1.0 INTRODUCTION

This *Remedial Investigation* (RI) is being furnished to the Washington Department of Ecology's (Ecology) *Voluntary Cleanup Program* (VCP) in accordance with 173-340-350 (7) of the Washington Administrative Code (WAC). The VCP address, applicant contact and designated consultant contact are listed in Table 1-1.

Table 1-1. Site Information

Site Name:	Former Cherry Custom Cleaners
Site Address:	2510 East Cherry Street
City, State, Zip Code:	Seattle, Washington 98122
Facility ID Number:	4765174
Cleanup ID:	4175
VCP ID:	NW2009
Owner/Operator Name:	Ms. Vera Benton
Mailing Address:	P.O. Box 145
City, State, Zip Code:	Grand Coulee, Washington 99133
Project Consultant	ECC Horizon
Mailing Address:	8383 Craig Street
City, State, Zip Code:	Indianapolis, Indiana 46250
Telephone Number:	317-595-4400
Designated Point of Contact:	Mr. James P. Hogan, Registered Geologist

In an effort to provide a clear and comprehensive report suitable for efficient review by Ecology, the contents of this RI are reported per Ecology's *Remedial Investigation Outline*, dated July 2009. The purpose of the RI is to collect and evaluate sufficient information to develop and evaluate technically feasible cleanup alternatives in accordance with WAC 173-340-360 through 173-340-390. An RI also provides sufficient data to develop a conceptual site model for use in evaluating potentially feasible remediation technologies. Upon Ecology's approval of the RI, ECC Horizon will prepare a *Feasibility Study* (FS) for Ecology's review.

2.0 SITE IDENTIFICATION AND LOCATION

2.1 Site Discovery and Regulatory Status

The site was discovered following an initial site characterization conducted by Adapt Engineering, Inc. (Adapt) in June of 2007. The release was subsequently reported to Ecology and entered into the VCP. The site is currently in the RI stage of the MTCA process as shown on Table 2-1.

Table 2-1. Regulatory Status

Step		Status
1.	Site Discovery and Initial Investigation	Complete
2.	Site Hazard Assessment and Hazard Ranking	Not Applicable – entered into VCP
3.	Remedial Investigation	Pending VCP Review
4.	Feasibility Study	Ongoing
5.	Cleanup Action Plan	Ongoing
6.	Site Cleanup	Incomplete

2.2 Site Location/Definition

The site was created as a result of tetrachloroethene (PCE) released to the soil and groundwater. The site is thus defined by the presence of chlorinated volatile organic compounds (cVOCs) in soil and groundwater that exceed the Model Toxics Control Act Method A Cleanup Levels (MTCA A CLs).

The site is located between First Hill and Lake Washington along the East Cherry Street corridor, which is approximately 2 miles east of downtown Seattle, Washington, as shown in Figure 1. It is bound between 25th Avenue to the west and 27th Avenue to the east. It is also bound to within 150 feet north of and 100 feet south of East Cherry Street. The ground surface elevation in this area is between 280 and 285 feet above mean sea level (msl). The site boundary is reflected by the soil borings, monitoring wells and vapor intrusion assessment locations shown on Figure 2. The potential source areas within the site are shown on Figure 3.

3.0 ENVIRONMENTAL INVESTIGATION/INTERIM ACTION SUMMARY

The constituents of concern in this matter are PCE and its daughter products trichloroethene (TCE), cis-1,2-dichloroethene (c-DCE) and vinyl chloride (VC) in soil, groundwater and air. The voluntary cleanup activities conducted thus far are summarized in Table 3-1.

Table 3-1. Voluntary Cleanup History

Year	Purpose	Contractor	Sample Location
2007	Soil & groundwater investigation	Adapt	B-1
2008	Soil & groundwater investigation	Farallon	FB-1 thru FB-10, MW-1 thru MW-10 and MW-1D
	Soil vapor extraction (SVE) and air sparge (AS) Pilot Study	Farallon	SVE-1 and MW-1D
2010	Soil & groundwater investigation	ECC Horizon	MW-11, IW-1 thru IW-28, SVE-2 and VP-1 thru VP-3
	Emulsified Oil Substrate (EOS) Pilot Study	ECC Horizon	IW-1 thru IW-28
	SVE Pilot Study	ECC Horizon	SVE-2 and VP-1 thru VP-3
2012	Soil & groundwater investigation	ECC Horizon	SB-1 thru SB-11 and MW-12 thru MW-17
	Vapor Intrusion Assessment (VIA)	ECC Horizon	2503, 2509, 2510, 2511, 2515, 2516, 2517 and 2518 E. Cherry Street; 720 25th Avenue; and 711A 26th Avenue
	EOS Performance Monitoring	ECC Horizon	Sample entire monitoring well network for 4 consecutive quarters (Q3 & Q4 2012, Q1 & Q2 2013)
2013	Interim Response Measure	ECC Horizon	Demolish Cherry Custom Cleaners building on subject property
	Soil & groundwater investigation	ECC Horizon	SB-21 and MW-15D, MW-17D, MW-18, MW-18D, MW-19, MW-19D and MW-20D
	VIA	ECC Horizon	Ecology-requested VIA at ISS
2014	Interim Response Measure	ECC Horizon	3 vac truck events to remove free-phase EOS that had sequestered PCE
	EOS Performance Monitoring	ECC Horizon	Annual sampling of entire monitoring well network
	Contained-Out Determination Sampling	ECC Horizon	SB-12 thru SB-20 and SB-22 thru SB-37
	Soil & groundwater investigation	ECC Horizon	MW-21D, MW-22D and MW-23

3.1 Investigation Summary

The sampling procedures and methodology associated with the prior Adapt and Farallon investigations have not been reported previously. Their investigation and sampling procedures are contained in draft reports included in Appendix A. The procedures and methodology for data obtained under ECC Horizon's direction were previously reported for everything collected between 2009 and mid-2013 as well as the VIA conducted within the ISS (ECC Horizon, 2013a, b).

Most recently, ECC Horizon prepared a Technical Briefing, dated 5/8/14, which included a summary of activities conducted since mid-2013, an approximate timeline of pending activities and a longer-term forecast of work schedule through the first quarter of 2015 (ECC Horizon, 2014). The briefing excluded sampling procedures and methodologies associated with those investigations, so this information is included in Appendix B[1]. The soil borings and monitoring well diagrams associated with the above-referenced Table 3 are included in Appendix C. The laboratory analytical reports for the investigation work since June of 2013 are presented in Appendix D.

The resulting soil, groundwater and air analyses are summarized in Table 1, Table 2 and Table 3, respectively[2]. The soil data are shown relative to sampling location on Figures 4a and 4b. The groundwater analytical results from the 4th quarter of 2013 and the annual sampling event from the 2nd quarter of 2014 are shown on Figures 5a and 5b, respectively. The 2012 VIAs and 2013 ISS VIA are shown on Figures 6a and 6b.

3.2 Pilot Studies and Interim Actions Summary

3.2.1 AS/SVE Summary

On April 11, 2008, Farallon conducted a soil vapor extraction (SVE) pilot test at SVE-1 to evaluate the vacuum and flow characteristics of subsurface sediments. The SVE test results reportedly indicated that SVE is a feasible technology for removal of contaminants from the vadose zone, with a conservative radius of influence of approximately 30 feet for the lower sandy soils and 15 feet for the upper silty sands.

---

[1] In addition to the data provided herein, SES collected their own groundwater and VIA data, which are reported in Appendix A.

[2] These data will also be uploaded to Ecology's Environmental Information Management (EIM) database within one month.

On October 17, 2008, Farallon conducted an air sparge (AS) pilot test at monitoring well MW-1D to evaluate the feasibility of air sparging to cleanup groundwater beneath the Site. Air sparge testing results reportedly confirmed that AS is a technically feasible alternative for groundwater cleanup, with a conservative radius of influence of approximately 50 feet.

