Based on database information received from WDFW, multiple Oregon white oak (*Quercus garryana*) stands and wetlands are identified adjacent to the project boundarie. Priority anadromous fish and priority resident fish habitat are located immediately off-site to the west and approximately 700 feet east of the subject site in Lake River and Gee Creek, respectively. Priority waterfowl habitat is documented to the south of the property in the NWR. Regular concentrations of purple martins are documented immediately adjacent to the western property boundary. Three bald eagle nests are identified more than ½ mile north of the subject property. Table 2 lists priority habitats and species within an approximate 0.5 mile radius of the subject site as documented by WDFW.

Table 2. Federal and state important species and habitats that may occur in the vicinity of the project boundaries based on agency database information.

Species Common Name	Species Scientific Name	Federal Status	State Status	Location
BIRDS				
Bald Eagle	*Haliaeetus leucocephalus*	None	Threatened	Off-site to the north, more than 0.5 mi away.
Purple Martin	*Progne subis*	None	Candidate	Off-site to the west, immediately adjacent to site boundaries, and off-site to the south, approximately 0.12 mile.
FISH				
Fall, spring, summer Chinook Salmon; Lower Columbia ESU	*Oncorhynchus tshawytscha*	Threatened	Candidate	Immediately off-site in Lake River
Fall stream Chinook Salmon	*Oncorhynchus tshawytscha*	None	Listed or Candidate	Immediately off-site in Lake River
Fall Chum Salmon; Columbia ESU	*Oncorhynchus keta*	Threatened	Candidate	Immediately off-site in Lake River
Pink Salmon	*Oncorhynchus*	None	Priority	Immediately off-site in Lake River
Sockeye Salmon	*Oncorhynchus*	None	Priority	Immediately off-site in Lake River
Coho Salmon; Lower Columbia ESU	*Oncorhynchus kisutch*	Candidate	Not listed	Immediately off-site in Lake River

Species Common Name	Species Scientific Name	Federal Status	State Status	Location
Summer, winter Steelhead	*Oncorhynchus mykiss*	Threatened	Candidate	Immediately off-site in Lake River
Coastal Cutthroat; resident	*Oncorhynchus clarki clarki*	None	Priority	Immediately off-site in Lake River, Gee Creek.
Rainbow Trout; resident	*Oncorhynchus mykiss*	None	Priority	Immediately off-site in Lake River
HABITAT				
Wetlands	---	None	Priority	Off-site immediately adjacent to northern and eastern site boundaries, within Ridgefield NWR.
Oregon white oak stands	---	None	Priority	Off-site, immediately adjacent to northern and eastern site boundaries, and off-site to the south within Ridgefield NWR. Approximately 0.15 mile off-site to the east in downtown Ridgefield.
Waterfowl concentrations	---	None	Priority	Off-site to the north and south within Ridgefield NWR.
Anadromous fish habitat	---	None	Priority	Immediately off-site within Lake River and Gee Creek.
Resident fish habitat	---	None	Priority	Immediately off-site within Lake River.

CITY CODE STANDARDS

Habitat Evaluation

Ridgefield Municipal Code 18.280.110 (C)(1) requires that a Critical Areas Report for a Riparian Management Area or Riparian Buffer include evaluation of the habitat functions using the Clark County habitat conservation ordinance Riparian Habitat field rating form or another habitat evaluation tool approved by the Washington Department of Fish and Wildlife. We used the Clark County rating form. This field rating form is intended only to qualitatively rate riparian habitats and is not an officially scored rating scale.

The riparian habitat in question received 11 out of a possible 48 points allotted on the rating form to assess fish habitat functions. The vegetation on-site provides little cover, there are no springs contributing to the main water channel, and there are no associated wetlands. The area had no observed influence over water flow, dissolved oxygen, or temperature. Vegetation along the banks may reduce sedimentation to a small degree. There are no pools or off channel habitats in which amphibians and fish may breed.

The habitat scored 10 out of a possible 23 points for terrestrial habitat function. With very few native woody plant species, downed logs, and snags, and the functional separation of the riparian area from other terrestrial habitats, there is limited potential for terrestrial fauna nesting.

Riparian Buffer Requirements

Pursuant to Ridgefield Municipal Code (RMC) 18.280.110 (A)(1), the Riparian Buffer extends landward 175 feet from the Ordinary High Water Mark of Shorelines of the state. The code allows development in the Riparian Management Area if it supports water-dependent, water-related, or water-enjoyment use. These terms are defined by Washington Administrative Code 173-26-020 (36), (37), (40; a, b). Water-dependent activities are those that cannot be accomplished at any location other than one that is directly adjacent to the water's edge. Water-related uses are those that do not require water access, but are economically more practical due to a proximal location to the water body such as those which require shipment of materials or provide services that are made more affordable or more convenient due to the location. Water-enjoyment use encompasses recreational or other appreciative access to the shoreline. The shoreline-oriented space of the establishment must be devoted to the water-enjoyment use and be open to the general public.

The riparian management code also states that if an impervious surface from previous development completely functionally isolates the Riparian Management Area or the Riparian Buffer from the water body, the regulated riparian area is to extend only from the ordinary high water mark to the impervious surface (RMC 18.280.110 (B)(3).

At the subject property, asphalt, concrete, gravel, or filled surfaces exist for the entire length of the shoreline, creating an impervious surface within the code described Riparian Buffer. Therefore, the regulated riparian area is limited to that part of the riverbank between the asphalt or concrete areas and the line of Mean Higher High Tide. Any additional impervious surface in the designated on-site buffer will be mitigated for.

Wetland Buffer Requirements

According to RMC, areas which are completely functionally separated from a wetland and do not protect the wetland from adverse impacts may be excluded from buffers otherwise required (18.280.150 (F)). Because the on-site areas adjacent to the wetland are paved and previously developed and are separated from the wetland by a retaining wall, the buffer will extend to the edge of the existing impervious surface. Any additional impervious surface in the designated on-site buffer will be mitigated for.

CONCLUSIONS

A substantial amount of fill has been placed on the subject property leading to its development and operation as an industrial mill for several decades. Because of this development and historical industrial and commercial activity, overall, the subject area is a low quality habitat and constitutes little functional value for native flora and fauna. Existing habitat value may be retained through preservation of trees within the functional buffers of Lake River and the adjacent off-site wetland. Additional impacts to riverine habitat can be avoided through use of existing piles beyond the ordinary high water mark of Lake River and use of existing stormwater outfalls within the riparian buffer. There is much potential for aesthetic and functional improvement with the construction of walking trails, parks, and landscaping along the river banks and replacement of non-native, invasive plant species with those that are native to this region.

Category III = Score 30-50
Category IV = Score < 30

Score for Water Quality Functions	22
Score for Hydrologic Functions	20
Score for Habitat Functions	22
TOTAL Score for functions	**64**

Category based on SPECIAL CHARACTERISTICS of wetland

I _____ II _____ Does not Apply X

Final Category **(choose the "highest" category from above)** II

Check the appropriate type and class of wetland being rated.

Wetland Type		Wetland Class	
Estuarine	☐	**Depressional**	☒
Natural Heritage Wetland	☐	**Riverine**	☐
Bog	☐	**Lake-fringe**	☐
Mature Forest	☐	**Slope**	☐
Old Growth Forest	☐	**Flats**	☐
Coastal Lagoon	☐	**Freshwater Tidal**	☐
Interdunal	☐		
None of the above		Check if unit has multiple HGM classes present	☐

Comments

Does the wetland being rated meet any of the criteria below?

If you answer YES to any of the questions below you will need to protect the wetland according to the regulations regarding the special characteristics found in the wetland.

Check List for Wetlands That Need Additional Protection (in addition to the protection recommended for its category)	YES	NO
SP1. *Has the wetland been documented as a habitat for any Federally listed Threatened or Endangered animal or plant species (T/E species)?* For the purposes of this rating system, "documented" means the wetland is on the appropriate state or federal database.		unknown
SP2. *Has the wetland unit been documented as habitat for any State listed Threatened or Endangered animal species?* For the purposes of this rating system, "documented" means the wetland is on the appropriate state database. Note: Wetlands with State listed plant species are categorized as Category 1 Natural Heritage Wetlands (see p. 19 of data form).		unknown
SP3. *Does the wetland contain individuals of Priority species listed by the WDFW for the state?*		unknown
SP4. *Does the wetland have a local significance in addition to its functions?* For example, the wetland has been identified in the Shoreline Master Program, the Critical Areas Ordinance, or in a local management plan as having special significance.		unknown

To complete the next part of the data sheet you will need to determine the Hydrogeomorphic Class of the wetland being rated.

The hydrogeomorphic classification groups wetlands into those that function in similar ways. This simplifies the questions needed to answer how well the wetland functions. The Hydrogeomorphic Class of a wetland can be determined using the key below. See p. 24 for more detailed instructions on classifying wetlands.

Comments These questions are marked unknown because research of state and federal listed species was not part of the project scope. Answering these questions has no affect on the final wetland rating.

Classification of Wetland Units in Western Washington

If the hydrologic criteria listed in each question do not apply to the entire unit being rated, you probably have a unit with multiple HGM classes. In this case, identify which hydrologic criteria in questions 1-7 apply, and go to Question 8.

1. Are the water levels in the wetland usually controlled by tides (i.e. except during floods)?

☒NO – go to 2 ☐**YES** – the wetland class is **Tidal Fringe**

If yes, is the salinity of the water during periods of annual low flow below 0.5 ppt (parts per thousand)? ☐ **YES – Freshwater Tidal Fringe** ☐**NO – Saltwater Tidal Fringe (Estuarine)**

*If your wetland can be classified as a Freshwater Tidal Fringe use the forms for **Riverine** wetlands. If it is Saltwater Tidal Fringe it is rated as an **Estuarine** wetland.* Wetlands that were called estuarine in the first and second editions of the rating system are called Salt Water Tidal Fringe in the Hydrogeomorphic Classification. Estuarine wetlands were categorized separately in the earlier editions, and this separation is being kept in this revision. To maintain consistency between editions, the term "Estuarine" wetland is kept. Please note, however, that the characteristics that define Category I and II estuarine wetlands have changed (see p.).

2. The entire wetland unit is flat and precipitation is the only source (>90%) of water to it. Groundwater and surface water runoff are NOT sources of water to the unit.

☒NO – go to 3 ☐**YES** – The wetland class is **Flats**

If your wetland can be classified as a "Flats" wetland, use the form for **Depressional** wetlands.

3. Does the wetland **meet both** of the following criteria?

☐ The vegetated part of the wetland is on the shores of a body of open water (without any vegetation on the surface) at least 20 acres (8 ha) in size;
☐ At least 30% of the open water area is deeper than 6.6 ft (2 m)?

☒NO – go to 4 ☐**YES** – The wetland class is **Lake-fringe (Lacustrine Fringe)**

4. Does the wetland **meet all** of the following criteria?

☐ The wetland is on a slope (*slope can be very gradual*),
☐ The water flows through the wetland in one direction (unidirectional) and usually comes from seeps. It may flow subsurface, as sheetflow, or in a swale without distinct banks.
☐ The water leaves the wetland **without being impounded**?
NOTE: *Surface water does not pond in these type of wetlands except occasionally in very small and shallow depressions or behind hummocks(depressions are usually <3ft diameter and less than 1 foot deep).*

☒NO - go to 5 ☐**YES** – The wetland class is **Slope**

Comments

5. Does the entire wetland unit **meet all** of the following criteria?

☐ The unit is in a valley, or stream channel, where it gets inundated by overbank flooding from that stream or river
☐ The overbank flooding occurs at least once every two years.
NOTE: The riverine unit can contain depressions that are filled with water when the river is not flooding.

☒NO - go to 6 ☐ **YES** – The wetland class is **Riverine**

6. Is the wetland in a topographic depression in which water ponds, or is saturated to the surface, at some time of the year. *This means that any outlet, if present, is higher than the interior of the wetland.*

☐NO – go to 7 ☒**YES** – The wetland class is **Depressional**

7. Is the wetland located in a very flat area with no obvious depression and no overbank flooding. The unit does not pond surface water more than a few inches. The unit seems to be maintained by high groundwater in the area. The wetland may be ditched, but has no obvious natural outlet.

☒NO – go to 8 ☐ **YES** – The wetland class is **Depressional**

8. Your wetland seems to be difficult to classify and probably contains several different HGM classes. For example, seeps at the base of a slope may grade into a riverine floodplain, or a small stream within a depressional wetland has a zone of flooding along its sides. GO BACK AND IDENTIFY WHICH OF THE HYDROLOGIC REGIMES DESCRIBED IN QUESTIONS 1-7 APPLY TO DIFFERENT AREAS IN THE UNIT (make a rough sketch to help you decide). Use the following table to identify the appropriate class to use for the rating system if you have several HGM classes present within your wetland. NOTE: Use this table only if the class that is recommended in the second column represents 10% or more of the total area of the wetland unit being rated. If the area of the class listed in column 2 is less than 10% of the unit; classify the wetland using the class that represents more than 90% of the total area.

HGM Classes within the wetland unit being rated	HGM Class to Use in Rating
Slope + Riverine	Riverine
Slope + Depressional	Depressional
Slope + Lake-fringe	Lake-fringe
Depressional + Riverine along stream within boundary	Depressional
Depressional + Lake-fringe	Depressional
Salt Water Tidal Fringe and any other class of freshwater wetland	Treat as ESTUARINE under wetlands with special characteristics

If you are unable still to determine which of the above criteria apply to your wetland, or you have more than 2 HGM classes within a wetland boundary, classify the wetland as **Depressional** for the rating.

Comments

D	**Depressional and Flats Wetlands** **WATER QUALITY FUNCTION** – Indicators that the wetland unit functions to improve water quality	**Points** (only 1 score per box)
D	**D 1. Does the wetland have the potential to improve water quality?**	*(see p.38)*
D	D 1.1 Characteristics of surface water flows out of the wetland: Unit is a depression with no surface water leaving it (no outlet) points = 3 Wetland has an intermittently flowing, OR highly constricted, permanently flowing outlet points = 2 Wetland has an unconstricted, or slightly constricted, surface outlet *(permanently flowing)* points = 1 Unit is a "flat" depression (Q. 7 on key), or in the Flats class, with permanent surface outflow **and no obvious natural outlet** and/or outlet is a man-made ditch points = 1 *(if ditch is not permanently flowing treat unit as "intermittently flowing")* Provide photo or drawing	Figure__ 2
D	D 1.2 The soil 2 inches below the surface (or duff layer) is clay or organic *(use NRCS definitions)* YES points = 4 NO points = 0	0
D	D 1.3 Characteristics of persistent vegetation (emergent, shrub, and/or forest class): Wetland has persistent, ungrazed, vegetation > = 95% of area points = 5 Wetland has persistent, ungrazed, vegetation > = 1/2 of area points = 3 Wetland has persistent, ungrazed vegetation > = 1/10 of area points = 1 Wetland has persistent, ungrazed vegetation <1/10 of area points = 0 Map of Cowardin vegetation classes	Figure__ 5
D	D1.4 Characteristics of seasonal ponding or inundation. *This is the area of the wetland that is ponded for at least 2 months, but dries out sometime during the year. Do not count the area that is permanently ponded. Estimate area as the average condition 5 out of 10 yrs.* Area seasonally ponded is > ½ total area of wetland points = 4 Area seasonally ponded is > ¼ total area of wetland points = 2 Area seasonally ponded is < ¼ total area of wetland points = 0 Map of Hydroperiods	Figure__ 4
D	**Total for D 1** *Add the points in the boxes above*	11
D	**D 2. Does the wetland have the opportunity to improve water quality?** Answer YES if you know or believe there are pollutants in groundwater or surface water coming into the wetland that would otherwise reduce water quality in streams, lakes or groundwater downgradient from the wetland? *Note which of the following conditions provide the sources of pollutants. A unit may have pollutants coming from several sources, but any single source would qualify as opportunity.* ☐ Grazing in the wetland or within 150 ft ☐ Untreated stormwater discharges to wetland ☐ Tilled fields or orchards within 150 ft of wetland ☐ A stream or culvert discharges into wetland that drains developed areas, residential areas, farmed fields, roads, or clear-cut logging ☒ Residential, urban areas, golf courses are within 150 ft of wetland ☐ Wetland is fed by groundwater high in phosphorus or nitrogen ☐ Other ____ ☒ **YES** multiplier is 2 ☐ **NO** multiplier is 1	*(see p.44)* multiplier 2
D	**TOTAL - Water Quality Functions** Multiply the score from D1 by D2 *Add score to table on p. 1*	22

D	**Depressional and Flats Wetlands** HYDROLOGIC FUNCTIONS – Indicators that wetland functions to reduce flooding and stream degradation	**Points**
	D 3. Does the wetland have the potential to reduce flooding and erosion?	*(see p.46)*
D	D 3.1 Characteristics of surface water flows out of the wetland unit Unit is a depression with no surface water leaving it (no outlet) points = 4 Unit has an intermittently flowing, OR highly constricted permanently flowing outlet points = 2 Unit is flat depression (Q. 7 on key), or in the Flats class, with permanent surface outflow **and no obvious natural outlet** and/or is a man-made ditch points = 1 *(If ditch is not permanently flowing treat unit as "intermittently flowing")* Unit has an unconstricted, or slightly constricted, surface outlet (permanently flowing) points = 0	Figure__ 2
D	D 3.2 Depth of storage during wet periods *Estimate the height of ponding above the bottom of the outlet. For units with no outlet measure from the surface of permanent water or deepest part (if dry).* Marks of ponding are 3 ft or more above the surface or bottom of outlet points = 7 The wetland is a "headwater" wetland points = 5 Marks of ponding between 2 ft to < 3 ft from surface or bottom of outlet points = 5 Marks are at least 0.5 ft to < 2 ft from surface or bottom of outlet points = 3 Wetland is flat (yes to Q 2 or Q. 7 on key) but has small depressions on the surface that trap water points = 1 Marks of ponding less than 0.5 ft points = 0	Figure_ 5
D	D 3.3 Contribution of wetland to storage in the watershed *Estimate the ratio of the area of upstream basin contributing surface water to the wetland to the area of the wetland unit itself.* The area of the basin is less than 10 times the area of unit points = 5 The area of the basin is 10 to 100 times the area of the unit points = 3 The area of the basin is more than 100 times the area of the unit points = 0 Entire unit is in the FLATS class points = 5	Figure__ 3
D	**Total for D 3** *Add the points in the boxes above*	10
D	**D 4. Does the wetland have the opportunity to reduce flooding and erosion?** Answer YES if the wetland is in a location in the watershed where the flood storage, or reduction in water velocity it provides, helps protect downstream property and aquatic resources from flooding or excessive and/or erosive flows. Answer NO if the water coming into the wetland is controlled by a structure such as flood gate, tide gate, flap valve, reservoir etc. OR you estimate that more than 90% of the water in the wetland is from groundwater in areas where damaging groundwater flooding does not occur. *Note which of the following indicators of opportunity apply.* ☒ Wetland is in a headwater of a river or stream that has flooding problems ☒ Wetland drains to a river or stream that has flooding problems ☐ Wetland has no outlet and impounds surface runoff water that might otherwise flow into a river or stream that has flooding problems ☐ Other ____ ☒ **YES** multiplier is 2 ☐ **NO** multiplier is 1	*(see p.49)* multiplier 2
D	**TOTAL - Hydrologic Functions** Multiply the score from D 3 by D 4 *Add score to table on p. 1*	20

Comments

These questions apply to wetlands of all HGM classes **Points** (only 1 score per box)

HABITAT FUNCTIONS – Indicators that wetland functions to provide important habitat

H 1. Does the wetland have the potential to provide habitat for many species?

H 1.1 Vegetation structure *(see p. 72)* **Figure__**

Check the types of vegetation classes present (as defined by Cowardin)- Size threshold for each class is ¼ acre or more than 10% of the area if unit is smaller than 2.5 acres.

☐ Aquatic bed
☒ Emergent plants
☒ Scrub/shrub (areas where shrubs have >30% cover)
☒ Forested (areas where trees have >30% cover)

If the unit has a forested class check if:

☐ Forested areas have 3 out of 5 strata (canopy, sub-canopy, shrubs, herbaceous, moss/ground-cover) that each cover 20% within the forested polygon

Add the number of vegetation types that qualify. If you have:

4 types or more	points = 4
3 types	points = 2
2 types	points = 1
1 type	points = 0

Map of Cowardin vegetation classes

2

H 1.2 Hydroperiods *(see p. 73)* **Figure__**

Check the types of water regimes (hydroperiods) present within the wetland. The water regime has to cover more than 10% of the wetland or ¼ acre to count. (See text for description of hydroperiods.)

☒ Permanently flooded or inundated
☒ Seasonally flooded or inundated
☐ Occasionally flooded or inundated
☒ Saturated only
☐ Permanently flowing stream or river in, or adjacent to, the wetland
☐ Seasonally flowing stream or river in, or adjacent to, the wetland
☐ ***Lake-fringe wetland* = 2 points**
☐ ***Freshwater tidal wetland* = 2 points**

4 or more types present	points = 3
3 types present	points = 2
2 types present	points = 1

2

H 1.3 Richness of Plant Species *(see p. 75)*

Count the number of plant species in the wetland that cover at least 10 ft². *(Different patches of the same species can be combined to meet the size threshold.)*

You do not have to name the species.

Do not include Eurasian Milfoil, reed canarygrass, purple loosestrife, Canadian Thistle.

If you counted:	> 19 species	points = 2
	5 - 19 species	points = 1
List species below if you want to:	<5 species	points = 0

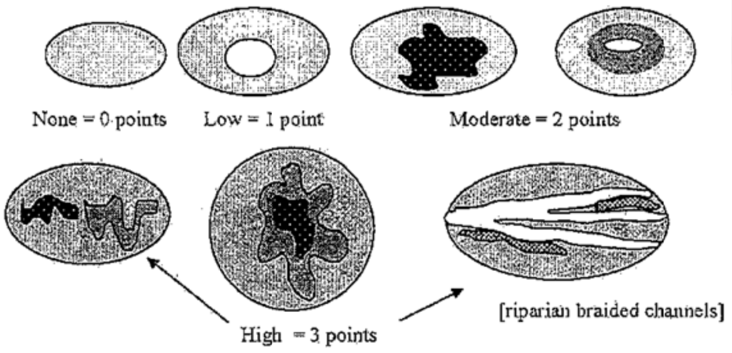
2

Total for page 6

H 1.4 Interspersion of habitats *(see p. 76)* **Figure__**

Decide from the diagrams below whether interspersion between Cowardin vegetation classes (described in H 1.1), or classes and unvegetated areas (can include open water or mudflats) is high, medium, low, or none.

3



NOTE: If you have four or more classes or three vegetation classes and open water the rating is always "high". Use map of Cowardin vegetation classes

H 1.5 Special Habitat Features: *(see p. 77)*

Check the habitat features that are present in the wetland. The number of checks is the number of points you put into the next column.

☒ Large, downed, woody debris within the wetland (>4in. diameter and 6 ft long).
☐ Standing snags (diameter at bottom >4 inches) in the wetland
☐ Undercut banks are present for at least 6.6 ft. (2m) and/or overhanging vegetation extends at least 3.3 ft (1m) over a stream (or ditch) in, or contiguous with the unit, for at least 33 ft (10m)
☐ Stable steep banks of fine material that might be used by beaver or muskrat for denning (>30 degree slope) OR signs of recent beaver activity are present *(cut shrubs or trees that have not yet turned grey/brown)*
☒ At least ¼ acre of thin-stemmed persistent vegetation or woody branches are present in areas that are permanently or seasonally inundated *(structures for egg-laying by amphibians)*
☐ Invasive plants cover less than 25% of the wetland area in each stratum of plants

Note: The 20% stated in early printings of the manual on page 78 is an error

2

H 1. TOTAL Score – potential for providing habitat
Add the scores from H1.1, H1.2, H1.3, H1.4, H1.5 11

Comments:

H 2. Does the wetland have the opportunity to provide habitat for many species?)	
H 2.1 Buffers *(see p. 80)* *Choose the description that best represents condition of buffer of wetland. The highest scoring criterion that applies to the wetland is to be used in the rating. See text for definition of "undisturbed."* ☐ 100 m (330ft) of relatively undisturbed vegetated areas, rocky areas, or open water >95% of circumference. No structures are within the undisturbed part of buffer. (relatively undisturbed also means no grazing, no landscaping, no daily human use) Points = 5 ☒ 100 m (330 ft) of relatively undisturbed vegetated areas, rocky areas, or open water >50% circumference. **Points = 4** ☐ 50 m (170ft) of relatively undisturbed vegetated areas, rocky areas, or open water >95% circumference. **Points = 4** ☐ 100 m (330ft) of relatively undisturbed vegetated areas, rocky areas, or open water >25% circumference. **Points = 3** ☐ 50 m (170ft) of relatively undisturbed vegetated areas, rocky areas, or open water for > 50% circumference. **Points = 3** **If buffer does not meet any of the three criteria above** ☐ No paved areas (except paved trails) or buildings within 25 m (80ft) of wetland > 95% circumference. Light to moderate grazing, or lawns are OK. **Points = 2** ☐ No paved areas or buildings within 50m of wetland for >50% circumference. Light to moderate grazing or lawns are OK **Points = 2** ☐ Heavy grazing in buffer. **Points = 1** ☐ Vegetated buffers are <2m wide (6.6ft) for more than 95% of the circumference (e.g. tilled fields, paving, basalt bedrock extend to edge of wetland) **Points = 0** ☐ Buffer does not meet any of the criteria above. **Points = 1** Aerial photo showing buffers	Figure__ 4
H 2.2 Corridors and Connections *(see p. 81)* H 2.2.1 Is the wetland part of a relatively undisturbed and unbroken vegetated corridor (either riparian or upland) that is at least 150 ft wide, has at least 30% cover of shrubs, forest or native undisturbed prairie, that connects to estuaries, other wetlands or undisturbed uplands that are at least 250 acres in size? *(dams in riparian corridors, heavily used gravel roads, paved roads, are considered breaks in the corridor).* ☐YES = **4 points** *(go to H 2.3)* ☒NO = go to H 2.2.2 H 2.2.2 Is the wetland part of a relatively undisturbed and unbroken vegetated corridor (either riparian or upland) that is at least 50ft wide, has at least 30% cover of shrubs or forest, and connects to estuaries, other wetlands or undisturbed uplands that are at least 25 acres in size? **OR a Lake-fringe** wetland, if it does not have an undisturbed corridor as in the question above? ☒YES = **2 points** *(go to H 2.3)* ☐NO = H 2.2.3 H 2.2.3 Is the wetland: within 5 mi (8km) of a brackish or salt water estuary OR within 3 mi of a large field or pasture (>40 acres) OR within 1 mi of a lake greater than 20 acres? ☐YES = **1 point** ☐NO = **0 points**	2

Total for page 6

H 2.3 Near or adjacent to other priority habitats listed by WDFW *(see p. 82)* Which of the following priority habitats are within 330ft (100m) of the wetland? *(NOTE: the connections do not have to be relatively undisturbed.* *These are DFW definitions. Check with your local DFW biologist if there are any questions* ☒ **Riparian**: The area adjacent to aquatic systems with flowing water that contains elements of both aquatic and terrestrial ecosystems which mutually influence each other. ☐ **Aspen Stands:** Pure or mixed stands of aspen greater than 0.8 ha (2 acres) ☐ **Cliffs:** Greater than 7.6 m (25 ft) high and occurring below 5000 ft ☐ **Old-growth forests:** (Old-growth west of Cascade crest) Stands of at least 2 tree species, forming a multi-layered canopy with occasional small openings, with at least 20 trees/ha (8 trees/acre) > 81 cm (32 in) dbh or > 200 years of age. ☐ **Mature forests:** Stands with average diameters exceeding 53 cm (21 in) dbh, crown cover may be less that 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth; 80 - 200 years old west of the Cascade crest ☐ **Prairies:** Relatively undisturbed areas (as indicated by dominance of native plants) where grasses and/or forbs form the natural climax plant community. ☐ **Talus:** Homogenous areas of rock rubble ranging in average size 0.15 - 2.0 m (0.5 - 6.5 ft), composed of basalt, andesite, and/or sedimentary rock, including riprap slides and mine tailings. May be associated with cliffs. ☐ **Caves:** A naturally occurring cavity, recess, void, or system of interconnected passages ☒ **Oregon white Oak:** Woodlands Stands of pure oak or oak/conifer associations where canopy coverage of the oak component of the stand is 25%. ☐ **Urban Natural Open Space:** A priority species resides within or is adjacent to the open space and uses it for breeding and/or regular feeding; and/or the open space functions as a corridor connecting other *priority habitats*, especially those that would otherwise be isolated; and/or the open space is an isolated remnant of natural habitat larger than 4 ha (10 acres) and is surrounded by urban development ☐ **Estuary/Estuary-like:** Deepwater tidal habitats and adjacent tidal wetlands, usually semi-enclosed by land but with open, partly obstructed or sporadic access to the open ocean, and in which ocean water is at least occasionally diluted by freshwater runoff from the land. The salinity may be periodically increased above that of the open ocean by evaporation. Along some low-energy coastlines there is appreciable dilution of sea water Estuarine habitat extends upstream and landward to where ocean-derived salts measure less than 0.5ppt. during the period of average annual low flow. Includes both estuaries and lagoons. ☐ **Marine/Estuarine Shorelines:** Shorelines include the intertidal and subtidal zones of beaches, and may also include the backshore and adjacent components of the terrestrial landscape (e.g., cliffs, snags, mature trees, dunes, meadows) that are important to shoreline associated fish and wildlife and that contribute to shoreline function (e.g., sand/rock/log recruitment, nutrient contribution, erosion control). If wetland has **3 or more** priority habitats = **4 points** If wetland has **2** priority habitats = **3 points** If wetland has **1** priority habitat = **1 point** No habitats = 0 points *Note: All vegetated wetlands are by definition a priority habitat but are not included in this list. Nearby wetlands are addressed in question H 2.4)*	3

H 2.4 Wetland Landscape *(choose the one description of the landscape around the wetland that best fits) (see p. 84)* There are at least 3 other wetlands within ½ mile, and the connections between them are relatively undisturbed (light grazing between wetlands OK, as is lake shore with some boating, but connections should NOT be bisected by paved roads, fill, fields, or other development. points = 5 The wetland is Lake-fringe on a lake with little disturbance and there are 3 other lake-fringe wetlands within ½ mile points = 5 There are at least 3 other wetlands within ½ mile, BUT the connections between them are disturbed points = 3 The wetland is Lake-fringe on a lake with disturbance and there are 3 other lake-fringe wetlands within ½ mile points = 3 There is at least 1 wetland within ½ mile. points = 2 There are no wetlands within ½ mile. points = 0	2
H 2. TOTAL Score -opportunity for providing habitat *Add the scores in the column above*	11

Total Score for Habitat Functions – add the points for H 1, H 2 and record the result on p. 1	22

Comments

CATEGORIZATION BASED ON SPECIAL CHARACTERISTICS

Please determine if the wetland meets the attributes described below and circle the appropriate answers and Category.

Wetland Type *Check off any criteria that apply to the wetland. Select the appropriate Category (from dropdown menu in Category column) when the appropriate criteria are met.*	**Category**
SC 1.0 Estuarine wetlands ***(see p. 86)*** Does the wetland meet the following criteria for Estuarine wetlands? ☐ The dominant water regime is tidal, ☐ Vegetated, and ☐ With a salinity greater than 0.5 ppt. ☐YES = Go to SC 1.1 ☒NO	
SC 1.1 Is the wetland within a National Wildlife Refuge, National Park, National Estuary Reserve, Natural Area Preserve, State Park or Educational, Environmental, or Scientific Reserve designated under WAC 332-30-151? ☐YES = Category I ☐NO go to SC 1.2	Cat. I
SC 1.2 Is the wetland at least 1 acre in size and meets at least two of the following three conditions? YES = Category I NO = Category II ☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing, and has less than 10% cover of non-native plant species. If the non-native *Spartina* spp. are the only species that cover more than 10% of the wetland, then the wetland should be given a dual rating (I/II). The area of Spartina would be rated a Category II while the relatively undisturbed upper marsh with native species would be a Category I. Do not, however, exclude the area of Spartina in determining the size threshold of 1 acre. ☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland. ☐ The wetland has at least 2 of the following features: tidal channels, depressions with open water, or contiguous freshwater wetlands.	Cat. I Cat. II Dual rating I/II

SC 2.0 Natural Heritage Wetlands *(see p. 87)*

Natural Heritage wetlands have been identified by the Washington Natural Heritage Program/DNR as either high quality undisturbed wetlands or wetlands that support state Threatened, Endangered, or Sensitive plant species.

Cat. I

SC 2.1 Is the wetland being rated in a Section/Township/Range that contains a Natural Heritage wetland? *(this question is used to screen out most sites before you need to contact WNHP/DNR)*

S/T/R information from Appendix D ☒ or accessed from WNHP/DNR web site ☐

YES ☐ – contact WNHP/DNR (see p. 79) and go to SC 2.2 NO ☒

SC 2.2 Has DNR identified the wetland as a high quality undisturbed wetland or as or as a site with state threatened or endangered plant species?

☐YES = Category I ☒NO__not in a Heritage Wetland

SC 3.0 Bogs *(see p. 87)*

Does the wetland (or part of the wetland) meet both the criteria for soils and vegetation in bogs? *Use the key below to identify if the wetland is a bog.* ***If you answer yes you will still need to rate the wetland based on its functions.***

1. Does the unit have organic soil horizons (i.e. layers of organic soil), either peats or mucks, that compose 16 inches or more of the first 32 inches of the soil profile? (See Appendix B for a field key to identify organic soils)
   Yes ☐ - go to Q. 3 No ☒ go to Q. 2
2. Does the wetland have organic soils, either peats or mucks that are less than 16 inches deep over bedrock, or an impermeable hardpan such as clay or volcanic ash, or that are floating on a lake or pond?
   Yes ☐ - go to Q. 3 No ☒ - Is not a bog for purpose of rating
3. Does the wetland have more than 70% cover of mosses at ground level, AND other plants, if present, consist of the "bog" species listed in Table 3 as a significant component of the vegetation (more than 30% of the total shrub and herbaceous cover consists of species in Table 3)?
   Yes ☐– Is a bog for purpose of rating No ☐-go to Q. 4
   NOTE: If you are uncertain about the extent of mosses in the understory you may substitute that criterion by measuring the pH of the water that seeps into a hole dug at least 16" deep. If the pH is less than 5.0 and the "bog" plant species in Table 3 are present, the wetland is a bog.
4. Is the wetland forested (> 30% cover) with sitka spruce, subalpine fir, western red cedar, western hemlock, lodgepole pine, quaking aspen, Englemann's spruce, or western white pine, WITH any of the species (or combination of species) on the bog species plant list in Table 3 as a significant component of the ground cover *(> 30% coverage of the total shrub/herbaceous cover)?*
   YES ☐ = Category I NO ☐ Is not a bog for purpose of rating

Cat. I

SC 4.0 Forested Wetlands *(see p. 90)*

Does the wetland have at least 1 acre of forest that meets one of these criteria for the Department of Fish and Wildlife's forests as priority habitats? *If you answer yes you will still need to rate the wetland based on its functions.*

☐ **Old-growth forests:** (west of Cascade crest) Stands of at least two tree species, forming a multi-layered canopy with occasional small openings; with at least 8 trees/acre (20 trees/hectare) that are at least 200 years of age OR have a diameter at breast height (dbh) of 32 inches (81 cm) or more.

NOTE: The criterion for dbh is based on measurements for upland forests. Two-hundred year old trees in wetlands will often have a smaller dbh because their growth rates are often slower. The DFW criterion is and "OR" so old-growth forests do not necessarily have to have trees of this diameter.

☐ **Mature forests:** (west of the Cascade Crest) Stands where the largest trees are 80 – 200 years old OR have average diameters (dbh) exceeding 21 inches (53cm); crown cover may be less that 100%; decay, decadence, numbers of snags, and quantity of large downed material is generally less than that found in old-growth.

☐YES = Category I ☒ NO not a forested wetland with special characteristics

Cat. I

SC 5.0 Wetlands in Coastal Lagoons *(see p. 91)*

Does the wetland meet all of the following criteria of a wetland in a coastal lagoon?

☐ The wetland lies in a depression adjacent to marine waters that is wholly or partially separated from marine waters by sandbanks, gravel banks, shingle, or, less frequently, rocks

☐ The lagoon in which the wetland is located contains surface water that is saline or brackish (> 0.5 ppt) during most of the year in at least a portion of the lagoon *(needs to be measured near the bottom)*

☐ YES = Go to SC 5.1 NO ☒ not a wetland in a coastal lagoon

SC 5.1 Does the wetland meet all of the following three conditions?

☐ The wetland is relatively undisturbed (has no diking, ditching, filling, cultivation, grazing), and has less than 20% cover of invasive plant species (see list of invasive species on p. 74).

☐ At least ¾ of the landward edge of the wetland has a 100 ft buffer of shrub, forest, or un-grazed or un-mowed grassland.

☐ The wetland is larger than 1/10 acre (4350 square feet)

YES ☐= Category I NO ☐= Category II

SC 6.0 Interdunal Wetlands *(see p. 93)* Is the wetland west of the 1889 line (also called the Western Boundary of Upland Ownership or WBUO)? ☐ YES = Go to SC 6.1 ☒NO -- not an interdunal wetland for rating ***If you answer yes you will still need to rate the wetland based on its functions.*** In practical terms that means the following geographic areas: • Long Beach Peninsula – lands west of SR103 • Grayland-Westport- lands west of SR 105 • Ocean Shores-Copalis- lands west of SR 115 and SR 109 SC 6.1 Is the wetland one acre or larger, or is it in a mosaic of wetlands that is one acre or larger? ☐ YES = Category II ☐ NO go to SC 6.2	
SC 6.2 Is the wetland between 0.1 and 1 acre, or is it in a mosaic of wetlands that is between 0.1 and 1 acre,?	Cat.II
☐ YES = Category III	Cat.III
Category of wetland based on Special Characteristics *Choose the "highest" rating if wetland falls into several categories, and record on p. 1* If you answered NO for all types enter "Not Applicable" on p. 1.	**N/A**

ATTACHMENT C

LAKE RIVER INDUSTRIAL SITE PLANTING LIST

Plants without a Tap Root List

Trees

Abies concolor	White Fir
Acer japonicum*	Japanese Maple
Acer macrophyllum	Big-Leaf Maple
Acer palmatum*	Japanese Maple
Acer rubrum*	Red Maple
Betula papyrifera*	Paper Maple
Betula pendula	Weeping Birch
Carpinus betulus*	European Hornbeam
Cercidiphyllum japonicum	Katsuratree
Cornus florida	Flowering Dogwood
Fagus sylvatica*	European Beech
Fraxinus pennsylvanica*	Green Ash
Larix occidentalis	Western Larch
Picea pungens*	Colorado Spruce
Picea sitchensis	Sitka Spruce
Platanus x acerfolia	London Plane Tree
Populus balsamifera	Black Cottonwood
Prunus emarginata	Bitter Cherry
Prunus serrulata	Japanese Flowering Cherry
Psuedotsug menziesii	Douglas Fir
Salix sp.	Willows
Styrax japonicas	Japanese Snowball
Thuja occidentalis*	Arborvitae
Thuja plicata	Western Red Cedar
Tilia cordata	Little Leaf Linden

Shrubs

Abelia x grandifolia	Glossy Abelia
Acer circinatum	Vine Maple
Andromeda polifolia	Bog Rosemary
Arcostaphylos uvu-ursi	Kinnikinnik
Azalea sp*	Azaleas
Berberis Thunbergii*	Japanese Barberry
Clethra alnifolia	Summersweet Clethra
Cornus alba*	Dogwood
Cornus siricea*	Redosier Dogwood
Deutzia gracilis	Slender Deutzia
Euonymus fortunei*	Wintercreeper Euonymus
Gautheria shallon	Salal
Hamamelis mollis*	Chinese Witchhazel
Hamamelis Virginia	Witch Hazel
Kalmia latifolia	Mountain Laurel
Lonicera japonica*	Japanese Honeysuckle
Mahonia aquifolium 'Compacta' - Compact Oregon Grape	
Oemleria cerasiformis	Indian plum
Physocarpus capitatus	Western Ninebark
Rosa Gymnocarpa	Baldhip Rose
Rhododendron sp.*	Rhododendrons
Sambucus cerulean	Blue elderberry
Sambucus racemosa	Red elderberry
Symphoricarpos albus	Snowberry
Vaccinium corymbosum	Highbush blueberry
Viburnum davidii -	Davids Viburnum
Vaccinium ovatum	Evergreen huckleberry
Viburnum lantana	Wayfaring Tree Viburnum
Viburnum opulus*	European Cranberrybush

Ground Cover

The following list includes anticipated ground cover for the site. However, other perennial herbaceous plants, annual flowers, grasses, sedges, ferns, and mosses are acceptable as well.

Aruncus dioicus	Goat's Beard	Helictotrichon sempervirens	Blue Oat Grass
Belchnum spicant	Deer fern	Miscanthus Sinensis	Maiden Grass
Calluna vulgaris*	Scotch Heather	Pennisetum alopecuroides	Fountain Grass
Camassia quamash	Common Camas	Sesleria autumnalis	Autumn Moor Grass
Cornus Canadensis	Bunchberry	Anemone hybrida	Japanese Anemone
Dicentra Formosa	Bleeding Heart	Daffodil -	Narcissus
Fragaria chiloensis	Coastal Strawberry	Echinacea purpurea -	Purple Cone Flower
Fragaria vesca	Woodland Strawberry	Hemerocallis -	Daylily
Maianthemum dilatatum	False Lily-of-the-Valley	Liriope muscari -	Lilyturf
Oxalis oregano	Wood sorrel	Rudbekia hirta -	Black-eyed Susan
Polystichum munitum	Sword fern	Sedum -	Stonecrop
Vancouveria hexandra	Inside-out flower	Lawn mixes	
Carex -	Sedges		
Deschampsia caespitosa	Tufted Hair Grass		

* Including varieties

Note: This list is not all inclusive and other plant material may be added with if they do not have a tap root.

Data for list was obtained from the following sources:

- US Forest Service Handbook 654 http://www.na.fs.fed.us/pubs/silvics_manual/table_of_contents.shtm
- US Forest Service Shrub list http://www.fs.fed.us/database/feis/plants/shrub/
- USDA Natural Resources Conservation Service – Plants Data Base- http://plants.usda.gov/index.html
- *The Complete Plant Selection Guide for Landscape Design* by Marc C. Stoecklein

APPENDIX C

LAKE RIVER AND CARTY LAKE HABITAT EVALUATION

APPENDIX C LAKE RIVER AND CARTY LAKE HABITAT EVALUATION CONTENTS

APPENDIX C LAKE RIVER AND CARTY LAKE HABITAT EVALUATION

The lower Columbia River extends 146 river miles from Bonneville Dam to the Pacific Ocean. Lake River lies within the lower Columbia River west of Ridgefield, WA, near the confluence of the Columbia River and the Willamette River. Elongated islands frequently divide the Columbia River and form sloughs, side channels, and adjacent lakes. Lake River is a side channel of the Columbia River, and Carty Lake lies in wetlands adjacent to the Columbia River. Both are part of the Portland metropolitan area's last major remnants of the Columbia River floodplain system.

This Lake River and Carty Lake habitat evaluation summarizes ecological information from the following sources: Ecological Land Services' habitat evaluation for the Port of Ridgefield's Lake River Industrial Site (LRIS) (ELS, 2007), Maul Foster & Alongi, Inc.'s Biological Evaluation/Biological Assessment of Day-use Dock and Floating Boat Expansion Project (MFA, 2003), the U.S. Fish and Wildlife Service's Ridgefield National Wildlife Refuge (RNWR) comprehensive conservation plan (USFWS, 2010), and the Washington State Department of Fish and Wildlife priority habitats and species reports for the vicinities of Carty Lake and Lake River (WDFW, 2011a,b).

1.1 Lake River Overview

Lake River is a tidally influenced, 10-mile-long channel on the Washington side of the Columbia River. The National Wetlands Inventory has classified Lake River as a riverine, tidal, unconsolidated bottom, permanent tidal habitat. For an overview of wetlands habitats surrounding Lake River, see Figure 2-3 in the main body of the RI/FS. Lake River originates at Vancouver Lake in Vancouver, WA, to the south. Lake River runs parallel to the Columbia River and merges with the Columbia at the northern tip of Bachelor Island. Sections of the RNWR border the entire length of Lake River to the west. Vancouver, Ridgefield, the LRIS, and Burlington Northern Santa Fe (BNSF) Railway tracks lie along the ridge to the east of Lake River. Lake River is slow moving, approximately 100 to over 300 feet wide and 10 feet deep or less, with steep banks on both sides, and limited to no emergent vegetation. Lake River is an area of high human traffic and boat usage; for example, a floathouse community is located on Lake River adjacent to RNWR land (MFA, 2003; USFWS, 2010). Because of its proximity to the Columbia River, anadromous fish use Lake River, and nearby areas may provide habitat for a diversity of species, including those in the following categories:

- Plants
- Shellfish
- Fish
- Birds
- Mammals

1.1.1 Plants

Lake River and adjacent areas support a variety of plant species. Three special-status plant species have been identified as potentially being present in the Carty Unit along which Lake River runs:

Water howellia (*Howellia aquatilus*), Bradshaw's desert parsley (*Lomatium bradshawii*), and Nelson's checker-mallow (*Sidalcea nelsoniana*) (MFA, 2003; USFWS, 2010). See the Carty Lake section on plants for further description. Oregon white oak woodlands are found along sections of Lake River both south and north of Ridgefield; this is a Washington State priority habitat potentially containing two plant species listed by the state as sensitive: the smallflower wakerobin (*Trillium parviflorum*) and the tall bugbane (*Cimicifuga elata*). Small patches (approximately 10 acres total) of unmanipulated upland grassland occur in oak woodland habitat in the Carty Unit adjacent to Lake River (USFWS, 2010). See the Carty Lake section on plants for further description of plants found in this habitat. In addition, Washington State priority-designated palustrine aquatic habitats are present along stretches of Lake River (WDFW, 2011b). Where Lake River passes high-impact areas such as the LRIS, vegetation such as reed canary grass, yellow marshcress, California false indigo, Himalaya blackberry, Pacific willow, Douglas fir, black cottonwood, and nonnative invasive shrub species are present (MFA, 2003; ELS, 2007). For a complete list of special-status plants that may occur in the vicinity of Lake River, see Table 1. This list is not specific to Lake River, but does encompass special-status plants that may potentially occur at Lake River.

1.1.2 Shellfish

Exotic mollusks carried in ship ballast (e.g., Asian clam [*Corbicula fluminea*]) are a potential threat to rivers and wetlands connected to the Columbia River. The Asian clam is abundant in some areas of the RNWR but was not found during sampling attempts by USFWS in 2000 (Buck, 2000). WDFW (as cited in Ecology 2011) also reported no recreational take of shellfish from the Columbia River in 2006. Crayfish are likely present in Lake River. No native shellfish found in Lake River are currently listed as special-status species to be considered for conservation and management (USFWS, 2010; WDFW, 2011b).

1.1.3 Fish

More than 40 species of fish have been documented in the RNWR, Lake River, and other waterways that flow in and around the RNWR (USFWS, 2010). Fish known to occur in Lake River include: common carp, largescale sucker, channel catfish (introduced), Pacific lamprey, mountain whitefish, brown trout (introduced), chiselmouth, longnose sucker, and sandroller. Because the RNWR is located along the lower Columbia River, listed anadromous fish may occur in Lake River at certain times of year. Special status species potentially present in Lake River include: steelhead (rainbow trout), chinook salmon, coho salmon, chum salmon, sockeye salmon, coastal cutthroat trout, and Pacific smelt (Eulachon) and critical habitat is identified for Pacific salmon and Eulachon (MFA 2003; USFWS, 2010; WDFW, 2011b). For a complete list of special-status fish that may occur in the vicinity of Lake River, see Table 2. This list is not specific to Lake River, but does encompass special-status fish that may potentially occur at Lake River.

1.1.4 Birds

Various bird species are present and common along Lake River because of its proximity to high-quality habitat at the RNWR. Washington State-designated priority waterfowl habitat occurs along the entire length of Lake River. Waterfowl representing more than 30 species use the RNWR during winter or as stopover sites during spring and fall migrations. Twelve species of waterfowl are known to breed on the RNWR. Wintering species include Canada geese, cackling geese, tundra swan, mallard, American wigeon, gadwall, northern shoveler, northern pintail, and green-winged teal. Special-status sandhill cranes occur along portions of Lake River. The RNWR also attracts significant numbers of diving ducks such as ring-necked duck, lesser scaup, and bufflehead. Common waterbird species that use RNWR wetlands along Lake River include coot, pied-billed grebe, double-crested cormorant, great blue heron, great egret, ring-billed gull, California gull, Thayer's gull, and glaucous-winged gull. The riparian and floodplain forests adjacent to Lake River host breeding terrestrial species, including commonly seen resident and migrant species such as downy woodpecker, northern flicker, western wood-pewee, Pacific slope flycatcher, tree swallow, common bushtit, Bewick's wren, American robin, Swainson's thrush, cedar waxwing, common yellowthroat, Wilson's warbler, spotted towhee, song sparrow, and black-headed grosbeak. WDFW priority designated Purple Martin foraging areas are present near Lake River. RNWR's oak woodlands along Lake River provide habitat for oak-associated landbird species that are now rare in western Washington, including the slender-billed white-breasted nuthatch, western scrub jay, and house wren (USFWS, 2010). As many as 50 bald eagles have been sighted using riparian trees on or near the RNWR for roosts from December through March, and at least six pairs are known to nest and breed within approximately 1 mile of Lake River. Eagles regularly roost along the section of Lake River between the River "S" bridge north to the Ridgefield marina and forage extensively on waterfowl within refuge boundaries (USFWS, 2010; WDFW, 2011b). For a complete list of special-status birds that may occur or that have occurred in the vicinity of Lake River, see Table 3. This list is not specific to Lake River, but does encompass special-status birds that may potentially occur at Lake River.

1.1.5 Mammals

Of the approximately 23 verified species of mammals on the RNWR, only Columbian white-tailed deer (*Odocoileus virginianus leucurus*) are special status-listed. White-tailed deer have recently been translocated form the Julia Butler Hansen Wildlife Refuge to the RNWR and may be present in the vicinity of Lake River. American beaver (*Castor canadensis*), muskrat (*Ondatra zibethicus*), river otter (*Lutra canadensis*), common opossum (*Didelphis marsupialis*), and nutria (*Myocastor coypus*) commonly inhabit wetlands along Lake River in the RNWR. Omnivores, including coyote (*Canis latrans*), raccoon (*Procyon lotor*), and striped skunk (*Mephitis mephitis*), as well as carnivores such as mink (*Mustela vison*), are frequently seen along the Lake River shoreline. The most common large mammal occurring on the RNWR is the mule deer (*Odocoileus hemionus*). Priority-designated white oak woodlands near Lake River may provide habitat for the special-status western gray squirrel (*Sciurus griseus*), although the presence of this species has not been confirmed (USFWS, 2010). For a complete list of special-status mammals likely to have occurred historically in the vicinity of Lake River, see Table 4. This list is not specific to Lake River, but does encompass special-status mammals that may potentially occur at Lake River.

