1.0 INTRODUCTION

1.1 BACKGROUND

This Final Remediation Report documents the cleanup action completed at the Richardson Airways Washdown Site (site), located at the Yakima Air Terminal (Air Terminal) at 2400 West Washington Avenue in Yakima, Washington (Figure 1). Richardson Airways is located inside the southeast corner of the Air Terminal near the North-South Taxiway. The site area is outlined on Figure 2.

The cleanup action was conducted to satisfy the requirements set forth in Consent Decree No. 08-2-04863-1 (Consent Decree) between the City of Yakima (City) and Yakima County (County) and the Washington State Department of Ecology (Ecology). Cleanup activities were completed following supplemental soil investigations conducted by Landau Associates at the site in April and June 2009. Cleanup activities were conducted in accordance with criteria outlined in the Cleanup Action Work Plan (CAWP) (Landau Associates 2009a) and CAWP Addendum #1 (Landau Associates 2009b) and the methods and procedures specified in the project Plans and Specifications (Yakima, City of 2009).

The primary objective of the cleanup action was to remove soils at the site containing concentrations of contaminants of concern (COCs) above the Washington State Model Toxics Control Act (MTCA) Method B soil cleanup levels (Ecology 2009). The primary COCs identified at the site included the pesticides and herbicides Aldrin, Dieldrin, Chlordane (alpha and gamma), DDT, DDD, DDE, Dinoseb, Endosulfan I (alpha and beta), Endosulfan Sulfate, Endrin, Endrin Aldehyde, Endrone Ketone, Methoxychlor, Toxaphene, 2,4,5-TP, and 2,4-D. Specific elements of the cleanup action included the following:

- Removing the top 2 feet (ft) of soil across the majority of the washdown area and removing deeper soil to a maximum depth of 6 ft in selected areas of the site.
- Loading and transport of contaminated soils to a Subtitle D solid waste landfill for disposal.
- Confirmation sampling and analysis to document performance of the remedial excavation.
- Backfilling and compaction of the excavation with approved clean fill, and grading of the site.

This report has been prepared to document the satisfactory completion of the cleanup action at the site and meet the MTCA requirements for a Final Remediation Report. The overall objective of this report is to document that the construction activities were completed in conformance with the CAWP, CAWP Addendum #1, and the associated construction Plans and Specifications.

1.2 REPORT ORGANIZATION

Section 2.0 of this report presents a summary of site conditions, and Section 3.0 presents a summary of the cleanup action construction activities. Section 4.0 presents the conclusions. Section 5.0

presents the Professional Engineer's statement regarding implementation of the cleanup action, and Section 6.0 presents the references for this document.

2.0 SITE CONDITIONS

This section presents a brief summary of site conditions relevant to the cleanup project. Additional details are included in the Sample and Analysis Plan (SAP; Landau Associates 2009c), CAWP, and CAWP Addendum #1.

2.1 SITE LOCATION

The Richardson Airways site is located at the Yakima Air Terminal (Air Terminal), 2400 West Washington Avenue, in Yakima County, Washington. The site is near the southern edge of the City, approximately 2 miles west of Interstate 82. Primary access is from Airport Lane and Alhtanum Road to the south. A site map is provided on Figure 2.

The site includes all areas where soil had come to be contaminated due to the operation of Richardson Airways, Inc. including, but not limited to, the real property legally described as follows:

Commencing at the Northwest corner of Section 2, T. 12N., R. 18E., W.M. Thence S 89°53'29" E along line of the Northwest quarter of said section a distance of 2013.08 feet; thence 00°25'05" E a distance of 1531.05 feet to a point in the North-South fence line West of the North-South Runway, said point being the True Point of Beginning. Then N 00°25'05" W along said fence line, and the extension thereof a distance of 186.27 feet, thence N 89°02'42" E a distance of 62.17 feet, Thence N 03°01'46" E a distance of 77.20 feet, Thence S 88°54'21" E a distance of 27.33 feet, Thence S 03°42'46" E a distance of 263.63 feet, Thence S 89°34'55" W a distance of 109.28 feet, to the point of the beginning.