3.2.2 EOS Summary

Pilot study monitoring has been ongoing since ECC Horizon subcontracted SES to inject EOS into the groundwater as part of a long-term pilot study and interim remediation effort. EOS enhances the biodegradation of cVOCs over a 3 to 5 year period. Due to the lengthy monitoring period, ECC Horizon opted to inject the EOS in July of 2010 before the RI was complete in order to simultaneously monitor the remedial effectiveness of the EOS while continuing with the RI activities over the ensuing years.

The injection well network consists of permanent injection wells IW-1 through IW-28 and monitoring wells MW-1, MW-2, MW-3 and MW-7. Monitoring wells MW-2, MW-3 and injection well IW-27 are located north of the former building. The rest of the injection wells are distributed along a single row of wells adjacent to the east and south sides of the property, respectively. During July of 2010, approximately 1,155 gallons of a 10-to-1 diluted solution of EOS was injected into each of the wells along the two rows, and 2,310 gallons were injected into each of the wells within the property. The injection well locations are highlighted on Figure 7.

Figure 7 also summarizes the relative change between the baseline sampling event from October of 2009 with the most recent data collected during June of 2013 and May of 2014. This comparison represents a 3-year post-injection performance monitoring window. Based on this comparison, the dissolved-phase cVOC mass in groundwater is relatively unchanged upgradient of the former Cherry Street Cleaners, but has significantly reduced within the source area and has moderately reduced downgradient of the source area. These data thus imply that EOS has effectively reduced dissolved-phase cVOC mass within the groundwater.

While monitoring the groundwater, however, ECC Horizon observed free-phase EOS resting on top of the water table. In discussing this observation with the manufacturer, they suggested that some of the EOS may have sequestered the cVOCs from the groundwater and subsequently separated from the water. If so, they hypothesized that the sequestered cVOCs could be reintroduced into the

aquifer as the EOS biodegrades over time. In order to prevent this from happening, they recommended that the free-phase EOS be removed.

To test this hypothesis, ECC Horizon collected EOS samples for chemical analysis in November of 2013. The laboratory analyzed the sample as a solid and reported PCE at 1,380 mg/kg, TCE at 15.6 mg/kg, and 1,2-DCE at 9.67 mg/kg, respectively. Based on these data, ECC Horizon concluded that some EOS sequestered cVOCs from groundwater and subsequently separated from the water table. Consequently, ECC Horizon subcontracted a vacuum truck during November of 2013, May of 2014 and July 2014 to vacuum the observed free-phase EOS from the top of the water table. Approximately 75, 75 and 120 gallons of EOS were removed during each sampling event, respectively. The EOS has shown to re-accumulate, so periodic vacuum truck events and analytical sampling are planned.

3.2.3 Excavation Planning

The former Cherry Custom Cleaners building was demolished between 7/15/13 and 7/22/13. This activity has introduced the feasibility of soil excavation. Hence, ECC Horizon is considering removing soils to 15 feet below ground surface (bgs) within the former Cherry Street Cleaners property and in-situ chemical oxidation (ISCO) between 15 and 30 feet bgs, which represents the volume of unsaturated soil between the base of the excavation and the top of the water table. Thereafter, ECC Horizon initiated a "Contained-Out" request with Ecology in December of 2013 to assist us with waste disposal options. In response, Ecology required a source area investigation to improve the resolution of the cVOCs planned for excavation and to also obtain toxicity characteristic leaching procedure (TCLP) analyses. The resulting analyses were presented in a revised request, dated 5/12/14 (ECC Horizon, 2014). On 5/29/14, Ecology determined that 200 of the 1,600 cubic yards of excavated soils shall be handled as dangerous waste. The contained-in request and response are included in Appendix E.

In addition, ECC Horizon has completed the necessary grading, erosion control, excavation, restoration, discharge and forestry plans for the Seattle Department of Planning and Development's (DPD's) review. Following DPD's review and authorization of permits, the excavation will proceed.

4.0 PROPERTY DEVELOPMENT AND HISTORY

The site is comprised of the subject source area property located at 2510 E. Cherry Street, which is zoned commercial. The subject property is bound on the west and north side by a commercial property and the east and south by City of Seattle right-of-ways (ROWs). The site boundary includes the aforementioned adjacent properties as well as commercial properties between an unnamed alleyway and 26th Street.

4.1 Subject Property within the Site

4.1.1 Past Uses and Facilities

The former Cherry Custom Cleaners used PCE from 1968 to June 2007 at its facility located at 2510 East Cherry Street in Seattle, Washington. Prior to 1968, the business operated as Accurate Cleaners, during which time petroleum-based dry cleaning solvents were used instead of PCE (Vera Benton, Personal Communication, 2013). The location of the former business is shown on Figure 1.

The Cherry Custom Cleaners business and property is owned by Ms. Vera Benton. During its operations, Cherry Custom Cleaners used two PCE dry cleaning machines (DCMs) of unknown makes and model numbers. The first DCM was used from 1968 to 1998, and the second DCM was used from 1998 to 2007.

The PCE used during the operations was delivered directly to the DCM tank by a PCE delivery service. The delivery service person would park their PCE tanker truck either on Cherry Street or in the alleyway adjacent to the east side of the building. They would then dispense PCE directly into the DCM's PCE tank through a hose connected to the truck's PCE tank.

Each DCM recycled PCE through a cooker in a closed-loop system. PCE sludge waste that built up in the cooker associated with the second DCM was shoveled into waste containers provided by Safety Kleen, Inc. Safety Kleen would then remove and dispose of the waste containers. It remains unclear at this time how the PCE sludge waste was handled with the first DCM.

4.1.2 Current Uses and Facilities

A single-story, 2,440 square-feet unoccupied commercial building was razed in July of 2013. Currently, the lot is vacant. It contains a chain-link fence on the

northern third of the property, which is filled in with grass and natural vegetative growth. The former building footprint is covered with gravel.

All of the utilities have been disconnected from the property. These included:

- Electricity and telephone services provided through overhead lines
- Natural gas service provided through an underground pipe from East Cherry Street, which runs under the western portion of the alley to a meter formerly located on the northern side of the former building
- Sanitary sewer service was provided through an underground pipe located on the northern side of the building that connected to a main located in the alley
- Water service was provided through an underground pipe on the southern side of the building that connected to a water main in East Cherry Street

The subject property location, utilities and surrounding land use are shown on Figure 2.

4.1.3 Proposed or Future Uses and Facilities

The subject property will remain zoned commercial. There are no development plans for the property.

4.2 Neighboring Properties within the Site

4.2.1 Past Uses and Facilities

Historically, the surrounding properties to the west, north and east have been consistently used for commercial purposes. Beyond these commercial strips, the properties within the site are residential. Along the south side of Cherry Street, the property has been primarily residential with the exception of a commercial property usage south and east of the site and at the southeast corner of east Cherry Street and 26th Avenue.

One of the commercial properties between the unnamed alleyway and 26th Avenue is a former business known as Unique Cleaners, which operated at the northwest corner of East Cherry Street and 26th Avenue (2522 East Cherry Street). Because this property is located between the former Cherry Custom Cleaners property and the known downgradient extent of the cVOC site, it is considered a potential contributing source area. To investigate further, ECC obtained

environmental data associated with 2522 East Cherry Street. Our findings indicate the following:

- Records from 1940, 1944, 1951 and 1960 consistently report that a cleaners operated on the property, including *Neighborhood Cleaners* in 1944 and *Unique Cleaners* in 1955 and 1960. We have interpreted this information to indicate that a cleaners operated at this facility between at least 1940 and 1960.
- The building was erected in 1924, demolished in 1965 and replaced with the current building footprint thereafter.
- The records do not indicate whether the cleaners used chlorinated solvents or petroleum-based Stoddard solvents in their operations.

Other cleaners downgradient of the site that were reported include:

- *One Touch Cleaners* at 2615 E. Cherry Street (2008)
- *Morris Cleaners* (1944) and *Bob's Cleaners* (1955, 1960, 1966, 1970) at 2718 E. Cherry Street.

The former Unique Cleaners and One Touch Cleaners are located within the site boundary as shown on Figure 2. ECC Horizon's EDR search is included in Appendix F.

