at depths that correspond with previous contamination levels, roughly 274 to 284 feet NAVD 88, and the annular space surrounding the screened interval will be filled with 10x20 Colorado Silica Sand from the bottom of the screened interval to 1 ft above the top of the screened interval. The wells will be completed with a traffic-rated, flush-mounted steel vault. The monitoring wells will be developed before measuring water levels or sampling groundwater. Development will involve pumping, surging, or bailing until the color of the discharge water does not change with additional development. Turbidity will be measured during well development. Water levels, amount of water removed, observations of the discharge water, and turbidity will be recorded. All development and sampling water will be handled as described in Section 3.4.2.3.

The compliance monitoring wells will be sampled quarterly for the first year. Groundwater samples will be analyzed for diesel-range hydrocarbons using Ecology Method NWTPH-Dx/Dx Ext., and VOCs using EPA Method 8260B. If the first year of monitoring does not indicate a significant seasonal variation in the results, the frequency of sampling will be revised to semi-annual to coincide with the high and low water table levels. Groundwater monitoring will continue until the concentrations of COCs in the groundwater samples are below cleanup levels for four consecutive sampling events.

3.6 Cleanup Action Consistency with MTCA Evaluation Criteria

The following sections describe how the cleanup actions described in this CAP meet the MTCA criteria for selecting a cleanup action.

3.6.1 Protectiveness

The cleanup actions described above achieve the cleanup levels in both soil and groundwater and are protective of human health and the environment. Contaminated soil excavation will remove soil contaminants exceeding cleanup levels, which will control leaching of contaminants to groundwater. The soil excavation activities will also be protective of Property workers who might contact the soil during subsequent construction activities because all soil exceeding cleanup levels will be removed.

The removal of the upper 4 feet of the saturated zone will effectively remove any residual source materials and allow for the natural attenuation of groundwater which will result in groundwater meeting CULs within a reasonably short timeframe.

3.6.2 Compliance with Cleanup Standards

The cleanup actions will meet soil cleanup standards on-Property through the excavation of contaminated soil above cleanup levels. Groundwater standards will be achieved at the point of compliance initially through the removal of the source materials (in soil) and through monitored natural attenuation. Over the long term, it is expected that natural attenuation will be sufficient to meet groundwater cleanup standards at the point of compliance.

3.6.3 Compliance with Regulatory Requirements

The cleanup actions will comply with the applicable legal requirements including MTCA. Off-site disposal of contaminated soil will be performed consistent with the state solid waste and dangerous waste regulations. A KCIW industrial waste discharge permit will be obtained for discharge of water (groundwater and/or storm water) entering the excavation during construction and for groundwater collected from the under-slab and foundation drainage system after construction is completed.

3.6.4 Compliance Monitoring

Performance and compliance monitoring are integral components of the CAP. Performance monitoring will ensure that the ongoing cleanup actions are performing as intended and to allow adjustments to be implemented as necessary. Compliance monitoring will be performed to demonstrate that cleanup levels are achieved.

3.6.5 Use of Permanent Solutions to Extent Practicable

This criterion is typically used when evaluating multiple cleanup action alternatives that meet the threshold requirements to determine which of the alternatives uses permanent solutions to the maximum extent practicable. The evaluation is commonly referred to as a disproportionate cost analysis and is described in WAC 173-340-360(3). However, this CAP describes the cleanup actions selected for the Property, which were developed based on existing Property conditions, the Property redevelopment plans, experience at other sites, and best professional judgment. As such, a detailed cost analysis was not performed. The following sections describe how the

selected cleanup actions meet the technical and administrative criteria for using permanent solutions to the extent practicable.

Protectiveness. The CAP will be protective of human health and the environment both on- and off-Property. The cleanup actions meet Ecology's requirements for conducting cleanup actions at residential properties in that all of the contaminated soil exceeding cleanup levels on the Property will be removed.

Permanence. The selected cleanup action permanently removes the primary sources of contaminants at the Property through the excavation and off-site disposal of contaminated soil. Secondary sources of contamination (residual concentrations of petroleum hydrocarbons in groundwater) are treated through natural attenuation.

Effectiveness Over the Long Term. The CAP utilizes remedial technologies that have been used routinely to address the types of impacts present at the Property and there is a high degree of certainty that they will be reliable over the long term. Soil excavation will effectively remove the primary source materials in a relatively short period of time.

Manage Short Term Risks. There are limited short term risks associated with the selected cleanup actions. The remedial construction activities will be conducted consistent with state and federal worker protection regulations and will use industry standard health and safety procedures to protect workers during construction activities. A health and safety plan will be developed outlining the specific requirements to protect remedial construction workers, including appropriate use of personal protective equipment and engineering controls.

Technical and Administrative Implementability. The cleanup actions are commonly used and readily available, and there are no significant technical implementability issues. The KCIW permit that will be required as described in Section 3.4, can reasonably be obtained prior to cleanup action implementation.

3.6.6 Restoration Time Frame

The cleanup action involves both short term and longer term actions that, when combined, result in the cleanup in a reasonable restoration time frame. Based on current site conditions and the proposed CAP, it is estimated that both soil and groundwater will cleanup levels within four years of the start of Property redevelopment activities. Short-term actions include the removal of the primary sources of contamination and off-site disposal. Longer term actions include allowing residual dissolved phase contamination to degrade naturally and on-going monitoring to confirm groundwater meets its cleanup levels. In addition, monitoring of the discharge from the sub-slab and foundation drainage system will demonstrate that subsurface groundwater meets CULs.

4.0 REPORTING AND SCHEDULE

4.1 Reporting

An independent remedial action report will be prepared to document the contaminated soil excavation and disposal and the results of the confirmation sampling. The report will include the following:

- A description of the extent of contaminated soil excavation, including a map showing excavation limits and depths and the location of confirmation soil samples;
- The results of the soil and groundwater performance and confirmation sampling;
- Copies of the disposal site weigh tickets and/or waste manifests documenting the contaminated soil disposal;
- Documentation of the quantity and disposition of any water removed from the excavation prior to backfilling; and
- Conclusions regarding the remedial actions compliance with the requirements of MTCA.

The independent remedial action report will be submitted to Ecology for review under the VCP.

4.2 Schedule

The re-development construction is anticipated to begin in mid-2013, depending on when the appropriate development permits are obtained. The cleanup action described in this CAP will be performed concurrent with the property re-development. The building demolition, monitoring well decommissioning, contaminated soil excavation and disposal, and excavation backfilling will take approximately 2 to 3 months to complete. The compliance monitoring wells will be installed once the construction activities have progressed to the point where their installation will not impede redevelopment construction and the construction will not damage the wells. Groundwater compliance monitoring will continue until the concentrations of COCs in groundwater are below cleanup levels for four consecutive monitoring events. The independent remedial action report will be submitted to Ecology within 1 month of demonstrating compliance with the groundwater cleanup levels.

Notes:

All analytical results reported in miligrams per kilogram (mg/kg) or parts per million (ppm).
TCE = Trichloroethylene.
PCE - Tetrachloroethylene.
MTCA - Washington State Department of Ecology Model Toxics Control Act.
ND = Analyte not detected in chromatogram.
-- = Not analyzed.
< = Not detected above associated Method Reporting Limit (MRL).
Bold denotes consituent detected at concentration at or above MRL
Shaded denotes concentration detected at or above regulatory cleanup leve
Sample Depth reported feet below grade (ground surface for exterior borings and finished floor elevation for interior borings).
1 = Sample Depth represents feet below grade (ground surface for exterior borings and finished floor elevation for interior borings)..
2 = Analytical results by gas chromatography by Washington State Department of Ecology Methods NWTPH-Dx/Dx Ext and NWTPH-HCID.
3 = Analytical results by gas chromatography and mass spectrometry by EPA Method 8260.
4 = MTCA Method A soil cleanup level for unrestricted land use unless otherwise specified.
5 = MTCA Method A soil cleanup level for gasoline range organics for unrestricted land uses is 100 mg/kg for soil with benzene, toulene, ethylbenezene, and/or xylenes present at concentrations greater than 1% and 30 mg/kg for all other mixtures.
6 = MTCA Method B cleanup level for direct contact for carcingenicity for vinyl chloride in soil.
A complete list of VOC data is provided in Appendix A

Notes:

All analytical results reported in micrograms per liter (mg/L) or parts per billion (ppb).
TCE = Trichloroethylene.
PCE = Tetrachloroethylene.
MTCA = Washington State Department of Ecology Model Toxics Control Act.
ND = Analyte not detected in chromatogram.
-- = Not analyzed.
< = Not detected above associated Method Reporting Limit (MRL).
Bold denotes consituent detected at concentration at or above MRL.
Shaded denotes concentration detected at or above regulatory cleanup level.
1 = Sample Depth represents feet below grade (ground surface for exterior borings and finished floor elevation for interior borings).
2 = Analytical results by gas chromatography by Washington State Department of Ecology Methods NWTPH-HCID and NWTPH-Dx/Dx Ext.
3 = Analytical results by gas chromatography and mass spectrometry by EPA Method 8260
4 = Cleanup value of 1,000 µg/L for gasoline mixtures without benzene present and 800 mg/L for gasoline mixtures with detectable benzene present.
5 = Geotechnical borings PB-1, PB-2, & PB-3 renamed by PanGeo to BH-3, BH-2, & BH-1, respectively.
A complete list of VOC data is provided in Appendix A.

1.0 INTRODUCTION

ATC Associates Inc. (ATC) conducted this Limited Phase II Subsurface Investigation at the 11th & Union Proposed Development property located at 1406 and 1416 10th Avenue and 1401 and 1405 11th Avenue in Seattle, Washington, at the request of Alliance Realty Partners, LLC (Alliance). The property is developed with four warehouse/commercial office structures, an asphalt-paved parking lot, and a gravel parking lot. The property is bound by 10th Avenue to the west, East Union Street to the south, and 11th Avenue to the east. To the north is a public pay surface parking lot. The property and the surrounding area are depicted on **Figure 1.**

Alliance requested a subsurface investigation of the property after a February 2012 Draft Phase I Environmental Site Assessment (ESA) of the property performed by ATC indentified several *recognized environmental conditions* that were determined to require further investigation.

2.0 SITE BACKGROUND

The property was first developed sometime prior to 1905 with residential structures. Current improvements were developed in 1913, 1915, and 1920. The Draft Phase I ESA of the property, prepared by ATC, dated February 2012, identifies historical property uses that include auto repair stations, auto body works and painting, machine shop, black smith, and auto springs manufacturing. These historical property uses present the likely historical use, storage and disposal of hazardous materials and petroleum products on the property. ATC concluded that these historical property uses represent a *recognized environmental condition* to the property.

The Draft Phase I ESA of the property identified two properties in the direction upgradient of assumed groundwater flow from the property, in state agency regulatory databases, with releases to groundwater. The regulatory databases list both of these properties as open cases. Based on the inferred upgradient hydraulic positions relative to the property, the distance (less than 500 feet), and the open status of the releases, ATC concluded that these two nearby, inferred upgradient properties represent a potential environmental concern to the property. Additionally the Draft Phase I ESA of the property identified several historical auto repair stations in locations adjacent or nearby inferred upgradient or inferred crossgradient to the property and several nearby historical dry cleaners. The historical operations at these nearby or adjacent inferred upgradient or inferred crossgradient properties represent potential environmental concerns to the property.

The Draft Phase I ESA also identified a former diesel underground storage tank (UST) on the property. The UST was formerly located north-adjacent to the 1406 10th Avenue building, in the current asphalt paved parking lot. In 1990, the UST and approximately 100 cubic yards of petroleum contaminated soils

were removed from the property and disposed of off-site. Prior to the collection of confirmation samples at the final limits of the remedial excavation, the UST excavation was backfilled, and no confirmation soils were collected. In August 1993, further excavation of the former UST area began. Removed petroleum hydrocarbon impacted soils were spread on-site in layers of 8 to 10 inches and treated by bioremediation. After bioremediation of the excavated soils, soil samples collected from the stockpiled soils indicated that levels of petroleum hydrocarbons were all below 10 milligrams per kilogram (mg/kg). These soils were subsequently reused on site as fill materials. Groundwater was encountered at approximately six feet below ground surface (bgs) in the excavation. Levels of tetrachloroethylene (PCE) were identified in the groundwater in the excavation. The groundwater entering the excavation was pumped through a carbon filter treatment tank until samples indicated PCE concentrations were acceptable for discharge to the sanitary system.

In September 1993, soil samples collected beneath the 1406 10th Avenue building indicated soil below this building contained levels of petroleum hydrocarbon between 330 mg/kg and 3,800 mg/kg. It was estimated that the amount of diesel contaminated soils remaining beneath the 1406 10th Avenue building to be 75 cubic yards. A concrete wall was placed between the UST excavation area and the 1406 10th Avenue building with a plastic lining along the bottom, to ensure that contaminated soils beneath the 1406 10th Avenue building would not continue to impact the excavated area. A water collection system was installed to continually treat and monitor the groundwater flowing from beneath the 1406 10th Avenue building until levels of the contaminants of concern fell below the Washington State Department of Ecology (Ecology) cleanup values.

Based on the results of the 1993 remedial work, Ecology issued a No Further Action determination on October 22, 1993. It was determined that based on the information presented that the property did not pose a threat to human health or the environment as a result of the release addressed in the independent remedial action report. Furthermore, "Ecology recognized the fact that a limited amount of petroleum contaminated soil remains under a building to the south of the cleanup site [1406 10th Avenue building], but as it is capped and contained, it is not anticipated to pose a problem." The Ecology letter further details that "this determination is made only with respect to the release identified in the remedial action report dated October 10, 1993. This no further action determination applies only to the area of the property at 1416 10th Avenue East affected by the release identified in the report." Based on the information presented in the regulatory database report listing, the prior reports and Ecology's No Further Action determination, ATC concluded that the remaining soil contamination below the 1406 10th Avenue building represents a ***recognized environmental condition*** and that the historically removed UST and historically contaminated soils and groundwater at the property represent a ***historical recognized environmental condition*** to the property.

According to the Draft Phase I ESA, the prior reports describe land farming and bioremediation of contaminated soils as related to the 1993 remedial activities on the northeast portion of the property. It was not reported in prior reports if confirmation soil samples were collected from the gravel lot beneath the land farmed soils to ensure that the soils had not impacted the northeast portion o the property. ATC concludes based on the lack of confirmation sampling beneath the land farmed soils that there is potential for impact to the property soil and therefore, represents a ***recognized environmental condition*** to the property.

According the Draft Phase I ESA of the property, the review of historical tax records and prior reports identified a historical apartment building on the northeast corner of the property as heated by an oil burner. The use of an oil burner indicates the potential for heating oil to have been stored in a UST or an aboveground storage tank (AST). To date, no records have identified a heating oil UST or AST associated with the historical apartment building. If the heating oil was stored in a UST, then it was likely removed during demolition activities; however, there is potential for a heating oil UST to remain on the property. If a heating oil UST is uncovered during construction activities, it should be removed and closed as per applicable regulations. ATC concludes that the potential for a heating oil UST to be on the property represents a potential environmental concern.

During field reconnaissance while performing the Draft Phase I ESA, a sump, of unknown use and discharge point, was observed south-adjacent to the 1416 10th Avenue building. The sump was observed to be dry and free of odors or stains. Based on the historical use of the 1416 10th Avenue building including auto repair and auto springs manufacturing and the unknown discharge point of the sump, ATC concludes that the sump adjacent to the 1416 10th Avenue building represents a potential environmental concern to the property.

The historical operations at the property and at adjacent and nearby properties, along with the potential presence of an abandoned heating oil UST, the known presence of remaining petroleum contaminated soils beneath the 1406 10th Avenue building, the historical land farming and bioremediation of soils on the property, the identified historical soil and groundwater contamination on the property, were identified in the Draft February 2012 Phase I ESA as ***recognized environmental conditions*** or potential environmental concerns, for which ATC recommended a limited subsurface investigation in order to assess soil and groundwater conditions at the property.

3.0 OBEJECTIVE AND SCOPE OF WORK

ATC's scope of work was intended to assess impact to property soil and groundwater at the subject property. On February 2 and 3, 2012, ATC advanced eleven (11) soil borings using direct push drilling technology, designated B-1 through B-9 and two (2) soil borings using a hand auger, designated HA-1 and HA-2. Selected soil samples and samples of first-encountered groundwater were analyzed for diesel, heavy oil, and volatile organic compounds (VOCs). On February 7, 2012, ATC advanced five (5) soil borings, designated B-10 through B-14. Selected soil samples and samples of first-encountered groundwater were analyzed for hydrocarbon identification, diesel, heavy oil, and VOCs. On February 24, 2012, PanGEO, Inc. (PanGeo) advanced three soil borings, designated BH-1 through BH-3 for geotechnical purposes. ATC collected samples from soil borings BH-1 through BH-3 and select soil samples and samples of first-encountered groundwater were analyzed for hydrocarbon identification and VOCs. On March 28, 29, and 30, 2012, ATC advanced eleven (11) soil borings, designated B-15 through B-26, and installed (5) groundwater monitoring wells, designated MW-1 through MW-5, using direct push technology. Selected soil samples and samples of first-encountered groundwater were analyzed for diesel, heavy oil, and VOCs. On April 4, 2012, ATC collected groundwater samples from monitoring wells MW-1 through MW-5. The groundwater samples were selectively analyzed for diesel, heavy oil, and VOCs. Collectively, the soil and groundwater samples were used to assess contaminant impact to soil and groundwater on the property. The locations of soil borings HA-1, HA-2, B-1 through B-26, and BH-1 through BH-3 and groundwater monitoring wells MW-1 through MW-5 are shown on **Figure 2**.

On February 23, 2012, a ground penetrating radar (GPR) survey was completed on the property parking areas in an attempt to evaluate the potential for remaining abandoned USTs or other underground features. On March 28, 2012, a survey of the subsurface drain system, including a television inspection, was conducted to evaluate the potential for releases from the drain system.

4.0 METHODS OF INVESTIGATION

4.1 Subsurface Utility Clearance and Site Health and Safety

Prior to initiating investigation activities, ATC evaluated the investigation areas for the presence of subsurface structures and utilities by contacting a service that notifies public and private utilities of the proposed subsurface investigation and requests their participation in identifying subsurface utilities. In addition, a site specific health and safety plan was developed for this project in accordance with Occupational Safety and Health Administration (OSHA) and state regulations and implemented during the field investigation. The investigation methods are summarized below.

4.2 Soil Boring Investigation

On February 2, 3, and 7, 2012, ATC contracted Cascade Drilling, Inc. (CDI) of Woodinville, Washington to advance 14 soil borings, designated B-1 through B-14, using direct-push drilling technology in order to collect subsurface soil samples and samples of first-encountered groundwater. Groundwater was initially encountered at eight (8) feet below ground surface (bgs) in soil borings B-1, B-3, and B-4, nine (9) feet bgs in soil borings B-2, B-12, and B-13, at 20 feet bgs in soil boring B-5, and at 16 feet bgs in soil borings B-6, B-7, B-8, and B-9. Groundwater was not encountered during the advancement of soil borings B-10, B-11, and B-14 due to drilling refusal at depths of 8.5 feet bgs, three (3) feet bgs, and nine (9) feet bgs, respectively.

On February 24, 2012, PanGeo contracted Boretec, Inc. (Boretec) of Valleyford, Washington to advance three soil borings, initially designated PB-1 through PB-3, although PanGeo later renamed PB-1 as BH-3, PB-2 as BH-2, and PB-3 as BH-1, using hollow-stem auger drilling technology in order to observe subsurface soil conditions, collect subsurface soil samples and samples of first-encountered groundwater. ATC was present during the advancement of PB-1 through PB-3. Groundwater was initially encountered at 10 feet bgs in borings PB-1 (BH-1) and PB-2 (BH-2) and at 18 feet bgs in PB-3 (BH-1).

On March 28, 29, and 30, 2012, ATC contracted Environmental Services Network (ESN) of Bellevue, Washington to advance fifteen (15) soil borings, five (5) to be completed as monitoring wells, designated B-15 through B-26 and MW-1 through MW-5, using direct-push drilling technology in order to collect subsurface soil samples and samples of first-encountered groundwater. Groundwater was initially encountered at four (4) feet below ground surface (bgs) in MW-5; at six (6) feet bgs in soil borings B-15 through B-18, B-26, MW-2 and MW-4; eight (8) feet below ground surface (bgs) in soil borings MW-1, B-19 through B-22 and B-24, nine (9) feet bgs in soil borings B-23, and at 12 feet bgs in MW-3.

Soil boring locations are shown on **Figure 2**.

4.3 Soil Screening and Soil and Groundwater Sampling

Monitoring of the drilling and sampling activities was performed by a qualified ATC field geologist. A detailed log of the subsurface lithologic conditions was maintained and a photoionization detector (PID) was used to screen the soils for organic vapors. Soils were also screened using visual and olfactory techniques to determine the potential for soil impacts by petroleum hydrocarbons. Soil samples obtained from direct push drilling were collected by hydraulically pushing a four (4) foot long core barrel sampler (macrocore sampler) containing a disposable acetate liner or a two (2) foot long split spoon sampler through the desired sample interval by means of direct push drilling techniques. After each sample interval is collected, the acetate liner is removed from the core barrel and cut to access soil for monitoring and sampling. Soil samples collected with a split spoon sampler are accessed by removing the sampler from the drill rods. Soil samples obtained from hollow stem auger drilling were collected by continually dropping a 140 pound hammer from a height of 30 inches onto a 1.5 foot long split-spoon sampler to drive the sampler into the undisturbed soil. The blow counts were recorded for every 6-inches the sampler is driven into the soil. The last 12-inches of the sampling interval was used to derive the hardness or density.

After each soil sampling interval, the split spoon or bore barrel was decontaminated using an alconox detergent and potable water wash followed by a clean potable water rinse and a final rinse with distilled water. In addition, disposable latex sampling gloves were worn between samples to avoid cross contamination between sample depths and locations.

Soil samples were also collected throughout the length of each boring for classification of the soils. Soil recovery was generally good with a maximum recovery of four (4) feet from the macrocore sampler and two (2) to 1.5 feet from split-spoon samplers. The soils were classified in general accordance with the Unified Soil Classification System (USCS). The logs of the borings are presented in **Appendix A**.

Select samples were placed in a sealable plastic bag and then mixed to volatilize any organic compounds present in the sample. The PID was then inserted into the bag to measure the organic vapor levels, which were recorded on the boring logs.

Soil samples collected for VOC analysis were collected under United States Environmental Protection Agency (EPA) Method 5035A using a five-gram soil core sampler inserted into a T-handle plunger. Each core sample was placed into a 40 milliliter (ml) glass volatile organic analysis (VOA) vial containing a sodium bisulfate preservative, bagged, and placed in a cooler on ice.

Soil samples collected for all other analysis were collected in glass jars provided by the analytical laboratory. After filling the jar with the sample, the jar was capped, bagged, and placed in a cooler on ice.

During the drilling of soil borings B-1 through B-9, B-12, B-13, PB-1 (BH-3), PB-2 (BH-2), and PB-3 (BH-1), B-16 through B-22, and B-24 through B-26 free groundwater was encountered and groundwater 'grab' samples were collected. The grab samples were collected from within the open borehole with dedicated high-density polyethylene (HDPE) tubing inserted into a polyvinyl chloride (PVC) slotted well casing and the sample was extracted into laboratory supplied containers using a peristaltic pump. After sample collection, the HDPE tubing and PVC well casing were removed from the borehole and discarded. The groundwater samples were placed in a cooler on ice.

4.4 Groundwater Monitoring Well Installation

After the advancement of the soil borings, groundwater monitoring wells MW-1 through MW-3 were installed by ESN into the open borehole by installing 2-inch diameter polyvinyl chloride (PVC) well casing to the desired depth with 0.01-inch slotted screen. The annular space around each well screen was filled with 10/20 sand and sealed with bentonite chips. Each well casing was fitted with a locking expansion cap and each well was completed at the surface by setting a traffic-rated vault box flush with the surrounding surface. The logs of the soil borings including well construction details are presented in **Appendix A**.

The wells were developed by ESN immediately after well completion by purging up to 5 gallons from each well or until dry. Turbidity in the purged groundwater was observed to be clear and free of significant sediment after completion of well development in each well.

After well installation each groundwater monitoring well was surveyed for top of casing and top of box elevation and northing and easting location. A copy of the surveyed well locations and elevation and location data is presented in **Appendix B.**

4.5 Groundwater Monitoring Well Sampling

On April 3, 2012, ATC collected groundwater samples from groundwater monitoring wells MW-1 through MW-5. Prior to collection of the groundwater samples, each monitoring well was purged using low-flow sampling techniques. During low-flow groundwater sampling, HDPE tubing is lowered into the well until set within the screen interval. Groundwater is then purged by means of a peristaltic pump set at a steady flow rate while maintaining a drawdown of less than 0.33 feet. After a minimum of one tubing volume (including the volume of water in the pump and flow cell) is purged water-quality indicator

parameters, including turbidity, dissolved oxygen, specific electrical conductance (specific conductance), pH, temperature, and oxidation-reduction potential (ORP) are recorded every three to five minutes until stabilization occurs. The stabilization criterion is based on three successive readings of the water quality field parameters. Stabilization is considered to have occurred when the following criteria are met, although due to geologic heterogeneities within the screened interval and site-specific conditions, adjustments on flow rate and stabilization criteria may be required:

- pH ± 0.1 pH units
- Specific Conductance ± 3%
- ORP± 10 millivolts (mV)
- Turbidity ± 10 % Nephelometric turbidity units (NTUs); when turbidity is greater than 10 NTUs

After achievement of stabilization, the well is considered purged, and the samples were collected in laboratory-prepared containers from the discharge port of the pump. The groundwater samples were then placed on ice and transported to the laboratory under chain-of-custody procedures. In order to prevent cross contamination the flow cell was cleaned and new HDPE tubing was used at each well. The well purge logs presented in **Appendix C** contain record of the low-flow sampling parameters recording during the April 3, 2012 groundwater sampling event.

4.6 Analytical Methods

Selected soil and groundwater samples collected during field activities were submitted for analysis to Fremont Analytical of Seattle, Washington, an Ecology accredited analytical laboratory. Select soil and groundwater samples were analyzed for hydrocarbon identification by Ecology Method NWTPH-HCID, diesel and heavy oil by Ecology Method NWTPH-Dx/Dx Ext., and VOCs by EPA Method 8260. The laboratory analytical reports are presented in **Appendix D**.

4.7 GPR Survey

On February 23, 2012, ATC subcontracted Underground Detection Services, Inc. (UDS) of Seattle, Washington to complete the survey using a skid mounted survey GPR equipment in the accessible areas of the property parking lots. The GPR survey was conducted in an effort to identify subsurface anomalies that could represent underground utilities and/or USTs. A copy of the GPR survey report is presented in **Appendix E**.

4.8 Subsurface Drainage Visual Survey

On March 28, 2012, ATC subcontracted CNI Locates (CNI) of Bonney Lake, WA to perform a survey of subsurface drains at the property to assess potential pathways for contaminant migration off-property and to survey the condition of subsurface drains. The survey was completed by inserting a push-rod with a mounted camera inside all existing on-property subsurface sewer and storm drains. The surveyed drains are shown on **Figure 2** and a copy of the television survey DVD is presented as **Appendix F**.

5.0 SUBSURFACE CHARACTERISTICS

5.1 Lithology

Subsurface soils encountered during the advancement of soil borings B-1 through B-4 were generally characterized by non-contiguous fine-grained and coarse-grained sediments. Silty sands and clayey fine sands were observed to a depth of 8 feet bgs, the greatest depth explored during the advancement of soil borings B-1 through B-4. Subsurface soils encountered during the advancement of soil borings B-5 through B-9, BH-3, and BH-2, were generally characterized by silty sands and clayey sands to a depth of 25 feet bgs, the greatest depth explored during the advancement theses borings. Subsurface soils encountered during the advancement of soil borings B-10 through B-14 were generally characterized by silty sands and sandy clays to a depth of 10 feet bgs, the greatest depth explored during the advancement of the borings. In boring PH-1, clayey sands were observed to an approximate depth of 5 feet bgs, followed by silty sands to an approximate depth of 20 feet bgs, and followed by saturated sands to 30 feet bgs, the greatest depth explored during the advancement of the soil boring PB-1 (BH-3).

Subsurface soils encountered during the advancement of soil borings B-18, B-19, B-22, B-25, and B-26 consisted of silty sands and clayey fine sand to a depth of 10 feet bgs, the greatest depth explored during the advancement of these borings. In soil borings B-21, B-23, and B-24, silty sands and clayey fine sands were observed to a depth of 11 feet bgs, the greatest depth explored during the advancement of borings B-21, B-23, and B-24. In soil borings MW-2, MW-4, and B-15 through B-17, Silty sands and clayey fine sands were observed down to 12 feet bgs, the greatest depth explored during the advancement of borings MW-2, MW-4, and B-15 through B-17. In soil borings MW-1 and B-20 silty sands and clayey fine sands were observed down to 16 feet bgs, the greatest depth explored during the advancement of borings MW-1 and B-20. In soil boring MW-3 silty sands and clayey fine sands were observed to depth of 26 feet bgs, the greatest depth explored during the advancement of MW-3.

5.2 Hydrogeology

Free groundwater was encountered between 8 and 20 feet bgs during the advancement of soil borings B-1 through B-13 on February 2, 3, and 7, 2012. Free groundwater was not encountered during the advancement of soil borings B-10, B-11, and B-14, which were advanced to a maximum depth of 9 feet bgs. The lack of free groundwater observed during the advancement of soil borings B-10, B-11, and B-14 is likely due to the greater elevation of the building slab. During the February 24, 2012 investigation, free groundwater was encountered at 10 feet bgs in BH-3 and BH-2, and at 20 feet bgs in BH-3.

Depth to groundwater elevations were collected from groundwater monitoring wells MW-1 through MW-5 during the April 3, 2012 sampling event. The depth to water data show a shallow groundwater gradient of approximately 0.002 ft/ft toward the northwest (**Figure 2**), although ATC expects the direction of flow is indicative of a localized soils with low hydraulic conductivity. Groundwater levels and/or flow direction(s) may vary due to seasonal fluctuations in precipitation, local usage demands, geology, underground structures, or dewatering operations.

5.3 Soil Analytical Results

Selected soil samples collected during the February and March 2012 field activities were analyzed for petroleum hydrocarbon identification, petroleum hydrocarbons as diesel and heavy oil, and VOCs. The data is summarized by three investigative areas, which were determined by identification of impact from previous investigations and during the process of this investigation.

1406 10th Avenue Building/Former UST Area

Data from soil borings B-1 through B-7, B-18, PB-3 (BH-1), and the soil borings advanced for the installation of groundwater monitoring wells MW-2 and MW-3 were used to characterized soil and groundwater conditions below the 1406 10th Avenue building and the location of the UST removed in 1990. Previous investigations indicated that diesel impacted soil and groundwater had been removed from this area during the 1990 UST removal and during remedial over-excavation and de-watering activities performed after the UST removal. Approximately 100 cubic yards of diesel impacted soil, located adjacent-south of the 1993 remedial excavation, under the 1406 10th Avenue building, had been reported to remain from the release attributed to the former UST.

Concentrations of petroleum hydrocarbons were detected in soil samples collected soil boring B-2, located within the 1406 10th Avenue building, in the area of the former diesel UST. Soil sample B-2-3, which was collected from three feet below the basement floor of the 1406 10th Avenue building contained 8,780 milligrams per kilograms (mg/kg) or parts per million (ppm) diesel, which is above the Model Toxics Control Act (MTCA) Method A cleanup level of 2,000 mg/kg for diesel range organics. Soil sample B-2-3 also contained 40.9 mg/kg heavy oil, which is below the MTCA Method A cleanup level of 2,000 mg/kg for heavy oil. Soil sample B-2-6, collected from six feet below the basement floor of the 1406 10th Avenue building contained 1,500 mg/kg diesel, which is below the MTCA Method A cleanup level of 2,000 mg/kg for diesel.

Concentrations of heavy oil were detected in soil boring B-18, which is located within the 1406 10th Avenue building. Soil sample B-18-4, collected from four (4) feet below the basement floor of the 1406 10th Avenue building contained 2,940 mg/kg heavy oil and soil sample B-18-8, collected from eight (8)

feet contained 2,830 mg/kg heavy oil, both of which are above the MTCA Method A cleanup level of 2,000 mg/kg for heavy oil.

Concentrations of VOCs were also detected in soil boring B-2. Soil sample B-2-3 contained 0.273 mg/kg benzene, which is above the MTCA Method A cleanup value of 0.03 mg/kg for benzene and concentrations of 1.07 mg/kg ethylbenzene, 0.1085 mg/kg xylenes, and 0.0272 mg/kg naphthalene, all of which are below the respective MTCA Method A cleanup values of 6 mg/kg for ethylbenzene, 9 mg/kg for xylenes, and 5 mg/kg for naphthalene. Soil sample B-2-6 contained 0.122 mg/kg benzene, which is above the MTCA Method A cleanup value of 0.03 mg/kg and 3.11 mg/kg ethylbenzene and 0.0467 mg/kg xylenes, both of which are below the respective MTCA Method A cleanup values of 6 mg/kg for ethylbenzene and 9 mg/kg for xylenes. Concentrations of isopropyl benzene, n-Propylbenzene, sec-Butylbenzene, 4-Isopropyltoluene, 1,2,4,-trimethylbenzene, 1,3,5-trimethylbenzene, and n-butylbenzene were detected in soil samples collected from soil boring B-2; although concentrations were either below MTCA risk-based standard formula values or the analytes are not regulated in MTCA.