1.2 Carty Lake Overview

Carty Lake is a 52-acre, ponded wetland located in the RNWR Carty Unit. The Carty Unit "lowlands" are immediately north of the LRIS, which was formerly used by Pacific Wood Treating Corporation to operate a wood-treating facility. Carty Unit is also bordered by Lake River to the west, Gee Creek to the north, and BNSF Railway tracks to the east. The National Wetlands Inventory has classified Carty Lake as palustrine, unconsolidated bottom, permanent nontidal wetland; the lake contains Washington State-designated priority palustrine habitat (ELS, 2007;

WDFW, 2011a). Diking and filling, in conjunction with agricultural development, have been a primary cause of decreases in tidal wetland area in the Columbia River estuary. These actions eliminated most of the natural tidal exchange of water, materials, and organisms between the Columbia River and the adjacent floodplain forests and overflow lakes. Because of Carty Lake's loss of connection with the Columbia River system, its functionality has been reduced, particularly with respect to anadromous fish rearing habitat and native mussel beds. As with other permanent nontidal wetlands on the RNWR, water quality and aquatic plants have been negatively impacted by introduced carp. Carty Lake and its adjacent areas may provide habitat for a diversity of species, including those in the following categories:

- Plants
- Shellfish
- Fish
- Birds
- Mammals

1.2.1 Plants

Carty Lake and adjacent land and wetlands in the Carty Unit support a variety of plant species. In permanent nontidal wetlands such as Carty Lake, open water and native submergent vegetation generally cover more than 70 to 75 percent of wetland basin during peak water elevations, while covering less than 25 percent of native emergent vegetation. Three special-status plant species have been identified as potentially being present in the Carty Unit: water howellia (*Howellia aquatilus*), Bradshaw's desert parsley (*Lomatium bradshawii*), and Nelson's checker-mallow (*Sidalcea nelsoniana*). Water howellia is often found in shallow water (1 to 2 meters deep) and on the edges of deep ponds that are partially surrounded by deciduous trees. Bradshaw's desert parsley is generally found on seasonally saturated or flooded prairies, adjacent to creeks and small rivers. Bradshaw's desert parsley and Nelson's checker-mallow may have been present historically, and experimental plantings were conducted in 2007. Permanent wetlands in the RNWR also support stands of persistent emergent vegetation such as cattail and softstem bulrush (MFA, 2003; USFWS, 2010). In addition, Oregon white oak woodlands are a state priority-designated habitat. Oregon white oak woodlands occur directly adjacent to the east and north of Carty Lake (WDFW, 2011a). Two plant species listed as sensitive in Washington can occur in Oregon white oak woodlands: the smallflower wakerobin (*Trillium parviflorum*) and the tall bugbane (*Cimicifuga elata*). Smallflower wakerobin has been found on the RNWR, but tall bugbane has not. Small patches (approximately 10 acres total) of unmanipulated upland (dry) grassland occur as openings in oak woodland habitat in the Carty Unit. Characteristic grasses associated with this habitat type include red fescue (*Festuca rubra*) and California oatgrass (*Danthonia californica*). These small patches are often dominated by introduced grasses, for example, poverty brome (*Bromus sterilis*) and orchardgrass (*Dactylis glomerata*); however, native wildflowers such as camas and Nuttall's larkspur also occur in these grassy openings. Along the Carty Lake shoreline, nonnative reed canary grass and Himalayan blackberry are abundant (ELS, 2007). Finally, Carty Lake formerly contained a large native wapato bed, which is currently confined to small areas of Carty Lake. Wapato beds are composed of emergent aquatic plants (tubers) in the family *Alismataceae* and are good indicators of suitable red-legged frog breeding habitat, since wapato beds require a similar water depth and hydroperiod (USFWS, 2010). For a complete list of special-status plants that may occur in the vicinity of Carty Lake, see Table 1. This list is not specific to Carty Lake, but does encompass special-status plants that may potentially occur at Carty Lake.

1.2.2 Shellfish

Because of loss of connection with the Columbia River, Carty Lake is unlikely to be susceptible to invasive shellfish and no longer adequately supports native mussel beds. Crayfish may be present in Carty Lake; however, no native shellfish found in the RNWR and therefore in Carty Lake are currently listed as special-status species to be considered for conservation and management (USFWS, 2010; WDFW, 2011a).

1.2.3 Fish

More than 40 species of fish have been documented in the RNWR and in the waterways that flow in and around the RNWR. Fish found in Carty Lake include primarily warm water fish: introduced common carp and largescale sucker. Other fish commonly found in the RNWR where Carty Lake lies include introduced goldfish, longnose dace, largescale sucker, brown bullhead, mosquitofish, three-spine stickleback, introduced largemouth bass, introduced black crappie, introduced white crappie, introduced bluegill, and introduced yellow perch. Because Carty Lake does not maintain connectivity with the Columbia River, state-listed and federally listed anadromous species such as Chinook and coho salmon are unlikely to use Carty Lake for spawning or rearing habitat (USFWS, 2010; WDFW, 2011a). For a complete list of special-status fish that may occur in the vicinity of Carty Lake, see Table 2. This list is not specific to Carty Lake, but does encompass special-status fish that may potentially occur at Carty Lake.

1.2.4 Birds

Waterfowl representing more than 30 species use the RNWR during winter or as stopover sites during spring and fall migrations. Waterfowl use both lacustrine and palustrine wetland habitats, such as Carty Lake, on the RNWR. Twelve species of waterfowl are known to breed on the RNWR, and Washington State-designated priority waterfowl habitat occurs in the vicinity of Carty Lake. Wintering species include Canada geese, cackling geese, tundra swan, mallard, American wigeon, gadwall, northern shoveler, northern pintail, and green-winged teal (USFWS, 2010). Special-status sandhill crane may aggregate at Carty Lake (MFA, 2003). The RNWR also attracts significant numbers of diving ducks, such as ring-necked duck, lesser scaup, and bufflehead. Common waterbird species that use RNWR wetlands such as Carty Lake include coot, pied-billed grebe, double-crested cormorant, great blue heron, great egret, ring-billed gull, California gull, Thayer’s gull, and glaucous-winged gull. The riparian and floodplain forests adjacent to Carty Lake host a number of breeding terrestrial species, including commonly seen migrant and resident species such as downy woodpecker, northern flicker, western wood-pewee, Pacific slope flycatcher, tree swallow, common bushtit, Bewick’s wren, American robin, Swainson’s thrush, cedar waxwing, common yellowthroat, Wilson’s warbler, spotted towhee, song sparrow, and black-headed grosbeak. As many as 50 bald eagles have been sighted using riparian trees on or near the RNWR for roosts from December through March, and three pairs are known to nest and breed approximately 1 mile northeast of Carty Lake (USFWS, 2010; WDFW, 2011a). RNWR’s oak woodlands near Carty Lake provide habitat for oak-associated landbird species that are now rare in western Washington, including the slender-billed white-breasted nuthatch, western scrub jay, and house wren (USFWS, 2010). For a complete list of special-status birds that may occur or that have occurred in the vicinity of Carty Lake, see Table 3. This list is not specific to Carty Lake, but does encompass special-status birds that may potentially occur at Carty Lake.

1.2.5 Mammals

Of the approximately 23 verified species of mammals on the RNWR, only Columbian white-tailed deer (*Odocoileus virginianus leucurus*) are special status-listed. White-tailed deer have recently been translocated form the Julia Butler Hansen Wildlife Refuge to the RNWR and are present in the vicinity of Carty Lake. American beaver (*Castor canadensis*), muskrat (*Ondatra zibethicus*), mink (*Mustela vison*), and river otter (*Lutra canadensis*) inhabit wetlands such as Carty Lake on the RNWR. Nonnative nutria (*Myocastor coypus*) is a commonly observed mammal in wetlands such as Carty Lake. The riparian and floodplain forests surrounding the edges of Carty Lake also provide mammal habitat. The most common large mammal occurring on the RNWR is the mule deer (*Odocoileus hemionus*). Riparian areas provide both forage and cover for this species and other mammals. Omnivores, including coyote (*Canis latrans*), raccoon (*Procyon lotor*), and striped skunk (*Mephitis mephitis*), are frequently seen on the RNWR. The white oak woodlands adjacent to Carty Lake may provide habitat for special-status western gray squirrel (*Sciurus griseus*), although the presence of this species has not been confirmed (USFWS, 2010). For a complete list of special-status mammals likely to have occurred historically in the vicinity of Carty Lake, see Table 4. This list is not specific to Carty Lake, but does encompass special-status mammals that may potentially occur at Carty Lake.

TABLES

Table C-1
Special-Status Plants That May Occur in Vicinity of Carty Lake and Lake River
Former PWT Site RI/FS

Species	Federal	Washington State	Current Occurrence on Ridgefield National Wildlife Refuge
Bradshaw's desert parsley (*Lomatium bradshawii*)	E	E	Two known locations in Washington, both in Clark County; not documented on RNWR. Experimental plantings on RNWR in 2007.
Nelson's checker-mallow (*Sidalcea nelsoniana*)	T	E	Occurs in Cowlitz and Lewis counties; not documented on RNWR. Experimental plantings on RNWR in 2007.
Smallflower wakerobin (*Trillium parviflorum)* Syn: *T. chloropetalum*		S	Occurs on RNWR.
Water howellia (*Howellia aquatilis*)	T	T	Occurs in small vernal ponds in the Carty Unit (only Clark County record).
Key to Codes: E = Endangered, S = Sensitive, T = Threatened. Source: Adapted from USFWS (2010).			

Table C-2
Special-Status Fish That May Occur in Vicinity of Carty Lake and Lake River
Former PWT Site RI/FS

Species	Federal	Washington State	Current Occurrence on Ridgefield National Wildlife Refuge
Bull trout (*Salvelinus confluentus)*	T	C	Records from Clark County, not known to occur in RNWR.
Chinook salmon (*Oncorhynchus tshawytscha)* (Lower Columbia evolutionarily significant unit [ESU])	T	C	Columbia River migration takes fish past RNWR. RNWR waterways may be used for rearing habitat. Juveniles trapped in Gee Creek in 1990s but not in 2002-2005 surveys. Juveniles trapped in Campbell Slough June 2007.
Chum salmon (*Oncorhynchus keta*) (Columbia River ESU)	T	C (Lower Columbia River)	RNWR not used. Columbia River migration takes fish past RNWR. Reported in Gee Creek in 1940s; extirpated.
Coastal cutthroat trout (*Oncorhynchus clarkii clarkii*)	SC		Spawning documented in Gee Creek. Gee Creek utilized for rearing habitat.
Coho salmon (*Oncorhynchus kisutch*) (Lower Columbia ESU)	T		RNWR waterways may be used for rearing habitat. Juveniles trapped in Gee Creek in 1990s and 2002-2005 surveys. Spawning not known in watersheds adjoining the RNWR.
Sockeye salmon (Snake River ESU)	E	C	RNWR not used. Columbia River migration takes fish past RNWR.
Steelhead trout (*Oncorhynchus mykiss*) (Lower Columbia ESU)	T	C	RNWR not used. Columbia River migration takes fish past RNWR. Spawning not known in watersheds adjoining the RNWR. Juveniles trapped in Gee Creek in 1990s, not in 2002-2005 surveys.
Pacific smelt (Southern distinct population segment [DPS])	T	C	Present in Gee Creek in low numbers; Columbia River migration takes fish past RNWR.

Key to Codes: C = Candidate, E = Endangered, T = Threatened. Source: Adapted from USFWS (2010); WDFW (www.wdfw.wa.gov).

Table C-3
Special-Status Birds That May Occur or That May Have Occurred in Vicinity of Carty Lake and Lake River
Former PWT Site RI/FS

Species	Federal	Washington State	Current Occurrence on Ridgefield National Wildlife Refuge
American white pelican		E	Infrequently seen Jan.-July; wintering and migrant birds; nonbreeding subadults.
Bald eagle	SC	S	Thirty to 50 eagles winter on or near the RNWR; six pairs nest on or near the RNWR.
Caspian tern		M	Infrequent observations.
Common loon		S	Rare, fall/winter/spring.
Golden eagle		C	Rare.
Lewis's woodpecker		C	Rare, fall/winter/spring.
Loggerhead shrike	SC	C	Rare, spring.
Long-billed curlew		M	Rare.
Northern goshawk	SC	C	Rare.
Olive-sided flycatcher	SC		Occasional seasonal migrant, spring/summer/fall.
Oregon vesper sparrow	SC	C	Rare, spring/fall.
Peregrine falcon, American	SC	S	Occasional observations, all seasons; displaced birds reared on RNWR.
Pileated woodpecker		C	Resident and nests on RNWR.
Purple martin		C	Uncommon, spring/summer/fall. Breeding; 15 pairs nest on RNWR.
Rufous hummingbird	SC		Nests on RNWR.
Sandhill crane, Canadian (*G. c. rowani*)		E	The RNWR and Sauvie Island, Oregon, are significant migration and wintering areas. Fall roost averages 1,700 birds; winter population 700-800. Occasionally seen in summer. Unconfirmed breeding record from Bachelor Island, late 1970s.
Short-billed dowitcher	SC		Rare.
Slender-billed white-breasted nuthatch	SC	C	Resident, nests on RNWR. Mainly confined to Vancouver vicinity, especially the RNWR.
Streaked horned lark	C	E	Rare, fall.
Vaux's swift		C	Seasonal migrant; uncommon summer/fall; occasional winter.
Western bluebird		M	Rare, spring.
Western grebe		C	Occasional, fall/winter/spring.
Willow flycatcher (*ssp. brewsteri*)	SC		Uncommon spring/summer/fall. Breeds on RNWR.

Key to Codes: C = Candidate, E = Endangered, M = Monitored, S = Sensitive, SC = Species of Concern. Source: Adapted from USFWS (2010); USFW (2008). (http://www.fws.gov/migratorybirds); WDFW (www.wdfw.wa.gov),

Table C-4
Special-Status Mammals That May Have Occurred Historically in Vicinity of Carty Lake and Lake River
Former PWT Site RI/FS

Species	Federal	Washington State	Current Occurrence on Ridgefield National Wildlife Refuge
Columbian white-tailed deer	E	E	Historically occurred on RNWR; recently been translocated form the Julia Butler Hansen Wildlife Refuge to the RNWR.
Gray-tailed vole *(Microtus canicaudus)*		C	A species known to Clark County, not confirmed on RNWR.
Mazama (Western) pocket gopher *(Thomomys mazama)*	C	T	A species historically present in Clark County; probably extinct in southwest Washington.
Townsend's big-eared bat (*Pacific ssp.*)	SC	C	Within range of species; not confirmed on RNWR.
Western gray squirrel *(Sciurus griseus)*	SC	T	The RNWR is in historical range and contains suitable oak habitat; not confirmed on RNWR. Two or more reliable reports in Clark County in the last five years (Linders and Stinson, 2007).

Key to Codes: C = Candidate, E = Endangered, SC = Species of Concern, T = Threatened. Source: Adapted from USFWS (2010); WDFW (www.wdfw.wa.gov).

APPENDIX D

SER LABORATORY ANALYTICAL RESULTS AND DATA REVIEW MEMORANDA

DATA QUALITY ASSURANCE/QUALITY CONTROL REVIEW

PROJECT NO. 9003.01.29 | FEBRUARY 10, 2012 | PORT OF RIDGEFIELD

This report reviews the analytical results for samples collected by the Port of Ridgefield and Maul Foster and Alongi on the property of Port of Ridgefield in Ridgefield, Washington. The samples were collected in November 2011.

Specialty Analytical (SA) and Pace Analytical (Pace) performed the analyses. SA report numbers 1111166, 1111219, 1112014 and Pace report number 10176664 were reviewed. The analyses performed are listed below.

Analysis	Reference
Total and dissolved metals	USEPA 6020/ 6010A
Semivolatile organic compounds	USEPA 8270D; USEPA 8270SIM; USEPA E8270B-AF
Volatile organic compounds	USEPA 8260B
NWTPH-Dx	NWTPH-Dx
Dioxins and Furans	USEPA 8290MOD

NWTPH = Northwest Total Petroleum Hydrocarbons.
SIM = selective ion monitoring.
USEPA = U.S. Environmental Protection Agency.

DATA QUALIFICATIONS

Analytical results were evaluated according to applicable sections of USEPA procedures (USEPA, 2008, 2010) and appropriate laboratory and method-specific guidelines (Pace, 2011; SA, 2011; USEPA, 1986). The data from Pace report 10176664 have been qualified below, based on polychlorinated diphenyl ether interference and exceedance of the calibration range as qualified and discussed in the laboratory report.

Sample	Component	Original Result (mg/L)	Confirmation Result (mg/L)
B322-S-2.5	2,3,4,7,8,-PeCDF	3000 P	3000 J
B322-S-2.5	Total HxCDF	71000 ED	71000 J
B322-S-2.5	Total HpCDF	83000 ED	83000 J
B322-S-2.5	1,2,3,4,6,7,8,-HpCDD	380000 ED	380000 J
B322-S-2.5	Total HpCDD	840000 ED	840000 J
B322-S-2.5	OCDD	3700000 ESD	3700000 J

NOTES:
J = estimated.
D = Result based on dilutiuon.
S = Peak Saturated.
HpCDD = heptachloro dibenzo-p-dioxin.
HpCDF = heptachloro dibenzofuran.
HxCDF = hexachloro dibenzofuran.
mg/L = milligrams per liter.
OCDD = octachloro dibenzo-p-dioxin.
P = PCDE Interference.
PeCDF = pentachloro dibenzofuran.

Any Method USEPA 8290 analytes flagged as an estimated maximum potential concentration by the lab have been qualified as estimates (J). The data are considered acceptable for their intended use, with the appropriate data qualifiers assigned.

HOLDING TIMES, PRESERVATION, AND SAMPLE STORAGE

Holding Times

Extractions and analyses were performed within the recommended holding time criteria.

Preservation and Sample Storage

The samples were preserved and stored appropriately.

BLANKS

Method Blanks

Laboratory method blank analyses were performed at the required frequencies. For purposes of data qualification, the method blanks were associated with all samples prepared in the analytical batch. In report 10176664, Method USEPA 8290MOD exceeded the reporting limits (RLs) at 10.0 nanograms per kilogram (ng/kg) for OCDD above the limit of 1.8 ng/kg. The sample value is greater than 5x the blank detection; therefore the data are not impacted. For Methods USEPA 6010A and 6020 with dissolved metals analysis, the ICB/Method Blank was not included in the quality control (QC) data. In report 1111219, there was a hit for Method NWTPH-Dx for diesel at 0.08172 mg/L and lube oil at 0.2092 mg/L, exceeding the corresponding practical quantification limits (PQLs) of 0.0800 mg/L and 0.200 mg/L, respectively. All samples greater than 5x the blank hit have not been impacted. The impacted results have been qualified accordingly below.

Sample	Component	Original Result (mg/L)	Confirmation Result (mg/L)
E3647112311	Lube Oil	1.03	1.03 J

Continuing Calibration Blank

CCBs were performed at the required frequency. All CCBs were below the method reporting limits and/or PQLs, with the exception of diesel that was detected at 0.08544 mg/L above the PQL (0.08 mg/L). All samples were greater than 5x the detection; therefore, the data are not impacted.

Trip Blanks

Trip blanks were not required for this sampling event.

Equipment Rinsate Blanks

Equipment rinsate blanks were not required for this sampling event, as all samples were collected using dedicated, single-use equipment.

SURROGATE RECOVERY RESULTS

The samples were spiked with surrogate compounds to evaluate laboratory performance on individual samples. All surrogate recoveries were within acceptance limits, with the exception of USEPA 8270, USEPA 8270SIM, and NWTPH-Dx, which had minor exceedances or matrix interferences. All samples had passing laboratory control sample (LCS) results.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE RESULTS

MS/MSD results are used to evaluate laboratory precision and accuracy. All MS/MSD samples were extracted and analyzed at the required frequency, excluding Method USEPA 8270D, and documented as LCS and laboratory control sample duplicate (LCSD) in place of MS/MSD. Various recovery results were outside acceptance limits because of one or more of the following:

- The analyte concentration in the sample was significantly higher than the added spike concentration, preventing accurate evaluation of the spike recovery.
- Matrix interferences prevented accurate quantitation of the spike recovery.

The reviewer took no action based on MS/MSD outliers, as batch LCS percent recoveries were within acceptance limits and remaining MS/MSD results were within acceptance limits for percent recovery and relative percent difference (RPD). In cases of MS/MSD exceedances, the laboratory appropriately documented and qualified the outliers.

LABORATORY DUPLICATE RESULTS

Duplicate results are used to evaluate laboratory precision. All duplicate samples were extracted and analyzed at the required frequency. All RPDs were within acceptance limits, with the exception of the methods noted below. Certain methods exceeded RPD because of matrix interference or high concentration of analyte, and the laboratory has qualified them accordingly. The duplicate for copper exceeded RPD limits in SA report 1112014 and for arsenic in SA report 1111166. No action was taken, as all associated QC met criteria, including MS/MSD percent recoveries and RPD for the same sample.

LABORATORY CONTROL SAMPLE/LABORATORY CONTROL SAMPLE DUPLICATE RESULTS

An LCS/LCSD is spiked with target analytes to provide information on laboratory precision and accuracy. The LCS/LCSD samples were extracted and analyzed at the required frequency. All LCS/LCSD samples met acceptance criteria, excluding qualified analytes for Method USEPA 8270D. The USEPA 8270D LCS/LCSD had minor laboratory exceedances, but meets National Functional Guideline requirements. In SA report 1112014, Method USEPA 8270 had a minor exceedance of RPD for the LCS/LCSD. In SA report 1112014, NWTPH-Dx had a minor high exceedance for the LCS and did not have volume to re-extract. No action was taken in cases of exceedances, as they do not impact data quality.

FIELD DUPLICATE RESULTS

Field duplicate samples measure both field and laboratory precision. No field duplicate samples were submitted.

REPORTING LIMITS

SA and Pace used routine RLs for non-detect results, except for samples requiring dilutions because of high analyte concentrations and/or matrix interferences.

DATA PACKAGE

The data packages were reviewed for transcription errors, omissions, and anomalies. None were found. For Method NWTPH-Dx, samples were qualified, notating that the gasoline-range organic and/or diesel-range organic sample was within the range, but not identified as a specific hydrocarbon when quantified against diesel and/or lube oil calibration standards. The reports also qualified specific samples biased high for diesel because of the amount of oil contained in the sample.

RE: Port of Ridgefield / 9003.01.29

Dear Alan Hughes:

Order No.: 1111166

Specialty Analytical received 12 samples on 11/18/2011 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Cindy Hillyard
Cindy Hillyard
Project Manager

KEY TO FLAGS

Rev. May 12, 2010

A	This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
A1	This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
A2	This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
A3	The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
A4	The product appears to be aged or degraded diesel.
B	The blank exhibited a positive result great than the reporting limit for this compound.
CN	See Case Narrative.
D	Result is based from a dilution.
E	Result exceeds the calibration range for this compound. The result should be considered as estimate.
F	The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
G	Result may be biased high due to biogenic interferences. Clean up is recommended.
H	Sample was analyzed outside recommended holding time.
HT	At clients request, samples was analyzed outside of recommended holding time.
J	The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
K	Diesel result is biased high due to amount of Oil contained in the sample.
L	Diesel result is biased high due to amount of Gasoline contained in the sample.
M	Oil result is biased high due to amount of Diesel contained in the sample.
MC	Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
MI	Result is outside control limits due to matrix interference.
MSA	Value determined by Method of Standard Addition.
O	Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
Q	Detection levels elevated due to sample matrix.
R	RPD control limits were exceeded.
RF	Duplicate failed due to result being at or near the method-reporting limit.
RP	Matrix spike values exceed established QC limits; post digestion spike is in control.
S	Recovery is outside control limits.
SC	Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
*	The result for this parameter was greater that the maximum contaminant level of the TCLP regulatory limit.

RE: SER Monitoring Dec-11 / 9003.01.29

Dear Alan Hughes: Order No.: 1111219

Specialty Analytical received 16 samples on 11/23/2011 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Cindy Hillyard
Cindy Hillyard
Project Manager

KEY TO FLAGS

Rev. May 12, 2010

A	This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
A1	This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
A2	This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
A3	The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
A4	The product appears to be aged or degraded diesel.
B	The blank exhibited a positive result great than the reporting limit for this compound.
CN	See Case Narrative.
D	Result is based from a dilution.
E	Result exceeds the calibration range for this compound. The result should be considered as estimate.
F	The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
G	Result may be biased high due to biogenic interferences. Clean up is recommended.
H	Sample was analyzed outside recommended holding time.
HT	At clients request, samples was analyzed outside of recommended holding time.
J	The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
K	Diesel result is biased high due to amount of Oil contained in the sample.
L	Diesel result is biased high due to amount of Gasoline contained in the sample.
M	Oil result is biased high due to amount of Diesel contained in the sample.
MC	Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
MI	Result is outside control limits due to matrix interference.
MSA	Value determined by Method of Standard Addition.
O	Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
Q	Detection levels elevated due to sample matrix.
R	RPD control limits were exceeded.
RF	Duplicate failed due to result being at or near the method-reporting limit.
RP	Matrix spike values exceed established QC limits; post digestion spike is in control.
S	Recovery is outside control limits.
SC	Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
*	The result for this parameter was greater that the maximum contaminant level of the TCLP regulatory limit.

RE: SER Monitoring Dec-11 / 9003.01.29

Dear Alan Hughes: Order No.: 1112014

Specialty Analytical received 17 samples on 12/1/2011 for the analyses presented in the following report.

There were no problems with the analysis and all data for associated QC met EPA or laboratory specifications except where noted in the Case Narrative, or as qualified with flags. Results apply only to the samples analyzed. Without approval of the laboratory, the reproduction of this report is only permitted in its entirety.

If you have any questions regarding these tests, please feel free to call.

Sincerely,

Cindy Hillyard

Cindy Hillyard
Project Manager

Technical Review

Date: *19-Dec-11*

CLIENT: Maul, Foster & Alongi
Project: SER Monitoring Dec-11 / 9003.01.29
Lab Order: 1112014

CASE NARRATIVE

The Laboratory Control Sample recoveries of Diesel and Lube Oil and the Laboratory Control Sample Duplicate recovery of Lube Oil were outside control limits (high). The Relative Percent Differences for both products were within laboratory control limits (<20%). Due to lack of available sample volume, re-extraction and re-analysis was not possible.

KEY TO FLAGS

Rev. May 12, 2010

A	This sample contains a Gasoline Range Organic not identified as a specific hydrocarbon product. The result was quantified against gasoline calibration standards
A1	This sample contains a Diesel Range Organic not identified as a specific hydrocarbon product. The result was quantified against diesel calibration standards.
A2	This sample contains a Lube Oil Range Organic not identified as a specific hydrocarbon product. The result was quantified against a lube oil calibration standard.
A3	The result was determined to be Non-Detect based on hydrocarbon pattern recognition. The product was carry-over from another hydrocarbon type.
A4	The product appears to be aged or degraded diesel.
B	The blank exhibited a positive result great than the reporting limit for this compound.
CN	See Case Narrative.
D	Result is based from a dilution.
E	Result exceeds the calibration range for this compound. The result should be considered as estimate.
F	The positive result for this hydrocarbon is due to single component contamination. The product does not match any hydrocarbon in the fuels library.
G	Result may be biased high due to biogenic interferences. Clean up is recommended.
H	Sample was analyzed outside recommended holding time.
HT	At clients request, samples was analyzed outside of recommended holding time.
J	The result for this analyte is between the MDL and the PQL and should be considered as estimated concentration.
K	Diesel result is biased high due to amount of Oil contained in the sample.
L	Diesel result is biased high due to amount of Gasoline contained in the sample.
M	Oil result is biased high due to amount of Diesel contained in the sample.
MC	Sample concentration is greater than 4x the spiked value, the spiked value is considered insignificant.
MI	Result is outside control limits due to matrix interference.
MSA	Value determined by Method of Standard Addition.
O	Laboratory Control Standard (LCS) exceeded laboratory control limits, but meets CCV criteria. Data meets EPA requirements.
Q	Detection levels elevated due to sample matrix.
R	RPD control limits were exceeded.
RF	Duplicate failed due to result being at or near the method-reporting limit.
RP	Matrix spike values exceed established QC limits; post digestion spike is in control.
S	Recovery is outside control limits.
SC	Closing CCV or LCS exceeded high recovery control limits, but associated samples are non-detect. Data meets EPA requirements.
*	The result for this parameter was greater that the maximum contaminant level of the TCLP regulatory limit.

REPORT OF LABORATORY ANALYSIS FOR PCDD/PCDF

Report Prepared Date:

December 16, 2011

Report Information:

Pace Project #: 10176664
Sample Receipt Date: 11/23/2011
Client Project #: 9003.01.29
Client Sub PO #: N/A
State Cert #: C755

Invoicing & Reporting Options:

The report provided has been invoiced as a Level 2 PCDD/PCDF Report. If an upgrade of this report package is requested, an additional charge may be applied.

Please review the attached invoice for accuracy and forward any questions to Scott Unze, your Pace Project Manager.

This report has been reviewed by:

Report of Laboratory Analysis

DISCUSSION

This report presents the results from the analysis performed on one sample submitted by a representative of Maul Foster & Alongi. The sample was analyzed for the presence or absence of polychlorodibenzo-p-dioxins (PCDDs) and polychlorodibenzofurans (PCDFs) using a modified version of USEPA Method 8290. Reporting limits were based on signal-to-noise measurements. Estimated Maximum Possible Concentration (EMPC) values were treated as positives in the toxic equivalence (TEQ) calculations. The sample was received above the recommended temperature range of 0-6 degrees Celsius.

The recoveries of the isotopically-labeled PCDD/PCDF internal standards in the sample extract ranged from 67-99%. Except for four low values, which were flagged "R" on the results table, the labeled standard recoveries obtained for this project were within the 40-135% target range specified in Method 8290. Also, since the quantification of the native 2,3,7,8-substituted congeners was based on isotope dilution, the data were automatically corrected for variation in recovery and accurate values were obtained.

In some cases, interfering substances impacted the determinations of PCDF congeners; the affected values were flagged "P" where polychlorinated diphenyl ethers were present. Values above the calibration range were flagged "E" and should be regarded as estimates. The 2,3,7,8-TCDD concentration reported for the field sample was obtained from a separate analysis of the sample extract; the value was flagged "N2" on the results table. The high concentration of OCDD in the field sample saturated the detector signal of the mass spectrometer, even upon analysis of a dilution of the sample extract; the value was flagged "S" and should be regarded as the minimum possible concentration.

A laboratory method blank was prepared and analyzed with the sample batch as part of our routine quality control procedures. The results show the blank to contain background levels of selected congeners. With the exception of the OCDD, these levels were below the calibration range of the method. The levels reported for the affected congeners in the field sample were higher than the corresponding blank levels by one or more orders of magnitude. These results indicate that the sample processing steps did not contribute significantly to the levels reported for the field sample.

A laboratory spike sample was also prepared with the sample batch using clean sand that had been fortified with native standard materials. The results show that the spiked native compounds were recovered at 96-120%, indicating a high degree of accuracy for these determinations. Matrix spikes were prepared with the sample batch using sample material from a separate project; results from these analyses will be provided upon request.

Date and Initials of person examining contents: 11 23 11

Comments:

Chain of Custody Present:	☑ Yes	☐ No	☐ N/A	1.
Chain of Custody Filled Out:	☑ Yes	☐ No	☐ N/A	2.
Chain of Custody Relinquished:	☑ Yes	☐ No	☐ N/A	3.
Sampler Name & Signature on COC:	☑ Yes	☐ No	☐ N/A	4.
Samples Arrived within Hold Time:	☑ Yes	☐ No	☐ N/A	5.
Short Hold Time Analysis (<72hr):	☐ Yes	☑ No	☐ N/A	6.
Rush Turn Around Time Requested:	☐ Yes	☑ No	☐ N/A	7.
Sufficient Volume:	☑ Yes	☐ No	☐ N/A	8.
Correct Containers Used:	☑ Yes	☐ No	☐ N/A	9.
-Pace Containers Used:	☐ Yes	☑ No	☐ N/A	
Containers Intact:	☑ Yes	☐ No	☐ N/A	10.
Filtered volume received for Dissolved tests	☐ Yes	☑ No	☐ N/A	11.
Sample Labels match COC:	☑ Yes	☐ No	☐ N/A	12.
-Includes date/time/ID/Analysis Matrix: SL				
All containers needing acid/base preservation have been checked. Noncompliance are noted in 13.	☐ Yes	☐ No	☑ N/A	13. ☐ HNO3 ☐ H2SO4 ☐ NaOH ☐ HCl Samp #
All containers needing preservation are found to be in compliance with EPA recommendation.	☐ Yes	☐ No	☑ N/A	
Exceptions: VOA, Coliform, TOC, Oil and Grease, WI-DRO (water)	☐ Yes	☑ No		Initial when completed ______ Lot # of added preservative ______
Samples checked for dechlorination:	☐ Yes	☐ No	☑ N/A	14.
Headspace in VOA Vials (>6mm):	☐ Yes	☐ No	☑ N/A	15.
Trip Blank Present:	☐ Yes	☐ No	☑ N/A	16.
Trip Blank Custody Seals Present	☐ Yes	☐ No	☑ N/A	
Pace Trip Blank Lot # (if purchased): ______				

Client Notification/ Resolution: Field Data Required? Y / N

Person Contacted: Kerry G. Date/Time: 11/28/11

Comments/ Resolution:

Proceed with analysis.

Project Manager Review: **Date:** 11/28/11

Note: Whenever there is a discrepancy affecting North Carolina compliance samples, a copy of this form will be sent to the North Carolina DEHNR Certification Office (i.e out of hold, incorrect preservative, out of temp, incorrect containers)

Reporting Flags

A = Reporting Limit based on signal to noise

B = Less than 10x higher than method blank level

C = Result obtained from confirmation analysis

D = Result obtained from analysis of diluted sample

E = Exceeds calibration range

I = Interference present

J = Estimated value

Nn = Value obtained from additional analysis

P = PCDE Interference

R = Recovery outside target range

S = Peak saturated

U = Analyte not detected

V = Result verified by confirmation analysis

X = %D Exceeds limits

Y = Calculated using average of daily RFs

* = See Discussion

APPENDIX E

LRIS SUMMARY OF SOIL ANALYTICAL RESULTS

APPENDIX E LRIS SUMMARY OF SOIL ANALYTICAL RESULTS CONTENTS

The tables in this appendix have been pulled from other reports previously submitted to and approved by the Washington State Department of Ecology. Tables are numbered with an E- prefix preceding their number in the original reports. The dioxin tables (E-I-6, E-3-1, and E-5-6) presented in the draft RI/FS are not included. Instead, the supplemental Table E-1 presents all updated dioxin congener and TEQ data and an updated notes page, which fully explains all abbreviations and qualifiers in the tables. The analytical results range in dates from 1991 to 2009.

The dioxin data has been updated to ensure consistent treatment of interferences and non-detects during data qualification and calculation of TEQs. Updated TEQs are calculated according to the methodology developed in coordination with Ecology and are described in Appendix F.

All dioxin data previously presented in the draft RI/FS Appendix E is included in Table E-1, with the exception of samples SS-31, SS-32, and SS-33. These samples are located in the off-property area and not in Cell 4. The dioxin TEQs in the original dioxin tables and Table E-1 are compared to the Model Toxics Control Act (MTCA) Method B and C Cleanup Levels; Ecology Natural Background Concentration; and MTCA Wildlife Ecological Indicator Concentration. In all cases the original and updated TEQs either both exceed or both do not exceed the screening criteria. Therefore, updating the dioxin TEQ calculation method does not change the interpretation of the dioxin data presented in the original reports.

All other tables are presented exactly as shown in the original reports, with the exception that titles and notes pages have been updated, which fully explain all abbreviations and qualifiers in the tables. As such, it is important to note that what has previously been referred to as "carcinogenic polycyclic aromatic hydrocarbons toxicity equivalent concentration" ("cPAH TEC") is the same as what is currently referred to as "carcinogenic polycyclic aromatic hydrocarbons toxicity equivalent" ("cPAH TEQ"). That is to say, the cPAH TEC is the sum of the cPAH compounds multiplied by their respective toxicity equivalent factors. In cases where all cPAHs for a sample were non-detect, the calculated cPAH TEQ is reported as "ND." Additionally, what was previously referred to as "Fuels" is the same as what is currently referred to as "Petroleum Hydrocarbons."

NOTES:

Bold number indicates a TEQ that exceeds the Ecology Natural Background Concentration.

Highlighted cell indicates a TEQ that exceeds the MTCA Wildlife Ecological Indicator Concentration.

MTCA = Washington State Department of Ecology's Model Toxics Control Act.

ng/kg = nanograms per kilogram (parts per trillion).

HpCDD = heptachloro dibenzo-p-dioxin.

HpCDF = heptachloro dibenzofuran.

HxCDD = hexachloro dibenzo-p-dioxin.

HxCDF = hexachloro dibenzofuran.

OCDD = octachloro dibenzo-p-dioxin.

OCDF = octachloro dibenzofuran.

PeCDD = pentachloro dibenzo-p-dioxin.

PeCDF = pentachloro dibenzofuran.

TCDD = tetrachloro dibenzo-p-dioxin.

TCDF = tetrachloro dibenzofuran.

TEQ = toxicity equivalent.

WAC = Washington Administrative Code

Soil sample locations previously excavated not evaluated against CULs or Wildlife Indicator Concentration.

J = estimated concentration.

U = not detected.

UJ = estimated nondetect; half the value used in calculations.

[a] = Ecology. 2010c. Natural background of dioxins/furans in WA soil. Technical memorandum No. 8. Washington State Department of Ecology. August 9.

CELLS 1 AND 2

Table E-I-1 through E-I-5 Notes
Lake River Industrial Site

MTCA Method B CUL value compared to detected soil concentrations for samples collected from 0 feet to 15 feet bgs.

Wildlife Indicator Soil Concentration compared to detected soil concentrations for samples collected from 0 feet to 6 feet bgs.

Metals soil concentrations compared against Clark County 90th Percentile Background Concentration if higher than Method B CUL or Wildlife Indicator Soil Concentration.

Petroleum hydrocarbon detected concentrations compared to MTCA Method A CUL.

Soil sample locations previously excavated, or not located at Cell 1 or Cell 2, not evaluated against CULs.

Bold number indicates detected concentration that exceeds MTCA Method B Cleanup Level.

Highlighted number indicates detected concentration that exceeds the Wildlife Indicator Soil Concentration.

-- = not analyzed.

bgs = below ground surface.

C = MRL is elevated because sample required diluting.

cPAH TEQ = carcinogenic polycyclic aromatic hydrocarbons toxicity equivalent.

ft = feet.

J = result for this analyte is estimated concentration.

mg/kg = milligrams per kilogram.

MTCA = Washington State Department of Ecology's Model Toxics Control Act.

ng/kg = nanograms per kilogram.

ND = The cPAH analytes were not detected at or above their respective method reporting limits.

Non-PHC = chemicals identified in the PHC range that did not match a typical TPH chromatograph

NV = No value listed by Washington Department of Ecology for analyte.

PAH = polycyclic aromatic hydrocarbon.

PHC = petroleum hydrocarbon.

Q = elevated method reporting limit caused by sample matrix.

TPH = Total petroleum hydrocarbon.

U = not detected at or above method reporting limit. half the value used in calculations.

UF = positive result for this hydrocarbon is due to a single component contamination. The product does not match any hydrocarbons in the fuels library. Desired analyte not detected at or above the method reporting limit.

UJ = compound analyzed, but not detected above estimated detection limit.

UQ = not detected at or above an elevated method reporting limit caused by sample matrix.

[a]Benzo(a)pyrene evaluated as component of sum under cPAH TEQ calculations.

Table E-3-2 Notes
Carcinogenic Polycyclic Aromatic Hydrocarbons (µg/kg)
Lake River Industrial Site

-- = not analyzed.

Bold values exceed MTCA method B unrestricted land use soil cleanup level for direct contact (ingestion) (Ecology, 2001). Non-detect values ("U") were not compared to cleanup level.

C = MRL is elevated because sample required diluting.

cPAH TEQ = carcinogenic polycyclic aromatic hydrocarbon toxicity equivalent.

CUL = cleanup level.

D = MRL is elevated because of matrix interferences and because sample required diluting.

ft bgs = feet below ground surface.

H = analysis was performed past the recommended hold time.

MTCA = Model Toxics Control Act, Washington State Department of Ecology, November 2001.

µg/kg = micrograms per kilogram.

NA = not applicable.

ND = the cPAH analytes were not detected at or above their respective method reporting limits.

U = analyte was not detected above MRL.

[a] TEQ calculation is missing one or more of the cPAHs.

Tables E-4-2 through E-4-6 Notes
Lake River Industrial Site

-- = not analyzed.

B = boring.

Bold values exceed MTCA method B unrestricted land use soil cleanup level for direct contact (ingestion) (Ecology, 2001) (TPH concentrations are compared against MTCA Method A cleanup levels for unrestricted land use). Non-detect values ("U") were not compared with MTCA method B.

C = MRL is elevated because sample required diluting.

D = MRL is elevated because of matrix interferences and because sample required diluting.

ft bgs = feet below ground surface.

H = analysis was performed past the recommended hold time.

HC = Hart Crowser.

J = Result is an estimated concentration.

JE = result is an estimated concentration because the value exceeds the calibration range.

JN = result is presumptive; analyte was tentatively identified at an estimated concentration, but confirmation analysis was not performed.

JW = post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance. treat as estimated concentration.

mg/kg = milligrams per kilogram.

MRL = method reporting limit.

MTCA = Model Toxics Control Act, Washington State Department of Ecology, November 2001.

MW = monitoring well.

N = result is presumptive; analyte was tentatively identified, but confirmation analysis was not performed.

N*J = result is presumptive and outside control criteria. treat as an estimated concentration.

NA = not applicable/available.

Non-PHC = chemicals identified in the PHC range that did not match a typical TPH chromatograph

PHC = petroleum hydrocarbon.

SPY = south pole yard.

TP = test pit.

U = analyte was not detected above MRL.

ug/kg = micrograms per kilogram.

*Values outside control criteria.

[a]Using MTCA Method B CUL for 1,3-dichloropropene.

CELL 4

Tables E-5-1 through E-5-5 Notes
Cell 4 Remedial Investigation and Feasibility Study
Port of Ridgefield
Ridgefield, Washington

-- = not analyzed.

Bold number indicates a detected concentration that exceeds MTCA Method B CUL, except for arsenic and dioxin concentrations, which are compared to natural background concentrations.

Highlighted cells indicate concentrations exceeding wildlife ecological criteria.

cPAH = carcinogenic polycyclic aromatic hydrocarbon, including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene.

cPAH TEQ = carcinogenic polycyclic aromatic hydrocarbon toxicity equivalent.

CULs = cleanup levels.

ft. bgs = feet below ground surface.

H = estimated concentration--sample analyzed outside recommended holding time.

J = estimated concentration.

mg/kg = milligrams per kilogram (parts per million).

MTCA = Washington State Model Toxics Control Act.

µg/kg = micrograms per kilogram (parts per billion).

ng/kg = nanogram per kilogram (parts per trillion).

Non-PHC = chemicals identified in the PHC range that did not match a typical TPH chromatograph.

ND = the cPAH analytes were not detected at or above their respective method reporting limits.

NV = no values.

PHC = petroleum hydrocarbons.

REL = remediation level, as discussed in Cell 4 RI/FS report as being MTCA Method C soil CUL.

TPH = total petroleum hydrocarbons.

U = not detected at or above method reporting limit.

UJ = Because of matrix interference, analyte could not be quantified; concentration is not greater than elevated method reporting limit presented on table.

[a] Used hexavalent chromium screening criteria.

[b] Used trivalent chromium screening criteria.

[c] Arsenic III values.

[d] Gasoline mixture without benzene present.

[e] Value is outside control criteria.

[f] Used 1,3-dichloropropene screening criteria.

APPENDIX F

DIOXIN AND FURAN ANALYSIS, DATA VALIDATION, AND TEQ CALCULATION RULES

APPENDIX F DIOXIN AND FURAN ANALYSIS, DATA VALIDATION, AND TEQ CALCULATION RULES CONTENTS

This appendix consists of the Dioxin and Furan Analysis, Data Validation, and TEQ Calculation Rules memorandum. Dioxin data presented in the RI/FS has been updated to ensure consistent treatment of interferences and non-detects during data qualification and calculation of TEQs. Updated TEQs are calculated according to the methodology developed in coordination with Ecology and is described in this appendix. Dioxin data are presented with two significant digits.

The methodology described in this appendix was used for all dioxin data when the required information was available; in some cases, the required detection limits (estimated detection limits, or EDLs) were unavailable for historical data. If EDLs were unavailable, method detections limits (MDLs) were used. In cases where EDLs and MDLs were unavailable, the method reporting limits (MRLs) were used. Because MRLs and MDLs are greater than EDLs, using these in place of the EDLs results in a higher dioxin TEQ result. Therefore, all dioxin TEQs for which EDLs were unavailable were calculated in a way that results in a conservative estimate of dioxin TEQ concentrations. In all cases, dioxin data was validated and calculated according to the methodology described in the appendix.

From: Erik Naylor

Project: 9003.01.49

RE: Dioxin and Furan Analysis, Data Validation, and TEQ Calculation Rules

The term dioxin is used to refer to a family of toxic chemicals that share a similar chemical structure and a common mechanism of toxic action. While there are 210 dioxin congeners, typically only the 17 most toxic congeners are reported by laboratories. The reported concentrations of the 17 dioxin congeners typically are validated to assess usability and then a toxicity equivalence (TEQ) is calculated from the reported results to evaluate the toxicity of these compounds as a whole. The purpose of this memo is to provide an approach for dioxin data validation and TEQ calculation for the former Pacific Wood Treating site. Further, analytical method recommendations and requirements for laboratory deliverables are provided to enable consistent data validation and TEQ calculation using data from a variety of laboratories.

Critical to consistent data use is consistent use of terminology. Terms used in this memorandum are defined below.

- Method Detection Limit (MDL)—The minimum concentration of a compound that can be measured and reported with 99 percent confidence that the value is greater than zero according to the Washington State Department of Ecology's (Ecology), Model Toxics Control Act (MTCA) (Ecology, 2007).
- Estimated Detection Limit (EDL)—The sample- and analyte-specific EDL is an estimate made by the laboratory of the concentration of a given analyte that would have to be present to produce a signal with a peak height of at least 2.5 times the background noise signal level (U.S. Environmental Protection Agency [USEPA], 2005).
- Practical Quantitation Limit (PQL)—The lowest concentration that can be reliably measured within specified limits of precision, accuracy, representativeness, completeness, and comparability during routine laboratory operating conditions, using Ecology-approved methods (Ecology, 2007). This value is usually the lowest concentration used to calibrate the instrument after being adjusted for sample volume, sample extract volume, cleanups performed, and injection volume. PQLs should be no greater than 10 times the MDL (Ecology, 2007) and no greater than what is established by the USEPA in 40 Code of Federal Regulations (CFR) 136, 40 CFR 141-143, or 40 CFR 260-270.

- Estimated Maximum Potential Concentration (EMPC)—An EMPC is a value calculated for a reported analyte when the signal-to-noise ratio is at least 2.5:1 for both quantitation ions, but the ion abundance ratio criteria used for analyte confirmation are not met (USEPA, 2005). An EMPC value represents the maximum possible result of an analyte that could not be positively identified. The inability to positively identify the analyte could be a result of matrix interference, a coeluting compound, or low response.
- Toxic Equivalency Factor (TEF)—The factor by which each congener is multiplied in order to calculate its toxicity relative to 2,3,7,8-TCDD (Ecology, 2007). These values are summed to calculate the TEQ. TEFs depend on the endpoint being examined (i.e., birds, fish, mammals).
- TEQs—Concentrations of each congener are adjusted and summed to reflect their potency relative to 2,3,7,8-TCDD, one of the most toxic congeners. The TEQ is the sum of congener results multiplied by their specific TEF (Ecology, 2007).

ANALYTICAL METHODS

Dioxins are analyzed generally by USEPA Method 1613B or 8290, using a high-resolution gas chromatograph paired with a high-resolution mass spectrometer. A laboratory's PQL is usually the same for both methods. While the methods are very similar, Method 1613B is preferred, as it requires more rigorous quality assurance and quality control (QA/QC) through the use of six more internal standards than Method 8290. Because analytical technology and methodology have advanced rapidly since the methods were written, many laboratories combine elements of both methods to obtain the best results possible (Hoffman, E., and D. Fox 2010). Often the preparation and analyses are run using Method 1613B (for the additional QA/QC), while the calculations will be performed by Method 8290 (in order to obtain the sample- and analyte-specific EDLs). Method 1613B with calculated EDLs is the preferred method.

LABORATORY DELIVERABLES

It is important to work closely with the laboratory performing the dioxin analyses because different laboratories report data in different ways. The following items should be requested to ensure that the analytical report and electronic data deliverable (EDD) will contain all of the requisite information to validation the data and calculate TEQs:

- EDLs[1]and PQLs should be included in the final analytical report. EDLs, MDLs, and PQLs should all be included in the EDD.
- Results should be reported to the sample- and analyte-specific EDL. Results below the PQL but above the EDL will be qualified as estimates (J).
- EMPC results should be reported at the EMPC value (EMPC values will be assigned a "U" qualifier [the analyte was not detected at or above the concentration qualified] at the time of validation).

---

[1] Note that USEPA Method 1613B does not provide for the calculation of EDLs; therefore, the laboratory must use the calculation approach provided in Method 8290 to report the required limits.

TEQ concentrations will not be requested from the laboratory. If the laboratory provides TEQ concentrations, they will not be used because the data have not been validated TEQs should be calculated only after the data are validated.

VALIDATION

Dioxin data are validated much like other organic data, but there are a few issues that do not typically arise in other organic data sets. In addition to standard validation procedures (USEPA 2005), the following scenarios should be addressed in the fashion described below, consistent with other Ecology sites (Ecology and Environment and G. L. Glass, 2011):

- EMPC reported values should be assigned a U qualifier at the reported EMPC value.
- EMPC values that appear to be significantly elevated should be investigated further with the laboratory and may be assigned an R qualifier (unusable) when applicable.
- Non-detected results should be assigned a U qualifier and reported at the EDL value.

Further dioxin validation guidelines can be found in the National Functional Guidelines for Chlorinated Dibenzo-p-Dioxins (CDDs) and Chlorinated Dibenzofurans (CDFs) Data Review (USEPA 2005). Data must be validated before TEQs are calculated.

TEQS

To express the overall toxicity of the 17 reported dioxins, the concentration of each congener is adjusted based on its toxicity relative to the most toxic congener, 2,3,7,8-TCDD, and then all 17 are added together. The adjustment factors, the TEFs, are provided by the 2005 World Health Organization. TEQs are commonly calculated by one of the following two methods:

1. Non-detected values (U) are set as one half of the EDL. Values that are detected, even as estimates (J), should be used at face value. Multiply congener values by their corresponding TEF and then sum all of the products.
2. Non-detected values (U) are set as 0. Values that are detected, even as estimates (J), should be used at face value. Multiply congener values by their corresponding TEF and then sum all of the products.

These methods result in two different TEQ values that can be shown as TEQ (U=1/2) and TEQ (U=0). TEQs should not be calculated to more significant figures than the original data. The table below illustrates these methods:

Table

Example of Handling Non-Detects and Resulting TEQs.

Dioxin	Result (ng/kg)	TEC[1] (U=1/2) (ng/kg)	TEC[1] (U=0) (ng/kg)	TEF Mammals

Total Pentachlorodibenzofuran (PeCDF)	44	44	44	--
Total Pentachlorodibenzo-p-dioxin (PeCDD)	32 J	32	32	--
Total Tetrachlorodibenzofuran (TCDF)	19	19	19	--
Total Tetrachlorodibenzo-p-dioxin (TCDD)	8.2	8.2	8.2	--
TEQ (U=1/2)	**15.2**	--	--	--
TEQ (U=0)	**12.3**	--	--	--

NOTES:
-- = no value.
ng/kg = nanograms per kilogram.
[1] TEC is analyte-specific TEF adjusted concentration.

The difference between TEQ (U=1/2) and TEQ (U=0) values gives data reviewers an idea of how much the EDL substitution affects the TEQ summation (Hoffman, E., and D. Fox 2010). While MTCA does not specify using the TEQ (U=1/2) method, it is the method that has been historically used at the Port of Ridgefield and will continue to be used.

SUMMARY

- USEPA Method 1613B is recommended for dioxin analysis (with Method 8290 EDL calculations).
- The laboratory must report a PQL and EDL for each sample and each congener, and provide a PQL, EDL, and MDL for each sample and each congener in the EDD.
- Results should be reported to the sample- and analyte-specific EDL. Results below the PQL but above the EDL will be qualified as estimates (J).
- EMPC results should be reported at the EMPC value (EMPC values will be assigned a "U" qualifier at the time of validation). However, if the EMPC is significantly elevated, additional qualification may be appropriate.
- Non-detected results should be assigned a U qualifier and reported at the EDL value.
- Laboratory data must be validated before a TEQ is calculated.
- TEQs should be calculated as follows: non-detected values (U) are set as one half of the EDL. Values that are detected, even as estimates (J), should be used at face value. Multiply congener values by their corresponding TEF and then sum all of the products.

APPENDIX G

LRIS SOIL FIGURES

APPENDIX G LRIS SOIL FIGURES
CONTENTS

The figures in this appendix are from previously submitted reports that have been approved by the Washington State Department of Ecology. All soil data shown was collected between 1993 and 2009. While the notes section of some of the figures have been updated to clarify the values presented and how they were calculated, only dioxin TEQ values have been updated from the values presented in the original reports. Dioxin TEQs have been updated in Figure 1 and Figure 5-4.

The dioxin data has been updated to ensure consistent treatment of interferences and non-detects during data qualification and calculation of TEQs. Updated TEQs are calculated according to the methodology developed in coordination with Ecology and are described in Appendix F.

The TEQs in the original dioxin figures are compared to the Model Toxics Control Act (MTCA) Method B Cleanup Level, 11 ng/kg, and the MTCA Method C Cleanup Level, 1500 ng/kg. In all cases the original and updated TEQs either both exceed or both do not exceed the screening criteria. Therefore, updating the dioxin TEQ calculation method does not change the interpretation of the dioxin data as presented in the original reports.