Additional information associated with the former Unique Cleaners is provided in Sound Earth Strategies' (SES) *Phase I Environmental Site Assessment* (Phase I ESA). SES prepared the Phase I ESA for East Cherry Properties LLC for the properties located at 2516 and 2518 East Cherry Street. These two commercial properties are located between the subject property and the former Unique Cleaners property as shown on Figure 2 of the Phase I ESA. SES also conducted a vapor intrusion assessment of 2516 and 2518 East Cherry Street and installed monitoring well MW-101 within 2516 East Cherry Street. The Phase I ESA and the data associated with SES's investigations are included in Appendix G with permission from East Cherry Properties LLC's attorney, Charles Wolfe, Esquire.

4.2.2 Current Uses and Facilities

The school within the site boundary located northwest of the subject property is currently identified as the Islamic School of Seattle (ISS) (720 25th Avenue). The school is occasionally used for Sunday gatherings. The commercial properties east of the subject property are known as the Twilight Exit Bar (2516 East Cherry Street), the Tana Market (2518 East Cherry Street) and the Hookah Lounge (2522 East Cherry Street). Along the south side of East Cherry Street, the Bar-B-Q Pit

operates south and east of the subject property and the Ethiopian Restaurant operates at the southeast corner of East Cherry Street and 26th Avenue.

All of the properties are furnished with the following utilities:

- Electricity and telephone services provided through overhead lines
- Natural gas, sanitary sewer and water services provided through underground utilities

The properties within the site and their associated utilities, where known, are shown on Figure 2.

4.2.3 Proposed or Future Uses and Facilities

At this time, ECC Horizon is unaware of plans to change property use in the future at any of the properties within the site, with the exception of 2516 and 2518 East Cherry Street. East Cherry Properties LLC is considering redeveloping these two properties into a multi-story tenant space that would include a subgrade parking garage with first floor commercial space overlain by residential space. These considerations are included in Attachment B of SES's letter to Charles Wolfe, Esquire, titled *Recommended Elements for Environmental Mitigation*, dated 3/19/14. This letter is included in Appendix G.

4.3 Potential Sources of Site Contamination

There are 3 properties within the site boundary that may have contributed to cVOC site contamination:

1. Custom Cherry Custom Cleaners: located at 2510 E. Cherry Street, the entire property effectively serves as a cVOC source area to groundwater contamination. PCE was used at this property between 1968 and 2007.
2. Unique Cleaners: located at 2522 E. Cherry Street, this cleaners operated between approximately 1940 and 1960. Details of the operations associated with this facility are unavailable.
3. One Touch Cleaners: located at 2615 E. Cherry Street, this cleaners existed in 2008. Details of the operations associated with this facility are unavailable.

The potential cVOC contaminant sources are shown on Figure 3.

In addition to the above-referenced cVOC source areas, a petroleum fueling station known as Ben's Service Station once operated at 2502 E. Cherry Street,

which is the northeast corner of E. Cherry Street and 25th Avenue on what is now part of the ISS property. Ben's Service Station operated between at least 1935 and 1951 according to the database search records provided in Appendix F.

5.0 NATURAL CONDITIONS

5.1 Physiographic Setting/Topography

The Site is located in the East Madison Low physiographic division of the Seattle metropolitan area. Based on the United State Geological Survey (USGS) Seattle South Quadrangle map, the approximate ground surface elevation of the property is 276 feet msl. Topographically, the landscape is in a gently north-sloping valley between two north-south trending ridges and drift uplands separated by glacial troughs that are occupied largely by tidal and lake waters, as shown on Figure 1.

5.2 Geology

Based on a review of The Geologic Map of Seattle (United States Geological Survey Open File Report 2005-1252, April 2005), geology in the region of the site consists of Quaternary pre-Olympian landslide glacial deposits consisting of fine-grained silts and clays with interbedded sands, underlain by very dense fine-grained till deposits. The till generally ranges from gravelly, sandy silt to silty sand with varied quantities of clay and scattered cobbles and boulders (Galster and Laprade, 1991).

Specific to the site, silt is generally encountered from the ground surface to approximately 5 to 10 feet below ground surface (bgs) followed by discontinuous interbedded silt, silty sand and sandy silt lenses within a noncohesive sand unit with some gravel to the total depth drilled of 60 feet bgs, as shown on geologic cross sections provided as Figures 8a, 8b and 8c. Investigative borings have not advanced beyond 60 feet bgs.

5.3 Surface Water

Lake Washington is the nearest surface water body, located approximately 1 mile to the east of the site. Lake Washington is connected to Lake Union through the Montlake Cut, and both lakes drain to Puget Sound via ship canal locks and dam. With the surface elevation of Lake Washington approximately 21 ft msl it is inferred that surface water that infiltrates to the shallow groundwater bearing zone discharges to the east-southeast toward Lake Washington. There are no surface streams in the vicinity of the site.

5.4 Groundwater

Regionally, shallow groundwater is generally confined to alluvial deposits overlying glacial till or consolidated sands and gravels that underlie the glacial till. The dense and relatively impermeable nature of the glacial till and the commonly discontinuous lateral continuity of the groundwater-bearing materials impede the lateral and vertical migration of groundwater. Permeability values for the glacial till range from 0.003 foot per day to 30 feet per day (Galster and Laprade, 1991).

Shallow and deep groundwater-bearing zones are generally encountered under unconfined conditions between 20 and 30 feet bgs within the noncohesive soil beneath the vicinity of the site. Groundwater level measurements indicate that the groundwater flow direction in the shallow monitoring wells located at the site is to the west at a gradient of 0.020 to 0.028 feet per foot. Groundwater level measurements indicate that the groundwater flow direction in the deep monitoring wells installed in the vicinity of the site is to the east-northeast and south-southeast toward Lake Washington at a gradient of 0.001 and 0.002 feet per foot, respectively. A hydrologic water table basin exists beneath the site in the vicinity of the EOS injection area previously described in Section 3.10. The historic groundwater elevation data are summarized in Table 4. The water table interpretations for the shallow and deep zones for the past 3 sampling events are shown on Figures 9a, 9b, 10a, 10b and 11a and 11b, respectively.

5.5 Natural Resources and Ecological Receptors

Under MTCA, a terrestrial ecological evaluation (TEE) is required where there has been a release of hazardous substances to soil. In the event of such a release, WAC 173-340-7490 requires that one of the following three actions be taken as part of site investigation and cleanup: 1) document an exclusion from further evaluation using the criteria in WAC 173-340-7491, 2) conduct a simplified evaluation as set forth in WAC 173-340-7492, or 3) conduct a site-specific evaluation as set forth in WAC 173-340-7493.

In this case, a simplified TEE was prepared. The results of the ranking for the simplified TEE-exposure analysis procedure under Table 749-1 of MTCA yielded a conservative score of 9, which qualifies the site for the TEE exclusion based on the criteria set forth in WAC 173-340-7491. No further consideration of ecological impacts is required under MTCA. A copy of the TEE is included in Appendix H.

6.0 CONTAMINANT OCCURRENCE AND MOVEMENT

6.1 Soil

The cVOC impacts to soil and groundwater have created a site that measures approximately 250 feet wide along the site's north-south axis by 300 feet long along the site's east-west axis. The site's unsaturated soils that exceed the MTCA A CLs are contained within the subject property and attenuate within approximately 30 feet of the subject property.

6.2 Groundwater

The site's saturated soils generally mimic the extent of cVOC impacts to the top of the groundwater, which extends downgradient to the east, ending between 26th Avenue and 27th Avenue. The termination of the downgradient edge of the site is preserved by a hydraulic and geologic controls observed on the north and south sides of East Cherry Street, respectively. The hydraulic control is evidenced by a consistent westward component of flow, which meets the east-directed flow at 26th Avenue as shown on Figures 9a, 10a and 11a. The geologic control is evidenced by a termination of the aquifer at MW-20D and MW-22D between 30 and 50 feet along 27th Avenue. This termination appears to wrap around the south end of the site at MW-21D along 26th Avenue.