Concentrations of other petroleum hydrocarbons and VOCs were not detected above laboratory detection limits in the remaining soil samples collected from below the 1406 10th Avenue building and in the vicinity of the former UST, including the soil borings advanced in areas topographically upgradient of the former UST area.

The vertical and lateral distribution of diesel in soil at the 1406 10th Avenue building and in the vicinity of the former UST is plotted as diesel isoconcentration contours over three depth intervals on **Figures 4 through 6**.

1401 and 1405 11th Avenue Buildings

Data from soil borings B-10 through B-14, B-16, B-17, B-19 through B-24, HA-1, HA-2, PB-2 (BH-2), and the soil borings advanced for the installation of groundwater monitoring wells MW-4 and MW-5 were used to characterized soil and groundwater conditions below the 1401 and 1405 11th Avenue buildings. Diesel impacted soil and groundwater has only been detected in this area of the property during this investigation.

Concentrations of diesel were detected above the MTCA Method A cleanup level of 2,000 mg/kg in soil samples collected from B-14, B-22, B-24, and the soil boring advanced for groundwater monitoring well MW-5. Soil sample B-14-6, collected from six (6) feet below the floor of the 1405 11th Avenue building in soil boring B-14 contained 2,310 mg/kg diesel. Soil sample B-22-3, collected from three (3) feet below the floor of the 1401 11th Avenue building in soil boring B-22 contained 2,550 mg/kg diesel. Soil sample B-24-8, collected from eight (8) feet below the floor of the 1405 11th Avenue building in soil

boring B-24 contained 4,500 mg/kg diesel. Soil sample MW-5-10, collected from ten (10) feet below the floor of the 1401 11th Avenue building in the soil boring advanced for groundwater monitoring well MW-5 contained 2,270 mg/kg diesel. All other soil samples collected from soil borings B-14, B-22, B-23, and the soil boring advanced for groundwater monitoring well MW-5 either contained concentrations of diesel below the MTCA Method A cleanup level of 2,000 mg/kg or below laboratory reporting limits.

Diesel was detected in concentrations above laboratory detection limits, but below the MTCA Method A cleanup level of 2,000 mg/kg, in soil samples collected from soil borings HA-1, B-10, B-12, B-13, B-20, B-21, and the soil boring advanced for groundwater monitoring well MW-4.

Concentrations of other petroleum hydrocarbons and VOCs were not detected above laboratory detection limits or above MTCA regulated cleanup levels in the remaining soil samples collected from the area of the 1401 and 1405 11th Avenue buildings.

The vertical and lateral distribution of diesel in soil in the area of the 1401 and 1405 11th Avenue buildings is plotted as diesel isoconcentration contours over three depth intervals on **Figures 4 through 6**.

Sump Area

Data from soil borings B-3, B-4, B-8, B-15 through B-17, B-25, B-26, PB-1 (BH-3), PB-3 (BH-1), and the soil borings advanced for the installation of groundwater monitoring wells MW-2 and MW-3 were used to characterized soil and groundwater conditions found within the vicinity of a sump/subsurface drain system previous identified as impacted with chlorinated VOCs above MTCA cleanup levels.

Concentrations of petroleum hydrocarbons were detected in soil boring B-17. Soil sample, B-17-3, collected from three (3) feet bgs contained 111 mg/kg diesel and soil sample, B-17-6, collected from six (6) bgs contained 312 mg/kg diesel, both of which are below the MTCA Method A cleanup level of 2,000 mg/kg for diesel.

Concentrations of VOCs, including chlorinated VOCS, were not detected above laboratory reporting limits in any of the remaining soil samples analyzed for VOCs in the sump area.

The vertical and lateral distribution of diesel in soil at the sump area is plotted as diesel isoconcentration contours or three depth intervals on **Figures 4 through 6**.

A summary of the laboratory analytical results for the soil samples is presented as **Tables 1a and 1b** and copies of the laboratory analytical results are presented in **Appendix D**. Soil samples collected from locations off-property were tabulated separately at the request of Alliance.

5.4 Groundwater Analytical Results

1406 10th Avenue Building/Former UST Area

Groundwater grab samples of first encountered groundwater were collected from soil borings B-1 through B-8, B-17, B-18, B-25, B-26, and PB-1 (BH-3) below the 1406 10th Avenue building and with the vicinity of the former UST removed in 1990. The groundwater samples were selectively analyzed for petroleum hydrocarbons and VOCs.

Diesel was detected in concentrations above the MTCA Method A cleanup level of 500 microgram per liter (µg/l) or parts per billion (ppb) in the groundwater samples collected from soil boring B-2 at 6,090 µg/l. The groundwater sample collected from soil boring B-2 also contained a concentration of 12.5 µg/l benzene, above the MTCA Method A cleanup level of 5 µg/l. Other fuel related VOCs, including ethylbenzene and xylenes were present in the groundwater sample collected from soil boring B-2, although in concentrations below MTCA Method A cleanup levels.

Diesel was also detected in the groundwater samples collected from soil boring B-1, B-6 through B-8, and B-17, although in concentrations below the MTCA Method A cleanup level of 500 µg/l.

Heavy oil was detected in concentrations above the MTCA Method A cleanup level of 500 µg/l in the groundwater sample collected from soil boring B-18 at 194,000 µg/l.

Groundwater samples were also collected from groundwater monitoring wells MW-1 through MW-3 to better assess groundwater conditions below the 1406 10th Avenue building and with the vicinity of the former UST removed in 1990.

Laboratory analytical results indicate that groundwater from the groundwater samples collected from groundwater monitoring wells MW-1 through MW-3 contain detections of diesel and heavy oil, although only the concentration of diesel from the groundwater sample collected from groundwater monitoring well MW-1, at 759 µ/l, was above the MTCA Method A cleanup level.

No other fuel-related compounds were detected in the groundwater grab samples collected from soil borings B-1 through B-8, B-17, B-18, B-25, B-26, and PB-1 (BH-3) and the groundwater samples collected from groundwater monitoring wells MW-1 through MW-3.

Chlorinated VOCs in concentrations above MTCA Method A cleanup levels are present in the groundwater grab sample collected from soil boring B-8 and the groundwater sample collected from MW-

1, although these impacts are not attributed to the UST release and will be discussed in the Sump Area section below.

1401 and 1405 11th Avenue Buildings

Groundwater grab samples of first encountered groundwater were collected from soil borings B-9, B-12, B-13, B-16, B-17, B-19 through B-22, B-24, and PB-2 (BH-2) to assess impact to groundwater from the petroleum hydrocarbon mass identified in soil below the 1401 and 1405 11th Avenue buildings. The groundwater samples were selectively analyzed for petroleum hydrocarbons and VOCs.

Diesel was detected in concentrations above the MTCA Method A cleanup level of 500 µg/ in the groundwater samples collected from soil borings B-12 (547,000 µg/l), B-13 (2,330 µg/l), B-19 (3,560 µg/l), B-20 (1,250 µg/l), B-21 (961,000 µg/l), B-22 (6,720 µg/l), and B-24 (121,000 µg/l).

Groundwater samples were also collected from groundwater monitoring wells MW-4 and MW-5 to better assess groundwater conditions below the 1401 and 1405 11th Avenue buildings and to assess the potential of off-property migration of dissolved phase petroleum hydrocarbons.

Laboratory analytical results indicate that groundwater from the groundwater samples collected from groundwater monitoring wells MW-4 and MW-5 contain detections of diesel at concentrations above the MTCA Method A cleanup level of 500 µg/l. The groundwater sample collected from groundwater monitoring well MW-4 contained a concentration of 6,120 µg/l and the groundwater sample collected from groundwater monitoring well MW-5 contained a concentration of 94,700 µg/l.

No other fuel related compounds were detected above laboratory detection limits or above MTCA Method A cleanup levels in the groundwater grab samples collected from soil borings B-9, B-12, B-13, B-16, B-17, B-19 through B-22, B-24, and PB-2 (BH-2) and from the groundwater samples collected from groundwater monitoring wells MW-4 and MW-5.

Chlorinated VOCs in concentrations above MTCA Method A cleanup levels are present in the groundwater grab sample collected from soil boring B-21.

Sump Area

Groundwater grab samples of first encountered groundwater were collected from soil borings B-3, B-4, B-8, B-16 through B-18, B-25, B-26, and PB-1 (BH-3) and groundwater samples were collected from groundwater monitoring wells MW-1 through MW-3 in the area of the sump/subsurface drains that previous investigations have identified as impacted with chlorinated VOCs.

The chlorinated VOCs trichloroethylene (TCE), tetrachloroethylene, also known as perchloroethylene (PCE), and vinyl chloride were detected in the groundwater sample collected from soil boring B-8 at respective concentrations of 7.45 µg/l, 35.5 µg/l, and 0.490 µg/l. These concentrations are above the respective MTCA Method A cleanup levels: TCE and PCE at 5 µg/l and vinyl chloride at 0.2 µg/l. In order to validate the result, a groundwater sample was collected from groundwater monitoring well MW-1, which contained concentrations of TCE (7.56 µg/l) and PCE (20.1 µg/l) above MTCA Method A cleanup levels.

Vinyl chloride was detected in the groundwater sample collected from soil boring B-21 at 0.410 µg/l, above the MTCA Method A cleanup level of 0.2 µg/l.

TCE in concentrations above the MTCA Method A cleanup level were also detected in the groundwater sample collected off-property, in soil boring PB-3 (BH-1). In order to assess the potential influence of off-Site sources and to better validate this data point, groundwater grab samples were collected from soil borings B-18, B-25, and B-26 and groundwater samples collected from groundwater monitoring wells MW-2 and MW-3. Laboratory analytical results indicated that only the groundwater sample collected from groundwater monitoring well MW-3 contained detectable concentrations of chlorinated VOCs: TCE was present in the groundwater sample collected from groundwater monitoring well MW-3 at 1.09 µg/l, below 5 µg/l, the MTCA Method A cleanup up level for TCE.

Concentrations of petroleum hydrocarbons in groundwater grab samples are shown on **Figure 7** and concentrations of petroleum hydrocarbons in groundwater are shown on **Figure 8**. A summary of the laboratory analytical results for the groundwater samples is presented as **Table 2a and 2b** and copies of the laboratory analytical results are presented in **Appendix D**. Groundwater samples collected from locations off-property were tabulated separately at the request of Alliance.

5.5 GPR Survey Results

UDS performed a GPR survey of the parking lots on the property on February 23, 2012. Several anomalies were identified during the GPR survey of the property parking areas. North of the 1406 10th Avenue building, an anomaly was identified that follows the sewer line to 10th Avenue. To the west of the 1401/1405 11th Avenue buildings, an electrical line, sump drain, sewer line, and another possible drain were identified. North-adjacent to the loading dock, between the 1401 and 1405 11th Avenue buildings, a heavily reinforced concrete slab was present (in the area of dumpsters) which prevented an evaluation of the subsurface with the GPR. In the northeast gravel parking lot, north of the 1405 11th Avenue building, an anomaly was identified. Based on the presented characteristics, the anomaly was determined to be

debris, and not likely an abandoned UST. The GPR survey did not identify any other anomalies or any suspected USTs.

A copy of the GPR Survey is presented in **Appendix D**.

5.6 Subsurface Drainage Video Survey Results

CNI performed a subsurface survey of the existing on-property sewer and storm drains on March 28, 2012. Four storm-sewer drainage lines were identified and surveyed: specified as North 1405, Middle 1405, South 1405 and Center 1406. The video survey did not identify any significant areas of damage or leakage. None of the drains appear to act as a conduit from the vicinity of chlorinated solvent impacted groundwater to off-property. A copy of the video survey DVD is included as **Appendix F**.

6.0 QUALIFICATIONS

ATC's professional services have been performed have been prepared in accordance with customary principles and practices in the fields of environmental science and engineering. This company is not responsible for the independent conclusions, opinions or recommendations made by others based on the information presented in this report.

In preparing this report, ATC has relied upon presumed accurate certain information (or absence thereof) about the property provided by the Client, and others identified herein. Except as otherwise stated in the report, ATC has not attempted to verify the accuracy or completeness of any such information.

The data reported and the findings, observations, and conclusions expressed in the report are limited by the Scope of Services, including the extent of subsurface exploration and other tests. The Scope of Services was defined through the requests of the Client, the time and budgetary constraints imposed by the Client, and the availability of access to the property.

This report is intended for the sole use of Alliance Realty Partners, LLC. This report may not be used or relied upon by any other party without the written consent of ATC.

Respectfully submitted,
ATC ASSOCIATES INC.

Sample Depth and Total Depth reported feet below ground surface (ft bgs)
TCE = Trichloroethylene
PCE - Tetrachloroethylene
-- = Not analyzed
MTCA - Washington State Department of Ecology Model Toxics Control Act
ND = Analyte not detected in chromatogram
Bold denotes concentration at or above regulatory cleanup level
1 = Analytical results by gas chromatography by Washington State Department of Ecology Methods NWTPH-Dx/Dx Ext and NWTPH-HCID.
2 = Analytical results by gas chromatography and mass spectrometry by EPA Method 8260
3 = MTCA Method A soil cleanup level for gasoline range organics for unrestricted land uses is 100 mg/kg for soil with benzene, toulene, ethylbenezene, and/or xylenes present at concentrations greater than 1% and 30 mg/kg for all other mixtures
4 = MTCA Method B cleanup level for direct contact for carcingenicity for vinyl chloride in soil
All analytical results reported in miligrams per kilogram (mg/kg) or parts per million (ppm)
A complete list of VOC data is provided in Appendix B.

Sample Depth and Total Depth reported feet below ground surface (ft bgs)
TCE = Trichloroethylene
PCE - Tetrachloroethylene
-- = Not analyzed
MTCA - Washington State Department of Ecology Model Toxics Control Act
ND = Analyte not detected in chromatogram
Bold denotes concentration at or above regulatory cleanup level
1 = Analytical results by gas chromatography by Washington State Department of Ecology Methods NWTPH-Dx/Dx Ext and NWTPH-HCID.
2 = Analytical results by gas chromatography and mass spectrometry by EPA Method 8260
3 = MTCA Method A soil cleanup level for gasoline range organics for unrestricted land uses is 100 mg/kg for soil with benzene, toulene, ethylbenezene, and/or xylenes present at concentrations greater than 1% and 30 mg/kg for all other mixtures
4 = MTCA Method B cleanup level for direct contact for carcingenicity for vinyl chloride in soil
All analytical results reported in miligrams per kilogram (mg/kg) or parts per million (ppm)
A complete list of VOC data is provided in Appendix B.

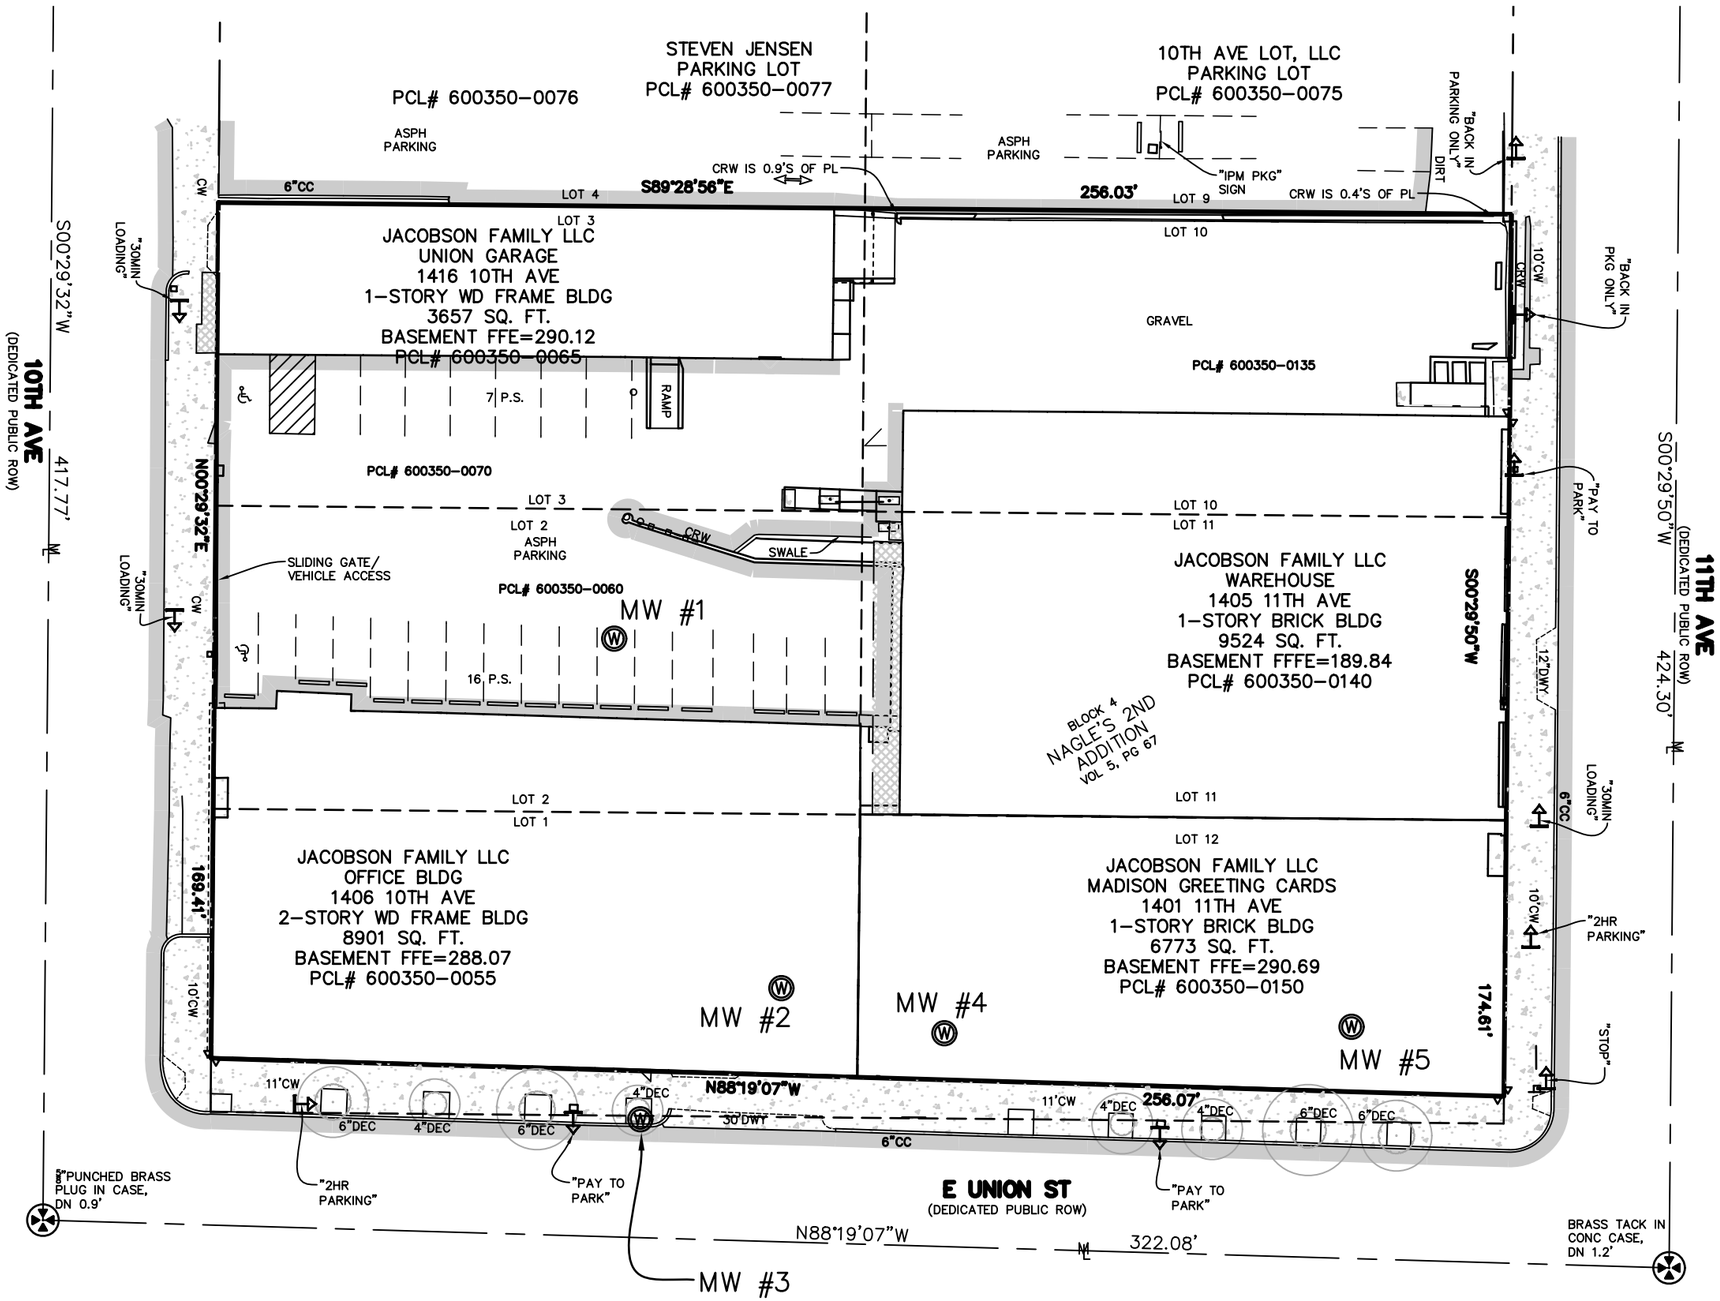
APPENDIX B
GROUNDWATER MONITORING WELL SURVEY MAP



MONITOR WELL	NORTHING	EASTING	RIM CASE ELEVATION	PVC PIPE ELEVATION	GROUND ELEVATION
MW #1	227236.19	1274000.70	290.12	289.74	290.11
MW #2	227167.01	1274033.80	287.86	287.60	287.84
MW #3	227141.05	1274005.87	298.16	297.43	298.12
MW #4	227158.07	1274066.95	289.83	289.53	298.81
MW #5	227159.36	1274146.68	289.77	289.41	289.76

SURVEY NOTES:

HORIZONTAL DATUM:

BASED UPON NAD83/91, WASHINGTON STATE PLANE COORDINATE SYSTEM, NORTH ZONE. US SURVEY FEET

COORDINATES SHOWN HEREON ARE BASED UPON GRID PROJECTIONS. ANGLES AND DISTANCES INVERSED BETWEEN THESE GRID COORDINATES WILL PRODUCE GRID DISTANCES.

ALL MEASUREMENTS SHOWN HEREON ARE US SURVEY FEET.

VERTICAL DATUM:
NAVD 88. BASED UPON SNV-2501
ELEVATION = 306.95

MONITOR WELL NOTE:

MONITOR WELL VAULES SHOWN HEREON ARE MEASURED AS FOLLOWS:

PVC PIPE LOCATED FROM THE TOP OF THE PVC PIPE AT THE NORTH EDGE FOR EACH WELL.

GOUND ELEVATIONS ARE SHOWN AS MEASURED AT THE GROUND SURFACE DIRECTLY ADJACENT.

RIM ELEVATIONS OF THE STRUCTURE SURROUNDING THE PVC PIPE ARE LOCATED AT NORTH RIM.

RE: 11th and Union
Lab ID: 1202045

February 13, 2012

Attention Hillary Williams:

Fremont Analytical, Inc. received 16 sample(s) on 2/7/2012 for the analyses presented in the following report.

Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.
Hydrocarbon Identification by NWTPH-HCID
Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

RE: 11th and Union
Lab ID: 1202025

February 13, 2012

Attention Hillary Williams:

Fremont Analytical, Inc. received 44 sample(s) on 2/3/2012 for the analyses presented in the following report.

Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.
Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

Fremont Analytical

Case Narrative

WO#: **1202025**
Date: **2/13/2012**

CLIENT: ATC Associates, Inc.
Project: 11th and Union

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Sample Log-In Check List

Client Name: **ATC**	Work Order Number: **1202025**
Logged by: **Troy Zehr**	Date Received: **2/3/2012 1:50:00 PM**

Chain of Custody

1.	Were custodial seals intact?	Yes	☐	No	☐	Not Present	☑
2.	Is Chain of Custody complete?	Yes	☑	No	☐	Not Present	☐
3.	How was the sample delivered?	Client					

Log In

4.	Coolers are present?	Yes	☑	No	☐	NA	☐
5.	Was an attempt made to cool the samples?	Yes	☑	No	☐	NA	☐
6.	Were all coolers received at a temperature of >0° C to 10.0°C	Yes	☑	No	☐	NA	☐
7.	Sample(s) in proper container(s)?	Yes	☑	No	☐		
8.	Sufficient sample volume for indicated test(s)?	Yes	☑	No	☐		
9.	Are samples properly preserved?	Yes	☑	No	☐		
10.	Was preservative added to bottles?	Yes	☐	No	☑	NA	☐
11.	Is there headspace present in VOA vials?	Yes	☐	No	☑	NA	☐
12.	Did all sample containers arrive in good condition?(unbroken)	Yes	☑	No	☐		
13.	Does paperwork match bottle labels?	Yes	☑	No	☐		
14.	Are matrices correctly identified on Chain of Custody?	Yes	☑	No	☐		
15.	Is it clear what analyses were requested?	Yes	☑	No	☐		
16.	Were all holding times able to be met?	Yes	☑	No	☐		

Special Handling (if applicable)

17.	Was client notified of all discrepancies with this order?	Yes	☐	No	☐	NA	☑

RE: 11th and Union
Lab ID: 1202148

March 02, 2012

Attention Hillary Williams:

Fremont Analytical, Inc. received 20 sample(s) on 2/24/2012 for the analyses presented in the following report.

Hydrocarbon Identification by NWTPH-HCID
Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

Date: *03/02/2012*

Case Narrative

WO#: **1202148**
Date: **3/2/2012**

CLIENT: ATC Associates, Inc.
Project: 11th and Union

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

NOTES:
Methylene Chloride is a common laboratory solvent.

Qualifiers:

B	Analyte detected in the associated Method Blank	D	Dilution was required
E	Value above quantitation range	H	Holding times for preparation or analysis exceeded
J	Analyte detected below quantitation limits	ND	Not detected at the Reporting Limit
RL	Reporting Limit	S	Spike recovery outside accepted recovery limits

April 06, 2012

Attention Simon Payne:

Fremont Analytical, Inc. received 6 sample(s) on 3/30/2012 for the analyses presented in the following report.

Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

Date: *04/06/2012*

CLIENT: ATC Associates, Inc.
Project: Alliance: Union Street (MW-3)
Lab Order: 1203193

Work Order Sample Summary

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received
1203193-001	MW-3-4'	03/30/2012 11:30 AM	03/30/2012 4:54 PM
1203193-002	MW-3-8'	03/30/2012 11:40 AM	03/30/2012 4:54 PM
1203193-003	MW-3-12'	03/30/2012 11:50 AM	03/30/2012 4:54 PM
1203193-004	MW-3-16'	03/30/2012 12:00 PM	03/30/2012 4:54 PM
1203193-005	MW-3-20'	03/30/2012 12:10 PM	03/30/2012 4:54 PM
1203193-006	MW-3-24'	03/30/2012 12:20 PM	03/30/2012 4:54 PM

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

Case Narrative

WO#: **1203193**
Date: **4/6/2012**

CLIENT: ATC Associates, Inc.
Project: Alliance: Union Street (MW-3)

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

RE: Alliance - 11th Ave/E. Union
Lab ID: 1204047

April 10, 2012

Attention Simon Payne:

Fremont Analytical, Inc. received 1 sample(s) on 4/3/2012 for the analyses presented in the following report.

Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

Date: *04/10/2012*

CLIENT: ATC Associates, Inc.
Project: Alliance - 11th Ave/E. Union
Lab Order: 1204047

Work Order Sample Summary

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received
1204047-001	MW-5	04/03/2012 2:15 PM	04/03/2012 6:10 PM

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

Case Narrative

WO#: **1204047**
Date: **4/10/2012**

CLIENT: ATC Associates, Inc.
Project: Alliance - 11th Ave/E. Union

I. SAMPLE RECEIPT:
All samples were received intact.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Prep Comments for METHOD (PREP-DX-W), SAMPLE (1204047-001A) required Silica Gel Cleanup Procedure.

RE: Alliance-11th Ave/E Union
Lab ID: 1204018

April 06, 2012

Attention Simon Payne:

Fremont Analytical, Inc. received 2 sample(s) on 4/3/2012 for the analyses presented in the following report.

Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.
Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

Date: *04/06/2012*

CLIENT: ATC Associates, Inc.

Lab Order: 1204018

Work Order Sample Summary

Lab Sample ID	Client Sample ID	Date/Time Collected	Date/Time Received
1204018-001	MW-3	04/03/2012 2:20 PM	04/03/2012 6:10 PM
1204018-002	Trip Blank	04/02/2012 10:50 AM	04/03/2012 6:10 PM

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

Case Narrative

WO#: **1204018**
Date: **4/6/2012**

CLIENT: ATC Associates, Inc.
Project: Alliance-11th Ave/E Union

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

Analytical Report

RE: Alliance-11th Ave/E Union
Lab ID: 1204017

April 06, 2012

Attention Simon Payne:

Fremont Analytical, Inc. received 5 sample(s) on 4/3/2012 for the analyses presented in the following report.

Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.
Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

1204017-003	MW-1	04/03/2012 3:45 PM	04/03/2012 6:10 PM
1204017-004	MW-2	04/03/2012 4:50 PM	04/03/2012 6:10 PM
1204017-005	Trip Blank	04/02/2012 10:50 AM	04/03/2012 6:10 PM

Note: If no "Time Collected" is supplied, a default of 12:00AM is assigned

Case Narrative

WO#: **1204017**
Date: **4/6/2012**

CLIENT: ATC Associates, Inc.
Project: Alliance-11th Ave/E Union

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.

RE: Alliance: 11th & Union
Lab ID: 1203194

April 06, 2012

Attention Simon Payne:

Fremont Analytical, Inc. received 61 sample(s) on 3/30/2012 for the analyses presented in the following report.

Diesel and Heavy Oil by NWTPH-Dx/Dx Ext.
Sample Moisture (Percent Moisture)
Volatile Organic Compounds by EPA Method 8260

This report consists of the following:

- Case Narrative
- Analytical Results
- Applicable Quality Control Summary Reports
- Chain of Custody

All analyses were performed consistent with the Quality Assurance program of Fremont Analytical, Inc. Please contact the laboratory if you should have any questions about the results.

Thank you for using Fremont Analytical.

Sincerely,

Michael Dee
Sr. Chemist / Principal

Case Narrative

WO#: **1203194**
Date: **4/6/2012**

CLIENT: ATC Associates, Inc.
Project: Alliance: 11th & Union

I. SAMPLE RECEIPT:
All samples were received intact. The internal ice chest temperatures were measured on receipt and are recorded on the attached Sample Receipt Checklist.

II. GENERAL REPORTING COMMENTS:
Results are reported on a wet weight basis unless dry-weight correction is denoted in the units field on the analytical report ("mg/kg-dry" or "ug/kg-dry").

Matrix Spike (MS) and MS Duplicate (MSD) samples are tested from an analytical batch of "like" matrix to check for possible matrix effect. The MS and MSD will provide site specific matrix data only for those samples which are spiked by the laboratory. The sample chosen for spike purposes may or may not have been a sample submitted in this sample delivery group. The validity of the analytical procedures for which data is reported in this analytical report is determined by the Laboratory Control Sample (LCS) and the Method Blank (MB). The LCS and the MB are processed with the samples and the MS/MSD to ensure method criteria are achieved throughout the entire analytical process.

III. ANALYSES AND EXCEPTIONS:
Exceptions associated with this report will be footnoted in the analytical results page(s) or the quality control summary page(s) and/or noted below.
Prep Comments for PREP-DX-W, Sample 1203194-033B: Sample contained suspended particulates.
Prep Comments for PREP-DX-W, Sample 1203194-049B: Sample contained suspended particulates.

NOTES:
S - Spike recovery indicates a possible matrix effect. The method is in control as indicated by the Laboratory Control Sample (LCS).

Qualifiers:

B	Analyte detected in the associated Method Blank	D	Dilution was required	E	Value above quantitation range
H	Holding times for preparation or analysis exceeded	J	Analyte detected below quantitation limits	ND	Not detected at the Reporting Limit
R	RPD outside accepted recovery limits	RL	Reporting Limit	S	Spike recovery outside accepted recovery limits

Work Order: 1203194
CLIENT: ATC Associates, Inc.

