Re: Phase II Environmental Site Assessment Letter Report
Store No. 1235 Proposed Fueling Center
2204-A Nob Hill Boulevard, Yakima, Washington

EPI Project No. 082132.1

Dear Mr. Johnson:

Environmental Partners, Inc. (EPI) is pleased to provide this letter report presenting the results of a recently completed Phase II Environmental Site Assessment (ESA) for a portion of the property located at 2204-A Nob Hill Boulevard in Yakima, Washington. The general location of this property is indicated on Figure 1.

This Phase II ESA focused on investigating the northeast portion of the parking lot of Safeway Store #1235. It is our understanding that Safeway Inc. (Safeway) is evaluating the feasibility of developing this area into a retail gasoline sales facility (i.e., fueling center). For the purposes of this Phase II ESA the term "subject property" shall refer only to the area being considered for development as a fueling center. This area is indicated on Figure 2. This Phase II ESA focused on investigating potential environmental impacts that may currently be present within the area of the proposed fueling center, and surrounding impacts that could effect environmental conditions within the fueling center.

EPI completed a Phase I ESA (January 29, 2001) of the subject property as part of Safeway's normal due diligence. The Phase I ESA revealed the following evidence of recognized environmental conditions in connection with the subject property:

- The **Tiger Oil CSCSL** and UST site (current Exxon) is located <0.125 miles northwest, up-slope, and adjacent to the subject property. The Tiger Oil site appeared to have impacted soil and ground water on the subject property and subsequent discussions with counsel for the subject property owners indicates that the subject property is within the bounds of the CSCSL site (statement amended by this letter report). According to the EDR report, the Ecology Site Status Relative to the MTCA Cleanup Process is "remedial action in progress". Regulatory reports reviewed at Ecology for the Tiger Oil site indicate both a separate-phase and dissolved-phase petroleum hydrocarbon plume are migrating to the southeast from the Tiger Oil property onto the subject property. The reports also indicate ground water and soil contamination concentrations above MTCA cleanup levels. Regulatory reports also indicate an interim remedial action system has been installed. The remediation system has been installed entirely

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

on the former Tiger Oil gas station in order to recover free product and impede further petroleum contamination migration onto the subject property. It was also installed in order to prevent further contamination migration into the county drainage improvement district (DID) line located north and east of the remediation system. This site represents a recognized environmental condition for the subject property. Ecology is reportedly drafting a final cleanup action plan for this site.

Subsequent to the completion of the Phase I ESA Safeway directed EPI to contact counsel for the current property owner and to discuss the site conditions with the consultant for the property owner. The consultant provided EPI with several additional documents for review.

The outcome of these conversations and additional document review indicated the following:

- The DID line appears to be acting as a cut-off trench for further eastward migration of separate-phase hydrocarbons and is also impeding the eastward migration of dissolved-phase hydrocarbons.
- The area east of the DID line has been identified as having a "Second Source." This Second Source appears to be associated with the historic use of the subject property by United Builders and has resulted in the presence of separate-phase hydrocarbons in monitoring well KMW-03. Previous investigations have not identified continuous separate-phase hydrocarbons extending from Tiger Oil to KMW-03.
- There appear to have been at least two underground storage tanks (USTs) associated with the former United Builders facility and at least two apparent dry wells were identified on historic site drawings. It is not known how many other undocumented USTs or dry wells may have been on the United Builders property.
- Ground water east of the DID line appears to be significantly impacted with gasoline-range petroleum hydrocarbons, diesel-range petroleum hydrocarbons, and aromatic fuel compounds.
- Recent conversations with Ms. Rachel Caron, the Ecology Site Manager for the Tiger Oil CSCSL site indicate that the eastern boundary of the Tiger Oil Site is the eastern limit of the backfill on the eastern side of the DID line. Ms. Caron provided EPI with the 1998 Enforcement Order against Tiger Oil which defines the site as:

"...bounded by South 24th Avenue to the west, West Nob Hill Boulevard to the north, by the Yakima County Drainage Improvement District storm drain line #4 (DID line) and surrounding soil and backfill on the east, by the extent of gasoline-contaminated water in the DID line to the southeast, and by the parking lot in front of Rite-Aid Drugstore to the south. These facility boundaries may be modified in the event that new data is received indicating that the extent of petroleum contamination has changed."