The area of concern is referred to as the "washdown area." It is located near the southeast corner of the Air Terminal property adjacent to the North-South Taxiway of Runway No. 34. At the washdown area, pesticides and herbicides were rinsed off aerial spray equipment.

2.2 SITE FEATURES

The site includes an approximately 17,000-square foot (ft²) washdown area located immediately southeast of the former Richardson Airways office and hangar buildings. The site is within the fenced airport boundary and access by the general public is restricted. The site is generally flat, with a ground surface elevation of approximately 1,050 ft above mean sea level (MSL). A perennial stream, called Bachelor Creek, is located approximately 450 to 500 ft to the north, and the Yakima River is located approximately 3½ miles to the east.

2.3 SITE HISTORY

The Air Terminal is currently owned and operated jointly by the City and County. Richardson Airways was operated on the airport property as an aerial pesticide application service for the regional agricultural industry between the 1950s and 1990s. Mr. Ralph Richardson leased the site from the Air Terminal for crop spraying operations and reportedly used the site for filling, mixing, and routine washing of pesticides and herbicides from spray equipment.

Soil sampling conducted at the site by Ecology in 1988 revealed soil contamination from chlorinated pesticides and herbicides. Ecology, Richardson Airways, and the Air Terminal subsequently entered into an Agreed Order (DE 91 TC-C455) in 1992 to conduct a Remedial Investigation/Feasibility Study (RI/FS) at the site. Ecology accepted the Final RI/FS Work Plan on October 5, 1992; the RI/FS was accepted by Ecology on December 10, 1993. In 1997, Ecology entered into a Consent Decree with potentially liable parties that required groundwater monitoring and placement of a restrictive covenant on the property. In 2008, Ecology entered into a new Consent Decree with the City and County to pursue soil cleanup at the site in order to accommodate future site development. The final Cleanup Action Plan (CAP) prepared by Ecology (Ecology 2008) included a supplemental soil investigation to further characterize the nature and extent of contamination, and the removal and offsite disposal of contaminated soil from the site.

2.4 ENVIRONMENTAL SITE CONDITIONS

The primary conclusions regarding site environmental conditions prior to completion of the cleanup action are summarized as follows:

- Soil sampling conducted at the Richardson Airways washdown area by Ecology in 1988 revealed soil contamination from chlorinated pesticides and herbicides.
- A Remedial Investigation/Feasibility Study was completed at the site by CH2MHill in 1993 (CH2MHill 1993). Soil sampling was conducted and monitoring wells were installed at the Richardson Airways site. The presence of chlorinated pesticides and herbicides above soil cleanup levels at the washdown area was confirmed. It was determined that groundwater was not impacted by pesticides or herbicides.
- In April 2009, Landau Associates conducted a supplemental investigation at the washdown area to further evaluate soil conditions. Samples were collected from 15 soil borings (DP1 through DP15) and analyzed for chlorinated herbicides and pesticides. Based on the results from the supplemental investigation and data presented in the previous remedial investigation by CH2MHill, pesticides were generally present in the upper 1.5 ft of soil across the area of concern. Herbicides were generally limited to small discrete areas within the upper 1.5 ft of soil. The results of the supplemental investigation are summarized in the Supplemental Investigation Data Report (Landau Associates 2009d).
- In June 2009, Landau Associates collected depth verification samples from four soil borings (DP16 through DP19). The samples were collected from similar areas and depths as the 1993

RI/FS and analyzed from various depth intervals to verify the 1993 results. The results indicated that COC concentrations had declined or were no longer present in some of the areas previously identified in the 1993 study. The verification results were thereby used to refine the anticipated horizontal and vertical limits for some areas of the planned excavation. The results of the verification sampling are summarized in the CAWP Addendum #1. Additionally, pre-excavation confirmation sampling was performed to define the excavation limits, as described in Section 2.5.