The deeper portion of the saturated zone has also been impacted with cVOCs at both MW-1D within the subject property's source area and downgradient at MW-15D at the southeast corner of the intersection of East Cherry Street and 26th Avenue, but none of the deeper monitoring wells surrounding MW-15D are impacted with cVOCs. Since the EOS was injected in 2010, cVOCs in MW-1D have steadily decreased below MTCA A CLs and have remained compliant for 4 consecutive quarters. At MW-15D, PCE was detected at 13.8 ug/L and 12.0 ug/L in November of 2013 and May of 2014, respectively.

To evaluate the migration of the cVOC plume over time, ECC Horizon prepared time-series plots for monitoring wells MW-1 through MW-17 and MW-1D. The plots show that the groundwater concentrations are stable or decreasing throughout the site, having decreased by as much as 99% within the area of the EOS injections. The EOS performance monitoring is shown relative to sampling location on Figure 7. The time-series plots are included in Appendix I.

6.3 Air

VIAs were initially conducted within several properties comprising the site during October and November of 2012 (ECC Horizon, 2013a). For reference, VIAs were conducted at the following locations:

1. Commercial Islamic School of Seattle, 720 25th Avenue
2. Residence, 711A 26th Avenue
3. Subject property, 2510 E. Cherry Street
4. Commercial Twilight Exit Bar, 2516 E. Cherry Street
5. Commercial Tana Market, 2518 E. Cherry Street
6. Residence, Multi-Tenant Residence, 2503 E. Cherry Street
7. Commercial BBQ Pit, 2509 E. Cherry Street
8. Residence, 2511 E. Cherry Street
9. Residence, 2515 E. Cherry Street
10. Residence, 2517 E. Cherry Street

Based on these data, ECC Horizon concluded that VI was occurring at concentrations exceeding the MTCA Method B Commercial Carcinogenic Indoor Air Screening Levels (CIASLs) within the former Cherry Custom Cleaners dry cleaning facility, but nowhere else[3]. No other location contained indoor air concentrations exceeding the MTCA Method B Residential CIASLs. These results are summarized in Table 3 and shown on Figure 6a.

In a letter dated 10/15/13, Ecology requested a second VIA within the Islamic School of Seattle building. In response, ECC Horizon conducted a VIA on 11/3/13. The ensuing report concluded that vapor intrusion was not occurring within the school building (ECC Horizon, 2013b). In a letter dated 3/6/14, Ecology concurred with this conclusion. The data for the second sampling event within the Islamic School of Seattle building are summarized in Table 3 and shown on Figure 6b.

In addition to the above, SES conducted a separate VIA within the 2516 and 2518 East Cherry Street buildings. Each of these properties is leased for commercial use through 3/31/17. The Commercial CIASLs thus apply to these properties at least until then. SES's findings show that, although slightly higher than ECC Horizon's

[3] The Commercial CIASLs are 10 times higher than the MTCA Method B CIASLs.

data, each of these locations complies with the Commercial CIASLs. The SES data are presented in Appendix G.

7.0 CLEANUP STANDARDS

The two types of risk for exposure associated with the presence of cVOCs at the site are risk to terrestrial ecology and risk to human health. Since the site qualifies for an exclusion from further TEE as discussed in Section 5.5, the potential exposure pathways are risk to human health, which include soil leaching, soil direct contact, groundwater ingestion and VI. For delineation purposes, the tables and figures compare the concentrations to MTCA A CLs and applicable MTCA B CLs where a MTCA A CL does not exist. Provided Ecology approves this RI, ECC Horizon will recommend permanent remedial action objectives in a forthcoming Feasibility Study (FS).

8.0 AREAS REQUIRING CLEANUP

Based on a comparison to MTCA A CLs, the areas requiring cleanup include the unsaturated soils beneath the subject property and within 30 feet of the subject property boundary. Plans are ongoing to remediate the soils within the subject property boundary via excavation to 15 feet bgs and deeper chemical oxidation between 15 and 30 feet bgs.

Groundwater remediation is necessary between the subject property and the downgradient monitoring well MW-15D. EOS has been remediating the source area groundwater for the past 4 years, but has sequestered PCE and separated from the water. EOS removal remains ongoing in order to prevent the re-release of PCE into the saturated unit.

Off-gassing of cVOCs from soil and groundwater have not produced conditions requiring VI mitigation at this time. In light of the above-referenced soil and groundwater remediation activities, the VI potential will likely decrease over time.

Looking forward, ECC Horizon will collect groundwater samples from all of the monitoring wells and conduct VIAs within the 2516 and 2518 East Cherry Street buildings following the soil remediation activities. Collectively, these data will be reported in an FS along with a recommendation for a permanent remedy.

Notes:
1. Washington State Department of Ecology Model Toxics Control Act (MTCA) Method A Cleanup Level
2. Washington State Department of Ecology Model Toxics Control Act (MTCA) Method B Cleanup Level; Method A Cleanup Level not established
3. # denotes no value exists in the CLARC database for this compound.
4. Denotes analytical data obtained from tables within previously submitted Farallon reports; actual lab report not available.
5. Denotes sample reanalyzed for correction for soil moisture content per Section 11.10.5 of EPA Method 8000C
6. **Bold** denotes concentrations exceeding the MTCA Cleanup Levels
7. -- Denotes not analyzed or reported
J = denotes result is less than the reporting limit but greater than or equal to the minimum detection limit and the concentration is an approximate value
* = denotes internal standard or retention time outside acceptable limits
bgs = below ground surface
mg/kg = milligrams per kilogram

Notes:
1. Washington State Department of Ecology Model Toxics Control Act (MTCA) Method A Cleanup Level
2. Washington State Department of Ecology Model Toxics Control Act (MTCA) Method B Cleanup Level; Method A Cleanup Level not established
3. "J" denotes Results is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
4. "B" denotes Compound was found in the blank and sample.
5. "H" denotes sample was prepped or analyzed beyond the specified holding time.
6. # denotes no value exists in the CLARC database for this compound.
7. '-- denotes parameter was not analyzed

µg/L - micrograms per liter

Bold denotes concentrations exceeding the MTCA Method A or Method B Cleanup Levels

Data prior to 9/30/09 provided by Farallon Consulting

Notes:

1. Screening Levels obtained from Cleanup Levels and Risk Calculations (CLARC) Database, developed and maintained by the Washington State Department of Ecology. Referenced June 2013.
2. # denotes no value exists in the CLARC database for this compound.
3. -- denotes compound not analyzed.
4. The laboratory measured a vacuum pressure of 0.0 inches Hg in sample ISS:IA17, which is lower than the measured pressure when the Summa canister was sealed at the ISS. Consequently, this container may have been contaminated by other air unrelated to the sample point either during transport to or upon re-opening at the laboratory.
5. Subslab Screening Levels and data are shaded gray to differentiate from unshaded Indoor Air Screening Levels and data.
6. **Bold** denotes concentration exceeds its respective MTCA Method B Screening Level.
7. µg/m^3 = micrograms per cubic meter

Notes:
1. Denotes top of casing modified and resurveyed on 2/22/10 by ECC Horizon. Modified again on 7/9/10, not re-surveyed.
2. Denotes top of casing resurveyed by Otak on 7/30/12
3. NM = Not measured
4. NMFP = No measured free product
5. Denotes top of casing resurveyed by ECC Horizon in March 2014.
6. Denotes top of casing surveyed by ECC Horizon in May 2014.
7. Denotes top of casing surveyed by ECC Horizon in July 2014.
For wells that contain free product, groundwater elevation is determined by the following calculation:
(Measured groundwater elevation) + (free product thickness x 0.95); 0.95 is the specific gravity of EOS

	MTCA Method A
PCE = Tetrachloroethene	0.05
TCE = Trichloroethene	0.03

Results reported in milligrams per kilogram (mg/kg)

MTCA Method A = Washinton State Department of Ecology Model Toxics Control Act Method A Cleanup Level