Sample Log-In Check List

Client Name: **ATC**	Work Order Number: **1203194**
Logged by: **Troy Zehr**	Date Received: **3/30/2012 4:54:00 PM**

Chain of Custody

1.	Were custodial seals present?	Yes ☐	No ☐	Not Required ☑
2.	Is Chain of Custody complete?	Yes ☑	No ☐	Not Present ☐
3.	How was the sample delivered?	Client		

Log In

4.	Coolers are present?	Yes ☑	No ☐	NA ☐
5.	Was an attempt made to cool the samples?	Yes ☑	No ☐	NA ☐
6.	Were all coolers received at a temperature of >0° C to 10.0°C	Yes ☑	No ☐	NA ☐
7.	Sample(s) in proper container(s)?	Yes ☑	No ☐	
8.	Sufficient sample volume for indicated test(s)?	Yes ☑	No ☐	
9.	Are samples properly preserved?	Yes ☑	No ☐	
10.	Was preservative added to bottles?	Yes ☐	No ☑	NA ☐
11.	Is there headspace present in VOA vials?	Yes ☐	No ☑	NA ☐
12.	Did all sample containers arrive in good condition?(unbroken)	Yes ☑	No ☐	
13.	Does paperwork match bottle labels?	Yes ☑	No ☐	
14.	Are matrices correctly identified on Chain of Custody?	Yes ☑	No ☐	
15.	Is it clear what analyses were requested?	Yes ☑	No ☐	
16.	Were all holding times able to be met?	Yes ☑	No ☐	

Special Handling (if applicable)

17. Was client notified of all discrepancies with this order? Yes ☐ No ☐ NA ☑

Hillary Williams
ATC Associates Inc.
6347 Seaview Avenue NW
Seattle, WA 98107

Dear Hillary:

This is a report on the equipment, procedures, and results of the geophysical survey performed at 1406 10th Avenue in Seattle, Washington. The purpose of the survey was to identify if underground storage tanks (UST) exist on the site.

The equipment that was used for the survey included, but was not limited to a Schonstedt GA-52 magnetic locator, GSSI Sir 3000 System ground penetrating radar (GPR) with 270 MHz antenna, and a MetroTech 810 pipe and cable locator.

The magnetic locator measures the magnetic field simultaneously from two separate elevations within the same piece of equipment. A high pitch sound is emitted from the equipment when in the proximity of ferrous material. The equipment is carried over the survey area and swung back and forth to cover as much area as possible in a reasonable time frame.

The GPR utilizes high frequency radio waves to probe the subsurface. A radio wave is emitted from the antenna and travels through the soil, if there is an anomaly below the antenna; the radio wave is reflected back. The data that is collected is displayed in real time, through a color display. After processing on a desktop computer printouts can be available.

The data that is produced is a cross section of the geology directly below the antenna. The top of the data represents the ground surface while the bottom of the page is a reading depth of the equipment. The data is collected and displayed from left to right, with left being the beginning and right being the end of the particular survey line. Anomalies typically appear white on a color screen.

The depth of the signal penetration is dependent upon geological factors beyond the control of the surveyor. Conductive soils, clays, and saturated soils, do not allow the GPR signal to penetrate as deeply as less resistive sandy soil.

The pipe and cable locator uses a defined radio frequency induced on the line from a transmitter attached to the line at the surface. The frequency travels the length of the line and acts as an antenna below the surface. A receiver tuned to that frequency is carried above the surface and locates the line with that frequency.

The area of concern for the GPR locate was the asphalted parking lot off of 10th Avenue. There was also an additional gravel lot that was north of the 1406 building. On the asphalt part of the survey there was a five foot linear grid measured out. Due to the increased slope of the parking lot the GPR would not get adequate results on the incline. The antenna would be shooting down at an angle and any anomalies indicated would be out of skew. For this reason, the survey was performed from south to north. When an anomaly was indicated it was also scanned east to west.

The second area that was surveyed was the gravel lot. Here there was also a five foot linear grid measured out. Three additional surveys were performed east to west and in the area of indicated anomalies.

This area of Seattle is known for very dense soils. Penetration of the signal from the GPR antenna is limited due to these soils. In the GPR readings this can be seen with the snow like look on the lower half of the reading. This can also be called noise. For the most part any anomalies that in within this area may go undetected. There also appeared to be a private locate performed on the site prior to UDS arrival. UDS did not perform any private utility locating on the site that was not visible from the GPR readings. Depths that are given to the left of each scan are approximate depths. A ground truth would need to be determined to provide relative depths to any anomaly indicated.

Exhibit A would have been closer to 10th Avenue and the scan would have been performed from south to north. The first reflection is more than likely a gas line that was marked out by the public one call service. The large anomaly that was in the middle of the scan could not be determined. This reading appeared to follow the possible sewer line that can be seen as the next anomaly to the right. This anomaly was also indicated on the surface by another private locate firm prior to arrival.

Exhibit B shows the same anomaly close to the possible sewer line. This reading is approximately 15 feet away from the reading found in Exhibit A.

Exhibit C is close to the break of the parking lot and the loading dock. From left to right and electrical line/sump drain, sewer line, and another possible drain was found. The drain to the far right of the scan may be a drain for the northern building. The sewer that was seen in Exhibit A & B is now closer to the surface as the parking lot sloped down.

Exhibit D & I is an area that was north of the loading dock and between the two buildings. At the time of the survey garbage bins were placed in the area. The picture of the area does not show the crack or noticeable difference in the asphalt. The GPR survey in Exhibit D shows that there is a heavily reinforced concrete slab in this area. This slab has since been asphalted over. It is unknown if this concrete slab is a surface protection for a UST. Due to the heavy reinforcement the GPR is unable to penetrate a signal through the metal in the slab.

Exhibit E & J is an area of an anomaly that was indicated in the gravel lot. In this area, the antenna had even less penetration due to the soils. This reading did not appear to have ferrous metallic quality to it when scanned using the magnetic locator. Measured from the corner of the building the anomaly is approximately 45 feet to the east and 15 feet to the north.

Exhibit F is another GPR scan to the east of one of the previous scans in Exhibit E. Here the same anomalies are not seen, but smaller utility like anomalies can been seen closer to the surface. These readings could not be followed and seen in further scans to the east.

Exhibit G is just an from east to west in the gravel parking lot. Being that this area was flat and not on a slope a few scans were performed east to west. Here the density of the soils is very prevalent. No anomalies were seen in the scan.

Exhibit H is a picture of the asphalt parking lot off of 10th Avenue. The white marks are the measured five foot grid. Also the marked gas line can been seen in the picture. The sewer line marked in green was running up the middle of the parking lot. Due to the night work, pictures were not as broad as if taken during the day.

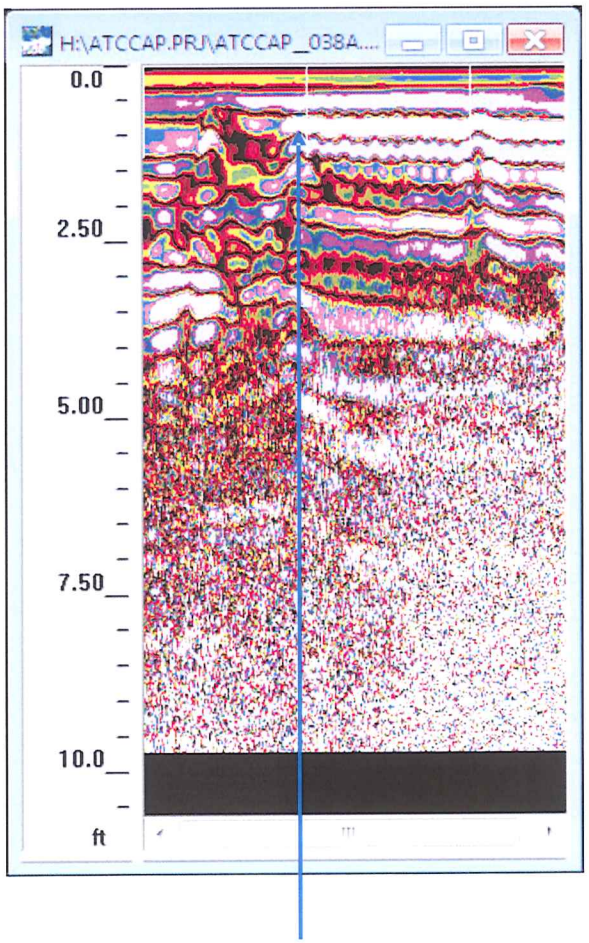
Possible electric and/or drain
Possible same drain line found in previous exhibits. This area is approximately at the split for the loading dock and the path to the gravel lot.
Unknown utility. May be drain line associated with building to the north.

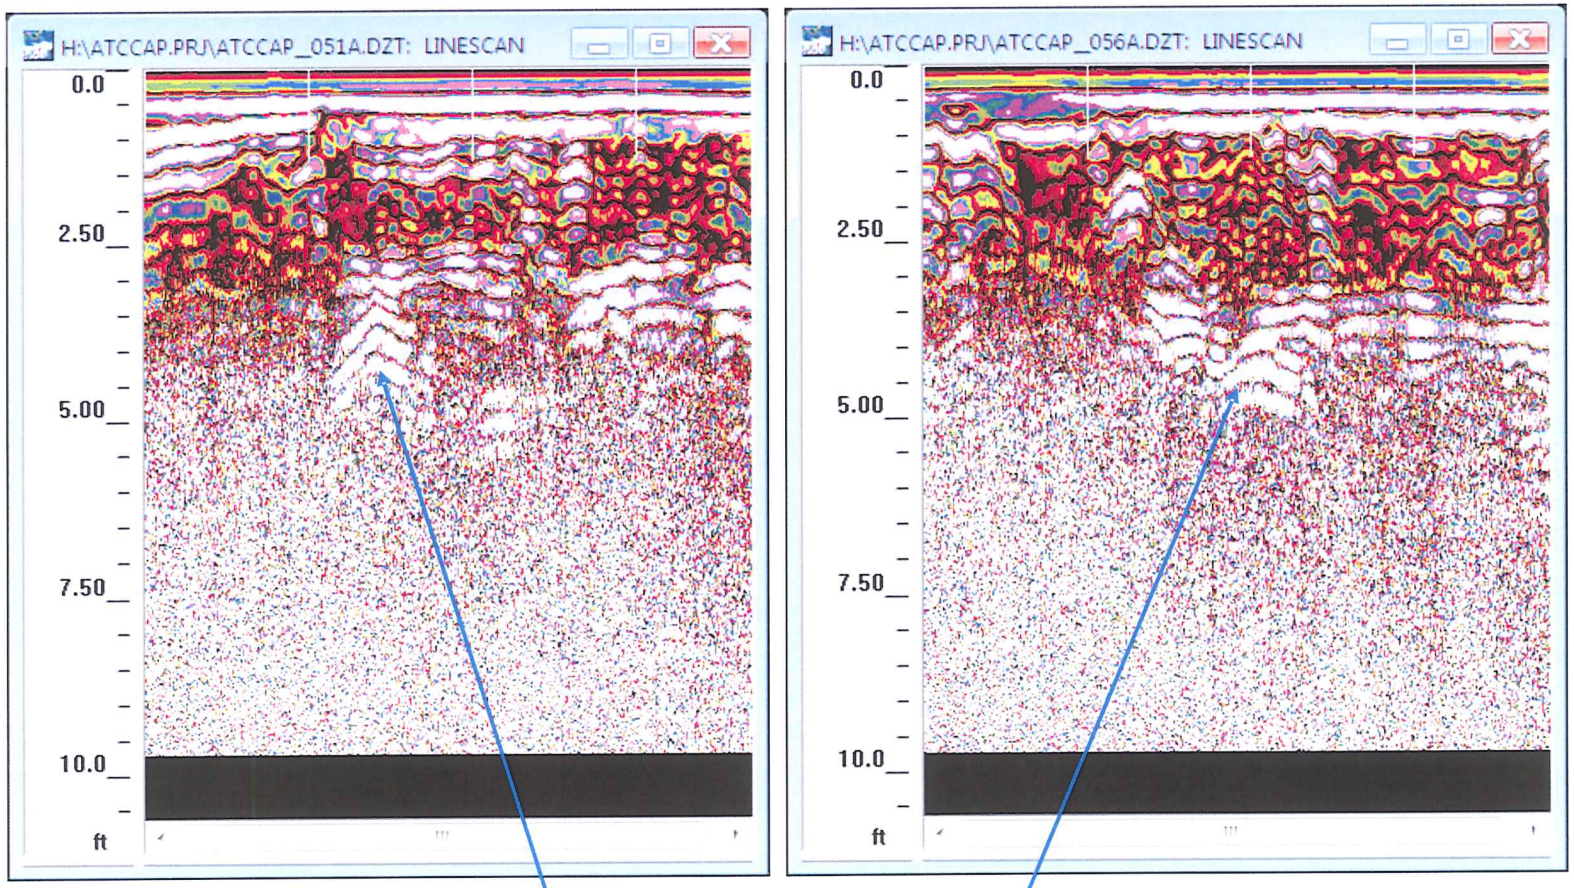
Exhibit C



Area between buildings that existing garbage bins sit. There is a noticeable crack in the concrete in the area. From the GPR reading it appears the area of the garbage bins is heavily reinforced. The GPR antenna signal is unable to penetrate through the heavily reinforced concrete.

Start of reinforced concrete

Exhibit D



Anomaly found in gravel lot. These readings were taken approximately 20 feet apart. Reading did not have a ferrous metallic makeup when scanned with the magnetic locator.

Exhibit E

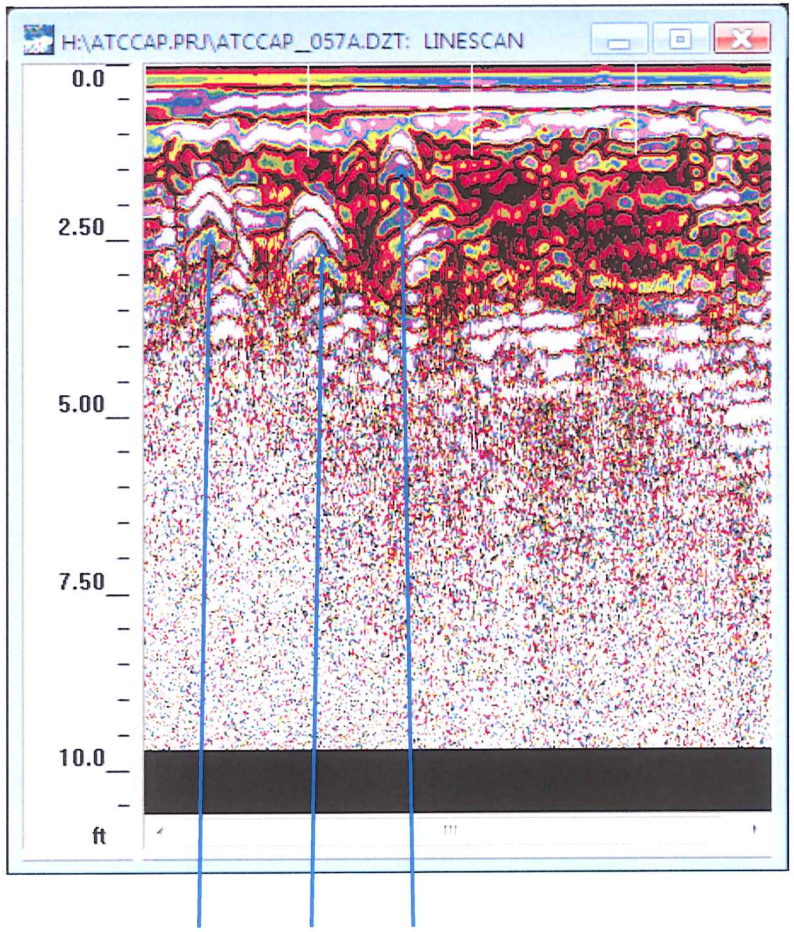


Exhibit F

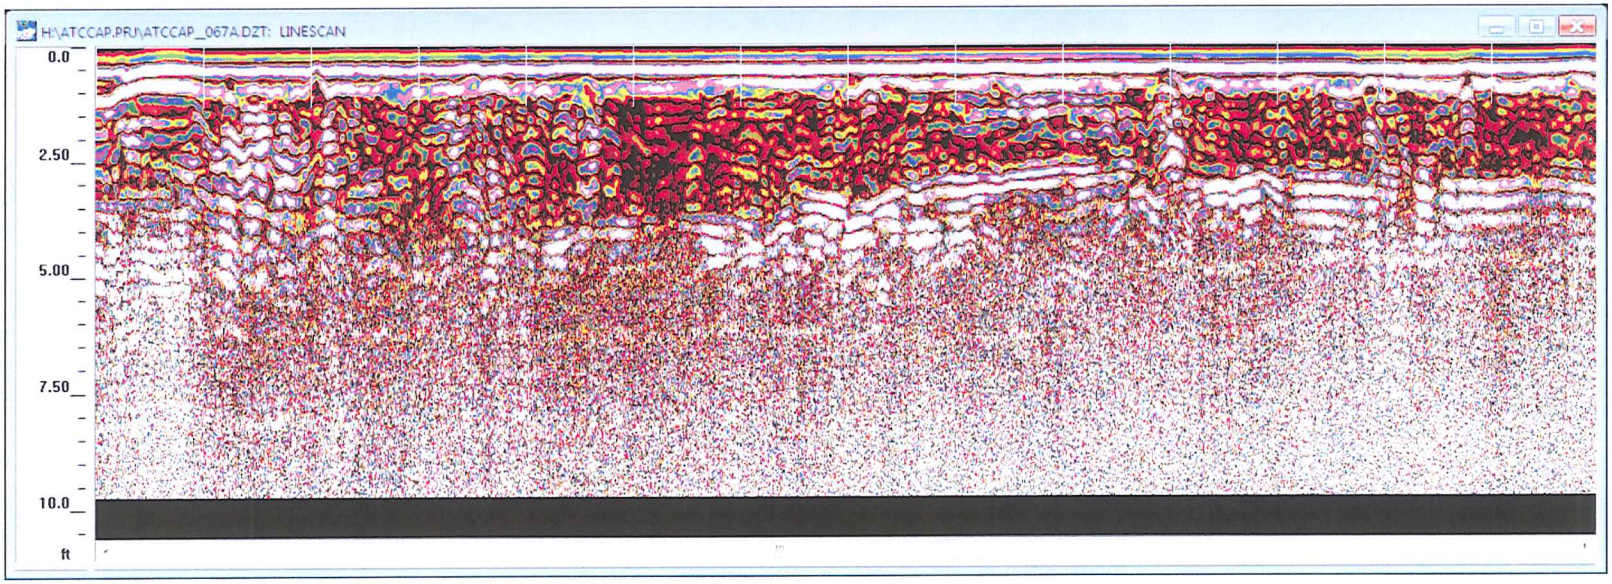
Scan is only 5 feet from the reading to the right found in Exhibit E. Hear that same anomaly is not found. However, now smaller utilities are indicated.



Scan of the gravel lot from east to west. Reading is an overall representation of the density of the soils that is usually found in this area of Seattle.

Exhibit G

Exhibit H

The white marks represent the 5 foot grid that was measured running east and west on the site. The yellow line the PSE gas line that was located by the 811 responding locator.

Area of heavily reinforced concrete in the area of the garbage bins.

Exhibit I

Anomaly indicated under gravel lot. Measurement taken from corner of building edge. This anomaly can be seen in Exhibit E on the GPR readings.

Re: **Geotechnical Engineering Report**
Proposed Development
11th Avenue & E Union Street
Seattle, Washington

Dear Ms. Morris,

Attached is our geotechnical engineering report to assist you and your project team with the design and construction of the proposed development in the Capitol Hill neighborhood of Seattle, Washington. This report documents the subsurface conditions at the site and our geotechnical engineering recommendations for the proposed project. In summary, conventional spread footing foundations bearing below the existing fill may be used for building support. If only one level of underground parking is incorporated into the building design, some localized over-excavation of weaker soils and replacement may be required. The depth and extent of over-excavation will be a function of the design footing elevation and the actual condition observed in the field, and does not require a specific alteration of the building design. Temporary shoring in the form of soldier pile walls or soil nail walls are feasible alternatives to support the proposed excavation and protect the adjacent property and city streets.

We appreciate the opportunity to work on this project. Please call if there are any questions.

Sincerely,

Jon C. Rehkopf, P.E.
Senior Project Geotechnical Engineer

GEOTECHNICAL ENGINEERING REPORT
PROPOSED DEVELOPMENT
11TH AVENUE & E UNION STREET
SEATTLE, WASHINGTON

1.0 INTRODUCTION

This report presents the results of geotechnical engineering studies that were undertaken to support the design and construction of the proposed development at 11th Avenue and East Union Street in Seattle, Washington. Our study was performed in accordance with our mutually agreed scope of work as outlined in our proposal dated January 10, 2012, and subsequently approved on January 12, 2012. Our service scope included reviewing readily available geologic data, conducting a site reconnaissance, performing subsurface investigations at the site, and developing the conclusions and recommendations presented in this report.

2.0 SITE AND PROJECT DESCRIPTION

The subject property is located in the Capitol Hill neighborhood of Seattle, Washington. The project site consists of seven parcels that make up the southern half of the block bounded by East Pike Street to the north, East Union Street to the south, 10th Avenue to the west and 11th Avenue to the east, as shown in Figures 1 and 2. The subject site measures approximately 172 feet in the north-south direction, and approximately 256 feet in the east-west direction, for an approximate area of 44,000 square feet.

The site is currently developed with three structures, as shown in Figure 2. A two-story masonry building with basement occupies the southwest portion of the site, and a one-story masonry building with basement is located at the southeast portion of the site. Additionally, a small, one-story building with basement is situated at the northwest corner of the site, and is detached from the two other buildings. The remainder of the site consists of asphalt and gravel surfaced driveways and parking areas that are depressed by about 10 feet below the surrounding street grades. The parking areas are accessed from a ramped driveway off of 10th Avenue, and the parking lot elevation roughly matches the basement floor elevation of all three buildings. A concrete retaining wall is located along the north end of the east property line, and allows for the vertical relief between the sidewalk and site grades. A parking lot is located north of the site, and has the approximately same elevation as the parking area on the subject site (i.e. below street level).

Based on our review of the site survey prepared by Bush, Roed & Hitchings, Inc., dated 01/12, the street grades along East Union Street vary from about elevation 297 feet (NAVD88) at the southwest corner of the site, to about 300 feet at the southeast corner.

3213 Eastlake Ave E, Ste B
Seattle, WA 98102
Tel (206) 262-0370
Fax (206) 262-0374

Along 10th Avenue the street grades descend from about elevation 298 feet at the north end of the site, to about 297 feet at the south end of the site. Along 11th Avenue, the site grades also descend from north to south, from about elevation 303 feet at the north end of the site to about 300 at the south end of the site.

It is our understanding that the development plans call for the construction of a multi-story mixed-use building at the subject site, with 1 or 2 levels of underground parking that may extend as much as 25 feet below the adjacent street grades. As such, excavations for the new building foundation may be several feet below the existing building foundations, or up to approximately 15 feet below the existing building foundations.

Plates 1 and 2 below depict current site conditions.

Plate 1. Looking NE along East Union Street at the south side of the subject site.	***Plate 2.*** Looking SW from 11th Avenue at the north side of the subject site (left side of photo) and neighboring parking lot (right side of photo).

3.0 SUBSURFACE EXPLORATIONS

3.1 CURRENT SUBSURFACE EXPLORATIONS

For this study, three borings were advanced at the site on February 24, 2012, to explore the underlying soil conditions. Borings BH-1 through BH-3 were drilled at the locations shown on Figure 2 to provide information for both geotechnical and environmental studies. The borings were drilled to depths of about 25 to 30 feet below surface grades using a track-mounted drill rig owned and operated by Boretec, Inc. The drill rig was equipped with a 6-inch outside diameter hollow stem auger, and soil samples were

obtained from the borings at 2½ & 5-foot intervals in general accordance with Standard Penetration Test (SPT) sampling methods (ASTM test method D-1586) in which the samples are obtained using a 2-inch outside diameter split-spoon sampler. The sampler was driven into the soil a distance of 18 inches using a 140-pound weight falling a distance of 30 inches.

A geologist from PanGEO was present throughout the field exploration program to observe the drilling, assist in sampling, and to document the soil samples obtained from the borings. In addition, a representative from ATC Associates Inc, was on-site to screen the soil for environmental purposes, and collect groundwater samples. The completed borings were backfilled with bentonite chips and drill cuttings. At the surface, the holes were sealed with a quick-set concrete. Summary logs from these explorations are presented in Appendix A in Figures A-2 through A-4.

3.2 PREVIOUS SUBSURFACE EXPLORATIONS

A review of on-line data bases as well geotechnical reports from adjacent properties indicated that multiple test borings have been previously advanced in the vicinity of the project site. The approximate locations of these previous borings are indicated in Figure 2. In particular, four test borings were advanced by others (Creative Engineering Options, 2006) for the new development at the northwest corner of East Union Street and 10th Avenue. These four borings were advanced in the basement of the existing building, which was about 13 feet below street grade. The two closest borings to the subject site are shown on Figure 2. Additionally, one test boring was advanced by others (Shannon & Wilson, 2002) along 10th Avenue, near the middle of the block between East Union Street and East Pike Street, for the preliminary design of Sound Transit Central Link Light Rail. Lastly, one boring was advanced by others (Seattle Engineering Department, 1972) near the northeast corner of East Union Street and 11th Avenue. The summary borings logs of these existing test borings were reviewed as part of our study, and are included in Appendix B.

4.0 ORIGINAL STREET GRADING PROFILES

To gain a better understanding of original grades at the site, and to therefore estimate the thickness of fill that may exist at the site, we reviewed City of Seattle street grading profiles along 10th Avenue, 11th Avenue, and East Union Street. The profiles show original grades along the centerline and edge of right-of-way, as well as existing grade. The three street grading profiles are shown on the following pages in Plates 3 through 5.

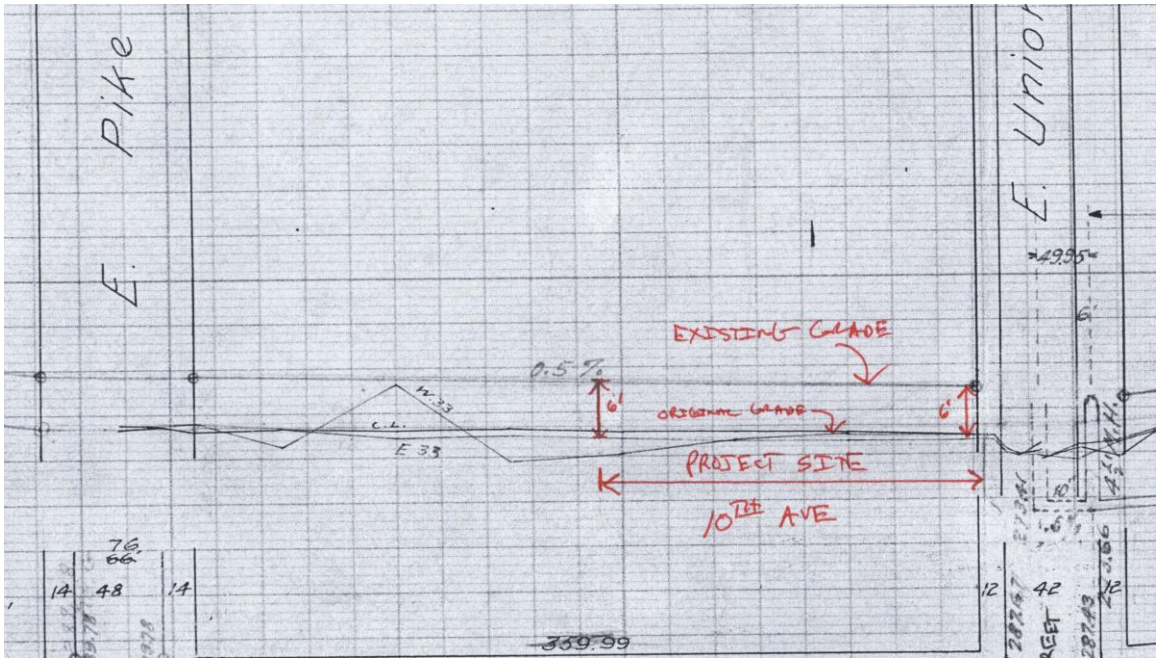

Plate 3. *Street grading profile along 10th Avenue, between East Pike Street and East Union Street. Note fill thickness is about 6 feet below existing street grade.*

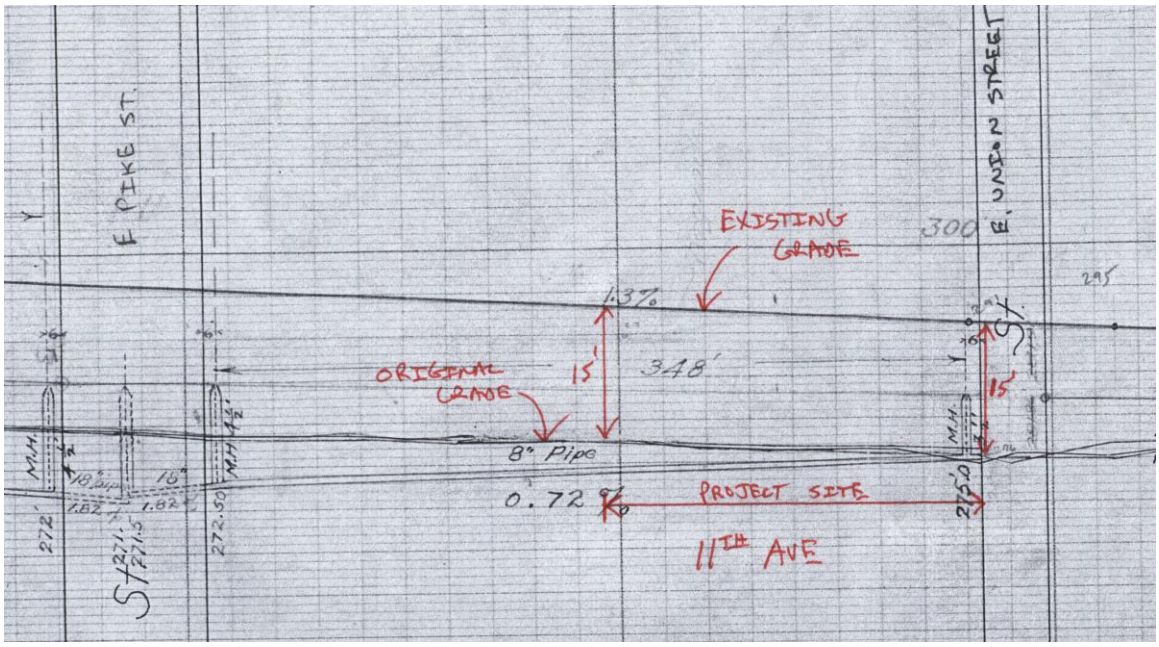

Plate 4. *Street grading profile along 11th Avenue, between East Pike Street and East Union Street. Note fill thickness is about 15 feet below existing street grade.*

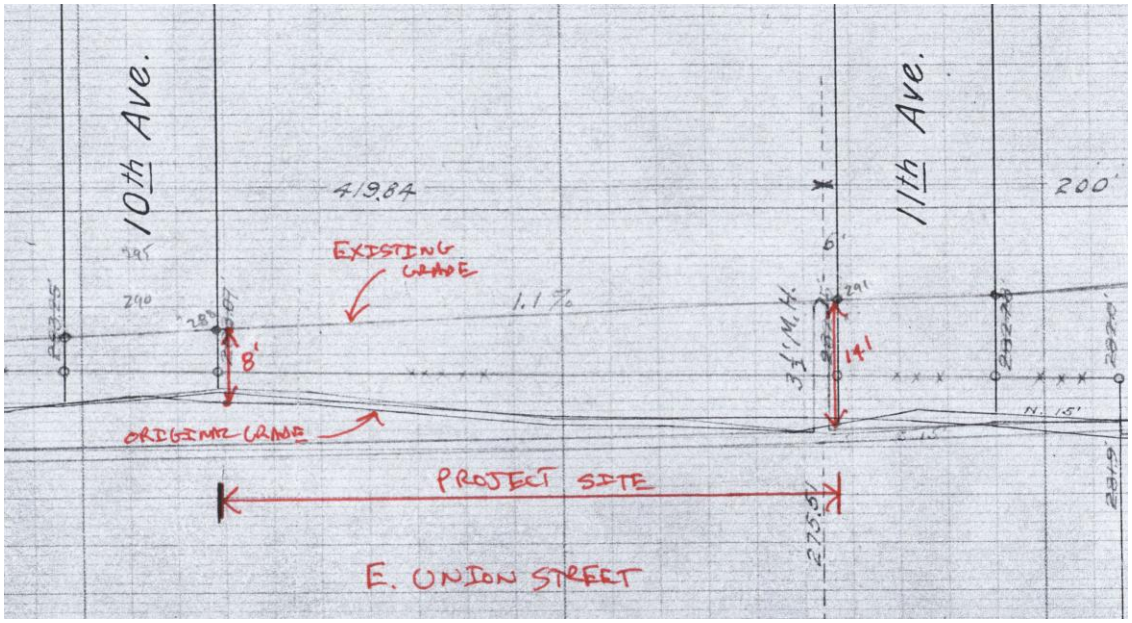

Plate 5. *Street grading profile along East Union Street, between 10th and 11th Avenues. Note fill thickness ranges from 8 to 14 feet below existing street grade.*

In summary, based on the street grading profiles, about 6 feet of fill was placed along 10th Avenue, about 15 feet of fill was placed along 11th Avenue, and from about 8 to 14 feet of fill was placed along East Union Street. The grading profiles suggest that original grades generally sloped gently from west to east across the project site, and therefore more fill was placed along the eastern portion of the site. The amount of fill indicted by the grading profiles generally matches what was encountered in the test borings (see below). It should be noted that the street grading profiles only indicate original grades at the property lines. However, we infer that original site grades may likely match what is shown on the street grading profiles.