2.5 PRE-EXCAVATION CONFIRMATION SAMPLING

As indicated above, pre-excavation confirmation sampling was performed at the site in June 2009. In order to expedite the remedial excavation and avoid downtime delays during construction due to laboratory turnaround times for confirmation sampling, systematic confirmation sampling was conducted to determine the limits of the excavation prior to commencing excavation activities (as approved by Ecology). The proposed excavation was divided into a grid with 40 ft by 40 ft squares. A confirmation sample was collected from the excavation “base” (i.e., the anticipated maximum depth of the excavation based on previous investigation results) with a direct-push drill rig at the approximate center of each grid area. If the excavation area did not encompass the entire grid area, the sample was collected at the approximate center of the excavation area within that grid. Pre-excavation base samples were collected only from the 2-ft excavation limit. Additionally, confirmation samples were collected from the “side walls” of the excavation (i.e., locations along the edge of the anticipated horizontal footprint of the excavation) at intervals of approximately 50 lineal ft. A few of the initial sidewall samples contained concentrations of COCs above the cleanup level. In these instances, additional samples were collected by stepping out in 5 to 10 ft increments to collect additional samples. With the exception of a few locations where post-excavation confirmation samples needed to be collected to confirm the excavation limits and excavation depths greater than 2 ft (see Section 3.2.2), this approach successfully defined the limits of the excavation. Stakes were placed at the sidewall confirmation sample locations and GPS coordinates were collected at each confirmation sampling location. Figure 3 identifies the base confirmation samples (“B-” series samples) and sidewall confirmation samples (“SW” series samples).

3.0 SUMMARY OF CLEANUP ACTION CONSTRUCTION ACTIVITIES

This section presents a summary of the cleanup action activities performed by the selected contractor, Tri-Valley Construction of Yakima, Washington, as well as a summary of construction monitoring and oversight activities conducted by the City and Landau Associates.

Onsite construction activities were conducted between December 28, 2009 and January 18, 2010. Completed cleanup action activities generally included the following:

- Installation of temporary security fencing at the site
- Removal of asphalt from the north end of the site
- Removal and transport of contaminated soils to a Subtitle D solid waste landfill for disposal
- Confirmation soil sampling to demonstrate that contaminated soil was removed
- Importing and placing clean excavation soil backfill from an Ecology-approved source.

Selected site photographs of the construction activities are included in Appendix A. Field reports, submittals, and notes documenting the work are being maintained by the City and Landau Associates.

3.1 CONSTRUCTION SUMMARY

The cleanup action construction activities were implemented in a manner that was consistent and in compliance with the CAP, SAP, Consent Decree, accepted engineering practices, and the requirements specified in WAC 173-340-360. Details regarding completion of the cleanup action are summarized below.

3.1.1 SITE PREPARATION

Prior to the initiation of earthwork, the excavation boundaries were clearly marked with spray paint and survey stakes. Excavation equipment was mobilized to the site and temporary chain-link security fencing was installed around the north, south, and east boundaries of the site to separate the area from surrounding Air Terminal property during construction work. During soil removal activities, approximately 4,100 ft² of asphalt concrete pavement was removed from the north end of the site for disposal. The pavement debris was disposed at Anderson Rock and Demolition Pits.

3.1.2 SOIL EXCAVATION

Soil with COC concentrations above MTCA Method B soil cleanup levels identified in the CAWP and CAWP Addendum #1 was excavated using track-mounted equipment and loaded directly into trucks for delivery to the Terrace Heights Landfill. During cleanup activities, 2,665 tons (approximately 2,250 cubic yards, as measured in place) of soil was removed from the site. Soil disposal documentation is included in Appendix B. The depth to which soil was removed for disposal ranged from 2.0 to 6.0 ft

below ground surface (BGS). Following excavation, where pre-excavation confirmation samples were not collected or had not demonstrated reaching clean excavation limits (see Section 2.5), confirmation soil samples were collected from the base and sidewalls of the excavation and analyzed for constituents of concern to confirm that soil above cleanup levels had been removed (see Sections 3.2.3 and 3.2.4). Once the laboratory results confirmed that no impacted soil remained, the excavation was backfilled with clean imported fill. An as-built drawing of the final excavation limits is included in Appendix C. The project plans and specifications also specified the removal of existing storm drain piping if encountered during excavation. No piping was encountered and removed during excavation activities and pesticides concentrations in samples collected in the vicinity of the gravel fill, believed to be associated with the storm drain system, were below laboratory reporting limits.