0.0810 = Denotes concentration above MTCA Method A

<0.003 = Denotes concentration below laboratory minimum reporting limit

(u) = Denotes unsaturated soil sampling interval

(s) = Denotes saturated soil sampling interval

J = Result is less than the reporting limit but greater than or equal to the minimum detection limit and the concentration is an approximate value

* = Internal Standard or retention time outside acceptable limits

All Tetrachloroethene concentrations are shown as well as parameters with concentrations exceeding MTCA Cleanup Levels

Note: Soil analytical results for SB-12 through SB-20 and SB-22 through SB-37 are presented on Figure 4b.

gProjects, LLC.
541 - 30th Avenue South
Seattle, WA 98144

Attention: Mr. Graham P. Black

Subject: Limited Phase II Environmental Site Assessment
Commercial Property
2510 East Cherry Street
Seattle, WA 98122

Dear Mr. Black,

Adapt Engineering, Inc. (Adapt) is pleased to provide you with the results of our Limited Phase II Environmental Site Assessment for the above-referenced site. This report is provided for gProjects, LLC. and their agents. If this report is to be reproduced and/or transmitted to a third party, it must be reproduced and/or transmitted in its entirety. Any exceptions will be made only with the written permission of Adapt. Authorization to perform this project was given by Adapt proposal number P-3001, dated May 22, 2007, signed by Mr. Graham P. Black on May 25, 2007.

Adapt appreciates the opportunity to be of service to you on this project. Should you have any questions concerning this report, or if we can assist you in any way, please feel free to contact us at (206) 654-7045.

Respectfully Submitted,

Adapt Engineering, Inc.

1.0 INTRODUCTION

1.1 Site Description

The subject site is located at 2510 East Cherry Street in Seattle, Washington (Section 33, Township 25 North, Range 4 East, W.M.). The subject site is located approximately 100 feet east of the intersection of East Cherry Street and 25th Avenue (Figure 1).

The subject site supports one building and is used as a dry cleaning facility. A grass lot enclosed by a chain link fence is located to the north of the onsite building.

Lake Washington is located approximately ¾ mile east of the subject site.

1.2 Project Background

Information obtained during a meeting and telephone conversations between Adapt personnel and Mr. Black indicated that a dry cleaning facility may have been operated at the subject site and a suspected heating oil underground storage tank (UST) was observed at the subject site. Based upon this information, a limited Phase II ESA was recommended.

1.3 Purpose

The purpose of this assessment is to evaluate the potential for a large-scale release at the subject site. This preliminary study is not sufficient to delineate the vertical and lateral extent of possible on-site or off-site contamination.

1.4 Scope of Work and Authorization

The scope of work for this project consisted of the collection of soil (and groundwater, if present) and analytical testing of recovered samples for dry cleaning solvents and petroleum hydrocarbons. Authorization to perform this project was given by Adapt proposal number P-3001, dated May 22, 2007, signed by Mr. Graham P. Black on May 25, 2007.

2.0 ACTIVITIES

2.1 Sample Collection and Observations

The originally proposed scope of work consisted of the advancement of two hollow stem auger (HSA) borings on the subject property, however, only one boring was completed because of site access limitations related to an overhead utility line. This boring (B-1) was completed to a depth of 35 feet below ground surface (bgs) and was located north of the site building, along the eastern property boundary (Figure 2). The boring was advanced using a truck-mounted drill rig owned and operated by Cascade Drilling, Inc., under subcontract to our firm. The boring was supervised, sampled, and logged by an Adapt Licensed Geologist.

Soil samples were collected at 2 ½-foot intervals from the site exploration. Discrete soil samples for volatile compounds were collected in compliance with EPA Method 5035A. Samples were collected using a Power Stop Handle and Easy Draw Syringe. The syringe was pushed into the core or the bottom of the borehole to obtain an approximately 5-gram soil sample. The soil core was then placed in an empty 40 ml glass vial with a Teflon lined lid with septum. Discrete soil samples from non-volatile compounds were collected using a gloved

hand and transferred to a clean 4-ounce glass jar with a Teflon lined lid. After collection, the samples were immediately transported to a subcontracted analytical laboratory under Adapt's chain-of-custody procedures. All soil samples were field screened using a MiniRae 10.6ev Photoionization Detector (PID).

Groundwater samples were collected from a temporary well installed within the HSA boring with a PVC screened section located at a depth that intersected the upper water surface. A submersible pump was used to purge water from the temporary well until the water became relatively clear and free of significant sediment prior to sampling. Samples were then obtained with a disposable hand bailer and then collected in laboratory prepared glass containers with teflon-lined lids. Then, as with the soil samples, the groundwater samples were stored at 4 degrees C, and transported as soon as possible to a subcontracted analytical laboratory under Adapt's chain-of-custody procedures.

Figure 2 shows the approximate locations of the borings, site boundaries, and pertinent site features. Subsurface exploration logs and soil sampling procedures are described in Appendix B.

3.0 RESULTS

3.1 Subsurface Conditions - Soil

The site boring generally disclosed stiff to very stiff, moist, brown, silty clay with gravel that extended to a depth of approximately 15 feet bgs. The underlying soils were interpreted to be dense to very dense, moist to wet, brown, silty sand that extended to the full depth explored of 35 feet bgs. All recovered soil samples were field screened using a MiniRae Photoionization Detector (PID).

Samples collected from B-1 did not exhibit obvious signs of contaminant impacts such as stains, or odors, and measurable PID readings ranged from 0.1 to 7.0 parts-per-million (ppm).

3.2 Subsurface Conditions - Groundwater

Groundwater levels were observed at approximately 29 feet bgs in the boring prior to the groundwater sampling activities. We did not observe a sheen or light, non-aqueous phase liquid (LNAPL) at the time of our sampling.

4.0 QUANTITATIVE ANALYSES

The analytical testing was performed by ESN Northwest's laboratories in Bellevue and Olympia, Washington, which are Washington state certified laboratories.

Selected soil samples were analyzed for gasoline, diesel, heavy oil, and mineral oil-range Total Petroleum Hydrocarbons (TPH) Northwest TPH-Hydrocarbon Identification (NWTPH-HCID). Groundwater samples were analyzed for NWTPH-HCID and volatile organic compounds by EPA Method 8260b.

Soil

Soil samples B-1:10' and B-1:12.5' did not exhibit detectable concentrations of gasoline, diesel, heavy oil, and mineral oil-range TPH by Ecology Method NWTPH-HCID.

None of the analyzed compounds in soil were reported at concentrations that were above the current Ecology Model Toxics Control Act (MTCA) Method A Unrestricted Land Use cleanup levels. Analytical test results are summarized in Table 1 below, and analytical test certificates are included in Appendix C.

Table 1: Summary of Analytical Results: Soil

Sample No.	Depth (feet)	PID (ppm)	HCID-G (ppm)	HCID-D (ppm)	HCID-HO (ppm)
B-1:10'	10	6.8	<20	<50	<100
B-1:12.5'	12.5	7.0	<20	<50	<100
MTCA Method A Unrestricted Land Cleanup Level			NA	NA	NA

All concentrations given in parts per million (ppm), which is equivalent to milligrams per kilogram
PID = Photo-ionization Detector.
NA = Not available
HCID-G, D, HO = Total petroleum hydrocarbons Hydrocarbon Identification – gasoline, diesel, and heavy oil
MTCA = Model Toxics Control Act (MTCA Cleanup levels shown)

Groundwater

Groundwater sample B-1 did not exhibit detectable concentrations of gasoline, diesel, heavy oil, and mineral oil-range TPH by Ecology Method NWTPH-HCID.

Sample B-1 exhibited detectable concentrations of tetrachloroethylene (2,400 ppb), trichloroethylene (64 ppb), cis-1,2-dichloroethene (22 ppb), carbon tetrachloride (6.4 ppb), and chloroform (2.7 ppb) by EPA Method 8260b.

Tetrachloroethylene (PCE) and trichloroethylene (TCE) were detected at concentrations above their respective MTCA Method A cleanup levels. Analytical results are summarized on Table 2 below, and analytical test certificates are included in Appendix C.