5.0 SUBSURFACE CONDITIONS

5.1 SOIL CONDITIONS

According to the geologic map of the Seattle area compiled by Troost and others (2005), the project site is underlain by recessional outwash deposits, which typically consist of loose to dense, moderately to well sorted sand and gravel, with less common silty sand and silt. Within one-block of the subject site, glacial till is also mapped, which consists of a dense to very dense unsorted mixture of silty sand and gravel. Our subsurface explorations at the site differed slightly from the mapped stratigraphy, and encountered fill soils over what we interpreted to be ice-contact deposits overlying till. Ice-contact

deposits generally consist of loose to very dense, intermixed to stratified gravel, sand and silt.

The following summarizes the soil units that were encountered in the test borings advanced at, and adjacent to the site.

Unit 1 – Fill: Boring BH-1, which was advanced in the sidewalk along East Union Street, encountered about 9 feet of fill soil, consisting of soft to medium stiff silt with some sand and clay, as well as loose sand with silt. Borings BH-2 and BH-3, which were advanced in the northern parking areas, encountered 4½ and 2½ feet of fill, respectively, that consisted of medium dense silt and sand with some gravel. Borings NB-313 and TH-10 encountered about 10½ and 13 feet of fill soil below the existing street grade, respectively. The fill in these borings typically consisted of intermixed loose to medium dense silty sand with some gravel and pockets of silty clay, with trace organics.

Unit 2 – Ice Contact Deposits (approximate elevation of 287 feet to 290 feet): The deposit consisting of medium stiff sandy and clayey silt, and medium dense silty sand that was encountered below the fill was interpreted to be ice contact deposits. Borings BH-2 and TH-10, which were located along the east side of the site, encountered what we interpreted to be ice contact deposits at an average elevation of about 287 feet. This is consistent with our review of the street grading profiles that indicated the original ground surface along the east side of the site ranged from about 285 to 288 feet. Borings BH-1 and BH-3, which were located in the western half of the site, encountered the ice contact deposits at an average elevation of about 289 feet. This is consistent with the street grading profiles for East Union Street and 10th Avenue that indicated the original ground surface along the west side of the site ranged from 292 to 289 feet. As such, we estimate that the ice contact deposit is present at an approximate elevation of 290 feet along the west side of the site.

Unit 3 – Till (approximate elevation of 278 to 283 feet): Below Unit 2, all borings encountered dense to very dense silty fine to medium sand with gravel that we interpreted to be till. In borings BH-2 and BH-3, which were advanced in the northern portion of the site, the till was encountered at an elevation of 278 feet. In borings BH-1 and TH-10, which were advanced along the south side of the site, the till was encountered at elevation 283 feet.

PanGEO was provided the boring logs of recent subsurface explorations advanced at the site by your environmental consultant, ATC Associates, Inc. The recent subsurface investigations consisted of fourteen direct push probings. Based on the depth of probe refusal, the dense to very dense till was generally encountered between elevations 279

feet and 282 feet, with the higher elevations being found along the approximately southern half of the site.

5.2 GROUNDWATER CONDITIONS

The groundwater conditions at the site were evaluated based on the results of the current and existing borings, as well as our review of the recent ATC Associates, Inc. explorations. Wet soil samples and a zone of seepage was encountered in test boring BH-1 at an elevation of about 282 feet, and at an elevation of about 280 feet in boring BH-2. In test boring BH-3, a minor zone of seepage and moist to wet soil samples were noted at an elevation of about 276 feet.

Based on our review of the soil logs prepared by ATC Associates, and our estimate of the ground surface elevation at the probe locations, what were described in the borings logs as saturated soil samples were encountered between an approximate elevation of 280 and 282 feet.

To the northwest of the site, groundwater in boring NB-313 was measured in a groundwater monitoring well in September of 1999 to be about 24 feet below street level, or at an elevation of approximately 274 feet. In this boring wet soil samples were noted between about a depth of 25 and 30 feet below the ground surface. To the east of the site, boring B-1 and B-2 encountered groundwater and wet samples between an elevation of about 279 and 280 feet. Lastly, groundwater was encountered in TH-10 at about 23 feet below grade during drilling (or about elevation 276 feet), and then 14 feet below grade one week after drilling (elevation 286 feet).

In summary, the existing on-site information suggests that zones of seepage and wet soil are likely present below an elevation of about 282 feet. Without accurate groundwater measurements, the gradient and direction of groundwater flow cannot be determined with certainty. In addition, because uniform soils are not present at the site, the groundwater could be located in isolated pockets of sandier material, and may not be continuous. However, because groundwater flow can often follow the surface topography, it may be possible that the groundwater flows follow the existing site grades as shown in the original street grading profiles above.

It should be noted that groundwater elevations may vary depending on the season, local subsurface conditions, and other factors. Groundwater levels are normally highest during the winter and early spring.

6.0 GEOTECHNICAL RECOMMENDATIONS

6.1 SEISMIC DESIGN PARAMETERS

The following provides seismic design parameters for the site that are in conformance with the 2009 and later editions of the International Building Code (IBC), which specifies a design earthquake having a 2% probability of occurrence in 50 years (return interval of 2,475 years), and the 2002 USGS seismic hazard maps:

Site Class	Spectral Acceleration at 0.2 sec. (g) S_S	Spectral Acceleration at 1.0 sec. (g) S_1	Site Coefficients		Design Spectral Response Parameters		Control Periods (sec.)		Design PGA (S_{DS}/2.5)
			F_a	F_v	S_{DS}	S_{D1}	T_O	T_S	
C	1.42	0.48	1.0	1.32	0.95	0.42	0.09	0.45	0.38

The spectral response accelerations were obtained from the USGS Earthquake Hazards Program website (2002 data) for the project latitude and longitude.

Because of the depressed groundwater level at the site, and because the underlying soils primarily consist of dense to very dense silty sand, in our opinion the potential for earthquake-induced soil liquefaction is considered to be low, and special design considerations associated with soil liquefaction are not necessary for this project.

6.2 BUILDING FOUNDATION

Based on the results of the subsurface investigations performed at the site and our understanding of the project, it is our opinion that conventional strip and spread footings are appropriate to support the proposed development.

If one level of underground parking is designed for, we anticipate that the footing will bear on or near the ice contact deposits (Unit 2) that underlie the existing fill. As noted in Section 4.1, we anticipate Unit 2 to be present at an elevation ranging from 290 feet on the west side of the site, to an elevation of about 287 feet on the east side of the site. If fill or loose/soft soils are encountered at the footing depth, which could be locally present in the Unit 2 deposit, some limited over-excavation may be required to reach suitable bearing materials. Such local over excavations may be replaced with properly compacted structural fill or lean concrete (2-sack mix) to provide suitable support beneath the

footings. The depth and extent of the footing over-excavations will be determined during construction based on our observations of exposed subgrade conditions.

If two levels of underground parking are incorporated into the project design, we anticipate that the footings will bear on the dense to very dense till (Unit 3). As described in Section 4.1, we anticipate that the till (Unit 3) will be present at an elevation of about 278 feet in the northern portion of the site, and at an elevation of about 283 feet along the southern portion of the site.

6.2.1 Allowable Bearing Pressure

We recommend that footings bearing on the ice contact deposits (Unit 2), structural fill, or lean mix concrete, be designed for an allowable bearing pressure of 4,000 psf. For footings bearing on the till (Unit 3), we recommend an allowable bearing pressure of 8,000 psf. For allowable stress design, the recommended allowable bearing pressure may be increased by 1/3 for transient conditions such as wind and seismic loadings. All footings should be founded a minimum depth of 18 inches below the floor slab. Spread and continuous footings should have minimum widths of 24 and 18 inches, respectively.

Total and differential settlements are anticipated to be within tolerable limits for footings designed and constructed as discussed above. Footing settlement under static loading conditions is estimated to be less than approximately 1 inch, and differential settlement between adjacent columns should be less than about ½ inch. Most settlement will occur during construction as loads are applied.

All footing excavations should be trimmed neat and footing subgrade should be carefully prepared. Any loose or softened soil should be removed from the footing excavation. Footing excavations should be observed by PanGEO to confirm that the exposed footing subgrade is consistent with the expected conditions and adequate to support the proposed building.

The contractor should be aware that the site soils are moisture sensitive, and will become disturbed and soft when exposed to inclement weather conditions. As a result, depending on the weather condition at the time of footing construction, it may be necessary to place 2 to 3 inches of lean-mix concrete or clean crushed rock on the exposed footing subgrade to protect against moisture and disturbance.

6.2.2 Lateral Resistance

Lateral forces from wind or seismic loading may be resisted by a combination of passive earth pressures acting against the embedded portions of the foundations and walls, and by friction acting on the base of the foundations. Passive resistance values may be determined using an equivalent fluid weight of 400 pounds per cubic foot (pcf). This value includes a factor safety of at least 1.5 assuming that properly compacted structural fill will be placed adjacent to the sides of the footings. A friction coefficient of 0.4 may be used to determine the frictional resistance at the base of the footings. This coefficient includes a factor safety of approximate 1.5.

6.3 BASEMENT WALLS

Presented below are our geotechnical recommendations for the design and construction of the proposed basement walls.

6.3.1 Lateral Earth Pressures

The basement walls may be designed for an earth pressure based upon an equivalent fluid weight of 45 pcf. For the seismic condition, we recommend including an incremental uniform lateral earth pressure of 7H psf (where H is the height of the below grade portion of the wall) as an ultimate seismic load. The recommended lateral pressures assume that the backfill behind the wall consists of a free draining and properly compacted fill with adequate drainage provisions to prevent the development of hydrostatic pressure. For walls that will be constructed against excavation shoring walls, drainage provisions such as incorporation of drainage mats must be provided between the shoring walls and the basement walls.

6.3.2 Wall Surcharge

The basement walls should be designed to accommodate traffic surcharge pressures if the traffic load is located within the height dimension of the wall. Similarly, surcharge loads from the adjacent structures as well as from construction equipment and soil/material stockpiles should be considered in the basement wall design. The lateral pressures acting on the wall from surcharge loads may be determined by the surcharge diagram found on the attached Figures 3.

6.3.3 Lateral Resistance

Lateral forces from wind or seismic loading and unbalanced lateral earth pressures may be resisted by a combination of passive earth pressures acting against the embedded portions of the foundations and by friction acting on the base of the foundations. Passive resistance values may be determined using an equivalent fluid weight of 400 pounds per cubic foot (pcf). A friction coefficient of 0.4 may be used to determine the frictional resistance at the base of the footings. Both of these values include a safety factor of at least 1.5.

6.3.4 Wall Drainage/Damp Proofing

Provisions for permanent control of subsurface water should be incorporated into the design and construction of the basement walls. We recommend that prefabricated drainage mats, such as Mirafi 6000 or equivalent, be installed behind the basement walls (full face coverage) and the collected water should be directed inside the building beneath the floor slab and tight lined to an appropriate outlet. Additionally, we recommend that a perforated footing drain be constructed on the interior of the perimeter footing to remove any groundwater seepage. If groundwater seepage is not observed over the base of the excavation during construction, the perforated drains may be omitted.

Additionally, bentonite panels, such as Miraclay, may be used at locations that would be sensitive to seepage or dampness (i.e. occupied areas). The clay mats may be omitted if the below-grade space will be used for parking only or other purposes where dampness may be considered acceptable.

6.3.5 Wall Backfill

The existing on-site soils are not suitable for wall backfill as they contain an excessive amount of fines. This makes the soil particularly difficult to handle and compact in wet weather; additionally, these soils have poor drainage characteristics. Where wall backfill will be needed, free draining granular soils such as Seattle Mineral Aggregate Type 17 (City of Seattle Standard Specifications, 9-03.12(3)) are recommended.

Wall backfill should be moisture conditioned to within about 3 percent of optimum moisture content, placed in loose, horizontal lifts less than 8 inches in thickness, and systematically compacted to a dense and relatively unyielding condition and to at least 95 percent of the maximum dry density, as determined using test method ASTM D 1557.

Within 5 feet of the wall, the backfill should be compacted to 90 percent of the maximum dry density.

6.4 CONCRETE SLAB ON GRADE

Conventional slab on grade construction may be used for the basement floor slabs. In areas where the underlying subgrade is particularly weak or soft, or where the native soils cannot be adequately compacted to a firm condition they should be over-excavated and backfill with granular soil (i.e. City of Seattle Type 17 or 22 material. We recommend use of a modulus of subgrade reaction of 100 pci for the floor slab design when slabs will be located over native soils, or property compacted structural fill placed over competent soils.

All interior floor slabs should be constructed on a minimum 4-inch thick capillary break consisting of free-draining, crushed rock or well-graded gravel compacted to a firm and unyielding condition. The capillary break material should have no more than 10 percent passing the No. 4 sieve and less than 5 percent by weight of the material passing the U.S. Standard No. 100 sieve. City of Seattle Type 22 material (clean crushed 5/8 inch rock) meets this gradation requirement. We also recommend that a 10-mil polyethylene vapor barrier be placed below the slab.

6.4.1 Sub-Floor Drain

If basement excavation will extend below about elevation 282 feet, groundwater may be present at the base of excavation. As a result, we recommend that an under-slab drain system be implemented for the proposed building to prevent accumulation of groundwater below the slab. In general, the under-slab drainage system should consist of 4-inch diameter perforated drainpipes placed in narrow (one foot or less), approximately 18-inch deep trenches (measured from the bottom of slab) spaced about 20 feet apart. The trenches should be backfilled with clean, free-draining 3/8 inch minus pea gravel. Water collected in these drainpipes should be conveyed to a permanent sump pump and discharged to an appropriate outlet. The design of the slab drain may be refined based on the final design of the building, and the actual conditions observed during construction.

6.5 TEMPORARY EXCAVATION AND SHORING

Excavations ranging from about 12 to 25 feet deep may be needed for the construction of the proposed underground parking garage. In our opinion, feasible temporary shoring systems include cantilever and tieback soldier pile walls, as well as soil nail walls with

vertical elements. A cantilever soldier pile system is typically used for excavations with heights up to about 15 feet. Greater excavation heights will likely require one or two rows of tiebacks to provide a more cost effective design. Because we anticipate loose/soft soil (Unit 1 - Fill) to exists within the upper 8 to 15 feet of the excavation, in our opinion, where existing basement walls will not be re-used as facing, vertical elements should be incorporated into the soil nail wall design to improve face stability.

At locations with an existing basement wall, the re-use of the basement wall in the shoring system is likely feasible and cost effective. We anticipate that the existing wall would need to be underpinned with soldier piles or small vertical elements for vertical support, and anchored with soil nails or tie-backs that are drilled through the wall to maintain lateral stability.

If the proposed development is set-back from a property line, and space permits, temporary open cuts could be used to reduce shoring construction costs.

6.5.1 Unsupported Cuts

The excavation is anticipated to encounter loose to medium dense and soft to medium stiff fill soil over medium stiff sandy silt and medium dense to very dense silty sand. Where space is available, an unsupported slope cut may be the most cost effective means of excavation support. If enough space is not available for a full height unsupported cut, a partial cut above a temporary shoring wall may reduce the cost of the shoring system. Temporary excavations greater than 4 feet deep should be properly sloped or shored. All temporary excavations should be performed in accordance with Part N of WAC (Washington Administrative Code) 296-155. The contractor is responsible for maintaining safe excavation slopes. For planning purposes, the temporary excavations may be sloped to as steep as 1(H):1(V). The stability of temporary excavation slopes should be evaluated in the field during construction based on actual observed soil conditions.

6.5.2 Soldier Pile Wall

If adequate room is not available for a temporary open cut, it is our opinion that a soldier pile wall is an appropriate temporary excavation support option for this project. A soldier pile wall consists of vertical steel beams, typically spaced from 6 to 8 feet apart along the proposed excavation wall, spanned by timber lagging. Prior to the start of excavation, the steel beams are installed into holes drilled to a design depth and then backfilled with lean mix concrete. As the excavation proceeds downward and the steel piles are

subsequently exposed, the timber lagging is installed between the piles to further stabilize the walls of the excavation.

Design Lateral Pressures – For a cantilevered soldier pile wall or a soldier pile wall with one level of tieback, the earth pressures depicted on Figure 3 should be used for design. For two or more levels of tiebacks, the earth pressure depicted on Figure 4 should be used for design. The lateral earth pressures shown on Figures 3 and 4 should be increased for any surcharge loads resulting from traffic, construction equipment, building loads or excavated soil if they are located within the height dimension of the wall. In addition, if a soldier pile wall is constructed below the existing basement walls, the surcharge pressure from the wall and backfill should be used in design of the soldier pile wall.

Above the bottom of excavation, the recommended active earth and surcharge pressures should be applied over the full width of pile spacing. Below the bottom of excavation, the active and surcharge pressures should be applied over one pile diameter, and the passive resistance should be applied over two times the pile diameter.

Vertical Capacity – Soldier piles may be designed using an allowable skin friction value of 1.0 ksf for the portion of the pile below the bottom of the excavation, and an allowable end bearing value of 15 ksf.

6.5.3 Lagging

Lagging design recommendations for general conditions are presented on Figures 3 and 4. Lagging located within 10 feet of the top of the shoring which may be subjected to surcharge loads from construction equipment or material storage should be designed for an additional uniform surcharge pressure of 200 psf. This pressure approximately corresponds to a uniform surcharge load of 500 psf at the top of the wall. Point loads located close to the top of the wall, such as outriggers of heavy cranes, may apply additional loads to the lagging. These loads may need to be individually analyzed. However, lagging designed for a uniform load of 600 psf in the top 10 feet of the wall should be able to accommodate most crane outrigger loads.

The shoring system should be designed to provide adequate protection for the workers, adjacent structures, utilities, and other facilities. Excavations should be performed in accordance with the current requirements of WISHA. Construction should proceed as rapidly as feasible, to limit the time temporary excavations are open.

6.5.4 Tiebacks

Tiebacks may be required for lateral support of walls with heights in excess of about 15 feet. Tiebacks may also be used to stabilize the existing basement walls if they are to be incorporated into the shoring system. Where used, the tiebacks will require construction easements from the neighboring property owners, including the City of Seattle Department of Transportation (SDOT). The easements should be obtained as early in the design process as possible. Tieback design will necessarily need to be designed to provide adequate clearance from utilities under East Union Street, 10th Avenue, and 11th Avenue. Although soldier piles or the existing basement walls may also be internally supported by braces or rakers, such construction methods will be significant more costly than tiebacks, and will impact the rate of construction.

Excessive pile top deflection could occur before the tiebacks are installed. To improve the performance of the tieback wall, it may be necessary to limit the tiebacks to no more than 10 feet below the pile top unless steel beams of sufficient size will be used to limit the magnitude of the cantilever deflection.

The anchor portion of the tiebacks must be located behind a no-load zone defined as a plane projected upward at a 60 degree angle from the base of the excavation, and setback from the face of the wall a minimum distance of 5 feet or H/4, where H is the exposed height of the wall. The tiebacks should have a minimum bond length of 15 feet beyond the no-load zone.

The manner in which the tieback anchors carry load will depend on the type of anchor selected, the method of installation, and the soil conditions surrounding the anchor. Accordingly, we recommend use of a performance specification requiring the shoring contractor to install anchors capable of satisfactorily achieving the design structural loads, with a pullout resistance factor of safety of 2.0. For planning purposes, however, the anchors may be sized for an allowable skin friction value of 3 kips per lineal foot of anchor bond length, assuming that small diameter (about 6 inches) pressure-grouted tiebacks will be used. Post-grouting may also be needed in order to achieve the design capacity.

The actual capacity of the anchors should be checked with 200 percent verification tests. At least two 200% tests should be performed prior to installing production anchors. All production anchors should be proof tested to 130% of the design load. The anchor installations should be conducted in accordance with the latest edition of the Post Tensioning Institute (PTI) "Recommendations for Prestressed Rock and Soil Anchors". Elements of the testing are as follows:

Verification Tests (200% Tests)

- Prior to installing production anchors, perform a minimum of two tests each on each anchor type, installation method and soil type with the tested anchors constructed to the same dimensions as production anchors
- Test locations to be determined in conjunction and approved by the geotechnical engineer
- Test anchors, which will be loaded to 200% of the design load, may require additional prestressing steel (steel load not to exceed 80% of the ultimate tensile strength) or reinforcing of the soldier pile
- Load test anchors to 150% load in 25% load increments, holding each incremental load for at least 5 minutes and recording deflection of the anchor head at various times within each hold to the nearest 0.01inch.
- At the 150% load, the holding period shall be at least 60 minutes.
- After completion of the 150% hold, load the anchor in 25% load increments to the 200% load, which shall be held for 10 minutes
- A successful test shall provide a measured creep rate of 0.04 inches or less at the 150% load between 1 and 10 minutes, and 0.08 inches between 6 and 60 minutes, and both shall have a creep rate that is linear or decreasing with time. The applied load must remain constant during all holding periods (i.e. no more than 5% variation from the specified load).

Proof Tests (130% load tests on all production anchors)

- Load test all production anchors to 130% of the design load in 25% load increments, holding each incremental load until a stable deflection is achieved (record deflection of the anchor head at various times within each hold to the nearest 0.01inch)
- At the 130% load, the holding period shall be at least 10 minutes
- A successful test shall provide a measured creep rate of 0.04 inches or less at the 130% load between 1 and 10 minutes with a creep rate that is linear or decreasing with time. The applied load must remain constant during the holding period (i.e. no more than 5% variation from the 130% load). Anchors failing this proof testing creep acceptance criteria may be held an additional 50 minutes for creep measurement. Acceptable performance would equate to a creep of 0.08 inches or less between 5 and 50 minutes with a linear or decreasing creep rate.

Verification tested anchors or extended creep proof tested anchors not meeting the acceptance criteria will require a redesign by the contractor to achieve the acceptance criteria.

In the tieback construction, a bond breaker shall be constructed in the no load zone when the installation procedures use single stage grouting.

Because the boring logs indicated the presence of perched ground water and weak/soft ground in the upper approximately 8 to 15 feet, the tieback installation method may require continuous support through the use of a hollow-stem auger or drill casing to prevent excessive caving. Drill casing would also likely be needed to reduce the amount of water entering the drill hole when drilling through zones of perched water or below the groundwater level.

All tiebacks should be designed to provide a minimum clearance of at least 5 feet from existing structures.

6.5.5 Performance

Solider pile shoring walls designed in accordance with the recommendations discussed above may be expected to deflect laterally and vertically about 1 inch or less. Ground settlements outside the excavation are expected to be less than 1 inch and practically negligible beyond 100 feet from the shoring wall.

6.5.6 Soil Nail Wall

The soil nail process involves "top-down" excavation, starting with a vertical cut, typically 3 to 6 feet high, depending on the vertical nail spacing. A row of holes is drilled with shallow inclinations (typically 5 to 20 degrees below horizontal) and steel rods are inserted and grouted into the drilled holes. This is followed by placement of facing elements (typically shotcrete with welded wire mesh), prior to excavating the next level. The process is repeated until the excavation is complete. Drainage behind the wall should be addressed by placing geotextile composite drainage panels against the soil prior to applying shotcrete. Water collected in the drainage panels should be directed to tightlines located below the basement floor slab and to an appropriate outlet.

If a soil nail wall is utilized, due to the presence of loose/soft fill in the upper 8 to 15 feet, we anticipate that the soil nail shoring system will incorporate vertical elements to help maintain face stability. At locations of existing basement walls, the soil nails would be drilled through the walls to provide lateral wall stability. Additionally, small vertical

elements would likely be needed to underpin the existing basement walls to provide vertical support. The soil nail installation method may require continuous support through the use of a hollow-stem auger or drill casing to prevent excessive caving. Drill casing would also likely be needed to reduce the amount of water entering the drill hole when drilling through zones of perched water or below the groundwater level.

For design purposes, we recommend the following soil parameters for soil nail wall design. Due to the upper loose/soft soils, we have provided two sets of soil parameters as shown below:

Soil Parameter	*Above El. 287'/ Below El. 287'*
Friction Angle:	30 degrees / 35 degrees
Apparent Cohesion:	50 psf / 100 psf
Soil Unit Weight:	125 pcf / 130 pcf
Ultimate Load Transfer:	3 kips per foot / 6 kips per foot along nail/soil interface
Traffic Surcharge:	Equivalent to 2 feet of soil (minimum)

The ultimate load transfer value will be affected by many factors including soil conditions, drilling methods and grouting pressures. Therefore, the recommended ultimate value must be verified in the field by conducting performance tests on at least two sacrificial nails, and load testing up to 5 percent of the production nails. Because of the loose fill soils in the upper 8 to 15 feet, we anticipate that post-grouting may be necessary to obtain the load transfer rates recommended above.

Adjacent Properties – Easements will need to be obtained from the adjacent property owners if the nails will extend into the adjacent properties or into the city right-of-way. Furthermore, utilities may exist under the adjacent roadways, and the soil nail layout will need to be designed to provide adequate clearance between the various utilities.

6.5.7 Baseline Survey and Monitoring

Ground movements will occur as a result of excavation activities. As such, ground surface elevations of the adjacent properties and city streets should be documented prior to commencing earthwork to provide baseline data. As a minimum, optical survey points should be established at:

- The top of every other soldier pile and at 20-foot intervals along the top of the soil nail wall. These monitoring points should be monitored twice weekly as required by the SDOT; and

- The curb and the centerlines of 10th Avenue, East Union Street, and 11th Avenue. The monitoring points should be spaced no more than 20 feet apart, and baseline data should be collected before the start of excavations. These monitoring points do not need to be surveyed after the baseline readings have been recorded unless the shoring wall deflections exceed about one inch.

The monitoring program should include changes in both the horizontal (x and y directions) and vertical deformations. The monitoring should be performed by the project surveyor to the nearest 0.01-foot, and the results be promptly submitted to PanGEO for review. The results of the monitoring will allow the design team to confirm design parameters, and for the contractor to make adjustments if necessary.

We also recommend that the existing conditions long the public right-of-way and the adjacent private properties be photo-documented prior to commencing on any earthworks at the site.

7.0 CONSTRUCTION CONSIDERATIONS

7.1 DEMOLITION AND GRADING

All footings and floor slabs of the existing buildings that will not be incorporated into the new structure or re-used as part of the temporary shoring system, as well as asphalt, building debris and concrete rubble should be removed from the site prior to the start of excavations or grading. Due to the presence of up to about 5 feet of fill at the site, there is the potential that unknown structures or debris, such as bricks, concrete or wood fragments, may be present within the fill. Additionally, the recommendations presented in the environmental assessment report prepared by ATC Associates should be followed for export of excavated soil from the site.

7.2 SOLDIER PILE INSTALLATION

Soldier piles could be installed through up to about 6 feet of loose fill material and into medium dense to very dense silty sand. As described above, debris or obstructions may exist within the fill. A backhoe should be used to remove any obstructions at shallow depths that preclude installation of the soldier pile. Furthermore, because loose to medium dense granular soils and soft to medium stiff silty soils could exist within the upper 6 to 10 feet, the contractor should be aware that temporary casing may be necessary to prevent caving of the soldier pile holes. Additionally, groundwater seepage is anticipated to occur around elevation 282 feet. As such, we recommend that the following should be incorporated into the project plans and specifications:

- The geotechnical engineer shall verify the suitability of all soldier pile holes before concrete placement;
- Tremie methods (i.e. augercast) shall be used for concrete placement in all holes having 3 or more inches of accumulated water; and
- All soldier pile holes drilled shall be filled with concrete on the same day.

7.3 DEWATERING

Due to the potential for groundwater seepage, the contractor should be prepared to provide temporary dewatering systems for the excavation. Based on our understanding of the project and site conditions, we anticipate that a conventional dewatering system consisting of trenches, sumps and pumps will be adequate to dewater the temporary excavation, and seepage quantities should be limited.

7.4 STRUCTURAL FILL AND COMPACTION

As currently envisaged, we do not anticipate the need for large quantities of fill for the proposed development. If structural fill will be needed, City of Seattle Type 17 material should be used. The structural fill should be moisture conditioned to within about 3 percent of optimum moisture content, placed in loose, horizontal lifts less than 8 inches in thickness, and systematically compacted to a dense and relatively unyielding condition and to at least 95 percent of the maximum dry density, as determined using test method ASTM D 1557.

While it may be possible to reuse some of the cleaner (i.e. low fines content) existing site materials for structural backfill in the summer, provided the soil can be properly moisture conditioned and adequately compacted, the moderate to high silt content of most of the native soils would generally render these materials as unsuitable for use during wet weather construction. For planning and budgeting purposes, we recommend granular import fill such as City of Seattle Type 17 be used for any structural fill needed at the site.

7.5 EROSION AND DRAINAGE CONSIDERATIONS

Surface runoff can be controlled during construction by careful grading practices. Typically, this includes the construction of shallow, upgrade perimeter ditches or low earthen berms to collect runoff and prevent water from entering the excavation. All collected water should be directed to a positive and permanent discharge system such as a storm sewer. It should be noted that some of the site soils are prone to surficial erosion.

Special care should be taken to avoid surface water on open cut excavations, and exposed slopes should be protected with visqueen.

Permanent control of surface water and roof runoff should be incorporated in the final grading design. In addition to these sources, irrigation and rain water infiltrating into landscape and planter areas adjacent to paved areas or building foundations should also be controlled. All collected runoff should be directed into conduits that carry the water away from the pavement or structure and into storm drain systems or other appropriate outlets. Adequate surface gradients should be incorporated into the grading design such that surface runoff is directed away from structures.

7.6 WET EARTHWORK RECOMMENDATIONS

General recommendations relative to earthwork performed in wet weather or in wet conditions are presented below:

- Because site soils are moisture sensitive, all footing surface should be protected against inclement weather. It is the contractor's responsibility to protect the footing subgrade from disturbance. One option is to place a 2- to 3-inch thick layer of 2-sack lean mix concrete on the footing subgrade as soon as the subgrade is exposed;

- Earthwork should be performed in small areas to minimize subgrade exposure to wet weather. Excavation or the removal of unsuitable soil should be followed promptly by the placement and compaction of clean structural fill. The size and type of construction equipment used may have to be limited to prevent soil disturbance;

- During wet weather, the allowable fines content of the structural fill should be reduced to no more than 5 percent by weight based on the portion passing ¾-inch sieve. The fines should be non-plastic;

- The ground surface within the construction area should be graded to promote run-off of surface water and to prevent the ponding of water;

- Bales of straw and/or geotextile silt fences should be strategically located to control erosion and the movement of soil. Erosion control measures should be installed along all the property boundaries; and

- Excavation slopes and soils stockpiled on site should be covered with plastic sheets.

8.0 ADDITIONAL SERVICES

We anticipate the City of Seattle will require a plan review and geotechnical special inspections to confirm that our recommendations are properly incorporated into the design and construction of the proposed development. Specifically, we anticipate that the following construction support services may be needed:

- Review final project plans and specifications;
- Verify implementation of erosion control measures;
- Observe installation of excavation shoring system;
- Observe the stability of open cut slopes;
- Evaluate optical survey data provided by others to evaluate the performance of the shoring system;
- Verify adequacy of footing and slab subgrades;
- Confirm the adequacy of the compaction of structural backfill;
- Observe installation of subsurface drainage provisions, and;
- Other consultation as may be required during construction.

Modifications to our recommendations presented in this report may be necessary, based on the actual conditions encountered during construction.

9.0 LIMITATIONS

We have prepared this report for use by Alliance Residential Company and the project team. Recommendations contained in this report are based on a site reconnaissance, review of pertinent subsurface information, and our understanding of the project. The study was performed using a mutually agreed-upon scope of work.

Variations in soil conditions may exist between the explorations and the actual conditions underlying the site. The nature and extent of soil variations may not be evident until construction occurs. If any soil conditions are encountered at the site that are different from those described in this report, we should be notified immediately to review the applicability of our recommendations. Additionally, we should also be notified to review the applicability of our recommendations if there are any changes in the project scope.

The scope of our work does not include services related to construction safety precautions. Our recommendations are not intended to direct the contractors' methods, techniques, sequences or procedures, except as specifically described in our report for consideration in design. Additionally, the scope of our work specifically excludes the

assessment of environmental characteristics, particularly those involving hazardous substances. We are not mold consultants nor are our recommendations to be interpreted as being preventative of mold development. A mold specialist should be consulted for all mold-related issues.