3.1.3 EXCAVATION BACKFILLING AND COMPACTION

At the completion of soil excavation and confirmation sampling activities, the excavation was backfilled with clean engineered fill; chemical and physical testing results of the backfill are included in Appendix D. The fill was placed in 8- to 12-inch lifts and compacted to at least 95 percent of its maximum dry density using a vibratory drum roller. Compaction testing was conducted by Tri-Valley Construction's subcontractor PLSA of Yakima, Washington.

3.1.4 CONSTRUCTION QUALITY ASSURANCE/QUALITY CONTROL

Day-to-day construction quality control (CQC) was performed by the contractor, consistent with the requirements of the construction contract specifications for the cleanup action. A quality assurance (QA) representative from Landau Associates was also on site during construction to confirm that the work was performed in accordance with the intent of the project plans and specifications. In accordance with WAC 173-340-400(7)(b), the cleanup action construction activities were performed under the supervision of a professional engineer registered in the State of Washington or a qualified technician under the direct supervision of the engineer.

Construction QA, conducted in conjunction with the project plans and specifications, included the following monitoring parameters:

- General construction methods and equipment
- Field engineering and survey methods
- Fill gradation, quality, and consistency
- Fill placement and compaction
- Contractor quality control methods and documentation
- As-built dimensions of completed work.

Specific quantitative measures and performance requirements were established for each of the above CQC/QA parameters during final design and were incorporated into the construction specifications for the cleanup action.

3.2 COMPLIANCE MONITORING

MTCA requires compliance monitoring for all cleanup actions, as described in WAC 173-340-410, and periodic reviews under WAC 173-340-420. Compliance monitoring is typically conducted for the following three purposes:

- Protection monitoring, to confirm that human health and the environment are adequately protected during construction and the operation and maintenance of the cleanup action.
- Performance monitoring, to confirm that the cleanup action has attained cleanup standards and any other performance standards.
- Confirmational monitoring, to confirm the long term effectiveness of the cleanup action once the cleanup standards and other performance standards have been attained.

3.2.1 PROTECTION MONITORING

Monitoring for protection of human health addresses worker safety for activities related to construction, operation, and maintenance of the cleanup action. This was addressed by the project and contractor health and safety plans (HASPs). The project HASP (included as an appendix to the SAP) addressed potential physical and chemical hazards associated with site activities, consistent with the requirements of WAC 173-340-810. Anticipated potential physical hazards included working in proximity to heavy equipment. Potential exposure to site contaminants, although not anticipated to be significant during cleanup construction activities, included various exposure pathways (i.e., direct contact, ingestion, and inhalation) through contact with potentially contaminated soil.

Monitoring for protection of the environment addresses environmental receptors that may be exposed to physical or chemical hazards at levels that may cause adverse effects. For this project, the potential physical adverse impacts were limited to the presence of heavy construction equipment and open excavations. The chemical hazards from low-level impacted soil and exposure pathways were minimized by the proper use of personal protective equipment and limited dust generation due to moist soil conditions.

3.2.2 PERFORMANCE MONITORING

Performance monitoring for this cleanup action took the form of confirmational soil sampling and analysis activities. Specific procedures, sampling locations, and sampling frequency for the confirmation

sampling program are presented in the CAWP, CAWP Addendum #1, and SAP. Results of the confirmation sampling program are presented in Section 3.2.3 of this report.

In accordance with the CAWP and CAWP Addendum #1, systematic confirmation sampling was conducted to determine the lateral and vertical limits of the excavation. The SAP was prepared as a guidance document for all investigative and confirmation sampling activities. A summary of confirmation sampling activities is provided below.

Where pre-excavation confirmation samples were not collected or had not demonstrated reaching clean excavation limits (see Section 2.5), post-excavation confirmation samples were collected. Figure 3 presents the approximate locations of both pre- and post-excavation confirmation samples.