▨ ESTIMATED DISTRIBUTION OF INDICATOR HAZARDOUS SUBSTANCES EXCEEDING RELATIVE SCREENING CRITERIA IN SOIL.

GENERAL EXPLANATION:

S = SHALLOW PORTION OF THE UPPER WATER BEARING ZONE

D = DEEP PORTION OF THE UPPER WATER BEARING ZONE

NOTE:

DISTRIBUTION OF INDICATOR HAZARDOUS SUBSTANCES CREATED BY OVERLAYING ESTIMATED SOIL EXCEEDANCE OF ARSENIC OF MTCA METHOD A CLEANUP LEVEL (DIRECT CONTACT PATHWAY) OF 20 MILLIGRAMS PER KILOGRAM, PENTACHLOROPHENOL OF MTCA METHOD B CLEANUP LEVEL (DIRECT CONTACT PATHWAY) OF 8,330 MICROGRAMS PER KILOGRAM (ug/kg), AND CHRYSENE OF MTCA METHOD B CLEANUP LEVEL (DIRECT CONTACT PATHWAY) OF 137 ug/kg.

Notes:
1. **Bold** font shows concentrations above MTCA Level B, except for Arsenic, which is compared to natural background concentration.
2. bgs = below ground surface.
3. mg/kg = milligram per kilogram.
4. ug/kg = microgram per kilogram.
5. ng/kg = nanogram per kilogram.
6. ft = feet.
7. PCP = Pentachlorophenol.
8. cPAH = Carcinogenic Polycyclic Aromatic Hydrocarbons.
9. TEQ = Toxicity Equivalent.
10. ND = Not detected at or above method reporting limit.

APPENDIX H

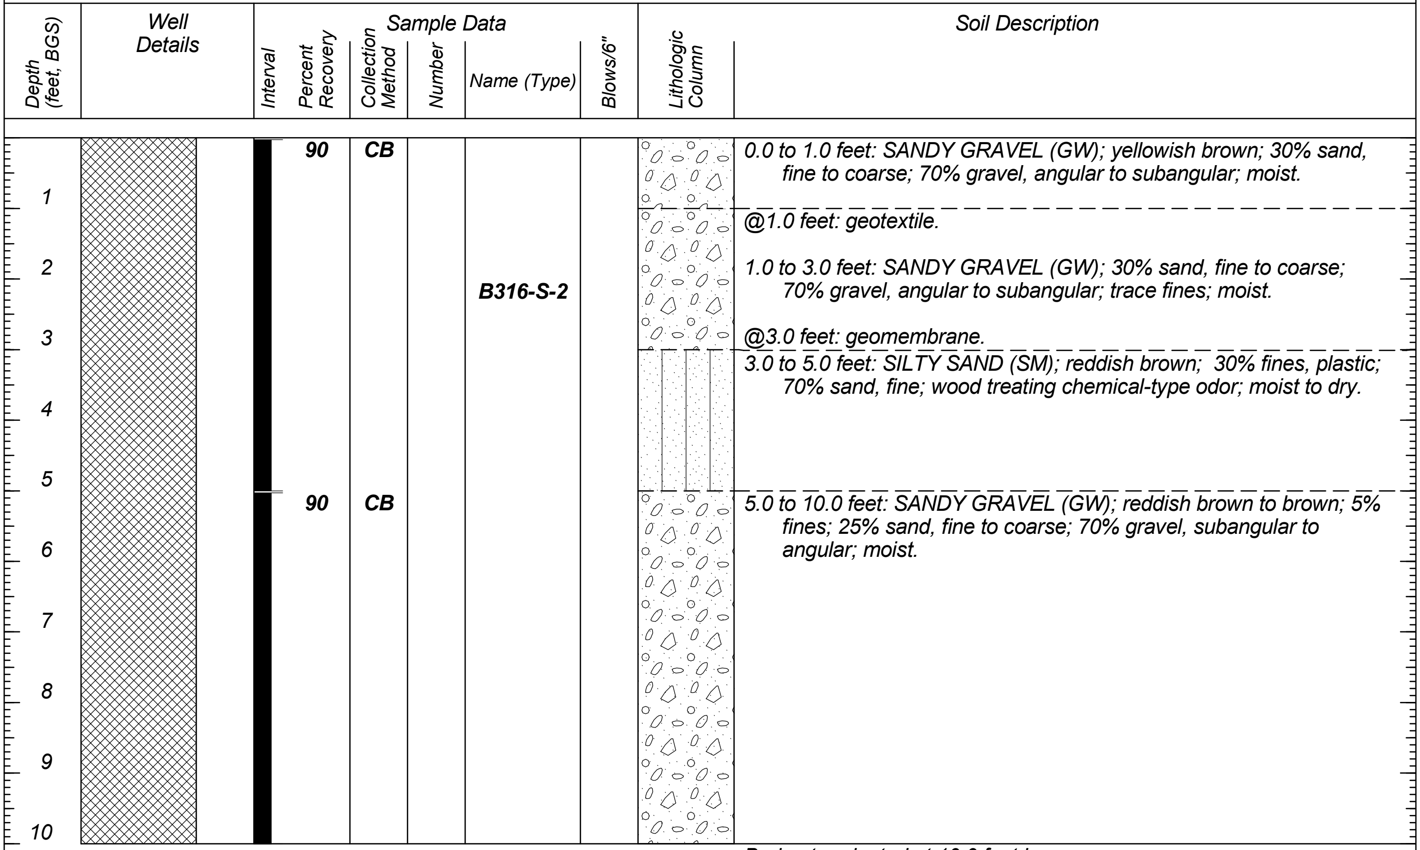
SER SOIL BORING LOGS

Maul Foster & Alongi, Inc.

Geologic Borehole Log/Well Construction

Project Number	Well Number	Sheet
9003.01.29	**B-316**	**1 of 1**

Project Name	**Port of Ridgefield**	TOC Elevation (feet)	
Project Location	**Ridgefield, WA**	Surface Elevation (feet)	
Start/End Date	**11/17/11 to 11/17/11**	Northing	
Driller/Equipment	**Major Drilling/Rotosonic**	Easting	
Geologist/Engineer	**K. Gallagher**	Hole Depth	**10.0-feet**
Sample Method		Outer Hole Diam	**6-inch**



Depth (feet, BGS)	Well Details	Interval	Percent Recovery	Collection Method	Number	Name (Type)	Blows/6"	Lithologic Column	Soil Description
0–1			**90**	**CB**					0.0 to 1.0 feet: SANDY GRAVEL (GW); yellowish brown; 30% sand, fine to coarse; 70% gravel, angular to subangular; moist.
1–3						**B316-S-2**			@1.0 feet: geotextile. 1.0 to 3.0 feet: SANDY GRAVEL (GW); 30% sand, fine to coarse; 70% gravel, angular to subangular; trace fines; moist. @3.0 feet: geomembrane.
3–5									3.0 to 5.0 feet: SILTY SAND (SM); reddish brown; 30% fines, plastic; 70% sand, fine; wood treating chemical-type odor; moist to dry.
5–10			**90**	**CB**					5.0 to 10.0 feet: SANDY GRAVEL (GW); reddish brown to brown; 5% fines; 25% sand, fine to coarse; 70% gravel, subangular to angular; moist.

Boring terminated at 10.0 feet bgs.

NOTES: (1) bgs - below ground surface.
(2) Borehole abandoned with bentonite chips hydrated with potable water.
(3) Composite sample collected from a range of 1 feet bgs to 3 feet bgs.

Maul Foster & Alongi, Inc.

APPENDIX I

GROUNDWATER TREND PLOTS

APPENDIX I GROUNDWATER TREND PLOTS
CONTENTS

The figures in this appendix have been pulled from other reports previously submitted to and approved by the Washington State Department of Ecology. This appendix summarizes groundwater trend plots. Appendix I-1 contains trend plots for Cells 1 and 2 plume monitoring wells in the UWBZ. Appendix I-2 contains trend plots for Cell 3 plume monitoring wells.

FIGURES

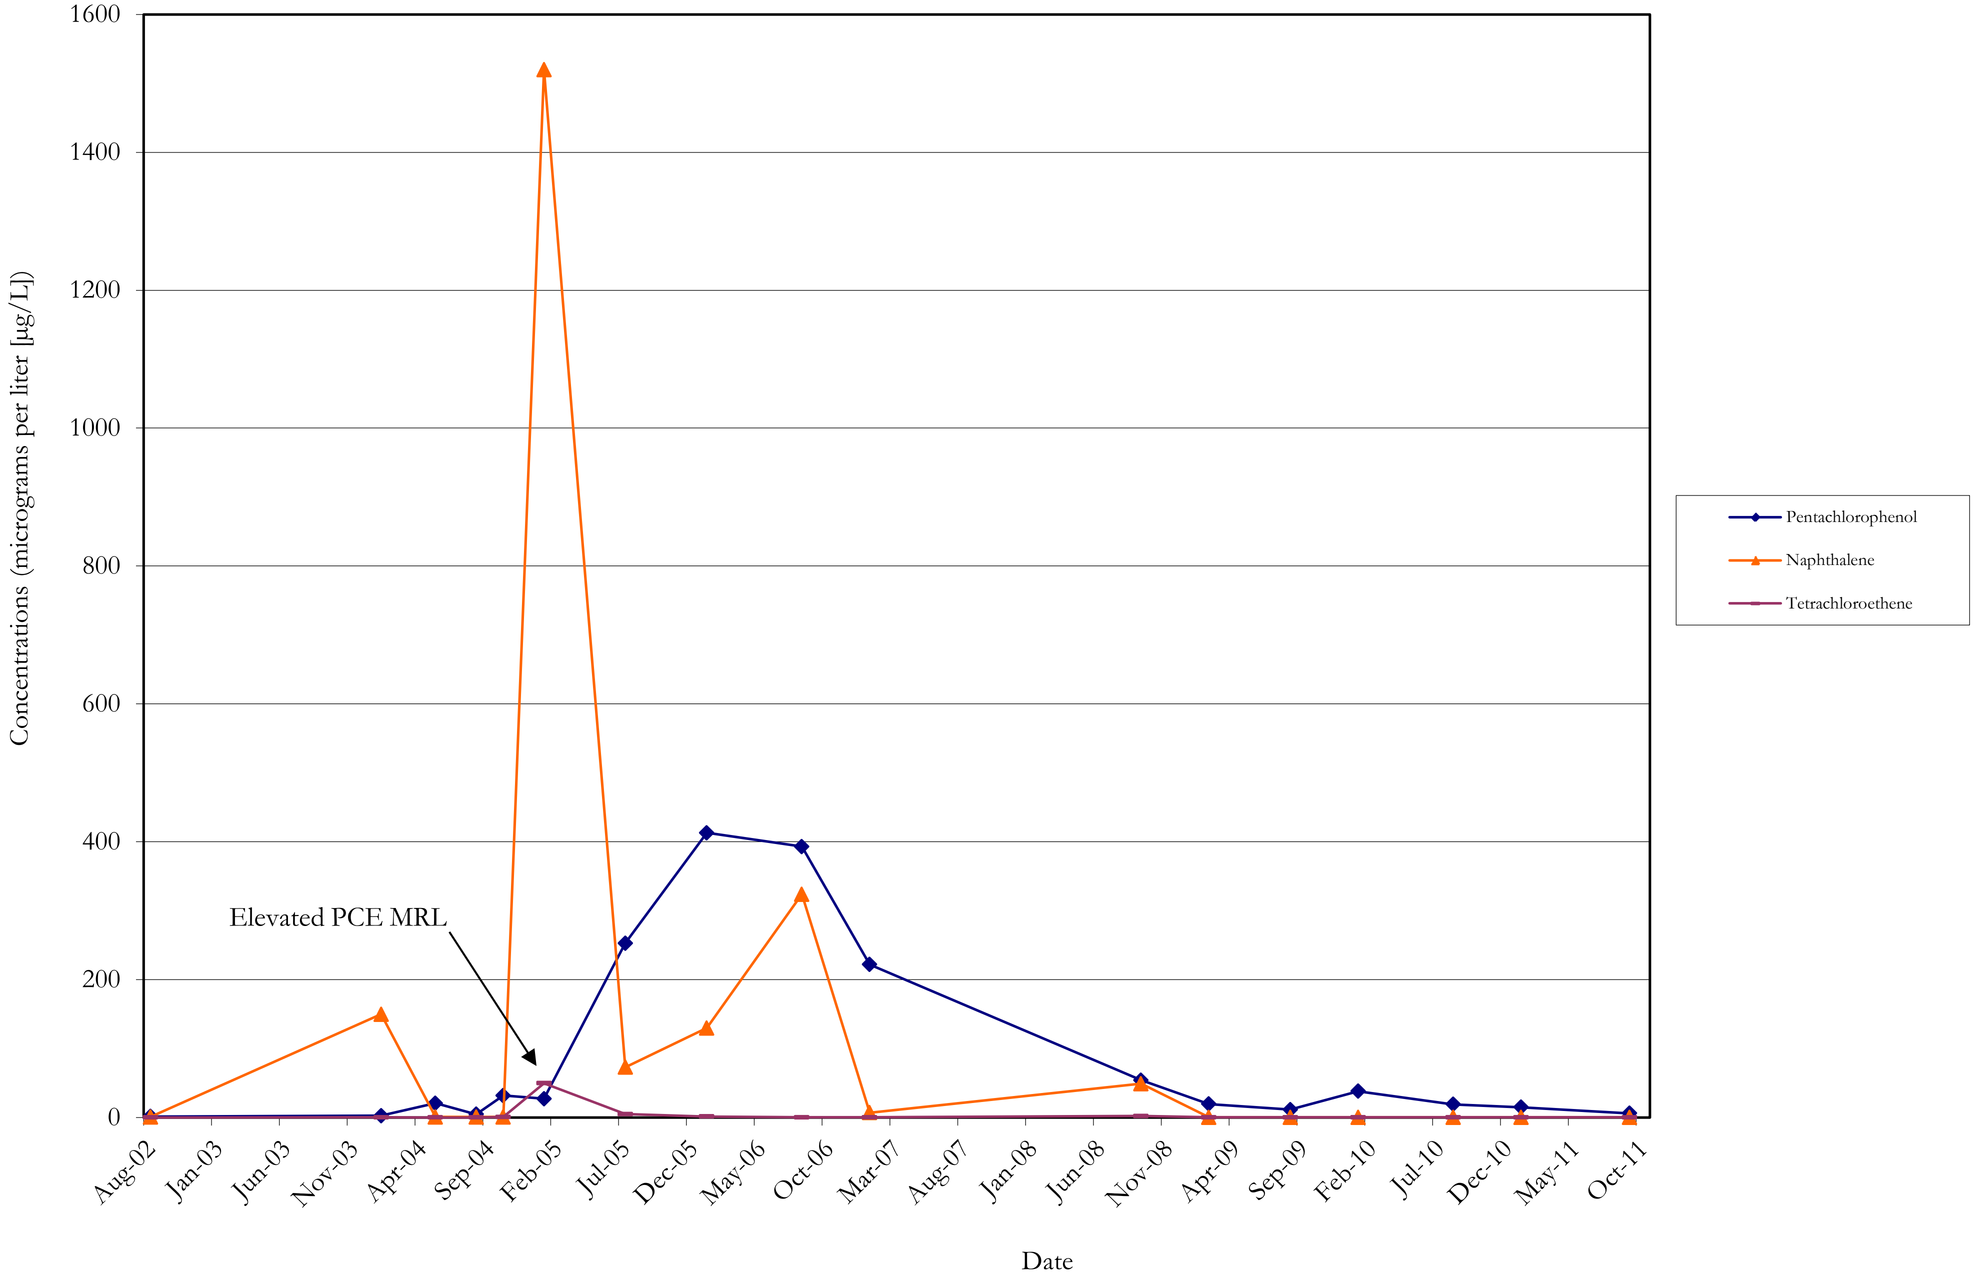
CELLS 1 AND 2

CELL 3

APPENDIX I-1

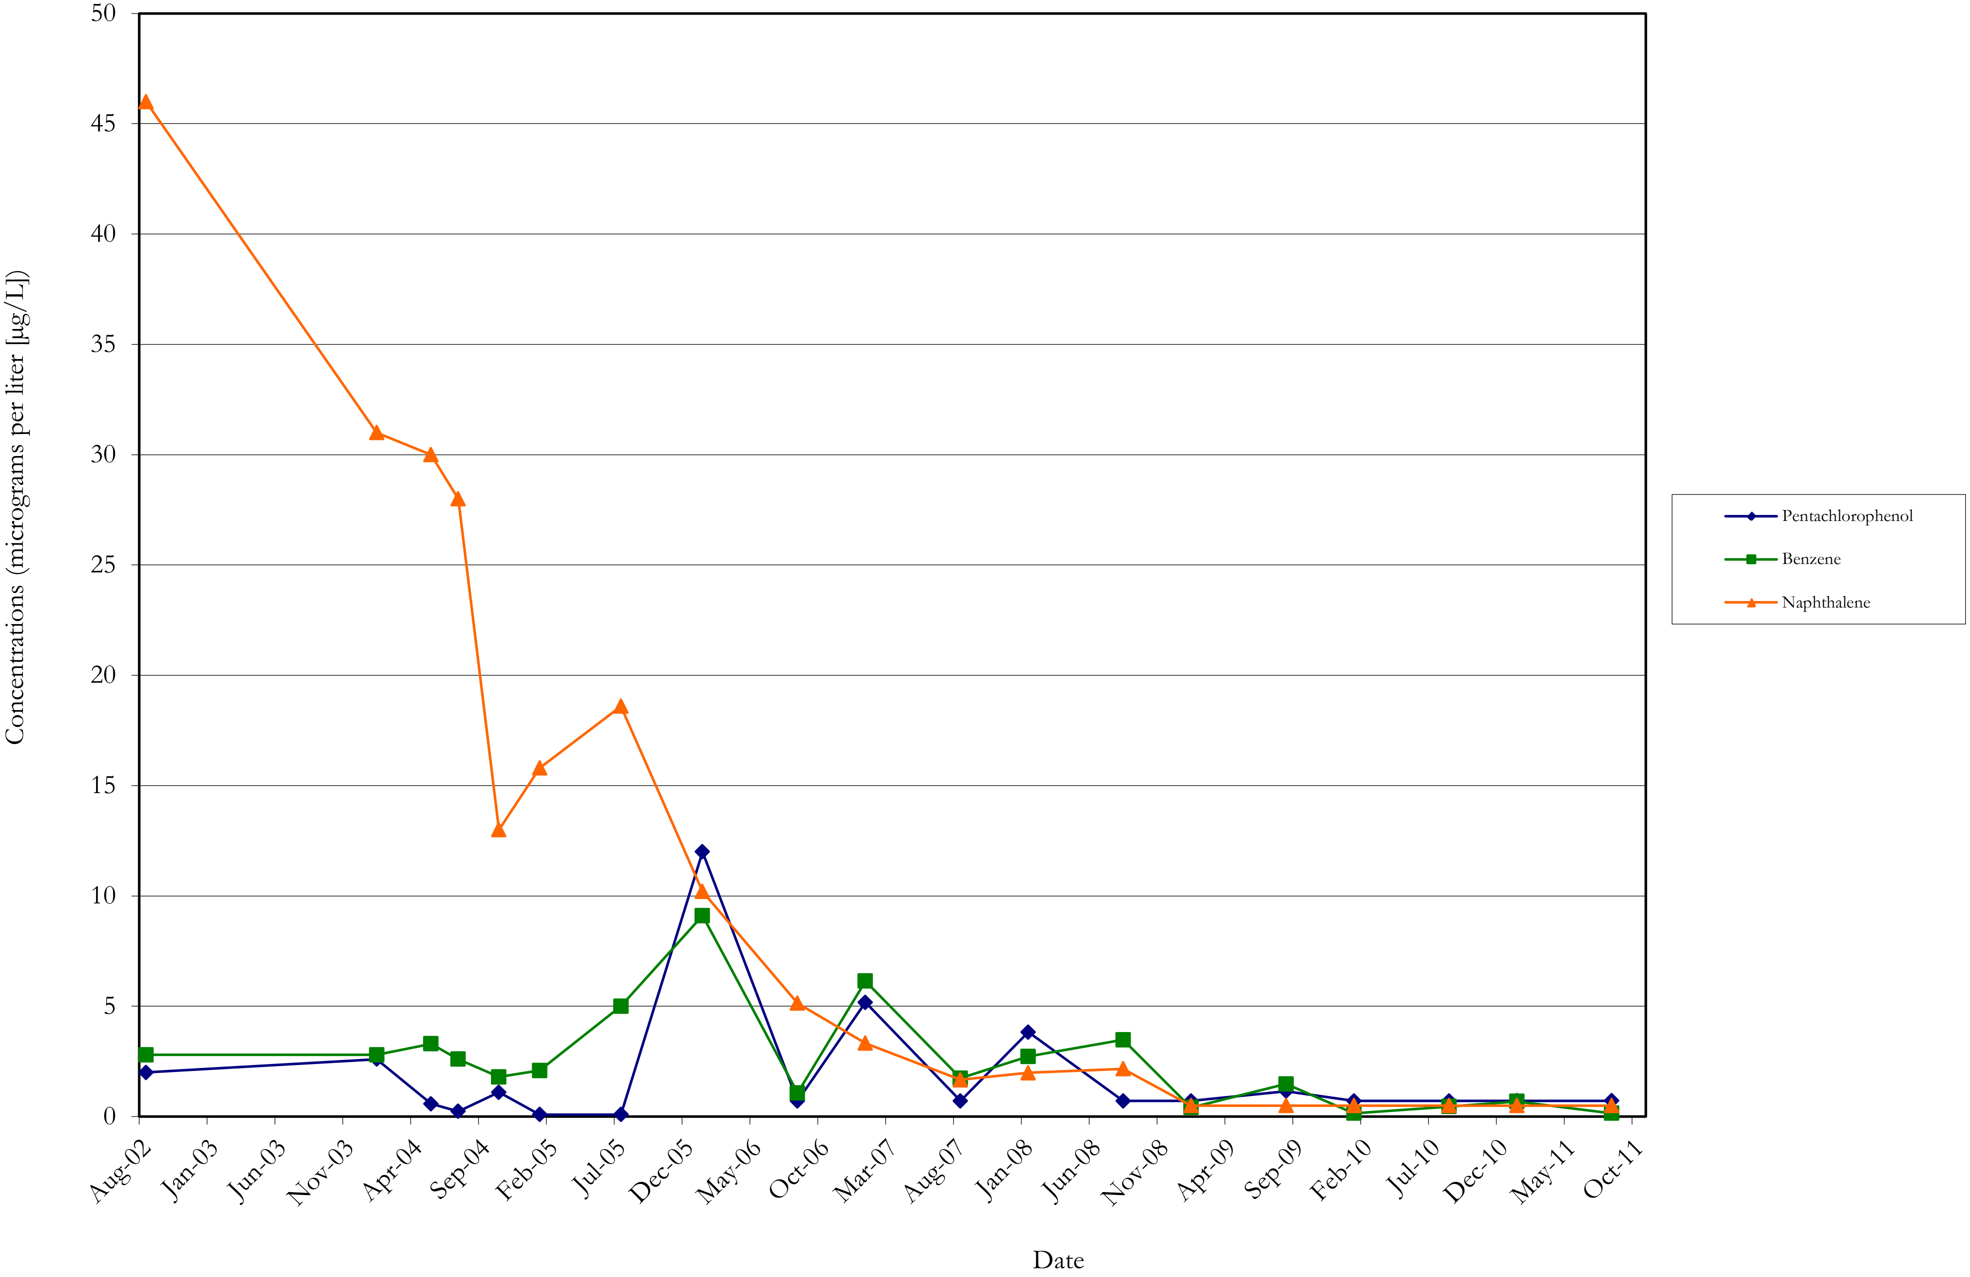
CELLS 1 AND 2 PLUME

Figure I-1-1. Indicator Hazardous Substance Trends in MW-7 in the Upper Water-Bearing Zone
Former PWT Site RI/FS



Note: Benzene was not graphed for MW-7 because it has not been detected at or above the method reporting limits.

Figure I-1-2. Indicator Hazardous Substance Trends in MW-16 in the Upper Water-Bearing Zone
Former PWT Site RI/FS



Note: Tetrachloroethene was not graphed for MW-16 because it has not been detected at or above the method reporting limits.

Figure I-1-3. Indicator Hazardous Substance Trends in MW-21 in the Upper Water-Bearing Zone
Former PWT Site RI/FS

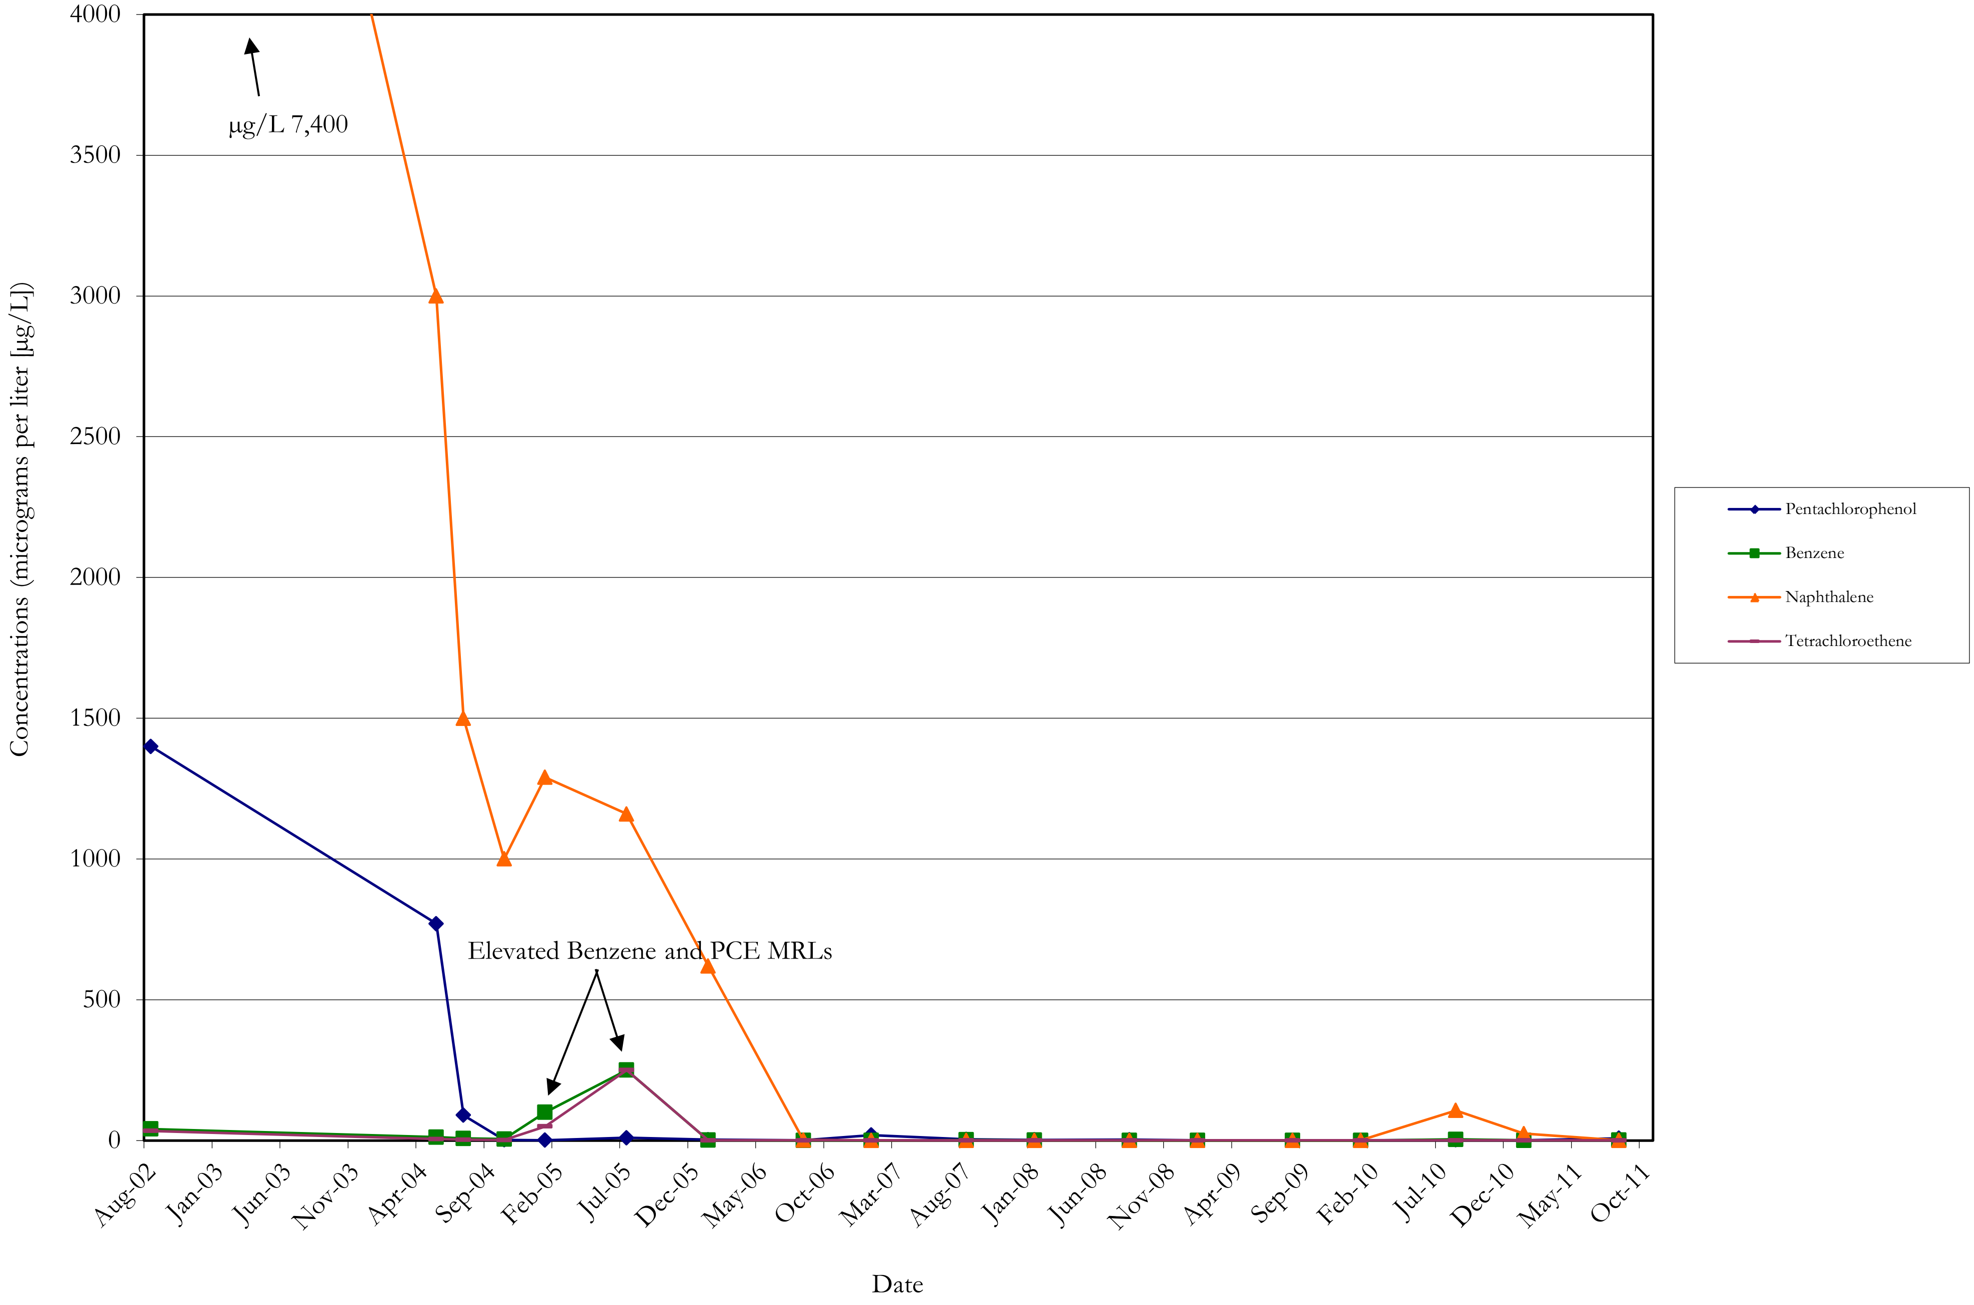


Figure I-1-4. Indicator Hazardous Substance Trends in MW-38 in the Upper Water-Bearing Zone
Former PWT Site RI/FS

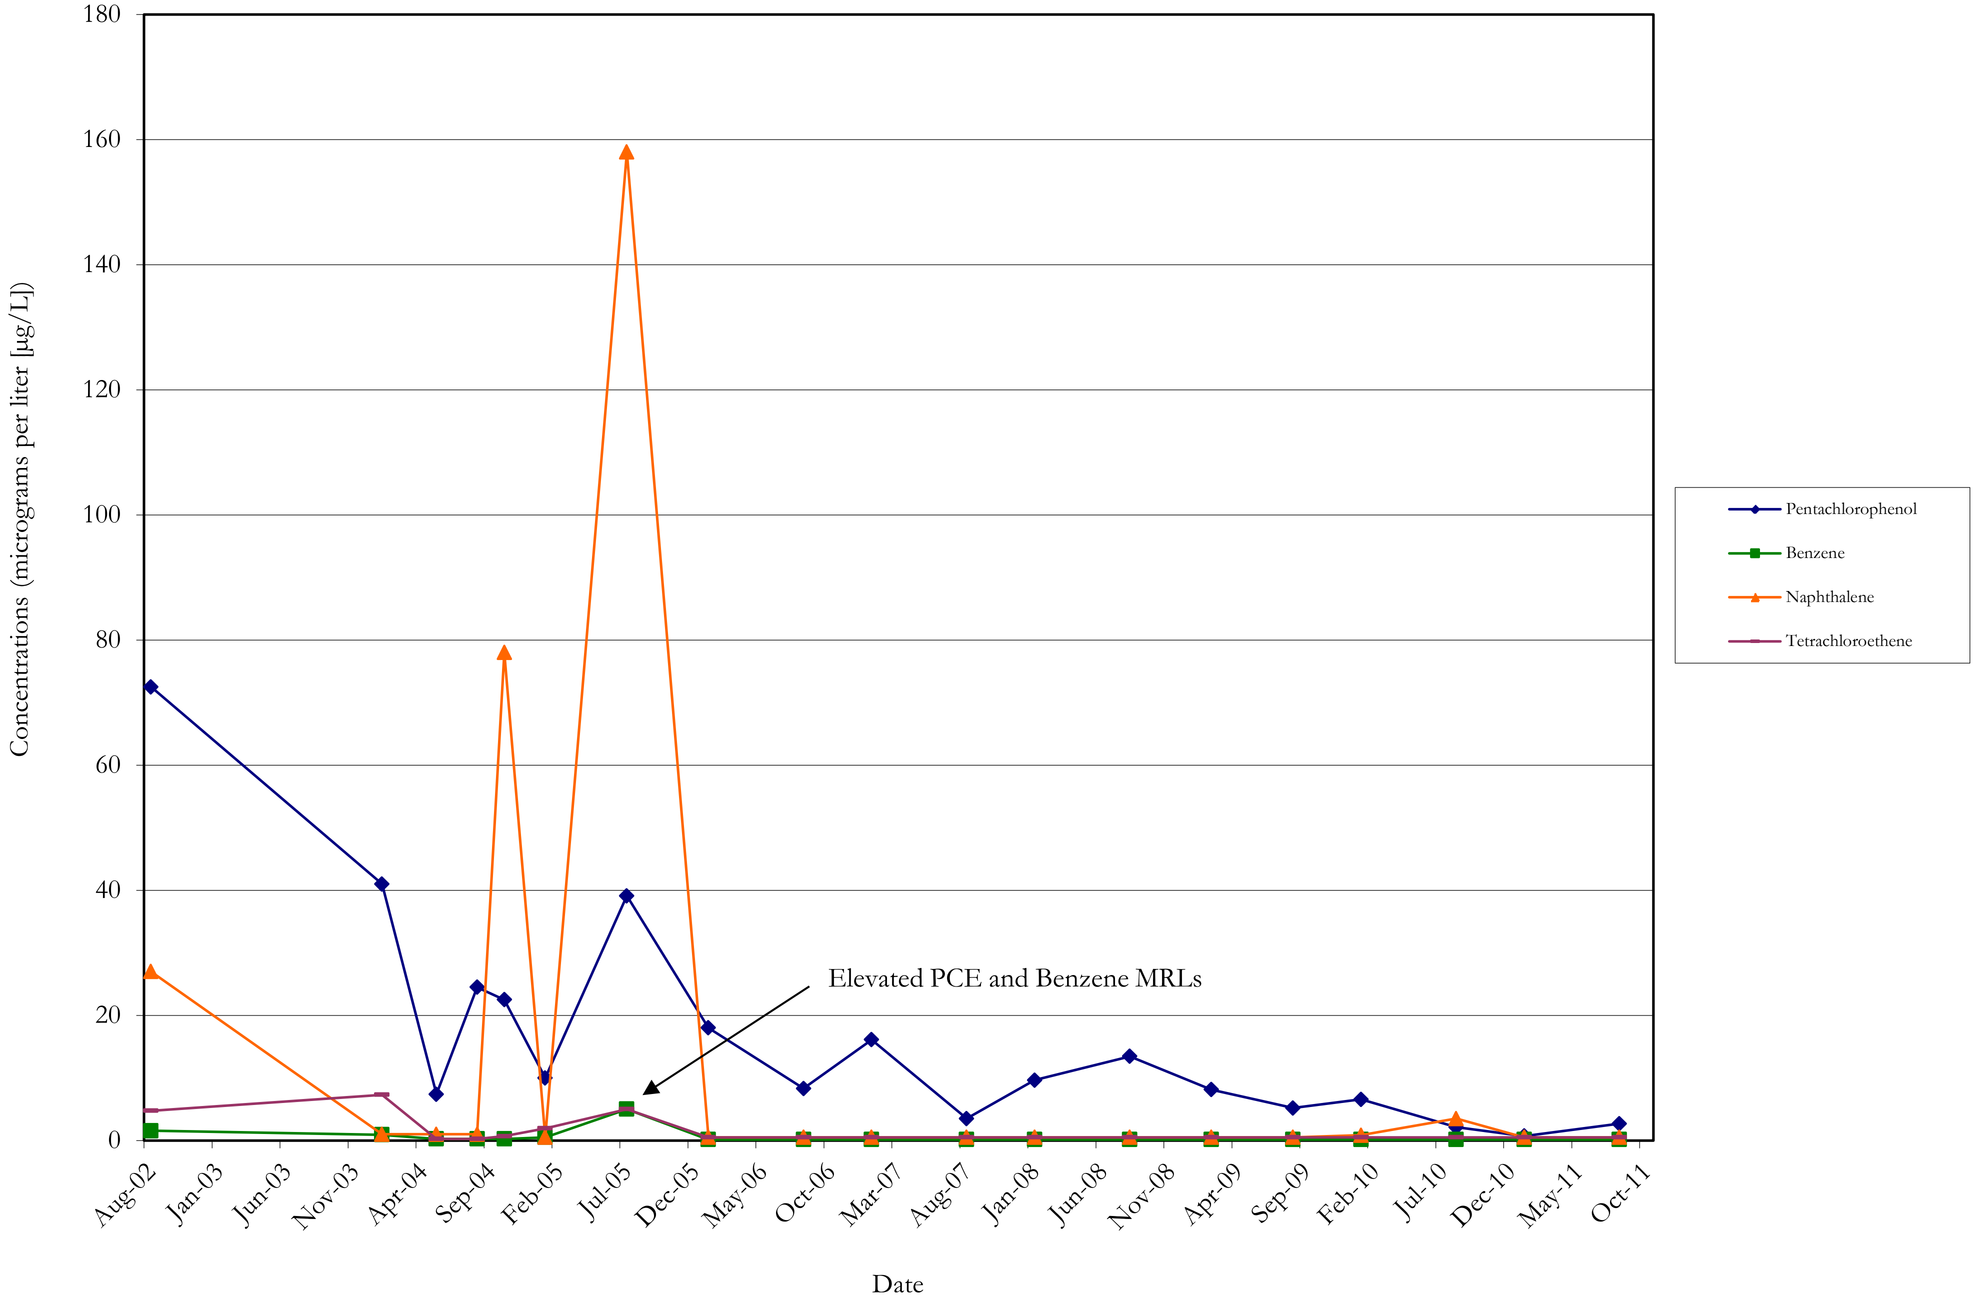

Figure I-1-5. Indicator Hazardous Substance Trends in MW-44 in the Upper Water-Bearing Zone
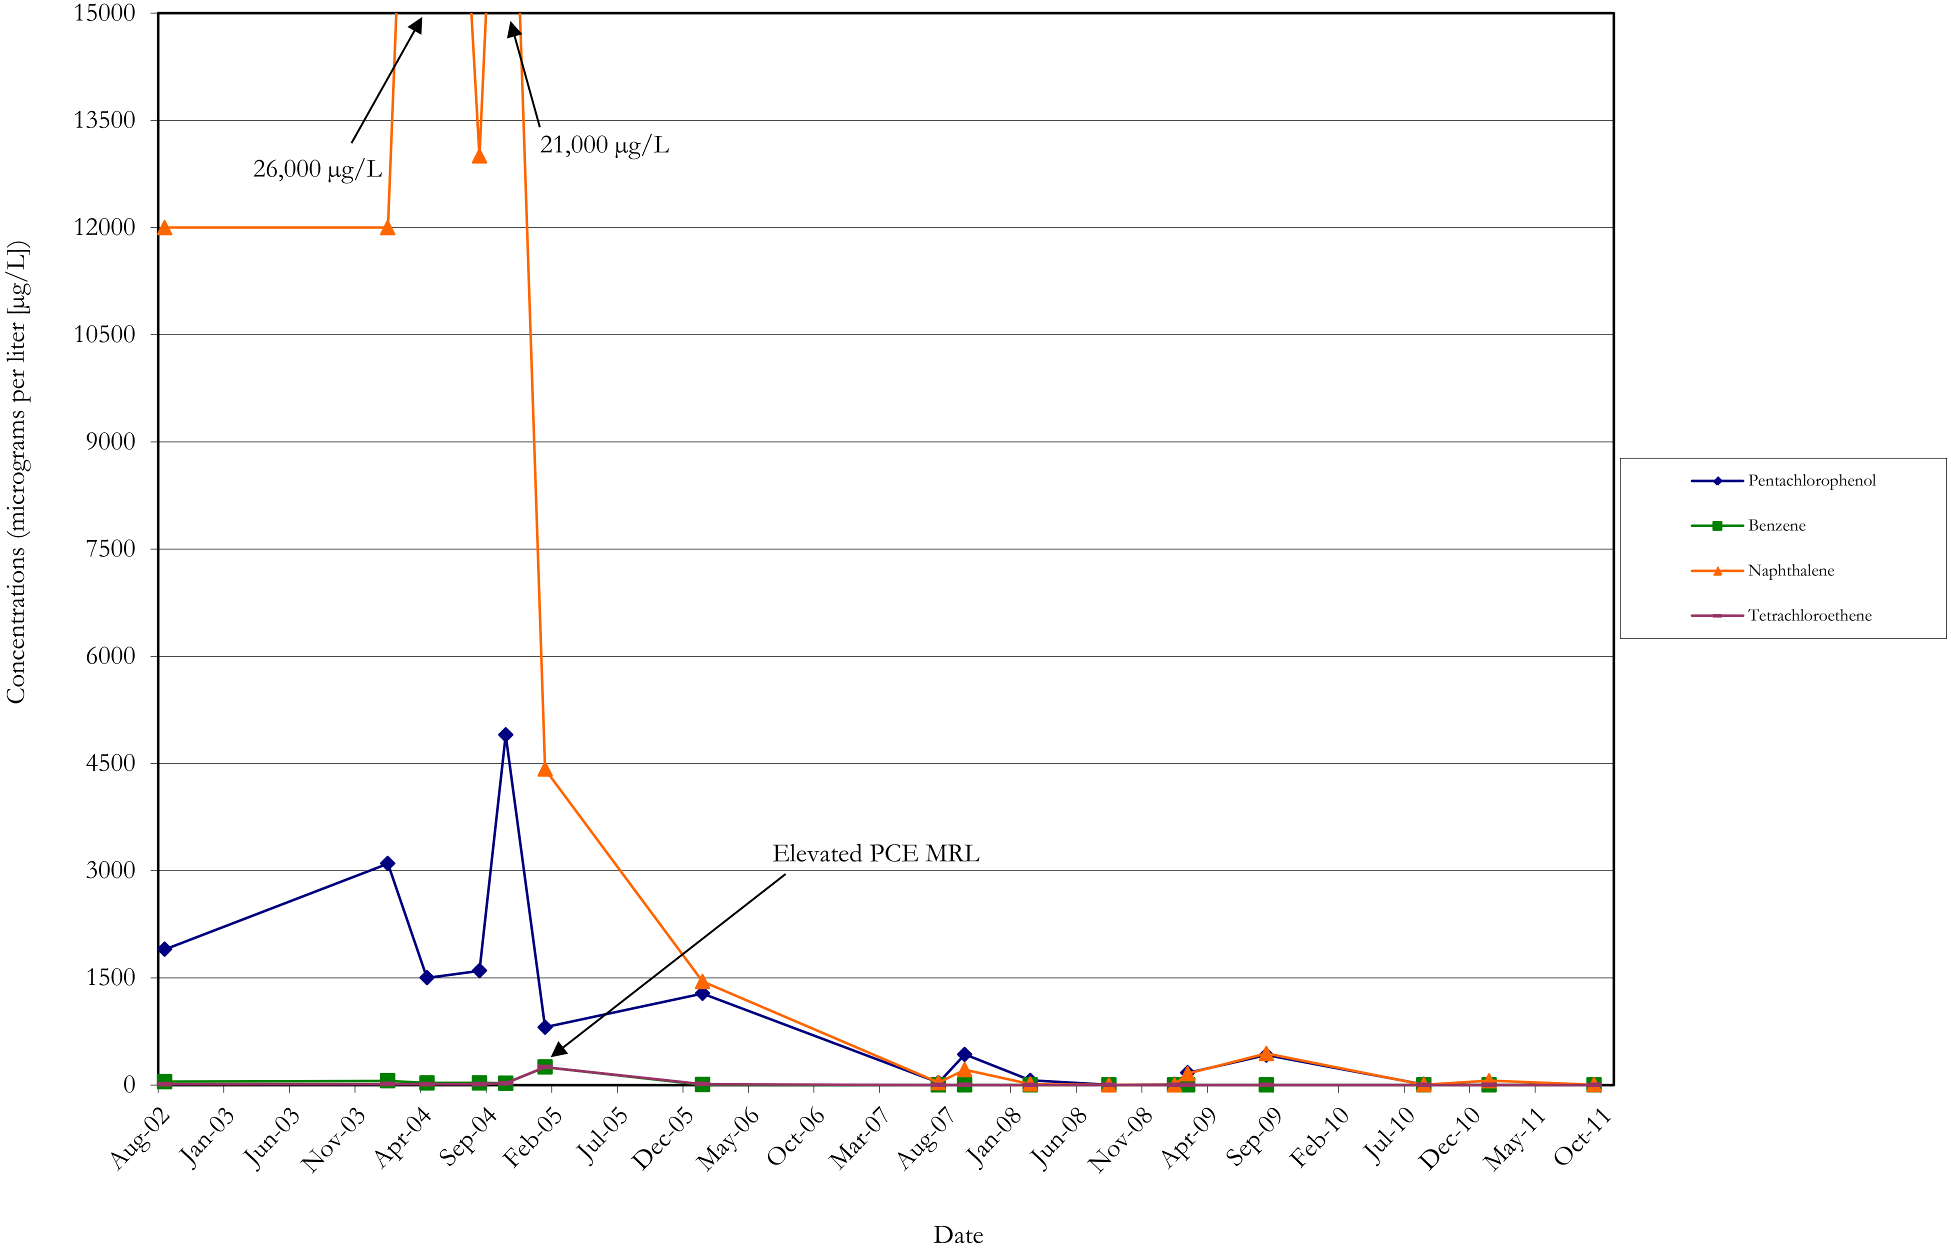
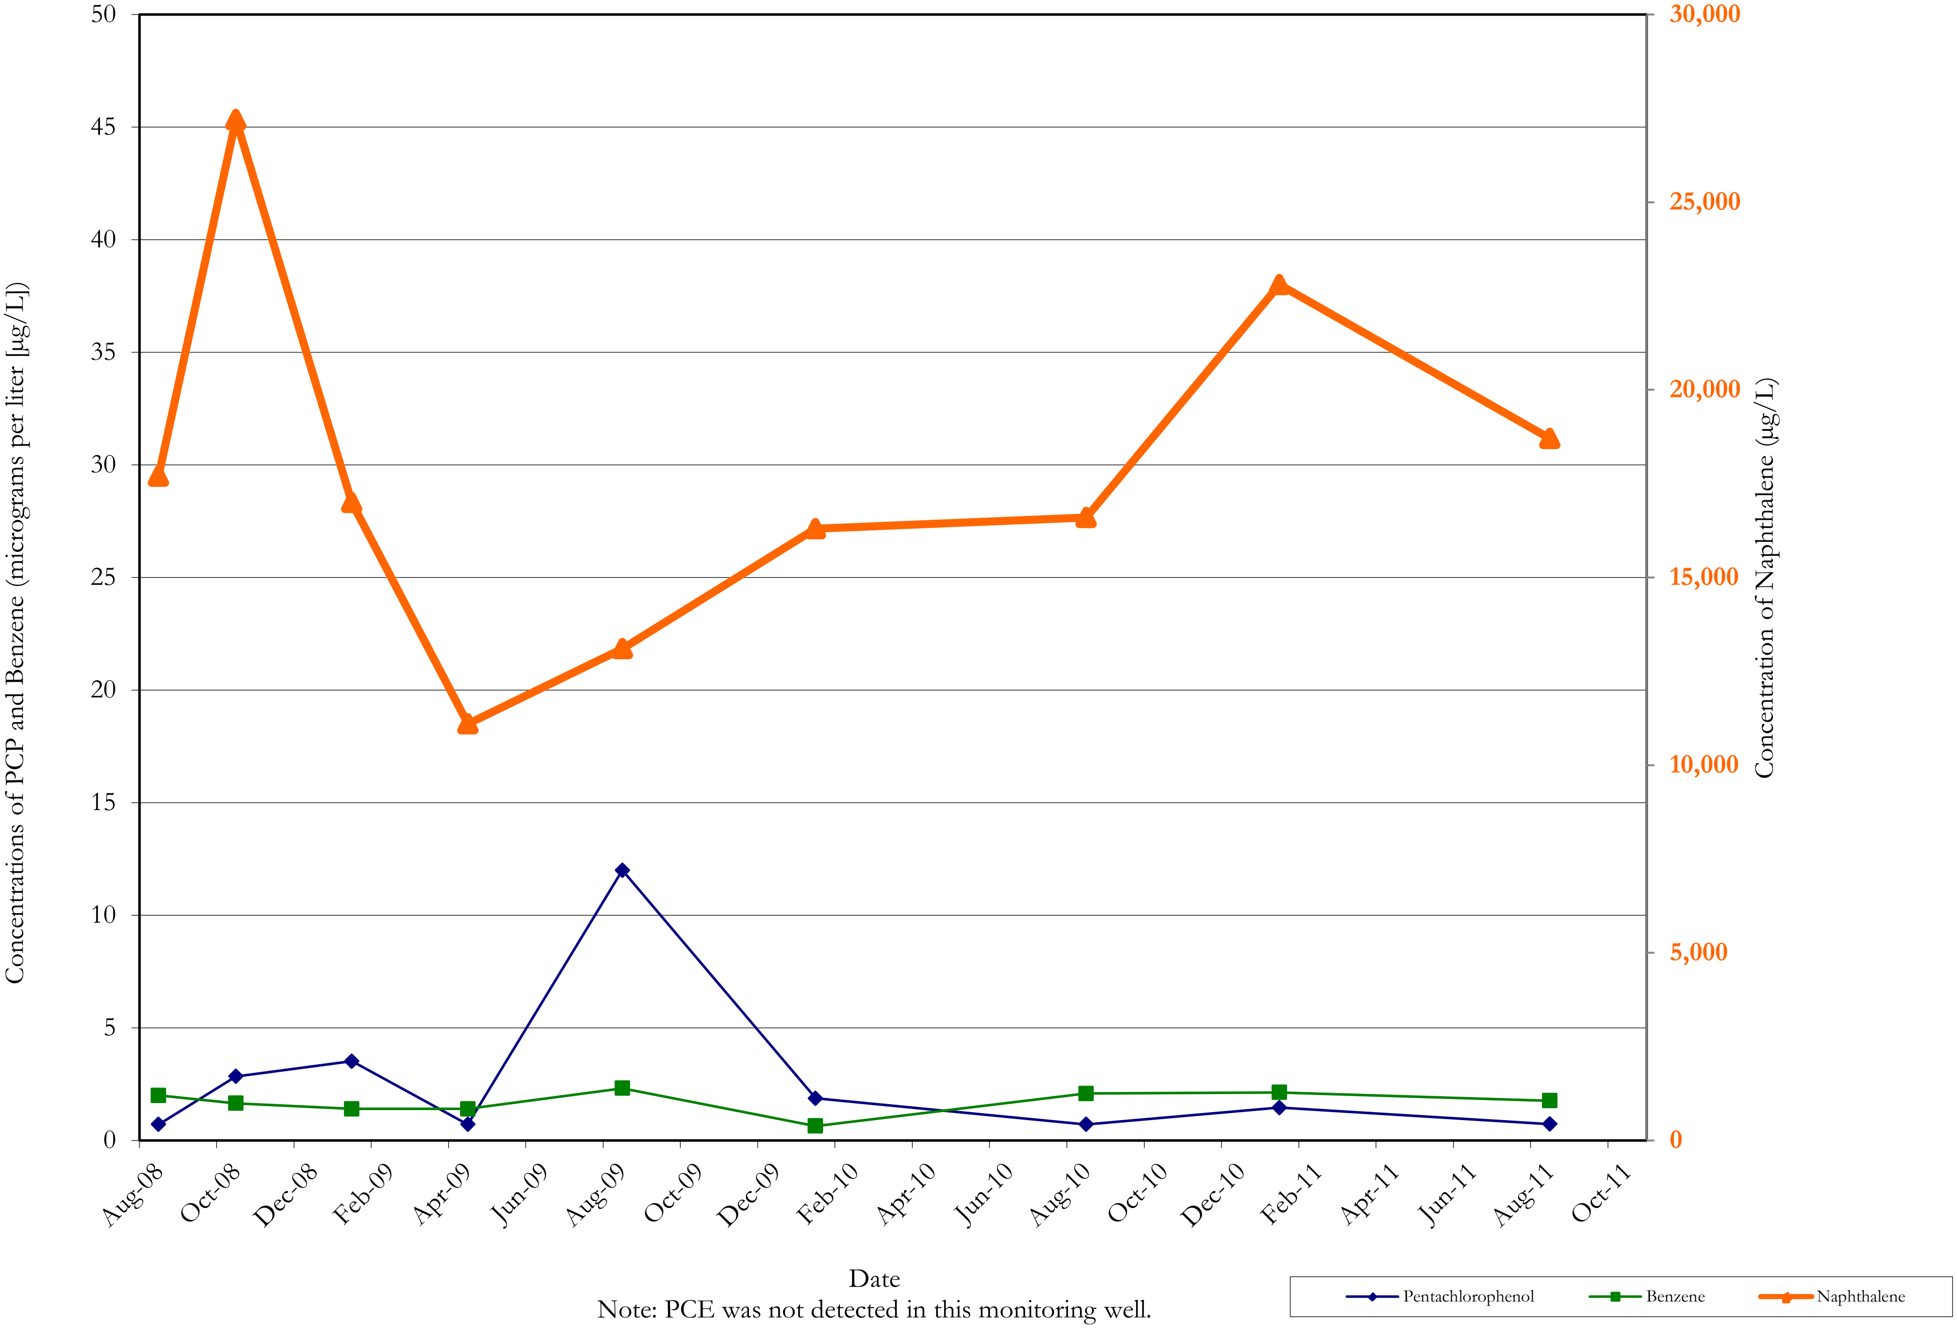
Former PWT Site RI/FS



Note: In January 2006, benzene was not detected, but the method reporting limit was elevated because of interference.