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

This description does not include the subject property but leaves open the possibility that the subject property could be added to the Tiger Oil Site in the future at the discretion of Ecology.

Historical use information from the Phase I ESA also suggested the following potential recognized environmental conditions:

- The 1950 and 1952 Sanborn Maps indicated that there was a "Spray MFG" building with associated storage tanks of "sulphur solution" located at the subject property.
- The southern half of the subject property appears to be an orchard in the 1955 aerial photograph and Sanborn Maps (dated 1920, 1950, 1952, 1959, 1962, 1967, and 1969) indicate that land beyond the represented structures at the subject property was most likely used as orchards.
- The 1959 and 1962 Sanborn Maps indicate that there were two paint shops located on the subject property.

OBJECTIVES

Based upon the findings of the Phase I ESA and upon EPI's review and discussions with representative of the property owner, EPI recommended the performance of a Phase II ESA of the subject property and immediately surrounding areas. After consultation with Safeway regarding its needs for the continued due diligence of the subject property, EPI developed a Phase II ESA designed to fulfill the following objectives:

- Establishing baseline soil and ground water (if present) conditions at the subject property prior to construction of a fueling center,
- Assessing the potential presence of on-going sources of ground water impacts in areas hydraulically up-gradient of the proposed fueling center, and
- Investigating potential impacts associated with former USTs at the subject property as well as historical uses of the subject property including a contracting yard and a spray manufacturing facility with sulphur solution tanks.

SCOPE OF WORK

EPI advanced a total of 25 soil borings using standard direct-push technology (DPT) sampling techniques in the locations indicated on Figure 3. Each boring was advanced to a depth of 12 feet below grade, which was about 2 to 5 feet below the upper surface of the water table aquifer.

During drilling, soil samples were collected at 2.5-foot vertical intervals and screened for the presence of volatile compounds using a photoionization detector (PID) and for separate-phase hydrocarbons

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

using sheen testing. The soil conditions encountered during drilling were described using the Unified Soil Classification System (USCS) visual-manual procedures (ASTM 2488D). The results of field screening and the soil conditions encountered during drilling are presented on soil borings logs in Attachment A.

Soil samples were selected for laboratory analysis based upon the results of field screening. A total of 33 soil samples were submitted for the analyses presented on Table 1.

Ground water was encountered in 25 of the boring locations at depths ranging from 8.5 to 10 feet below grade. Ground water grab samples were collected from the DPT sampling probe. At the appropriate depth the stainless steel screen was exposed to the surrounding saturated formation and a ground water sample was collected using a peristaltic pump and disposable tubing. After purging about 1 gallon of water from the formation, ground water samples were pumped directly into appropriate sample containers at a flow rate of less than 100 milliliters/minute.

Ground water samples were submitted for the analyses presented in Table 2. All ground water samples submitted for dissolved metals analysis were field filtered using a 0.45 micron filter and placed in containers preserved with nitric acid. Immediately upon collection, all soil and ground water samples were labeled and placed in an iced cooler pending submittal to the analytical laboratory. All samples were handled and transported under standard chain-of-custody protocols.

FINDINGS

Subsurface Conditions

Soils at the subject property generally consist of brown, soft, Sandy Silt with trace gravel. Detailed descriptions of the soil types encountered at each boring location and the results of field screening are presented on the boring logs in Attachment A.

Saturated conditions were generally first encountered at a depth of about 9 to 10 feet below grade and the static water level appeared to stabilize at a depth of about 8 to 9 feet below grade during this investigation. The investigation was performed in November and this water level likely represents the mid-range of seasonal variation in the water table elevation.

Previous investigations have consistently indicated that the hydraulic gradient is southeasterly on the eastern side of the DID line where the subject property is located.

The results of field screening indicated that an apparent zone of hydrocarbon impacts is present in soil at depth ranging from about 5 feet to 10 feet below grade in borings YSB-1, YSB-4, YSB-6, YSB-8, YSB-13, YSB-14, and YSB-20. The depth and occurrence of this zone of impacts is consistent with a smear zone resulting from the presence of separate-phase hydrocarbons (SPH).

Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

SPH were detected in ground water monitoring well KMW-03, and soil boring location YSB-1. The thickness of the SPH was 9.6 inches in YSB-1 and 3 inches in monitoring well KMW-03. The estimated extent of SPH at the subject property is shown on Figure 3.

Analytical Results

Soil Samples

A total of 33 soil samples were submitted for a range of laboratory analyses as indicated in Table 1. The results of soil sample laboratory analyses are summarized in Tables 3 and 4. Final laboratory analytical reports are presented in Attachment B.

Gasoline-range petroleum hydrocarbons (GRPH) were detected in 7 soil samples from borings YSB-1, YSB-4, YSB-5, YSB-13, and YSB-14. The detected concentrations ranged from 4 milligrams/kilogram (mg/kg) to 2,200 mg/kg and exceeded the MTCA Method A soil cleanup level of 30 mg/kg in samples YSB-1:11, YSB-4:9, YSB-13:10, and YSB-14:10.

Diesel-range petroleum hydrocarbons (DRPH) were detected in 10 soil samples from borings YSB-1, YSB-4, YSB-6, YSB-9, YSB-10, YSB-13, YSB-14, YSB-20, YSB-21, and YSB-23. The detected concentrations ranged from 52 mg/kg to 10,000 mg/kg and exceeded the MTCA Method A soil cleanup level of 2,000 mg/kg in samples YSB-6:11, YSB-13:10, and YSB-20:7.

Higher-range petroleum range petroleum hydrocarbons (HRPH) were detected in soil samples from borings YSB-4, YSB-6, YSB-8, YSB-9, YSB-11, YSB-21, YSB-22, and YSB-23. The detected concentrations ranged from 75 mg/kg to 3,300 mg/kg and exceeded the MTCA Method A soil cleanup level of 2,000 mg/kg in sample YSB-8:6.

BTEX compounds were detected in 5 soil samples from soil borings YSB-1, YSB-4, YSB-5, YSB-13, and YSB-14. The detected concentrations of benzene ranged from 0.1 mg/kg to 6.4 mg/kg and exceeded the MTCA Method A soil cleanup level of 0.03 mg/kg in samples YSB-1:11, YSB-13:10, and YSB-14:10. The detected concentrations of toluene ranged from 0.1 mg/kg to 3.1 mg/kg. None of the detected concentrations of toluene exceeded the MTCA Method A soil cleanup level of 7 mg/kg. The detected concentrations of ethylbenzene ranged from 0.1 mg/kg to 32 mg/kg and exceeded the MTCA Method A soil cleanup level of 6 mg/kg in sample YSB-14:10. The detected concentrations of total xylenes ranged from 0.2 mg/kg to 3.9 mg/kg. None of the detected concentrations of total xylenes exceeded the MTCA Method A soil cleanup level of 9 mg/kg.

Methyl tert butyl ether (MTBE) was detected in one soil sample (i.e., YSB-14:10) at a concentration that is above the MTCA Method A soil cleanup level of 0.1 mg/kg.

The following VOCs and their maximum concentrations were detected in soil samples collected from soil borings YSB-4, YSB-5, YSB-6, YSB-7, and YSB-23:

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

- Methylene chloride – 0.021 mg/kg;
- Ethylbenzene – 5.3 mg/kg;
- Isopropylbenzene – 0.94 mg/kg;
- N-propyl benzene – 3 mg/kg;
- S-butyl benzene – 0.22 mg/kg;
- N-butylbenzene – 0.51 mg/kg;
- 1,3,5-trimethylbenzene – 5.5 mg/kg;
- 1,2,4-trimethylbenzene – 17 mg/kg; and
- Naphthalene – 0.99 mg/kg.

According to laboratory reports, the concentrations of methylene chloride detected in soils at the subject property were "due to *laboratory contamination*". Of the remaining VOC concentrations detected in soils at the subject property, all were either below an applicable MTCA cleanup level, or there is no individual cleanup level available, or the compounds are regulated as a part of total petroleum hydrocarbons.

The following two semi-volatile organic compounds (SVOCs) and their maximum concentrations were detected in one soil sample (i.e., YSB-23:9) from soil boring YSB-23:

- Benzoic acid – 1.5 mg/kg; and
- Phenol – 1.7 mg/kg.