As excavation work proceeded, confirmation soil samples were collected from each grid area (that was not previously sampled) upon completion of the excavation for that grid (as practicable based on the configuration of the excavation of proximate areas) and submitted to the analytical laboratory for analysis as appropriate. Soil samples were submitted to an Ecology-accredited analytical laboratory to determine whether contamination from each area of the excavation has been successfully removed. Based on the analytical results, the excavation was extended vertically or horizontally and additional samples collected and analyzed at the discretion of the environmental professional.

3.2.3 CONFIRMATION SAMPLING RESULTS

Pesticides were detected above the MTCA Method B soil cleanup levels established for the site (Ecology 2009) in 6 of the 55 pre- and post-excavation soil confirmation samples. The remaining samples were either below their respective cleanup level and/or below the laboratory reporting limit. Herbicides, analyzed in pre-excavation confirmation samples, were not detected in any of the samples in which they were analyzed for, with the exception of one sample as discussed below. Post-excavation confirmation samples were analyzed for organochlorine pesticides only. More specifically:

- **Herbicide Samples:** Samples from locations B-1A, B-1B, SW1, SW2, SW10, SW11, DP-17, and DP-18 were collected and analyzed for herbicides concurrently with pre-excavation “depth” and “sidewall” confirmation samples. The samples contained no herbicide concentrations above the laboratory reporting limit, with the exception of the sample collected from boring DP-17 at 2 to 3 ft BGS which contained Dinoseb at a concentration of 1,000 micrograms per kilogram ($\mu\text{g}/\text{kg}$), which is below the cleanup level of 1,600 $\mu\text{g}/\text{kg}$. Therefore, no post-excavation samples were analyzed for herbicides.
- **Pre-Excavation “Base” Confirmation Samples:** Samples from locations B-1A, B-7A, B-1B, B-2B, B-3B, B-4B, B-5B, B-1C, and B-3C were collected and analyzed from a depth of approximately 2 ft BGS. Pesticide concentrations in samples from each of these sampling locations were below the laboratory reporting limit with the exception of one location (B-1A) where Endosulfan I was detected at a concentration (2.7 $\mu\text{g}/\text{kg}$) slightly above the reporting limit, but well below the cleanup level (4,300 $\mu\text{g}/\text{kg}$).

- **Pre-Excavation “Sidewall” Confirmation Samples:** Samples from the “SW” locations were analyzed in two rounds of analysis. Samples from locations SW1 through SW13, which defined the initially estimated boundaries of shallow soil contamination, were analyzed first. Sample pesticide concentrations from each of these locations were below the site cleanup levels with the exception of samples from locations SW1, SW3, SW4, and SW13. Therefore, samples from locations SW14, SW16, SW17, and SW25 (which were advanced approximately 5 ft radially outward from the four locations with exceedances) were analyzed. Sample concentrations from each of these locations were below cleanup levels except for the sample from location SW14, which contained Dieldrin at a concentration (15 µg/kg) slightly above the cleanup level (10 µg/kg). Due to the exceedance in SW14, the remedial excavation was extended beyond (northwest of) this point and additional post-excavation sidewall samples were collected, as described below.
- **Post-Excavation “Base” Confirmation Samples:** Confirmation samples B-2A, B-2C, and B-5A were collected from base excavation depths of 2 ft BGS; B-3A was collected from an excavation depth of 3 ft BGS; and B-5A and B-3C were each collected from excavation depths of 6 ft BGS. The concentrations of pesticides reported in samples from each of these locations were below the laboratory reporting limit.
- **Post-Excavation “Sidewall” Confirmation Samples:** Confirmation samples SW26 through SW33 were each collected from the 6 ft excavation sidewalls, at approximately 4 ft BGS; and samples SW35 through SW37 were each collected from the 2 ft excavation sidewalls at the northwest corner of the washdown area, at approximately 0.5 ft BGS. A concentration of Dieldrin was reported in sidewall sample SW35 at 47 µg/kg, which was above the cleanup level (10 µg/kg). Subsequent to additional soil removal, confirmation samples SW36 and SW37 were collected from locations west and north of SW35, respectively, to confirm that contaminated soil was adequately removed from the area where the lateral excavation limit was extended.

Confirmation sampling results are tabulated in Table 1. Laboratory analytical results are included in Appendix E.

