

What Happens During Soil Removal

Tacoma Smelter Plume

August 2018

This handout explains the soil removal and replacement process on a typical yard. Before construction, the homeowner provides access to the work area of the yard. This may include clearing yard furniture, play equipment or other personal items from the area.

1

The contractor brings equipment to the site.

2

The crew installs fencing. Fencing creates safe access to your home and insures pets and children stay out of the work area.

3

During construction, the contractor removes the top 12 to 18 inches of contaminated soil. They also remove grass and plants.

4

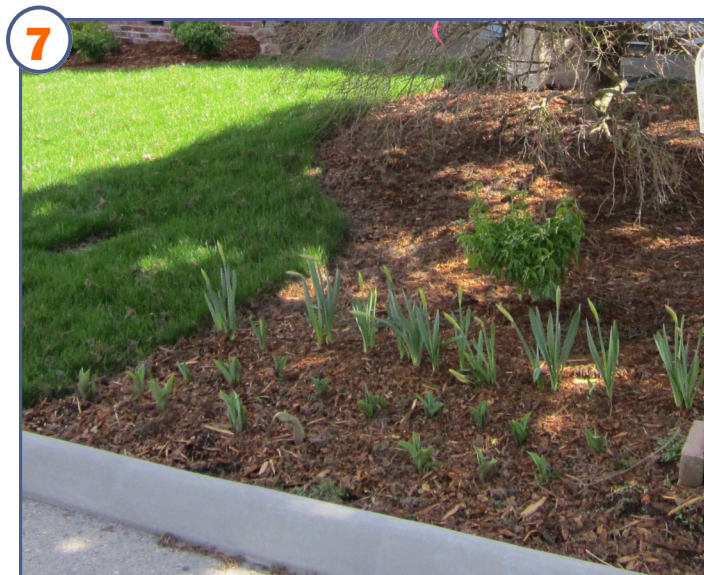

The contractor delivers clean soil to your yard.

5 They spread the soil and level it to the pre-existing grade.

6 They deliver sod or other landscape materials to your yard.

7 They replace shrubs and plants with younger versions. They replace the lawn with sod or hydroseed.

8 The contractor maintains the new lawn for the first 60 days. They may leave fences in place during this time. After this, lawn and landscape care is up to you.