Neither of these SVOC concentrations exceeded a MTCA soil cleanup level.

Ground Water Samples

A total of 25 ground water samples were submitted for a range of laboratory analyses as shown in Table 2. It should be noted that ground water samples were not collected from wells with observable SPH. The analytical results for the water samples are summarized in Tables 5 and 6. Final laboratory analytical reports are presented in Attachment B. The distribution of dissolved-phase hydrocarbons and benzene discussed below, and presented in the referenced figures, were contoured using the Surfer software package and a "minimum curvature" algorithm.

GRPH were detected in 8 ground water samples from KMW-04, YSB-2, YSB-3, YSB-4, YSB-5, YSB-6, YSB-13, and YSB-14. The detected concentrations ranged from 120 micrograms/Liter ($\mu\text{g}/\text{L}$) to 20,000

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

µg/L and exceeded the MTCA Method A ground water cleanup of 800 µg/L in YSB-2, YSB-4, and YSB-13. The approximate distribution GRPH is indicated on Figure 6.

DRPH were detected in 16 ground water samples from KMW-04, YSB-2, YSB-4 through YSB-8, YSB-10 through YSB-14, YSB-16, YSB-20, YSB-21, and YSB-24. The detected concentrations ranged from 180 µg/L to 54,000 µg/L and exceeded the MTCA Method A ground water cleanup of 500 µg/L in KMW-04, YSB-2, YSB-4 through YSB-7, and YSB-10 through YSB-14. The approximate distribution of DRPH is shown on Figure 7.

HRPHs were detected in 12 ground water samples from YSB-2, YSB-5 through YSB-12, and YSB-14 through YSB-16. The detected concentrations ranged from 270 µg/L to 6,800 µg/L and exceeded the MTCA Method A ground water cleanup level of 500 µg/L in YSB-2, YSB-7, YSB-10, YSB-11, YSB-12, and YSB-14.

BTEX compounds were detected in 7 ground water samples from KMW-04, YSB-2 through YSB-5, SB13, and YSB-14. The detected concentrations of benzene ranged from 3 µg/L to 220 µg/L and exceeded the MTCA Method A ground water cleanup level of 5.0 µg/L in YSB-2, YSB-5, YSB-13, and YSB-14. The approximate distribution of dissolved-phase benzene is shown on Figure 8.

Toluene was not detected above the method detection limit of the method used in any of the ground water samples collected from the subject property.

Detected concentrations of ethylbenzene ranged from 1 µg/L to 1,000 µg/L and exceeded the MTCA Method A ground water cleanup level of 700 in sample SB-13.

Detected concentrations of total xylenes ranged from 15 µg/L to 451 µg/L. None of the detected concentrations of total xylenes exceeded the MTCA Method A ground water cleanup level of 1,000 µg/L.

MTBE was detected in 4 ground water samples collected from KMW-04, YSB-8, YSB-12, and YSB-14. The detected concentrations ranged from 4 µg/L to 16 µg/L. None of the detected MTBE concentrations exceeded the MTCA Method A cleanup level of 20 µg/L.

The following 12 VOCs and their maximum concentrations were detected in ground water samples from YSB-3 through YSB-7, YSB-13, YSB-20, and YSB-22 through YSB-24:

- Tetrachloroethene – 21 µg/L;
- Trichloroethene – 4 µg/L;
- Chloroethane – 5 µg/L;
- Isopropylbenzene – 77 µg/L;
- 1,3,5-trimethylbenzene – 370 µg/L;

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

- 1,2,4-trimethylbenzene – 1,500 µg/L;
- p-Isopropyltoluene – 3 µg/L;
- n-propyl benzene – 220 µg/L;
- s-butyl benzene – 6 µg/L;
- n-butyl benzene – 8 µg/L;
- Naphthalene – 450 µg/L; and
- 1-methylnaphthalene – 2 µg/L.

Tetrachloroethene, trichloroethene, and chloroethane are chlorinated hydrocarbons likely related to solvent use or the environmental degradation of a released solvent. The remaining VOCs detected in ground water are fuel-related compounds and are all common components of gasoline and diesel fuels.