3.2.4 CONFIRMATIONAL MONITORING

Confirmational monitoring to confirm the long-term effectiveness of the cleanup action would typically be implemented in instances where contamination is left in place following cleanup or where the potential exists for recontamination from an ongoing source. Because this cleanup action removed the impacted soil above the Ecology-approved cleanup level, no long-term confirmational monitoring is necessary or appropriate at the site.

4.0 CONCLUSIONS

Based on the satisfactory excavation and disposal of soils contaminated with pesticides and herbicides at concentrations above the MTCA Method B cleanup levels protective of groundwater, as confirmed by the results of final confirmation samples and as documented herein, the washdown area of the Richardson Airways site has been returned to "clean site status." Therefore, with submission of this Final Remediation Report, the City and County have completed their obligations under the Consent Decree.

Furthermore, the Restrictive Covenant presently on the property should be lifted per the conditions of the Consent Decree which states:

"If soil confirmation analyses confirm that MTCA Method B Protective of Groundwater has been achieved, the [March 26, 1998] Restrictive Covenant presently on the Site shall be removed from the property title."

5.0 PROFESSIONAL ENGINEER'S STATEMENT

Landau Associates was retained by the City of Yakima and Yakima County to complete the design and planning for the Richardson Airways Cleanup Action in Yakima, Washington. The City and County, as owners, completed contractor selection and provided construction QA monitoring and documentation of remedial construction activities.

As Landau Associates' and the site owner representatives, we hereby conclude that, to the best of our knowledge, the cleanup action construction and compliance monitoring activities summarized in this report have been satisfactorily completed in substantial compliance with the Ecology-approved Plans and Specifications for the Richardson Airways Cleanup Action, and other related project documents.

TABLE 1
CONFIRMATION SAMPLING RESULTS
YAKIMA AIR TERMINAL - RICHARDSON AIRWAYS
WASHDOWN SITE
YAKIMA, WASHINGTON

Notes

U = Indicates the compound was undetected at the reported concentration.

Bold = Detected compound.

Box = Initial exceedance of cleanup level. However, additional soil excavation was conducted in the area of exceedance and subsequent confirmation sampling demonstrated compliance with soil cleanup levels (see text for further discussion).

(a) = Listed values are for endosulfan.

(b) = Listed values are for endrin.

(c) = Listed values are for chlordane.

Site Photographs

1. View of former washdown area prior to excavation (looking south from northeast corner of site). December 28, 2009.

2. View of 2-ft excavation on south end of site (looking south-southwest from southeast edge of site). December 28, 2009.

3. View of 3-ft and 6-ft excavations on west half of site (looking north).
December 28, 2009.

4. View of 3-ft and 6-ft excavations on west half of site (looking south).
December 28, 2009.

5. View of 2-ft excavation at north end of site (looking west from northeast edge). January 4, 2010.

6. View from north end of excavation (looking south). January 4, 2010.

7. View from south end of excavation (looking north). January 4, 2010.

8. View of 6-ft excavation and gravel over stormwater drain line on east half of site (looking north). January 4, 2010.

9. View of clean soil backfill on north end of excavation (looking east-southeast from northeast corner). January 11, 2010.

Notes and Definitions

Report Specific Notes:

- A-01 - The MS/MSD were above acceptance limits.
- C - Calibration Verification recovery was above the method control limit for this analyte. Analyte not detected, data not impacted.
- C8 - Calibration Verification recovery was above the method control limit for this analyte. A high bias may be indicated.
- L - Laboratory Control Sample and/or Laboratory Control Sample Duplicate recovery was above the acceptance limits. Analyte not detected, data not impacted.
- M7 - The MS and/or MSD were above the acceptance limits. See Blank Spike (LCS).
- M8 - The MS and/or MSD were below the acceptance limits. See Blank Spike (LCS).
- R2 - The RPD exceeded the acceptance limit.
- R4 - Due to the low levels of analyte in the sample, the duplicate RPD calculation does not provide useful information.