Figure I-1-6. Indicator Hazardous Substance Trends in MW-57S in the Upper Water-Bearing Zone
Former PWT Site RI/FS



Note: PCE was not detected in this monitoring well.

Figure I-1-7. Indicator Hazardous Substance Trends in MW-57D in the Upper Water-Bearing Zone
Former PWT Site RI/FS

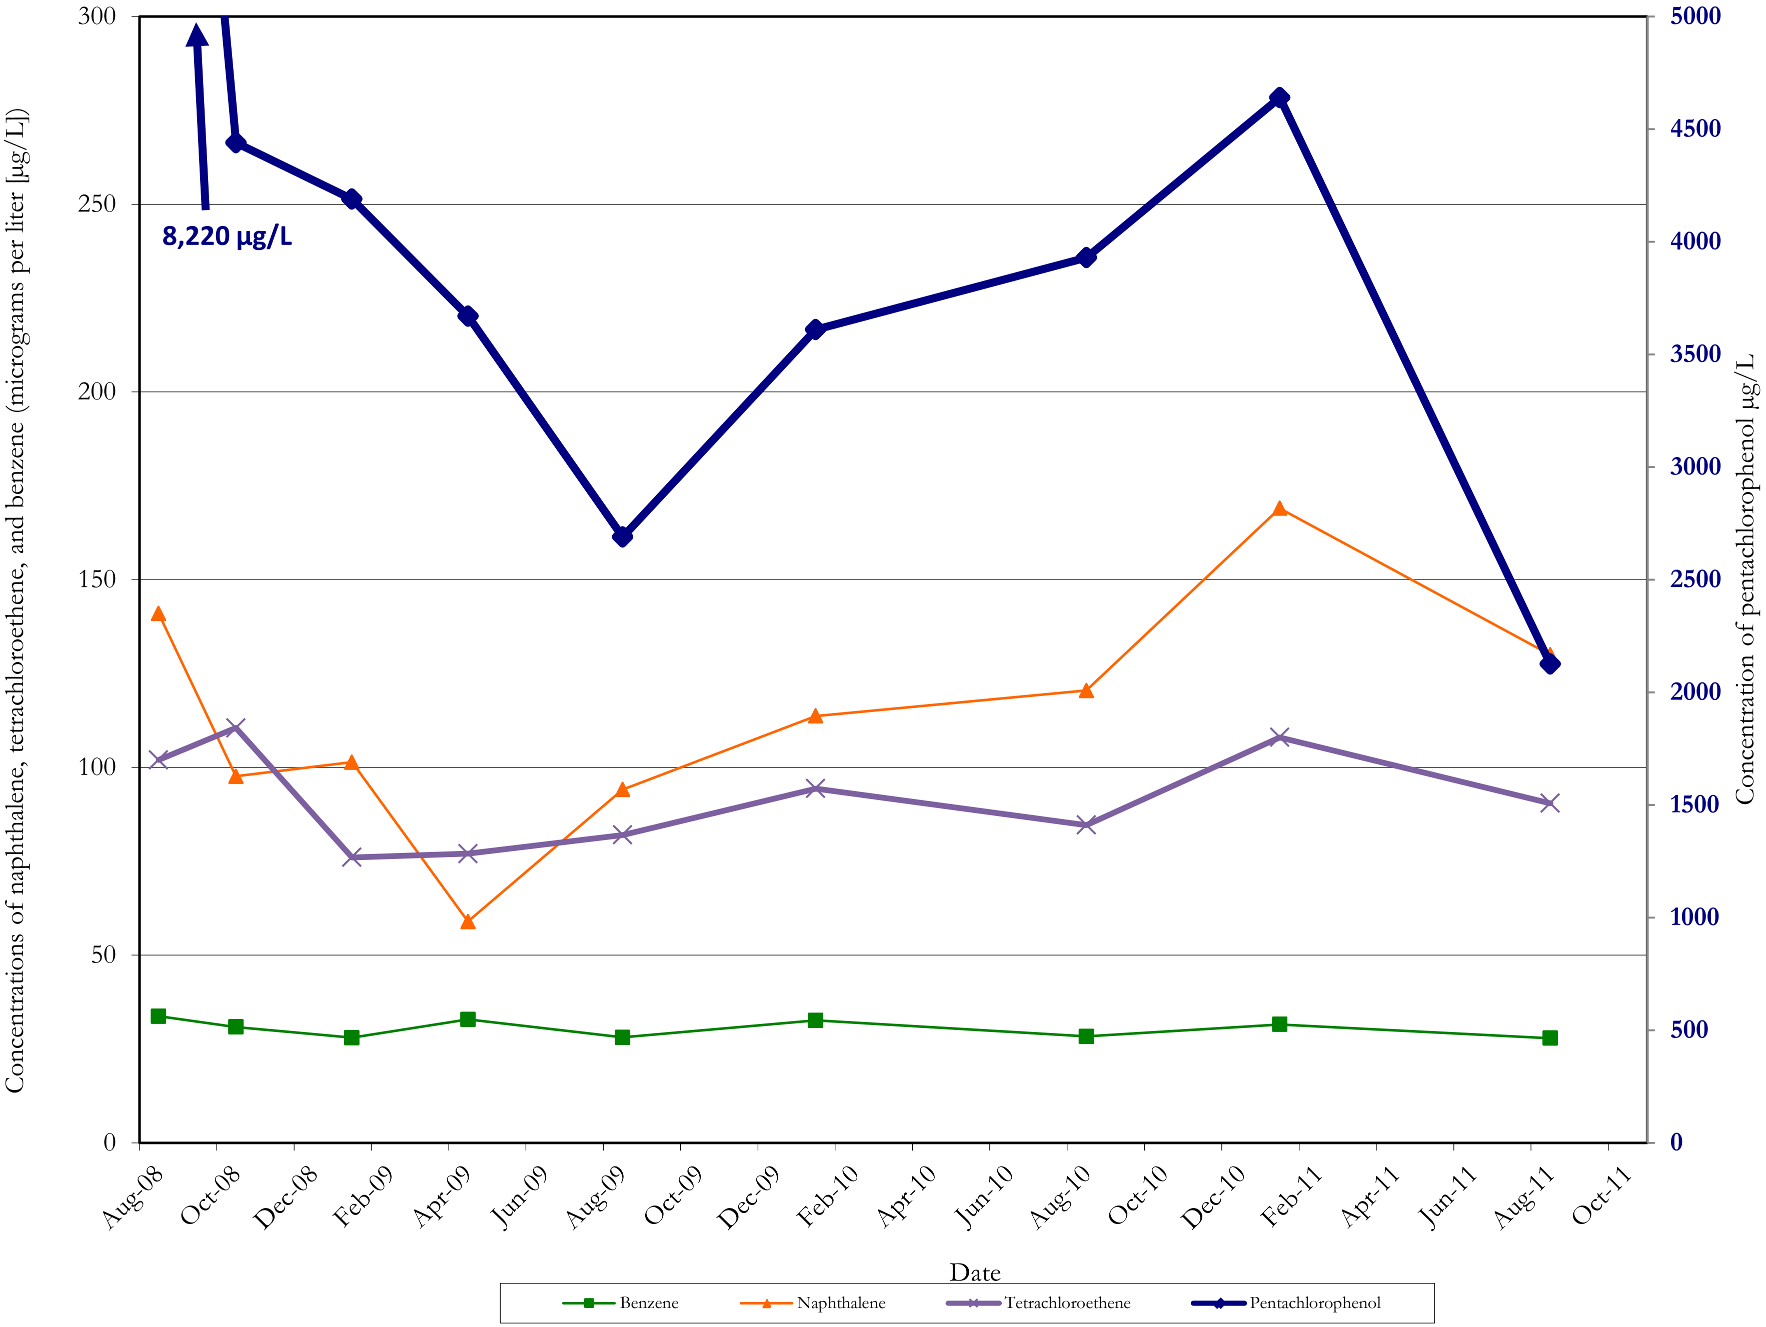


Figure I-1-8. Indicator Hazardous Substance Trends in USDFW-1 in the Upper Water-Bearing Zone
Former PWT Site RI/FS

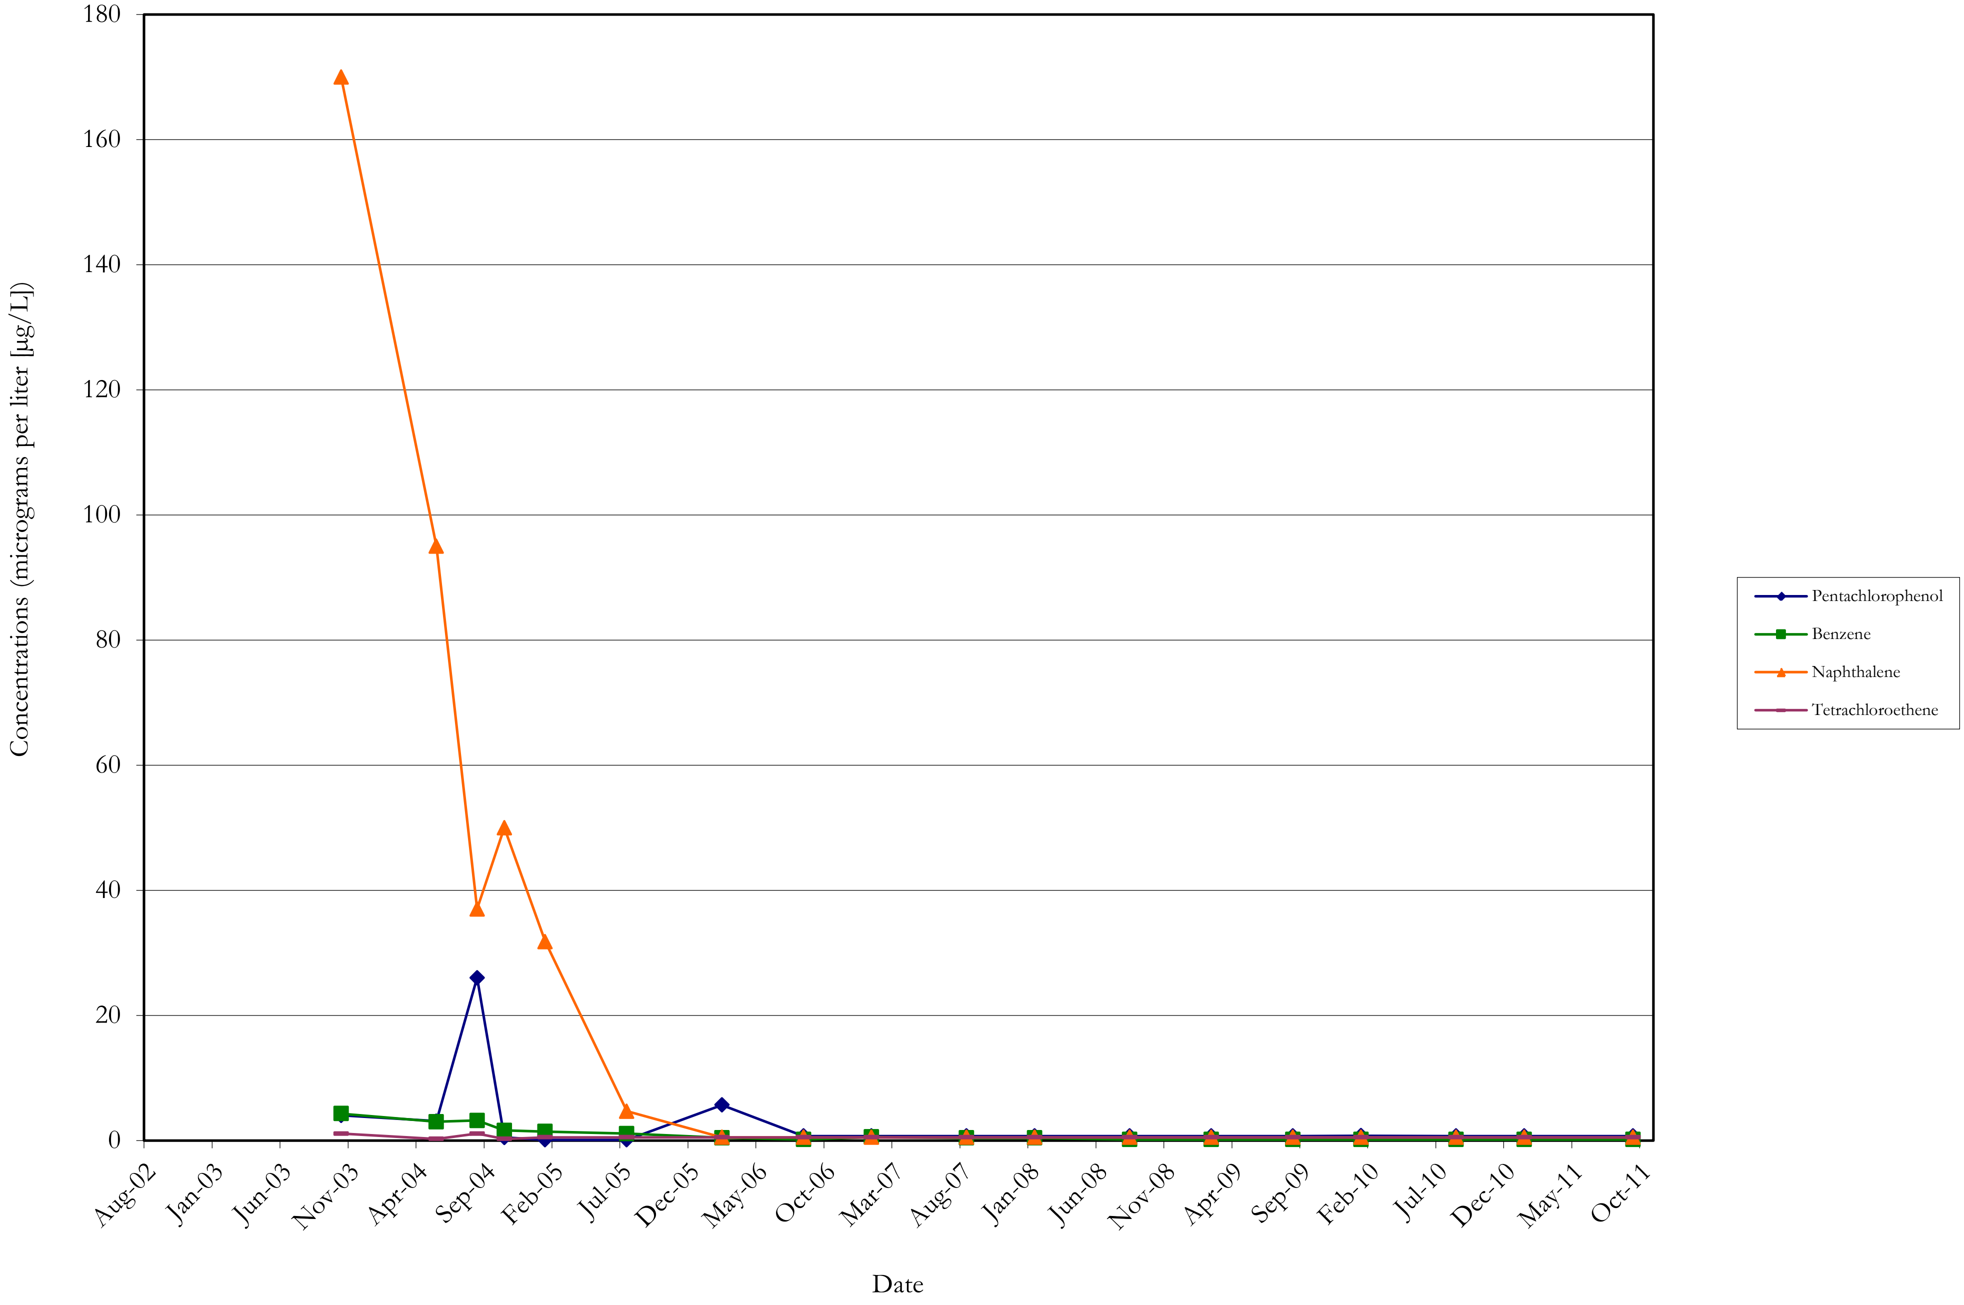

Figure I-1-9. Indicator Hazardous Substance Trends in RMW-2S and RMW2-D in the Upper Water-Bearing Zone Former PWT Site RI/FS

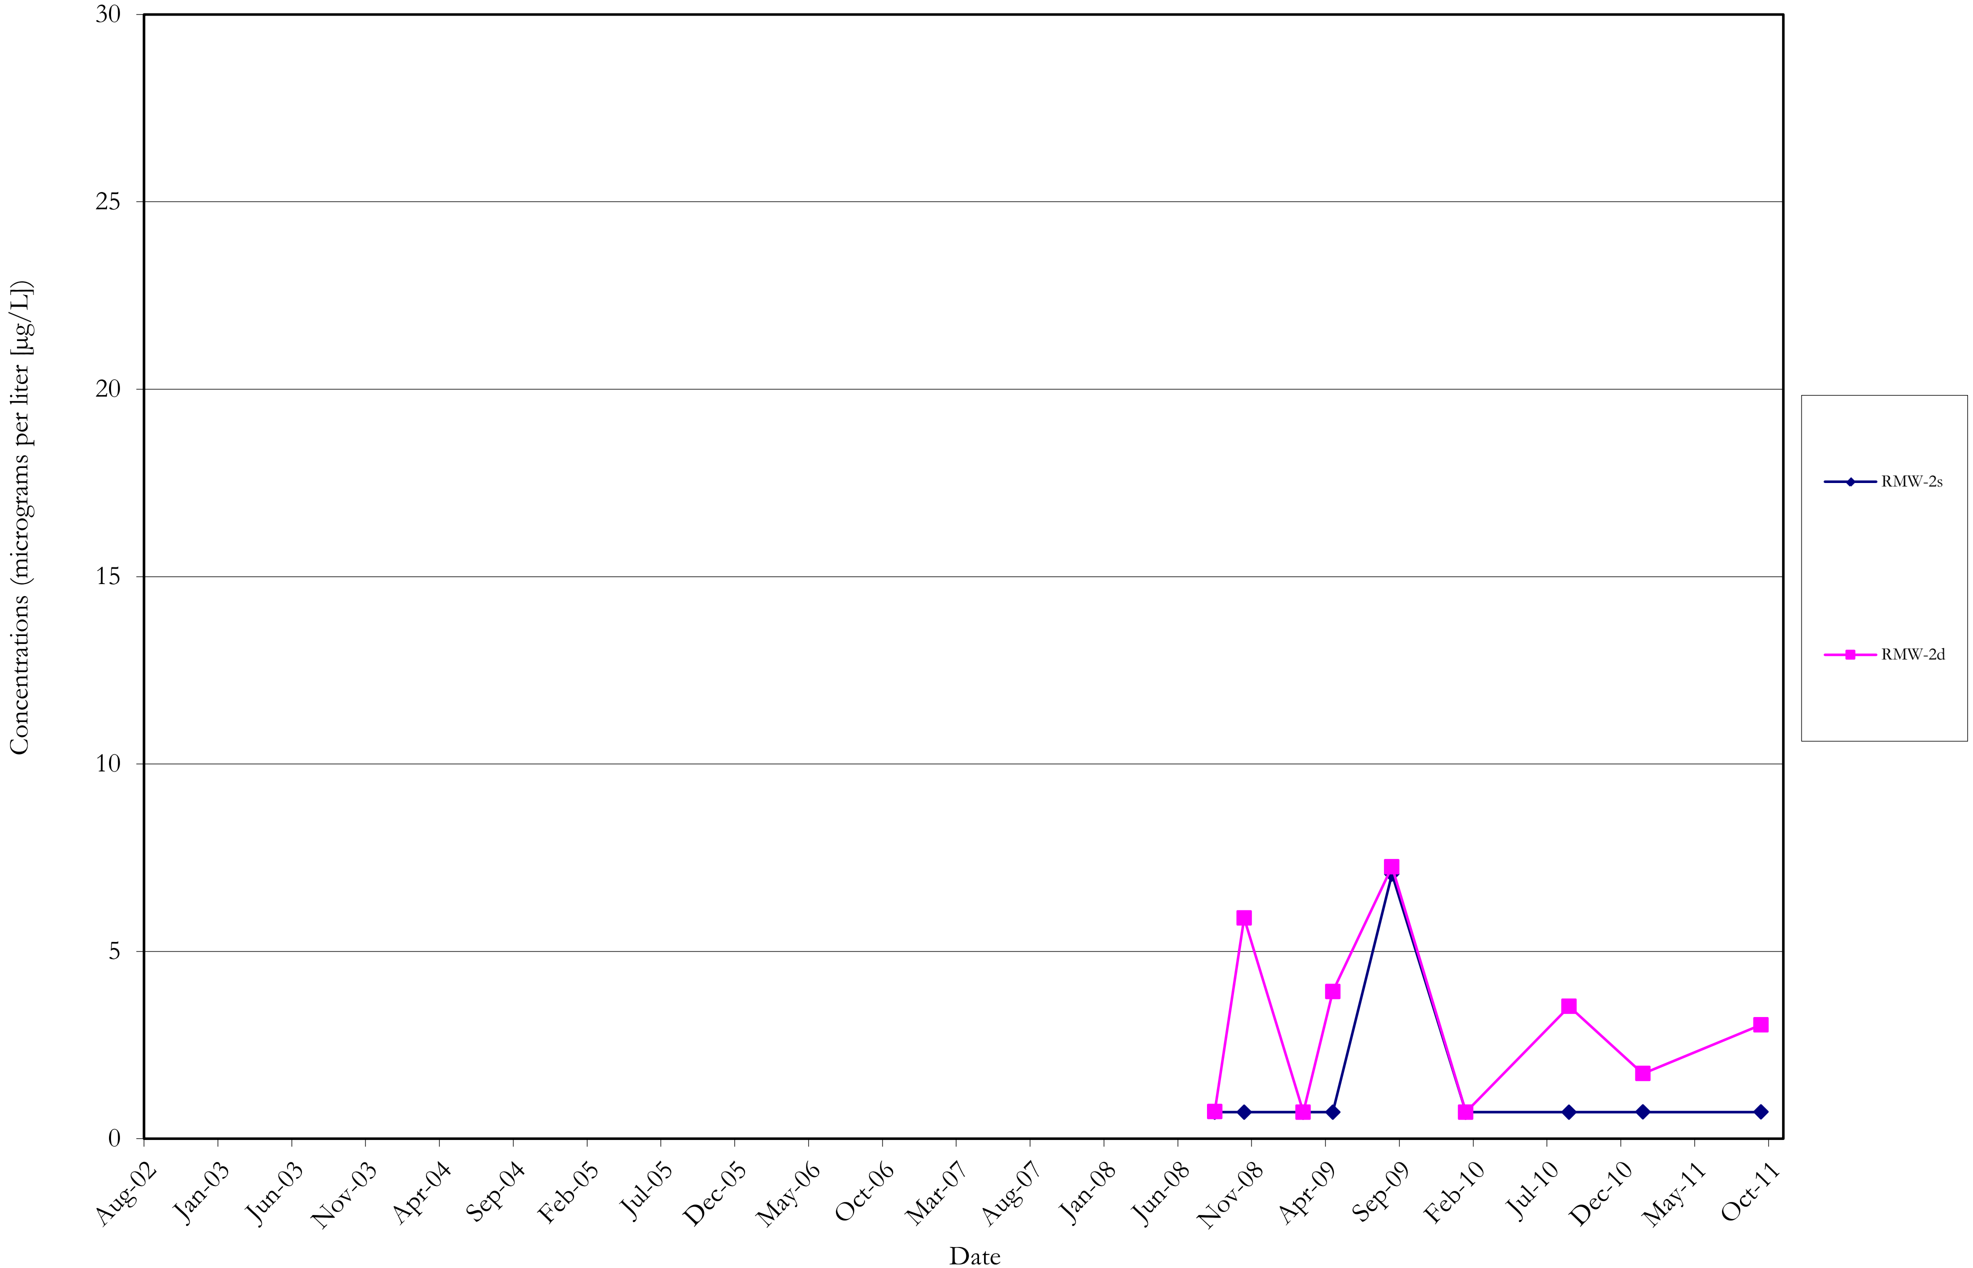
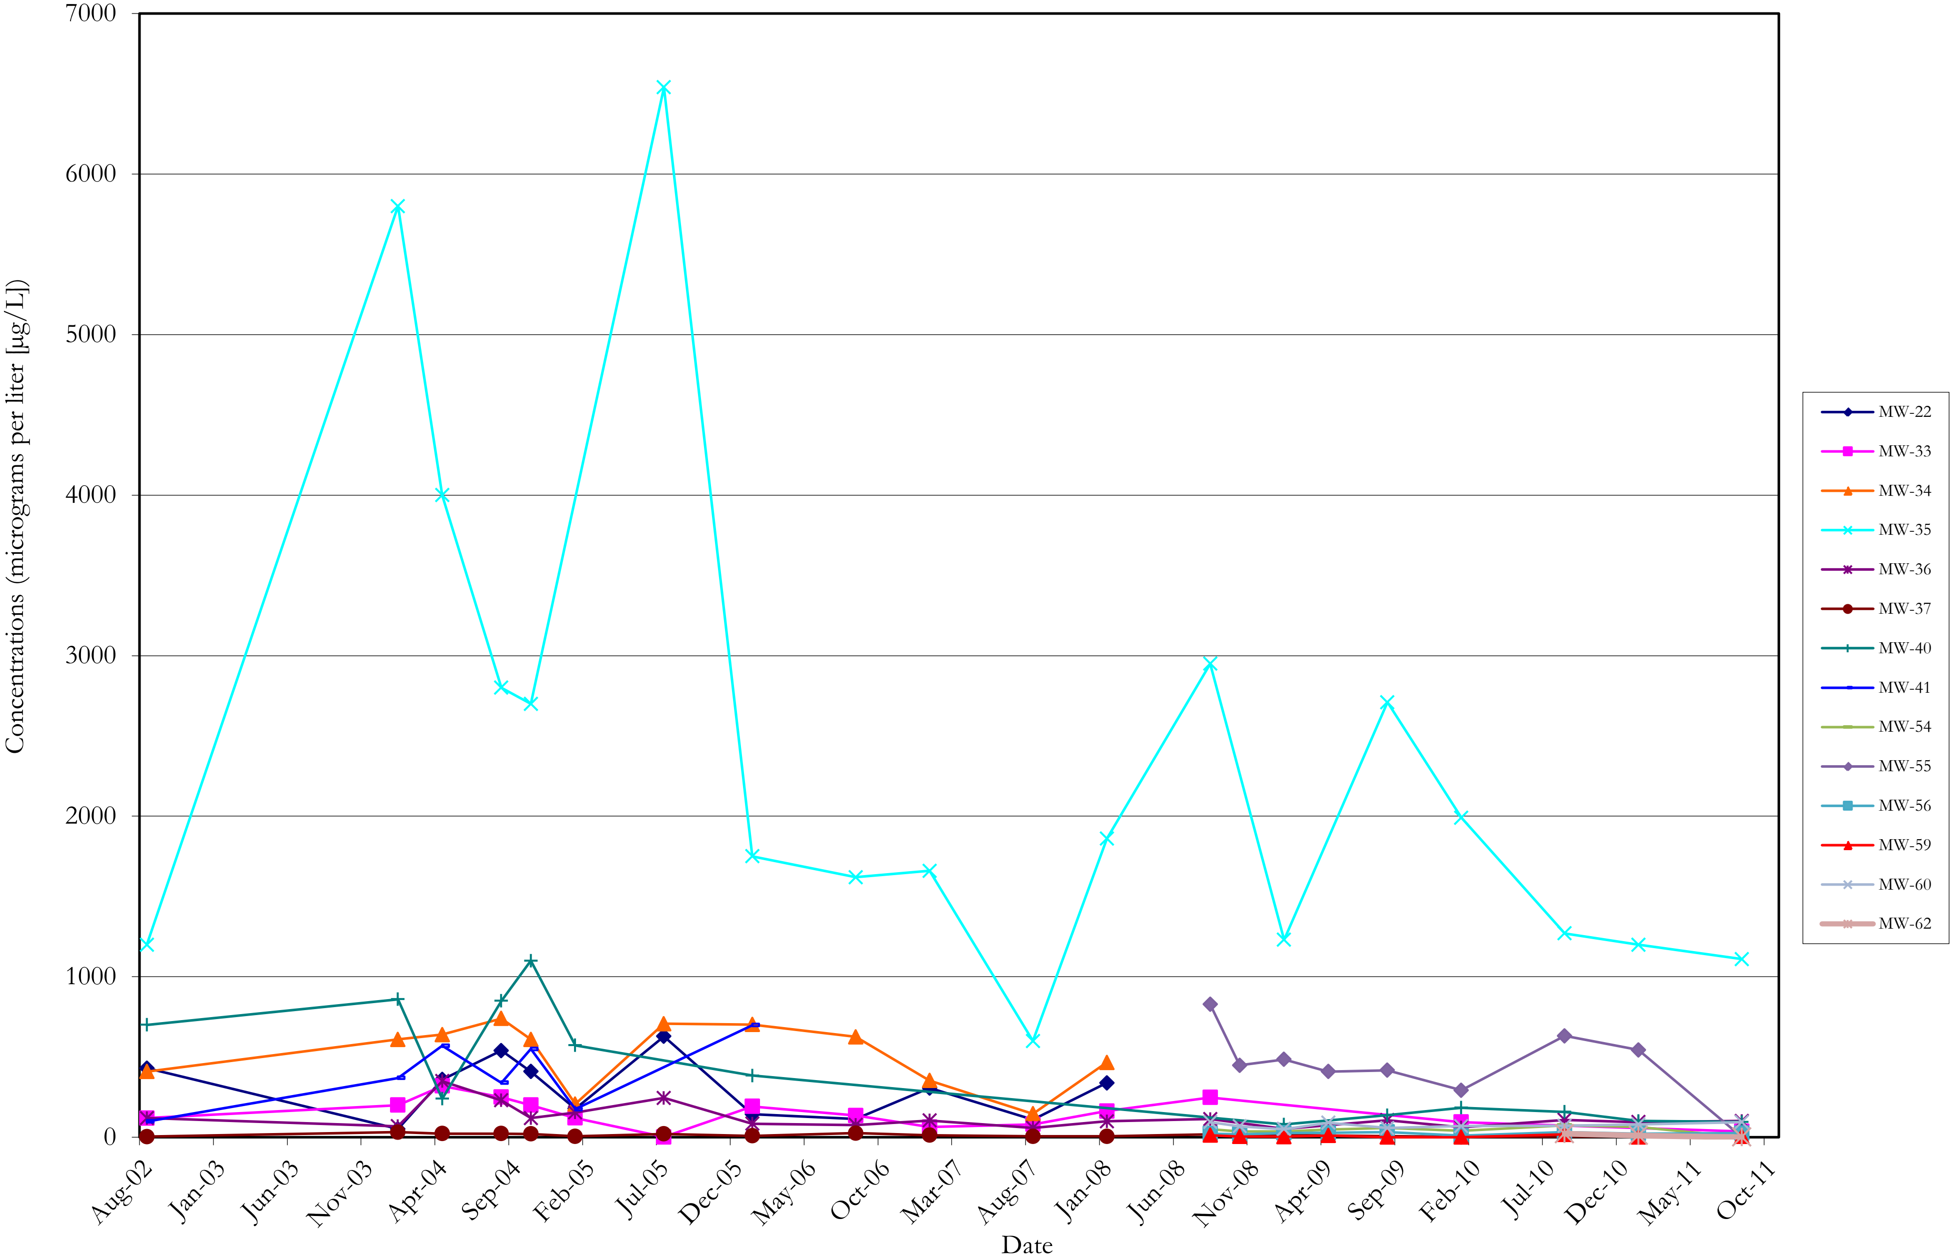


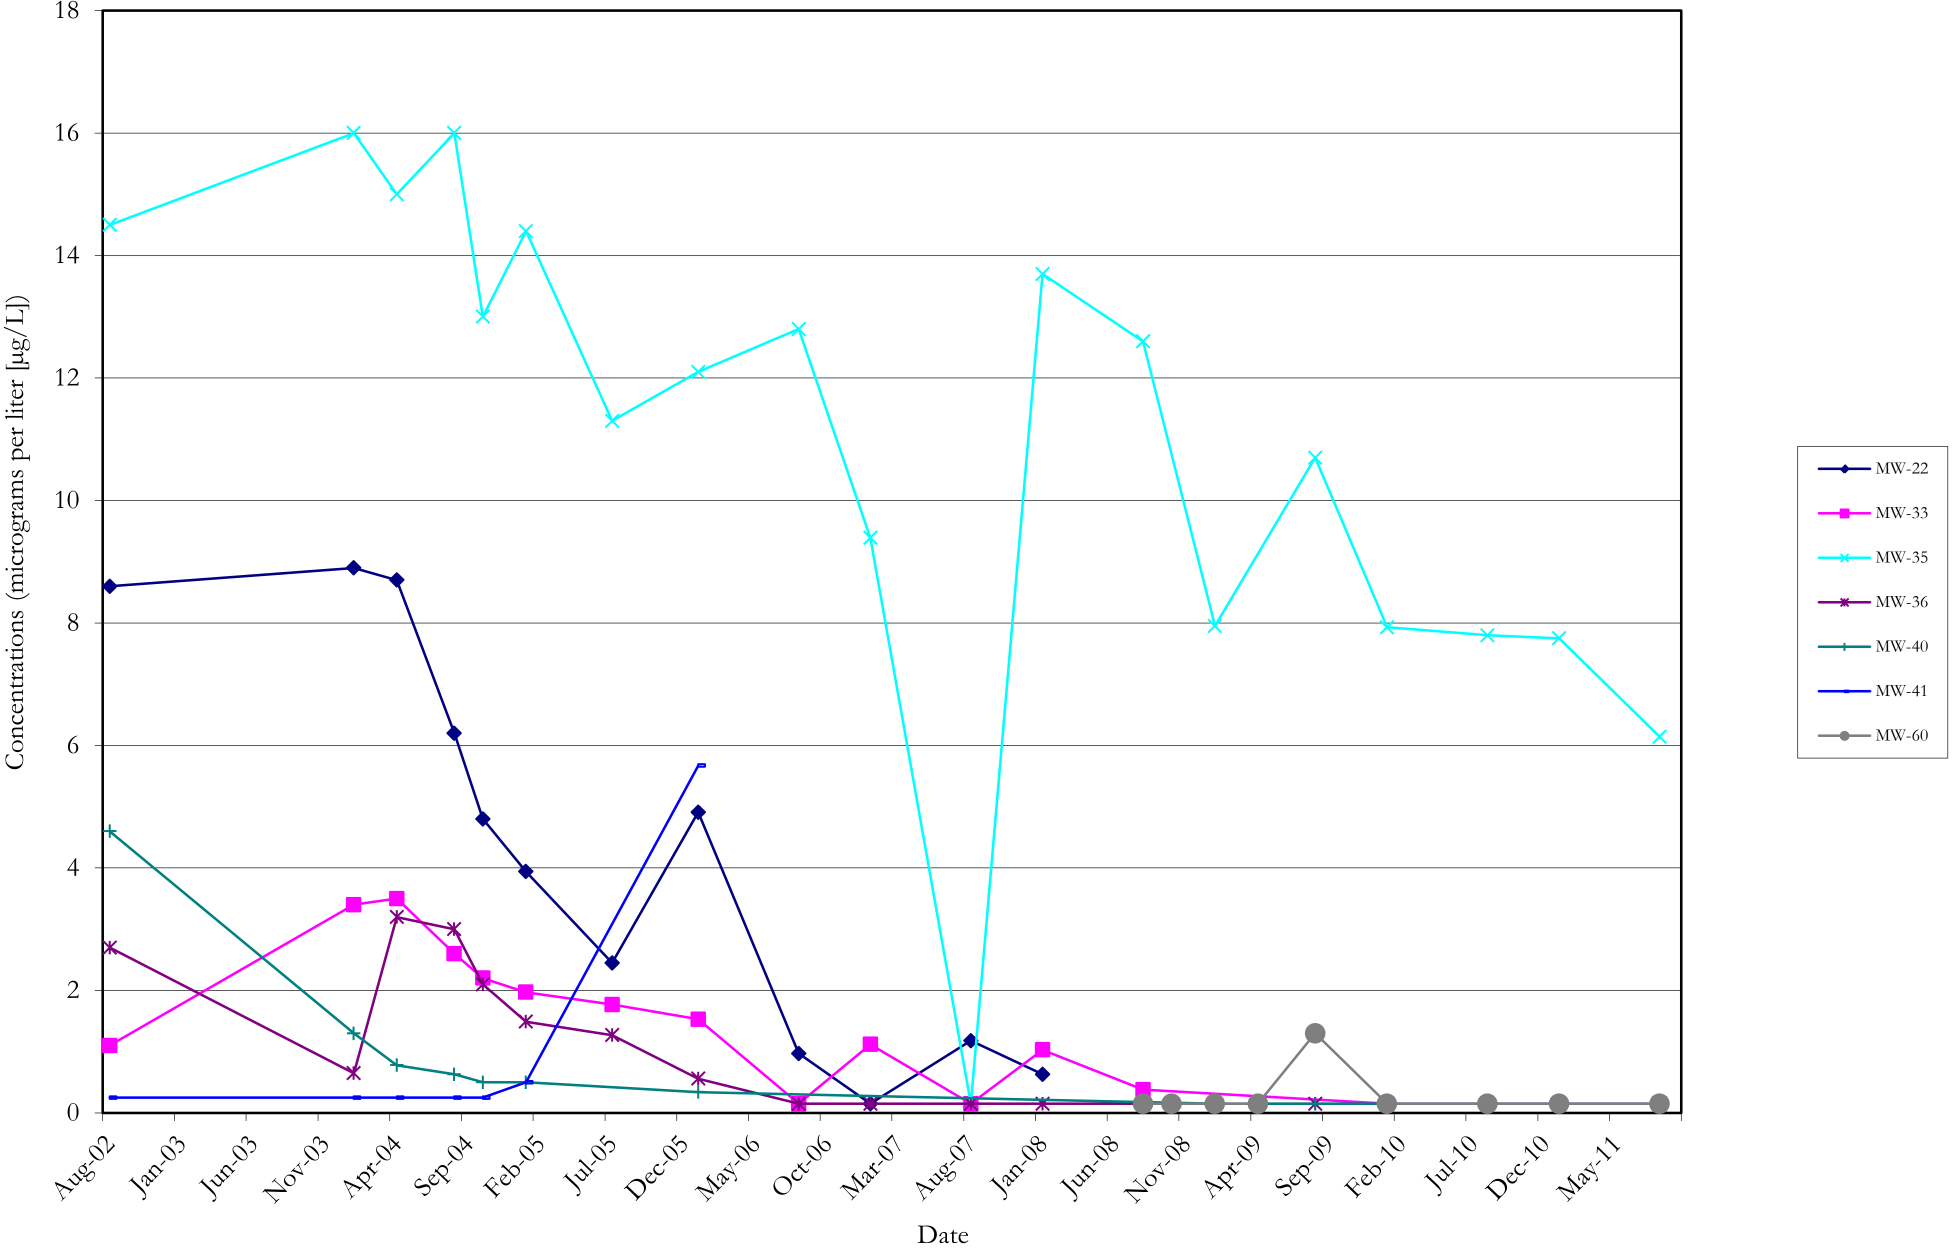
Note: Benzene, tetrachloroethene, and naphthalene were not graphed because they have not been detected at or above the method reporting limits.

Figure I-1-10. Pentachlorophenol Trends in the Lower Water-Bearing Zone
Former PWT Site RI/FS



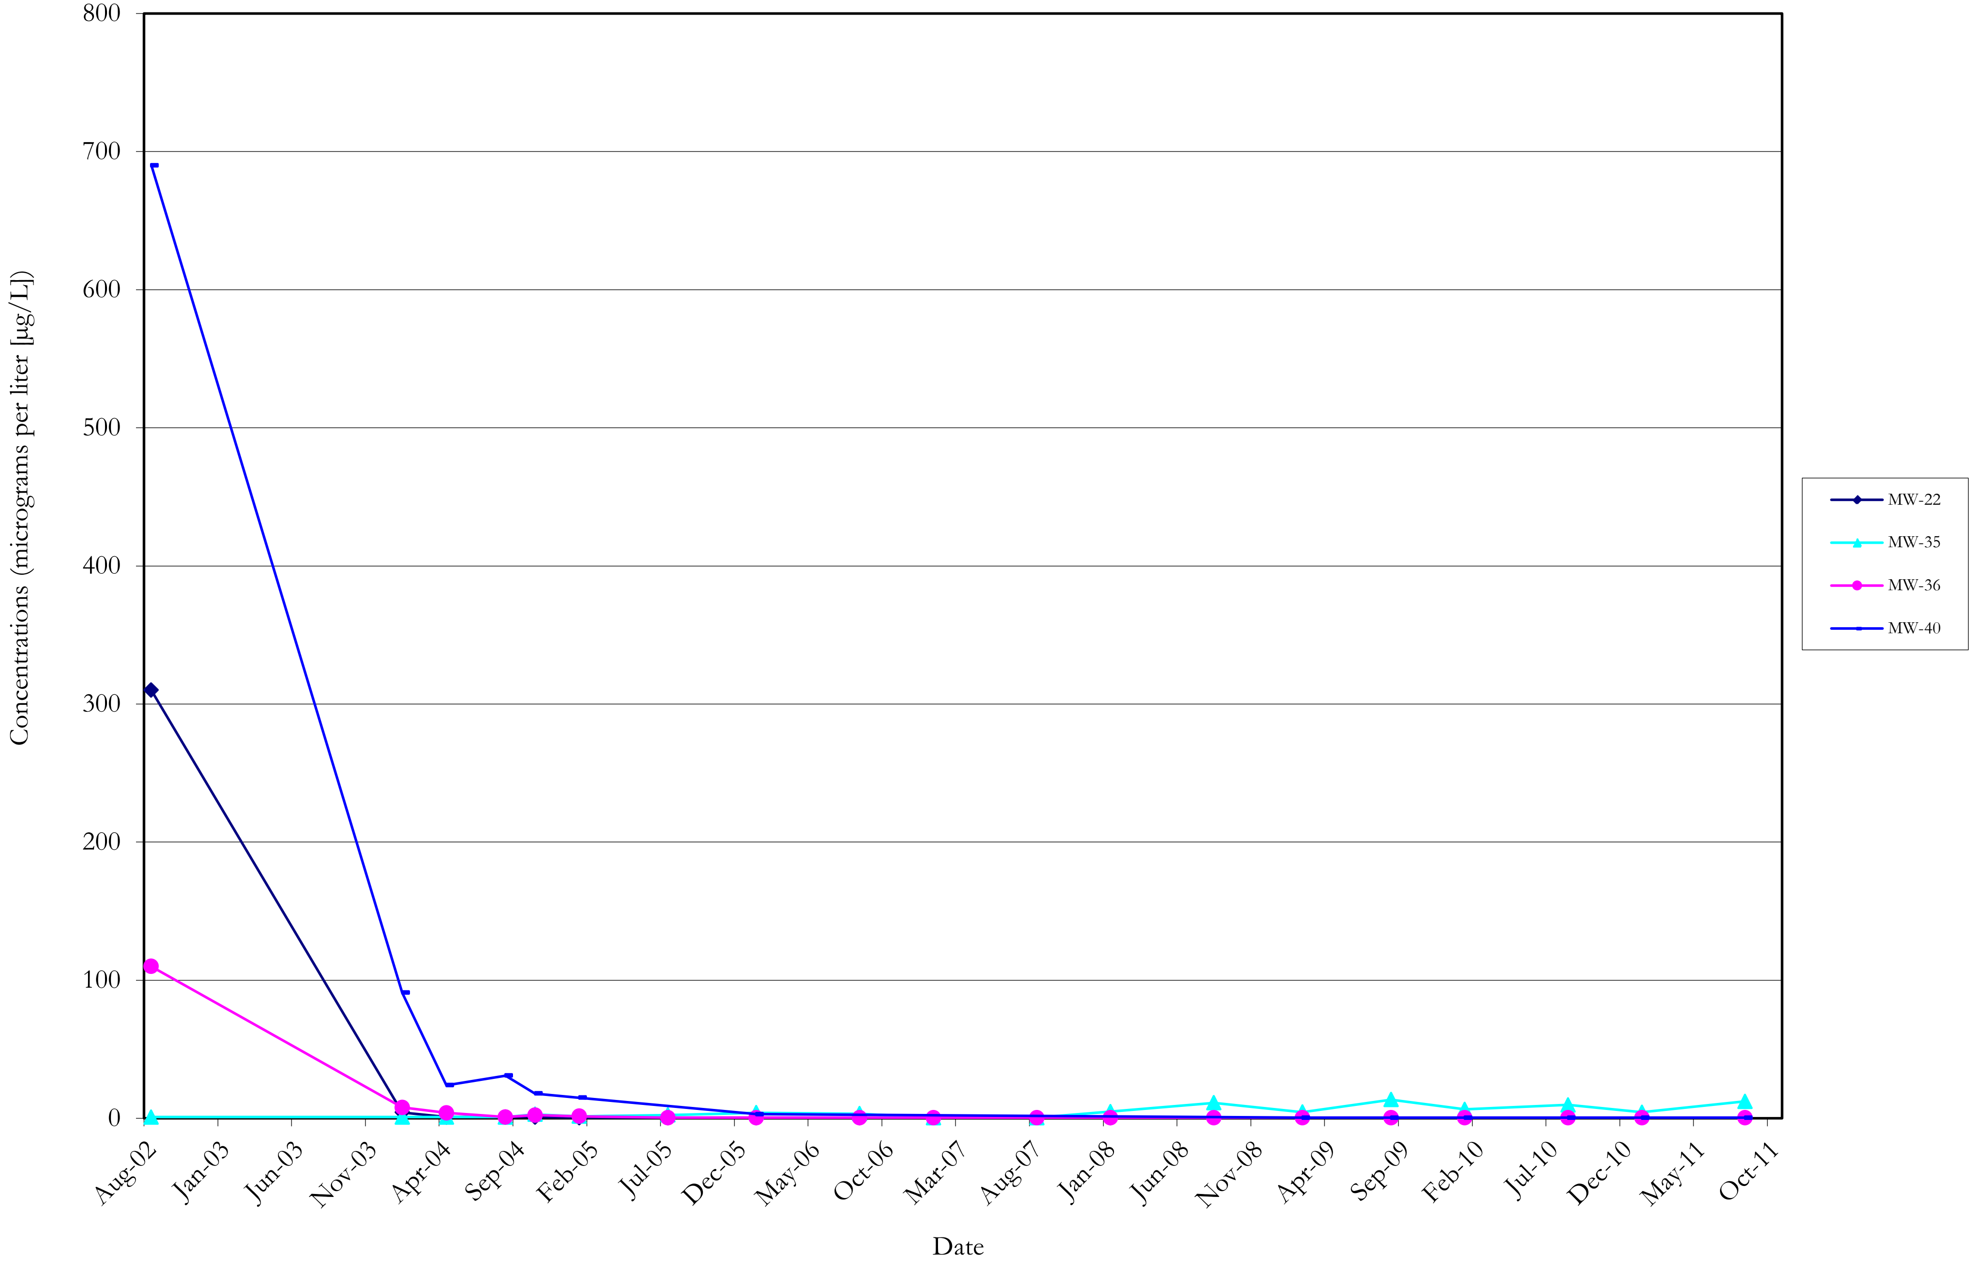
Note: Results from MW-61 were not graphed because pentachlorophenol has not been detected in this monitoring well.