This report may be used only by the client and for the purposes stated, within a reasonable time from its issuance. Land use, site conditions (both off and on-site), or other factors including advances in our understanding of applied science, may change over time and could materially affect our findings. Therefore, this report should not be relied upon after 24 months from its issuance. PanGEO should be notified if the project is delayed by more than 24 months from the date of this report so that we may review the applicability of our conclusions considering the time lapse.

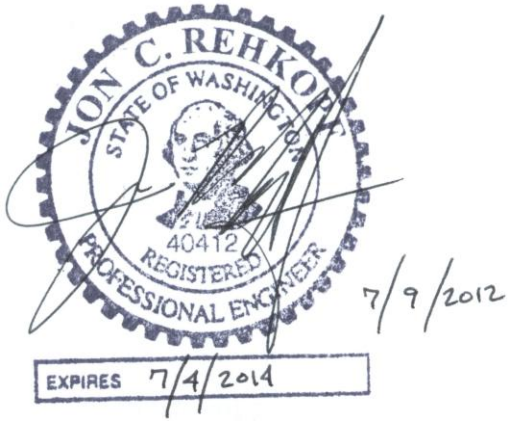
It is the client's responsibility to see that all parties to this project, including the designer, contractor, subcontractors, etc., are made aware of this report in its entirety. The use of information contained in this report for bidding purposes should be done at the contractor's option and risk. Any party other than the client who wishes to use this report shall notify PanGEO of such intended use and for permission to copy this report. Based on the intended use of the report, PanGEO may require that additional work be performed and that an updated report be reissued. Noncompliance with any of these requirements will release PanGEO from any liability resulting from the use this report.

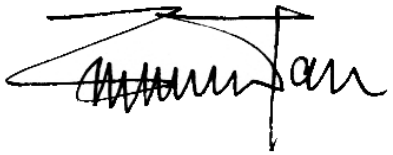
Within the limitation of scope, schedule and budget, PanGEO engages in the practice of geotechnical engineering and endeavors to perform its services in accordance with generally accepted professional principles and practices at the time the Report or its contents were prepared. No warranty, express or implied, is made.

We appreciate the opportunity to be of service to you on this project. Please feel free to contact our office with any questions you have regarding our study, this report, or any geotechnical engineering related project issues.

Sincerely,

PanGEO, Inc.





Jon C. Rehkopf, P.E.
Senior Project Geotechnical Engineer

Siew L. Tan, P.E.
Principal Geotechnical Engineer

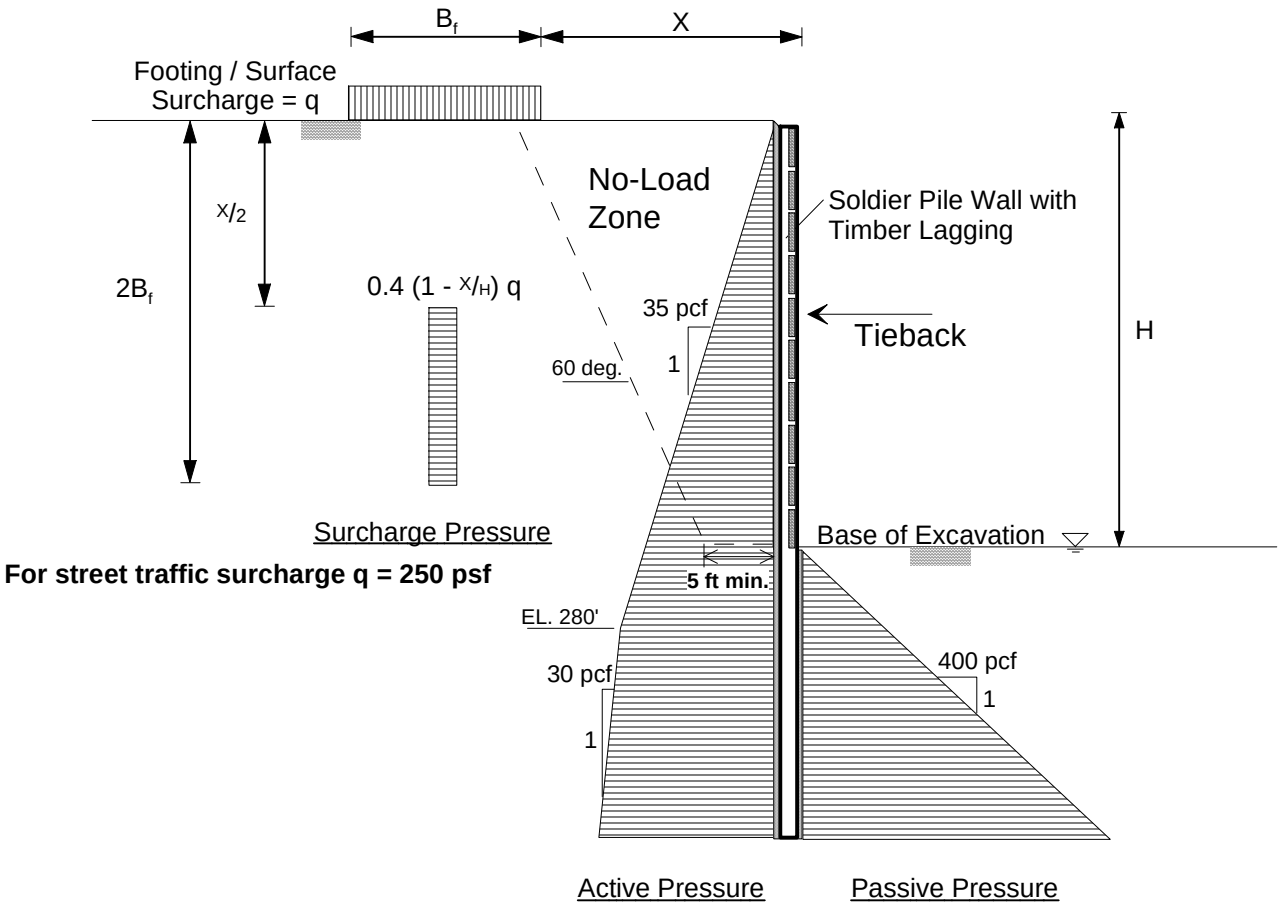
DRAWN BY: SHE CHECKED BY: JR DATE: 02.29.12 Z:\Projects\2012 Projects\12-006 11th & Union\Survey\2011156_02_21_12_XS-ALTA\XS-ALTA.dwg



For street traffic surcharge q = 250 psf

Notes:

1. Minumum embedment should be at least 10 feet below bottom of excavation.
2. A factor of safety of 1.5 has been applied to the recommended passive pressure values. No factor of safety has been applied to the recommended active earth pressure values.
3. Active and surcharge pressures should be applied over the full width of the pile spacing above the base of the excavation, and over one pile diameter below the base of the excavation.
4. Passive pressure should be applied to two times the diameter of the soldier piles.
5. Use 50% earth pressure for lagging design with soldier piles spaced at 8' or less.
6. Refer to report text for additional discussions.

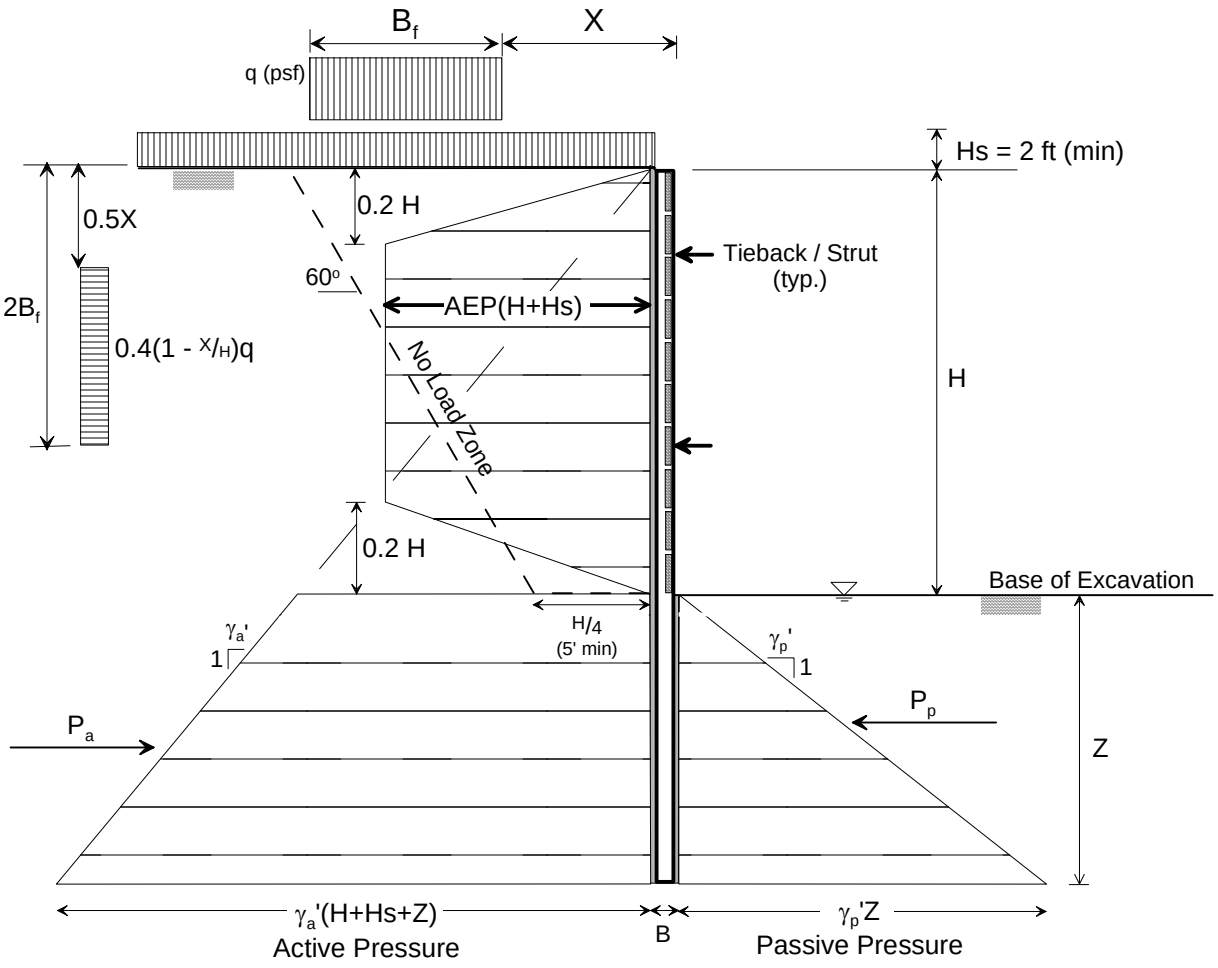
DESIGN LATERAL PRESSURES
SOLDIER PILE WALL
CANTILEVERED AND ONE TIEBACK

Project No. **12-006** | Figure No. **3**



LEGEND

P_a, P_p = Active & Passive Forces Below Base of Excavation

Z = Embedment Depth (min 10 ft)

B = Soldier Pile Width

AEP = Apparent Earth Pressure Coefficient (pcf)

Hs = Equivalent soil height for general traffic loading (2 ft) - Greater for construction surcharge

q = Footing surcharge (psf)

H = Height of Excavation (ft)

γ_a' γ_p' = Equiv. Effective Fluid Weights (Active & Passive) (pcf)

NOTES

1. Passive Pressure computed as acting on 2 times pile diameter B.
2. Active Pressures computed as acting over full pile spacing above base of excavation, and on one pile diameter B below base of excavation.
3. Use 80% of the above pressures for computing moments in soldier piles.
4. Determine soldier pile penetration Z by moment equillibrium at lowest tieback level.
5. Free drainage assumed behind the wall.
6. Locate anchor bond length behind no-load zone.
7. Design pressure values:
   γ_a' = 30 pcf
   γ_p' = 400 pcf
   AEP = 23 pcf

   Where γ_a' and AEP have safety factor = 1 and γ_p'has safety factor = 1.5.
8. Lagging design:
   Clear Span (ft) 8 or less
   50% of calculated earth pressure
9. Allowable vertical pile capacity:
   Skin Friction = 1.0 ksf
   End Bearing = 15 ksf

Fax (206) 262-0374

RELATIVE DENSITY / CONSISTENCY

SAND / GRAVEL			SILT / CLAY		
Density	SPT N-values	Approx. Relative Density (%)	Consistency	SPT N-values	Approx. Undrained Shear Strength (psf)
Very Loose	<4	<15	Very Soft	<2	<250
Loose	4 to 10	15 - 35	Soft	2 to 4	250 - 500
Med. Dense	10 to 30	35 - 65	Med. Stiff	4 to 8	500 - 1000
Dense	30 to 50	65 - 85	Stiff	8 to 15	1000 - 2000
Very Dense	>50	85 - 100	Very Stiff	15 to 30	2000 - 4000
			Hard	>30	>4000

UNIFIED SOIL CLASSIFICATION SYSTEM

MAJOR DIVISIONS		GROUP DESCRIPTIONS	
Gravel 50% or more of the coarse fraction retained on the #4 sieve. Use dual symbols (eg. GP-GM) for 5% to 12% fines.	GRAVEL (<5% fines)	GW	Well-graded GRAVEL
		GP	Poorly-graded GRAVEL
	GRAVEL (>12% fines)	GM	Silty GRAVEL
		GC	Clayey GRAVEL
Sand 50% or more of the coarse fraction passing the #4 sieve. Use dual symbols (eg. SP-SM) for 5% to 12% fines.	SAND (<5% fines)	SW	Well-graded SAND
		SP	Poorly-graded SAND
	SAND (>12% fines)	SM	Silty SAND
		SC	Clayey SAND
Silt and Clay 50%or more passing #200 sieve	Liquid Limit < 50	ML	SILT
		CL	Lean SILT
		OL	Organic SILT or CLAY
	Liquid Limit > 50	MH	Elastic SILT
		CH	Fat CLAY
		OH	Organic SILT or CLAY
Highly Organic Soils		PT	PEAT

Notes: 1. Soil exploration logs contain material descriptions based on visual observation and field tests using a system modified from the Uniform Soil Classification System (USCS). Where necessary laboratory tests have been conducted (as noted in the "Other Tests" column), unit descriptions may include a classification. Please refer to the discussions in the report text for a more complete description of the subsurface conditions.

2. The graphic symbols given above are not inclusive of all symbols that may appear on the borehole logs. Other symbols may be used where field observations indicated mixed soil constituents or dual constituent materials.

DESCRIPTIONS OF SOIL STRUCTURES

Layered: Units of material distinguished by color and/or composition from material units above and below

Laminated: Layers of soil typically 0.05 to 1mm thick, max. 1 cm

Lens: Layer of soil that pinches out laterally

Interlayered: Alternating layers of differing soil material

Pocket: Erratic, discontinuous deposit of limited extent

Homogeneous: Soil with uniform color and composition throughout

Fissured: Breaks along defined planes

Slickensided: Fracture planes that are polished or glossy

Blocky: Angular soil lumps that resist breakdown

Disrupted: Soil that is broken and mixed

Scattered: Less than one per foot

Numerous: More than one per foot

BCN: Angle between bedding plane and a plane normal to core axis

COMPONENT DEFINITIONS

COMPONENT	SIZE / SIEVE RANGE	COMPONENT	SIZE / SIEVE RANGE
Boulder:	> 12 inches	Sand	
Cobbles:	3 to 12 inches	Coarse Sand:	#4 to #10 sieve (4.5 to 2.0 mm)
Gravel		Medium Sand:	#10 to #40 sieve (2.0 to 0.42 mm)
Coarse Gravel:	3 to 3/4 inches	Fine Sand:	#40 to #200 sieve (0.42 to 0.074 mm)
Fine Gravel:	3/4 inches to #4 sieve	Silt	0.074 to 0.002 mm
		Clay	<0.002 mm

1.0 EXECUTIVE SUMMARY

1.1 General Information

Project Information:
Proposed 11th & Union Development

Site Information:
1406 & 1416 10th Avenue and
1401 & 1405 11th Avenue
Seattle, Washington 98122
King County

Consultant Information:
ATC Associates Inc.
6347 Seaview Avenue NW
Seattle, Washington 98107
Telephone: 206-781-1449
Fax: 206-781-1543
Reconnaissance Date: January 3, 2012
Site Assessor: Hillary Williams
Senior Reviewer: Jessica Czerny
Environmental Professional: Hillary Williams
Jessica Czerny

Site Access Contact:
Scott Northfield
Real Property Associates

Client Information:
Mr. Noel Johnson
Alliance Residential Company
1300 Dexter Avenue North, Suite 110
Seattle, Washington 98109

Environmental Professional Statement:
I declare that, to the best of my professional knowledge and belief, I meet the definition of *Environmental Professional* as defined in § 312.10 part of 40 CFR 312. We have the specific qualifications based on education, training and experience to assess a property of the nature, history and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Hillary Williams, Project Manager
Site Assessor, Environmental Professional

Jessica Czerny, Project Manager
Senior Reviewer, Environmental Professional

1.2 Findings and Conclusions Summary

ATC Associates Inc. (ATC) has performed this Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of ASTM Standard Practice E 1527-05. Any exceptions to, or deletions from, this practice are described in Section 2.0 of this report. This assessment has revealed evidence of *recognized environmental conditions* in connection with the property, as described below:

FINDINGS AND CONCLUSIONS SUMMARY							
Report Section		Further Action?	De Minimis Condition	Recognized Environmental Condition (REC)	Historical REC	ASTM Non-Scope Condition	Description
4.0	**User Provided Information**	No					
5.1.1	**Federal Database Findings**	No					
5.1.2	**State and Tribal Database Findings**	**Yes**		**X**	**X**		See Notes 1, 2, 3, and 4 below.
5.1.3	**Local Environmental Record Sources**	No					
5.3	**Historical Records Sources**	**Yes**		**X**	**X**		See Note 1, 5, 6, 7, and 8 below
6.2	**Hazardous Substance Use, Storage and Disposal**	No					
6.3	**Underground Storage Tanks**	No					
6.4	**Aboveground Storage Tanks**	No					
6.5	**Other Petroleum Products**	No	**X**				See Note 9 below
6.6	**Polychlorinated Biphenyls (PCBs)**	**Yes**					See Note 10 below
6.7	**Unidentified Substance Containers**	No					
6.8	**Nonhazardous Solid Waste**	No					
6.9	**Wastewater**	No					
6.10	**Waste Pits, Ponds and Lagoons**	No					
6.11	**Sumps**	**Yes**					See Note 11 below

8.4	**Lead-Based Paint (LBP)**	**Yes**				**X**	See Note 13 below
8.5	**Mold Screening**	No					
8.6	**Additional User Requested Conditions**	No					

Note 1: The property address, 1416 10th Avenue, is identified in the Confirmed Suspected Contaminated Sites List (CSCSL) No Further Action (NFA), and Independent Cleanup Report (ICR) databases. The CSCSL NFA and ICR databases indicate that in 1990, there was a petroleum release to soil and in 1993, after independent remedial action, the Washington State Department of Ecology (Ecology) issued a No Further Action determination to the property as related to the contamination. No further information was provided.

The property listing in the CSCSL NFA and ICR databases corresponds to information presented in the *Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington*, prepared by Nurseryman Products, Inc., dated October 10, 1993. According to this report, a 6,000-gallon underground storage tank (UST) was removed from the property in 1990. The UST was removed from the current asphalt-paved parking area, north-adjacent to the 1406 10th Avenue Building. In 1990, approximately 100 cubic yards of petroleum contaminated soils were removed from the property and disposed of off-site. Prior to the collection of excavation

limit confirmation samples, the UST excavation was backfilled. In March 1993, soil samples were obtained from the property and analyzed for petroleum hydrocarbons. Soil samples returned levels of petroleum hydrocarbons at 311 milligrams per kilogram (mg/kg) and 355 mg/kg, which were above Ecology's cleanup values at that time.

In August 1993, excavation of the former UST area began. Contaminated, excavated soils were laid on-site in a layer of 8 to 10 inches and treated by bioremediation. The highest detection of initial petroleum hydrocarbon concentrations was reportedly 11,000 kg/mg. After bioremediation of the excavated soils, levels of petroleum hydrocarbons were all below 10 kg/mg. Groundwater was encountered at approximately six feet below ground surface (bgs) in the excavation. The report indicates that "upon review of the water samples collected from the referenced holes, it was apparent that there was some contamination." It is not noted what type of contamination was identified; however, further in the report it was indicated that levels of tetrachloroethylene (PCE) were identified in the groundwater in the excavation. The groundwater entering the excavation was pumped through a carbon filter treatment tank until samples indicated the groundwater was not further.

The report also indicates that contaminated soils remain on the property underneath the south-adjacent building (1406 10th Avenue building). In September 1993, samples were collected beneath the 1406 10th Avenue building indicating levels of petroleum hydrocarbon between 330 kg/mg and 3,800 kg/mg. It was estimated that the amount of diesel contaminated soils remaining beneath the 1406 10th Avenue building to be 75 cubic yards. A concrete wall was placed between the UST excavation area and the 1406 10th Avenue building with a plastic lining along the bottom, to ensure that contaminated soils beneath the 1406 10th Avenue building would not migrate to the excavated area. A water collection system was installed to continually treat and monitor the groundwater flowing from beneath the 1406 10th Avenue building until contamination levels fall below Ecology's cleanup values.

In October 1993, soil samples were collected of the treated excavated soil and found levels of petroleum contamination below 10 kg/mg and groundwater samples collected from groundwater entering the excavation site indicated no contamination of PCE or trichloroethylene (TCE).

ATC reviewed Ecology's No Further Action Letter pertaining to the 1416 10th Avenue property, dated October 22, 1993. According to Ecology's No Further Action Letter, Ecology issued the No Further Action determination based on the information presented in the Independent Remedial Action Report submitted October 13, 1993 and on information presented in the site file located at Ecology. It was determined that based on the information presented the property does not pose a threat to human health or the environment as a result of the release addressed in the independent remedial action report. Furthermore, "Ecology recognized the fact that a limited amount of petroleum contaminated soil remains under a building to the south of the cleanup site [1406 10th Avenue building], but as it is capped and contained, it is not anticipated to pose a problem." The Ecology letter further details that "this determination is made only with respect to the release identified in the remedial action report dated October 10, 1993. This no further action determination applies only to the area of the property at 1416 10th Avenue East affected by the release identified in the report."

Based on the information presented in the regulatory database report listing, the prior reports and Ecology's No Further Action determination, ATC concludes that the remaining soil contamination below the 1406 10th Avenue building represents a ***recognized environmental condition*** and that the historically removed UST and historically contaminated soils and groundwater at the property represent a ***historical recognized environmental condition*** to the property. ATC reviewed available files from Ecology's Northwest Regional Office related to the property. Ecology's files contained duplicate information as documentation previously provided by the client.

Note 2: Two nearby, upgradient properties, A1 Brake and Recreational Equipment Inc. (REI), were identified in state agency regulatory databases with open status releases to groundwater. Based on the upgradient hydrologic positions relative to the property, the distance (less than 500 feet) and the open status of the releases, ATC concludes that the A1 Brake and REI property releases represent a potential environmental concern to the property.

Note 3: Review of EDR Proprietary Records, identified seven historical auto stations on the property. The historical property long term use for auto repair represents a ***recognized environmental condition*** to the property.

Note 4: ATC notes that the EDR Proprietary Records identified numerous historical auto repair stations at adjacent or nearby upgradient or crossgradient properties and several nearby historical dry cleaners. The historical nearby or adjacent upgradient or crossgradient property use as auto repair stations or dry cleaners represent potential environmental concerns to the property.

Note 5: The review of historical sources identified adjacent property historical use a gas and oil storage, as auto repair, auto radiator repair, painting, tool companies, and machine shop. These historical adjacent property uses represent potential environmental concerns to the property.

Note 6: Review of historical sources identified property historical use as auto body works and painting, auto repair, machine shop, black smith, and auto springs manufacturing. These historical property uses represent the likely use, storage and disposal of hazardous materials and petroleum products on the property. ATC concludes that these historical property uses represent a ***recognized environmental condition*** to the property.

Note 7: The review of historical tax records and prior reports identified a historical apartment building on the northeast corner of the property as heated by an oil burner. The use of an oil burner indicates the potential for heating oil to have been stored in a UST or an aboveground storage tank (AST). To date, no records have identified a heating oil UST or AST associated with the historical apartment building. If the heating oil was stored in a UST, then it was likely removed during demolition activities; however, there is potential for a heating oil UST to remain on the property. If a heating oil UST is uncovered during construction activities, it should be removed and closed as per applicable regulations. ATC concludes that the potential for a heating oil UST to be on the property represents a potential environmental concern.

Note 8: The prior reports describe land farming and bioremediation of contaminated soils as related to the 1993 remedial activities on the northeast portion of the property. It was not reported in prior reports if confirmation soil samples were collected from the gravel lot beneath the land farmed soils to ensure that the soils had not impacted the northeast portion o the property. ATC concludes based on the lack of confirmation sampling beneath the land farmed soils that there is potential for impact to the property soil and therefore, represents a ***recognized environmental condition*** to the property.

Note 9: ATC was able to raise the car lift in the 1406 10th Avenue building slightly to observe the pit condition beneath the lift. No light was available in the pit. ATC observed what appeared to be minor staining on the dirt. It is unknown if this staining was moisture or petroleum related. Based on the limited staining observed, ATC concludes that the staining in the car lift pit represents a ***de minimis*** condition.

Note 10: ATC observed a hydraulic elevator in the 1405 11th Avenue building. According to Mr. Scott Northfield, site escort, the elevator was installed in 1950. Hydraulic fluids from circa 1950 have the potential to contain PCBs. The elevator pit of the hydraulic elevator at 1405 11th Avenue building was inaccessible. ATC did not observe evidence of staining or release around the hydraulic fluid reservoir in the elevator equipment room. Mr. Northfield also indicated that the elevator is serviced and maintained on a regular basis. Based on the age of the elevator, there is potential for the hydraulic fluid used to contain PCBs. The potential presence of PCB-containing hydraulic oil and the inaccessibility of the elevator pit to inspect for potential impact, represent a potential environmental concern.

Note 11: ATC observed a sump of unknown use and discharge point located south-adjacent of the 1416 10th Avenue building. It was observed to be dry and free of odors or stains. Based on the historical use of the 1416 10th Avenue building including auto repair and auto springs manufacturing and the unknown discharge point of the sump, ATC concludes that the sump adjacent to the 1416 10th Avenue building represents a potential environmental concern to the property.

Note 12: Based on the scope of work approved for this Phase I ESA, no sampling for asbestos was performed. However, ATC visually observed various types of suspect asbestos-containing materials (ACM) in the form of drywall with joint compound, suspended ceiling tiles, resilient vinyl floor tiles with mastic, vinyl baseboard with mastic, concrete masonry unit and grout, spray insulation at doors, carpet mastics, brick and mortar, ceramic tile and

associated grout, vinyl sheet flooring and associated mastics, and exterior roofing components. These materials were in fair to good overall condition.

Prior to the start of renovation/demolition/maintenance activities that may disturb suspect ACM, ATC recommends that suspect ACM be properly assessed. Should ACM be identified, an AHERA-accredited professional should prepare a project specification that would reference the applicable regulations and work practices that an asbestos abatement contractor must follow. ATC also recommends that contractors comply with all federal, state, and local regulations regarding abatement, demolition and disposal of the building materials noted in this report.

Note 13: Based on the original construction date of the property buildings (early 1900s), it is possible that LBP is present at the property. Observed suspect LBP was noted to be in good condition at the time of the property reconnaissance. ATC recommends that painted surfaces be sampled for lead prior to disturbance. ATC also recommends that contractors performing work on painted surfaces should follow applicable OSHA guidelines for lead in painted surfaces.

1.3 Significant Data Gap Summary

The following is a summary of *significant data gaps* identified in this report.

SIGNIFICANT DATA GAP SUMMARY		
Report Section		**Description**
3.5	**Current Uses of Adjoining Properties**	No *significant data gap* identified.
4.2	**Environmental Liens or Activity and Use Limitations (AULs)**	No *significant data gap* identified.
5.1	**Standard Environmental Records**	No *significant data gap* identified.
5.2	**Physical Setting Sources**	No *significant data gap* identified.
5.3	**Historical Records Sources**	No *significant data gap* identified.
6.1	**Methodology and Limiting Conditions**	No *significant data gap* identified.
7.0	**Interviews**	No *significant data gap* identified.

1.4 Recommendations

Based on information collected from the Phase I ESA, ATC offers the following recommendations for further action:

- Based on the proposed demolition of the property structures and redevelopment of the property, a subsurface investigation is warranted to characterize the potential subsurface impact from historical property uses and adjacent or nearby upgradient property uses, including soil and groundwater sampling.
- Based on the proposed demolition of the property structures and redevelopment of the property, notification to Ecology will be required prior to any activities as it is likely that the remaining contaminated soils beneath the 1406 10th Avenue building will be exposed. Additional sampling of the soil will likely be necessary to characterize and delineate the remaining contaminated soils to ensure proper off-site disposal and to ensure proper worker health and safety during construction activities.
- The elevator pit in the 1415 11th Avenue building should be inspected and PCB wipe samples should be collected to ensure historical hydraulic fluid use did not contaminate the pit with PCBs.
- The car lift pit in the 1406 10th building should be accessed to further inspect the condition and evaluate the source of staining.

2.0 INTRODUCTION

2.1 Purpose

The purpose of this Phase I ESA was to identify *recognized environmental conditions* and certain potential environmental conditions outside the scope of ASTM Standard Practice E 1527-05 in connection with the property at the time of the site reconnaissance. This report documents the findings, opinions and conclusions of the Phase I ESA.

2.2 Scope

This Phase I ESA was conducted in general accordance with the ASTM Standard Practice E 1527-05 and the Alliance Phase I ESA Scope of Work, consistent with a level of care and skill ordinarily practiced by the environmental consulting profession currently providing similar services under similar circumstances. Significant additions, deletions or exceptions to ASTM Standard Practice E 1527-05 are noted below or in the corresponding sections of this report. The scope of this assessment included an evaluation of the following:

- Physical setting characteristics of the property through a review of referenced sources such as topographic maps and geologic, soils and hydrologic reports.

- Usage of the property, adjoining properties and surrounding area through a review of referenced historical sources such as land title records, fire insurance maps, city directories, aerial photographs, prior reports and interviews.

- Observations and interviews regarding current property usage and conditions including: the use, treatment, storage, disposal or generation of hazardous substances, petroleum products, hazardous wastes, nonhazardous solid wastes and wastewater.

- Usage of adjoining and surrounding area properties and the likely impact of known or suspected releases of hazardous substances or petroleum products from those properties on the property.

- Information in referenced environmental agency databases and local environmental records, within the specified approximate minimum search distance from the property.

- An evaluation of "Business Environmental Risks" per the Alliance Scope of Work, including wetlands, endangered species, and archaeological, cultural, and historic resources.

2.3 Significant Assumption

Any assumptions in this report were not considered as having significant impact on the determination of *recognized environmental conditions* associated with the property.

2.4 Limitations and Exceptions

ATC has prepared this Phase I ESA report using reasonable efforts to identify *recognized environmental conditions* associated with hazardous substances or petroleum products at the property. Findings contained within this report are based on information collected from observations made on the day(s) of the site reconnaissance and from reasonably ascertainable information obtained from certain public agencies and other referenced sources.

The ASTM Standard Practice E 1527-05 recognizes inherent limitations for Phase I ESAs, including, but not limited to:

- *Uncertainty Not Eliminated* – A Phase I ESA cannot completely eliminate uncertainty regarding the potential for *recognized environmental conditions* in connection with any property.

- *Not Exhaustive* – A Phase I ESA is not an exhaustive investigation of the property and environmental conditions on such property.

- *Past Uses of the Property* – Phase I requirements only require review of standard historical sources at five year intervals. Therefore, past uses of property at less than five year intervals may not be discovered.

Users of this report may refer to ASTM Standard Practice E 1527-05 for further information regarding these and other limitations. This report is not definitive and should not be assumed to be a complete and/or specific definition of all conditions above or below grade. Current subsurface conditions may differ from the conditions determined by surface observations, interviews and reviews of historical sources. The most reliable method of evaluating subsurface conditions is through intrusive techniques, which are beyond the scope of this report. Information in this report is not intended to be used as a construction document and should not be used for demolition, renovation, or other property construction purposes. Any use of this report by any party, beyond the scope and intent of the original parties, shall be at the sole risk and expense of such user.

ATC makes no representation or warranty that the past or current operations at the property are, or have been, in compliance with all applicable federal, state and local laws, regulations and codes. This report does not warrant against future operations or conditions, nor does it warrant against operations or conditions present of a type or at a location not investigated. Regardless of the findings stated in this report, ATC is not responsible for consequences or conditions arising from facts not fully disclosed to ATC during the assessment.

An independent data research company provided the government agency database referenced in this report. Information on surrounding area properties was requested for approximate minimum search distances and is assumed to be correct and complete unless obviously contradicted by ATC's observations or other credible referenced sources reviewed during the assessment. ATC shall not be liable for any such database firm's failure to make relevant files or documents properly available, to properly index files, or otherwise to fail to maintain or produce accurate or complete records.