Table 2: Summary of Analytical Results: Groundwater

Sample No.	HCID-G (ppb)	HCID-D (ppb)	HCID-HO (ppb)	PCE (ppb)	TCE (ppb)	cis-1,2-DCE (ppb)	Carbon tetrachloride (ppb)	Chloroform (ppb)
B-1	<250	<500	<500	**2,400**	**64**	22	6.4	2.7
MTCA Method A Cleanup Level	NA	NA	NA	5	5	NA	NA	NA

All concentrations given in parts per billion (ppb), which is equivalent to micrograms per liter
NA = Not available
HCID-G, D, HO = Total petroleum hydrocarbons Hydrocarbon Identification – gasoline, diesel, and heavy oil
DCE = dichloroethene
MTCA = Model Toxics Control Act (MTCA Cleanup levels shown)

5.0 CONCLUSIONS AND RECOMMENDATIONS

Information obtained during a meeting and telephone conversations between Adapt personnel and Mr. Black indicated that a dry cleaning facility may have been operated at the subject site and a suspected heating oil UST was observed at the subject site. Based upon this information, a limited Phase II ESA was recommended. The results of the Limited Phase II ESA appear to indicate no obvious indications that a large-scale release to groundwater has resulted from the suspected heating oil UST, however, significant impacts to groundwater have likely resulted from the historic onsite dry cleaning activities and it is likely that the soils located beneath the north end existing building, although not sampled as part of this limited Phase II ESA, may also be impacted by historic dry cleaning activities. In addition, soils immediately surrounding the heating oil UST may be impacted.

In Adapt's opinion, the presence of contaminated groundwater at the subject property represents a potential "Recognized Environmental Condition" to the site. The MTCA Cleanup Regulation Chapter 173-340-300(2) describes the requirements for reporting hazardous substance releases to Ecology. It is Adapt's professional opinion that it would be prudent for the property owner/operator to consult with an environmental attorney to discuss issues relating to the reporting requirements, and how they may apply to the conditions at the subject site.

Given that our assessment was limited and peripheral to the potential source areas, it is possible that a release may have occurred that was not discovered during our assessment. If future subsurface work encounters, stained, odorous, or otherwise contaminated soils, such soils should be managed as contaminated soils, which may include additional analytical testing an off-site treatment or disposal.

6.0 LIMITATIONS

Information contained in this report is based upon site characterization, field observations, and the laboratory analyses completed for this study. Conclusions presented are professional opinions based upon our interpretation of the analytical laboratory test results, as well as our experience and observations during the field activities. The location and depth of the exploration, as well as the analytical scope were completed within the site and proposal constraints. Adapt's observations and the analytical data are limited to the vicinity of each test probe and do not necessarily reflect conditions across the site. No other warranty, express or implied is made. In the event that additional information regarding either the site or surrounding properties becomes known, or changes to existing conditions occurs, the conclusions in this report should be reviewed, and if necessary, revised to reflect the updated information. Project specific limitations are presented in the appropriate sections of this report.

This report has been prepared for the exclusive use of gProjects, LLC. and their agents for specific application to the project site. Use or reliance upon this report by a third is at their own risk. Adapt does not make any representation or warranty, express or implied, to such other parties as to the accuracy or completeness of this report or the suitability of its use by such other parties for any purpose whatever, known or unknown, to Adapt.

Adapt appreciates the opportunity to be of service to you on this project. Should you have any questions concerning this report, or if we can assist you in any way, please contact us at (206) 654-7045.

APPENDIX B

SUBSURFACE EXPLORATION PROCEDURES AND BORING LOGS

APPENDIX B

SUBSURFACE EXPLORATION PROCEDURES AND BORING LOGS

Direct Push Method Borings

The field exploration program conducted for this study consisted of advancing a series of six (6) direct push method borings. The approximate locations are illustrated on Figure 2. These locations were obtained in the field by taping and pacing from existing site features.

The direct push method borings were advanced on April 25, 2007 by ESN Northwest, a local exploration drilling company under subcontract to our firm. Each boring consisted of driving a 1.5-Inch outside diameter drill rod and attached sample barrel and probe tip with a truck-mounted drill rig. Prior to each boring, the drilling equipment and sampling tools were scrubbed with a stiff brush and a solution of Liquinox (a phosphate free detergent) and water, and then rinsed with potable water and deionized water. The drill rod was pushed to the desired sampling depth then the sample barrel was pushed either two-feet or four feet dependant on soil sampler length. Soil samples were continuously obtained using either a two-foot or four-foot long sampler. Borings were continuously observed and logged in the field by a geologist from our firm. Prior to each boring, the drilling equipment and sampling tools were decontaminated.

Upon completion, the test probe holes were abandoned by placing dry bentonite into the probe holes, which was then hydrated. The probe holes were sealed to match the existing surface. The probe and sampling equipment were decontaminated between each sampling event using water and Alconox wash and water rinse.

Characterization of Soil

Relatively undisturbed soil samples were collected at four-foot intervals by using a four-foot long split spoon sample barrel lined with an acetate liner. The split spoon sample barrel was pushed to the desired depth and then pushed into undisturbed soil at the bottom of the boring.

All soil samples were field screened using a MiniRae 10.6ev Photoionization Detector (PID). Field screen samples were collected from the remaining soil in the sampled interval. A representative soil sample was placed in a Ziplock® type plastic bag and sealed. The sample was allowed to volatilize for at least 10 minutes prior to obtaining a reading. The PID tip was inserted in small hole poked in the bag just prior to reading. The highest PID reading observed was recorded on the boring log sheet, as were any subjective olfactory impressions of the sample by the on-site geologist.

RE: LIMITED SUBSURFACE ASSESSMENT
CHERRY STREET CLEANERS
2510 EAST CHERRY STREET, SEATTLE, WASHINGTON
FARALLON PN: 129-001

Dear Ms. Benton:

Farallon Consulting, L.L.C. (Farallon) has prepared this letter report to document the results of a limited subsurface assessment of soil and groundwater conditions at the commercial property located at 2510 East Cherry Street in Seattle, Washington (herein referred to as the Site) (Figure 1). A release of the dry cleaning solvent tetrachloroethene (PCE) to groundwater was confirmed at the Site during a prior subsurface assessment conducted by others. The objectives of the limited subsurface assessment conducted by Farallon were to:

- Identify the location(s) where PCE was released to the subsurface;
- Characterize the extent of PCE concentrations in shallow soil within the property boundaries;
- Install monitoring wells to estimate the direction of groundwater flow and gradient, and to characterize groundwater quality at the Site; and
- Provide information that will support future evaluation of potentially feasible remediation technologies for the Site.

The limited subsurface assessment was conducted as an independent remedial action in accordance with the Washington State Model Toxics Control Act Cleanup Regulation (MTCA), Chapter 173-340 of the Washington Administrative Code (WAC 173-340), as amended February 12, 2001. This letter report provides a description of the Site and surrounding features, describes the fieldwork conducted for the limited subsurface assessment, presents the results, and provides conclusions and recommendations.

SITE DESCRIPTION

The Site is located in a mixed-use neighborhood of Seattle, approximately 2 miles east of the downtown area. A paved parking area is located west of the Site that serves a private school building located to the north-northwest. An alley followed by commercial buildings are present to the east along Cherry Street. Garfield High School is located to the south-southwest.

Topographically the Site is in a gently north-sloping valley between two north-south trending low hills. The nearest surface water body is Lake Washington, which is located approximately 0.75 mile east of the Site.

The Site is an approximately 90-foot by 40-foot lot occupied by a one-story building with a small shed abutting the north-central building wall (Figure 2). The northern portion of the lot is unpaved and fenced. Doors exiting the north side of the Site building are located on the east and west sides of the shed. The shed formerly held a boiler for the dry cleaner. Both the building and shed are constructed of masonry block walls and concrete slab floors. A fill port for an underground storage tank that is assumed to have been used for storage of heating oil is located in the east-central portion of the unpaved area.