Figure I-1-11. Benzene Trends in the Lower Water-Bearing Zone
Former PWT Site RI/FS



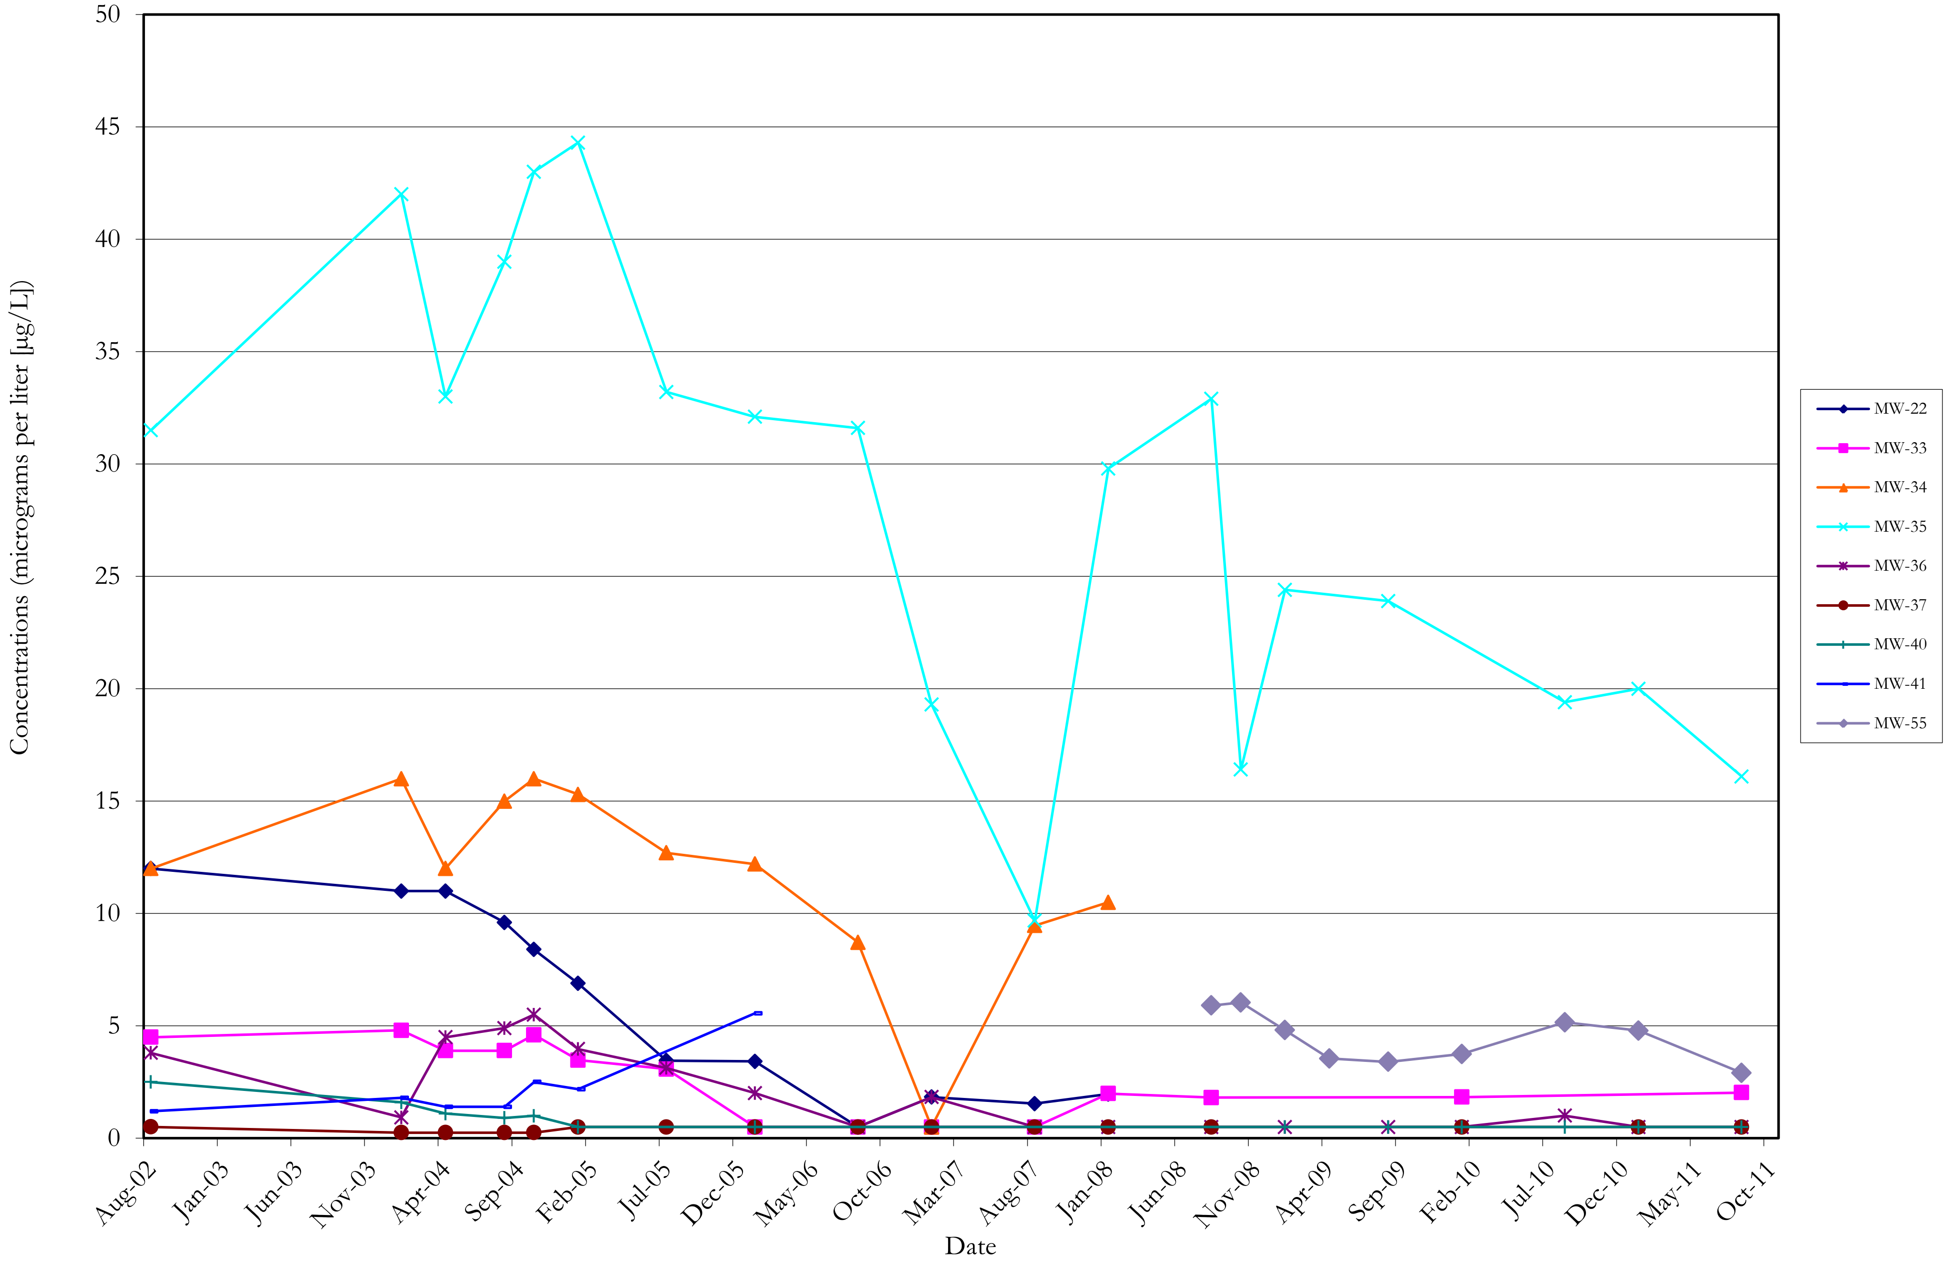
Note: Results from MW-34, MW-37, MW-54, MW-55, MW-56, MW-59, MW-61, and MW-62 were not graphed because benzene has not been detected, or has rarely been detected, in these monitoring wells.

Figure I-1-12. Naphthalene Trends in the Lower Water-Bearing Zone
Former PWT Site RI/FS



Note: Results from MW-33, MW-34, MW-37, MW-41, MW-54, MW-55, MW-56, MW-59, MW-60, MW-61, and MW-62 were not graphed because naphthalene has not been detected in these monitoring wells.

Figure I-1-13. Tetracholoroethene Trends in the Lower Water-Bearing Zone
Former PWT Site RI/FS



Note: Results from MW-54, MW-56, MW-59, MW-60, MW-61, and MW-62 were not graphed because PCE has not been detected in these monitoring wells.

APPENDIX J

EXTRACTION WELL AND RECONNAISSANCE GROUNDWATER RESULTS

APPENDIX J EXTRACTION WELL AND RECONNAISSANCE GROUNDWATER RESULTS

CONTENTS

The tables in this appendix have been pulled from other reports previously submitted to and approved by the Washington State Department of Ecology. Tables include the SER groundwater monitoring results from December 2011 (Appendix J-1) and reconnaissance groundwater results from events on the LRIS during May and June 2009 and from the RNWR from September 2006 (Appendices J-2 and J-3, respectively). Concentration contour plots representing these data are provided in the main body of the Remedial Investigation/Feasibility Study Report (see Sections 3 and 4).

The notes pages have been updated to fully explain all abbreviations and qualifiers in the tables. As such, it is important to note that what has previously been referred to as “carcinogenic polycyclic aromatic hydrocarbons toxicity equivalent concentration” (“cPAH TEC”) is the same as what is currently referred to as “carcinogenic polycyclic aromatic hydrocarbons toxicity equivalent” (“cPAH TEQ”). That is to say, the cPAH TEC is the sum of the cPAH congeners multiplied by their respective toxicity equivalent factors. In cases where all cPAHs for a sample were non-detect, the calculated cPAH TEQ is reported as “ND.”

TABLES

APPENDIX J-1

EXTRACTION WELL

Notes for Extraction Wells Tables J-1-1 through J-1-4
SER Sampling
Lake River Industrial Site

Bold numbers indicate values that exceed MTCA Method B cleanup level. Non-detect analytes ("U" or "UQ") were not compared to cleanup level.

Highlight indicates that values exceed draft MTCA Method B vapor intrusion (VI) screening level. Non-detect analytes ("U" or "UQ") were not compared to the screening level.

Two separate samples were collected from E-32 and E-36 for volatile organic compounds, using a disposable bailer (B) and the peristaltic pump (P) in May 2007. Subsequent samples were collected using a peristaltic pump or the dedicated pneumatic pump. Groundwater sampling was conducted per the scope of work desribed in the *Groundwater Sampling in the Steam Enhanced Remediation Treatment Area* letter to D. Alexanian from Maul Foster & Alongi on June 26, 2007. The scope of work was approved with slight modification in an email (re GW sampling in the SER area report) to A. Hughes, Maul Foster & Alongi, from D. Alexanian, Washington State Department of Ecology, on June 29, 2007.

-- = not applicable.

B = The blank exhibited a positive result great than the reporting limit for this compound.

cPAH = carcinogenic polycyclic aromatic hydrocarbons include benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene.

cPAH TEQ = carcinogenic polycyclic aromatic hydrocarbon toxicity equivalent.

ft. bgs = feet below ground surface.

M = Method blank exhibited positive result greater than reporting limit for this compound.

mg/L = milligrams per liter.

MTCA = Washington State Department of Ecology's Model Toxics Control Act.

µg/L = micrograms per liter.

NA = not available.

ND = The cPAH analytes were not detected at or above their respective method reporting limits.

NV = no value.

PAH = polycyclic aromatic hydrocarbon.

pi. = pump intake, the depth of the pump intakes varied and were unknown.

U = not detected at or above the shown method reporting limit.

UQ = The analyte was analyzed for, but was not detected above the reporting limit. Reporting limit is elevated due to sample matrix interference.

[a] m-Xylene screening criteria.

[b] MTCA Method A cleanup level listed for arsenic, which is representative of background conditions.

[c] Hexavalent chromium screening criteria.

[d] Diesel-range organic screening criteria.

APPENDIX J-2

MAY AND JUNE 2009 RECONNAISSANCE

Notes for Reconnaissance Groundwater Tables J-2-1 through J-2-3
Former PWT Site RI/FS

Bold = detected concentration that exceeds MTCA Method B (Method A for Arsenic only) groundwater cleanup level. Non-detect values were not compared with cleanup level.

Highlight indicates detected concentration that exceeds MTCA Method B Groundwater VI Level. Non-detect values were not compared with cleanup levels.

cPAH = carcinogenic polycyclic aromatic hydrocarbon, including benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, benzo(k)fluoranthene, chrysene, dibenzo(a,h)anthracene, and indeno(1,2,3-cd)pyrene.

cPAH TEQ = carcinogenic polycyclic aromatic hydrocarbon toxicity equivalent.

CUL = cleanup level.

Dup = duplicate sample.

ft. bgs = feet below ground surface.

MTCA = Washington State Department of Ecology's Model Toxics Control Act.

µg/L = micrograms per liter (parts per billion).

ND = The cPAH analytes were not detected at or above their respective method reporting limits.

NTU = nephelometric turbidity unit.

NV = no value.

PAH = polycyclic aromatic hydrocarbon.

U = not detected at or above method reporting limit; half the value used in calculations.

[a] m-Xylene.

[b] MTCA Method A CUL listed for arsenic, which is representative of background conditions.

APPENDIX K

BACKGROUND CONCENTRATIONS OF DIOXINS IN SEDIMENTS

APPENDIX K BACKGROUND CONCENTRATIONS OF DIOXINS IN SEDIMENTS

CONTENTS

This appendix consists of the Background Dioxin Concentrations in Sediment Discussion which was submitted to the Washington State Department of Ecology (Ecology) on February 10, 2012. Ecology commented that "Table 3 is confusing – there is a separate column showing 'upper tolerance limit', which is actually showing the rounded-up value of the number shown in the column entitled 90th UCL on the 90th Percentile – which is the UTL. This makes it look like 2 different things. Possibly last column should say 'Lake River Background.'" MFA agrees with the comment, however, no changes were made and the original Ecology-approved memo is presented in its entirety.

RE: Dioxin Natural Background Sediment Evaluation
Port of Ridgefield Lake River Industrial Site
Agreed order No. 01TCPSR-3119

On behalf of the Port of Ridgefield (Port), Maul Foster & Alongi, Inc. (MFA) has prepared this memorandum to provide the results of a literature search conducted to identify chlorinated dibenzo-p-dioxins and dibenzofurans (collectively referred to as dioxins) data in sediment in the region in order to develop a natural background upper tolerance limit (UTL) for dioxins. This evaluation updates the previous dioxin background memorandum prepared and communicated to Ecology on August 24, 2011. In an electronic mail (Mercuri, 2011a), Ecology requested an evaluation of dioxin background concentrations as part of the dioxin cleanup-level development process for Carty Lake and Lake River, adjacent to the Port's LRIS property. In subsequent electronic email (Mercuri, 2011b), Ecology requested revisions to the background calculation method. This memorandum addresses the requested revision. This evaluation is being conducted as part of ongoing remedial investigation and feasibility study activities being performed at the Lake River Industrial Site (LRIS) in Ridgefield, Washington, under an Agreed Order between the Port and the Washington State Department of Ecology (Ecology).

Background

The current Ecology definition of natural background under MTCA regulations (WAC 173-340-200) is as follows: "The concentration of hazardous substance consistently present in the environment that has not been influenced by localized human activities. For example, low concentrations of some particularly persistent organic compounds such as polychlorinated biphenyls (PCBs) can be found in surficial soils and sediment throughout an area due to global distribution of these hazardous substances. These low concentrations would be considered natural background."

Review of Natural Sediment Data

MFA consulted multiple sources in seeking sediment dioxin data that may be suitable for generating a natural dioxin background level, including Ecology, the Oregon Department of Environmental Quality, the U.S. Army Corps of Engineers (COE), the U.S. Environmental Protection Agency (USEPA), the U.S. Fish and Wildlife Service (USFWS), and the Lower Columbia River Estuary Partnership. Table 1 summarizes the studies MFA reviewed and provides comments as to the suitability of the data for evaluating natural background concentrations of dioxins in sediment. For this assessment data from samples collected along the Lower Columbia River and tributaries were assembled; samples collected in the Willamette River and the Columbia River estuary were not incorporated into the natural background data analysis for Lake River and Carty Lake.

Only sediment samples collected from the surface of the river bottom were included in the analysis. Surface samples are generally considered to include sediment collected from zero to 30 centimeters below the mudline. However, in an effort to assemble as many data points as possible, five samples were included that were collected from zero to approximately 40 or 50 centimeters below the mudline.

The attached figure shows the approximate locations of the samples included in the natural background data analysis and Table 2 summarizes the dioxin data used. Grain size and total organic carbon (TOC) results are also listed in Table 2 when available. Table 3 summarizes the statistics calculated using the background data set. Dioxin data were all reported on a dry weight basis.

Not all data listed in Table 2 are considered ideal for natural background concentration development for comparison with dioxin concentrations in Carty Lake and Lake River. It is generally preferable to include in the background data set samples that are collected in a similar manner, from a similar fluvial environment, with similar TOC and grain size, and analyzed using the same method. However, sample results appear to be generally similar (average and median concentrations are within the same order of magnitude), indicating that the sampling and analytical methodology and physical characteristics of the sample sediment may not cause undue influence on this analysis. Therefore, all data shown in Table 2 are used in the dioxin background evaluation.

TEQs were calculated as described below using the following data rules to handle non-detect and estimated results.

- For congeners not detected and assigned a "U" qualifier, half of the detection limit was used in the TEQ calculation.

- Sample results that were estimated and flagged with "J' were used in TEQ calculations at the reported, estimated value.

- Historical data with "E" or "EMPC" flagged results (i.e., result is the estimated maximum possible concentration because of unresolved interfering compounds) were treated as estimated results (i.e., "J"-flagged results) consistent with validation procedures applied to site data (Anchor QEA and MFA, 2011).

- Historical data with "PR" (chromatograph peak was poorly resolved and concentration was likely overestimated) and "E" (result is estimated; result concentration exceeds the calibration range) qualifiers were treated as estimated results and used in TEQ calculations at face value.

- Historical data with "B" (analyte is detected in the laboratory method blank; concentration could be overestimated) qualifiers were treated as follows: 1) where the sample concentration was less than five times the blank concentration, the results were treated as a non-detect and ½ the value was used in the TEQ calculation, and 2) where the sample concentration was greater than five times the blank concentration the results were treated as detections and the face value was used in the TEQ calculation.

Derivation of Natural Background Sediment Concentrations

Statistics were calculated for the total 2,3,7,8-tetrachlorodibenzo-p-dioxin equivalence (2,3,7,8-TCDD TEQ). The 2,3,7,8-TCDD TEQ concentrations were calculated consistent with WAC 173-340-900 using toxic equivalence factors adopted by the World Health Organization in 2006 for evaluating risk to mammals and humans. Consistent with recent interagency guidance (COE et al., 2009), the dioxin background UTL was calculated based on the 90th upper confidence limit on the 90th percentile using the Kaplan-Meier nonparametric method. This is appropriate when there are greater than ten detections. The USEPA ProUCL software version 4.1.01 was used to calculate the UTL, which is shown in Table 3 to one significant figure. The ProUCL output is provided as an attachment.

Lake River total organic carbon (TOC) concentrations tend to be approximately 1 percent (the Lake River surface sediment TOC range is 0.34 to 3.2 percent, with an average and median of 1.3 percent and 1.2 percent, respectively) while the background data set TOC is generally about half that of Lake River (the background data set TOC range is 0.045 to 1.4 percent, with an average and median of 0.53 percent and 0.49 percent, respectively). TOC content effects the bioavailability of dioxins; as TOC increases, bioavailability decreases. Thus the bioavailability of dioxins in the Lower Columbia River where background samples were collected is higher than in Lake River. If the background UTL is corrected for bioavailability, the UTL is effectively raised by a factor of two for comparison with Lake River dioxin concentrations.

Table 1
Background Dioxins in Sediment Literature Review Summary
Lower Columbia River
Oregon and Washington

Study	Prepared By	Prepared For	Study Year	Purpose	Project Area	Results Used in Regional Background Evaluation	Notes
Longview Fibre Co.—Class 2 Inspection	NA; data reviewed via EIM	NA; data reviewed via EIM	1990	This survey originally entered in 1997. Catalogue Number SY-24.	Longview	No	Results all non-detect. Data not usable because of elevated detection limits.
Oregon Dioxin Sediment Study	COE	USEPA	1990	Study performed to correlate organochlorines and dioxins in sediments.	Columbia, Chetco, and Willamette rivers and Yaquina Bay	Yes	Method reporting limits acceptable. Sediment data collected 21 years ago and may not be representative of current background conditions. Information on potential sources of dioxins at sample locations in 1990 is not available. Surface sediment data (up to 46 cm) included in regional background evaluation.
Dioxin/Furans Study	Bi-State Water Quality Program	Bi-State Water Quality Program	1991	Dioxin/furan evaluation.	Wallace Island	No	Dioxins analyzed in fish tissue only, not in sediment.
Lower Columbia Backwater Reconnaissance Survey	NA; data reviewed via EIM	NA; data reviewed via EIM	1993	Bioaccumulation study.	Three locations near Columbia River from Washougal to Longview, including Bachelor Slough and Burke Slough	No	Results all non-detect. Data not usable because of elevated detection limits.
Hammond Boat Basin Sediment Evaluation	COE	COE	1994	Characterization for dredging action.	Hammond Boat Basin, located 8.7 miles from mouth of Columbia River on Oregon side	No	Method reporting limits acceptable. QA/QC sample results were not provided by COE with data, although discussion of QA results deemed QA/QC acceptable. Sediment data collected 17 years ago at a boat basin. Given age of data (17 years), potential sources of dioxin to boat basin, and location in Columbia River Estuary, sediment data are not considered suitable for use in regional background determination.
Westport Slough Sediment Evaluation	COE	COE	1998	Characterization for dredging action.	Westport Slough entrance at Columbia River RM 43.5.	Yes	Dioxin analysis conducted by screening method P-450 RGA. Method reporting limits acceptable. COE did not provide QA/QC sample results with data, although discussion of QA results deemed QA/QC acceptable. Sediments were found to be suitable for open, in-water, unconfined placement. Sediment sample was a composite from two different locations (one 21-inch core and one 44-inch core). Sediment data included in regional background evaluation.
Polychlorinated Dibenzo-p-dioxin and Polychlorinated Dibenzofuran Congener Profiles in Fish, Crayfish, and Sediment Collected Near a Wood Treating Facility and a Bleached Kraft Pulp Mill	Foster et al.	Bulletin of Environmental Contamination and Toxicology	1999	Dioxin/furan evaluation.	Lake River	No	Sediment data presented as averages that include locations both upstream and downstream of effluent discharges. Sediment data are not considered suitable for use in regional background determination.

Table 1
Background Dioxins in Sediment Literature Review Summary
Lower Columbia River
Oregon and Washington

Study	Prepared By	Prepared For	Study Year	Purpose	Project Area	Results Used in Regional Background Evaluation	Notes
Investigation of the Distribution of Organochlorine and Polycyclic Aromatic Hydrocarbon Compounds in the Lower Columbia River Using Semipermeable Membrane Devices	U.S. Dept. of the Interior, USGS; Kathleen McCarthy, Robert Gale	USFWS	1999	Evaluation of potential impacts to fish and wildlife throughout Columbia River Basin.	Lower Columbia River Region	No	Some congeners detected and quantified and others detected but not quantified. Data set not complete and not usable.
Columbia River Mile 29-24, Brookfield Mound and Skamakawa Turn Sediment Evaluation	COE	COE	2000	Characterization for dredging action.	Columbia River RM 29-24, Brookfield Mound and Skamakawa Turn	Yes	Dioxin analysis conducted by screening method P-450 RGA. Method reporting limits acceptable. Sediments were found to be suitable for open, in-water, unconfined placement. Sediment data included in regional background evaluation.
Oregon Slough Entrance Channel Sediment Evaluation	COE	COE	2001	Study performed for dredging action.	Oregon Slough entrance near Columbia River RM 108	No	Most results non-detect. Method reporting limits acceptable. COE did not provide QA/QC sample results with data, although discussion of QA results deemed QA/QC acceptable. Vibracore sediment samples collected; depths of samples not provided in report, but sedqual results indicate that sample depth was between 0 and 177 to 304 centimeters, depending on the sample. Sediments were found to be suitable for open, in-water, unconfined placement. Given that sediment samples likely do not represent surface sediment conditions, sediment not used for regional background determinations.
Portland Harbor Public Health Assessment	ATSDR	City of Portland	2002	Evaluation of public health significance as mandated by Congress.	Portland Harbor	No	Provides ranges of dioxin concentrations for 20 samples collected in and around Portland Harbor. Not considered representative of background.
Bachelor Slough Study , Dredged Material Evaluation	COE	COE and USFWS	2003	Study performed for dredging action proposed by USFWS~~,~~ and Ridgefield NWR~~,~~ to dredge Bachelor Slough to enhance in-stream salmonid habitat. Study to determine suitability of the material in Bachelor Slough for upland disposal sites on Bachelor Island.	Bachelor Slough	Yes	Method reporting limits acceptable. COE did not provide QA/QC sample results with data. Surface sediment samples collected; maximum depth of sediment samples was 22.86 cm. No known sources of dioxins to Bachelor Slough. Sediment evaluation determined sediment suitable for unconfined, in-water or upland placement without further characterization. Sediment data included in regional background evaluation.
Environmental Contaminants in Aquatic Resources from the Columbia River	Jeremy Buck, Environmental Specialist, USFWS	State and federal agencies	2004	Determine if persistent, bioaccumulative compounds are present at concentrations hazardous to fish and wildlife inhabiting NWRs and other locations in the Columbia River.	Lower Columbia River (between mouth and Camas Slough; in middle river region near McNary Dam; Willamette River near Portland)	Yes	A single composite consisting of three sediment grab samples collected from each sample area. Collected from shallow, depositional areas. Qualifiers indicate that results may be overestimated. Samples collected from Julia Butler Hansen NWR, Longview, Ridgefield, and Camas Slough selected as potentially most representative of regional dioxin concentrations. Lewis and Clark NWR samples were anomalously elevated and Baker and Cathlamet Bay samples were collected in the Columbia River Estuary. Sediment data included in regional background evaluation.

Table 1
Background Dioxins in Sediment Literature Review Summary
Lower Columbia River
Oregon and Washington

Study	Prepared By	Prepared For	Study Year	Purpose	Project Area	Results Used in Regional Background Evaluation	Notes
City of Ridgefield Sediment Sampling	MFA	City of Ridgefield	2007	Evaluate sediment in areas of proposed WWTP outfall and piping.	Lake River	Yes	Single composite consisting of three sediment grab samples collected; one grab sample collected just downstream of LRIS in area of contamination. Because of proximity of one sample location to known source of dioxins, data not suitable for regional background evaluation.
Vancouver Lake PCBs, Chlorinated Pesticides, and Dioxins in Fish Tissue and Sediment	Ecology	Ecology	2007	Evaluate fish tissue and sediment in Vancouver Lake and Lake River.	Lake River	No	Dioxins analyzed in fish tissue only, not in sediment.
Boise St. Helens Pulp and Paper Mill Remedial Investigation	URS Corporation	OfficeMax, Inc.	2010	Background assessment for remedial investigation.	Multnomah Channel	Yes	Three incremental sample composites. Method reporting limits acceptable; QA/QC sample results appear acceptable. Data included in regional background evaluation.
Davy Crockett Ship Dismantling Area Investigation, Camas, Washington	Laboratory Reports from Apex Laboratories	Ecology	2011	Characterization of ship dismantling area.	Lower Columbia River	No	Laboratory results initially provided by Ecology for use in regional background evaluation. Not included in analysis due to elevated dioxin reporting limits relative to other studies included in evaluation.
Lake River Industrial Site Remedial Investigation	Anchor QEA and MFA	Port of Ridgefield	2011	Background assessment for remedial investigation.	Lake River and Bachelor Slough	Yes	Method reporting limits acceptable. QA/QC sample results acceptable. Sediment data included in regional background evaluation.

APPENDIX L

CITY STORMWATER DISCUSSION

APPENDIX L CITY STORMWATER DISCUSSION CONTENTS

This appendix consists of the LRIS City Stormwater Discussion which was submitted to the Washington State Department of Ecology (Ecology) on February 10, 2012. This appendix is presented exactly as it was submitted to Ecology. As such, it is important to note that what has previously been referred to as "toxicity equivalent concentration" ("TEC") is the same as what is currently referred to as "toxicity equivalent" ("TEQ"). That is to say, the dioxin TEC presented in this letter is the sum of the dioxin congeners multiplied by their respective toxicity equivalent factors.

The dioxin data has been updated, as part of the Draft RI/FS revisions, to ensure consistent treatment of interferences and non-detects during data qualification and calculation of TEQs. Updated TEQs are calculated according to the methodology developed in coordination with Ecology and are described in Appendix F.

This updated calculation method changes the dioxin TEQ of sample LRIS-SS-16 from 14.3 ng/kg to 14 ng/kg, and the LRIS-SS-52 sample from 6.0 ng/kg to 3.2 ng/kg; however, these changes do not affect the interpretation of the data as originally presented.

Vancouver, Washington 98661-462

Re: City of Ridgefield Stormwater Outfall Evaluation

Dear Mr. Rankine:

On behalf of the Port of Ridgefield (Port), Maul Foster & Alongi, Inc. (MFA) has prepared this letter describing the drainage area of a City of Ridgefield (City) stormwater outfall and the potential sources of chlorinated dibenzo-p-dioxins and dibenzofurans (collectively referred to in this letter as dioxins) detected in Lake River sediment collected near the outfall. The outfall discharges south of the Port's Lake River Industrial Site (LRIS) property (see the attached figure). The Washington State Department of Ecology (Ecology) requested this evaluation at a meeting held on January 5, 2012, as part of the remedial investigations (RIs) and feasibility study being performed to evaluate and manage site-related chemical impacts to soil, sediment, and groundwater resulting from historical Pacific Wood Treating Company (PWT) operations. The work is being completed consistent with the requirements of the Model Toxics Control Act (MTCA) and the Agreed Order No. 01TCPSR-3119 between Ecology and the Port.

BACKGROUND

Sediment samples were collected in 2010 in Lake River to characterize the nature and extent of potential impacts from historical PWT operations near the LRIS. The results were reported in an RI technical memorandum (Anchor QEA and MFA, 2011). Sample LRIS-SS-16 was collected upstream of the LRIS property near the City stormwater outfall on April 20, 2010 (see the attached figure) with the intent to identify potential upstream sources of contamination. The location was selected because it was near a City outfall and over-water structures that had the potential to contribute to Lake River impacts. Multiple attempts were required to collect sample LRIS-SS-16 because a significant quantity of debris was encountered, preventing the Van Veen grab sampler from closing. The debris included household waste, plastic bags, and asphalt roofing shingles (presumably used as a dock antiskid coating). Substantial amounts of organic fibers and woody debris were observed in the sample, and upon homogenization a sheen was observed (Anchor QEA and MFA, 2011, Appendix A). The dioxin toxicity equivalent concentration (TEC) in sample LRIS-SS-16 was 14.3 nanograms per kilogram (ng/kg). The area of contamination at sample LRIS-SS-16 was discontinuous from the areas of elevated dioxins in sediments adjacent to the LRIS property.

STORMWATER SYSTEM AND DRAINAGE AREA

The City stormwater outfall is located approximately 900 feet south of Cell 3, the southern portion of the LRIS (see the attached figure). The drainage basin for this outfall had not been determined by the City, but MFA was able to model it using city stormwater maps and direct observation. Catchment areas in the city stormwater outfall drainage area were calculated by using a combination of Civil3D and ArcGIS Spatial Analysis tools, as well as surface topography. These preliminary catchment areas were based on the information available; as described below, a site visit was conducted by MFA staff to observe site conditions and stormwater flow and to help refine the computer-generated catchment areas.

The estimated area drained by the city outfall is shown on the attached figure. The drainage area is approximately 61 acres, which includes Pioneer Street (the main street in town), 9th Avenue, View Ridge (middle school), and parts of side streets (see the figure). The city impervious drainage area is calculated as approximately 20 acres. Stormwater from this area is collected in a ditch extending along the east side of the Burlington Northern Santa Fe railroad tracks and is then routed to the north side of a private road used by McCuddy's Marina (see the attached figure and photographs). A culvert redirects this water under the road to the west and into a vegetated swale. The swale is approximately 170 feet long and 10 feet wide. At the bank of Lake River, the stormwater in the swale enters a culvert and is discharged into Lake River. It appears that, during large flow events, some water from the swale bypasses the culvert and flows over the bank directly into Lake River.

On January 30, 2012, MFA personnel performed a site visit to verify stormwater features draining to the city outfall. A second pipe outlet was identified on the east side of the McCuddy's roadway, and appears to drain the large vegetated slope into the ditch running along the east side of the McCuddy's roadway (see the attached figure). Standing water was observed in this ditch during the site visit. The ditch then passes under the McCuddy's roadway, where it connects to the swale described above. Some of the pervious land area immediately adjacent to the swale has the potential to drain into the swale during large storm events. This area is outlined in orange on the attached figure and is approximately 1 acre in size. The portion of the McCuddy's property located north of the swale and parking area is grassy (pervious) and hummocky in appearance, indicating that stormwater would likely pool and infiltrate in this area. Storage of decaying, treated lumber was observed in this vicinity during the site visit. Also, the ditch running along the west side of the McCuddy's roadway was being excavated at the time of the site visit, and treated lumber was observed in this ditch.

In order to evaluate the relative contribution of the Ridgefield drainage area (outlined in blue on the figure) to stormwater entering the system from the area around the swale (outlined in orange on the figure) to the City outfall, the annual runoff volumes of each of these catchments were calculated and compared.

Runoff for the Ridgefield drainage area and the swale drainage area was calculated using the Simple Method. The Simple Method is a mathematical equation that is appropriate for smaller watersheds (less than 640 acres). The annual runoff volume was calculated as follows:

$$R_0 = P \times R_v \times 0.9 \times A_{basin}$$

R_0 = annual runoff volume (cubic feet)
P = annual rainfall (feet)
R_v= runoff coefficient (unitless)
A_{basin} = area of drainage basin (square feet)
0.9 = standard factor representing the fraction of rainfall that produces runoff (unitless)

$$R_v = 0.05 + 0.9 \times I_a$$

I_a = impervious fraction of the drainage basin

Rainfall data were obtained from the Clark County Water Resources Department. Monthly rainfall data from water years 2004 to 2010 were summed for each water year, and the geometric mean value of annual rainfalls was calculated (n=7). An annual rainfall of 31.49 inches was used in the above equation.

Calculations are presented in the attached table. The estimated runoff volume for the Ridgefield drainage area that enters the City outfall is 60,323,331 liters. The runoff volume of water that could enter the swale directly is 2,763,123 liters. The volume of water entering the outfall from the swale drainage area represents only 4.4 percent of the total volume. Also, given the larger city drainage area, it can be concluded that Pioneer Street, 9th Avenue, the middle school, and adjacent neighborhoods are by far the most significant sources of stormwater to the City outfall.

UPLAND DIOXIN CONCENTRATIONS

Dioxin compounds are ubiquitous in the environment and can result from both natural and anthropogenic sources (U.S. Environmental Protection Agency [USEPA], 2006). The area around the LRIS is an urban environment where industrial activity has been conducted and a city has been established for over 100 years. In urban areas, dioxin compounds can result from vehicle emissions, back-yard trash burning, structure fires, stormwater runoff, and other common events and activities. Dioxin concentrations in urban environments are typically higher than on land that is not near development. Ecology has defined the natural background concentration of dioxins for Washington area soils as 5.2 ng/kg (Ecology, 2010).

One soil sample was collected near the swale on the McCuddy's Marina property during upland characterization events. The soil sample (SS-52) had a dioxin TEC concentration of 6.0 ng/kg. As described further below, Ecology has conducted numerous studies of background levels of dioxins in urban soils. These studies indicate that the soil sample from SS-52 observed in the McCuddy's Marina swale is consistent with background concentrations.

Rogowski and Yake (2005) studied the typical concentrations of dioxins in soil of Washington State and found that dioxins were present in soil throughout the state, even including remote wilderness areas. Consistent with the findings of several others, they discovered that dioxin concentrations were relatively high in urban environments, even when there was no known local source.

An early Ecology study of background soils included a number of samples collected from urban areas. In these urban soil samples, dioxin TECs ranged from 0.639 ng/kg to 21.9 ng/kg (Ecology, 1999, Appendix 3-G). Ecology more recently completed an investigation of surface soils from each of six Seattle neighborhoods (South Park, Georgetown, West Seattle, Ballard, Capitol Hill, and Ravenna) (Ecology, 2011). In these samples, dioxin TECs ranged from 1.7 ng/kg to 110 ng/kg, with an average concentration of 19 ng/kg. The median concentrations measured in the neighborhoods was 12 ng/kg overall, and the median concentrations for individual neighborhoods were as high as 23 ng/kg (under MTCA, background-based concentrations can be established using concentrations equal to four times the median concentration, or 48 to 92 ng/kg, if based on this study). The 90th percentile concentration measured in the Seattle study was 46 ng/kg overall, or as high as 60 ng/kg for individual neighborhoods (under MTCA, background-based concentrations can be established using concentrations equal to the 90th percentile concentrations, or 46 to 60 in this case, without additional statistical evaluations). In conclusion, the dioxin TEC in soil upland of the City outfall is well within the range typical of urban areas and does not appear to be the result of historical PWT operations.

POTENTIAL SOURCES OF DIOXINS

Mechanisms by which PWT historical activities have impacted Lake River sediments directly offshore of the LRIS include historical stormwater discharge, direct discharge of wood-treating chemicals, and overwater activities (Anchor QEA and MFA, 2011). As mentioned above, dioxin compounds can result from many industrial, commercial, and residential activities, including being a byproduct of and impurity in pentachlorophenol (PCP). While PCP was used in industrial activities at the LRIS, it was also commonly used in the preservation of wood structures such as utility poles, fences, and docks, as well as non-wood-preserving applications such as herbicides, mossicides, and defoliants prior to 1987 (USEPA, 2007, 2008). Dioxins are produced by combustion processes, including the burning of wood, coal, gas and oil (FDA, 2003). These combustion processes can be industrial or residential in nature, including the heating of homes or other structures. In the same manner, any barrel burning of trash or other wastes can release dioxins from papers, plastics, and treated woods.

Currently, the most significant contributions of dioxins to the environment include combustion sources such as industrial coal, oil, and wood burning, residential wood and oil burning, and diesel fuel combustion (ATSDR, 1998). Emissions from incineration are both wet and dry deposited where the particles can become entrained in stormwater, contributing to dioxin contamination in surface waters and sediments (ASTDR, 1998). Other potential sources of dioxins include metal smelting, cement kilns, automobile shredding, PCP contaminants, polychlorinated biphenyl-containing transformer oil leaks, gravel road dust suppressants, forest fires, and cigarette smoke.

Several potential sources of dioxins exist along the Pioneer Street drainage area as well as the area near sediment sample LRIS-SS-16. Pioneer Street is the major transportation corridor through the city; as a result, vehicle exhaust is prominent along this street. A significant number of diesel-powered school buses provide student transportation along Pioneer Street to the View Ridge Middle School, located in the Pioneer Street drainage area. During sports events, school buses park along 5th Avenue.

The property located south of the LRIS and the boat launch property was formerly occupied by a mill that produced wood roofing materials. In 1929 or possibly earlier, a mill operated on the southern portion of the McCuddy's property. This mill was removed sometime before 1939 and a second mill was built near the center of the property and operated until the mid-1950s, although it burned to the ground three times Sawdust from mill operations was landfilled on the Property and reportedly spontaneously combusted from time to time.

A fuel storage and distribution facility was located at the center of the Property from approximately 1960 to 1992. It appears from aerial photographs that, in the 1960s and early 1970s, more than 20 large, aboveground storage tanks (ASTs) (25 to 30 feet long by 8 feet in diameter) were located on the Property as part of this facility. In the late 1970s and the 1980s, two large, vertical ASTs were in use by Harbor Oil, at least part of the time. The contents of all the tanks during the lifetime of their use have not been identified, but Harbor Oil reportedly collected and stored used oil and bunker "C" fuel oil in these tanks.

A railroad siding was present on the north end of the McCuddy's property from the 1920s to the early 1960s.

Further, there is the potential for releases from houseboats and other overwater structures near LRIS-SS-16 from activities such as wood burning.

In conclusion, there are multiple potential sources of dioxins detected at LRIS-SS-16 that could originate upland in the city and subsequently become entrained in and transported by stormwater in addition to overwater activities near the sample location.

CONCLUSIONS

There is no indication that the dioxin contamination detected at station LRIS-SS-16 is related to historical PWT operations or the LRIS site:

- The drainage area for the outfall is large and does not overlap with either the LRIS or the adjacent off-site area containing elevated dioxins. There is no evidence of a complete stormwater pathway by which PWT-associated contamination may have come to be located at LRIS-SS-16.

- Most of the drainage area serviced by the stormwater outfall (approximately 95.6 percent of the estimated runoff) consists of the city's Pioneer Street stormwater basin. The previous off-site soil sampling shows that the area of elevated dioxin concentrations near the LRIS does not overlap with this basin.

- A small portion of the total basin (approximately 4.4 percent of the estimated runoff) includes a portion of the McCuddy's Marina property. That area has measured soil dioxin levels that are consistent with natural background levels.

- The source of the elevated dioxin concentrations present at sediment sample location LRIS-SS-16 has not been determined, but could include either stormwater-associated pollutants from urban sources located in the Pioneer Street stormwater basin, or a more localized source of contamination present in the sediments at the LRIS-SS-16 sampling location. As noted previously, a significant amount of debris and sheen was noted in the sample, suggesting a potential localized contamination source.

Sincerely,

Maul Foster & Alongi, Inc.

LIMITATIONS

The services undertaken in completing this report were performed consistent with generally accepted professional consulting principles and practices. No other warranty, express or implied, is made. These services were performed consistent with our agreement with our client. This report is solely for the use and information of our client unless otherwise noted. Any reliance on this report by a third party is at such party's sole risk.

Opinions and recommendations contained in this report apply to conditions existing when services were performed and are intended only for the client, purposes, locations, time frames, and project parameters indicated. We are not responsible for the impacts of any changes in environmental standards, practices, or regulations subsequent to performance of services. We do not warrant the accuracy of information supplied by others, or the use of segregated portions of this report.

The purpose of an environmental assessment is to reasonably evaluate the potential for or actual impact of past practices on a given site area. In performing an environmental assessment, it is understood that a balance must be struck between a reasonable inquiry into the environmental issues and an exhaustive analysis of each conceivable issue of potential concern. The following paragraphs discuss the assumptions and parameters under which such an opinion is rendered.

No investigation is thorough enough to exclude the presence of hazardous materials at a given site. If hazardous conditions have not been identified during the assessment, such a finding should not, therefore, be construed as a guarantee of the absence of such materials on the site.

Environmental conditions that cannot be identified by visual observation may exist at the site. Where subsurface work was performed, our professional opinions are based in part on interpretation of data from discrete sampling locations that may not represent actual conditions at unsampled locations.

Except where there is express concern of our client, or where specific environmental contaminants have been previously reported by others, naturally occurring toxic substances, potential environmental contaminates inside buildings, or contaminate concentrations that are not of current environmental concern may not be reflected in this document.

APPENDIX M

CLEANUP LEVEL DEVELOPMENT

APPENDIX M CLEANUP LEVEL DEVELOPMENT CONTENTS

APPENDIX M-1

RISK-BASED CUL DEVELOPMENT METHODS

APPENDIX M-1 RISK-BASED CLEANUP LEVEL DEVELOPMENT METHODS

This appendix describes the development of risk-based cleanup levels (CULs) for polychlorinated dibenzo-p-dioxins and dibenzofurans (hereafter dioxins) in Lake River and Carty Lake, adjacent to the Lake River Industrial Site (LRIS). Dioxins are hydrophobic compounds that adsorb strongly to sediment, bioaccumulate in animal tissue, and are less abundant in surface water. The CUL development focuses on exposure of human and ecological receptors to dioxins in sediment and tissue; exposure to dioxins in surface water is considered negligible.

The Model Toxics Control Act (MTCA) provides that CULs may be set at the higher of natural background concentration or the practical quantitation limit (PQL) if the calculated risk-based values are below those levels. An evaluation of natural background levels of dioxins in the Lower Columbia River is presented in Appendix K of this remedial investigation and feasibility study (RI/FS) report, and an appropriate dioxin toxicity equivalent (TEQ) PQL was determined in consultation with the Washington State Department of Ecology (Ecology), based on a survey of dioxin laboratories. The basis for the PQL determination is in Ecology's central files for the Site (defined in the body of the RI/FS as the LRIS, upland off-property areas, and nearby surface water bodies Lake River and Carty Lake), and the development of risk-based CULs is described further below.

Risk-based CULs for sediment are addressed in MTCA by reference to the Sediment Management Standards (Chapter 173-204 Washington Administrative Code [WAC]). Because Ecology has not promulgated a framework or specific parameters to evaluate the risk from sediments, the CULs developed in this appendix rely on standard default assumptions commonly used and in rule, when available. Human-health-based CULs are evaluated on a dioxin TEQ basis, whereas ecological-receptor-based CULs are developed on a congener-specific basis. Limited site-specific assumptions, where applicable, are integrated into CUL models, although models developed do not represent refined, site-specific risk analyses. Establishing certain site-specific parameters (e.g., fish consumption rates) can be time-consuming and may result in CULs that are below natural background and the PQL. Therefore, this process was not carried out for either Lake River or Carty Lake, as defaulting to natural background or the PQL is likely.

CULs are developed for the following potential receptors and exposure pathways identified for human health (see Sections 6.3.1 and 6.3.2 of the main body of the RI/FS) for Lake River and/or Carty Lake:

- Recreationist direct contact with dioxins in sediment and incidental ingestion (Lake River). Recreationist exposure to dioxins in sediment likely is limited, as use of nearshore LRIS areas and/or sustained contact with sediment near the LRIS are currently unlikely. Future use of the nearshore environment may increase when the shoreline is regraded as part of upland LRIS remedial actions; however, remedial actions include capping the bank, which will limit future transport and exposure. The CUL protective against this pathway is therefore developed as a precaution.

- Human consumption of dioxins in fish tissue (Lake River). The level of fishing activity in Lake River is not known. In the absence of site-specific fish consumption data, a CUL was developed using default assumptions for development of surface water cleanup levels.
- Human consumption of dioxins in fish tissue (Carty Lake). In Carty Lake fishing activity is expected to be very low, based on U.S. Department of Fish and Wildlife (USFWS) staff observations (see Section 6.3.2 of the main body of this RI/FS). However, it is unknown what would constitute an appropriate site-specific fish consumption rate, or if fish consumption occurs. A CUL was therefore not calculated; rather, the amount of fish that could be consumed to meet acceptable risk levels (ARLs) was calculated to investigate if a risk-based CUL is likely to be below natural background and the PQL.
- Worker direct contact with dioxins in sediment and incidental ingestion (Carty Lake) during reed canary grass removal activities. CULs are based on conservative estimates of exposures that may occur during management of invasive vegetation in the future (but not currently), as identified by the USFWS (see Section 6.3.2 of the main body of this RI/FS).

CULs are developed for the following potential ecological receptor exposures (see Sections 6.3.1 and 6.3.2 of the main body of the RI/FS) for both Lake River and Carty Lake:

- Fish (salmonid) uptake of dioxins in sediment
- Bird consumption of dioxins accumulated in prey
- Mammal consumption of dioxins accumulated in prey

1. Recreationist Incidental Ingestion of and Direct Contact with Sediment

This section describes the development of a CUL protective of a hypothetical recreationist exposed to impacted sediment via direct contact and incidental ingestion. As noted above, recreationist exposure to dioxins in sediment likely is limited, as use of nearshore LRIS areas and/or sustained contact with sediment near the LRIS is unlikely. Although the recreationist pathway is not likely to be significant, CULs protective against direct contact with dioxins in sediment are developed as a precaution.

All values used in CUL_R (sediment CUL protective of recreationists) development and value references for Lake River are summarized in Table M-1-1. The recreationist CUL is protective of children exposed to sediment six hours per day, for three days a week, over 12 weeks per year for six years. This equates to 216 hours per year, or an exposure frequency of approximately 0.025. The exposure assumptions are very conservative and are not representative of current use. However, the resulting CUL provides a high level of certainty that any future populations directly contacting sediment offshore of Lake River will not experience adverse effects.

The CUL protective of this exposure scenario was calculated consistent with WAC 173-340-740 equation 740-5:

$$\mathrm{CUL_R} = \frac{10^6\ \mathrm{ng/kg} * \mathrm{ARLc} * \mathrm{BW} * \mathrm{AT}}{\mathrm{EF} * \mathrm{ED}[(\mathrm{IR} * \mathrm{AB} * \mathrm{SFo})/10^6\ \mathrm{mg/kg}) + (\mathrm{SA} * \mathrm{AF} * \mathrm{ABS} * \mathrm{SFd})/10^6\ \mathrm{mg/kg})]}$$

where:

$\mathrm{CUL_R}$ is the sediment CUL for recreationists (nanograms [ng] per kilogram [kg]);

$\mathrm{ARL_C}$ is the ARL for carcinogenic dioxins (unitless, 1 X 10^{-6});

BW is body weight over the exposure duration (16 kg);

AT is averaging time (75 years);

EF is exposure frequency (unitless, 0.025);

ED is exposure duration (six years);

IR is the sediment ingestion rate (200 milligrams [mg] per day);

AB is the gastrointestinal absorption factor (unitless, 0.6);

SFo is oral cancer potency factor (1.5 X 10^5 [kg-day/mg]);

GI is gastrointestinal absorption conversion factor (unitless, 0.8);

SA is dermal surface area (2,200 square centimeters [cm^2]);

AF is adherence factor (3.3 mg/cm^2/day);

ABS is dermal absorption fraction (unitless, 0.03); and

SFd is dermal cancer potency factor (kg-day/mg) derived by SFo/GI.

Assumptions of low body weight, high sediment ingestion rate, and a high sediment adherence factor result in a conservative $\mathrm{CUL_R}$ of 138 ng/kg dioxin TEQ.

There are significant uncertainties associated with several model parameters, including the duration and frequency of exposure, the sediment ingestion rate, and the adherence factor. All model parameters except exposure frequency and adherence factor are based on MTCA defaults. Exposure frequency was determined as noted above, based on the site-specific reasonable maximum exposure scenario for recreational contact with sediments. The sediment adherence factor was selected based on a reasonable maximum exposure scenario for children (Integral et al., 2009) and is significantly greater than the MTCA default soil adherence factor of 0.2 mg/cm^2/day (WAC 173-340-740). Given the conservative assumptions, the $\mathrm{CUL_R}$ is expected to be protective for a reasonable maximum exposure scenario.

2. Human Consumption of Fish

The CULs for human health fish consumption in Lake River represent dioxin concentrations in sediment at and below which dioxins would not be expected to accumulate in fish tissue above levels acceptable for human consumption. These values were calculated as follows:

$\mathrm{CUL_H} = (10^6\ \mathrm{ng/kg} * f_{OC} * (\mathrm{ATL_H}\ /\ (\mathrm{BSAF} * f_{FL})$

where:

CUL_H is the sediment bioaccumulation screening level values for human population (ng/kg);

f_{OC} is the fraction of organic carbon in surface sediment (unitless, 0.01);

ATL_H is the acceptable tissue levels for carcinogens such as dioxins (mg/kg, calculated value of 4.3 X 10^{-8});

BSAF is the biota-sediment accumulation factor for organic contaminants (kg sediment carbon/kg organism lipid, 1); and

f_{FL} is the fraction of organism lipid content of fillet or portion of fish/shellfish consumed (unitless, 0.03).

Under MTCA, when establishing and determining compliance with human health CULs, including determining compliance with excess cancer risk, mixtures of dioxins must be considered a single hazardous substance, i.e., expressed as a dioxin TEQ. This is achieved by using the CUL established for 2,3,7,8-tetrachloro dibenzo-p-dioxin as the CUL for mixtures of dioxins (WAC 173-340-708).

A BSAF equal to 1 was selected, consistent with the State of Washington's common practice. Because of the uncertainties and wide range of literature values for BSAFs, Ecology has applied the value of 1 as a somewhat conservative BSAF to develop dioxin TEQ screening levels. This assumes that 100 percent of the sediment TEQ concentration transfers to tissue.

ATL_H were calculated from ARLs in accordance with the MTCA rule for fish consumption limits and for conducting human health assessments. Separate levels are not calculated for men and women, as differences in consumption rates to body weight are minor. ATL_H was calculated as follows:

$ATL_H = (ARL_C * BW * AT) / (SF * IR * ED * FDF)$

where:

ATL_H represents the maximum concentration of dioxins in fish tissue that will not result in a risk of cancer;

ARL_C is the ARL for carcinogenic dioxins (unitless, 1 X 10^{-6});

BW is body weight (kg);

AT is averaging time (years);

SF is the oral slope factor (kg-day/mg);

IR is fish/shellfish ingestion rate (kg/day);

ED is exposure duration (years); and

FDF is fish diet fraction (unitless, 0.5).

A conservative CUL_H of 0.014 ng/kg dioxin TEQ protective of human consumption was calculated for Lake River. All values applied in CUL and acceptable tissue level development for human fish consumption, as well as the basis of the values, are summarized in Table M-1-2.