Tetrachloroethene was detected in two samples (i.e., YSB-4, and YSB-20) at concentrations that exceed the MTCA Method A ground water cleanup level of 5 µg/L. Trichloroethene was not detected at a concentration above the MTCA Method A cleanup level. No MTCA ground water cleanup value is available for chloroethane.

Naphthalene was detected in ground water samples collected from YSB-3, YSB-4, YSB-5, and YSB-13. The concentrations of naphthalene ranged from 9 µg/L to 450 µg/L and exceeded the MTCA Method A ground water cleanup level of 160 µg/L for combined naphthalenes in one sample (i.e., YSB-13). The presence of naphthalenes in ground water at a concentration exceeding the MTCA cleanup levels makes naphthalenes a contaminant of concern in soil.

The remaining VOCs detected in ground water at the subject property are fuel-related compounds that are regulated as components of total petroleum hydrocarbons and are not regulated individually.

No SVOCs were detected above the method detection limit in ground water at the subject property.

One priority pollutant metal was detected in ground water at the subject property. Dissolved zinc was detected in sample YSB-23 at a concentration of 0.51 milligrams per liter (mg/L). The detected concentration of dissolved zinc is below the MTCA Method B ground water cleanup level of 4.8 mg/L.

No organochlorine pesticides were detected in ground water at the subject property.

EPI Project No. 082132.1
March 25, 2002

CONCLUSIONS

The following conclusions are supported by the findings of this Phase II ESA:

- Subsurface conditions at the subject property generally consist of soft, brown Sandy Silt with trace gravel. These soils appeared to have a relatively high hydraulic conductivity and all sampling locations freely yielded ground water.
- Ground water was encountered at an average depth of about 9 feet below grade. This finding suggests that it may be necessary to perform dewatering during underground storage tank (UST) installation, even with the use of sheet piling. The discharge and disposal of dewatering liquids is likely regulated by local Yakima County agencies if the water is placed into the sanitary sewer and by the Washington Department of Ecology (Ecology) and EPA if it is placed into the storm drains, applied to land, or reinjected into the subsurface.
- Ground water extracted during dewatering will likely require treatment prior to discharge. Treatment will be required to reduce turbidity and to remove petroleum hydrocarbons and BTEX compounds. EPI has successfully performed this type of treatment at other Safeway fueling center sites using an 18,000 gallon fractionation (i.e., settling) tank and a 16,000 gallon holding tank used for air sparging. Depending upon local regulations this can be performed as either a continuous or batch process and compliance monitoring is required before and during discharge. EPI has not explored the specific local permitting requirements.
- The results of field screening and laboratory analytical results for soil samples indicate that there is a smear zone of petroleum-contaminated soil (PCS) at the subject property which is likely the result of SPH and the seasonal variation in water table elevation. The approximate area of PCS is indicated on Figure 4 and the eastern portion of the impacted area overlaps the proposed location for the fueling center.
- Analytical results for ground water samples collected during this investigation indicate that the water table aquifer at the subject property is impacted with a variety of contaminants related to petroleum fuels. Several compounds, including GRPH, DRPH, HRPH, and benzene are present in the dissolved-phase at concentrations exceeding MTCA Method A ground water cleanup levels. The presence of these compounds is due to the SPH detected on the water table and the observed smear zone, both of which act as long-term sources of dissolution of the compounds to ground water. Without remediation of the smear zone and SPH the ground water at the subject property will remain contaminated for the foreseeable future.
- The chlorinated compounds detected during this investigation (i.e., perchloroethene, trichloroethene, chloroethane) appear to be present only at low level with only one compound, perchloroethene, detected at a concentration exceeding a MTCA Method A ground water cleanup level. These compounds are most likely associated with releases to

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 – Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

the former on-site dry wells. These compounds may be addressed during the soil and ground water remediation efforts. Regardless, these compounds represent a baseline condition and it is EPI's understanding that these compounds will not be used as part of Safeway's fueling center operations.