Electrical power to the Site building is provided by overhead lines from the southeast (Figure 2). Natural gas is provided from a line running beneath the alley that enters the building on the north side of the shed where the boiler was formerly located. The sanitary sewer exits the north side of the building and runs northeast to the alley where it connects to a main line. The restrooms are located in the northeastern corner of the Site building. A floor drain was observed by Farallon just south of the restrooms. The surface of the concrete floor in the vicinity of the floor drain was observed to be in poor condition due to etching and pitting.

BACKGROUND

Farallon understands that a dry cleaner operated in the building at the Site from the late 1960s until approximately a year ago. During the period of dry cleaning operations, three dry cleaning machines were used successively. The first dry cleaning machine was replaced shortly after the current property owner took over the business in approximately 1968. The second dry cleaning machine was replaced in approximately 1996-97. All three dry cleaning machines were installed in the same location at the rear of the building and east of the back door (Figure 2). The dry cleaning equipment and other fixtures were removed in 2007, and a carpentry shop now operates in the Site building.

The following information was obtained during a telephone interview with the current property owner, Ms. Vera Benton. Ms. Benton did not recall any specific instance when PCE was spilled during operation of the dry cleaner business but did state that if a spill did occur, the fluid would likely have been washed out the back door. Prior to the implementation of regulations governing disposal of waste PCE in the 1980s, used dry cleaning machine filters and other waste was disposed to a dumpster located outside the eastern back door or in the adjacent alley. The condensate from the boiler was discharged to the ground surface north of the shed. At some time in the 1980s, a waste disposal service was contracted to periodically pick up and properly dispose of waste PCE.

A utility map of the Site vicinity obtained by Farallon from the City of Seattle originally dated 192_ (illegible) (revised in 1993 and bar coded in 2001) shows a service station at the northeast corner of 25th Avenue and East Cherry Street west of the Site and a "wash rack" located directly northwest of the Site building. No additional historical information was obtained prior to conducting the limited subsurface assessment.

Farallon reviewed the *Limited Phase II Environmental Site Assessment* letter report (Phase II ESA Report) dated June 13, 2007 prepared by Adapt Engineering, Inc for a prospective purchaser of the Site property. The Phase II ESA Report documented the results of limited sampling conducted adjacent to the suspected heating oil underground storage tank at the Site. The field work involved drilling boring B-1 just north of the fill port for the suspected heating oil underground storage tank to a depth of 35 feet below ground surface (bgs) (Figures 3 and 4). Soil samples were collected from 10 and 12.5 feet bgs from this boring and analyzed for total petroleum hydrocarbons by Northwest Method NWTPH-HCID. No soil samples were analyzed for PCE or other volatile organic compounds. In addition, a reconnaissance groundwater sample was collected from a temporary well screen that was installed at a depth that intersected the groundwater table at this location (the specific depth was not provided in the Phase II ESA Report). The reconnaissance groundwater sample was analyzed for total petroleum hydrocarbons by Northwest Method NWTPH-HCID and halogenated volatile organic compounds by U.S. Environmental Protection Agency (EPA) Method 8260B.

The laboratory analytical results indicated that total petroleum hydrocarbons were not detected above the analytical method reporting limit in either the soil samples or the reconnaissance groundwater sample. Several volatile organic compounds were detected in the reconnaissance groundwater sample, including PCE and its breakdown products trichloroethene (TCE) and cis-1,2-dichloroethene (Figure 4). Concentrations of both PCE and TCE exceeded the MTCA Method A cleanup levels for groundwater. Although low concentrations of carbon tetrachloride and chloroform were also detected in the reconnaissance groundwater sample, these compounds are not typically related to dry cleaning. The Phase II ESA Report concluded that "significant impacts to groundwater have likely resulted from the historic[al] onsite dry cleaning activities and it is likely that the soils located beneath the north end [of the] existing building, although not sampled as part of this limited Phase II ESA, may also be impacted by historic[al] dry cleaning activities. In addition, soils immediately surrounding the heating oil UST [underground storage tank] may be impacted."

FIELD WORK

This section provides a description of the field activities conducted by Farallon for the limited subsurface assessment. The limited subsurface assessment included drilling six borings to investigate soil beneath the Site building floor slab and adjacent to the back doors, and installation of three monitoring wells to assess groundwater conditions (Figures 3 and 4).

Prior to the commencement of drilling, Applied Professional Services, Incorporated of North Bend, Washington conducted a private utility locate at the Site. In addition, debris that covered the southeastern portion of the unpaved area north of the Site building and a large tree along the western property line were removed to facilitate access for the limited subsurface assessment (Figure 2).

A Street Use permit was obtained from the City of Seattle to allow the installation of monitoring well MW-1 in the alley east of the Site. Cascade Drilling, Incorporated of Woodinville, Washington performed the drilling activities for the soil borings on January 4, 2008 using a limited access direct-push Geoprobe drilling rig and for the monitoring well installation from January 21 through 23, 2008 using a limited-access hollow-stem auger drill rig.

Borings FB-1 and FB-2 were located outside the Site building adjacent to the east and west back doors (Figure 3). These boring locations were selected to investigate whether disposal of waste PCE had occurred to the unpaved area just behind the Site building and to delineate the northern extent of PCE in shallow soil. Borings FB-3 and FB-6 were located in the central portion of the Site building, south of the suspected source locations. These boring locations were selected to delineate the southern extent of PCE in shallow soil. Borings FB-4 and FB-5 were located adjacent to a floor drain and remnants of floor bolts, respectively. The floor bolts at boring FB-5 may have been used to secure the former dry cleaning machines.

Based on local topography, Farallon inferred that the direction of shallow groundwater flow would most likely be toward the north-northeast. Monitoring well MW-1 was placed in the alley in the assumed up-gradient direction of groundwater flow from the suspected source locations inside the Site building. Monitoring wells MW-2 and MW-3 were located down-gradient to cross-gradient of the suspected source locations. Monitoring well MW-2 was situated near boring B-1 from the Adapt Engineering subsurface assessment to confirm the reconnaissance groundwater sample analytical results reported in the Phase II ESA Report. Monitoring well MW-3 provided the third point necessary to measure groundwater levels and estimate the gradient and direction of groundwater flow. This monitoring well was situated east-northeast of a former "wash rack" shown on a City of Seattle utility map to assess if there may have been a historical release of petroleum hydrocarbons in this area.

Direct-push borings FB-1 through FB-6 were sampled in continuous 3-foot intervals from the ground surface to depths ranging from 7 to 8.5 feet bgs. The sampler was lined with disposable acetate sleeves, which were removed and opened to expose the sample after each interval was completed. The monitoring well borings MW1 through MW-3 were sampled in 2.5-foot intervals from the ground surface to 10 feet bgs. Beyond 10 feet bgs, the borings were sampled in 5-foot intervals to the final depths of 40 to 42 feet bgs. The soil samples were collected from the intervals with a 4-inch-diameter 18-inch-long split-spoon sampler driven by a 140-pound hammer.

The soil sample from each interval was described in accordance with the Unified Soil Classification System, and evidence of potential contamination such as unusual odor, discoloration, or sheen was noted. The soil samples were also screened in the field for evidence of potential contamination using a photoionization detector (PID) to detect the presence of volatile organic vapors. Soil for field screening was placed in resealable plastic bags, and the headspace in the bags was allowed to equilibrate. After equilibration was reached, the probe of the PID was inserted into the bag to measure the relative concentration of volatile organic vapors in the headspace. The boring logs containing the soil descriptions, field observations, and PID readings are provided in Attachment A.

Soil samples were selected for analysis based on PID readings that exhibited the most significant indications of contamination, in areas intended to delineate the lateral extent of soil contamination, or from the maximum depth of the borings. Soil samples collected from the borings were transferred directly into laboratory-prepared containers according EPA Method 5035A, following Washington State Department of Ecology (Ecology) guidance. Care was taken to not handle the seal or the inside cap of the container when the sample was placed into

the containers. Any soil residue on the threads of the sample container and vial was removed prior to capping.