Laboratory Reporting Conventions:

- DET - Analyte DETECTED at or above the Reporting Limit. Qualitative Analyses only.
- ND - Analyte NOT DETECTED at or above the reporting limit (MDL or MRL, as appropriate).
- NR/NA - Not Reported / Not Available
- dry - Sample results reported on a Dry Weight Basis. Results and Reporting Limits have been corrected for Percent Dry Weight.
- wet - Sample results and reporting limits reported on a Wet Weight Basis (as received). Results with neither 'wet' nor 'dry' are reported on a Wet Weight Basis.
- RPD - RELATIVE PERCENT DIFFERENCE (RPDs calculated using Results, not Percent Recoveries).
- MRL - METHOD REPORTING LIMIT. Reporting Level at, or above, the lowest level standard of the Calibration Table.
- MDL* - METHOD DETECTION LIMIT. Reporting Level at, or above, the statistically derived limit based on 40CFR, Part 136, Appendix B. *MDLs are listed on the report only if the data has been evaluated below the MRL. Results between the MDL and MRL are reported as Estimated Results.
- Dil - Dilutions are calculated based on deviations from the standard dilution performed for an analysis, and may not represent the dilution found on the analytical raw data.
- Reporting Limits - Reporting limits (MDLs and MRLs) are adjusted based on variations in sample preparation amounts, analytical dilutions and percent solids, where applicable.
- Electronic Signature - Electronic Signature added in accordance with TestAmerica's *Electronic Reporting and Electronic Signatures Policy*. Application of electronic signature indicates that the report has been reviewed and approved for release by the laboratory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Test America Cooler Receipt Form

WORK ORDER # SSL0005 CLIENT: landau PROJECT: Yakima

Date /Time Cooler Arrived 11/30/09 15:55 Cooler signed for by: NICHOLE HOBBS
(Print name)

Preliminary Examination Phase:

Date cooler opened: ☐ same as date received or 1/1/10

Cooler opened by (print) N/A - client delivered w/o cooler

1. Delivered by ☐ ALASKA AIRLINES ☐ Fed-Ex ☐ UPS ☐ NAC ☐ LYNDEN ☒ CLIENT ☐ Other: _____

Shipment Tracking # if applicable _____ (include copy of shipping papers in file)

2. Number of Custody Seals N/A Signed by _____ Date 1/1/10

Were custody seals unbroken and intact on arrival? ☐ Yes ☐ No

3. Were custody papers sealed in a plastic bag? ☐ Yes ☒ No

4. Were custody papers filled out properly (ink, signed, etc.)? ☒ Yes ☐ No

5. Did you sign the custody papers in the appropriate place? ☒ Yes ☐ No

6. Was ice used? ☒ Yes ☐ No Type of ice: ☐ blue ice ☐ gel ice ☐ real ice ☐ dry ice Condition of Ice: unknown

Temperature by IR Gun 6.8 °C Thermometer Serial # 81500

Acceptance Criteria: 0 - 6°C

7. Packing in Cooler: ☐ bubble wrap ☐ styrofoam ☐ cardboard ☐ Other: N/A

8. Did samples arrive in plastic bags? ☐ Yes ☒ No

9. Did all bottles arrive unbroken, and with labels in good condition? ☒ Yes ☐ No

10. Are all bottle labels complete (ID, date, time, etc.) ☒ Yes ☐ No

11. Do bottle labels and Chain of Custody agree? ☒ Yes ☐ No

12. Are the containers and preservatives correct for the tests indicated? ☒ Yes ☐ No

13. Is there adequate volume for the tests requested? ☒ Yes ☐ No

14. Were VOA vials free of bubbles? ☒ N/A ☐ Yes ☐ No

If "No" which containers contained "head space" or bubbles? _____

Log-in Phase:

Date of sample log-in 12/1/09

Samples logged in by (print) C. Hansen (sign) [Signature]

1. Was project identifiable from custody papers? ☒ Yes ☐ No

2. Do Turn Around Times and Due Dates agree? ☒ Yes ☐ No

3. Was the Project Manager notified of status? ☒ Yes ☐ No

4. Was the Lab notified of status? ☒ Yes ☐ No

5. Was the COC scanned and copied? ☒ Yes ☐ No