A CUL for human fish consumption at Carty Lake was not developed. At Carty Lake, fishing for consumption is likely to be very limited (see Section 5.6). There are approximately 260 fishing visits annually throughout the entire Ridgefield National Wildlife Refuge, with use distributed between Gee Creek, Duck Lake, Middle Lake, and Carty Lake, suggesting that fishing, and therefore Carty Lake fish consumption, is rare. In the absence of reliable information on fish consumption rates for Carty Lake, the fish consumption model described above for Lake River was used to calculate the amount of fish that could be consumed to meet the ARL of 1 X 10^{-6}, with the exception that a site-specific f_{OC} value of 0.029 for Carty Lake (see Section 4.1 below) was used. Under current conditions (i.e., at the current Carty Lake dioxin TEQ surface weighted average concentration [SWAC] of 44 ng/kg; see the Attachment in Appendix T) approximately 1 ounce of fish per year could be consumed to meet the ARL of 1 X 10^{-6}. Therefore, even a very low fish consumption rate at Carty Lake would exceed the ARL, indicating that a risk-based CUL is likely to be below natural background or the PQL. Remedial actions that reduce the Carty Lake dioxin TEQ SWAC would increase the amount of fish that could be consumed while meeting the ARL.

Risk assessment calculations based on procedures for developing surface water CULs (WAC 173-340-730, Equation 730-2) as applied above provide an initial framework for developing sediment concentrations that are predicted to result in acceptable tissue levels in fish. However, to most accurately develop risk-based sediment CULs for Lake River and Carty Lake, it would be necessary to conduct site-specific studies of fish consumption and the relationship between sediment and fish tissue contamination.

3. Worker Incidental Ingestion of and Direct Contact with Sediment

The CUL for direct contact and incidental ingestion of sediment is developed to be protective of workers exposed to dioxin-impacted sediment in Carty Lake during potential future vegetation restoration efforts (e.g., removal of reed canary grass). Values were calculated consistent with WAC 173-340-745 equation 745-5:

$$\mathrm{CUL_W} = \frac{10^6\ \mathrm{ng/kg} * \mathrm{ARLc} * \mathrm{BW} * \mathrm{AT}}{\mathrm{EF} * \mathrm{ED}[(\mathrm{IR} * \mathrm{AB} * \mathrm{SFo})/10^6\ \mathrm{mg/kg}) + (\mathrm{SA} * \mathrm{AF} * \mathrm{ABS} * \mathrm{SFd})/10^6\ \mathrm{mg/kg})]}$$

where:

$\mathrm{CUL_W}$ is the sediment CUL for workers (ng/kg);

$\mathrm{ARL_C}$ is the ARL for carcinogenic dioxins (unitless, 1 X 10^{-5});

BW is body weight over the exposure duration (70 kg);

AT is averaging time (75 years);

EF is exposure frequency (unitless, 0.005);

ED is exposure duration (20 years);

IR is the sediment ingestion rate (50 mg/day);

AB is the gastrointestinal absorption factor (unitless, 0.6);

SFo is oral cancer potency factor (1.5 X 10^5 kg-day/mg);

GI is gastrointestinal absorption conversion factor (unitless, 0.8);

SA is dermal surface area (2,500 cm^2);

AF is adherence factor (0.3 $mg/cm^2/day$);

ABS is dermal absorption fraction (unitless, 0.03); and

SFd is dermal cancer potency factor (kg-day/mg) derived by SFo/GI.

USFWS indicated that future workers who may be tasked with disking reed canary grass are likely to require a full work week (i.e., 40 hours) (Lapp, 2012). Further, workers likely would disk the vegetation about once every three years (Lapp, 2012). The assumptions applied in the model above are based on communications with USFWS, but add a layer of conservatism by assuming that workers would conduct 40 hours of vegetation restoration every year. Assumptions of exposure frequency of 40 hours per year for 20 years result in a conservative CULW of 66,000 ng/kg dioxin TEQ protective of workers. All values used in CULW development and value references for Carty Lake are summarized in Table M-1-3.

There are uncertainties associated with several model parameters, including the duration and frequency of exposure, the adherence factor, and sediment ingestion rates. As explained above, assumptions were based on default values and on communications with the USFWS, with an additional layer of conservatism to estimate a reasonable maximum exposure.

4. CULs for Ecological Receptors

Dioxins are bioaccumulative chemicals that also biomagnify, that is, dioxins accumulate to successively higher concentrations at higher trophic levels. To evaluate the potential adverse effects at higher trophic levels (i.e., piscivorous birds and mammals, in this case) resulting from dioxins in sediment, it is necessary to evaluate accumulation. Accumulation in aquatic organisms can be assessed in one of two ways: (1) direct measurement through the collection and analysis of tissue, or (2) modeling expected concentrations in tissue, applying default or site-specific assumptions. Appropriate tissue data are not available at the Site; therefore, CULs based on default assumptions or site-derived data were developed using standard U.S. Environmental Protection Agency (USEPA) models (Oregon Department of Environmental Quality [DEQ], 2007; USEPA, 1989; WAC 173-340-730). These models evaluate risk on a congener-specific basis, and the default assumptions incorporated into models rely on studies and reports, including the following: USEPA (1985), USEPA (1995), Sample et al. (1996), Steevens et al. (2005), and COE et al. (2009). Models and assumptions used to generate CULs for fish, birds, and mammals are further explained below.

4.1 Fish

The CULs for fish represent dioxin concentrations in sediment at and below which dioxins would not be expected to accumulate in fish tissue above acceptable levels for fish. These values were calculated as follows:

$$CUL_F = 10^6 \text{ ng/kg} * f_{OC} * (CTL / (BSAF * f_L)) / SU$$

where:

CUL_F is the CUL for fish (ng/kg);

f_{OC} is the fraction of total organic carbon in surface sediment (unitless);

CTL is the critical tissue levels for fish (mg/kg);

BSAF is the biota-sediment accumulation factor for organic contaminants (kg sediment carbon/kg organism lipid);

f_L is the fraction of organism lipid content (unitless); and

SU is the site use factor for the fish (unitless).

Values used in CUL development, as well as the basis of the values, are summarized in Table M-1-4 for Lake River and in Table M-1-5 for Carty Lake. Selected values are based on defaults selected and discussed in DEQ (2007), with the exception of f_{OC} and SU. Fraction of organic carbon is generally assumed at 0.01 (DEQ, 2007), but surface f_{OC} at the Lake River site ranges from 0.0034 to 0.032, with an average of 0.0128. At Carty Lake, surface f_{OC} ranges from 0.013 to 0.054, with a mean of 0.029 (see Sections 2.7.1.3 and 2.7.2.2 of the main body of the RI/FS).

An SU of 0.5 was applied. This value is a conservative assumption relevant for salmonids that accounts for the life cycles of species (i.e., coastal cutthroat trout and coho salmon) likely present in Lake River and in Gee Creek. Salmonids in Gee Creek may use Carty Lake if a permanent connection to Gee Creek is restored (see Section 2.8.4 of the main body of the RI/FS). Coastal cutthroat trout exhibit varied life cycles and may range greater than 50 kilometers away from their natal stream, while coho salmon spend approximately half of their life cycle away from their natal stream or other freshwater habitat (Moore et al., 2010). Assuming the presence of other salmonids in Lake River and Carty Lake at this time or in the future, these species are also likely to use Carty Lake for substantially less than 50 percent of their life cycle, given their anadromous life history.

CTLs represent concentrations in tissue at or below which approximately 95 percent of aquatic organisms would be highly unlikely to experience adverse health effects. CTLs are not species-specific and are calculated using the species sensitivity distribution approach, which employs empirical-effects data. DEQ (2007) calculated CTLs used in CUL model calculations based on the methodology of Steevens et al. (2005) and toxic equivalency factors (Van den Berg, 1998, 2006). The CTL developed by DEQ is based on four species endpoints, including immature coho salmon [*Oncorhynchus kisutch*] and immature rainbow trout [*Oncorhynchus mykiss*]). Therefore, the fish CULs developed here likely are protective of juvenile salmonids that may occur in Lake River or Carty Lake in the event that a connection between Carty Lake and the Columbia River is restored (see Section 2.8.4 in the main body of the RI/FS). Sediment CULs for individual dioxin congeners protective of fish are summarized in Tables M-1-4 and M-1-5 for Lake River and Carty Lake, respectively.

4.2 Birds

The CULs for birds represent dioxin concentrations in sediment at and below which dioxins are not expected to result in tissue residue levels in prey that could adversely affect the health of birds that prey on fish or other aquatic organisms. Thus, contaminants in prey items at or below the CULs are predicted not to harm the most sensitive life stage of bird predators. CULs can be calculated for both individual and population bird receptors. Individual CULs are based on no-observed-adverse-effect levels (NOAEL), which are appropriate when Endangered Species Act (ESA)-listed species are likely to utilize areas of concern. Population CULs are based on lowest-observed-adverse-effects levels. Because no ESA-listed bird species reside or are likely to reside in the area of concern (see Appendix C of the RI/FS report), population-level CULs were used for birds. The great blue heron was the selected receptor for determining protection of piscivorous birds. CULs were calculated as follows:

$CUL_B = 10^6 \text{ ng/kg} * f_{OC} * (ATL_B / (BSAF * f_L))$

where:

CUL_B is the sediment bioaccumulation screening level values for piscivorous bird receptors (ng/kg);

f_{OC} is the fraction of total organic carbon in surface sediment (unitless);

ATL_B is the acceptable tissue levels in diet for birds (mg/kg);

BSAF is the biota-sediment accumulation factor for organic contaminants (kg sediment carbon/kg organism lipid);

f_L is the fraction of organism lipid content of whole body wet weight (unitless).

Specifically, ATL_B represents the concentration of a contaminant that a bird could consume that would result in a dose equal to a given toxicity reference value (TRV) (mg/kg/day) at or below which the population of bird receptors would be protected.

ATL_B was calculated as follows:

$ATL_B = TRV / (IR / BW)$

where IR is the daily food ingestion rate (kg/day) and BW is body weight (kg) of the selected receptor bird (great blue heron). This calculation is inherently conservative in that it assumes that birds are present year-round and that they obtain all of their food from areas of impacted sediment.

Site-specific organic carbon values were applied for both Lake River and Carty Lake; all other parameters are default values. All values used in bird CUL development, as well as the basis for these values, is summarized in Tables M-1-6 and M-1-7.

4.3 Mammals

The CULs for mammals represent dioxin concentrations in sediment at and below which dioxins are not expected to result in tissue residue levels in prey that could adversely affect the health of mammals that prey on fish or other aquatic organisms.

Thus, contaminants present in prey items at or below the CULs are predicted not to harm the most sensitive life stage of mammal predators. CULs can be calculated for both individual and population mammal receptors. Individual CULs are based on NOAEL, which are appropriate when ESA-listed species are likely to utilize areas of concern. Population CULs are based on lowest-observed-adverse-effects-levels. Because no ESA-listed mammal species reside or are likely to reside in the area of concern (see Appendix C of the of the RI/FS report), population-level CULs were used for mammals. Mink was the selected receptor for determining protection of piscivorous mammals. CULs were calculated as follows:

$CUL_M = 10^6$ ng/kg * f_{OC} * (ATL_M / (BSAF * f_L))

where:

CUL_M is the sediment bioaccumulation screening level values for piscivorous mammal receptors (ng/kg);

f_{OC} is the fraction of total organic carbon in surface sediment (unitless);

ATL_M is the acceptable tissue levels in diet for mammals (mg/kg);

BSAF is the biota-sediment accumulation factor for organic contaminants (kg sediment carbon/kg organism lipid);

f_L is the fraction of organism lipid content of whole body wet weight (unitless).

Specifically, ATL_M represents the concentration of a contaminant that a mammal could consume that would result in a dose equal to a given TRV (mg/kg/day) at or below which the population of mammal receptors would be protected.

ATL_M was calculated as follows:

ATL_M = TRV / (IR / BW)

where IR is the daily food ingestion rate (kg/day) and BW is body weight (kg) of the selected receptor mammal (mink). This calculation is inherently conservative in that it assumes that mammals are active year-round and that they obtain all of their food from areas of impacted sediment. Site-specific organic carbon values were applied for both Lake River and Carty Lake; all other parameters are default values. All values used in mammal CUL development, as well as the basis for these values, are summarized in Tables M-1-8 and M-1-9.

As described above, selection of primarily default values (which are inherently conservative) and susceptible end-point receptors for the ecological risk assessments likely result in overestimates of risk to receptors evaluated.

However, evaluation of ecological risk is often limited by lack of site-specific data, generating considerable uncertainty in model estimates. This uncertainty is often circumvented by making conservative estimates based on other available site- or laboratory-derived data; however, because these assumptions do not necessarily correlate to the site of investigation, results of the risk calculations are themselves uncertain.

One of the most significant sources of uncertainty is the BSAF, which tends to be species-specific and affected by environmental factors such as grain size and organic carbon. In the absence of empirically derived site- and species-specific BSAFs, conservative literature values are applied, likely resulting in overestimates of risk.

APPENDIX M-2

EVALUATION OF PRACTICAL QUANTITATION LIMITS FOR DIOXIN ANALYSIS

MAUL
FOSTER
ALONGI

MEMORANDUM

To: Craig Rankine and Joyce Mercuri
Washington State Department of Ecology

Date: December 15, 2011

From: Madi Novak

Project: 9003.01.40

Madi Novak

RE: Evaluation of Practical Quantitation Limits for Dioxin Analysis
Port of Ridgefield Lake River Industrial Site
Agreed Order No. 01TCPSR-3119

On behalf of the Port of Ridgefield (Port), Maul Foster & Alongi, Inc. (MFA) has prepared this memorandum to provide the results of a review of practical quantitation limits (PQLs) that can be achieved by various laboratories in the analysis of polychlorinated dibenzo-*p*-dioxins and polychlorinated dibenzofurans (collectively herein referred to as dioxins). This evaluation is being conducted as part of ongoing remedial investigation and feasibility study activities being performed at the Lake River Industrial Site (LRIS) in Ridgefield, Washington, under an Agreed Order between the Port and the Washington State Department of Ecology (Ecology). Ecology has requested an evaluation of achievable PQLs as part of the dioxin cleanup level development process for Carty Lake and Lake River, adjacent to the Port's LRIS property.

MFA assembled PQL and quality control (i.e., method blank) information from six laboratories that specialize in dioxin analysis to evaluate the quality and usability of laboratory-reported PQLs. As with site concentrations, dioxin PQLs are expressed as toxicity equivalent quotients[1] (TEQs). A PQL TEQ of 5.2 nanograms per kilogram (ng/kg) is the lowest, most applicable limit for use as a cleanup level.

BACKGROUND

The PQL is the lowest concentration that can be reliably measured within specified limits of precision, accuracy, representativeness, completeness, and comparability during routine laboratory operating conditions (Washington Administrative Code [WAC] 173-340-200). While laboratories may report concentrations of congeners to a variety of possible limits (e.g., method detection limit or

---

[1] TEQs are shown to two significant figures.

400 East Mill Plain Blvd., Suite 400 | Vancouver, Washington 98660 | p. 360 694 2691 | f. 360 906 1958
www.maulfoster.com

estimated detection limits), the PQL is the lowest point at which the laboratory can report a definitive concentration (i.e., not qualified as estimated) of a compound. Ecology may consider using PQLs as cleanup levels where risk-based cleanup levels and background levels are below PQLs (WAC 173-340-700).

METHOD AND RESULTS

To evaluate the range of achievable PQLs, MFA contacted multiple laboratories and requested each laboratory's lowest achievable PQL (see Table 1 for a list of laboratories). Submittals from and communications with the laboratories are provided as an attachment. Table 2 summarizes PQLs for each of the 17 commonly analyzed dioxin congeners provided by each laboratory. Note that two laboratories reported multiple sets of PQLs. Columbia Analytical Services, Inc. (CAS) has two sets of PQLs, depending on the U.S. Environmental Protection Agency (USEPA) Method applied (i.e., Method 8290 versus 1613), and Cape Fear Analytical, LLC (Cape Fear) has three sets of PQLs that are described as follows: (1) standard PQLs, (2) one-half of their standard PQLs, and (3) PQLs requested by Ecology. Only the second and the third sets of PQLs from Cape Fear appear in Table 2.

TEQs for PQLs were calculated for each laboratory. The toxicity equivalency factor for each congener (as listed in Table 708-1 of WAC 173-340-900) was applied to the respective congener PQL provided by the laboratory. The resulting PQL-based toxicity equivalent concentration for each congener were then summed for a TEQ. TEQs are summarized in Table 2.

To further evaluate applicability of laboratory-reported PQLs, method blank results were reviewed. Method blanks are required by dioxin analytical methods (USEPA Methods 8290 and 1613) to demonstrate that all parts of the analytical equipment in contact with the sample and reagents are interference-free. Method blank analysis is considered "critical to the provision of meaningful sample results" (USEPA, 2007). Method blank results are evaluated during standard data quality assurance/quality control review as follows:

- Method blank results may not exceed the PQL except in the case of octachlorinated dibenzo-*p*-dioxin (OCDD)/octachlorinated dibenzofuran (OCDF) (for OCDD and OCDF the maximum allowable amount is less than three times the PQL). If method blank contamination is greater than the PQL (or greater than three times the PQL for OCDD/OCDF), then the detections must be qualified as estimates or non-detects, and the non-detected congener PQLs must be qualified as estimates. Further, professional judgment may be applied to qualify detects as unusable if method blank contaminant concentrations are similar to levels reported in samples (USEPA, 2005).

- If method blank contamination is less than the PQL, then the sample detections less than the PQL are qualified as non-detect and sample results higher than the PQL are qualified using best professional judgment. It is common practice to qualify sample results that are less than five times the method blank detection as non-detect; this practice has historically been applied to site data (Anchor and MFA, 2011).

Method blank data were evaluated relative to PQLs provided by Cape Fear to understand potential implications for data usability. While method blank results were requested from additional laboratories (CAS and AXYS Analytical Services, Ltd.), as of this writing only Cape Fear in North Carolina provided method blank results. Cape Fear-reported method blank detections are provided in the attachment; MFA averaged method blank detections and summarized the results in Table 3.

A method blank contamination-modified PQL TEQ was calculated. To start, the average method blank contamination was multiplied by five (MB*5) and compared with PQLs. If MB*5 was less than the PQL, then the PQL was applied in the TEQ calculation. However, to be consistent with data review practices, if MB*5 was greater than the PQL, the MB*5 result was applied in the TEQ calculation. Table 3 shows the method blank contamination-modified PQL TEQ for the Cape Fear Ecology-requested PQL of 5.2 ng/kg.

CONCLUSIONS AND RECOMMENDATION

Laboratory PQLs are a product of what can be technically achieved using the instruments available while following the prescribed method. While laboratories may be able to calibrate to very low levels, it is still necessary to evaluate the results in terms of precision, accuracy, representativeness, completeness, and comparability to achieve high-quality, usable results. The USEPA contract-required quantitation limit (i.e. PQL) for 2,3,7,8-TCDD TEQ is 11 parts per trillion (ppt), which is the same PQL achieved by three of the seven laboratories surveyed (TestAmerica, Analytical Resources, Incorporated, and Pace Analytical Services, Inc.). Cape Fear reported PQL TEQs of 5.7 and 4.3 ppt, one-half the typical PQL and an Ecology-requested PQL, respectively. After evaluating data usability given average method blank contamination levels, the 4.3 ppt PQL TEQ was raised to a 5.2 ppt PQL TEQ. Two laboratories, AXYS and CAS, provided PQL TEQs at the lowest end of the range at 2.3 ppt. Unfortunately, neither laboratory provided method blank contamination data. However, given the method blank contamination observed in dioxin analysis in site samples and also the method blank contamination reported by Cape Fear, it is considered likely that laboratories reporting to 2.3 ppt PQL TEQ would be affected by method blank contamination at these extremely low levels. Therefore, MFA recommends use of the lowest PQL TEQ usable without qualifiers: 5.2 ng/kg.

RE: CAMU-eligible soils at the Pacific Wood Treating/Port of Ridgefield Site
Facility Site ID 1019

Dear Ms. Olin:

This letter documents the Department of Ecology's (Ecology's) determination that contaminated soils from Pacific Wood Treating Site are Corrective Action Management Unit (CAMU)-eligible waste under the Dangerous Waste Regulations (Chapter 173-303 WAC). These soils may be disposed off-site at a designated hazardous waste landfill according to WAC 173-303-646920.

In a March 16 e-mail to Jennifer King, Ecology stated that adequate information had been submitted by Maul Foster & Alongi, Inc, the Port of Ridgefield's consultant, for Ecology to tentatively approve placement of soils from the Pacific Wood Treating Site in an off-site dangerous waste landfill as CAMU-eligible waste.

The Dangerous Waste Regulations require Ecology to determine principal hazardous constituents (PHCs) in the soils and proposed treatment levels for each PHC. For the Pacific Wood Treating Site these are found in Appendix A (Corrective Action Management Unit Documentation) in *Cells 1 and 2 Interim Action Work Plan, Former Pacific Wood Treating Corporation*, dated April 13, specifically in the table entitled "Table Proposed Treatment Levels for CAMU Disposal, Port of Ridgefield - Lake River Industrial Site, Ridgefield, Washington."

The Dangerous Waste Regulations require Ecology to provide public notice and a reasonable opportunity for public comment before approving placement of CAMU-eligible waste in an off-site landfill. The recent public comment period (April 25 to May 25, 2011) on the interim action work plan included information and a request to comment about the off-site disposal of site soils as CAMU-eligible waste. No comments were received specific to the CAMU-eligible waste proposal.

The federal regulations (40 CFR 264.555) outline the remaining requirements for approving placement of CAMU-eligible waste in an off-site landfill. Part 264.555(e) outlines the necessary procedures for public comment and regulatory approval at the landfill before CAMU-eligible waste may be placed in the off-site landfill. Ecology understands that soils from the Pacific Wood Treating Site will be sent to the Chemical Waste Management (CWM) Subtitle C Facility in Arlington, Oregon, and that this facility is permitted to accept CAMU-eligible waste. For each cleanup generating a CAMU-eligible waste, CWM must request an additional permit modification from the Oregon Department of Environmental Quality (DEQ), including the source of the CAMU waste, its PHCs, and the applicable treatment requirements. Public notice by CWM is also required (40 CFR § 264.555(d)-(e)). The DEQ may object to the off-site placement of CAMU-eligible waste within 30 days of CWM's notification (40 CFR §264.555(e)(3)). CAMU-eligible wastes may not be placed in the landfill until DEQ has notified CWM that DEQ does not object to its placement.

WAC 173-303-646910(6) requires generators of CAMU-eligible wastes sent to an off-site dangerous waste landfill to comply with the reporting, tracking, and recordkeeping requirements of 40 CFR 268.7(a)(4).

If you have any questions about this letter, please contact me at 360-407-6359.

Sincerely,

Kaia Petersen

MEMORANDUM

To: Kaia Petersen, Washington State Department of Ecology

Date: April 13, 2011

From: Jennifer King

Project: 9003.01.47

RE: Port of Ridgefield – Site Information

The Port of Ridgefield (Port) is requesting that the Washington State Department of Ecology consider waste at the Lake River Industrial Site (LRIS) as CAMU-eligible. The Port is preparing to conduct an interim action in Cells 1 and 2 of the LRIS during the summers of 2011 and 2012.

Per Washington Administrative Code (WAC) 173-303-64650(3)(a), "CAMU-eligible wastes" are defined as "all solid and dangerous wastes, and all media (including ground water, surface water, soils, and sediments) and debris, that are managed for implementing cleanup." Under WAC 173-303-646920, the Department of Ecology (Ecology) may approve the disposal of CAMU-eligible waste in a Resource Conservation and Recovery Act (RCRA) Subtitle C landfill located outside of the State of Washington, without the soils meeting the land disposal restrictions (LDRs) of 40 CFR 268. The following site information is provided to inform the process of making the CAMU-eligible determination.

SITE HISTORY

The physical address of the LRIS is 111 West Division Street, Ridgefield, Washington. It is located in section 24, township 4 north, range 1 west, Willamette Meridian. The LRIS is the former location of the Pacific Wood Treating Co. (PWT) facility. The Port owns the property, which PWT leased from approximately 1964 to 1993. PWT's former operations involved pressure-treating wood products with oil-based treatment solutions containing creosote, pentachlorophenol (PCP), and a water-based mixture of copper, chromium, and arsenic and copper, chromium, and zinc. Figure 1 shows the historical and current site features related to PWT's operations.

Impacts to the site occurred through different mechanisms, such as spills, drippage, storage of treated lumber, and treatment of wastes. The impacts occurred throughout PWTs operation.

Investigations on the LRIS show that wood-treating solutions were released to the surface throughout most of the site and have impacted soil and groundwater. Impacted soil is believed to have been caused by the incidental drippage and associated activities from wood storage. Because the soil contains listed wood-preserving wastes from former PWT operations, the soils have to be

2001 NW 19th Avenue, Suite 200 | Portland, Oregon 97209 | p. 971 544 2139 | f. 971 544 2140
www.maulfoster.com

managed as dangerous waste. The following waste codes (WAC 173-303-9904) apply to soil that will be removed from LRIS:

- Listed Waste code F032—Preservative drippage in soil that contains chlorophenolic wastes (listed December 6, 1990; land disposal requirements in effect August 12, 1997)
- Listed Waste code F034—Preservative drippage in soil that contains creosote wastes (listed December 6, 1990; land disposal requirements in effect August 12, 1997)
- Listed Waste code F035—Preservative drippage in soil that contains arsenic and chromium wastes (listed December 6, 1990; land disposal requirements in effect August 12, 1997)

At this time the Port plans to excavate soil with waste codes F032, F034, and F035 from two locations, SS-14 and TP-03 (see Figure 2). Additional soil from the SER treatment area as identified on Figure 2 may be generated, which would carry the same F-listed waste codes.

Site impacts also occur around a former wastewater treatment feature, the "concrete pond" (see Figure 2). Impacts in the concrete pond area (including TP-13 location) are understood to be the result of treatment of wastewater from wood preserving processes. Because soils in the concrete pond area contain listed wood-preserving wastes from former PWT operations, the soils have to be managed as dangerous waste. The following waste code (WAC 173-303-9904) applies to soil that would be removed from the concrete pond area:

- Listed Waste code K001—Bottom sediment sludge from the treatment of wastewaters from wood preserving processes that use creosote and/or pentachlorophenol (listed May 19, 1980; land disposal requirements in effect August 8, 1988).

The attached Table includes the proposed levels where treatment is required prior to landfilling at a Subtitle C disposal facility as a CAMU-eligible waste. The principal hazardous constituents are based on chemicals that exceeded cleanup levels and regulated hazardous constituents listed under waste codes F032, F034, F035, and K001.

APPENDIX O

TECHNOLOGY SCREENS

APPENDIX O TECHNOLOGY SCREENS

Table O-1
Summary of Remedial Technology Screening Process for Port-Owned Properties
Former PWT Site RI/FS

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
No Action	None	Not Applicable	No Action	Yes	A no-action alternative was considered and dismissed as an option because of ecological exposure concerns.
Institutional Controls	Restrictions	Deed Notifications	Institutional controls are non-engineered instruments, such as administrative and legal controls, that help minimize the potential for human exposure to contamination and/or protect the integrity of the remedy. Institutional controls are meant to supplement engineering controls.	Yes	Institutional controls, specifically deed restrictions, is retained for further evaluation as a remedial technology for the Port-owned Railroad Avenue property.
		Access/Fencing	Access restrictions such as fencing create a physical impedance in order to protect human receptors.	Yes	For the Port-owned Railroad Avenue property, access restrictions such as fencing and signage are retained as viable remedial technologies.
In Situ Containment	Capping	Clean Soil Cap	Capping is commonly used at contaminated sites because it is generally less expensive than active remediation technologies and can effectively manage the human and ecological risks associated with a remediation site. Caps can range from a one-layer system of vegetated soil to a complex, multi-layer system of soils, geosynthetics, and impervious surfaces. Capping does not lessen toxicity, mobility, or volume of hazardous wastes, but does mitigate migration and eliminate some exposure pathways.	Yes	For the Port-owned Railroad Avenue property, a cap alternative is easily implementable and cost effective, and is therefore retained for further evaluation.
In Situ Treatment	Biological	Natural Attenuation	Consideration of this option usually requires modeling and evaluation of contaminant degradation rates and pathways, as well as predicting contaminant concentration at downgradient receptor points, especially when the plume is still expanding/migrating. The primary objective of site modeling is to demonstrate that natural processes of contaminant degradation will reduce contaminant concentrations below regulatory standards or risk-based levels before potential exposure pathways are completed. In addition, long-term monitoring must be conducted throughout the process to confirm that degradation is proceeding at rates consistent with meeting cleanup objectives.	No	As dioxins do not readily degrade in the environment, requiring more than 50 years to reduce the highest concentrations to CULs in the area, the natural attenuation option is not retained.
		Slurry Bioremediation	Addition of nutrients and other amendments to enhance bioremediation, the process in which microorganisms degrade organic contaminants, converting them to innocuous end products.	No	This technology is not retained for further evaluation because of limited effectiveness and low implementability.
		Phytoremediation	Use of plants to remove, transfer, stabilize, and destroy contaminants in soil and sediments.	No	This technology is not retained for further evaluation because of limited effectiveness and low implementability.
		Aerobic Biodegradation/ Bioventing	Bioremediation is a process in which microorganisms degrade organic contaminants, converting them to innocuous end products. Nutrients, oxygen, or other amendments may be used to enhance bioremediation and contaminant desorption from subsurface materials. Aerobic bioremediation requires an oxygen source. Bioventing stimulates the natural in situ biodegradation of any aerobically degradable compounds in soil by providing oxygen to existing soil microorganisms. Oxygen is most commonly supplied through direct air injection into residual contamination in soil.	No	This technology is not retained for further evaluation because of limited effectiveness (especially related to dioxins) as well as implementability issues.
		Anaerobic Biodegradation	Bioremediation conducted in the absence of oxygen.	No	This technology is not retained for further evaluation because of limited effectiveness (especially related to dioxins) as well as implementability issues.

Table O-1
Summary of Remedial Technology Screening Process for Port-Owned Properties
Former PWT Site RI/FS

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
In Situ Treatment, cont.	Chemical	Chemical Oxidation	Application of chemical oxidants to contaminated soil to convert hazardous contaminants to nonhazardous or less toxic compounds that are more stable, less mobile, and/or inert. Chemical oxidation typically involves reduction/oxidation (redox) reactions. The oxidizing agents most commonly used are ozone, hydrogen peroxide (H2O2), hypochlorites, chlorine, and chlorine dioxide.	No	This technology is not retained for further evaluation because of limited effectiveness as well as low implementability. Oxidation would not be effective for reducing total dioxin concentrations. Implementing this cleanup action alternative component would pose many logistical issues.
	Physical—Extractive Processes	Soil Flushing	In situ flushing is defined as the injection or infiltration of an aqueous solution into a zone of contaminated soil/groundwater, followed by downgradient extraction of groundwater and elutriate (flushing solution mixed with the contaminants) and aboveground treatment and discharge or reinjection.	No	Screened out because of limited effectiveness and implementability issues. The technology mobilizes contaminants from the soils and should be used only where flushed contaminants and flushing fluid can be contained and recaptured. The potential exists for washing the contaminant beyond the capture zone. Costs associated with treatment of the recaptured fluids are high.
		Vapor Extraction	Soil vapor extraction (SVE) is an in situ unsaturated (vadose) zone soil remediation technology in which a vacuum is applied to the soil to induce the controlled flow of air and remove volatile and some semivolatile contaminants from the soil. The gas leaving the soil may be treated to recover or destroy the contaminants, depending on local and state air discharge regulations.	No	This technology is not effective for the remediation of dioxins and therefore is not retained for further consideration.
		Thermal Extraction	Thermally enhanced SVE is a full-scale technology that uses electrical resistance/electromagnetic/fiber optic/radio frequency heating or hot-air/steam injection to increase the volatilization rate of semivolatiles and facilitate extraction.	No	This technology is not effective for the remediation of dioxins and therefore is not retained for further consideration.
	Enhancement	Fracturing	Fracturing is an enhancement technology designed to increase the efficiency of other in situ technologies in difficult soil conditions. The fracturing extends and enlarges existing fissures and introduces new fractures, primarily in the horizontal direction. After fracturing has been completed, the formation is subjected to vapor extraction, either by applying a vacuum to all wells or by extracting from selected wells, while other wells are capped or used for passive air inlet or forced air injection.	No	None of the retained technologies will benefit from the fracturing enhancement, and therefore fracturing is not retained for further consideration.
	Physical—Immobilization	Solidification/Stabilization	The addition of reagents that immobilize and/or bind contaminants to the sediment in a solid matrix or chemically stable form.	No	This technology is not retained for further evaluation because of limited effectiveness, constraints on future use, and low implementability. The technology is effective for inorganics at a limited depth. Because residential properties are impacted, the technology is not highly implementable.
		Vitrification	Use of strong electrical current to heat sediment to temperatures above 2400ºF to fuse it into a glassy solid.	No	This technology is not retained for further evaluation because of limited effectiveness and low implementability.
		Electrokinetic Separation	Application of a low-intensity direct current through the soil between ceramic electrodes divided into a cathode array and an anode array mobilizing charged species. Two primary mechanisms transport contaminants through the soil toward one or the other electrode: electromigration and electro-osmosis.	No	This technology is effective only on polar contaminants and fine-grained soils, and is not retained for further evaluation because of limited effectiveness for the IHSs present in the soil and because of many implementability issues. Additionally, there have been few, if any, commercial applications of electrokinetic remediation in the United States.

Table O-1
Summary of Remedial Technology Screening Process for Port-Owned Properties
Former PWT Site RI/FS

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
In Situ Treatment, cont.	Physical—Immobilization, cont.	Ground Freezing	The ground-freezing process converts in situ pore water to ice through the circulation of a chilled liquid via a system of small-diameter pipes placed in drilled holes. The ice acts to fuse the soil or rock particles together, creating a frozen mass of improved compressive strength and impermeability. Brine is the typical cooling agent, although liquid nitrogen can be used in emergency situations or where the freeze is required to be maintained only for a few days.	No	This technology is not retained for further evaluation because of limited effectiveness and serious implementability issues.
Ex Situ Treatment	Containment	Excavation and Off-Site Disposal	Contaminated material is removed and transported to permitted off-site treatment and/or disposal facilities. Some pretreatment of the contaminated media usually is required in order to meet land disposal restrictions.	Yes	Easily implementable, cost effective, retained for further evaluation.
	Biological	Biopiles, Composting, Land Farming, Slurry Phase	Biopile treatment is a full-scale technology in which excavated soils are mixed with soil amendments and placed on a treatment area that includes leachate collection systems and some form of aeration. It is used to reduce concentrations of petroleum constituents in excavated soils through the use of biodegradation. Moisture, heat, nutrients, oxygen, and pH can be controlled to enhance biodegradation.	No	This technology is not retained for further evaluation because it is not effective for the remediation of dioxins. It also poses logistical implementability issues.
	Chemical	Extraction	Chemical extraction does not destroy wastes but is a means of separating hazardous contaminants from soils, sludges, and sediments, thereby reducing the volume of the hazardous waste that must be treated. The technology uses an extracting chemical and differs from soil washing, which generally uses water or water with wash-improving additives. Commercial-scale units are in operation. They vary in regard to the chemical employed, type of equipment used, and mode of operation.	No	These technologies are not retained for further evaluation because the contamination levels in the soil and sediment associated with these projects do not require treatment prior to disposal.
		Reduction/Oxidation	Reduction/oxidation (redox) reactions chemically convert hazardous contaminants to nonhazardous or less toxic compounds that are more stable, less mobile, and/or inert. Redox reactions involve the transfer of electrons from one compound to another. Specifically, one reactant is oxidized (loses electrons) and one is reduced (gains electrons). The oxidizing agents most commonly used for treatment of hazardous contaminants are ozone, hydrogen peroxide, hypochlorites, chlorine, and chlorine dioxide. Chemical redox is a short- to medium-term technology.	No	
		Soil Washing	Ex situ soil separation processes (often referred to as "soil washing") are based mostly on mineral processing techniques. Soil washing is a water-based process for scrubbing soils ex situ to remove contaminants. The process removes contaminants from soils in one of the following two ways: by dissolving or suspending them in the wash solution (which can be sustained by chemical manipulation of pH for a period of time); or by conc+D26entrating them into a smaller volume of soil through particle size separation, gravity separation, and attrition scrubbing.	No	

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
Ex Situ Treatment, cont.	Chemical, cont.	Dehalogenation	Contaminated soil is screened, processed with a crusher and pug mill, and mixed with reagents. The mixture is heated in a reactor. The dehalogenation process is achieved by either the replacement of the halogen molecules or the decomposition and partial volatilization of the contaminants.	No	These technologies are not retained for further evaluation because the contamination levels in the soil and sediment associated with these projects do not require treatment prior to disposal.
	Physical	Separation/Screening	The separation processes are used for removing contaminated concentrates from soils, to leave relatively uncontaminated fractions that can then be regarded as treated soil. Ex situ separation can be performed by many processes. Gravity separation and sieving/physical separation are two well-developed processes that have long been primary methods for treating municipal wastewaters. Magnetic separation, on the other hand, is a much newer separation process that is still being tested.	No	
		Solidification/Stabilization	Ex situ S/S contaminants are physically bound or enclosed within a stabilized mass (solidification), or chemical reactions are induced between the stabilizing agent and contaminants to reduce their mobility (stabilization). Ex situ S/S, however, typically requires disposal of the resultant materials.	No	
		Thermal Treatment	The process involves raising the temperature of the contaminated equipment or material to 260°C (500°F) for a specified period of time. The gas effluent from the material is treated in an afterburner system to destroy all volatilized contaminants. The method eliminates a waste that currently is stockpiled and requires disposal as a hazardous material. This method will permit reuse or disposal of scrap as nonhazardous material.	No	

Table O-2
Summary of Remedial Technology Screening Process for Carty Lake and Lake River
Former PWT Site RI/FS

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
No Action	None	Not Applicable	No Action	No	Does not meet cleanup standards for either site.
Institutional Controls	Governmental Controls	Waterway Use Restrictions or Regulated Navigation	Notice to marine vessels to prevent damage to caps; in situ treatment; EMNR, etc.	Yes	Institutional controls will be necessary for all remedial options and are therefore included in the Carty Lake and Lake River alternatives.
	Proprietary Controls	Land Use/Access Restrictions	Restrictions, such as deed restrictions, easements, and covenants, placed in property-related documents or physical implements such as fences or signs.	Yes	Institutional controls will be necessary for all remedial options and are therefore included in the Carty Lake and Lake River alternatives.
	Enforcement and Permit Tools	Permit Processes or Provisions of Administrative Orders or Consent Decrees	Legal implements intended to place restrictions on certain site activities.	Yes	Institutional controls will be necessary for all remedial options and are therefore included in the Carty Lake and Lake River alternatives.
	Informational Devices	Fish Consumption Advisories	Fish consumption advisories provide information to the public from state departments of health or other governmental entities on acceptable fish consumption rates and fish preparation techniques.	Yes	Institutional controls will be necessary for all remedial options and are therefore included in the Carty Lake and Lake River alternatives.
Natural Attenuation	Chemical and Biological Degradation	Dechlorination (aerobic and anaerobic), biodegradation	Includes chemical and/or biological processes that, under favorable conditions, act without human intervention to reduce the mass, toxicity, mobility, volume, or concentration of contaminants in sediment.	No	Bioremediation, including biodegradation, is regarded as an attractive possibility for cleaning up dioxin-contaminated soil, but its real applicability and effectiveness are unknown. The following technical obstacles continue to limit the application of bioremediation: 1) only very specialized biological systems can be effective against the high toxicity, low volubility, and high absorptivity of dioxin; 2) a very stringent cleanup standard must be met; and 3) it may be difficult to find a microorganism that can effectively deactivate dioxins under the different conditions present at existing dioxin-contaminated sites.
	Physical Burial Process	Sedimentation	A physical process that, under favorable conditions, acts without human intervention to reduce the mobility and/or concentration of contaminants in sediment.	Yes	This technology is retained for further consideration for both Carty Lake and Lake River.
Enhanced Natural Recovery	Enhanced Burial/Dilution	Thin-Layer Cap	Enhancement of natural attenuation consisting of a thin-layer cap (i.e., 6 inches to 1 foot of sand) that provides a surface layer of cleaner sediment accelerating physical isolation that occurs from the natural sedimentation process.	Yes	An ENR cap is a cost-effective, easily implemented, and low-impact technology. This technology is retained for further consideration for both Carty Lake and Lake River.
In Situ Containment	Capping	Sand Cap	Physical isolation of contaminants with sand cover. Capping does not lessen toxicity or volume of hazardous wastes nor does it completely eradicate mobility, but it does mitigate migration and eliminate some exposure pathways.	Yes	Capping is an effective and easily implemented technology. The fluvial environment associated with Carty Lake would be conducive to the longevity of a cap. However, in the case of Lake River, the sediment cap would be vulnerable to river velocities, tidal fluctuations, wave energy, propeller wash, and other damaging environmental effects. The cap also limits future use, navigability, and access to shore.
		Armored Cap	Physical isolation of contaminants with sand cover and an additional armor layer to safeguard the integrity of the cap.	Yes	Adding armor protects the isolation layer of the cap but further limits navigability and access to shore by increasing the cap section, decreasing the depth of water. In addition, environmental impacts on features such as habitat must be considered. This technology is retained for further consideration for Lake River.

Table O-2
Summary of Remedial Technology Screening Process for Carty Lake and Lake River
Former PWT Site RI/FS

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
In Situ Containment, cont.	Capping, cont.	Composite Cap—Geosynthetic Fabrics and Membranes	Geomembranes provide multiple functions, including providing a bioturbation barrier, stabilizing the cap, reducing contaminant flux, preventing mixing of cap materials with underlying sediments, promoting uniform consolidation, and reducing erosion of the capping materials.	No	Geomembranes (e.g., HDPE) have constructability issues as well as questions regarding their long-term integrity. Impermeable layers have been known to trap gas and lift off of the sediment. Geosynthetics (e.g., GCL and RCM) are widely available and easily implemented; however, the cost of these components can be high and the application limits future use, development, navigability, and access to shore. The requirements for future navigation channel dredging by the Corps of Engineers removes the feasibility of using geosynthetics and geomembranes in the alternatives.
		Reactive Cap	Placement of active capping layers such as activated carbon or organoclay to reduce contaminant flux through capping materials.	No	Reactive caps are easily implemented and limit loss of water depth by reducing the cross section because of the multiple layers associated with traditional armored caps; however, this technology places the same constraints as the above option on future navigation dredging as well as on future development.
In Situ Treatment	Biological	Slurry Bioremediation	Addition of nutrients and other amendments to enhance bioremediation, the process in which microorganisms degrade organic contaminants, converting them to innocuous end products.	No	This technology is not retained for further evaluation because of limited effectiveness and low implementability.
		Phytoremediation	Use of plants to remove, transfer, stabilize, and destroy contaminants in soil and sediments.	No	This technology is not retained for further evaluation because of limited effectiveness and low implementability.
		Aerobic Biodegradation	Bioremediation is a process in which microorganisms degrade organic contaminants, converting them to innocuous end products. Nutrients, oxygen, or other amendments may be used to enhance bioremediation and contaminant desorption from subsurface materials. Aerobic bioremediation requires an oxygen source.	No	This technology is not retained for further evaluation because of limited effectiveness (especially related to dioxins) as well as implementability issues. Enhanced bioremediation of sediments can be impeded by the environmental constraints found underwater such as low temperature, oxygen deficiency (if an aerobic condition is needed), and varying organic and nutrient concentrations.
		Anaerobic Biodegradation	Bioremediation is a process in which microorganisms degrade organic contaminants, converting them to innocuous end products. Nutrients, oxygen, or other amendments may be used to enhance bioremediation and contaminant desorption from subsurface materials. Anaerobic processes take place in the absence of oxygen.	No	This technology is not retained for further evaluation because of limited effectiveness (especially related to dioxins) as well as implementability issues. Enhanced bioremediation of sediments can be impeded by the environmental constraints found underwater such as low temperature, oxygen deficiency (if an aerobic condition is needed), and varying organic and nutrient concentrations.
	Chemical	Chemical Slurry Oxidation	Application of chemical oxidants to contaminated sediments to convert hazardous contaminants to nonhazardous or less toxic compounds that are more stable, less mobile, and/or inert. Chemical oxidation typically involves reduction/oxidation (redox) reactions. The oxidizing agents most commonly used are ozone, hydrogen peroxide (H_2O_2), hypochlorites, chlorine, and chlorine dioxide.	No	This technology is not retained for further evaluation because of limited effectiveness as well as low implementability. Chemical oxidation has limited demonstrated effectiveness for PCP. Oxidation would not be effective for reducing total dioxin concentrations. Chemical oxidation is not proven to be effective for treating all PAHs. Implementing this cleanup action alternative component would pose many implementability issues.

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
In Situ Treatment, cont.	Physical—Immobilization	Solidification/Stabilization	The addition of reagents that immobilize and/or bind contaminants to the sediment in a solid matrix or chemically stable form.	No	This technology is not retained for further evaluation because of limited effectiveness, constraints on future use, and low implementability. The technology is effective for inorganics at a limited depth. The technology is not effective for PAHs and has limited effectiveness for PCP.
		Vitrification	Use of strong electrical current to heat sediment to temperatures above 2400ºF to fuse it into a glassy solid.	No	This technology is not retained for further evaluation because of limited effectiveness and low implementability.
		Electrokinetic Separation	Application of a low-intensity direct current through the soil between ceramic electrodes divided into a cathode array and an anode array mobilizing charged species. Two primary mechanisms transport contaminants through the soil toward one or the other electrode: electromigration and electro-osmosis.	No	This technology is not retained for further evaluation because of limited effectiveness for the IHSs present in the sediment as well as because of many implementability issues. Additionally, there have been few, if any, commercial applications of electrokinetic remediation in the United States.
		Ground Freezing	The ground-freezing process converts in situ pore water to ice through the circulation of a chilled liquid via a system of small-diameter pipes placed in drilled holes. The ice acts to fuse the soil or rock particles together, creating a frozen mass of improved compressive strength and impermeability. Brine is the typical cooling agent, although liquid nitrogen can be used in emergency situations or where the freeze is required to be maintained only for a few days.	No	This technology is not retained for further evaluation because of limited effectiveness and serious implementability issues.
Removal	Dredging	Mechanical Dredging	Use of a clamshell, closed, hydraulic, or other bucket from a barge or other vessel to remove contaminated sediment from the submerged substrate. Includes use of excavator or derrick.	Yes	Dredging is easily implementable and highly effective. This technology is retained for further consideration for Lake River for all sediments below the slope break considered the bank. Removal actions will not be feasible above the slope break at the beach to bank interface because of the discovery of cultural artifacts in the bank and the requirements to preserve the artifacts in place.
		Mechanical Dredging, Land-Based	Use of excavators, buckets, etc., deployed from land-based equipment. Can be "in the wet" or "in the dry" in combination with sheet piles, coffer dams, or other measures to remove water.	Yes	Mechanical, land-based dredging is easily implementable for Carty Lake and is a highly effective removal technology. It is retained for further consideration for the Carty Lake site.
		Hydraulic Dredging	Use of hydraulic dredges (e.g., cutter-head, horizontal auger, plain suction, pneumatic, or specialty dredges) to remove contaminated sediments from submerged substrates in a slurry phase. Requires extensive dewatering facilities.	No	Hydraulic dredging requires extensive dewatering facilities, generally consisting of settlement ponds, earthen dikes, multiple tanks, geotextile tubes, or some combination of these. Because of site constraints, this technology has low implementability.
Confinement	Commercial Landfill	Various	A disposal site where solid waste is buried between layers of dirt and other materials in such a way as to reduce contamination of the surrounding land. Modern landfills are often lined with layers of absorbent material and sheets of plastic to keep pollutants from leaking into the soil and water.	Yes	The wastes generated at these sites are nonhazardous and may therefore be disposed of at a Subtitle C landfill.
	Confined Aquatic Disposal (CAD)		Holes dug in open water or low spots in the aquatic environment that are filled and then covered with clean material (e.g., cap).	No	This technology is not retained for further evaluation because of low implementability and logistical issues associated with material-laden barges successfully passing through the shallow mouth of Lake River.

Table O-2
Summary of Remedial Technology Screening Process for Carty Lake and Lake River
Former PWT Site RI/FS

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
Confinement, cont.	Confined Disposal Facility (CDF)	Various	Engineered structures enclosed by dikes and designed to retain dredged materials.	No	This technology is not retained for further evaluation because of low implementability and logistical issues associated with material-laden barges successfully passing through the shallow mouth of Lake River.
Ex Situ Treatment	Physical	In-barge Dewatering	Dewatering through passive dewatering on a barge.	Yes	This technology is retained for further consideration for Lake River.
		Lagoon Dewatering	Dewatering through placement in a lagoon. Water discharge takes place on particles that have settled out.	No	This technology is not retained for further evaluation because of low implementability due to site constraints and dewatering logistics.
		Geotextile Tube Dewatering	Geotextile tubes allow water to migrate through membrane sediment-retaining membranes.	No	This technology is not retained for further evaluation because it would be left up to the contractor to decide whether to employ.
		Mechanical Dewatering	Use of filter presses or similar equipment.	No	This technology is not retained for further evaluation because of low implementability due to dewatering logistics.
		Reagent Dewatering	Use of reagents to chemically absorb excess water.	No	This technology is not retained for further evaluation because of low implementability due to dewatering logistics.
		Cement Solidification/Stabilization	Solidification/stabilization of contaminated sediments through the addition of Portland cement.	Yes	This technology is retained for further consideration for both Lake River and Carty Lake.
		Sorbent Clay Solidification/Stabilization	Solidification/stabilization of contaminated sediments through the D49addition of sorbent clays such as bentonite.	Yes	This technology is retained for further consideration for both Lake River and Carty Lake.
	Biological Methods	Land Treatment	Large-scale land treatment to reduce contaminant concentrations through biological processes.	No	These technologies are not retained for further evaluation because the contamination levels in the soil and sediment associated with these projects do not require treatment prior to disposal.
		Composting	Large-scale land treatment to reduce contaminant concentrations through composting.		
		Biopiles	Large-scale land treatment to reduce contaminant concentrations through biopiles.		
		Fungal Biodegradation	Large-scale land treatment to reduce contaminant concentrations through fungal plants.		
		Slurry-phase Treatment	Biological treatment in a slurry phase.		
		Enhanced Biodegradation	Acceleration of the natural bioremediation processes by providing oxygen, reducing agents, nutrients, and degrading microorganisms.		
	Chemical	Acid Extraction	Use of acids to extract contaminants from dredged sediments.	No	These technologies are not retained for further evaluation because the contamination levels in the soil and sediment associated with these projects do not require treatment prior to disposal.
		Solvent Extraction	Use of solvents to extract contaminants from dredged sediments.		

General Response Action	Remedial Technology	Process Options	Description	Retained for Alternatives	Screening Comments
Ex Situ Treatment, cont.	Physical/Chemical	Sediment Washing	Wash sediments with water to remove contaminants.	No	These technologies are not retained for further evaluation because the contamination levels in the soil and sediment associated with these projects do not require treatment prior to disposal.
		Chemical Oxidation/Reduction/ Oxidation	Reduction/oxidation (redox) reactions chemically convert hazardous contaminants to nonhazardous or less toxic compounds that are more stable, less mobile, and/or inert. Redox reactions involve the transfer of electrons from one compound to another. Specifically, one reactant is oxidized (loses electrons) and one is reduced (gains electrons). The oxidizing agents most commonly used for treatment of hazardous contaminants are ozone, hydrogen peroxide, hypochlorites, chlorine, and chlorine dioxide. Chemical redox is a short- to medium-term technology.		
		Dehalogenation	Removal of halogens (e.g., chlorine) through chemical dehalogenation reactions.		
		Slurry Oxidation	Involves mixing an oxidizing agent with contaminated sediments. The oxidation process mineralizes most organic compounds to carbon dioxide, water, and salts. Typical oxidizing agents include: sodium hypochlorite (or other hypochlorite compounds), hydrogen peroxide, chlorine, chlorine dioxide, potassium permanganate, and ozone.		
	Thermal Methods	Incineration	Thermal treatment through incineration.	No	These technologies are not retained for further evaluation because the contamination levels in the soil and sediment associated with these projects do not require treatment prior to disposal.
		Pyrolysis	Thermal treatment through pyrolysis. Chemical decomposition induced in organic materials by heat in the absence of oxygen. Pyrolysis typically occurs under pressure and at operating temperatures above 430ºC (800ºF).		
		High-Temperature Thermal Desorption	Heating of contaminated sediment to drive off and capture contaminants. Involves the application of heat (320 to 560ºC or 600 to 1,000ºF) to excavated wastes to volatilize organic contaminants and water. Typically, a carrier gas or vacuum system transports the volatilized water and organics to a treatment system, such as a thermal oxidation or recovery unit.		
		Low-Temperature Thermal Desorption	Involves the application of heat (90 to 320ºC or 200 to 600ºF) to excavated wastes to volatilize organic contaminants and water. Typically, a carrier gas or vacuum system transports the volatilized water and organics to a treatment system, such as a thermal oxidation or recovery unit.		
		High-Pressure Oxidation	This category includes two related technologies: wet air oxidation and supercritical water oxidation. Both processes use the combination of high temperature and pressure to break down organic compounds.		
		Vitrification	Application of electrical current to heat contaminated sediments to high temperatures.		