RECOMMENDATIONS

Based upon our understanding of Safeway's objectives for this Phase II ESA and on the future plans for development of the subject property, EPI makes the following recommendations:

- Prior to construction of the fueling center Safeway should secure an agreement with the property owner to excavate all of the smear zone soils and excavate the area of SPH. This action will result in the removal of the source of the ground water impacts observed at the subject property.
- During the smear zone and SPH excavation, as well as during the fueling center construction, ground water should be extracted at a high rate and treated prior to discharge. This approach couples dewatering and ground water remediation and allows for removal of a large volume of impacted ground water along with the source material for those impacts. This action seeks to minimize the contaminant load remaining in the ground water and facilitate natural attenuation of the remaining dissolved-phase contaminants. In the absence of source material and high concentration impacted ground water natural attenuation mechanisms will be more likely to address the residual dissolved-phase impacts.
- The subject property will remain impacted with dissolved-phase impacts after fueling center construction. It is highly unlikely that the actions noted above will bring the subject property into full compliance with the MTCA regulation. Therefore, Safeway should consider acquiring an indemnification for these baseline conditions.
- Installation and monitoring of three ground water monitoring wells within the boundary of the new fueling center. These wells should be 1) on the up-gradient boundary, 2) immediately down-gradient of the new USTs and pump islands, and 3) near the down-gradient edge of the new fueling center. Routine sampling and analysis of these wells will establish changes in ground water quality and facilitate the ability to determine if any changes in ground water quality are the result of normal variation in ground water quality or the result of a new release.
- Safeway should consider acquiring an indemnification or similar protection to assure that Safeway will be protected in the event the subject property is added to the Tiger Oil CSCSL site as a result of the baseline conditions.

Mr. Mitch Johnson, Safeway Inc.
Phase II Environmental Site Assessment
Store No. 1235 - Proposed Fueling Center
EPI Project No. 082132.1
March 25, 2002

- Safeway should consider an environmental holdback, or similar mechanism, to cover the costs of addressing environmental impacts that are currently undiscovered but may become apparent during fueling center construction. Such costs could include, but are not limited to, removal and remediation of undocumented UST or dry wells.

EPI appreciates the opportunity to be of assistance on this project. If you have any questions or comments please do not hesitate to contact me at (425) 889-4747.

1,2,3-TRICHLOROBENZENE	EPA-8260A	ND(<500)	.UG/KG	11/12/01	RAL

NOTE: CHROMATOGRAM INDICATES SAMPLE CONTAINS PRODUCTS WHICH ARE LIKELY DIESEL AND LUBE OIL

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:

GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 3 MG/KG

DIESEL RANGE REPORTING LIMIT IS 130 MG/KG

LUBE OIL RANGE REPORTING LIMIT IS 250 MG/KG

** UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS

NOTE: CHROMATOGRAM INDICATES SAMPLE CONTAINS UNIDENTIFIED LATE DIESEL RANGE PRODUCT AND LUBE OIL

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:

GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 3 MG/KG

DIESEL RANGE REPORTING LIMIT IS 25 MG/KG

LUBE OIL RANGE REPORTING LIMIT IS 50 MG/KG

** UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS

*** RESULT DUE TO LABORATORY CONTAMINATION

TPH-OIL RANGE	NWTPH-DX	560	UG/L	11/10/01	RAB

NOTE: CHROMATOGRAM INDICATES SAMPLE CONTAINS PRODUCTS WHICH ARE LIKELY WEATHERED GASOLINE,
DIESEL, AND LUBE OIL

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:

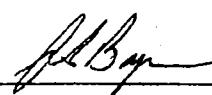

GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 50 UG/L

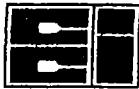

DIESEL RANGE REPORTING LIMIT IS 130 UG/L

LUBE OIL RANGE REPORTING LIMIT IS 250 UG/L

** UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS

*** ANY POSITIVE MTBE RESULT SHOULD BE CONFIRMED BY GC/MS ANALYSIS

* "ND" INDICATES ANALYTE ANALYZED FOR BUT NOT DETECTED AT LEVEL ABOVE REPORTING LIMIT. REPORTING LIMIT IS GIVEN IN PARENTHESES OR AS FOLLOWS:
GASOLINE(VOLATILE RANGE) REPORTING LIMIT IS 50 UG/L
DIESEL RANGE REPORTING LIMIT IS 130 UG/L
LUBE OIL RANGE REPORTING LIMIT IS 250 UG/L

** UNITS FOR ALL NON LIQUID SAMPLES ARE REPORTED ON A DRY WEIGHT BASIS