ATC used reasonable efforts to identify evidence of aboveground and underground storage tanks and ancillary equipment on the property during the assessment. "Reasonable efforts" were limited to observation of accessible areas, review of referenced public records and interviews. These reasonable

efforts may not identify subsurface equipment or evidence hidden from view by things including, but not limited to, snow cover, paving, construction activities, stored materials and landscaping.

Any estimates of costs or quantities in this report are approximations for commercial real estate transaction due diligence purposes and are based on the findings, opinions and conclusions of this assessment, which are limited by the scope of the assessment, schedule demands, cost constraints, accessibility limitations and other factors associated with performing the Phase I ESA. Subsequent determinations of costs or quantities may vary from the estimates in this report. The estimated costs or quantities in this report are not intended to be used for financial disclosure related to the Financial Accounting Standards Board (FASB) Statement No. 143, FASB Interpretation No. 47, Sarbanes/Oxley Act or any United States Securities and Exchange Commission reporting obligations, and may not be used for such purposes in any form without the express written permission of ATC.

ATC is not a professional title insurance or land surveyor firm and makes no guarantee, express or implied, that any land title records acquired or reviewed in this report, or any physical descriptions or depictions of the property in this report, represent a comprehensive definition or precise delineation of property ownership or boundaries.

The Environmental Professional Statement in Section 1.1 of this report does not "certify" the findings contained in this report and is not a legal opinion of such *Environmental Professional*. The *Environmental Professional* Statement is intended to document ATC's opinion that an individual meeting the qualifications of an Environmental Professional was involved in the performance of the assessment and that the activities performed by, or under the supervision of, the *Environmental Professional* were performed in conformance with the standards and practices set forth in 40 CFR Part 312 per the methodology in ASTM Standard Practice E 1527-05 and the scope of work for this assessment.

Per ASTM Standard Practice E 1527-05, Section 6, User Responsibilities, the User of this assessment has specific obligations for performing tasks during this assessment that will help identify the possibility of *recognized environmental conditions* in connection with the property. Failure by the User to fully comply with the requirements may impact their ability to use this report to help qualify for *Landowner Liability Protections* (LLPs) under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). ATC makes no representations or warranties regarding a User's qualification for protection under any federal, state or local laws, rules or regulations.

In accordance with the ASTM Standard Practice E 1527-05, this report is presumed to be valid for a six month period. If the report is older than six months, the following information must be updated in order for the report to be valid: (1) regulatory review, (2) site visit, (3) interviews, (4) specialized knowledge and (5) environmental liens search. Reports older than one year may not meet the ASTM Standard Practice 1527-05 and therefore, the entire report must be updated to reflect current conditions and property-specific information.

Other limitations and exceptions that are specific to the scope of this report may be found in corresponding sections.

2.5 Special Terms and Conditions (User Reliance)

This report is for the use and benefit of, and may be relied upon by, Alliance Residential Company, and any of its affiliates, and third parties authorized in writing by Alliance Residential Company and ATC, including the lender(s) in connection with a secured financing of the property, and their respective successors and assigns. Any third party agrees by accepting this report that any use or reliance on this report shall be limited by the exceptions and limitations in this report, and with the acknowledgment that actual site conditions may change with time, and that hidden conditions may exist at the property that were not discovered within the authorized scope of the assessment. Any use by or distribution of this report to third parties, without the express written consent of ATC, is at the sole risk and expense of such third party.

ATC makes no other representation to any third party except that it has used the degree of care and skill ordinarily exercised by environmental consultants in the preparation of the report and in the assembling of data and information related thereto. No other warranties are made to any third party, either expressed or implied. Unless otherwise agreed upon in writing by ATC and a third party, ATC's liability to any third party authorized to use or rely on this report with respect to any acts or omissions shall be limited to a total maximum amount of $100,000.

3.0 SITE DESCRIPTION

3.1 Location and Legal Description

The property addresses are 1406 & 1416 10th Avenue and 1401 & 1405 11th Avenue in Seattle, King County, Washington. Site Photographs are provided in Appendix C and a Site Vicinity Map is located in Appendix A. According to information obtained from the King County Assessor, the property is identified as Assessor Parcel Numbers (APNs) 600350-0055, -0060, -0065, -0070, -0135, -0140 and -0150. Copies of King County Assessor reports for the property, including legal descriptions, are provided in Appendix L.

3.2 Surrounding Area General Characteristics

The topography of the surrounding area slopes to the southwest. The property is located in Seattle, in an area that is characterized by dense urban development, including mixed retail, residential and commercial uses. Specific adjacent property uses are discussed in further detail in Section 3.5.

3.3 Current Use of the Property

The property is currently developed with four commercial structures. The two structures on the easternmost portion of the property addressed at 1401 and 1405 11th Avenue are identified as two structures in King County Assessor records, but are connected and serve one tenant, Madison Park Greetings. The northwest structure, addressed at 1416 10th Avenue, is currently used for storage by Pravda Studios and Madison Park Greetings. The southwest structure, addressed at 1406 10th Avenue, is a commercial building currently occupied by Capitol Hill Housing Improvement Project, Grace Church Seattle and Pravda Studios, all of which are office use, with the exception of Pravda Studios which also has space for holding events. The northwestern portion of the property is a gravel lot. The central eastern portion of the property is asphalt paved parking. The topography of the property varies with all of the structures at grade with the surrounding sidewalks, the eastern parking lot slopes down from the west to the east and the northwest parking lot is flat, but below the grade of adjacent 11th Avenue. A Site Plan is located in Appendix B.

3.4 Description of Property Improvements

The following table provides general descriptions of the property improvements.

PROPERTY IMPROVEMENTS	
Size of Property (approximate)	1.02 acres
General Topography of Property	The topography of the property varies with a general slope from the west down to the east.
Adjoining and/or Access/Egress Roads	10th Avenue to the west, 11th Avenue to the east and East Union Street to the south
Paved or Concrete Areas (including parking)	Asphalt-paved parking on the eastern portion of the property and concrete sidewalks bordering the property
Unimproved Areas	The northeastern portion of the property is a gravel lot
Landscaped Areas	None
Surface Water	None
Potable Water Source	City of Seattle
Sanitary Sewer Utility	City of Seattle

PROPERTY IMPROVEMENTS	
Storm Sewer Utility	City of Seattle
Electrical Utility	Seattle City Light
Natural Gas Utility	Puget Sound Energy
Current Occupancy Status	100%
Number of Occupied Buildings	None

PROPERTY IMPROVEMENTS – 1406 10TH AVENUE BUILDING	
General Building Description	Commercial office building
Number of Floors	Two stories with basement
Total Square Feet of Space (approximate)	26,676 (Source: King County Assessor)
Construction Completion Date (year)	1915
Construction Type	Wood framed, masonry and prefabricated metal
Interior Finishes Description	Wallboard, 12”x12” vinyl floor tile and associated mastics, vinyl sheet flooring, cove base and associated mastics, carpet and suspended ceiling panels
Exterior Finishes Description	Prefabricated metal and brick
Cooling System Type	Roof-mounted natural gas and electric powered package units
Heating System Type	Roof-mounted natural gas and electric powered package units
Emergency Power	None

PROPERTY IMPROVEMENTS – 1416 10TH AVENUE BUILDING	
General Building Description	Warehouse storage building
Number of Floors	One story with basement
Total Square Feet of Space (approximate)	7,320 (Source: King County Assessor)
Construction Completion Date (year)	1913
Construction Type	Wood framed, masonry and prefabricated metal
Interior Finishes Description	Wallboard, unfinished concrete floors
Exterior Finishes Description	Prefabricated metal and brick
Cooling System Type	None
Heating System Type	Electric powered space heaters and natural gas furnace
Emergency Power	None

PROPERTY IMPROVEMENTS – 1401 11TH AVENUE BUILDING	
General Building Description	Commercial office and warehouse
Number of Floors	One with basement
Total Square Feet of Space (approximate)	14,080 (Source: King County Assessor)
Construction Completion Date (year)	1920
Construction Type	Masonry
Interior Finishes Description	Wallboard, carpet, wood floor, ceramic tile and grout, 12”x12” vinyl floor tile and associated mastic, cove base and associated mastic, carpet and suspended ceiling panels
Exterior Finishes Description	Brick and glass
Cooling System Type	Roof-mounted electric and natural gas powered package units
Heating System Type	Roof-mounted electric and natural gas powered package units
Emergency Power	Unknown

PROPERTY IMPROVEMENTS – 1405 11TH AVENUE BUILDING	
General Building Description	Warehouse storage
Number of Floors	One with basement
Total Square Feet of Space (approximate)	19,450 (Source: King County Assessor)
Construction Completion Date (year)	1920
Construction Type	Masonry
Interior Finishes Description	Wallboard and unfinished concrete floor
Exterior Finishes Description	Brick, glass and concrete masonry unit
Cooling System Type	Roof-mounted electric and natural gas powered package units
Heating System Type	Roof-mounted electric and natural gas powered package units
Emergency Power	None

3.5 Current Uses of Adjoining Properties

Current uses of the adjoining properties were observed to be as follows:

Direction from Property	Address	Occupant(s) Name	Current Use	Potential Environmental Conditions
North	1424 10th Avenue	Steve Jensen Art Studio and Gallery	Art studio and gallery	None
North	None posted	IPM Public Pay Parking	Parking lot	None

4.0 USER PROVIDED INFORMATION

The following section summarizes information (if any) provided by Alliance Realty Company (User) with regard to the Phase I ESA. Documentation may be found in Appendix D or where referenced in this report.

4.1 Title Records

User provided no title records information. However, ATC contracted Ameristar Information Network, Ltd. (Ameristar) to conduct an environmental lien and activity and use limitations (AULs) search for the property parcels, which included a copy of the most recent title record. According to the environmental lien and AUL search report dated January 4, 2012, Conrad W. Jacobsen and Judith M. Jacobsen, husband and wife, Jacobsen Family, LLC was identified as the property owners. No environmental concerns were identified during the review of the title record.

4.2 Environmental Liens or Activity and Use Limitations (AULs)

User provided no information regarding property environmental liens or activity and use limitations. ATC contracted Ameristar to conduct an environmental lien and AULs search for the property parcels. According to the environmental lien and AUL search report dated January 4, 2012, Conrad W. Jacobsen and Judith M. Jacobsen, husband and wife, Jacobsen Family, LLC was identified as the property owners. The environmental lien and AULs search report did not identify any environmental liens or AULs associated with the property.

4.3 Specialized Knowledge

User provided no specialized knowledge regarding *recognized environmental conditions* associated with the property, other than what was identified in prior reports provided by the property owner.

4.4 Significant Valuation Reduction for Environmental Issues

User provided no information regarding a significant valuation reduction for environmental issues associated with the property.

4.5 Owner, Property Manager and Occupant Information

User identified Mr. Scott Northfield of Real Property Associates as the site access contact and property manager. User provided ATC with a tenant list describing the commercial occupants of the property.

4.6 Reason for Performing Phase I ESA

User indicated this Phase I ESA was to be conducted in connection with the potential acquisition and development of the property.

4.7 Other User Provided Documents

Per the ASTM Standard Practice E 1527-05 ATC obtained the documents listed below from User. Further discussion may be found in relevant sections of this report.

OTHER USER PROVIDED DOCUMENTS		
Title	**Date (if known)**	**Author and/or Source (if known)**
Client Questionnaire	December 22,, 2011	Noel Johnson, Alliance Managing Director, Alliance Residential Company
Phase I Environmental Audit, 1416-1418 10th Avenue, 1401 11th Avenue and 1414 10th Avenue, Seattle, Washington	August 16, 1999	Environmental Associates, Inc.
Phase I ESA, 1415 11th Avenue, Seattle, Washington	December 13, 1996	Kleinfelder, Inc.

Rent Roll	October 31, 2011	Jacobsen Family LLC

5.0 RECORDS REVIEW

5.1 Standard Environmental Records

The regulatory agency database report discussed in this section, provided by Environmental Data Resources, Inc. (EDR) of Milford, Connecticut, was reviewed for information regarding reported releases of hazardous substances and petroleum products on or near the property. ATC also reviewed the "unmappable" (also referred to as "orphan") listings within the database report, cross-referencing available address information and facility names. Unmappable sites are listings that could not be plotted with confidence, but are potentially in the general area of the property based on the partial street address, city, or zip code. Any unmappable site that was identified by ATC as a being within the approximate minimum search distance from the property based on the site reconnaissance and/or cross-referencing to mapped listings, is included in the discussion within this section. The complete regulatory agency database report may be found in Appendix E.

The following is a summary of the findings of the database review.

SUMMARY OF FEDERAL, STATE AND TRIBAL DATABASE FINDINGS			
Regulatory Database	**Approx. Minimum Search Distance**	**Property Listed?**	**# Sites Listed**
Federal National Priority (NPL)	1 mile	No	0
Federal Delisted NPL	½ mile	No	0
Federal Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) list	½ mile	No	0
Federal CERCLIS No Further Remedial Action Planned (NFRAP)	½ mile	No	1
Federal Resource Conservation and Recovery Act (RCRA), Corrective Action facilities (CORRACTS)	1 mile	No	0
Federal RCRIS non- CORRACTS Treatment, Storage, and Disposal Facilities (TSD)	½ mile	No	0
Federal RCRA Generators	Property & Adjoining	Yes	2
Federal Institutional Control/Engineering Control Registry	Property	No	NA
Federal Emergency Response Notification System (ERNS) list	Property	No	NA
State and Tribal NPL (HSL)	1 mile	No	7
State and Tribal CERCLIS (CSCSL)	½ mile	No	33
State and Tribal Equivalent CERCLIS No Further Action (CSCSL NFA)	½ mile	No	22
State and Tribal Landfill or Solid Waste Disposal Sites	½ mile	No	1
State and Tribal Leaking Underground Storage Tanks (LUST)	½ mile	No	23
State and Tribal Registered Underground Storage Tanks (UST)	Property & Adjoining	No	1
State and Tribal Institutional Control/Engineering Control Registry	Property	No	NA
State and Tribal Voluntary Cleanup Site (VCP)	½ mile	No	21
State and Tribal Brownfield Sites	½ mile	No	1

5.1.1 Federal Agency Database Findings

The property was listed on the following federal databases searched for this ESA.

Davis Hoffman Auto Rebuild
1406 10th Avenue
Seattle, Washington
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Databases: RCRA-CESQG, FINDS
Regulatory Data Summary: The property is identified in the Resource Conservation Recovery Act (RCRA) Conditionally Exempt Small Quantity Generator (CESQG) and the Facility Index System/Facility Registry System (FINDS) databases. The RCRA CESQG database indicates that the property generated hazardous waste at the property that was shipped off site in 1998. No further information was provided. The FINDS database listing is administrative in nature and acts as a pointer to other databases. No violations or releases are associated with either listing.
Discussion: Based on the lack of reported violations and releases, ATC concludes that the property listing in the RCRA-CESQG and FINDS databases do not represent a *recognized environmental condition* to the property.

The following listing(s) with a known or significant potential for release and impact on the property were identified in the federal agency databases searched:

Auto Battery
1009 East Union Street
Seattle, Washington
Databases: RCRA-SQG
Approximate Distance from the Property: South-adjacent (beyond East Union Street)
Assumed Groundwater Gradient: Downgradient
Regulatory Data Summary: The south-adjacent property is identified as a RCRA Small Quantity Generator (SQG) in 1996. A compliance visit was done in 1996 with no notices of violations or releases. The RCRA-SQG database listing indicates that in 1996, the south-adjacent property generated hazardous waste.
Discussion: Based on the regulatory status, the lack of reported releases and the inferred hydrologic downgradient position relative to the property, ATC concludes that the south-adjacent property listing does not represent a likely past, present or future threat of release on the property.

Premeir Auto Body 11th Avenue
1422 11th Avenue
Seattle, Washington
Databases: RCRA-CESQG
Approximate Distance from the Property: East-adjacent (beyond 11th Avenue)
Assumed Groundwater Gradient: Crossgradient
Regulatory Data Summary: The east-adjacent property is identified as a RCRA CESQG in 1995. The RCRA-CESQG database listing indicates that in 1995, the east-adjacent property generated hazardous waste. No violations or releases are associated with this listing.
Discussion: Based on the regulatory status, the lack of reported releases and the inferred hydrologic crossgradient position relative to the property, ATC concludes that the east-adjacent property listing does not represent a likely past, present or future threat of release on the property.

Based on distance, topography, assumed groundwater gradient, current regulatory status, and/or the absence of reported releases, none of the other sites listed in the federal agency databases are considered to represent a likely past, present or material threat of release on the property.

5.1.2 State and Tribal Database Findings

The property was listed on the following state or tribal databases searched for this ESA.

Davis Hoffman Auto Rebuild
1406 10th Avenue
Seattle, Washington
Databases: ALLSITES
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the Facility/Site Identification System Listing (ALLSITES) database. The ALLSITES database is administrative in nature and is a pointer to other databases. No violations or releases are associated with the listing.
Discussion: Based on the nature of the database listing and the lack of reported releases or violations, ATC concludes that the property listing in the ALLSITES database does not represent a *recognized environmental condition* to the property.

Ruth Ashbrook Bakery
1416 10th Avenue
Seattle, Washington
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Databases: ALLSITES, CSCSL NFA, ICR
Regulatory Data Summary: The property is identified in the ALLSITES, Confirmed Suspected Contaminated Sites List (CSCSL) No Further Action (NFA), and Independent Cleanup Report (ICR) databases. The ALLSITES database is administrative in nature and is a pointer to other databases. The CSCSL NFA and ICR databases indicate that in 1990, there was a petroleum release to soil and in 1993, after independent remedial action, the Washington State Department of Ecology (Ecology) issued a No Further Action determination to the property as related to the contamination. No further information was provided.

Discussion: Based on the administrative nature of the listing, ATC concludes that the property listing in the ALLSITES database does not represent a *recognized environmental condition* to the property.

The property listing in the CSCSL NFA and ICR databases corresponds to information presented in the *Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington*, prepared by Nurseryman Products, Inc., dated October 10, 1993. According to this report, a 6,000-gallon underground storage tank (UST) was removed from the property in 1990. The UST was removed from the current asphalt-paved parking area, north-adjacent to the 1406 10th Avenue Building. In 1990, approximately 100 cubic yards of petroleum contaminated soils were removed from the property and disposed of off-site. Prior to the collection of excavation limit confirmation samples, the UST excavation was backfilled. In March 1993, soil samples were obtained from the property and analyzed for petroleum hydrocarbons. Soil samples returned levels of petroleum hydrocarbons at 311 milligrams per kilogram (mg/kg) and 355 mg/kg, which were above Ecology's cleanup values at that time.

In August 1993, excavation of the former UST area began. Contaminated, excavated soils were laid on-site in a layer of 8 to 10 inches and treated by bioremediation. The highest detection of initial petroleum hydrocarbon concentrations was reportedly 11,000 kg/mg. After bioremediation of the excavated soils, levels of petroleum hydrocarbons were all below 10 kg/mg. Groundwater was encountered at approximately six feet below ground surface (bgs) in the excavation. The report indicates that "upon review of the water samples collected from the referenced holes, it was apparent that there was some contamination." It is not noted what type of contamination was identified; however, further in the report it was indicated that levels of tetrachloroethylene (PCE) were identified in the groundwater in the excavation. The groundwater entering the excavation was pumped through a carbon filter treatment tank until samples indicated the groundwater was not further.

The report also indicates that contaminated soils remain on the property underneath the south-adjacent building (1406 10th Avenue building). In September 1993, samples were collected beneath the 1406 10th Avenue building indicating levels of petroleum hydrocarbon between 330 kg/mg and 3,800 kg/mg. It was estimated that the amount of diesel contaminated soils remaining beneath the 1406 10th Avenue building to be 75 cubic yards. A concrete wall was placed between the UST excavation area and the 1406 10th Avenue building with a plastic lining along the bottom, to ensure that contaminated soils beneath the 1406 10th Avenue building would not migrate to the excavated area. A water collection system was installed to continually treat and monitor the groundwater flowing from beneath the 1406 10th Avenue building until contamination levels fall below Ecology's cleanup values.

In October 1993, soil samples were collected of the treated excavated soil and found levels of petroleum contamination below 10 kg/mg and groundwater samples collected from groundwater entering the excavation site indicated no contamination of PCE or trichloroethylene (TCE).

ATC reviewed Ecology's No Further Action Letter pertaining to the 1416 10th Avenue property, dated October 22, 1993. According to Ecology's No Further Action Letter, Ecology issued the No Further Action determination based on the information presented in the Independent Remedial Action Report submitted October 13, 1993 and on information presented in the site file located at Ecology. It was determined that based on the information presented the property does not pose a threat to human health or the environment as a result of the release addressed in the independent

remedial action report. Furthermore, "Ecology recognized the fact that a limited amount of petroleum contaminated soil remains under a building to the south of the cleanup site [1406 10th Avenue building], but as it is capped and contained, it is not anticipated to pose a problem." The Ecology letter further details that "this determination is made only with respect to the release identified in the remedial action report dated October 10, 1993. This no further action determination applies only to the area of the property at 1416 10th Avenue East affected by the release identified in the report."

ATC notes that the Draft Phase I ESA of the Salvation Army Commercial Property, 1401 11th Avenue, Seattle, Washington, prepared by RZA AGRA, Inc., dated January 3, 1994, notes that Ecology's No Further Action letter does not address identified PCE and TCE contaminated water identified during excavation activities. Although Ecology's No Further Action determination letter does not specifically address the PCE and TCE contaminated groundwater at the excavation site, the *Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington*, prepared by Nurseryman Products, Inc., dated October 10, 1993, does discuss this groundwater contamination and indicates the groundwater was treated and resampled showing no detections of PCE or TCE. As Ecology's No Further Action Letter applies "only with respect to the release identified in the remedial action report dated October 10, 1993," it appears that the letter cover all of the releases/contamination identified in the October 10, 1993 Nurseryman Products, Inc. report, including the PCE and TCE contaminated groundwater.

Based on the information presented in the regulatory database report listing, the prior reports and Ecology's No Further Action determination, ATC concludes that the remaining soil contamination below the 1406 10th Avenue building represents a ***recognized environmental condition*** and that the historically removed UST and historically contaminated soils and groundwater at the property represent a ***historical recognized environmental condition*** to the property. ATC reviewed available files from Ecology's Northwest Regional Office related to the property. Ecology's files contained duplicate information as documentation previously provided by the client.

The following listing(s) with a known or significant potential for release and impact on the property were identified in the state and tribal agency databases searched:

International Clinical Laboratory / Tomlinson Inc.
1100 East Union Street
Seattle, Washington
Databases: UST, LUST, ICR, CSCSL
Approximate Distance from the Property: East-adjacent (beyond 11th Avenue)
Assumed Groundwater Gradient: Crossgradient
Regulatory Data Summary: The east-adjacent property is identified in the Underground Storage Tank (UST), Leaking UST (LUST), Independent Cleanup Report (ICR), and CSCSL database. The east-adjacent site had a UST removed that impacted soil. The LUST and ICR databases indicate that the release to soil status is listed as cleanup started. The CSCSL database identified confirmed gasoline soil contamination and suspected benzene and other petroleum products soil contamination, with status listed as cleanup started.
Discussion: Based on the inferred crossgradient hydrologic position relative to the property and the reported release to soil only, ATC concludes that the east-adjacent property listing does not represent a likely past, present or future threat of release on the property.

A1 Brake
1520 10th Avenue
Seattle, Washington
Databases: HSL, CSCSL
Approximate Distance from the Property: 307 feet to the north
Assumed Groundwater Gradient: Upgradient
Regulatory Data Summary: The A1 Brake site is identified in the Hazardous Sites List (HSL) and CSCSL databases with confirmed metals and petroleum products soil contamination and suspected metals and petroleum products groundwater, surface water and air contamination. The status of the site is identified as awaiting cleanup.
Discussion: Based on the inferred upgradient hydrologic position relative to the property, the distance (less than 500 feet) and the open status of the release, ATC concludes that the A1 Brake property represents a potential environmental concern to the property.

Recreational Equipment Inc. (REI) Seattle
1525 11th Avenue
Seattle, Washington
Databases: CSCSL, ICR
Approximate Distance from the Property: 327 feet to the north
Assumed Groundwater Gradient: Upgradient
Regulatory Data Summary: The REI site is identified in the CSCSL and ICR databases with confirmed non-halogenated solvents and petroleum contamination to soil and groundwater and poly aromatic hydrocarbons (PAHs) and solvents contamination to soil. The status of the site is identified as awaiting cleanup.
Discussion: Based on the inferred upgradient hydrologic position relative to the property, the distance (less than 500 feet) and the open status of the release, ATC concludes that the REI property represents a potential environmental concern to the property.

Based on distance, topography, assumed groundwater gradient, current regulatory status, and/or the absence of reported releases, none of the other sites listed in the state and tribal databases are considered to represent a likely past, present or material threat of release on the property.

Orphan Sites

Additional facilities were listed as "unmappable" or "orphan" sites in the EDR database report. These facilities cannot be plotted due to errors or missing information in the regulatory records. ATC reviewed the "orphan summary" in the EDR database report and determined that none of these facilities were within their respective search radii of the site.

EDR Proprietary Records

The property was listed on the following EDR Proprietary Records databases searched for this ESA.

Thompson Bros Auto Rebuild
1020 East Union
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)

Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1944 and 1950.
Discussion: According to ATC's review of historical fire insurance maps, the address 1020 East Union is a historical address associated with the property, formerly located on the southeast side of the property, in the location of the current 1401 11th Avenue building. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

Eleventh Avenue Garage
1405 11th Avenue
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1920.
Discussion: According to ATC's review of historical fire insurance maps, the address 1405 11th Avenue is a historical address associated with the property, located on the southeast side of the property, in the location of the current 1405 11th Avenue building. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

Shaw and Mercll Inc.
1408 10th Avenue
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1951.
Discussion: According to ATC's review of historical fire insurance maps, the address 1408 10th Avenue is a historical address associated with the property, formerly located on the western property boundary, north-adjacent to the current 1406 10th Avenue building. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

Davis and Hoffman Inc.
1406 10th Avenue
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1920, 1940, 1944, 1951, and 1980.
Discussion: The 1406 10th Avenue building is located on the southwest corner of the property. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

Mosey and Mosey Inc.
1416 10th Avenue
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1920, 1925, 1930, 1935, and 1940.
Discussion: The 1416 10th Avenue building is located on the northwest corner of the property. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

Specialty Automotive Warehouse Inc.
1416 10th Avenue
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1951, 1975, and 1980.
Discussion: The 1416 10th Avenue building is located on the northwest corner of the property. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

Engler Joe
1401 11th Avenue
Seattle, Washington
Databases: EDR Historical Auto Stations
Approximate Distance from the Property: N/A (Property)
Assumed Groundwater Gradient: N/A (Property)
Regulatory Data Summary: The property was listed in the EDR Historical Auto Stations database as automobile repair in 1930 and 1935.
Discussion: The 1401 11th Avenue building is located on the southeast corner of the property. The historical use of the property for automobile repair purposes represents a ***recognized environmental condition*** to the property.

ATC notes that the EDR Proprietary Records identified numerous historical auto repair stations at adjacent or nearby upgradient or crossgradient properties and several nearby historical dry cleaners. The historical nearby or adjacent upgradient or crossgradient property use as auto repair stations or dry cleaners represent potential environmental concerns to the property.

Based on distance (i.e. 500 feet from the property), topography, assumed groundwater gradient, current regulatory status, and/or the absence of reported releases, none of the other sites listed in the EDR Proprietary Records are considered to represent a likely past, present or material threat of release on the property.

5.1.3 Local Environmental Records Sources

Local Health Department

ATC contacted Public Health Seattle King County (PHSKC) regarding records for the property. ATC received a response from Mr. Patrick Vanzo, Public Disclosure Officer with PHSKC, on January 6, 2012, indicating that PHSKC has no records pertaining to the property.

Local Environmental Agency

ATC submitted a written request to Ecology for records pertaining to the property. Ecology acts as the regulatory agency for cleanup of hazardous materials released to the environment, including soil and groundwater assessments performed during UST removal activities. Ecology also acts as the UST implementing agency of Washington State. ATC received a general response from Ms. Sally Perkins of Central Records for the Northwest Regional Ecology office indicating that Ecology received ATC's records request. ATC reviewed available files at Ecology's Northwest Regional Office on January 30, 2012. Ecology's files contained duplicate information as documentation previously provided by the client. See Section 5.1.2 and 5.3.9 for a discussion related to these records.

Fire Department

ATC contacted the City of Seattle Fire Department regarding records for the property. Ms. Lauren Poole of the City of Seattle Fire Department Fire Marshal's Office responded on January 3, 2012, indicating that no records for the property addresses were identified. ATC notes that prior to 1996 the City of Seattle Fire Department was not always notified of UST installation or removal, indicating potential reasons why the department had no records of the 1990 UST removal at the property.

Department of Planning and Zoning

According to the City of Seattle 2010 Zoning Map, the property is zoned as neighborhood commercial and pedestrian areas, which is appropriate for current use.

Building Department

ATC reviewed available files from the City of Seattle Department of Planning and Development (DPD) online services (www.seattle.gov/DPD/permit) for building records related to the property. ATC identified records for 1406 and 1416 10th Avenue buildings and records for a historical building at the property, 1415 11th Avenue. ATC identified records for the 1401 and 1405 11th Avenue building filed under 1407 11th Avenue. In addition, ATC reviewed historical building records related to the property on February 1, 2012 at the City of Seattle DPD Microfilm Library. A discussion of these records is presented in Section 5.3.7.

Electrical Utility Company

ATC spoke with an unnamed customer service representative of Seattle City Light, who confirmed that Seattle City Light provides electric service to the property.

Water Utility

ATC spoke with an unnamed representative of City of Seattle Public Utilities who confirmed that the City of Seattle provides potable water utilizes to the property. The customer service representative knew of no problems relating to the potable water system. The source of drinking water for the system is the Cedar River and Tolt River watersheds, located east of Seattle in the Cascade Mountains.

Sewer Utility

According to the Side Sewer Cards for the property as obtained from the City of Seattle DPD, the property was connected to the sanitary sewer system in stages between 1899 and 1920.

ATC spoke with a customer service representative of the City of Seattle who confirmed that the City of Seattle provides storm and sanitary sewer services to the property. The customer service representative knew of no problems relating to the storm or sanitary sewer system.

Other Local Environmental Records Sources

No additional local environmental records sources were reviewed.

5.2 Physical Setting Sources

5.2.1 Topography

According to the United States Geological Survey (USGS) 7.5-Minute Series *Seattle South, Washington*, Quadrangle dated 1983 and information provided by the King County Geographic Information System (GIS) Center as presented in the online application iMap, the property is located at an approximate elevation of between 290 and 295 feet above mean sea level (msl). The topography of the property varies, with a general slope down from the west to the east. The topography of the surrounding area varies, but generally slopes to the southwest. The nearest surface water feature is Elliott Bay, part of Puget Sound, located approximately one mile southwest of the property. A copy of the topographic map is included in Appendix A.

5.2.2 Geology

ATC reviewed the Washington State Division of Geology and Earth Resources *Geologic Map of Washington,* 2002. According to this map, the property is located in the Puget Lowland physiographic province, which consists of a broad, low-lying region situated between the Cascade Range to the east and the Olympic Mountains and Willapa Hills to the west. Lower Tertiary sedimentary rocks unconformably overlie the Crescent Formation. The oldest of these sedimentary rocks consist of sandstones, shales, and coals deposited on a coastal plain fed by westward flowing rivers. As the Cascade Range began to form, much of the sediment deposited on the coastal plain was derived from volcanic eruptions. During the Quaternary, the Puget Lowland was covered a number of times by continental ice sheets. The most recent (Fraser) glaciation reached its peak about 14,000 years ago. The Fraser ice sheet extended to Littlerock, south of Olympia. Maximum ice thickness during the Fraser Glaciation was approximately 1,000 feet at Olympia, 3,000 feet at Seattle, and over 5,000 feet at Bellingham. The Fraser ice retreated quickly, leaving behind a landscape sculpted by glacial erosion and covered by newly deposited glacial drift. The location of present-day waterways and river drainages was established by the pattern of Fraser glacial erosion and deposition. The depth to the bedrock is greater than 60 inches.

Oil and gas exploration, production, or distribution is not a concern in the area of the site.

5.2.3 Soils

According to soils data compiled by EDR from digitized United States Department of Agriculture (USDA) maps and resources, the property is underlain by Alderwood gravelly-sandy loam. Alderwood gravelly-sandy loam is the predominant soil type and is characterized by slow infiltration rates with layers of soil impeding downward movement of water, or soils with moderately fine or fine textures. The soils are moderately well-drained and have a layer of low hydraulic conductivity. A typical profile of Alderwood gravelly-sandy loam includes zero to seven inches below ground surface (bgs) of gravelly-sandy loam, seven to 35 inches bgs of very gravelly-loam, and 35 to 39 inches bgs of cemented materials. Alderwood gravelly-sandy loam is generally characterized as coarse-grained soils with gravels, gravels with fines and silty gravel.