APPENDIX P

UPLAND OFF-PROPERTY DIOXIN WASTE DESIGNATION

MAUL
FOSTER
ALONGI

MEMORANDUM

To: Craig Rankine
Date: December 20, 2012
From: Madi Novak Madi Novak
Project: 9003.01.39
Steve Taylor, PE

RE: Upland Off-Property Dioxin Waste Designation
Former Pacific Wood Treating Site, Ridgefield, Washington
Agreed Order No. 01TCPSR-3119

On behalf of the Port of Ridgefield, (Port), Maul Foster & Alongi, Inc. (MFA) has prepared this memorandum to determine the waste designation for soils containing dibenzo-p-dioxins and furans (collectively referred to as dioxins) off-property of the Lake River Industrial Site (LRIS) in Ridgefield, Washington. The LRIS is the location of the former Pacific Wood Treating Corporation (PWT) facility where historical operations primarily involved pressure-treating wood products with oil-based treatment solutions containing creosote, pentachlorophenol (PCP), and water-based mixtures of copper, chromium, arsenic, and/or zinc.

Soils that are located off property of the LRIS in the adjoining residential neighborhood and McCuddy's Marina parking area (i.e., off-property area) contain dioxins. However, the source of the dioxins is not readily apparent. Sources of dioxins at the PWT facility may have included spent formulations from wood preserving processes, combustion of waste by PWT and a previous shingle mill, combustion of fuels at the facility, and by trucks and trains traveling adjacent to the facility and to the offsite properties.

The U.S. Environmental Protection Agency (USEPA) has prepared a document clarifying RCRA policy for remediation waste[1] which provides the following on page 5 of the document.

> *Where a facility owner/operator makes a good faith effort to determine if a material is a listed hazardous waste but cannot make such a determination because documentation regarding a source of contamination, contaminant, or waste is unavailable or inconclusive, EPA has stated that one may assume the source, contaminant or waste is not listed hazardous waste and, therefore, provided the material in question does not*

---

[1] USEPA, 1998. Management of Remediation Waste under RCRA. Office of Solid Waste and Emergency Response. Ref. EPA530-F-98-026. October 14.

> *exhibit a characteristic of hazardous waste, RCRA requirements do not apply... This approach was confirmed in the final NCP[2] preamble. See, 53 FR 51444, December 21, 1988 for proposed NCP preamble discussion; 55 FR 8758, March 13, 1990 for final NCP preamble discussion.*

There are no historical records of a release off- property from PWT's operation that would result in the determination that the off-property soils are a listed hazardous waste, specifically the F032, F034 and F035 listings that are assigned to *wastewater, process residuals, preservative drippage, and spent formulations from wood preserving processes that used chlorophenolic formulations, creosote or arsenic based treating solutions respectively.* These waste codes have been applied to soils on the property because of known releases on the property.

The soil containing dioxins that is located offsite of the former PWT facility (i.e., LRIS) is not designated as hazardous waste under the guidelines provided by USEPA. The operation that generated the dioxin compounds cannot be determined because there are several potential sources (including the wood treating operations) that could have led to contamination of soils in the offsite areas. Given this information, the F032, F034 and F035 listed hazardous waste codes are not applicable to the soil that could be generated during any future remedial action in the off-property area.

The soil sample results have also been reviewed for possible designation as a characteristic hazardous waste or a Washington state-only dangerous waste Per WAC 173-303-100 Dangerous Waste Criteria. The concentration of dioxins, polycyclic aromatic hydrocarbons (PAHs) and halogenated organic compounds (HOCs) were reviewed in accordance with the WAC 173-303-100 requirements as follows:

> Toxic Dangerous Wastes - The equivalent concentration for the toxic constituents (metals, PAHs, HOCs, and dioxins) is below the 0.001 percent threshold in WAC 173-303-100(5), and the material does not designate as a state-only toxic waste.
>
> Persistent Dangerous Wastes - PAHs, HOCs, and dioxins are below the 0.01 percent threshold for characterizing a material as a persistent dangerous waste as described in WAC 173-303-100(6).

Based on the above review, the soil to be generated during the off-property remedial action would not designate as a Washington state-only dangerous waste.

DEPARTMENT OF ECOLOGY
2108 Grand Boulevard ▪ Vancouver, Washington 98661-4622 ▪ (360) 690-7171

January 30, 2013

Mr. Brent Grening
Executive Director
Port of Ridgefield
Post Office Box 55
Ridgefield, WA 98642

Re: Approval of January 29, 2013, *Upland Off-Property Dioxin Waste Designation Former Pacific Wood Treating Site, Ridgefield Washington* Memorandum, prepared by Maul, Foster, Alongi, Inc.
Ecology Facility Site Identification #1019

Dear Mr. Grening:

This letter provides the Port of Ridgefield (Port) with the Washington State Department of Ecology's (Ecology) written approval of the above-referenced memorandum. Approval of project documentation by this agency is required by Agreed Order Number 01TCPSR-3119 executed by Ecology and the Port of Ridgefield for cleanup efforts at the former Pacific Wood Treating (PWT) Corporation facility and surrounding environs.

If you have any questions or care to discuss items in this letter, please contact me by telephone at (360) 690-4795 or by e-mail at cran461@ecy.wa.gov.

Sincerely,

Craig Rankine, RG, LHG

APPENDIX Q

APPLICABLE OR RELEVANT AND APPROPRIATE FEDERAL LAWS AND REGULATIONS

APPENDIX Q APPLICABLE OR RELEVANT AND APPROPRIATE FEDERAL LAWS AND REGULATIONS

CONTENTS

APPENDIX Q-1

APPLICABLE OR RELEVANT AND APPROPRIATE FEDERAL LAWS AND REGULATIONS—UPLAND OFF-PROPERTY

1 INTRODUCTION

Washington Administrative Code (WAC) 173-340-710 states that cleanup actions conducted under the Model Toxics Control Act (MTCA) shall comply with applicable state and federal laws. This WAC section also addresses relevant and appropriate requirements, substantive (as opposed to procedural) requirements, and local government permits and approvals. This appendix summarizes the analysis completed to ensure conformance with WAC 173-340-710.

1.1 EXEMPTIONS FOR REMEDIAL ACTIONS

MTCA exempts persons conducting a remedial action at a facility, under a consent decree, order, or agreed order, from the procedural requirements of Chapters 70.94 (Air), 70.95 (Solid Waste), 70.105 (Hazardous Waste), 75.20 (Hydraulic Permit), 90.48 (Water Quality), and 90.58 (Shorelands) Revised Code of Washington (RCW), and the procedural requirements of any laws requiring or authorizing local government permits or approvals for the remedial action. This exemption does not apply to independent actions.

The Washington State Department of Ecology (Ecology) is required to ensure compliance with the substantive provisions of Chapters 70.94, 70.95, 70.105, 75.20, 90.48, and 90.58 RCW, and the substantive provisions for laws requiring or authorizing local government permits or approvals. Ecology makes the final decision regarding which substantive provisions are applicable. Under policy and procedure directive 130B, Ecology describes how these exemptions will be implemented and compliance assured.

Effect on Design:

The remedial action likely will be conducted in accordance with either the Port of Ridgefield's (the Port) existing Agreed Order with Ecology (Agreed Order No. 01TCPSR-3119), or an amended order or consent decree, and therefore evaluation of the allowed exemptions to the laws, regulations, and rules will be conducted during the design of the remedial action. The remedial action will be developed to ensure conformance with the substantive provisions of these laws, regulations, and rules.

2 SUMMARY OF GENERALLY APPLICABLE OR RELEVANT AND APPROPRIATE FEDERAL LAWS AND REGULATIONS

Remediation at the upland off-property portion of the Port site will be subject to a variety of federal laws and regulations that govern site cleanup. The applicable or relevant and appropriate requirements (ARARs) are discussed below.

2.1 CLEAN WATER ACT

The federal Water Pollution Control Act (FWPCA) Amendments of 1972, commonly referred to as the Clean Water Act (CWA), sets forth a number of provisions that require the development of regulations to protect the nation's waters. Section 402 of the CWA requires the development of comprehensive programs for preventing, reducing, or eliminating pollution in the nation's waterways. National Pollutant Discharge Elimination System (NPDES) requirements are specified in Section 402. This program has been delegated to the State of Washington (see Section 3.4).

The objective of the CWA (33 U.S. Code [USC] 1251-1376 and 40 Code of Federal Regulations [CFR] 129 and 131) is to restore and maintain the chemical, physical, and biological integrity of the nation's waters. Sections 303 and 304 of the CWA require the U.S. Environmental Protection Agency (USEPA) to issue ambient surface water quality criteria for the protection of aquatic life and human health. The federal water quality criteria (FWQC), as specified in 40 CFR 131, are nonenforceable guidelines to be used by states to set water quality standards for surface water. FWQC, based on chronic and acute effects to aquatic life, have been developed for 120 priority toxic pollutants and 45 nonpriority pollutants for marine waters and freshwater.

Effect on Design:

During construction, water will be directed through erosion- and sediment-control features to meet any water quality standards. There should be no releases of water to the surrounding waterways associated with the upland off-property work. Any water discharged to Carty Lake or Lake River will be required to meet the FWQC. The State of Washington has been delegated the authority to implement the CWA and has rules and regulations corresponding to all of those stated in the CWA. Therefore, for the Port, any discharges to surface water will be managed under the state program. In addition, ambient surface water quality criteria are considered screening criteria.

2.2 MIGRATORY BIRD TREATY ACT

The federal Migratory Bird Treaty Act (MBTA) of 1918 makes it unlawful to kill migratory birds by any means unless permitted by regulations. Furthermore, the MBTA requires that identified ecosystems of special importance to migratory birds be protected against pollution, detrimental alterations, and other environmental degradations.

Effect on Design:

Implementing the remedial action in conformance with MTCA will protect wildlife, including migratory birds. Consequently, no additional actions are needed to conform to the MBTA.

2.3 THE SAFE DRINKING WATER ACT

The Safe Drinking Water Act (SDWA) was initially passed by Congress in 1974 and then amended in 1986. The SDWA establishes maximum contaminant levels (MCLs) and maximum contaminant level goals (MCLGs) for the protection of the nation's public water systems. The USEPA has established MCLs in 40 CFR Part 141 as the maximum permissible concentrations of specific contaminants in water that is delivered to any user of a public water system. While nonenforceable, MCLGs represent the maximum level beyond which persons drinking the water may experience adverse effects.

Under the SDWA amendments, the USEPA is required, every three years, to develop a list of contaminants that must be regulated in the form of MCLs or MCLGs. Those regulations must be finalized within a year of their proposal. In addition, the USEPA identifies contaminants that are under consideration for listing as MCLs, as well as contaminants that are under consideration for modification of the MCL concentration.

The State of Washington has authorization from the USEPA to administer and enforce this act, and although the state has developed and continues to develop state-specific MCLs and MCLGs, it incorporates the federal standards by reference.

Effect on Design:

The upland off-property remedial action will have no effect on groundwater or any other water source used as drinking water.

2.4 NATURAL RESOURCE DAMAGES

The Natural Resource Damage provisions of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Oil Pollution Act of 1990, and the CWA allow natural resource trustees to assess damages for losses arising from injury to public natural resources caused by the release of oil or hazardous substances. 43 CFR 11.62 provides the definitions of what constitutes an injury to a natural resource, particularly the definitions of injury to surface-water resources, groundwater resources, air resources, geologic resources, and biological resources. The definition of injury either must be met or likely will be met for natural-resource damages to be included for a given facility or property.

Once natural resource damages have been established by federal, state, or Native American Tribe trustees, the responsible party must take action to restore the damaged resource. These actions can take the form of cash payment to a trustee, or the responsible party can undertake its own restoration projects, or both.

Effect on Design:

In accordance with MTCA, the remedial design will establish means and methods to ensure that the remedial action minimizes short-term risks during implementation. Consequently, natural-resource damages caused by remedial action implementation will be avoided.

2.5 NATIONAL PRETREATMENT STANDARDS FOR DISCHARGES TO A PUBLICLY OWNED SEWER SYSTEM

In general, the discharge of wastewater to a publicly owned treatment works is considered an off-site activity. Requirements of the National Pretreatment Program include general and specific discharge prohibitions (40 CFR 403).

Effect on Design:

No water treatment system will be discharged to a publicly owned sewer system as part of the remedial action; therefore, this requirement is not applicable.

2.6 IDENTIFICATION AND LISTING OF HAZARDOUS WASTE AND STANDARDS FOR GENERATORS

The Solid Waste Disposal Act (42 USC 6921 Subtitle C) incorporated under the federal Resource Conservation and Recovery Act (RCRA, 40 CFR § 260 through 266) contains requirements for "cradle to grave" management of materials that meet the RCRA definition of hazardous waste. These requirements may apply to wastes generated during the remedial action.

RCRA defines hazardous wastes as either those wastes specifically listed in 40 CFR § 261 Subpart D or wastes that exhibit one of four hazardous characteristics: ignitability, corrosivity, reactivity, or toxicity as determined by the toxicity characteristic leaching procedure (TCLP). Requirements to determine whether waste being generated is hazardous, whether by sampling and analysis or by process knowledge, are listed in 40 CFR § 262.11.

Effect on Design:

The source of the material cannot be determined; therefore, under the guidelines provided by the USEPA, the dioxin-contaminated soil is not designated as hazardous waste, and this requirement is not applicable.

2.7 TREATMENT, STORAGE, AND DISPOSAL FACILITY STANDARDS

The Solid Waste Disposal Act (42 USC 6921 Subtitle C) incorporated under RCRA (40 CFR § 264) provides design standards for treatment, storage, and disposal (TSD) facilities. The TSD requirements for hazardous wastes are normally associated with facilities applying for, or having received, a RCRA permit.

Applicability of the TSD facility requirements to an on-site remedial action is contingent on whether the remedy includes on-site disposal. According to USEPA guidance, "disposal" is synonymous only with a new "placement" of hazardous waste. No "placement" occurs in connection with in situ treatment or containment of contamination. "Placement" occurs whenever hazardous wastes are moved from one area of containment (AOC) to another, or are removed, treated, and later returned to the same AOC (National Contingency Plan (NCP) Preamble at 8759; USEPA Office of Solid Waste and Emergency Response Directive 9347.3-05FS [Superfund land-disposal restriction (LDR) Guide 5]). The boundaries of an AOC are formed by the areal extent of contiguous contamination, regardless of variations in contaminant type or concentration (NCP Preamble at 8758).

Ecology incorporated this policy into MTCA as an interprogram policy in 1991.

Effect on Design:

No consolidation or off-site (outside the AOC) treatment is associated with the remedial action. Any excavation, stockpiling, or sorting of soil and debris on the site is not subject to the TSD facility requirements.

2.8 LAND-DISPOSAL RESTRICTIONS

LDRs for RCRA wastes characterized as toxic (40 CFR § 268) require that the waste be treated to specified concentrations before placement in a land-based unit. LDRs would apply to wastes removed from the site that exceed treatment standards for waste codes or that fail a TCLP analysis.

Effect on Design:

No waste characterized as toxic under RCRA is known to be present on site; therefore, this requirement is not applicable.

2.9 U.S. DEPARTMENT OF TRANSPORTATION HAZARDOUS MATERIALS REGULATIONS

The U.S. Department of Transportation has published regulations, including requirements regarding communications and emergency response, shipping, and packaging (40 CFR 171 through 180), that govern the transportation of hazardous materials to or from the site.

The provisions of 40 CFR § 263 establish minimum standards that apply to persons transporting hazardous waste by air or water.

Effect on Design:

No elements of the remedial action involve off-site transportation of hazardous waste; therefore, this requirement is not applicable.

2.10 NATIONAL AMBIENT AIR QUALITY STANDARDS ATTAINMENT AREA

The USEPA has established national ambient air quality standards (NAAQS) for a variety of potentially airborne substances known as criteria pollutants. NAAQS are ARARs for any conditions at a site that may result in emissions to the air of any listed criteria pollutant. Criteria pollutants include carbon monoxide, nitrogen dioxide, ozone, lead, particulates smaller than 10 micrometers, and sulfur dioxide.

Effect on Design:

Some of the alternatives involve soil handling and/or excavation. The air emissions generated by handling soil at the site are subject to applicable air-quality standards to control or prevent the emission of air contaminants. Based on the contaminants present at the site, the applicable criteria pollutant at the site would be particulate matter (dust).

2.11 OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION

Federal Occupational Safety and Health Administration (OSHA) regulations pertaining to hazardous waste sites are addressed under 29 CFR 1910.120, the Hazardous Waste Operations and Emergency Response Standard. This standard applies to cleanup and corrective actions, as well as to operations involving hazardous wastes, that are conducted at a permitted TSD facility, unless the employer can demonstrate that the operations do not involve employee exposure or the reasonable possibility of employee exposure to safety or health hazards.

Effect on Design:

All work will be performed under a site health and safety plan in conformance with the applicable federal and state OSHA regulations.

3 SUMMARY OF GENERALLY APPLICABLE OR RELEVANT AND APPROPRIATE WASHINGTON STATE LAWS AND REGULATIONS

The following state laws and regulations and local requirements were determined to be ARARs.

3.1 MODEL TOXICS CONTROL ACT

In Washington State, MTCA governs the investigation and cleanup of contaminated sites (Chapter 70.105D RCW). A contaminant is defined by MTCA 173-340-200 as any hazardous substance that does not occur naturally or that occurs at concentrations greater than natural levels.

MTCA became effective in March 1989 and was enacted through a voter initiative process. The MTCA cleanup regulation, cited under Chapter 173-340 WAC, was amended in February 2001. MTCA contains provisions controlling site cleanup activities, including site discovery, priority, listing, investigation, and cleanup; liability provisions; administrative options for remedial actions, payment of costs, and funding; public participation; cleanup standards; and other general provisions. The law regulates the cleanup of sites contaminated with CERCLA hazardous substances, all state and federal RCRA hazardous and dangerous wastes, and petroleum products.

Effect on Design:

All elements of the remedial design and remedial action will comply with MTCA standards.

3.2 WATER QUALITY STANDARDS FOR SURFACE WATERS AND GROUNDWATERS OF THE STATE

In Washington, water quality standards for surface waters of the state are promulgated under Chapter 173-201A WAC. The purpose of this chapter is to establish water quality standards for surface waters of Washington State that are consistent with public health and related public enjoyment, and with the propagation and protection of fish, shellfish, and wildlife, pursuant to the provisions of Chapter 90.48 RCW. The criteria listed in Chapter 173-201A WAC for surface water quality provide protective numbers for both freshwater and marine aquatic life for both acute and chronic exposure to toxic substances.

Water quality standards for groundwater are promulgated under Chapter 173-200 WAC. This chapter implements the FWPCA and Chapters 90.48 and 90.54 of the RCW, as well as the federal Water Resources Act of 1971. Chapter 173-200 WAC applies to all groundwaters of the state that occur in a saturated zone or stratum beneath the land surface or below a surface-water body. The water quality standards listed in Chapter 173-200 WAC apply to cleanup actions, conducted under MTCA, involving potable groundwater.

Effect on Design:

No water will be generated or discharged to Lake River or Carty Lake during construction. During construction, water will be directed through erosion- and sediment-control features to meet any water quality standards. In addition, state water quality standards are considered screening criteria.

3.3 WASHINGTON DANGEROUS WASTE REGULATIONS

Washington regulations identify RCRA F-listed and K-listed wastes as dangerous waste (WAC 173-303-9904). Designated dangerous wastes may be treated, stored, or disposed of at a permitted TSD facility.

Effect on Design:

Material generated on site would not be considered dangerous waste; therefore, this requirement is not applicable.

3.4 NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM STORMWATER PERMIT PROGRAM

Chapter 173-220 WAC establishes a state permit program, applicable to the discharge of pollutants and other wastes and materials to the surface waters of the state, operating under state law as a part of the NPDES created by Section 402 of the FWPCA. Permits issued under this chapter are intended to satisfy the requirements for discharge permits under both Section 402(b) of the FWPCA and Chapter 90.48 RCW.

Effect on Design:

NPDES construction stormwater permits are required for construction sites of 1 acre or larger. The remedial alternatives involving soil handling will have a construction footprint greater than 1 acre; therefore, the substantive requirements of the NPDES construction stormwater permit will be met in the design of the selected alternative.

3.5 SHORELINE MANAGEMENT ACT

The state Shoreline Management Act (SMA) (Chapter 173-22 WAC) regulates any action within 200 feet of the ordinary high-water mark of a shoreline. Shorelines in towns and cities are regulated by shoreline master programs (Chapter 173-26 WAC) adopted by local municipalities. Substantive shoreline management requirements in the City of Ridgefield's shoreline master program, may be triggered by cleanup actions at McCuddy's Marina (see

Section 4, Local Requirements, below). However, cleanup actions are exempt from the procedural (permitting) requirements (Chapter 173-27 WAC).

Effect on Design:

The effect of the SMA on design is discussed in Section 4.1, Shoreline Master Program, below.

3.6 AIR QUALITY STANDARDS

Chapters 173-400, -460, and -470 WAC establish provisions for general regulation of air pollution sources, ambient air quality standards, and acceptable levels for particulate matter, and stipulate requirements for new sources of toxic air pollutant emissions. These regulations may be applicable to cleanup actions at the site; for example, to control particulate emissions generated during soil excavation activities, or emissions resulting from air stripping or other groundwater treatment technologies. These standards are typically administered and enforced by the local clean air agency, which in this case would be the Southwest Clean Air Agency. Chapter 173-401 operating permits may be required for fugitive emissions from new sources. Emission standards for volatile organic compounds are set in Chapter 173-490.

Effect on Design:

All of the alternatives include soil handling. During soil-excavation activities, it may be necessary to implement engineering controls such as soil wetting to control particulate emissions. Air testing may be required to show that emissions meet the substantive requirements of applicable air quality permits and rules. If results illustrate that substantive requirements have not been met, the design will require modification.

3.7 NOISE REGULATIONS

Maximum environmental noise levels have been determined and are contained in Chapter 173-60 WAC. Approved procedures for measurement of environmental noise are contained in Chapter 173-58 WAC.

Effect on Design:

During design, expected noise levels will be estimated and compared to the limitations established in 173-60 WAC. The need to adjust the approach to meet these requirements will be determined. For example, the noise level regulations may limit the operating hours of some parts of the remedial action.

3.8 STATE ENVIRONMENTAL POLICY ACT

The State of Washington administers and enforces a program equivalent to the federal National Environmental Policy Act. The State Environmental Policy Act (SEPA), contained in Chapter 43.21C RCW, provides the framework for agencies to consider the environmental consequences of a proposal before taking action. It also gives agencies the ability to condition or deny a proposal because of identified likely significant adverse impacts. The act is implemented through the SEPA Rules and Procedures, Chapters 197-11 and 173-802 WAC, respectively.

SEPA review is a comprehensive assessment of potential environmental, economic, and cultural impacts from a specific development project or a proposed policy, plan, or program. The SEPA review process requires the preparation of an environmental checklist, which may be achieved by review of the environmental impacts and proposal of mitigation measures. The completed checklist helps to identify potential environmental impacts associated with the proposed action. Following a threshold determination, the lead agency will issue either a Determination of Non-Significance that will allow the action or permitting process to continue, or a Determination of Significance that will require that an environmental impact statement (EIS) be prepared before agency action can be taken. Typically, one checklist or EIS is required for a project, although it may require modification or application of numerous permits by federal, state, or local agencies.

Effect on Design:

SEPA review will be conducted for the project design. The Port or Ecology can act as the lead agency for SEPA review. The Port will prepare a SEPA checklist to be reviewed during Ecology's evaluation of the project design.

3.9 WASHINGTON INDUSTRIAL SAFETY AND HEALTH ADMINISTRATION

Washington Industrial Safety and Health Administration (WISHA) regulations pertaining to hazardous waste sites are addressed under WAC 296-843, Hazardous Waste Operations. This standard applies to cleanup and corrective actions at MTCA-regulated sites.

Effect on Design:

All work will be performed under a site health and safety plan in conformance with the applicable WISHA regulations.

4 LOCAL REQUIREMENTS

4.1 SHORELINE MASTER PROGRAM

A cleanup action or "substantial development" conducted along any shoreline of statewide significance in the city of Ridgefield is regulated under the Shoreline Master Program (Chapter 18.820 of the Ridgefield Municipal Code [RMC]). A Substantial Development Permit (SDP) is required for such an action. The City of Ridgefield adopted an updated Shoreline Master Program in 2012. The environmental designation for the Lake River shoreline under the updated program is High Intensity.

Effect on Design:

Most of the proposed locations for off-property remedial actions are outside the shoreline jurisdiction. If a remedial action associated with McCuddy's Marina is completed within 200 feet of a shoreline, the substantive requirements of the SDP will be met as part of the remedial design.

4.2 CITY OF RIDGEFIELD CRITICAL AREAS ORDINANCE

The City of Ridgefield Critical Areas Ordinance designates and regulates projects that may impact ecologically sensitive areas, including wetlands and fish and wildlife habitat conservation areas, or geophysical hazards such as geologically hazardous areas and frequently flooded areas (RMC 18.280.120).

Effect on Design:

Most of the locations for proposed off-property remedial actions are designated as critical aquifer recharge areas, but do not include other critical area designations. The remedial design will meet the substantive requirements of the ordinance to protect these resources.

APPENDIX Q-2

APPLICABLE OR RELEVANT AND APPROPRIATE FEDERAL LAWS AND REGULATIONS—LAKE RIVER AND CARTY LAKE

1 INTRODUCTION

Washington Administrative Code (WAC) 173-340-710 states that cleanup actions associated with sediments and conducted under the Model Toxics Control Act (MTCA) shall comply with the sediment management requirements (WAC 173-204, Sediment Management Standards [SMS]) and applicable state and federal laws. This WAC section also addresses relevant and appropriate requirements, substantive (as opposed to procedural) requirements, and local government permits and approvals. This appendix summarizes the analysis completed to ensure conformance with WAC 173-340-710.

1.1 EXEMPTIONS FOR REMEDIAL ACTIONS

MTCA exempts persons conducting a remedial action at a facility, under a consent decree, order, or agreed order, from the procedural requirements of Chapters 70.94 (Air), 70.95 (Solid Waste), 70.105 (Hazardous Waste), 75.20 (Hydraulic Permit), 90.48 (Water Quality), and 90.58 (Shorelands) Revised Code of Washington (RCW), and the procedural requirements of any laws requiring or authorizing local government permits or approvals for the remedial action. This exemption does not apply to independent actions.

The Washington State Department of Ecology (Ecology) is required to ensure compliance with the substantive provisions of Chapters 70.94, 70.95, 70.105, 75.20, 90.48, and 90.58 RCW, and the substantive provisions of laws requiring or authorizing local government permits or approvals. Ecology makes the final decision regarding which substantive provisions are applicable. Under policy and procedure directive 130B, Ecology describes how these exemptions will be implemented and compliance assured.

Effect on Design:

Any interim or remedial action likely will be conducted in accordance with the Port of Ridgefield's (the Port) existing Agreed Order with Ecology (Agreed Order No. 01TCPSR-3119) or an amended order or consent decree, and therefore evaluation of the allowed exemptions to the laws, regulations, and rules will be conducted during the design of the remedial action. The remedial action will be developed to ensure conformance with the substantive provisions of these laws, regulations, and rules.

2 SUMMARY OF GENERALLY APPLICABLE OR RELEVANT AND APPROPRIATE FEDERAL LAWS AND REGULATIONS

Remediation at Lake River and Carty Lake will be subject to a variety of federal laws and regulations that govern site cleanup. The applicable or relevant and appropriate requirements (ARARs) for both are discussed below.

2.1 U.S. ARMY CORPS OF ENGINEERS PERMITTING REQUIREMENTS

The U.S. Army Corps of Engineers (COE) requires that a dredge/fill permit be obtained consistent with Section 404 of the Federal Water Pollution Control Act (FWPCA) Amendments of 1972, commonly referred to as the Clean Water Act (CWA). The permit also requires that the state issue a certification of the project under CWA Section 401, which is described in Section 2.3. Section 404 requires that a permit be obtained to perform dredge and fill operations in U.S. waterways and wetlands. Discharges of dredged or fill materials are not permitted unless there is no practicable alternative that will have less adverse impact on the aquatic ecosystem.

Section 10 of the Rivers and Harbors Act of 1899 (33 U.S. Code [USC] 403) prohibits the unauthorized obstruction or alteration of any navigable water of the United States. This section states that any other work affecting the course, location, condition, or physical capacity of U.S. waterways is unlawful unless the work has been permitted by the COE.

The National Historic Preservation Act (NHPA), passed in 1966 (16 USC 470 et seq.), established a national policy for the protection of important historic buildings and archeological sites and outlined responsibilities for federal and state governments. Under Section 106 of the NHPA, each agency must consult with the Washington State Department of Archaeology and Historic Preservation (DAHP) to assure that cultural resources are identified and to obtain the formal opinion of the DAHP on each site's significance and the impact of an action upon the site. The responsibilities of all parties in the Section 106 review process are set forth in federal regulations developed by the Advisory Council on Historic Preservation (ACHP) as 36 Code of Federal Regulations (CFR) 800. Section 106 compliance is required, as state funds are being used to facilitate a portion of the cleanup and activities requiring a permit from the COE are being conducted.

Effect on Design:

COE permitting to fulfill the requirements of CWA Section 404, Section 10 of the Rivers and Harbors Act, and federal requirements under Section 106, through the preparation of a Joint Aquatic Resources Permit Application, will be included in the implementation of all alternatives in conjunction with design. Because the dredged sediment will not be discharged to waters of the U.S. and no adverse effect on the historic integrity of the site is expected, approval of the action is expected, provided that the Endangered Species Act (ESA) consultation and the Section 401 Water Quality Certification are successfully completed.

2.2 ENDANGERED SPECIES ACT AND BIOLOGICAL OPINION

Permitting requirements with the COE may prompt an ESA consultation with the National Oceanic and Atmospheric Administration (NOAA) National Marine Fisheries Service (NMFS). The consultation would result in a biological opinion in which NMFS would document their opinion as to whether an in-water project or action is likely to jeopardize the existence of a species recorded on the ESA list or to result in the destruction or improper modification of the habitat of that protected species.

Effect on Design:

Permitting is likely to include an ESA consultation with NOAA, as this is typically requested by the COE for projects of this magnitude. A biological evaluation or assessment will be conducted to evaluate whether adverse or negative impacts to endangered species and their critical habitats are anticipated during or as a result of remedy implementation.

2.3 WATER QUALITY PROVISIONS OF CLEAN WATER ACT

The CWA sets forth a number of provisions that require the development of regulations to protect the quality of the nation's waters. Section 401 requires that applicants for a federal license or permit to conduct work that may result in discharges into navigable U.S. waters provide the licensing or permitting agency a certification from the state that the discharge will comply with the applicable provisions of Sections 301, 302, 303, 306, and 307 of the CWA. Section 402 of the CWA requires the development of comprehensive programs for preventing, reducing, or eliminating pollution in the nation's waterways. National Pollutant Discharge Elimination System (NPDES) requirements are specified in Section 402. This program has been delegated to the State of Washington (see Section 3.5). Section 404 regulates the discharge of dredged or fill materials into waters of the U.S. (see Section 2.1, above).

Section 401 requests every applicant for a federal permit for any activity that may result in a discharge to a water body to obtain a certification from the state that the proposed activity will comply with state water quality standards. The objective of the CWA (33 USC 1251-1376 and 40 CFR 129 and 131) is to restore and maintain the chemical, physical, and biological integrity of the nation's waters. Sections 303 and 304 of the CWA require the U.S. Environmental Protection Agency (USEPA) to issue ambient surface-water quality criteria for the protection of aquatic life and human health. The federal water quality criteria (FWQC) as specified in 40 CFR 131 are nonenforceable guidelines to be used by states to set water-quality standards for surface water. FWQC, based on chronic and acute effects to aquatic life, have been developed for 120 priority toxic pollutants and 45 nonpriority pollutants for marine waters and freshwaters.

Effect on Design:

A Section 401 Water Quality Certification from Ecology will be required for permitting of this project. Water quality impacts resulting from the remedy will be further evaluated in the design phase. Best management practices may be required along with water quality monitoring (i.e., turbidity monitoring) during all in-water work activity. The elements of the water quality program will be developed by the design team and evaluated by Ecology during the design and permitting process.

The dredging remedy is likely to result in the discharge of water from dredged sediments over water and in upland handling facilities. If water from the dredged material is discharged to Carty Lake or Lake River, it will be required to meet the FWQC. The State of Washington has been delegated the authority to implement the water quality programs under CWA, and has rules and regulations corresponding to all of those stated in the CWA. Therefore, any discharges to surface water will be managed under the state water quality program. Upland activities will be required to meet construction standards for erosion- and sediment-control such that water quality standards are met.

2.4 MIGRATORY BIRD TREATY ACT

The federal Migratory Bird Treaty Act (MBTA) of 1918 makes it unlawful to kill migratory birds by any means unless permitted by regulations. Furthermore, the MBTA requires that identified ecosystems of special importance to migratory birds be protected against pollution, detrimental alterations, and other environmental degradations.

Effect on Design:

Implementing the remedial action in conformance with MTCA and SMS will protect wildlife, including migratory birds. If site activities are anticipated to occur during the nesting season, special care will be taken to prevent the establishment of nests in the work area, or the area may have to be protected until the nest has been vacated. Additional consultation with the U.S. Fish and Wildlife Service is recommended during construction planning because of the close proximity of the Ridgefield National Wildlife Refuge.

2.5 NATURAL RESOURCE DAMAGES

The Natural Resource Damage provisions of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), the Oil Pollution Act of 1990, and the CWA allow natural resource trustees to assess damages for losses arising from injury to public natural resources caused by the release of oil or hazardous substances. 43 CFR 11.62 provides the definitions of what constitutes an injury to a natural resource, particularly the definitions of injury to surface-water resources, groundwater resources, air resources, geologic resources, and biological resources. The definition of injury either must be met or likely will be met for natural resource damages (NRDs) to be included for a given facility or property.

Once NRDs have been established by federal, state, or Native American Tribe trustees, the responsible party must take action to restore the damaged resource. These actions can take the form of cash payment to a trustee, or the responsible party can undertake its own restoration projects, or both.

Effect on Design:

No injury has been identified by natural resource trustees, and no NRD claim has been initiated. Because the action is not a federal action, such a claim is unlikely.

2.6 NATIONAL PRETREATMENT STANDARDS FOR DISCHARGES TO A PUBLICLY OWNED SEWER SYSTEM

In general, the discharge of wastewater to a publicly owned treatment works is considered an off-site activity. Requirements of the National Pretreatment Program include general and specific discharge prohibitions (40 CFR 403).

Effect on Design:

No water is anticipated to be discharged to a publicly owned sewer system as part of the remedial action; therefore, this requirement is not applicable.

2.7 IDENTIFICATION AND LISTING OF HAZARDOUS WASTE AND STANDARDS FOR GENERATORS

The Solid Waste Disposal Act (42 USC 6921 Subtitle C) incorporated under the federal Resource Conservation and Recovery Act (RCRA, 40 CFR § 260 through 266) contains requirements for "cradle to grave" management of materials that meet the RCRA definition of hazardous waste. These requirements may apply to wastes generated during the remedial action.

RCRA defines hazardous wastes as either those wastes specifically listed in 40 CFR § 261 Subpart D or wastes that exhibit one of four hazardous characteristics: ignitability, corrosivity, reactivity, or toxicity as determined by the toxicity characteristic leaching procedure (TCLP). Requirements to determine whether waste being generated is hazardous, whether by sampling and analysis or by process knowledge, are listed in 40 CFR § 262.11.

Any soil, sludge, or debris that is excavated from the site and is treated or disposed of off site will be subject to the hazardous waste requirements if it contains a hazardous waste or exhibits a characteristic of hazardous waste.

Effect on Design:

The sediment data have been reviewed for waste designation purposes and the dredged material would not be designated as either a RCRA listed hazardous waste or a RCRA characteristic waste. The dredged material will be designated as a nonhazardous waste; therefore, this requirement has already been fulfilled.

2.8 LAND-DISPOSAL RESTRICTIONS

Land-disposal restrictions for RCRA wastes characterized as toxic (40 CFR§ 268) require that the waste be treated to specified concentrations before placement in a land-based unit. Land-disposal restrictions would apply to wastes removed from the site that exceed treatment standards for waste codes or that fail a TCLP analysis.

Effect on Design:

The dredged material will be designated and disposed of as a nonhazardous waste.

2.9 U.S. DEPARTMENT OF TRANSPORTATION HAZARDOUS MATERIALS REGULATIONS

The U.S. Department of Transportation has published regulations, including requirements regarding communications and emergency response, shipping, and packaging (40 CFR 171 through 180), that govern the transportation of hazardous materials to or from the site.

The provisions of 40 CFR § 263 establish minimum standards that apply to persons transporting hazardous waste by air or water.

Effect on Design:

The dredged material will be designated and transported as a nonhazardous waste.

2.10 NATIONAL AMBIENT AIR QUALITY STANDARDS ATTAINMENT AREA

The USEPA has established national ambient air quality standards (NAAQS) for a variety of potentially airborne substances known as criteria pollutants. NAAQS are ARARs for any conditions at a site that may result in emissions to the air of any listed criteria pollutant. Criteria pollutants include carbon monoxide, nitrogen dioxide, ozone, lead, particulates smaller than 10 micrometers, and sulfur dioxide.

Effect on Design:

Some of the alternatives involve dredging and/or upland sediment handling. The air emissions generated by handling sediment upland at the site are subject to applicable air-quality standards to control or prevent the emission of air contaminants. Based on the contaminants present at the site, the applicable criteria pollutant at the site would be particulate matter (dust).

2.11 OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION

Occupational Safety and Health Administration (OSHA) regulations pertaining to construction, cleanup, and corrective actions will apply, unless the employer can demonstrate that the operations do not involve employee exposure or the reasonable possibility of employee exposure to safety or health hazards.

Effect on Design:

All work will be performed under a site health and safety plan in conformance with the applicable federal and state OSHA regulations.

2.12 CULTURAL RESOURCES

The federal Antiquities Act (1906) laid out penalties for the unauthorized excavation of archaeological sites, granted the president the authority to designate national monuments, and authorized the managers of federal lands to grant permits for examinations of archaeological resources. The law granted the government the authority not only to declare landmarks on federal lands but also to receive "relinquished" segments of private land. Permits for "examination, excavation, and gathering…of objects of an antiquity" are to be granted by the secretaries of the interior, agriculture, and army only to organizations conducting work to expand the knowledge of those objects and only so that they may be displayed in public museums 16 USC 431-433).

The 1966 NHPA states the importance of "historic heritage" to the nation, and spells out in general terms the federal government's intentions to protect and administer cultural resources. Section 101 directs the secretary of the interior to establish the National Register of Historic Places (NRHP); to set rules and guidelines relating to nominations; to appoint state historic preservation officers and establish state preservation programs; to assist tribes in historic preservation and in designating tribal historic preservation officers; and to make traditional cultural properties eligible for listing. Section 106 has had a large impact on, and is central to, resource management. Section 106 requires that federal agencies that have any indirect or direct jurisdiction over undertakings that involve federal funds or federal licensing take into account the effect the undertaking will have on a resource that is listed, or that is potentially eligible for listing, on the NRHP. Agencies are required to allow the ACHP time to comment on the proposed undertakings. 36 CFR provides regulations regarding parks, forests, and public property; 36 CFR 60.4 outlines criteria used to evaluate the eligibility of a property for listing on the NRHP. Section 110 of the law makes it the specific responsibility of federal agencies to implement historic preservation plans, list eligible properties, appoint "preservation officers," and generally comply with the NHPA for properties under the agencies' management. In other sections the law generally mandates federal agencies to protect, list on the NRHP, manage, and identify properties, and to assist and consult with other agencies and private groups on resource management. In Title II it establishes the ACHP and empowers the council to implement NHPA regulations.

The 1978 American Indian Religious Freedom Act made it the policy of the U.S. government and federal agencies to "…protect and preserve for American Indians their inherent right of freedom to believe, express, and exercise the traditional religions…." This protection is centered on religious practice but encompasses and recognizes the importance of place and objects. The act requires federal agencies to consult with traditional religious leaders on potential impacts to rights and practices (42 USC 1996).

The 1979 Archaeological Resources Protection Act (ARPA) defines archaeological resources and stipulates that the act applies to resources older than 100 years of age; furthermore, it strengthens the permit process for work on these resources on federal and Indian lands. Permits granted under this law for work that may disturb archaeological resources are subject to review by Tribes "which may consider the site as having religious or cultural importance" 16 USC 470cc(c)). The law grants the secretary of the interior authority to develop regulations regarding the exchange and curation of excavated materials and encourages the coordination of efforts between federal agencies and private individuals with archaeological collections. 43 CFR 7.9 outlines permit requirements, including an agreement about the final disposition of collected artifacts. It also criminalizes the removal of resources without a permit, specifies criminal and civil penalties for doing so, and exempts the disclosure of the location of archaeological resources from the public record (16 USC 470aa-470mm). 32 CFR 229 provides the regulations, definitions, and standards needed to implement ARPA.

The 1990 Native American Graves Protection and Repatriation Act deals with the disposition of indigenous tribal cultural items recovered on tribal or federal lands. It defines and addresses human remains, funerary goods, sacred objects, and objects of cultural patrimony, which are referred to as cultural items, and specifies the return of those objects to lineal descendants of the individual or tribe on whose land the items were recovered. The act further outlines the process by which permits are granted (under the ARPA framework) for excavation of described cultural items.

36 CFR 79 (Curation of Federally Owned and Administered Archeological Collections) was codified in 1990 to "…establish definitions, standards, procedures and guidelines to be followed by Federal agencies to preserve collections of prehistoric and historic material remains, and associated records…" as stipulated in the Antiquities Act, the Reservoir Salvage Act, the NHPA, and ARPA (36 CFR 79.1). This complicated set of regulations lays out many guidelines on the care and management of existing and future collections of archaeological material.

Effect on Design:

Affected tribes will review a site cultural resource protection plan under which work will be conducted.

3 SUMMARY OF GENERALLY APPLICABLE OR RELEVANT AND APPROPRIATE WASHINGTON STATE LAWS AND REGULATIONS

The following state laws and regulations and local requirements were determined to be ARARs.

3.1 REMEDIAL ACTION UNDER SEDIMENT MANAGEMENT STANDARDS

In Washington State, the SMS governs the investigation and cleanup of contaminated sediment sites (WAC 173-204). The SMS includes procedures for conducting hazard assessments to identify cleanup sites, determining the appropriate site cleanup authority, conducting a site cleanup study, determining the site-specific cleanup standard, and selecting a site cleanup action.

The sediment quality standards of the SMS include chemical concentration criteria; biological effects criteria; human health criteria; other toxic, radioactive, biological, or deleterious substances criteria; and nonanthropogenically affected sediment quality criteria, all of which are used to identify sediments that have no adverse effects on biological resources and that correspond to no significant health risk to humans.

Effect on Design:

All elements of the remedial design and remedial action will comply with the SMS.

3.2 SITE CLEANUP UNDER MODEL TOXICS CONTROL ACT

In Washington State, MTCA governs the investigation and cleanup of contaminated sites (Chapter 70.105D RCW). A contaminant is defined by MTCA 173-340-200 as any hazardous substance that does not occur naturally or that occurs at concentrations greater than natural levels.

MTCA became effective in March 1989 and was enacted through a voter initiative process. The MTCA cleanup regulation, cited under Chapter 173-340 WAC, was amended in February 2001. MTCA contains provisions controlling site cleanup activities, including site discovery, priority, listing, investigation, and cleanup; liability provisions; administrative options for remedial actions, payment of costs, and funding; public participation; cleanup standards; and other general provisions. The law regulates the cleanup of sites contaminated with CERCLA hazardous substances, all state and federal RCRA hazardous and dangerous wastes, and petroleum products.

Effect on Design:

All elements of the remedial design and remedial action will comply with MTCA as well as the SMS.

3.3 WATER QUALITY STANDARDS FOR SURFACE WATERS AND GROUNDWATERS OF THE STATE

In Washington, water-quality standards for surface waters of the state are promulgated under Chapter 173-201A WAC. The purpose of this chapter is to establish water-quality standards for surface waters of Washington State that are consistent with public health and related public enjoyment, and with the propagation and protection of fish, shellfish, and wildlife, pursuant to the provisions of Chapter 90.48 RCW. The criteria listed in Chapter 173-201A WAC for surface-water quality provide protective numbers for both freshwater and marine aquatic life for both acute and chronic exposure to toxic substances.

Effect on Design:

Water quality monitoring during all in-water work activity is anticipated and will be specifically addressed in the design phase of the project and through issuance of the Section 401 Water Quality Certification (see Section 2.3).

The developed dredging remedy alternative includes treatment of water following dewatering of sediment. If water from the dredged material is discharged to Carty Lake or Lake River, it will be required to meet the water quality standards.

During access improvements and sediment-handling operations, water will be directed through erosion- and sediment-control features to meet any water quality standards. In addition, state water quality standards are considered screening criteria.

3.4 WASHINGTON DANGEROUS WASTE REGULATIONS

Washington regulations identify RCRA F-listed and K-listed wastes as dangerous waste (WAC 173-303-9904). Designated dangerous wastes may be treated, stored, or disposed of at a permitted treatment, storage, and disposal facility.

Effect on Design:

The dredged material will not be designated as either a RCRA listed hazardous waste or a RCRA characteristic waste. The dredged material will be designated as a nonhazardous waste; therefore, this requirement is not applicable.

3.5 NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM STORMWATER PERMIT PROGRAM

Chapter 173-220 WAC establishes a state permit program, applicable to the discharge of pollutants and other wastes and materials to the surface waters of the state, operating under state law as a part of the NPDES created by Section 402 of the FWPCA. Permits issued under this chapter are intended to satisfy the requirements for discharge permits under both Section 402(b) of the FWPCA and Chapter 90.48 RCW.

Effect on Design:

NPDES construction stormwater permits would be required for discharging surface water from the site, including from sediment dewatering. The substantive requirements of the NPDES construction stormwater permit will be met in the design of the selected alternative, should the alternative warrant the permit. A stormwater pollution prevention plan and best management practices will be prepared and implemented as part of the final design.

3.6 SHORELINE MANAGEMENT ACT

The state Shoreline Management Act (SMA) (Chapter 173-22 WAC) regulates any action within 200 feet of the ordinary high-water mark of a shoreline. Shorelines in towns and cities are regulated by shoreline master programs (Chapter 173-26 WAC) adopted by local municipalities. Substantive shoreline management requirements in the City of Ridgefield's shoreline master program, may be triggered by cleanup actions associated with dredging. However, cleanup actions are exempt from the procedural (permitting) requirements (Chapter 173-27 WAC).

Effect on Design:

The SMA may be applicable in association with the access improvements and construction of an upland sediment handling site, and will be addressed during the design.

3.7 WASHINGTON DEPARTMENT OF NATURAL RESOURCES STATE AQUATIC LANDS REQUIREMENTS

The Washington Department of Natural Resources (DNR) requires that an authorization be obtained to perform any work over state-owned aquatic lands. A DNR authorization is different from other regulatory permits in that it is a legal contract in which DNR outlines the terms and conditions of the use, as well as conveying property rights to the user in exchange for rent.

DNR suggests contacting them early in the design process to avoid delays in receiving authorization. The consultation will work to ensure that land is available, to determine if the proposed use is appropriate, and to avoid or minimize impacts to aquatic resources.

Effect on Design:

DNR will be contacted early in the design and permitting process to ensure a timely consult.

3.8 WASHINGTON DEPARTMENT OF FISH AND WILDLIFE HYDRAULIC PROJECT APPROVAL PERMITTING

The Washington State Legislature developed the Hydraulic Project Approval (HPA) process to provide requirements for the protection of fish and fish habitat from the impacts of hydraulic projects (Chapter 77.55 RCW). These projects are considered to be any work that would use, divert, obstruct, or change the natural flow or bed of any river or stream or utilize any waters of the state.

The Hydraulic Code requires any person or agency that desires to undertake a hydraulic project to obtain approval from the Washington Department of Fish and Wildlife in the form of a permit, before beginning work.

Effect on Design:

In conjunction with design, an HPA will be obtained as part of the permitting process by coordinating with the Washington Department of Fish and Wildlife. All prescribed work windows will be observed.

3.9 AIR QUALITY STANDARDS

Chapters 173-400, -460, and -470 WAC establish provisions for general regulation of air pollution sources, ambient air quality standards, and acceptable levels for particulate matter, and stipulate requirements for new sources of toxic air pollutant emissions. These standards are typically administered and enforced by the local clean air agency, which in this case would be the Southwest Clean Air Agency.

Effect on Design:

Some of the alternatives include sediment handling. During sediment-handling activities, it may be necessary to implement engineering controls to manage particulate emissions. Air testing may be required to show that emissions meet the substantive requirements of applicable air quality permits and rules. If results illustrate that substantive requirements have not been met, the design will require modification.

3.10 NOISE REGULATIONS

Maximum environmental noise levels have been determined and are contained in Chapter 173-60 WAC. Approved procedures for measurement of environmental noise are contained in Chapter 173-58 WAC.

Effect on Design:

During design, expected noise levels will be estimated and compared to the limitations established in 173-60 WAC. The need to adjust the approach to meet these requirements will be determined. For example, the noise level regulations may limit the operating hours of some parts of the remedial action.

3.11 STATE ENVIRONMENTAL POLICY ACT

The State of Washington administers a program similar to the federal National Environmental Policy Act. The State Environmental Policy Act (SEPA), contained in Chapter 43.21C RCW, provides the framework for state and local agencies to consider the environmental consequences of a proposal before taking action. It also gives agencies the ability to condition or deny a proposal because of identified likely significant adverse impacts. The act is implemented through the SEPA Rules and Procedures, Chapters 197-11 and 173-802 WAC, respectively.

SEPA review is a comprehensive assessment of potential environmental, economic, and cultural impacts from a specific development project or a proposed policy, plan, or program. The SEPA review process requires the preparation of an environmental checklist, which may be achieved by review of the environmental impacts and proposal of mitigation measures. The completed checklist helps to identify potential environmental impacts associated with the proposed action. Following a threshold determination, the lead agency will issue either a Determination of Non-Significance that will allow the action or permitting process to continue, or a Determination of Significance that will require that an environmental impact statement (EIS) be prepared before agency action can be taken. Typically, one checklist or EIS is required for a project, although it may require modification or application of numerous permits by federal, state, or local agencies.

Effect on Design:

SEPA review will be conducted for the project design. The Port or Ecology can act as the lead agency for SEPA review. The Port will complete a SEPA checklist for Ecology's review.

3.12 WASHINGTON STATE DEPARTMENT OF ARCHEOLOGICAL AND HISTORIC PRESERVATION AND WASHINGTON STATE STATUTORY GUIDELINES

Under the Washington State governor's Executive Order 05-05, archeological and cultural resources must be evaluated to satisfy federal regulations 36 CFR 800. The order compels agencies to "review capital construction projects and land acquisitions for the purpose of a capital construction project, not undergoing Section 106 review…with DAHP and affected Tribes to determine the potential impacts to cultural resources." The order outlines mitigation procedures when impacts to "significant resources" will occur, directs funding to be allocated for review, and directs the agency to report back to the governor's office on progress.

RCW 27.44 (Indian Graves and Records) addresses the need to protect Indian graves, cairns, and glyptic marks, and outlines penalties, civil actions, and procedures for unintentional disturbance of skeletal human remains. RCW 27.5 (Archaeological Sites and Resources) lays out the State of Washington's interest in protecting archaeological resources and establishes and empowers DAHP to complete an inventory, study, make NRHP nominations, and identify and excavate the "state's archeological resources" (RCW 27.53.020). The code establishes permit requirements, lays out penalties, and describes the contracting process.

WAC 25-48 establishes procedures for implementing the permit sections of RCW 27.53. WAC 25-46 establishes regulation procedures for historic archaeological resources on, in, or under aquatic lands owned by the state; RCW 79.105.600 deals with "archaeological activities" on state aquatic lands, and addresses shoreline management (via RCW 79.105). RCW 42.56.300 exempts disclosure of the location of archaeological sites.

Effect on Design:

The DAHP and affected Tribes will review a site cultural resource protection plan under which work will be conducted.

3.13 WASHINGTON INDUSTRIAL SAFETY AND HEALTH ADMINISTRATION

Washington Industrial Safety and Health Administration (WISHA) regulations pertaining to hazardous waste sites are addressed under WAC 296-843, Hazardous Waste Operations. This standard applies to cleanup and corrective actions at MTCA-regulated sites.

Effect on Design:

All work will be performed under a site health and safety plan in conformance with the applicable WISHA regulations.

4 LOCAL REQUIREMENTS

4.1 SHORELINE MASTER PROGRAM

A cleanup action or "substantial development" performed along any shoreline of statewide significance in the city of Ridgefield is regulated under the Shoreline Master Program (Chapter 18.820 of the Ridgefield Municipal Code [RMC]). A Substantial Development Permit (SDP) is required for such an action. The City of Ridgefield adopted an updated

Shoreline Master Program in 2012. The environmental designation for the Lake River shoreline under the updated program is High Intensity.

Effect on Design:

Since the remedial action may include upland construction of a sediment-handling facility, bank work, and possible access improvements completed within 200 feet of a shoreline, the substantive requirements of the SDP will be met as part of the remedial design.

4.2 CITY OF RIDGEFIELD CRITICAL AREAS ORDINANCE

The City of Ridgefield Critical Areas Ordinance designates and regulates projects that may impact ecologically sensitive areas, including wetlands and fish and wildlife habitat conservation areas, or geophysical hazards such as geologically hazardous areas and frequently flooded areas (RMC 18.280.120).

Effect on Design:

The remedial action will be conducted in an area that includes designated fish and wildlife habitat conservation areas, critical aquifer recharge areas, and frequently flooded areas. The design will meet the substantive requirements designed to protect these resources.

4.3 CITY OF RIDGEFIELD FLOOD CONTROL ORDINANCE

The purpose of the Flood Control Ordinance is to promote public health, safety, and general welfare; reduce the cost of flood insurance; and minimize public and private losses due to flooding (RMC 18.750). Elements of the remedial action will be conducted in an area designated as being in the 100-year floodplain. The ordinance requires a demonstration that development, grading, and filling projects will not exacerbate flood conditions through hydrologic and hydraulic analyses showing that the proposed encroachment would not result in a net increase in base flood elevation or flood velocity.

Effect on Design:

The alternatives will be designed to ensure that there is no net increase in fill in the floodway and that there is no net increase in base flood elevation or velocity due to fill in the floodway. Hydraulic analysis will be provided. Consultation with the city will confirm that the design meets the substantive requirements.

APPENDIX R

COST ESTIMATES

APPENDIX R RETAINED ALTERNATIVES COST ESTIMATES CONTENTS

TABLE

Table R-1
Retained Alternatives Cost Estimate Summary
Former PWT Site RI/FS

Area	Alternative	Remedial Action	Total cost	Table
Port-Owned Properties	1	Institutional Controls	$53,000	R-2
	2	Engineered Cap: ▪ Placement of a cap at the Port Railroad Avenue properties; and ▪ Annual cap monitoring and development of a site management plan.	$116,000	R-3
	3	Sampling and Soil Removal: ▪ Prefinal design sampling at the Port Railroad Avenue properties; ▪ Removal of soil at the Port Railroad Avenue properties; and ▪ Placement of crushed rock for operational surface	$273,000	R-4
Lake River	1	Monitored Natural Recovery: ▪ Natural attenuation in the form of sedimentation; ▪ Multiple sampling events; ▪ Long-term monitoring plan; and ▪ Institutional controls.	$679,000	R-5
	2	Enhanced Monitored Natural Recovery: ▪ Placement of a sand layer to enhance natural attenuation; ▪ Long-term monitoring plan; and ▪ Institutional controls.	$2,815,000	R-6
	3	Engineered Cap: ▪ Placement of an engineered sand cap; ▪ Placement of a protective armor layer; ▪ Implementation of long-term monitoring and maintenance; and ▪ Institutional controls.	$7,718,000	R-7
	4	Dredging and ENR: ▪ The removal of impacted sediment through mechanical dredging; ▪ Existing in-water structure removal; ▪ Lower bank stabilization; and ▪ Placement of an enhanced natural recovery (ENR) layer.	$9,492,000	R-8

Table R-1
Retained Alternatives Cost Estimate Summary
Former PWT Site RI/FS

Area	Alternative	Remedial Action	Total cost	Table
Carty Lake	1	Monitored Natural Recovery: ▪ Natural attenuation; ▪ Multiple sampling events; ▪ Long-term monitoring plan; and ▪ Institutional controls to protect receptors.	$280,500	R-9
	2	Focused Dredge and Limited Residuals Cap: ▪ Dredging the highly impacted southern area of Carty Lake; ▪ Placement of residuals cap layer over the dredged area; ▪ Post-Remedy Monitoring; and ▪ Institutional controls to protect receptors.	$1,633,000	R-10
	3	Focused Dredge and Expanded Residuals Cap: ▪ Dredging the highly impacted southern area of Carty Lake; ▪ Placement of residuals cap layer over an expanded area; ▪ Post-Remedy Monitoring; and ▪ Institutional controls to protect receptors.	$2,308,000	R-11
	4	Focused Dredge and Full Residuals Cap: ▪ Dredging the highly impacted southern area; ▪ Placement of sediment cap layer over the entire lake; ▪ Implementation of long-term monitoring and maintenance; and ▪ Institutional controls to protect receptors.	$7,340,000	R-12

MAUL FOSTER ALONGI

2001 NW 19th Avenue, Suite 200
Portland, OR 97209
971.544.2139 (p)
971.544.2140 (f)
www.maulfoster.com

Assumptions

1 One sampling event every other year for ten years (five events).
2 Ten samples taken per event.
3 Analytical work will be for dioxins/furans only.
4 Duration of each sampling event will be approximately 12 hours, with two full-time employees.
5 A comprehensive work plan will be produced.
6 A report will be generated after each sampling event.
7 Surface sediment sampling only.
8 30% contingency.

Item	Unit Cost	Unit	Quantity	Total Cost
1.0 Design and Permitting				
1.1 Work plan and negotiations	$15,000	LS	1	$15,000
Total Design and Permitting Cost				**$15,000**
2.0 Sediment Sampling (5 events)				
2.1 Labor cost per sampling event	$2,400	EA	5	$12,000
2.2 Equipment cost per sampling event	$700	EA	5	$3,500
Total Sediment Sampling Cost				**$15,500**
3.0 Monitoring and Reporting (5 events)				
3.1 Sample analysis for dioxins/furans per sampling event	$6,500	EA	5	$32,500
3.2 Reporting per sampling event	$10,000	EA	5	$50,000
4.0 Bank Stabilization				
4.1 Bank stripping and grubbing	$7,946	AC	1	$7,946
4.2 Bank armor geosynthetic	$3	SY	12,500	$34,500
4.3 Acquisition and placement of 8" minus river rock armor	$80	CY	4,200	$336,000
Total Monitoring and Maintenance Cost				**$460,946**
Subtotal				**$491,446**
Tax			8.20%	**$40,299**
Contingency			**30%**	**$147,434**
TOTAL COST ESTIMATE, INCLUDING 30% CONTINGENCY				**$679,178**

Revision #: 0	

Assumptions

1 Design includes bathymetric survey, construction plans and documents.

2 Permitting includes approval and processing with City of Ridgefield and Ecology, U.S. Army Corps of Engineers, USFWS, 401 Certification, HPA, and NMFS consultation.

3 Assume silt curtain required in water.

4 Access improvements include clearing and grubbing, grading staging area, and haul road construction.

5 Placement of sand for ENR by barge derrick.

6 ENR cap over all sediment above 5 ppt dioxins at 1-foot thickness.

7 Duration of work estimated to be 20 days.

8 Water quality monitoring will be for turbidity only. Fieldwork to be conducted by MFA field crew, testing to be completed on site.

9 10% volume contingency to include irregularities in placement.

10 30% contingency.

Item	Unit Cost	Unit	Quantity	Total Cost
1.0 Design and Permitting				
1.1 Work plan and negotiations	$100,000	LS	1	$100,000
1.2 Engineering design, construction plans, and specifications	$10,000	LS	1	$10,000

Assumptions

1 Design includes bathymetric survey, construction plans and documents.
2 Permitting includes approval and processing with City of Ridgefield and Ecology, U.S. Army Corps of Engineers, USFWS, 401 Certification, HPA, and NMFS consultation.
3 Dredge quantities based on neatline depth plus 1 foot of overdredge.
4 Assume silt curtain required in water.
5 Access improvements include clearing and grubbing, grading staging area, dewatering facility, and haul road construction.
6 Mechanical dredging rate assumed to be 800–1,000 CY/Day.
7 ENR cap (1-foot thickness) over all sediment above 10 ppt dioxins and all dredged locations.
8 Duration of work estimated to be 2 months.
9 Water quality monitoring will be for turbidity only. Fieldwork to be conducted by MFA field crew, testing to be completed on site.
10 Primary dewatering will occur on the barges prior to off-site disposal.
11 A barge slip will be excavated and a second crane derrick will be used to skip the material upland.
12 Dredged material will be cement amended upland at a rate of 7%.
13 10% dredge volume contingency to include side slopes and volume uncertainty.
14 30% contingency.

Assumptions

1 Design includes survey, construction plans and documents.
2 Permitting includes approval and processing with City of Ridgefield and Ecology, U.S. Army Corps of Engineers, USFWS, 401 Certification, HPA, and NMFS consultation.
3 5,540-CY volume dredge prism including 1-ft overdredge.
4 Access improvements include clearing and grubbing, and staging area.
5 Excavation of sediments using tracked equipment.
6 Transport of sediment by truck.
7 Direct landfill of sediment as nonhazardous material at Waste Management's Hillsboro Subtitle D disposal facility.
8 One foot of clean sand ENR backfill to be placed.
9 30% contingency.

Item	Unit Cost	Unit	Quantity	Total Cost
1.0 Design and Permitting				
1.1 Work plan and negotiations	$75,000	LS	1	$75,000

APPENDIX S

LAKE RIVER DREDGE SCENARIOS

APPENDIX S LAKE RIVER DREDGE SCENARIOS CONTENTS

The dioxin data have been updated, as part of the draft RI/FS revisions, to ensure consistent treatment of interferences and non-detects during data qualification and calculation of TEQs. Updated TEQs are calculated according to the methodology developed in coordination with Ecology and are described in Appendix F.

APPENDIX S LAKE RIVER DREDGE SCENARIOS

Various dredging scenarios were evaluated to select the most appropriate dredging remedy, based on technical feasibility, meeting of cleanup levels (CULs), and cost/benefit associated with reduction of concentrations of dioxins (evaluated as toxic equivalents, or TEQs) in sediment.

Five dredge scenarios[1] were evaluated:

- Scenario A—removal of dioxin concentrations above 100 nanograms per kilogram (ng/kg)
- Scenario B—removal of dioxin concentrations above 60 ng/kg
- Scenario C—removal of dioxin concentrations above 30 ng/kg
- Scenario D—removal of dioxin concentrations above 10 ng/kg
- Scenario E—removal of dioxin concentrations above 5 ng/kg

The scenarios were selected based on evaluation of the distribution of concentrations in surface and subsurface sediment. Measured dioxin TEQ concentrations and modeled concentrations for subsurface areas not measured (see Attachment 1) were used to estimate both the lateral and vertical dredging footprint for each scenario. For each scenario, any surface or interval (e.g., 1 to 2 foot interval) with measured or modeled concentrations above the scenario target (e.g., 30 ng/kg for Scenario C) would be removed. In all scenarios, the leave surface in dredged areas and areas not dredged exceeding the dioxin CUL of 5 ng/kg TEQ are additionally covered with 1 foot of sand; this enhanced natural recovery (ENR) layer would cover any residuals generated during dredging. Finally, all scenarios include long term monitoring of the ENR layer to ensure continued dioxin TEQ reductions. See Attachment 1 for further description and a figure showing estimated post-remedial surface concentrations. Attachment 2 discusses a detailed residuals analysis.

All non-dioxin hazardous substances above screening levels occur only in areas with dioxin concentrations exceeding 100 ng/kg (see Section 3 of the report), and would be removed in all of these scenarios. In addition, the CUL protective of human direct contact and incidental ingestion of impacted sediment is 138 ng/kg (see Appendix M of the report). Because all dredge scenarios achieve removal of dioxin concentrations exceeding 100 ng/kg and other elevated hazardous substances, they are protective of this exposure scenario.

1. Concentration Reduction

To evaluate the dioxin TEQ concentrations anticipated in post-remedy conditions, surface weighted average concentrations (SWACs) were calculated for each dredge scenario. SWACs are used to evaluate remedy protectiveness of beneficial uses represented by aquatic-dependent wildlife and human seafood consumption. SWACs were calculating by placing Thiessen polygons around each dioxin sample result in the study area (see attached Figure S-1). Only areas currently above the CUL

---

[1] Dredge scenarios include removal of sediment and placement of 1 foot of sand to enhance natural recovery; see Section 11.3 of the main body of this remedial investigation and feasibility study for a description of the remedial alternative; see Attachment 1 for a description of how enhanced natural recovery ENR) was incorporated into the remedial evaluation.

of 5 ng/kg dioxin TEQ (see Section 2) were included in SWAC calculations. Thiessen polygons define the area around each sample point, using an algorithm to calculate the location of a boundary midway between available points. Each Thiessen polygon is then assigned the concentration represented by the sample it encompasses. In this way, the concentrations are spatially weighted, based on the area the polygon represents. This technique is well established and in use throughout the country at sediment remedial sites (see Attachment 1). Attachment 1 provides details on the SWAC calculation methods and assumptions. In brief, the predicted post-dredge concentration was initially determined from actual sample results or by extrapolating, assuming similar percent reduction as observed at other areas where dioxin data at depth were available. Next, the concentration at the bottom of the dredge cut was presumed to fully mix with the sand layer, so concentrations of the sand layer and the post-dredge surface were averaged for the resultant SWAC. This is a conservative assumption, as 100 percent mixing is unlikely and resulting surface concentrations are therefore likely to be lower at the point of compliance (i.e., the top 10 centimeters of the resulting Lake River bottom) than assumed for these hypothetical scenarios. The resulting post-remedy SWACs for each scenario are shown in the Table. This evaluation is an initial conservative estimate, and more specific information (e.g. dioxin concentrations at depth) will be collected during the design phase to refine estimates.

To understand the cost/benefit of each of the dredge scenarios, the post-remedy SWACs are compared with cost for each scenario. Cost estimate details are provided in Appendix R of the report. Figure S-2 shows a graph of the results and demonstrates that removal of concentrations for all scenarios provides substantial risk reduction. Removing dioxin concentrations above 100 ng/kg reduces the initial dioxin TEQ SWAC of 147 ng/kg to 16 ng/kg at a cost of $7.1M. Removing concentrations over 60 ng/kg and 30 ng/kg reduces the SWAC to 10 ng/kg and 7 ng/kg, respectively, at an additional cost of approximately $1M to $2M. Removal of dioxin concentrations above 10 and 5 ng/kg results in a SWAC of 3 or 2 ng/kg, respectively, at an additional cost of approximately $5M to $6M.

2. Comparison with CUL

A dioxin TEQ CUL of 5 ng/kg was selected, based on a reliably attainable practical quantitation limit (Section 6 of the report). Scenarios D and E immediately meet the CUL, based on post-remediation SWAC estimates. Note that only areas currently exceeding the CUL were included in SWAC calculations; when including all Lake River areas, Scenarios B through E meet the CUL. Scenarios B through E also achieve SWACs that meet ecological CULs developed for individual congeners (see Attachment 1). In all scenarios surfaces above 5 ng/kg will receive a sand layer of 1 foot, and long-term deposition is expected to ensure compliance with the CUL. More specific information (e.g. dioxin concentrations at depth) will be collected during the design phase to refine postremedial estimates.

3. Feasibility

Evaluation of technical feasibility is especially important when considering dredging remedies. A primary consideration is generation of dredging residuals. Generated residuals are sediment disturbed or resuspended during dredging that settles back to the sediment bed. A range of factors can impact residuals generation, including dredging methods, sediment geotechnical and geophysical characteristics, and physical site conditions. Residuals are expected to result from dredging and are addressed by placement of a clean sand layer. The uncertainty associated with estimating the nature and extent of residual contamination can make prediction of dredging effectiveness difficult and achieving levels in the low parts per trillion highly ambitious (see Attachment 2). A residuals analysis integrating site-specific characteristics, including sediment dioxin TEQ concentration data, estimates that surface concentrations between approximately 20 percent and 60 percent of the starting concentration may remain after dredging. Methods such as best management practices (BMPs) may help to limit residuals re-contamination. Dredging areas below 10 ng/kg (e.g. areas currently at approximately 2 ng/kg) may result in marginal dioxin reductions (~1 ng/kg) in those areas, resulting in minute SWAC reductions (see Table 3 in Attachment 2). Dredging studies show that residuals contamination, combined with dredging disturbance of sequestered contamination at depth, can actually increase postremedial concentrations[2] in areas with relatively low surface contamination. Sequestered dioxins are unlikely to occur at depth in areas where surface dioxin TEQ is relatively low (i.e., between 5-10 ng/kg). It is crucial to carefully consider the limited benefits of dredging to address the lowest TEQ areas (minimal dioxin TEQ reductions at best) with considerable additional monetary costs (see Section 2 above). Dredging areas below approximately 5 to 10 ng/kg dioxin TEQ may result in minimal dioxin reductions and is therefore not considered feasible.

4. Conclusion

Scenarios B and C result in significant dioxin TEQ reductions. Scenario B consists of dredging concentrations above 60 ng/kg while Scenario C consists of dredging concentrations above 30 ng/kg. ENR application to surfaces with concentrations above 5 ng/kg would occur for both scenarios. These scenarios are the preferred dredging remedial alternatives for the following reasons:

- Scenario B and C approach the dioxin TEQ CUL on an areawide basis; Scenario B results in a SWAC of 10 ng/kg while Scenario C results in a SWAC of 7 ng/kg.
- The additional estimated reduction in dioxin TEQ SWACs is minimal for Scenarios D through E, and cost analysis shows significant additional cost disproportionate to the benefit.
- Residuals analysis shows that dredging areas below 30 ng/kg may result in minimal additional dioxin reduction, and additional dioxin reductions may not occur at all in very low concentration areas (e.g. <10 ng/kg). As a result, residuals in these areas would need to be managed with additional ENR sand placement, resulting in significantly increased costs and relatively minimal additional dioxin TEQ reduction.
- Removing sediment achieves greater than 90 percent reduction in dioxin TEQ SWACs for Scenarios B and C.
- Removing sediment at concentrations above 60 ng/kg or 30 ng/kg dioxin TEQ achieves dioxin congener SWACs protective of ecological receptors.
- Scenario C is more expensive than Scenario B, but has the added benefit of removing almost all the elevated dioxin along the eastern shoreline, which is the area most likely to be used by people and impacted by processes that may disturb or re-suspend affected sediment (e.g., prop wash from boats).

ATTACHMENT 1

DREDGE VOLUME AND SWAC ANALYSIS

ATTACHMENT 1 DREDGE VOLUME AND SWAC ANALYSIS

1. Overview

The relationship between estimated volume of sediment dredged and concomitant reductions in modeled Lake River final surface sediment dioxin TEQ concentrations was analyzed. Variations of the general dredging scenario, Dredging with Enhanced Natural Recovery (DENR), were addressed to span potential approaches aimed at reducing dioxin concentrations. The general DENR scenario consists of dredging specified areas (generated via Thiessen polygon analysis; see below) and placement of a 1-foot sand cover over all areas dredged. In addition, a 1-foot sand cover is placed over all undredged areas exceeding 5 nanograms per kilogram (ng/kg) toxicity equivalent quotient (TEQ) in each scenario. Results for the preferred dredging alternatives (Scenarios B and C) are shown in the Figure.

2. Dioxin TEQ and Volume Analysis

Surface Weighted Average Concentration (SWAC) Analysis

The shape and surface area of potential areas to be dredged were identified using the "Build Thiessen Polygons" tool in the XTools Pro (ver. 8.0) toolset for ArcGIS 10. Briefly, Thiessen polygons are the polygons generated from points, defined by the perpendicular bisectors of the lines between all points and drawn so that each polygon bounds the region that is closer to one point than to any adjacent point.

In this analysis, sample locations represent the points used to define polygons; associated sample dioxin TEQ concentrations at surface and at depth were assigned to polygons generated for Lake River (see Appendix S). A SWAC approach was used to estimate overall current dioxin concentrations, where:

$$\text{SWACc} = \sum (\text{SAi} / \text{TSA}) * \text{SCi}))$$

SAi is the surface area of the ith polygon, TSA is the sum of all polygon surface areas, and SCi is the current measured surface concentration (SC) of the ith polygon. This results in a currently existing dioxin SWAC of 147 ng/kg dioxin TEQ. Only areas exceeding 5 ng/kg were included in all evaluations. LRIS-LR-16 and LRIS-LR-17 were not included in any calculations, as dioxin extent is defined to the north of these areas at LRIS-LR-19 (see Section 3.5.2 in the main body RI/FS).

The SWAC technique is well established and in use throughout a broad range of sciences, as well as at many nationally known sediment remedial investigation sites, including the Hudson River, Portland Harbor Cleanup, the Duwamish River Cleanup, Lower Passaic River Cleanup, Fort Ord, and others. With respect to fish consumption, the likelihood that anglers will consume fish caught from the same location every day for 30 or more years is low, since anglers are likely to use different fishing locations from time to time based on fish abundance, which can be seasonal or vary year to year. Therefore, using a SWAC is expected to be conservative with respect to anticipated human consumption patterns. Similarly, non-sessile aquatic organisms also use different locations throughout the aquatic environment, and thus a spatial averaging of concentrations may best represent expected contamination contact. SWAC analysis will be refined following collection of additional data during pre-design activities.

Dredge and ENR Volumes

Five specific DENR scenarios were analyzed:

- Scenario A: dredge all polygons > 100 ng/kg dioxin TEQ.
- Scenario B: dredge all polygons > 60 ng/kg dioxin TEQ.
- Scenario C: dredge all polygons > 30 ng/kg dioxin TEQ.
- Scenario D: dredge all polygons > 10 ng/kg dioxin TEQ.
- Scenario E: dredge all polygons > 5 ng/kg dioxin TEQ.

For each of the five scenarios (S-X) described in the overview, the final calculated dredge removal volume included neatline (NL) dredge volume, an additional 1-foot overdredge (OD), and a 10 percent contingency. Dredge volumes will be refined following collection of additional data during pre-design activities. Associated ENR sand volumes were assigned a 20 percent contingency.

Estimates of dredge volumes and hypothetical final surface concentrations (FSCs) were calculated under the following assumptions:

- For each scenario S-X, all polygons with SCs > X ng/kg were targeted for at least 1 foot NL depth removal.
- If measured dioxin TEQ concentrations were < X ng/kg at 1- to 2-foot depth, then:
    - One-foot NL dredge removal was assumed.
- If measured dioxin TEQ concentrations at 1- to 2-foot depth were not available, then:
    - One-foot NL dredge removal was assumed if the calculated post-dredge surface (PDSC1) was < X ng/kg. PDSC1 was calculated as: PDSC1 = SC * (100%-75%); this equation assumes a 75 percent reduction in dioxin concentration of the measured SC. Seventy-five percent reduction was chosen based on calculations showing a mean reduction of 77 percent for sample locations at which both surface and 1- to 2-foot depth measurements were taken and a decrease from surface to 1- to 2-foot depth was observed. Four sample locations (LRIS-LR-01, LRIS-LR-05, LRIS-LR-09, and LRIS-LR-12) met these criteria.

  - If the calculated PDSC1 remained > X ng/kg, then additional 1-foot dredge removal was assumed until the final PDSCi was < X ng/kg, where PDSCi = PDSCi-1 * (100%-75%); see above for derivation.

- If measured dioxin TEQ concentrations were > X ng/kg at 1- to 2-foot depth, then:

  - Two-foot dredge removal was assumed if the calculated post-dredge SC (PDSC2) was < X ng/kg; see above for derivation.

  - If the calculated PDSC2 remained > X ng/kg, then additional 1-foot dredge removal was assumed until the final PDSCi was < X ng/kg, where final PDSCi = PDSCi-1 * (100%-75%); see above for derivation.

  - Three-foot NL removal was assumed for LR-08 in all scenarios because of high concentration at 1 to 2 feet (910 ng/kg TEQ) but comparatively low concentration at 3 to 4 feet (6.9 ng/kg).

This procedure was developed because it utilized all available measured dioxin TEQ concentrations—estimates were generated only for depths at which no data were available.

- For each S-X scenario, dredge volume for each polygon (DVi) was calculated as:

  - DVi (cubic yards) = DRi (yards) * SAi (square yards); DRi is the calculated dredge removal depth of the ith polygon plus a 1-foot OD; SAi is the surface area of the ith polygon.

- Dredge volume total (DVTx) for each S-X scenario (Table 1) includes a 10 percent contingency and was calculated as: DVTx = ∑ DVi + 0.1 * ∑ DVi.

- Total ENR volume for each scenario (in all scenarios ENR is placed over the same areas—those currently exceeding 5 ng/kg) was 14,220 cubic yards, assuming a 20 percent contingency.

- SWACs following each S-X scenario (SWACx) were calculated as follows:

  - SWACx = ∑ (SAi / TSA) * FSCf)); SAi is the surface area of the ith polygon, TSA is the sum of all polygon surface areas, and FSCf is the FSC for the ith polygon (if dredged and treated with ENR, FSCf = FSCi; if not dredged, FSCf = SCi).

The FSC for each dredged polygon (FSCi) was calculated assuming 100 percent mixing between FSCf (i.e., FSC for each polygon) and the ENR sand concentration. ENR sand is estimated as 0.365 ng/kg, based on measured mean dioxin TEQ concentrations for Columbia River sand used in previous sediment sand cap remedies.[1] Although 100 percent mixing is unlikely to occur in all areas (although prop wash, anchor release, etc., could generate 100 percent mixing), this calculation

---

[1] MFA. Memorandum (re: Columbia river sand sampling with Hickey Marine Enterprises) to S. Manzano, Oregon Department of Environmental Quality, from E. Bakkom and M. Murray, Maul Foster & Alongi, Inc. June 13, 2011.

represents a conservative estimate of final surface sediment concentration for dredged areas treated with ENR. Similarly, 100 percent mixing was assumed for nondredged areas exceeding 5 ng/kg treated with ENR only.

For a summary of dredge depths estimated for all scenarios evaluated, see Table 1. Final SWACs for all scenarios are summarized in Table 2.

3. Dioxin Congener SWAC Analysis

How DENR scenarios may impact postdredge dioxin congener SWACs was evaluated, including the potential for ecological CUL exceedances (see Section 6 in main body of the RI/FS). Tetrachlorodibenzo-p-dioxin (TCDD) and pentachlorodibenzofuran (PeCDF) currently exceed CULs on a SWAC basis. The same percent reduction for dioxin TEQs determined for each area in each scenario (see above for derivation) was applied to congeners to model post-dredge congener SWACs. Analysis shows that Scenarios B through E resulted in TCDD and PeCDF SWACs below CULs; all other congeners were below CULs on a point-by-point and SWAC basis for these scenarios. Results for TCDD and PeCDF postdredge SWACs for only the least protective scenario (Scenario B, dredge all areas > 60 ng/kg) that meets ecological CULs are presented in Table 3.

SWAC = surface weighted average concentration; calculated using only areas initally above 5 ng/kg dioxin TEQ.

TCDD = tetrachloro dibenzo-p-dioxin.

ATTACHMENT 2

DREDGE RESIDUALS ANALYSIS

ATTACHMENT 2 DREDGE RESIDUALS ANALYSIS

1. Overview

Dredging residuals are contaminated sediment found at the post-dredge surface of the sediment profile, either within or adjacent to the dredging footprint. The nature and extent of post-dredging sediment residuals are related to dredging equipment, dredging methods, sediment geotechnical and geophysical characteristics, the variability in contaminant distributions, and physical site conditions (including hydrodynamics). A range of factors can impact residuals generation, and the uncertainty associated with estimating the nature and extent of residual contamination can make it difficult to predict dredging effectiveness (Patmont and Palermo, 2007). The purpose of this appendix is to first best estimate generated dredging residuals that may remain within the surficial sediment layer at Lake River following dredging operations before subsequent placement of a sand layer, i.e., enhanced natural recovery treatment. These results help define technically feasible cleanup levels, as residuals recontamination is an unavoidable feature of dredging. A point of diminishing returns, where additional dredging achieves minimal to no reductions in contamination due to residuals, is also identified.

1.1 Dredging Residuals Characteristics

There are numerous potential sources of residual sediment contaminants, and residuals can be grouped into two general categories: (1) undisturbed residuals, and (2) generated residuals. Undisturbed residuals are contaminated sediments found at the post-dredge sediment surface that have been uncovered by dredging but not fully removed. Generated residuals are contaminated post-dredge surface sediments that are dislodged or suspended by the dredging operation and are subsequently redeposited on the bottom of the water body (Patmont and Palermo, 2007).

Undisturbed and generated residuals may have similar or very different characteristics, depending on the process by which they were created. Generally, undisturbed residuals remain below the dredge cut elevation at a higher dry bulk density than generated residuals; their dry bulk density would be similar to those of the in situ sediments. Undisturbed residuals may therefore exist as relatively thick layers amenable to further cleanup pass dredging if necessary. In contrast, generated residuals are the result of the dredging process itself, and can accumulate at the sediment/water interface in thin layers and at relatively low dry bulk density if deposited from suspension or from fluid mud layers. Generated residuals may also exhibit a soft, unconsolidated layer resulting from resettlement and fluidized mud flows, along with sloughing (i.e., shallow slope failures) of dredge cut slopes. Because of these characteristics, generated residuals can resuspend and/or migrate within and outside of the dredging footprint, making them difficult to remove even with additional cleanup dredging passes (Patmont, 2006).

A number of factors impact post-dredging residual contamination at sites, including: nature of dredging equipment and operation, extent of controls on resuspended sediment dispersion, sediment characteristics, site conditions (e.g., river depth and flow velocity), and extent of vertical/horizontal sediment contamination (Palermo et al., 2008). Following pre-design data collection, which includes addition subsurface characterization, potential for undisturbed residuals at Lake River can be more fully assessed. Generally, undisturbed residuals can be caused by:

- Attempts to dredge contaminated sediment that:
  - Covers highly uneven surfaces, or debris or boulders that are left in place
  - Is located near piers, pilings, utility crossing that are left in place
  - Directly overlies bedrock or hardpan
- Not dredging contaminated sediment because of:
  - Incomplete characterization of the horizontal and vertical extent of contaminants
  - Inappropriate selection of a target dredge cut design elevation and/or inaccuracies in meeting targeted dredging elevations
  - Development of dredge plans that intentionally do not target complete removal of contaminated sediments (e.g., because of engineering limitations)

The primary causes of generated residuals include:

- Sediments dislodged but left behind by the dredgehead ("fallback") and/or left behind by debris-removal operations
- Sediment that sloughs into the dredge cut from adjacent undredged areas
- Sediment moved by slope failures caused by the process of dredging or innate slope instability
- Sediments resuspended by dredging or other dredging-related activities that resettle within or adjacent to the dredging footprint

2. Generated Residuals Model

It is important to develop a site-specific model estimating generated residuals because generated residuals: (1) are unavoidable and potentially difficult to remove, (2) can strongly impact post-dredge contaminant concentrations, and (3) are linked to site- and operation-specific factors (Patmont and Palermo, 2007). To best estimate the potential impacts of residuals, a predictive model estimating post-dredge residuals and post-dredge surface contaminant concentrations was applied (Palermo et al., 2008; Patmont, 2006). Surface and subsurface data collected at Lake River were used to parameterize the model (see Section 3 of the report). This model takes into account dredging operation factors and Lake River site and sediment characteristics.

General assumptions include application of mechanical dredging using a conventional open clamshell bucket as done in the Palermo et al. (2008) model; a different method may be applied at the Lake River site. The residual contaminant concentration is estimated as equal to the depth-averaged contaminant concentration of the sediment removed in the last dredging pass; the sediment concentration of the last pass is influenced by the residuals volume and concentration from prior dredge passes if multiple passes are performed. Residuals volume can be estimated at 5 to 20 percent of the volume of the previous pass, depending on equipment type, sediment properties, water depth, and other site conditions. The volume would be expected to be at the upper range or greater with softer sediments and/or more steeply sloped sediments. This model has a high degree of uncertainty, but no other predictive techniques are available (Palermo et al., 2008).

A total of six polygons were analyzed to model final surface concentrations given residuals contamination; these are the polygons for which both surface (0 to 10 centimeters [cm]) and 1- to 2-foot subsurface dioxin toxic equivalent (TEQs) are available (see Table 1). The following parameters were applied to best account for potential dredging operations and Lake River site and sediment characteristics:

- One dredging production pass followed by a 1-foot final partial/overdredge pass was assumed; a 1-foot production pass thickness was applied for four polygons where subsurface dioxin contaminant concentrations decreased at 1- to 2-foot depth versus 0- to 10-cm depth; a 2-foot production pass thickness was applied for two polygons where subsurface dioxin contaminant concentrations increased at 1- to 2-foot depth versus 0- to 10-cm depth.

- A 20 percent residuals volume for all dredging passes was assumed to account for soft sediments at Lake River (Palermo et al., 2008).

- Subsurface sediment bulk dry density was calculated as 930 kilograms per cubic meter (kg/m^3) for 1-foot production passes and 1040 kg/m^3 for all overdredge passes. 985 kg/m^3 was assumed for 2-foot production passes. Bulk dry density estimates were calculated from geotechnical data collected during pre-design activities for Lake River (see Table 2). The residuals layer density was estimated as 80 percent of 930 kg/m^3 (i.e., of the most shallow sediment density data available, following Palermo et al. [2008]).

- Measured dioxin TEQ concentrations were applied to estimate dredged sediment cut concentrations as follows:

    - Zero- to 10-cm TEQ for 1-foot cuts from 0- to 1-foot depth (TEQ0-1; four polygons)
    - One- to 2-foot TEQ for 1-foot cuts from 1- to 2-foot depth (TEQ1-2; four polygons)
    - ((0-10 cm TEQ + 1-2 ft TEQ) / 2) for 2-foot cuts from 0- to 2-foot depth (TEQ0-2; two polygons)
    - Three- to 4-foot TEQ (if available) for 1-foot cuts from 2- to 3-foot depth (TEQ2-3; one polygon)
    - ((100%-75%) * 1- to 2-foot TEQ) for 1-foot cuts from 2- to 3-foot depth (TEQ2-3; one polygon; for derivation see Attachment 1 on dredge volumes and SWACs)

Final concentration (FCi), the estimated dioxin concentration of the final post-dredge surface layer of the ith polygon, is calculated as:

- FCi (ng/kg) = $1x10^6$ * (Contaminant mass final composite layer (CMf mg ft/m3) / Mass final composite layer (Mf kg ft/m^3)) where:

- CMf = contaminant mass first pass residuals layer (CM1) + contaminant mass final pass overdredge layer (CM2)
    - CM1 = TEQ0-1 (ppm) * M1 *or* CM1 = TEQ0-2 (ppm) * M1
    - CM2 = TEQ1-2 (ppm) * M2 *or* CM2 = TEQ2-3 (ppm) * M2
- Mf = M1 + M2
    - M1 = residuals volume * cut depth (ft) * sediment density (kg/m^3)
    - M2 = residuals volume * 1 ft cut depth * sediment density (kg/m^3)

For each of the six sample polygons i, the percent dioxin TEQ reduction (DRi), was then estimated as:

- DRi = 100% - (FCi / SCi); SCi is the measured initial surface concentration (0 to 10 cm) of the ith polygon.

Upper, middle, and lower bound estimates of the final post-dredge surface layer dioxin TEQ concentrations were calculated to estimate the range of residuals impacts on all hypothetical post-dredge polygon surfaces. This was done by multiplying the surface concentration of all areas by the minimum, mean, and maximum of calculated DRi's.

3. Results

Percent dioxin TEQ reduction for the six modeled areas ranged from 37 percent to 85 percent, with a mean reduction of 64 percent (see Table 1). Initial surface dioxin TEQ concentrations and post-dredge surface dioxin TEQ estimates for all areas are presented in Table 3 and the attached Figure. These results show that, when accounting for residuals, the mean total dioxin TEQ reduction is estimated at 10 ng/kg or less for all areas above the CUL of 5 ng/kg and with < 30 ng/kg initial dioxin TEQ surface concentrations. As a result, if these areas are dredged, a minimal reduction of dioxin surface concentrations is expected at those locations (see the attached Figure) suggesting a high cost to benefit ratio at these locations.

APPENDIX T

CARTY LAKE REMEDIAL ALTERNATIVES

APPENDIX T CARTY LAKE REMEDIAL ALTERNATIVES CONTENTS

APPENDIX T—CARTY LAKE REMEDIAL ALTERNATIVES

Four remedial scenarios for Carty Lake contamination are evaluated in the feasibility study (FS):

- Alternative 1—Monitored natural recovery
- Alternative 2 (see the attachment)—removal of significantly elevated dioxin concentrations (i.e., 100 nanograms per kilogram [ng/kg])[1] and other hazardous substances above screening levels and placement of an enhanced natural recovery (ENR) layer in these areas to address residuals
- Alternative 3 (see the attachment)—same as Alternative 2 but with additional ENR placement in areas of somewhat elevated dioxin concentrations (i.e., sample locations LRIS-CL-07 and LRIS-CL-09)[2]
- Alternative 4 (see the attachment)—removal of dioxin concentrations above 100 ng/kg and ENR placement in all areas above the cleanup level (CUL) of 5 ng/kg

Alternatives 2, 3, and 4 are evaluated here in terms of technical feasibility and cost/benefit associated with reduction of concentrations of dioxins (evaluated as toxicity equivalents [TEQs]).

The scenarios were selected based on the spatial distribution of dioxin concentrations in surface and subsurface sediment. Measured dioxin TEQ concentrations for surface and subsurface sediment (see the attachment) were used to estimate both the lateral and vertical dredging footprints for each scenario. In each scenario, any surface or interval (e.g., 1- to 2-foot interval) with measured concentrations above the scenario target (i.e., 100 ng/kg in this example) would be removed. This would effectively result in 2 feet of neatline removal in LRIS-CL-01 and LRIS-CL-04, and 3 feet of neatline removal in LRIS-CL-02 for all scenarios (see the attachment). The ENR placement would cover residuals generated during dredging for Alternative 2, while Alternative 3 additionally includes ENR for some undredged areas. Alternative 4 is the same as Alternative 3 but includes ENR for all sediment with concentrations above the practical quantitation limit-based CUL of 5 ng/kg dioxin TEQ. All scenarios include long-term monitoring of the ENR layer to ensure continued dioxin TEQ reductions.

In all areas except the highly impacted locations LRIS-CL-01, -02, and -04, dioxin congeners are found at levels below risk-based CULs for ecological receptors, and therefore all remedies are expected to result in postremedial conditions protective of ecological receptors. Risk-based CULs for ecological receptors are identified in the remedial investigation and feasibility study (RI/FS) as remediation levels. In the event that a connection between Carty Lake and the Columbia River is restored (see Section 2.8.4 in the main body of the RI/FS), access for salmonids such as cutthroat trout and coho salmon could be achieved. The fish CUL developed for Carty Lake relies on a species sensitivity distribution described by the Oregon Department of Environmental Quality

---

[1] "Elevated dioxin concentrations" are defined here as 100 ng/kg dioxin TEQ for purposes of cost/benefit comparison; if additional dioxin data are collected, the analysis will be reevaluated to optimize the benefit to cost.

[2] If additional dioxin data are collected, areas of ENR placement may be modified; for purposes of this feasibility and cost/benefit comparison, the areas represented by sediment samples LRIS-CL-07 and LRIS-CL-09, both above 30 ng/kg dioxin TEQ, are included.

(based on four species endpoints, including immature coho salmon [*Oncorhynchus kisutch*] and immature rainbow trout [*Oncorhynchus mykiss*]), and therefore is likely protective of juvenile salmonids.

1. Concentration Reduction

To evaluate the dioxin TEQ concentrations anticipated in postremedy conditions, surface weighted average concentrations (SWACs) were calculated for each scenario. SWACs are used to evaluate remedy protectiveness of beneficial uses represented by aquatic-dependent wildlife and potential human seafood consumption. SWACs were calculated by generating Thiessen polygons for each dioxin sample result in the study area (see the attached figure). Only areas initially above the CUL of 5 ng/kg dioxin TEQ (see Section 2) were included in SWAC calculations. Thiessen polygons define the area around each sample point, using an algorithm to calculate the location of a boundary midway between available points. Each Thiessen polygon is then assigned the concentration represented by the sample it encompasses. In this way, the concentrations are spatially weighted, based on the area the polygon represents. This technique is well established and in use throughout the country at sediment remedial sites (see the attachment, which provides details on the SWAC calculation methods and assumptions). In brief, the predicted postdredge concentration was initially determined from sample results. Next, the concentration at the bottom of the dredge cut was presumed to fully mix with the 1-foot ENR sand layer, so concentrations of the sand layer and the postdredge surface were averaged for the resultant SWAC. Similarly, 100 percent mixing between surface sediment and ENR sand was assumed for each area receiving only ENR treatment. This is a conservative assumption, as 100 percent mixing is unlikely and resulting surface concentrations are therefore likely to be lower at the point of compliance (i.e., the top 10 centimeters of the resulting Lake River bottom) than assumed for these hypothetical scenarios. The resulting postremedy SWACs for each scenario are shown in Table T-1. This evaluation is an initial conservative estimate, and more specific information will be collected during the design phase to refine estimates.

2. Comparison with CUL

A dioxin TEQ CUL of 5 ng/kg was selected for protection of human health, based on a reliably attainable practical quantitation limit (Section 6 of the report). No scenario meets the CUL, based on postremediation SWAC estimates.

A human health risk-based CUL for human fish consumption at Carty Lake was not developed, given the absence of reliable information on fish consumption rates for Carty Lake. The fish consumption model described for Lake River (see Appendix M) was used to calculate the amount of fish that could be consumed to meet the acceptable risk level (ARL) of 1×10^{-6}, with the exception that a site-specific organic carbon content value of 0.029 for Carty Lake was used. To evaluate the relative benefits of each scenario, the amount of fish per year that could be consumed to meet the ARL of 1×10^{-6} was calculated (see Table T-2).

All scenarios are expected to meet ecological CULs protective of ecological receptors for individual dioxin congeners; in all areas except the highly impacted LRIS-CL-01, -02, and -04 (which would be dredged under each alternative to depths at which congeners are below CULs), dioxin congeners are currently found at levels below risk-based CULs for ecological receptors (see Section 6 of the main body of the RI/FS text).

3. Feasibility

Evaluation of technical feasibility is especially important when considering dredging remedies. A primary consideration is generation of dredging residuals. Generated residuals are sediment disturbed or resuspended during dredging that settles back to the sediment bed. A range of factors can impact residuals generation, including dredging methods, sediment geotechnical and geophysical characteristics, and physical site conditions. Residuals are expected to result from dredging and are addressed by placement of a clean sand layer. The uncertainty associated with estimating the nature and extent of residual contamination can make prediction of dredging effectiveness difficult and achieving levels in the low parts per trillion highly ambitious (see Appendix S). A residuals analysis was not conducted for Carty Lake, since limited subsurface data are available. However, methods such as best management practices may help to limit residuals recontamination, but dredging areas close to 10 ng/kg may result in marginal dioxin reductions (see Appendix S). Dredging studies show that residuals contamination, combined with dredging disturbance of sequestered contamination at depth, can actually increase postremedial concentrations[3] in areas with relatively low surface contamination. Thus it is crucial to carefully consider the limited benefits of dredging to address areas of lower dioxin concentrations (minimal dioxin TEQ reductions), with additional monetary costs certain. In addition, placement of ENR throughout most of Carty Lake (i.e., Alternative 4), which is generally shallow, may have significant short-term effects on aquatic biota and fundamentally alter its bathymetry.

In the future, The U.S. Fish and Wildlife Service may consider the feasibility of reconnecting Carty Lake either to the Columbia River via Gee Creek or to Lake River through a constructed channel. Of the two options, the Gee Creek connection would likely be most feasible in terms of construction and access for salmonids such as cutthroat trout and coho salmon. The resulting hydrology of the lake could vary considerably, depending on the option selected; however, some changes to the fish, wildlife, and vegetation communities would be expected and implementation would need to consider potential for contaminant impacts to fish and potential for contaminant migration.

4. Conclusion

Table T-1 shows the anticipated reduction of dioxin concentrations upon implementation of Alternatives 2 through 4. Alternative 2 results in a dioxin TEQ reduction of nearly 50 percent and is expected to achieve ecological CULs. This is the preferred scenario for the following reasons:

- Alternative 2 targets the areas most impacted by dioxins and other hazardous substances and is expected to achieve ecological CULs.
- Alternative 2 results in nearly the same postremedial dioxin TEQ SWAC as Alternative 3, and is more cost effective because of less ENR placement (Alternative 2 is estimated at approximately $700,000 less than Alternative 3; see Appendix R).

---

[3] Patmont, C., and M. Palermo. Case studies of environmental dredging residuals and management implications. Proceedings, Fourth International Conference on Remediation of Contaminated Sediments, January 22-25, Savannah, Georgia. 2007.

- While Alternative 4 results in more significant reduction in dioxin concentrations than Alternatives 2 and 3, the resulting increase (approximately 1 ounce per year) in the amount of fish that could be consumed to meet the ARL is marginal (see Table T-2).
- Alternative 4 results in greater postremedial dioxin TEQ reduction than Alternative 2, but also does not immediately meet the CUL of 5 ng/kg and is significantly more invasive, resulting in potentially extreme short-term impacts to aquatic biota.
- Alternative 4 is significantly less cost effective, at approximately 5.7 and 5 million dollars more than Alternatives 2 and 3, respectively (see Appendix R).

Alternative 4	12	1.9E-04	0.069	2.4

NOTES:

Model used to generate estimates based on Lake River Human Fish Consumption Model presented in Appendix N; Carty Lake site-specific f(oc) of 0.029 was applied.

Postremedy estimates are reported to one significant figure.

ARL = acceptable human health risk level (1X10^{-6}).

f(oc) = fraction of total organic carbon in surface sediment.

kg/day = kilograms per day.

kg/yr = kilograms per year.

ng/kg = nanogram per kilogram.

oz/yr = ounces per year.

SWAC = surface weighted average concentration; calculated using only areas initially above 5 ng/kg dioxin TEQ.

TEQ = toxicity equivalent.

ATTACHMENT

DREDGE VOLUME AND SWAC ANALYSIS

ATTACHMENT—DREDGE VOLUME AND SWAC ANALYSIS

Overview

This document provides the methods and results of an analysis of the relationship between estimated volume of sediment dredged and concomitant reductions in Carty Lake postremedial surface sediment dioxin toxicity equivalent (TEQ) concentrations. Variations of the general dredging scenario, dredging with enhanced natural recovery (ENR), were addressed to span potential approaches intended to reduce dioxin concentrations. Alternative 2 consists of dredging specified areas (generated via Thiessen polygon analysis; see below) and placement of a 1-foot ENR layer (i.e., sand cover) over all areas dredged. ENR would cover any residuals generated during dredging. In Alternative 3, a 1-foot-thick ENR layer is additionally placed over all undredged areas exceeding 30 nanograms per kilogram (ng/kg) TEQ. Areas exceeding 5 ng/kg dioxin TEQ would be treated with ENR in Alternative 4. All scenarios include long-term monitoring of the ENR layer to ensure continued dioxin TEQ reductions. Resulting estimated dioxin TEQ surface concentrations for the alternatives are shown in the attached figure.

Dioxin TEQ and Volume Analysis

Surface Weighted Average Concentration Analysis

The shape and surface area of potential areas to be dredged were identified using the "Build Thiessen Polygons" tool in the XTools Pro (ver. 8.0) toolset for ArcGIS 10. Briefly, Thiessen polygons are the polygons generated from points, defined by the perpendicular bisectors of the lines between all points and drawn so that each polygon bounds the region that is closer to one point than to any adjacent point.

In this analysis, sample locations represent the points used to define polygons; associated sample dioxin TEQ concentrations at surface and at depth were assigned to polygons generated for Carty Lake. A surface weighted average concentration (SWAC) approach was used to estimate overall current dioxin concentrations, where:

$$SWACc = \sum (SAi / TSA) * SCi))$$

SAi is the surface area of the ith polygon, TSA is the sum of all polygon surface areas, and SCi is the current measured surface concentration (SC) of the ith polygon. Only areas exceeding 5 ng/kg were included in all evaluations. This calculation indicates that current dioxin SWAC is 44 ng/kg.

The SWAC technique is well established and in use throughout a broad range of sciences, as well as at many nationally known sediment remedial investigation sites, including the Hudson River, the Portland Harbor Cleanup, the Duwamish River Cleanup, the Lower Passaic River Cleanup, and Fort Ord. With respect to exposure to sediment contamination, such as via fish consumption, exposure to larger areas rather than discrete locations are more realistic given that anglers are likely to use different fishing locations from time to time, based on fish abundance, which can be seasonal or vary year to year. Therefore, using a SWAC is expected to be conservative with respect to anticipated human consumption patterns. Similarly, nonsessile aquatic organisms also use different locations throughout the aquatic environment, and thus a spatial averaging of concentrations may best represent expected contamination exposure.

Dredge and ENR Volumes

Three dredge and ENR scenarios were evaluated:

- Alternative 2—removal of significantly elevated dioxin concentrations and other indicator hazardous substances above screening levels and ENR placement in these areas to address residuals
- Alternative 3—same as Alternative 2 but with additional ENR placement in areas of somewhat elevated dioxin concentrations (i.e., sample locations LRIS-CL-07 and LRIS-CL-09)
- Alternative 4—removal of dioxin concentrations above 100 ng/kg and ENR placement in all areas above the CUL of 5 ng/kg

For each of the Alternatives (2, 3, and 4) described, the final calculated dredge removal volume included neatline (NL) dredge volume, an additional 1-foot overdredge (OD), and a 10 percent contingency. Dredge volume was the same for each scenario. Dredge volumes will be refined following collection of additional data during predesign activities. Associated ENR sand volumes were assigned a 20 percent contingency.

Estimates of dredge volumes and hypothetical final surface concentrations (FSCs) were calculated under the following assumptions:

- For each scenario, all polygons with SCs > 100 ng/kg were targeted for at least 1 foot NL depth removal. This included LRIS CL-01, -02, and -04.
  - At LRIS CL-01 and -04, the 1- to 2-foot intervals were below 10 ng/kg dioxin TEQ, and thus only an additional 1 foot OD removal was assumed.
  - At LRIS CL-02, the 1- to 2-foot interval is elevated (130 ng/kg dioxin TEQ), whereas the 2- to 3-foot interval is 2.5 ng/kg. Thus, 2 feet NL depth removal with 1 foot OD was assumed.
- For each scenario, dredge volume for each polygon (DVi) was calculated as:
  - DVi (cubic yards) = DRi (yards) * SAi (square yards); DRi is the calculated dredge removal depth of the ith polygon plus a 1-foot OD; SAi is the surface area of the ith polygon.
- Dredge volume total (DVTx) for each scenario (Table 1) includes a 10 percent contingency and was calculated as: $DVTx = \sum DVi + 0.1 * \sum DVi$. Total dredge volume was 5,649 cubic yards for all scenarios.

- Total ENR volume for each scenario (in all scenarios ENR is placed over the dredged area, and there are additional areas for Scenarios B and C—those currently exceeding 30 ng/kg or 5 ng/kg, respectively) is shown in Table 1, assuming a 20 percent contingency.
- SWACs following each scenario (SWACx) were calculated as follows:
  - SWACx = ∑ (SAi / TSA) * FSCf)); SAi is the surface area of the ith polygon, TSA is the sum of all polygon surface areas, and FSCf is the FSC for the ith polygon (if dredged and treated with ENR, FSCf = FSCi; if not dredged, FSCf = SCi).

The FSC for each dredged polygon (FSCi) was calculated assuming 100 percent mixing between FSCf and the ENR sand concentration. ENR sand is estimated as 0.365 ng/kg, based on measured mean dioxin TEQ concentrations for Columbia River sand used in previous sediment sand cap remedies.[1] Although 100 percent mixing is unlikely to occur in all areas, this calculation represents a conservative estimate of final surface sediment concentration for dredged areas treated with ENR. Similarly, 100 percent mixing was assumed for undredged areas treated with ENR only.

For a summary of dredge depths estimated for all scenarios evaluated, see Table 1. Final SWACs for all scenarios are summarized in Table 2.