ATC reviewed the *Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington*, prepared by Nurseryman Products, Inc., dated October 10, 1993, for information regarding property soil characteristics. ATC notes that the prior report does not describe the characteristics of the soils encountered at the property.

5.2.4 Hydrology

According to the USGS *Groundwater Atlas of the United States - Idaho, Oregon, Washington*, the property overlies the Puget-Willamette Trough regional aquifer system. In the King County area, the system is filled with unconsolidated deposit aquifers that collectively are as much as 3,000 feet thick and that might be consolidated in their lower part. Perched aquifers can exist in shallow subsurface. The shallow groundwater flow direction generally follows the local topography and may be affected by localized conditions. Based on the topography, the inferred local direction of groundwater flow is to the southwest toward Elliott Bay.

ATC reviewed the *Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington*, prepared by Nurseryman Products, Inc., dated October 10, 1993, for information related to groundwater characteristics at the property. According to the report, groundwater was encountered on the property at approximately 7.5 feet bgs. This report states that groundwater at the property appears to be flowing to the southeast. ATC notes that the only way to measure groundwater flow is through the installation and measurement of at least three groundwater monitoring wells on the property. ATC did not identify any records indicating that groundwater monitoring wells had been installed at the property; therefore, the reported groundwater flow direction beneath the property to the southeast is likely an estimated direction.

5.3 Historical Records Sources

The following table summarizes the findings of the research presented below pertaining to historical property and surrounding area uses.

HISTORICAL USE SUMMARY				
Period	**Identified Historical Uses**		**Source(s)**	**Intervals/Comments**
	Property	**Surrounding Area**		
Prior to 1940	Residential, Auto Repair, Commercial	Residential, Commercial	Aerial Photograph, Fire Insurance Map, Tax Records, Topographic Maps, City Directories, Building Records	Earliest record identified was an 1895 Topographic Map. No data gaps identified. Current property structures developed in 1913, 1915 and 1920.
1940-1960	Residential, Auto Repair, Auto Springs Manufacturing, Auto Body Work, Bakery, Commercial	Residential, Commercial, Gas Station, Auto Repair	Aerial Photograph, Fire Insurance Maps, Tax Records, Topographic Map, City Directories, Building Records	No data gaps identified.
1961-1980	Residential, Auto Repair, Auto Springs Manufacturing, Auto Body Work, Bakery, Commercial	Residential, Commercial, Gas Station, Auto Repair	Aerial Photographs, Fire Insurance Map, Tax Records, Topographic Map, City Directories, Building Records	No data gaps identified.
1981 to present	Residential, Auto Repair, Bakery, Commercial	Residential, Commercial, Auto Repair	Aerial Photographs, Tax Records, Topographic Map, City Directories, Building Records, Site Reconnaissance, Interview	No data gaps identified.

5.3.1 Aerial Photographs

Aerial photographs were provided by EDR and the King County iMap website (www.kingcounty.gov/operations/gis/Maps/iMap.com). Available aerial photographs ranged in date from 1936 to 2007. The following are descriptions and interpretations from the aerial photograph review.

AERIAL PHOTOGRAPH SUMMARY		
Year	**Scale**	**Comments**
1936	1" = 76'	**Property**: The eastern portion of the property is developed with three structures, two of which correspond to the current 1401 and 1405 11th Avenue buildings. The third building is located on the northeastern corner of the property and corresponds to an apartment building identified during the review of fire insurance maps, historical tax records and prior reports. The western portion of the property is developed with four structures, two of which correspond to current improvements, 1406 and 1416 10th Avenue. The third structure, situated on the western property boundary, north-adjacent to the 1406 10th Avenue building is present and the fourth structure is a small

AERIAL PHOTOGRAPH SUMMARY		
Year	**Scale**	**Comments**
		rectangular structure located north of the 1406 10th Avenue building. **Surrounding Area**: The north- and east-adjacent properties are developed with residential and commercial structures. The south-adjacent properties are developed with commercial structures and one structure that corresponds in shape and orientation to a gas and oil station observed on historical fire insurance maps. The west-adjacent property is developed with commercial structures, corresponding to current improvements.
1956	1" = 750'	**Property**: The property appears to remain generally unchanged from the prior photograph; however, the quality of the photograph is poor, making specific land use not discernible. **Surrounding Area**: The adjacent properties appear to remain generally unchanged from the prior photograph; however, the quality of the photograph is poor, making specific land use not discernible.
1965	1" = 750'	**Property**: The western portion of the property continues to be developed with three structures, two corresponding to 1401 and 1405 11th Avenue and one corresponding to the historical apartment building. The eastern portion of the property is developed with three structures, two corresponding to 1406 and 1416 10th Avenue and a third, south-adjacent to the 1416 10th Avenue building. **Surrounding Area**: The north-adjacent property is developed with one small commercial structure and surface parking. The east-adjacent property is developed with surface parking and a commercial structure. The south-adjacent property is developed with commercial structures. The west-adjacent property remains unchanged from the prior photograph.
1969	1" = 500'	**Property**: The western portion of the property remains generally unchanged from the prior photograph. The eastern portion of the property is developed with two structures, corresponding to the 1406 and 1416 10th Avenue buildings. **Surrounding Area**: The adjacent properties remain generally unchanged from the prior photograph, with the exception of the north-adjacent property which is now developed with surface parking only.
1977	1" = 500'	**Property**: The property remains generally unchanged from the prior photograph. **Surrounding Area**: The adjacent properties remain generally unchanged from the prior photograph.
1980	1" = 1,000'	**Property**: The property is depicted within a generally developed area of Seattle; however, due to the poor quality of the photograph, specific land use is not discernible. **Surrounding Area**: The surrounding area is depicted within a generally developed area of Seattle; however, due to the poor quality of the photograph, specific land use is not discernible.
1985, 1990	1" = 500' 1" = 604'	**Property**: The property remains generally unchanged from the prior photographs. **Surrounding Area**: The adjacent properties remain generally unchanged from the prior photographs.

AERIAL PHOTOGRAPH SUMMARY		
Year	**Scale**	**Comments**
1998, 2002, 2006, 2007	1" = 76' 1" = 76' 1" = 500' 1" = 76'	**Property**: The property is developed with four structures, two on the eastern portion, corresponding to the 1401 and 1405 11th Avenue buildings and two on the western portion, corresponding to the 1406 and 1416 10th Avenue buildings. The former apartment structure located on the northeast corner of the property is gone. The northeastern corner of the parking lot is now a parking lot. **Surrounding Area**: The adjacent properties remain generally unchanged from the prior photograph.

The review of aerial photographs identified a structure, corresponding to a gas and oil structure, historically located on the south-adjacent property, beyond East Union Street. Based on the proximity of the historical gas and oil structure to the property, ATC concludes that the adjacent historical gas and oil structure represents a potential environmental concern to the property.

The review of aerial photographs did not identify past uses indicating *recognized environmental conditions* at the property and/or surrounding area.

Copies of reproducible aerial photographs are included in Appendix F.

5.3.2 Fire Insurance Maps

A search for fire insurance maps for the property and surrounding area was conducted by EDR. The following are descriptions and interpretations from the fire insurance map reviews. Documentation is included in Appendix G.

FIRE INSURANCE MAP SUMMARY	
Year	**Comments**
1905	**Property**: The property is developed with four residential structures and three outbuildings. **Surrounding Area**: The north-, east-, and south-adjacent properties are developed with residential structures. The west-adjacent property is developed with the Broadway Stables.
1949, 1950	**Property**: The eastern portion of the property is developed with three structures. The two structures in the southeast corner of the property correspond to current improvements of 1401 and 1405 11th Avenue, which are labeled auto body works and painting and autos and general storage. The third structure on the eastern portion of the property is an apartment building situated on the northeastern corner of the property. The western portion of the property is developed with five structures, identified as auto repair/auto body works/painting, machine shop, black smith, apartments, and auto springs manufacturing. The auto repair/auto body works/painting building and auto springs manufacturing building correspond to current improvements, 1406 and 1416 10th Avenue, respectively. **Surrounding Area**: The north-adjacent property is developed with residential structures. The east-adjacent property is developed with a residential structure and commercial structure identified as photo supplies. The south-adjacent property is developed with an auto repair facility, an auto body works and painting facility and a gas station, noted as gas and oil. The southwest-adjacent property is developed with an auto radiator shop. The east-adjacent property is developed with commercial structures identified as auto storage.

FIRE INSURANCE MAP SUMMARY	
Year	**Comments**
1969	**Property**: The eastern portion of the property continues to be developed with three structures; however, the two structures situated on the southeast corner of the property are identified as a bake house with a steel oven and as wrapping. The structure on the northeastern corner of the property continues to be an apartment building. The western portion of the property is developed with two structures, corresponding to current improvements. The structures are identified as auto repairing/auto body works/painting and auto springs manufacturing. The central western portion of the property is parking. **Surrounding Area**: The north-adjacent property is parking, followed by commercial structures. The east-adjacent property is developed with parking, an open deck garage and a county library storage building. The south-adjacent properties are developed with commercial properties, including an auto parts store with machine shop, auto electrical service and auto repair. The southwest-adjacent property continues to be developed with an auto radiator shop. The west-adjacent property is developed a structure occupied by garment insulation manufacturing.

The review of fire insurances maps identified the south- and southwest-adjacent property uses as auto repair, auto radiator repair, painting, gas and oil storage and machine shop. These historical uses of adjacent properties represent potential environmental concerns to the property.

The review of fire insurance maps identified historical property use as auto body works and painting, auto repair, machine shop, black smith, and auto springs manufacturing. These historical property uses represent the likely use, storage and disposal of hazardous materials and petroleum products on the property. ATC concludes that these historical property uses represent a *recognized environmental condition* to the property.

5.3.3 Property Tax Files

ATC reviewed available tax information for the property as obtained from King County Department of Assessments website for historical use and ownership information on the property. The King County Department of Assessments website tax records document land use from 1993 through 2012. The King County Assessor tax records indicate that the property APNs are 600350-0055, -0060, -0065, -0070, -0135, -0140, and -0150. The property APNs are currently owned by the Jacobsen Family LLC. The records indicate that the property is currently developed with four structures. The commercial structure, 1406 10th Avenue, was constructed in 1915 and is two stories with a basement. The commercial structure, 1416 10th Avenue, was constructed in 1913 and is one story with a basement. The commercial structure, 1401 11th Avenue, was constructed in 1920 and is one story with a basement. The commercial structure, 1405 11th Avenue, was constructed in 1920 and is one story with a basement. The records indicate that the property is currently owned by the Jacobsen Family LLC, which purchased the property parcels in 2000 and 2001 from Judith and Conrad Jacobsen. Judith and Conrad Jacobsen acquired the property parcels in stages in 1993 and 1997 from Jean Stiles and Connie Witkoski, Kum Lin Chen, and Larry Moore.

In addition, ATC reviewed available historical tax files for the property as obtained from the Washington State Puget Sound Regional Archives in Bellevue, Washington.

The records identified the 1406 10th Avenue building was constructed in 1915 and was occupied by Davis Hoffman Auto Rebuilding, which was connected to the sewer and used hot air for heating. The tax records document the property assessment and development from 1938 through 1973. The records

identified the area, north of 1406 10th Avenue building, as 1408 10th Avenue, and as Ruth Ashbrook Bakeries parking and tank. The tank was noted as installed in 1961 and with a 6,000-gallon capacity. Prior to the parking and tank, this portion of the property was occupied by 1410 10th Avenue, a Machine Shop, constructed in 1905. The machine shop was one story and was heated by a stove. The property was also occupied by a structure labeled as Trim Shop, constructed in 1905. The records identified the eastern portion of the property developed with a residential structure, located at 1414 10th Avenue, constructed in 1904, heated by a pipeless furnace. The property was occupied on the northwestern corner by the 1416 10th Avenue building, a warehouse with one story and a basement, occupied by Leiberg's blacksmith and forging and built in 1913.

The records identified the eastern portion of the property developed with three structures. The 1401 11th Avenue building was constructed in 1920 and occupied originally by Joe Engler auto repairing. The structure was noted as heated by a stove and was connected to sewer. In circa 1957, Ruth Ashbrook Bakeries moved into the 1401 11th Avenue building. The property structure, 1405 11th Avenue was constructed in 1920 and was historically occupied by a garage, then by Ruth Ashbrook Bakeries. The very northeastern portion of the property was historically developed with an apartment building, addressed at 1415 11th Avenue. The apartment building was constructed in 1907 and was heated by an oil burner.

Other historical tax records, dated between 1983 and 1993, document the property as occupied by Davis Hoffman Auto Repair, a parking lot, specialty auto warehouse damaged by fire, the former Van Ness Apartments that burned down due to arson, and the Ruth Ashbrook Bakery.

The review of historical tax records identified the historical property use as Davis Hoffman Auto Repair, a machine shop, and a blacksmith and forging business. These historical property uses represent the potential historical use, storage and disposal of hazardous materials or petroleum products on the property. ATC concludes that these long term historical property uses represent a ***recognized environmental condition*** to the property.

The review of historical tax records identified a historical 6,000-gallon tank installed at the property in circa 1961. No further information related to the tank was provided in the records. This historical tank documentation corresponds to the UST discussed in Sections 5.1.2 and 5.3.9. Based on the removal of the UST and the removal of the petroleum contaminated soils, ATC concludes that the UST represents a ***historical recognized environmental condition*** to the property. See Sections 5.1.2 and 5.3.9 for further information.

The review of historical tax records identified a historical apartment building on the northeast corner of the property as heated by an oil burner. The use of an oil burner indicates the potential for heating oil to have been stored in a UST or an aboveground storage tank (AST). To date, no records have identified a heating oil UST or AST associated with the historical apartment building. If the heating oil was stored in a UST, then it was likely removed during demolition activities; however, there is potential for a heating oil UST to remain on the property. If a heating oil UST is uncovered during construction activities, it should be removed and closed as per applicable regulations. ATC concludes that the potential for a heating oil UST to be on the property represents a potential environmental concern.

Documentation is provided in Appendix G.

5.3.4 Recorded Land Title Records

The acquisition of recorded land title records was not required by the scope of work for the Phase I ESA.

5.3.5 Historical USGS Topographic Quadrangles

ATC reviewed available historical USGS Topographic Quadrangles, as provided by EDR, for information regarding past uses of the property. Available topographic quadrangles ranged from 1895 to 1983. The following are descriptions and interpretations from the aerial photograph review.

TOPOGRAPHIC QUADRANGLES SUMMARY		
Name / Year	**Scale**	**Comments**
Snohomish/ 1895, Seattle/ 1897	1 inch = 125,000 feet	**Property**: The property is depicted in a developed area of Seattle; however, specific land use was not discernible. **Surrounding Area**: The surrounding area is depicted in a developed area of Seattle; however, specific land use was not discernible.
Seattle/ 1901	1 inch = 62,500 feet	**Property**: The property is depicted in a developed area of Seattle; however, specific land use was not discernible. **Surrounding Area**: The surrounding area is depicted in a developed area of Seattle; however, specific land use was not discernible.
Seattle South/ 1949, 1968, 1973, 1983	1 inch = 24,000 feet,	**Property**: The property is depicted in a pink shaded area of Seattle, indicating dense, urban development. **Surrounding Area**: The surrounding area is depicted in a pink shaded area of Seattle, indicating dense, urban development.

The review of historic USGS Topographic Quadrangles did not identify past uses indicating *recognized environmental conditions* at the property and/or surrounding area.

5.3.6 City Directories

Research of historical city directory listings was obtained from EDR. City directories were available for the years 1920 to 2005. The following are descriptions and interpretations from the historical city directory review. Due to the densely developed surrounding area, specific adjacent properties with addresses are only identified below if they represent a potential environmental concern to the property. Otherwise, the surrounding area is generally characterized. Documentation is included in Appendix G.

During review of the city directory abstract provided by EDR, ATC referenced historical property addresses (1406-1416 [even only] 10th Avenue, 1401-1415 [odd only] 11th Avenue, and 1014, 1018 and 1024 East Union Street) identified on the historical fire insurance maps, also provided by EDR.

CITY DIRECTORY SUMMARY	
Year	**Comments**
1920	**Property**: Hoffman's – manufacturers of auto bodies, springs, wheels, painting and trimming, welding and forging (1406 10th Avenue), Residential (1408 10th Avenue), Apartments (1414 10th Avenue), Residential (1411 11th Avenue), Espenolla Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Lewis Sim May – auto repair (1009 East Union), Sound Radiator Co (953 East Union Street)

CITY DIRECTORY SUMMARY	
Year	**Comments**
1925	**Property**: H (1406 10th Avenue), Residential (1408 10th Avenue), Apartments (1414 10th Avenue), Bortner & Hutchinson – auto trucks (1401 11th Avenue), Dehco Enameling Co, Seattle Day Nursery (1407 11th Avenue), Athmore Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Engler Automotive Repair (1001 East Union Street)
1930	**Property**: Snyder Gene – mach (1406 10th Avenue), Residential (1408 10th Avenue), Engler – auto repair (1401 11th Avenue), Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Puget Radiator & Fender Works (953 East Union Street)
1935	**Property**: Heiser Inc. (1406 10th Avenue), Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Puget Auto Rebuild – auto repair (953 East Union Street), Tenth Avenue Garage (1423 10th Avenue)
1940	**Property**: Davis Hoffman Co – auto body repair (1406 10th Avenue)**,** Apartments (1414 10th Avenue), Lieberg Auto Spring Works (1416 10th Avenue), Vacant (1401 11th Avenue), Grandma Baking (1407 11th Avenue), Ransom Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Otto's Radiator Service repair (953 East Union Street)
1944	**Property**: Davis Hoffman Co – auto body repair (1406 10th Avenue), Apartments (1414 10th Avenue), Lieberg Spring Works Manufactures and Reed Printing (1416 10th Avenue), Grandma Baking Co, Cottage Donuts (1407 11th Avenue), Ransom Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Otto's Radiator Service repair (953 East Union Street)
1951	**Property**: Davis Hoffman Co – auto body repair (1406 10th Avenue), Shaw & Mercill Inc – machines (1408 10th Avenue), Residential (1414 10th Avenue), Lieberg Spring Works Manufactures (1416 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue), Apartment (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Otto's Radiator Service (953 East Union Street)
1955	**Property**: Shaw & Mercill Inc – auto repairs (1408 10th Avenue), No return (1414 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue) **Surrounding Area**: Commercial, Apartments, Municipal Library, Otto's Radiator Service repair (953 East Union Street)
1960	**Property**: Davis Hoffman Co – auto body repair (1406 10th Avenue), Shaw & Mercill Inc – machines (1408 10th Avenue), Vacant (1414 10th Avenue), Lieberg Spring Works Manufactures (1416 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue), Van Ness Apartments (1415 11th Avenue) **Surrounding Area**: Olympic , Tool & Supply Co (1424 10th Avenue), C&S Auto Repair (1424 11th Avenue), Apartments, Municipal Library, Seattle Tool Supply Industrial (1161 11th Avenue), Federal Mogul Serv – who auto parts (1009 East Union Street), Otto's Radiator Service repair (953 East Union Street)
1966	**Property**: Davis Hoffman Co – auto body repair (1406 10th Avenue), Vacant (1414 10th Avenue), Lieberg Spring Works Manufactures (1416 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue), Van Ness Apartments (1415 11th Avenue) **Surrounding Area**: Olympic Tool & Supply Co (1424 10th Avenue), Economy Auto Rebuild (1424 11th Avenue), Apartments, Municipal Library, Otto's Radiator Service repair (953 East Union Street)

CITY DIRECTORY SUMMARY	
Year	**Comments**
1970	**Property**: Davis & Hoffman Hansell – auto body repair (1406 10th Avenue), Bondo Brothers Body Shop (1416 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue), Van Ness Apartments (1415 11th Avenue) **Surrounding Area**: Olympic Tool & Supply Co (1424 10th Avenue), Parts Service Inc. – auto parts (1424 11th), Municipal Library, Seattle Tool Supply Industrial (1161 11th Avenue), Bob's Automotive Machine Shop (1017 East Union Street), Auto Battery & Electric Co (1009 East Union Street), Otto's Radiator Service repair (953 East Union Street)
1975	**Property**: Davis & Hoffman Co – auto body repair (1406 10th Avenue), Specialty Automotive Warehouse – auto repair (1416 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue) **Surrounding Area**: Olympic Tool & Supply Co (1424 10th Avenue), Bondo Auto Rebuild (1424 11th Avenue), Solder Supply & Equipment (1161 11th Avenue), Bob's Automotive Machine Shop (1017 East Union Street), Auto Battery & Electric Co and Broadway Auto Electric – auto repair (1009 East Union Street), Otto's Radiator Service repair (953 East Union Street)
1980	**Property**: Davis & Hoffman Co – auto body repair (1406 10th Avenue), Specialty Automotive Warehouse – auto repair (1416 10th Avenue), Ruth Ashbrook Bakeries (1407 11th Avenue), Van Ness Apartments (1415 11th Avenue) **Surrounding Area**: Olympic Tool & Supply Co (1424 10th Avenue), Solder Supply & Equipment (1161 11th Avenue), Bob's Automotive Machine Shop (1017 East Union Street), Auto Battery & Electric Co (1009 East Union Street), Otto's Radiator Service repair (953 East Union Street)
1986	**Property**: Davis & Hoffman Co – auto body repair (1406 10th Avenue), Ruth Ashbrook Bakery (1416 10th Avenue), Van Ness Apartments (1415 11th Avenue) **Surrounding Area**: Solder Supply & Equipment (1161 11th Avenue), Auto Battery & Electric Co (1009 East Union Street), Otto's Radiator Service repair (953 East Union Street)
1990	**Property**: Davis & Hoffman Co – auto body repair (1406 10th Avenue), Ruth Ashbrook Bakery (1416 10th Avenue), Van Ness Apartments (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Solder Supply & Equipment (1161 11th Avenue), Auto Battery & Electric Co (1009 East Union Street), Michael's Radiator Service repair (953 East Union Street)
1996	**Property**: Davis & Hoffman Inc. (1406 10th Avenue), Individuals/Apartment (1408 10th Avenue), Hamilton Custom Press, Intercode Custom Screen, Lighting Accessories (1414 10th Avenue), Senani Coffee Co (1416 10th Avenue), Greetings, Sudio2, Charles Blackburn Photography, Madison Park (1407 11th Avenue), Residential (1415 11th Avenue) **Surrounding Area**: Commercial, Apartments, Office, Auto Battery Electric Co (1009 East Union Street)
2005	**Property**: Chip Building, Pantages Apartments Li (1406 10th Avenue), Building – lighting accessories (1414 10th Avenue), Copy Queen, Unnea Publishing, Inc, Teach First, Inc. (1407 11th Avenue) **Surrounding Area**: Commercial, 6 Premier Auto Body (1422 11th Avenue), Apartments

The review of city directories identified adjacent historical property uses as a tool companies, auto body work, auto repair, and a machine auto shop. All of these historical adjacent property uses represent the potential for the use, storage or disposal of hazardous materials or petroleum products. ATC concludes that the above listed historical adjacent property uses represent a potential environmental concern to the property.

The review of city directories identified historical property uses for auto body work and painting, machine shop, auto repair, auto spring works manufacturing and printing. All of these historical property uses represent the potential for the use, storage or disposal of hazardous materials or petroleum products on the property. ATC concludes that the above listed historical property uses represent a ***recognized environmental condition*** to the property.

5.3.7 Building Department Records

ATC reviewed available building department records from the City of Seattle Department of Planning and Development (DPD) website for information related to the property. The available records were construction permits for current improvements, mechanical, electrical, signage and interior tenant improvements for the property structure. The permit list identified permits dated 1985 through 2011. Several permits related to 1406 10th Avenue identified the building as occupied by an auto body shop in 1990, 1991 and 1997. A 1992 permit documented the demolition of the former apartment building at 1415 11th Avenue due to fire damage. No permits of environmental concern were noted. A complete list of all building permits issued for the property is included in Appendix G.

In addition, ATC reviewed available historical building records related to the property at the City of Seattle DPD Microfilm Library. ATC reviewed a permit card for 1411-1415 11th Avenue, documenting the construction of a structure in 1899, interior alterations in 1901, construction of a porch in 1952 and the replacement of stairs in 1957. The additional permit card entries on the card were illegible. ATC removed a 1992 permit for the demolition of a apartment building at 1415 11th Avenue that was damaged by a fire. ATC reviewed a 1992 permit for the installation of a spray paint booth for the existing auto body repair business on the second floor of the 1406 10th Avenue building. ATC reviewed a 1997 permit for the change in use of the 1415 11th Avenue property (current gravel parking lot) from apartment to parking lot. ATC also reviewed several drawings depicting portions of the property dated 1947, 1967, and 2000.

The review of historical building department records identified historical property use as auto body repair, which represents a *recognized environmental condition.*

5.3.8 Zoning/Land Use Records

According to the City of Seattle 2010 Zoning Map, the property is zoned as neighborhood commercial and pedestrian areas, which is appropriate for current use.

ATC reviewed available records from the City of Seattle Department of Planning and Development (DPD) website. No records related to historical zoning were identified during the review of the records, although all tenants of the property were identified as commercial use, indicating that the property was likely historically zoned for such use.

5.3.9 Prior Reports

The following provides a summary of information from prior reports made available to ATC for review. A copy of the prior report is included in Appendix H.

Final Cleanup Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue, Seattle, Washington, prepared by Nurseryman Products, Inc., dated October 10, 1993:

According to the *Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington*, prepared by Nurseryman Products, Inc., dated October 10, 1993, a 6,000-gallon underground storage tank (UST) was removed from the property in 1990. The UST was removed from the current asphalt-paved parking area, north-adjacent to the 1406 10th Avenue Building. In 1990, approximately 100 cubic yards of petroleum contaminated soils were removed from the property and disposed of off-site. Prior to the collection of excavation limit confirmation samples, the UST excavation was backfilled. In March 1993, soil samples were obtained from the property and analyzed for petroleum hydrocarbons. Soil samples returned levels of petroleum hydrocarbons at 311 milligrams per kilogram (mg/kg) and 355 mg/kg, which were above Ecology's cleanup values at that time.

In August 1993, excavation of the former UST area began. Contaminated, excavated soils were laid on-site in a layer of 8 to 10 inches and treated by bioremediation. The highest detection of initial petroleum hydrocarbon concentrations was reportedly 11,000 kg/mg. After bioremediation of the excavated soils, levels of petroleum hydrocarbons were all below 10 kg/mg. Groundwater was encountered at approximately six feet below ground surface (bgs) in the excavation. The report indicates that "upon review of the water samples collected from the referenced holes, it was apparent that there was some contamination." It is not noted what type of contamination was identified; however, further in the report it was indicated that levels of tetrachloroethylene (PCE) were identified in the groundwater in the excavation. The groundwater entering the excavation was pumped through a carbon filter treatment tank until samples indicated the groundwater was not further.

The report also indicates that contaminated soils remain on the property underneath the south-adjacent building (1406 10th Avenue building). In September 1993, samples were collected beneath the 1406 10th Avenue building indicating levels of petroleum hydrocarbon between 330 kg/mg and 3,800 kg/mg. It was estimated that the amount of diesel contaminated soils remaining beneath the 1406 10th Avenue building to be 75 cubic yards. A concrete wall was placed between the UST excavation area and the 1406 10th Avenue building with a plastic lining along the bottom, to ensure that contaminated soils beneath the 1406 10th Avenue building would not migrate to the excavated area. A water collection system was installed to continually treat and monitor the groundwater flowing from beneath the 1406 10th Avenue building until contamination levels fall below Ecology's cleanup values.

In October 1993, soil samples were collected of the treated excavated soil and found levels of petroleum contamination below 10 kg/mg and groundwater samples collected from groundwater entering the excavation site indicated no contamination of PCE or trichloroethylene (TCE).

ATC reviewed Ecology's No Further Action Letter pertaining to the 1416 10th Avenue property, dated October 22, 1993. According to Ecology's No Further Action Letter, Ecology issued the No Further Action determination based on the information presented in the Independent Remedial Action Report submitted October 13, 1993 and on information presented in the site file located at Ecology. It was determined that based on the information presented the property does not pose a threat to human health or the environment as a result of the release addressed in the independent remedial action report. Furthermore, "Ecology recognized the fact that a limited amount of petroleum contaminated soil remains under a building to the south of the cleanup site [1406 10th Avenue building], but as it is capped and contained, it is not anticipated to pose a problem." The Ecology letter further details that "this determination is made only with respect to the release identified in the remedial action report dated

October 10, 1993. This no further action determination applies only to the area of the property at 1416 10th Avenue East affected by the release identified in the report."

Phase I ESA of Salvation Army Commercial Property, 1401 11th Avenue, Seattle, Washington, prepared by RAZ AGRA, Inc., dated January 3, 1994:

According to the *Phase I ESA of Salvation Army Commercial Property, 1401 11th Avenue, Seattle, Washington*, prepared by RAZ AGRA, Inc., dated January 3, 1994, during the site inspection, a sheen was observed on groundwater entering the excavation described in the 1993 Nurseryman Products report and PCE and TCE was identified in groundwater at levels above cleanup values. The report indicates that Ecology's No Further Action determination does not cover the PCE and TCE groundwater contamination. The report concludes that based on the historical use of the property and surrounding area, there is a potential for adverse environmental conditions to exist on the property that is not related to the historical leaking UST. Furthermore, if the 1406 10th Avenue building is ever demolished, additional sampling would be prudent to sample the soil and groundwater for possible contaminants. The report also concluded that due to the remediation activities related to the historical leaking UST to include bioremediation and land farmed soils, it may be prudent to sample and analyze soil underlying the soil treatment area (northeast corner of property).

Phase I ESA of 1415 11th Avenue, Seattle, Washington, prepared by Kleinfelder, Inc., dated December 13, 1996:

According to the *Phase I ESA of 1415 11th Avenue, Seattle, Washington*, prepared by Kleinfelder, Inc., dated December 13, 1996, this report only covers the very northeastern corner of the property (current gravel parking lot). Kleinfelder concluded that based on the storage of petroleum contaminated soils on the 1415 11th Avenue portion of the property for bioremediation activities related to the UST excavation, that shallow soil samples should be collected to ensure that no contaminated soils remain in that area, as no confirmation soil sampling was identified. Kleinfelder also discusses the potential for a heating oil UST to remain on the property as related to the former apartment building situated on the northeast corner of the property. Kleinfelder also indicates that there is a possibility that PCE and TCE contaminated groundwater have impacted the northeast portion of the property, as related to the UST excavation on the adjacent area.

Phase I Environmental Audit, Two Commercial Buildings 1416-1418 10th Avenue and 1401 11th Avenue/1414 10th Avenue, Seattle, Washington, prepared by Environmental Associates, dated August 16, 1999:

According to the *Phase I Environmental Audit, Two Commercial Buildings 1416-1418 10th Avenue and 1401 11th Avenue/1414 10th Avenue, Seattle, Washington*, prepared by Environmental Associates, dated August 16, 1999, concluded that potential PCB-containing ballasts were present on the property, that suspect asbestos-containing materials (ACMs) were present on the property, and there is potential for a heating oil UST to remain on the northeastern corner of the property. The report further concludes that the soil and groundwater contamination identified during the 1990 and 1993 remedial investigations were cleaned up and issued a No Further Action determination by Ecology. Furthermore, the report concludes that historical property uses for automotive repair and machine shop represents a risk of potential environmental impact.

ATC notes that the *Draft Phase I ESA of the Salvation Army Commercial Property, 1401 11th Avenue, Seattle, Washington*, prepared by RZA AGRA, Inc., dated January 3, 1994 (discussed below), notes that

Ecology's No Further Action letter does not address identified PCE and TCE contaminated water identified during excavation activities. Although Ecology's No Further Action determination letter does not specifically address the PCE and TCE contaminated groundwater at the excavation site, the ***Final Clean-up Report for the Ruth Ashbrook Bakery Property at 1416 10th Avenue in Seattle, Washington***, prepared by Nurseryman Products, Inc., dated October 10, 1993, does discuss this groundwater contamination and indicates the groundwater was treated and resampled showing no levels of PCE or TCE. As Ecology's No Further Action Letter applies "only with respect to the release identified in the remedial action report dated October 10, 1993," it appears that the letter cover all of the releases/contamination identified in the October 10, 1993 Nurseryman Products, Inc. report, including the PCE and TCE contaminated groundwater.

Based on the information presented in the regulatory database report listing, the prior reports and Ecology's No Further Action determination, ATC concludes that the remaining soil contamination below the 1406 10th Avenue building represents a ***recognized environmental condition*** and that the historically removed UST and historically contaminated soils and groundwater at the property represent a ***historical recognized environmental condition*** to the property. ATC reviewed available files from Ecology's Northwest Regional Office related to the property. Ecology's files contained duplicate information as documentation previously provided by the client.

The prior reports describe land farming and bioremediation of contaminated soils as related to the 1993 remedial activities on the northeast portion of the property. It was not reported in prior reports if confirmation soil samples were collected from the gravel lot beneath the land farmed soils to ensure that the soils had not impacted the northeast portion o the property. ATC concludes based on the lack of confirmation sampling beneath the land farmed soils, that there is potential for impact to the property soil and therefore, represents a ***recognized environmental condition*** to the property.

Based on the information presented in prior reports regarding historical property uses, such as machine shop and automotive repair, ATC concludes that the historical property uses represent a ***recognized environmental condition*** to the property.

ATC makes no warranty, guaranty or certification regarding the quality, accuracy or reliability of any prior report provided to ATC and discussed in this Phase I ESA report. ATC expressly disclaims any and all liability for any errors or omissions contained in any prior reports provided to ATC and discussed in this Phase I ESA report.

5.3.10 Other Historical Sources

No other historical sources were reviewed.

6.0 SITE RECONNAISSANCE

The following is a summary of visual and/or physical observations of the property on the day of the site visit. Photographs are provided in Appendix C.

6.1 Methodology and Limiting Conditions

The site reconnaissance consisted of visual and/or physical observations of: the property and improvements; adjoining sites as viewed from the property; and, the surrounding area based on visual observations made during the trip to and from the property. Unimproved portions of the property were observed along the perimeter and in a general grid pattern in safely accessible areas. Building exteriors were observed along the perimeter from the ground, unless described otherwise. Building interiors were observed as they were made safely accessible, unless described otherwise. The elevator equipment room for the hydraulic passenger elevator in the 1406 10th Avenue building was not accessible. The elevator pits in the 1406 10th Avenue and 1405 11th Avenue buildings and the car lift pit in the 1406 10th Avenue building were also not accessible. The weather at the time of reconnaissance was overcast and cool with no visibility limitations.

Ms. Hillary Williams, ATC Project Manager, was escorted through the property during the site reconnaissance by Mr. Scott Northfield, Property Manager with Real Property Associates.

6.2 Hazardous Substance Use, Storage, and Disposal

ATC did not observe the use, storage or disposal of hazardous substances, including hazardous wastes, on the property with the exception of small quantities (less than five gallons) of commercial cleaning and maintenance products that were properly stored in original containers.

6.3 Underground Storage Tanks (USTs)

ATC did not observe evidence of USTs on the property.

See Sections 5.1.2 and 5.3.9 for a discussion related to a removed 6,000-gallon diesel UST formerly on the property.

6.4 Aboveground Storage Tanks (ASTs)

ATC did not observe evidence of ASTs on the property.

6.5 Other Petroleum Products

ATC observed evidence of the use, storage or disposal of other petroleum products on the property as summarized below.

OTHER PETROLEUM PRODUCTS				
Type of Material	**Quantity & Container Type**	**Location**	**Use**	**Condition of Containers & Area**
Elevator hydraulic fluid	One, 50-gallon reservoir	Elevator equipment room of 1406 10th Avenue building	Elevator operation	No concerns reported; regular maintenance
Gear oil	Two, 5-gallon buckets	Elevator equipment room of 1405 11th Avenue building	Elevator operations	Good, no evidence of leaks or spills

The elevator equipment room of the 1406 10th Avenue building was inaccessible at the time of the site reconnaissance. ATC identified a permit from the City of Seattle DPD indicating that the hydraulic elevator at the 1406 10th Avenue building was installed in 1999. According to Mr. Scott Northfield, site escort, the elevator is serviced and maintained on a regular basis and no issues have ever been reported. Based on the reported conditions, regular maintenance, and the installation date of the elevator, ATC concludes that the elevator hydraulic fluid at the 1406 10th Avenue building does not represent a recognized environmental condition to the property.

Based on the conditions observed and the minor amount stored, ATC concludes that the storage of the gear oil on the property does not represent a *recognized environmental condition* to the property.

ATC was able to raise the car lift in the 1406 10th Avenue building slightly to observe the pit condition beneath the lift. No light was available in the pit. ATC observed what appeared to be minor staining on the dirt. It is unknown if this staining was moisture or petroleum related. Based on the limited staining observed, ATC concludes that the staining in the car lift pit represents a *de minimis* condition.

6.6 Polychlorinated Biphenyls (PCBs)

ATC observed a hydraulic elevator in the 1405 11th Avenue building. According to Mr. Scott Northfield, site escort, the elevator was installed in 1950. Hydraulic fluids from circa 1950 have the potential to contain PCBs. The elevator pit of the hydraulic elevator at 1405 11th Avenue building was inaccessible. ATC did not observe evidence of staining or release around the hydraulic fluid reservoir in the elevator equipment room. Mr. Northfield also indicated that the elevator is serviced and maintained on a regular basis. Based on the age of the elevator, there is potential for the hydraulic fluid used to contain PCBs. The potential presence of PCB-containing hydraulic oil and the inaccessibility of the elevator pit to inspect for potential impact, represent a potential environmental concern.

Another potential source of PCBs is the ballasts of fluorescent lights. Fluorescent lighting is present at the property. Based on the age of the property improvements (circa early 1900s), it is possible that PCB-containing ballasts are present. During the course of normal maintenance, ballasts should be inspected for labeling indicating their PCB content. In general, any ballast not specifically labeled as not containing PCBs is presumed to contain them and will require special disposal practices when discarded.

ATC observed pole-mounted transformers, located off the property on adjacent streets.

ATC notes that the car lift located in the 1406 10th Avenue building was reported as a gear traction system, not a hydraulic system.

6.7 Unidentified Substance Containers

ATC did not observe the presence of unidentified substance containers on the property.

6.8 Nonhazardous Solid Waste

ATC observed evidence of the generation, storage or disposal of nonhazardous solid waste on the property as summarized below.

NONHAZARDOUS SOLID WASTE SUMMARY TABLE						
Type of Waste	**Generation Process**	**Quantity**	**Type of Storage**	**Location**	**Disposal/Removal Method & Frequency**	**Evidence of Release?**
Municipal garbage	Routine site operations	One	Dumpster	Parking lot	Weekly by City of Seattle contractor	No evidence of release
Recyclables	Routine site operations	One	Dumpster	Parking lot	Weekly by City of Seattle contractor	No evidence of release

Based on the observed conditions, ATC concludes that the generation, storage or disposal of nonhazardous solid waste on the property does not represent a *recognized environmental concern* to the property.

6.9 Wastewater

ATC observed evidence of wastewater generated, treated or discharged (including sanitary sewage and stormwater) on the property or to adjoining properties as summarized below.

WASTEWATER SUMMARY TABLE			
Type of Wastewater	**Generation Process**	**Treatment System?**	**Discharged To?**
Commercial Sanitary Sewage	General site operations	No	Sanitary sewer
Stormwater	N/A	No	Storm sewer

ATC did not observe petroleum staining or odors in the vicinity of the storm water drains and sanitary sewer access manholes on the property. Based upon observed conditions, ATC concludes that wastewater generation and discharge at the property does not represent a *recognized environmental condition* to the property.

6.10 Waste Pits, Ponds and Lagoons

ATC did not observe evidence of waste pits, ponds or lagoons on the property.

6.11 Sumps

ATC observed evidence of sumps on the property as summarized below.

SUMPS						
Location	**Age**	**Construction Materials**	**Capacity & Contents**	**Use Status**	**Discharges To or Disposal Method**	**Condition of Sump & Area**
Southeast corner of asphalt paved parking, north of 1406 10th Avenue building	2 years	Unknown	Unknown capacity / stormwater contents	Active	Storm sewer	Unknown condition of sump; condition of area was free of odors or staining.
South-adjacent to 1416 10th Avenue building	Unknown	Unknown	Unknown	Inactive	Unknown	Unknown condition of sump; condition of area was free of odors or staining

The stormwater sump pump located north of the 1406 10th Avenue building and east of the 1405 11th Avenue building is situated at the lowest point of the asphalt paved parking. According to Mr. Northfield, the sump is less than two years old and is inspected and maintained on a regular basis. No evidence of odors or staining around the sump was observed. Mr. Northfield indicated that the current sump replaced a sump that was installed at an unknown date. ATC has not been able to identify any other records to date identifying the previous sump. Based on the conditions observed, ATC concludes that the sump does not represent a *recognized environmental condition* to the property.

The sump of unknown use and discharge point located south-adjacent of the 1416 10th Avenue building was observed to be dry and free of odors or stains. Based on the historical use of the 1416 10th Avenue building including auto repair and auto springs manufacturing and the unknown discharge point of the sump, ATC concludes that the sump adjacent to the 1416 10th Avenue building represents a potential environmental concern to the property.

6.12 Septic Systems

ATC did not observe evidence of a septic system on the property.

6.13 Stormwater Management System

Storm water is conveyed from the roof by drains that discharge to adjacent sidewalks to the municipal stormwater system. Storm water reaching the surrounding pavement travels by sheet flow to the stormwater sump and catch basins on the property to adjoining streets, where it flows along the gutters to the nearest municipal storm drain.

ATC did not observe indications of staining or release in the areas of stormwater collection/discharge. Based on the observed conditions, ATC concludes that stormwater management does not represent an *environmental concern* to the property.

6.14 Wells

ATC did not observe evidence of wells on the property.

7.0 INTERVIEWS

The following persons were interviewed to obtain information regarding *environmental concerns* in connection with the property:

INTERVIEW SUMMARY				
Role	**Name**	**Title/Company**	**Years Assoc. With Property**	**Interview Type**
Site Escort	Mr. Scott Northfield	Property Manager / Real Property Associates	6	In person
Local Govt. Official	Ms. Sally Perkins	Public Disclosure Coordinator / Ecology	NA	In writing
Local Govt. Official	Mr. Patrick Vanzo	Public Disclosure Coordinator / Public Health – Seattle King County	NA	In writing
Local Govt. Official	Ms. Lauren Poole	Representative / City of Settle Fire Department	NA	In writing
Local Utilities Representative	Unnamed representative	Representative / Seattle Public Utilities	NA	Telephone
Local Utilities Representative	Unnamed representative	Representative / Seattle Public Utilities – Seattle City Light	NA	Telephone

Pertinent information from the interviews is discussed in applicable sections of this report with details (including failed attempts to interview) documented on Record of Communication forms in Appendix J.

8.0 OTHER ENVIRONMENTAL CONDITIONS

8.1 Asbestos-Containing Material (ACM)

Based on the scope of work approved for this Phase I ESA, no sampling for asbestos was performed. However, ATC visually observed various types of suspect asbestos-containing materials (ACM) in the form of drywall with joint compound, suspended ceiling tiles, resilient vinyl floor tiles with mastic, vinyl baseboard with mastic, concrete masonry unit and grout, spray insulation at doors, carpet mastics, brick and mortar, ceramic tile and associated grout, vinyl sheet flooring and associated mastics, and exterior roofing components. These materials were in fair to good overall condition.

Based on the scope of work approved for this Phase I ESA, ATC also reviewed the *Project Close Out Book for Asbestos Abatement at Ruth Ashbrook Bakery, 1407 11th Avenue, Seattle, Washington*, prepared by Performance Abatement Services, dated December 15, 1993. The Project Close Out indicates that in September 1993, Performance Abatement Services removed the following asbestos containing materials from the 1407 11th Avenue building: sheet flooring, vinyl asbestos tile, and pipe insulation. ATC notes that no descriptions (colors, quantities, locations) of the materials were provided, nor was a sample location map.

Prior to the start of renovation/demolition/maintenance activities that may disturb suspect ACM, ATC recommends that suspect ACM be properly assessed. Should ACM be identified, an AHERA-accredited professional should prepare a project specification that would reference the applicable regulations and work practices that an asbestos abatement contractor must follow. ATC also recommends that contractors comply with all federal, state, and local regulations regarding abatement, demolition and disposal of the building materials noted in this report.

8.2 Radon

Radon is a naturally occurring colorless, odorless gas that is a by-product of the decay of radioactive materials potentially present in bedrock and soil. Radon gas may enter the lowest level of a building through floor cracks, structural joints, or plumbing conduits. The United States Environmental Protection Agency (EPA) guidance action level for annual residential exposure to radon is 4.0 Pico Curies per liter of air (pCi/L). The guidance action level is not a regulatory requirement for private owners of commercial real estate, but is commonly used for comparison purposes to suggest whether further action at a building may be prudent.

ATC's review of published radon data indicates that the property is located in an area identified as EPA Radon Zone 3, which indicates a low propensity with regard to the potential for elevated levels of radon gas. Of 106 radon tests conducted in King County, 97% of sample results from basements and 99% of sample results from first floor living areas were below the EPA guidance action level of 4.0 pCi/L. Based upon identified statistics, ATC does not consider radon to be an environmental concern to the property, and no additional radon investigations are recommended at this time. Therefore, as part of this assessment, it was not necessary to conduct radon tests.

8.3 Lead in Drinking Water

ATC confirmed with the City of Seattle that the municipally supplied water meets or exceeds all drinking water standards, including those for lead. Based on the fact that the water supplied to the property is from the municipality, lead in drinking water testing was not conducted for this Phase I ESA.

8.4 Lead-Based Paint (LBP)

Based on the original construction date of the property buildings (early 1900s), it is possible that LBP is present at the property. Observed suspect LBP was noted to be in good condition at the time of the property reconnaissance. ATC recommends that painted surfaces be sampled for lead prior to disturbance. ATC also recommends that contractors performing work on painted surfaces should follow applicable OSHA guidelines for lead in painted surfaces.

8.5 Mold Screening

ATC conducted a screening survey for readily observable mold and conditions conducive to mold on the property. The screening consisted of limited interview, document review and physical observation.

Ms. Hillary Williams of ATC spoke with Mr. Scott Northfield of Real Property Associates regarding potential mold conditions at the property. According to Mr. Northfield, he knows of no potential mold conditions at the property.

ATC requested documentation regarding current or historic mold conditions at the property. No documentation was provided to ATC for review.

During the site reconnaissance, Ms. Williams of ATC conducted a physical observation of certain HVAC system areas and other representative building areas as described in Section 2.2. ATC was escorted by Mr. Northfield of Real Property Associates, who provided access and answered questions.

Based on the results of the interview, document review and physical observation, ATC found no evidence indicating potential mold impact at the property. However, Mr. Northfield indicated that in the 1406 10th Avenue building, there are some moisture intrusion issues that result in stained ceiling panels. The moisture intrusion events are reported and addressed as needed. Mr. Northfield was not aware of any areas of potential suspect mold growth.

Based on the results of the interview and physical observation, ATC found no evidence indicating significant potential mold impact at the property.

8.6 Additional User Requested Conditions

In accordance with the Alliance Phase I Scope of Work, the following additional environmental risks were evaluated:

Environmentally Sensitive Areas

ATC obtained a NEPACheck® report from EDR to further evaluate potential environmentally sensitive areas. The results of the search are summarized in the table below. A summary of the database information is presented in the following section.

A copy of the NEPACheck report is provided in Appendix L.

NEPACheck®			
Database Searched	**Search Radius**	**Site Listed in Database**	**Number of Sites Within Search Radius**
Natural Areas			
US Federal Lands	1 mile	No	0
WA Endangered Species	1 mile	No	0
County Endangered Species	County	Yes	1
Historic Sites			
National Register of Historic Places	1 mile	No	42
WA Historic Sites	1 mile	No	46
Floodplains			
Floodplain	1 mile	No	0
Wetlands			
National Wetlands Inventory	1 mile	Yes	1

Natural Areas Map

The Natural Areas Map included information from the Federal Lands database, the Officially Designated Wildlife Preserves, Sanctuaries, and Refuges database (updated 12/31/2005), the Wild and Scenic Rivers database (updated 12/31/2005), and the Endangered Species database (update not indicated).

The property is not listed in the Federal Lands database.

Neither the property nor other properties within a one-mile radius of the property are listed in the Officially Designated Wildlife Preserves, Sanctuaries, and Refuges database.

Neither the property nor other properties within a one-mile radius of the property are listed in the Wild and Scenic Rivers database.

King County is listed in the Endangered Species database for the Northern Spotted Owl, the Marbled Murrelet, the Bald Eagle, the Chinook Salmon, the Bull Trout, the Gray Wolf and the Grizzly Bear; however, no specific habitat areas are identified. Based on the long term urban development (since the circa early 1900s) of the property and surrounding area, ATC concludes that the property does not inhabit any of the endangered species listed.

Historic Sites Map

The Historic Sites Map included information from National Register of Historic Places (NRHP, updated 3/23/2006):

The property is not listed within the NRHP. Numerous nearby properties were identified within the NRHP within one mile of the property. Majority of the sites are located to the southwest and south-southwest in the historic areas of Downtown Seattle. Two nearby properties are listed within the NRHP, within one-eighth to one-quarter mile from the property, including Fire Station 25 and Phillips House. Due to the dense development of the surrounding area, neither of these listed nearby properties are visible from the property and therefore are not considered a concern to the property.

Floodplain Map

According to a review of the Federal Emergency Management Agency (FEMA), Flood Insurance Rate Map (FIRM) for Community Panel Number 53033C0630F dated May 16, 1995; the property is located in Zone X, which is determined to be areas outside the 500-year flood plain. Based on this information, flood plains do not represent an environmental concern to the property. A copy of this map is provided in Appendix L.

According to the FEMA Floodplain Map obtained by EDR neither the Site nor other properties within a one-mile radius of the Site are located within a floodplain.

Wetlands Map

According to the Wetlands Map obtained by EDR from the United States Fish and Wildlife Service (USFWS), no on-site wetlands were identified; one isolated wetland is listed within a one mile radius of the property. Based on this information and the fully developed nature of the property, wetlands do not represent an environmental concern to the property. A copy of this map is provided in Appendix L.

APPENDIX D

USER PROVIDED DOCUMENTATION

ATTACHMENT
CLIENT QUESTIONNAIRE

Per ASTM Standard Practice E 1527-05, Section 6, User Responsibilities, the User of an ESA has specific obligations for performing tasks during the ESA that will help identify the possibility of *recognized environmental conditions* in connection with the Site. Failure by the User to fully comply with the requirements may result in a *data gap* being identified in the report and may impact their ability to use the report to help qualify for *Landowner Liability Protections* (LLPs) under Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). If this questionnaire is not returned to ATC prior to issuance of the draft report, then ATC assumes that the User does not have any information or actual knowledge pursuant to ASTM Standard Practice E 1527-05, Section 6, User Responsibilities. ATC makes no representations or warranties regarding a User's qualification for protection under any federal, state or local laws, rules or regulations.

Please complete the following and return immediately via email or fax to the attention of: Hillary Williams at (206) 781-1543 or via e-mail to hillary.williams@atcassociates.com
If other parties are intending to be the Users of the ESA report, then please forward a copy of this questionnaire for them to complete and return to ATC.

Site Name: Proposed 11th & Union Development

Site Address: 1406 & 1416 10th Avenue and 1401 & 1405 11th Avenue, Seattle, WA

ATC Project Number: _____

Please provide the following information (if available) per the requirements of ASTM E 1527-05.

1. Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25)

Are you aware of any environmental cleanup liens against the site that are filed or recorded under federal, tribal, state or local law? Yes ☐ or No ☒

If yes, please provide a description of the lien(s).

See land owner provided materials to review, Alliance has no knowledge of this site

2. Activity and land use limitations (AULs) that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26)

Are you aware of any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law? Yes ☐ or No ☒ If yes, please provide.

3. Specialized knowledge or experience of the person seeking to qualify for the Landowner Liability Protections (40 CFR 312.28)

As the user of this ESA do you have any specialized knowledge or experience related to the site or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the site or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

Yes ☐ or No ☒ If yes, please explain.

4. Relationship of the purchase price to the fair market value of the site if it were not contaminated (40 CFR 312.29)

a. Does the purchase price being paid for this site reasonably reflect the fair market value of the site? Yes ☒ or No ☐

b. If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the site? Yes ☐ or No ☐ If yes, please explain.

N/A

5. Commonly known or reasonably ascertainable information about the site (40 CFR 312.30)

Are you aware of commonly known or reasonably ascertainable information about the site that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user,

a. Do you know the past uses of the site? Yes ☐ or No ☒ If yes, please state.

b. Do you know of specific chemicals that are present or once were present at the site? Yes ☐ or No ☒ If yes, please state.

c. Do you know of spills or other chemical releases that have taken place at the site? Yes ☐ or No ☒ If yes, please state.

6. Do you know of any environmental cleanups that have taken place at the site? Yes ☐ or No ☒ If yes, please state.

7. The degree of obviousness of the presence or likely presence of contamination at the site, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31)

As the user of this ESA, based on your knowledge and experience related to the site are there any obvious indicators that point to the presence or likely presence of contamination at the site?
Yes ☐ or No ☒ If yes, please explain.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY SEARCH RESULTS

The target property was not listed in any of the databases searched by EDR.

DATABASES WITH NO MAPPED SITES

No mapped sites were found in EDR's search of available ("reasonably ascertainable ") government records either on the target property or within the search radius around the target property for the following databases:

EXECUTIVE SUMMARY

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 02/25/2011 has revealed that there is 1 CERC-NFRAP site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 06/15/2011 has revealed that there is 1 RCRA-LQG site within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SUPERIOR CLEANERS	1221 E MADISON ST	E 0 - 1/8 (0.073 mi.)	H89	59

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 06/15/2011 has revealed that there are 5 RCRA-SQG sites within approximately 0.25 miles of the target property.

RCRA-CESQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

A review of the RCRA-CESQG list, as provided by EDR, and dated 06/15/2011 has revealed that there are 16 RCRA-CESQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

CSCSL: The State Hazardous Waste Sites records are the states' equivalent to CERCLIS. These sites may or may not already be listed on the federal CERCLIS list. Priority sites planned for cleanup using state funds (state equivalent of Superfund) are identified along with sites where cleanup will be paid for by potentially responsible parties. The data come from the Department of Ecology's Confirmed & Suspected Contaminated Sites List.

A review of the CSCSL list, as provided by EDR, and dated 10/25/2011 has revealed that there are 90 CSCSL sites within approximately 1 mile of the target property.

State and tribal landfill and/or solid waste disposal site lists

SWF/LF: The Solid Waste Facilities/Landfill Sites records typically contain an inventory of solid waste disposal facilities or landfills in a particular state. The data come from the Department of Ecology's Solid Waste Facilities Handbook.

A review of the SWF/LF list, as provided by EDR, and dated 10/11/2011 has revealed that there is 1 SWF/LF site within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the Department of Ecology's Statewide UST Site/Tank Report.

A review of the UST list, as provided by EDR, and dated 11/22/2011 has revealed that there are 20 UST sites within approximately 0.25 miles of the target property.

CSCSL NFA: The data set contains information about sites previously on the Confirmed and Suspected Contaminated Sites list that have received a No Further Action (NFA) determination. Because it is necessary to maintain historical records of sites that have been investigated and cleaned up, sites are not deleted from the database when cleanup activities are completed. Instead a No Further Action code is entered based upon the type of NFA determination the site received.

A review of the CSCSL NFA list, as provided by EDR, and dated 10/25/2011 has revealed that there are 22 CSCSL NFA sites within approximately 0.5 miles of the target property.

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 06/15/2011 has revealed that there are 19 RCRA-NonGen sites within approximately 0.25 miles of the target property.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

EDR Historical Auto Stations: EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc.

A review of the EDR Historical Auto Stations list, as provided by EDR, has revealed that there are 199 EDR Historical Auto Stations sites within approximately 0.25 miles of the target property.

EDR Historical Cleaners: EDR has searched selected national collections of business directories and has collected listings of potential dry cleaner sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include dry cleaning establishments. The categories reviewed included, but were not limited to dry cleaners, cleaners, laundry, laundromat, cleaning/laundry, wash & dry etc.

A review of the EDR Historical Cleaners list, as provided by EDR, has revealed that there are 40 EDR Historical Cleaners sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a

FERRARI OF SEATTLE (Continued) **1001969793**

means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Comments:	This is a site where monitoring wells have been installed and are being tested on an annual basis. In the course of taking a sample, purge water containing low levels of chlorinated solvents (less than 100 ppb) were pumped out of the monitoring wells as a part of overall remediation activities.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:
Waste code: WSQG
Waste name: A placeholder to allow BR submission to validate. In WA State, Conditionally Exempt Small Quantity Generators (Called SQG in WA) are not required to report waste streams, so no valid State or Fed codes are available for reporting to BR.

Violation Status: No violations found

FINDS:

Registry ID: 110005313455

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

CALLAHANS AUTO REBUILD INC (Continued) **1004793562**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport,

SEATTLE UNIVERSITY (Continued) **1000421930**

and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

CAR TENDER (Continued) **1001490858**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Facility name: SEATTLE CENTRAL COMMUNITY COLLEGE
Classification: Large Quantity Generator

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D005
Waste name: BARIUM

Waste code: D007

SEATTLE CENTRAL COMMUNITY COLLEGE (Continued) **1004613903**

Waste name: CHROMIUM

Waste code: D008
Waste name: LEAD

Waste code: D009
Waste name: MERCURY

Waste code: D011
Waste name: SILVER

Waste code: D035
Waste name: METHYL ETHYL KETONE

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: U080
Waste name: METHANE, DICHLORO-

Waste code: WP01
Waste name: Washington State Extremely Hazardous Persistent Waste containing Halogenated Organic Compounds (HOC) at a total concentration level of Greater than 1.0%.

Waste code: WSC2
Waste name: Washington State solid or semisolid corrosive Dangerous Waste with a pH less than or equal to 2, or greater than or equal to 12.5, based upon a specific testing method.

Waste code: WT02
Waste name: Washington State Dangerous Toxic Waste with a toxic constituents concentration greater than or equal to 0.001% and less than 1.0%, determined by biological testing methods or a book designation procedure.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Handler Activities Summary:
U.S. importer of hazardous waste: No
Mixed waste (haz. and radioactive): No
Recycler of hazardous waste: No
Transporter of hazardous waste: No
Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D005
Waste name: BARIUM

Waste code: D008
Waste name: LEAD

Waste code: D009
Waste name: MERCURY

Waste code: D010
Waste name: SELENIUM

Waste code: D011
Waste name: SILVER

Waste name: ACETONE (I)

Waste code: U010
Waste name: AZIRINO[2',3':3,4]PYRROLO[1,2-A]INDOLE-4,7-DIONE, 6-AMINO-8-[[(AMINOCARBONYL)OXY]METHYL]-1,1A,2,8,8A,8B-HEXAHYDRO-8A-METHOXY-5-METHYL-, [1AS-(1AALPHA, 8BETA,8AALPHA,8BALPHA)]-

Waste code: WP02
Waste name: Washington State Dangerous Persistent Waste containing Halogenated Organic Compounds (HOC) at a total concentration level of 0.01% to 1.0%.

Waste code: WSC2
Waste name: Washington State solid or semisolid corrosive Dangerous Waste with a pH less than or equal to 2, or greater than or equal to 12.5, based upon a specific testing method.

Waste code: WT02
Waste name: Washington State Dangerous Toxic Waste with a toxic constituents concentration greater than or equal to 0.001% and less than 1.0%, determined by biological testing methods or a book designation procedure.

Biennial Reports:

Last Biennial Reporting Year: 2011

Annual Waste Handled:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
Amount (Lbs): 92087

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
Amount (Lbs): 90

Waste code: D005
Waste name: BARIUM
Amount (Lbs): 125

Waste code: D008
Waste name: LEAD
Amount (Lbs): 240

Environmental Interest/Information System

Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

AFS (Aerometric Information Retrieval System (AIRS) Facility Subsystem) replaces the former Compliance Data System (CDS), the National Emission Data System (NEDS), and the Storage and Retrieval of Aerometric Data (SAROAD). AIRS is the national repository for information concerning airborne pollution in the United States. AFS is used to track emissions and compliance data from industrial plants. AFS data are utilized by states to prepare State Implementation Plans to comply with regulatory programs and by EPA as an input for the estimation of total national emissions. AFS is undergoing a major redesign to support facility operating permits required under Title V of the Clean Air Act.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	No
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No

PACIFIC NORTHWEST RESEARCH FOUNDATION (Continued) **1004795091**

Treater, storer or disposer of HW: No
Underground injection activity: No
On-site burner exemption: No
Furnace exemption: No
Used oil fuel burner: No
Used oil processor: No
User oil refiner: No
Used oil fuel marketer to burner: No
Used oil Specification marketer: No
Used oil transfer facility: No
Used oil transporter: No

Date form received by agency: 12/31/2007
Facility name: PACIFIC NORTHWEST RESEARCH FOUNDATION
Classification: Not a generator, verified

Date form received by agency: 12/31/2005
Facility name: PACIFIC NORTHWEST RESEARCH FOUNDATION
Classification: Not a generator, verified

Date form received by agency: 12/31/2003
Facility name: PACIFIC NORTHWEST RESEARCH FOUNDATION
Classification: Small Quantity Generator

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D011

PACIFIC NORTHWEST RESEARCH FOUNDATION (Continued) **1004795091**

Waste name: SILVER

Waste code: D022
Waste name: CHLOROFORM

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: P009
Waste name: AMMONIUM PICRATE (R)

Waste code: U002
Waste name: ACETONE (I)

Waste code: U003
Waste name: ACETONITRILE (I,T)

Waste code: U007
Waste name: ACRYLAMIDE

Waste code: U018
Waste name: BENZ[A]ANTHRACENE

Waste code: U019
Waste name: BENZENE (I,T)

Waste code: U044
Waste name: CHLOROFORM

PACIFIC NORTHWEST RESEARCH FOUNDATION (Continued) **1004795091**

Waste code: U188
Waste name: PHENOL

Waste code: U196
Waste name: PYRIDINE

Waste code: U201
Waste name: 1,3-BENZENEDIOL

Waste code: WSC2
Waste name: Washington State solid or semisolid corrosive Dangerous Waste with a pH less than or equal to 2, or greater than or equal to 12.5, based upon a specific testing method.

Waste code: WSQG
Waste name: A placeholder to allow BR submission to validate. In WA State, Conditionally Exempt Small Quantity Generators (Called SQG in WA) are not required to report waste streams, so no valid State or Fed codes are available for reporting to BR.

Waste code: WT01
Waste name: Washington State Extremely Hazardous Toxic Waste with a toxic constituents concentration greater than or equal to 1.0%, determined by biological testing methods or a book designation procedure.

Waste code: WT02
Waste name: Washington State Dangerous Toxic Waste with a toxic constituents concentration greater than or equal to 0.001% and less than 1.0%, determined by biological testing methods or a book designation procedure.

Violation Status: No violations found

Registry ID: 110009513151

Environmental Interest/Information System
Washington Facility / Site Identification System (WA-FSIS) provides a means to query and display data maintained by the Washington Department of Ecology. This system contains key information for each facility/site that is currently, or has been, of interest to the Air Quality, Dam Safety, Hazardous Waste, Toxics Cleanup, and Water Quality Programs.

RCRAInfo is a national information system that supports the Resource

PACIFIC NORTHWEST RESEARCH FOUNDATION (Continued) **1004795091**

Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Tank ID: 28507
Tank Name: 4
Install Date: 1/1/1991
Capacity: Not reported
Tank Upgrade Date: 1/1/0001
TankSystem Status: Removed
TankSystem Status Change Date: 8/26/1996
Tank Status: Removed
Tank Permit Expiration Date: 1/1/0001
Tank Closure Date: 1/1/0001
Tank Pumping System: Pressurized System
Tank Spill Prevention: Spill Bucket/Spill Box
Tank Overfill Prevention: Overfill Alarm
Tank Material: Fiberglass Reinforced Plastic
Tank Construction: Double Wall Tank
Tank Tightness Test: Not reported
Tank Corrosion Protection: Corrosion Resistant
Pipe Material: Fiberglass
Pipe Construction: Double Wall Pipe
Pipe Primary Release Detection: Automatic Line Leak Detection
Pipe Second Release Detection: Not reported
Pipe Corrosion Protection: Corrosion Resistant
Tank Primary Release Detection: Not reported
Tank Second Release Detection: Not reported
Pipe Tightness Test: Not reported
Tank Actual Status Date: 8/6/1996
Tag Number: A5344

Tank ID: 28552
Tank Name: 8
Install Date: 1/1/1992
Capacity: 10,000 to 19,999 Gallons
Tank Upgrade Date: 2/5/1998
TankSystem Status: Operational
TankSystem Status Change Date: 8/26/1996
Tank Status: Operational
Tank Permit Expiration Date: 10/31/2012

SHELL STATION 121499 (Continued) **U003378491**

Tank Closure Date:	1/1/0001
Tank Pumping System:	Pressurized System
Tank Spill Prevention:	Spill Bucket/Spill Box
Tank Overfill Prevention:	Ball Float Valve (vent line)
Tank Material:	Fiberglass Reinforced Plastic
Tank Construction:	Double Wall Tank
Tank Tightness Test:	Not reported
Tank Corrosion Protection:	Corrosion Resistant
Pipe Material:	Fiberglass
Pipe Construction:	Double Wall Pipe
Pipe Primary Release Detection:	Automatic Line Leak Detection
Pipe Second Release Detection:	Interstitial Monitoring (sump sensor)
Pipe Corrosion Protection:	Corrosion Resistant
Tank Primary Release Detection:	Interstitial Monitoring
Tank Second Release Detection:	Not reported
Pipe Tightness Test:	Not reported
Tank Actual Status Date:	8/6/1996
Tag Number:	A5344