The soil samples were labeled, placed on ice, and transported for laboratory analysis to OnSite Environmental Inc. in Redmond, Washington under chain-of-custody protocols. Soil samples were submitted for analysis of halogenated volatile organic compounds by EPA Method 8260B. In addition, soil samples collected from 7.5 feet bgs at borings MW-2 and MW-3 were analyzed for petroleum hydrocarbon identification by Northwest Method NWTPH-HCID.

Monitoring wells MW-1, MW-2, and MW-3 were installed in the shallow water-bearing zone encountered at a depth of approximately 30 feet bgs. The wells were constructed in accordance with WAC 173-160, *Minimum Standards for Construction and Maintenance of Wells*. Monitoring well MW-1 was constructed of 2-inch-diameter blank polyvinyl chloride (PVC) casing, flush-threaded with 0.010-inch slotted well screen from 22 to 42 feet bgs. Monitoring wells MW-2 and MW-3 were constructed of 4-inch-diameter blank PVC casing, flush-threaded with 0.010-inch slotted well screen from 20 to 40 feet bgs. The bottom and top of each well were fitted with a threaded PVC bottom cap and a locking compression-fit well cap. The annulus of the monitoring well borings was filled with #2/12 silica sand to a minimum height of 2 feet above the top of the screened interval. A bentonite seal was installed above the sand pack to approximately 1 foot below grade. The wells were completed at the surface with a flush-mounted, traffic-rated well box set in concrete. The log of boring/well construction details for the monitoring wells are provided in Attachment A.

The monitoring wells were developed following installation using a surge block and submersible pump. The monitoring wells were surveyed on the north side of the casing relative to an arbitrary datum of 100 feet established at the Site.

The groundwater monitoring event was conducted on January 25, 2008. Prior to sampling, Farallon measured the depth to groundwater in each monitoring well using an electronic water level indicator. The monitoring wells were opened and the water levels were allowed to equilibrate for approximately 15 minutes before measurements were taken. The groundwater level in each monitoring well was measured from the top of the well casing.

Monitoring wells MW-1 through MW-3 were purged using a peristaltic pump and dedicated polyethylene tubing. Before the monitoring wells were purged, the dedicated polyethylene tubing intake was placed at the approximate center of the screened interval in each monitoring well. Groundwater was then purged from each well at flow rates ranging from approximately 100 to 500 milliliters per minute. Field measurements for pH, temperature, specific conductivity, dissolved oxygen, and oxidation-reduction potential were collected during purging of groundwater prior to sampling at each monitoring well, using a YSI Model 600XL water quality analyzer equipped with a flow-through cell. Groundwater samples were collected after the pH, temperature, and specific conductivity parameters had stabilized. Stabilization is determined as a relative percent difference of less than 3 percent for temperature and specific conductivity, and a change of ± 0.1 pH unit between readings for three consecutive measurements.

The samples were collected by pumping groundwater directly from each monitoring well through the dedicated polyethylene tubing into laboratory-prepared containers. The samples were labeled, placed on ice, and transported to OnSite Environmental Inc. under chain-of-custody protocols. The groundwater samples were submitted for analysis of halogenated volatile organic compounds by EPA Method 8260B and for total petroleum hydrocarbons as diesel- and as oil-range organics by Northwest Method NWTPH-Dx.

All soil cuttings, decontamination water, purge water, and other wastewater generated during the limited subsurface assessment field program were temporarily stored on the Site in labeled 55-gallon steel drums. The analytical results of the soil and groundwater samples will be used to develop a waste profile for disposal at an approved transport, storage, and disposal facility. Waste disposal will be completed within 90 days of the generation date for the wastes.

RESULTS

This section presents the results of the limited subsurface assessment conducted by Farallon, including a description of soil and groundwater conditions, and analytical results for the soil and groundwater samples. The soil and groundwater analytical results presented in this report have been compared to MTCA Method A and Method B soil and groundwater cleanup levels in accordance with WAC 173-340-720 and WAC 173-340-740. The complete laboratory analytical reports are provided in Attachment B.

The concrete slab was 4 to 5 inches thick at the boring locations inside the Site building. Up to 4 feet of fill was encountered at the boring locations inside the Site building. The fill material was underlain by silty sand and sandy silt with some gravel to the total depth drilled of 8 feet bgs. At the monitoring well borings, soil was primarily silty sand and sandy silt with some gravel to the total depth drilled of 42 feet bgs. A thin sand and gravel layer was present at approximately 25 feet bgs at monitoring well MW-1. The native soil at the Site is typical of dense glacial till.

Groundwater was present under unconfined conditions at approximately 30 feet bgs at all three monitoring well borings. Groundwater level measurements indicate groundwater flow direction to the south at a gradient of 0.002 foot/foot. Geochemical parameters measured during groundwater purging prior to collection of samples for laboratory analyses indicate that the shallow water-bearing zone is aerobic, containing 6 to 10 milligrams per liter of dissolved oxygen. This is consistent with the oxidation/reduction potential measurements that ranged from 67 to 112 millivolts, which indicate a mildly oxidizing environment.

The soil analytical results for halogenated volatile organic compounds are summarized on Table 1 and shown on Figure 3. Concentrations of PCE exceeding the MTCA Method A cleanup level were detected in the 12 soil samples from borings FB-1 through FB-6 but were less than the MTCA Method A cleanup level in borings MW-1 through MW-3. The concentrations of PCE in borings FB-1 through FB-6 ranged from 0.091 to 440 milligrams per kilogram (mg/kg). The MTCA Method A cleanup level for PCE in soil is 0.05 mg/kg. Concentrations of PCE generally decreased with depth except at borings FB-2 and FB-3 where concentrations increased slightly between the shallow and deep soil samples.

Concentrations of TCE exceeded the MTCA Method A cleanup level for soil of 0.03 mg/kg in the soil samples collected at borings FB-3, FB-4, and FB-5. Cis-1,2-dichloroethene was detected in six soil samples collected from four borings at concentrations less than the MTCA Method B cleanup level for soil of 800 mg/kg. TCE and cis-1,2-dichloroethene are degradation products of PCE. No other halogenated volatile organic compounds were detected in the soil samples above the laboratory practical quantitation limits.

Concentrations of PCE and TCE exceeded the MTCA Method A cleanup levels in the groundwater samples collected at all three monitoring wells at the Site (Table 2; Figure 4). Concentrations of PCE ranged from 1,100 to 2,300 micrograms per liter (µg/l) and TCE concentrations ranged from 24 to 42 µg/l. The MTCA Method A cleanup levels for PCE and TCE in groundwater are both 5 µg/l. A concentration of cis-1,2-dichloroethene less than the MTCA Method B cleanup level was detected in groundwater at monitoring well MW-1. No other halogenated volatile organic compounds were detected in the groundwater samples.

Concentrations of total petroleum hydrocarbons were not detected above the laboratory practical quantitation limits in the soil samples analyzed from borings MW-2 and MW-3. In addition, concentrations of diesel- and oil-range petroleum hydrocarbons were not detected above the laboratory practical quantitation limits in the groundwater samples collected from monitoring wells MW-1, MW-2, and MW-3.

CONCLUSIONS AND RECOMMENDATIONS

Farallon completed six soil borings and installed three monitoring wells at the Site to further assess subsurface conditions. Conditions observed during the limited subsurface assessment indicate that the Site is underlain by a thin layer of fill and/or weathered glacial till comprised primarily of dense silty sand and sandy silt with some gravel. A shallow, unconfined water-bearing zone is present at approximately 30 feet bgs. The groundwater table has an approximate gradient of 0.002 foot/foot and groundwater flow in the shallow water-bearing zone is toward the south.

A release of PCE occurred in the northern portion of the Site building. The highest concentration of PCE was detected in boring FB-4 adjacent to the floor drain in the northeastern portion of the building (Figure 2). Although concentrations of PCE generally decrease with depth at the boring locations, the vertical extent of PCE exceeding MTCA Method A cleanup levels was not defined. The soil analytical data from the borings for monitoring wells MW-2 and MW-3 suggest that the lateral distribution of PCE is bounded to the north. In addition, soil analytical data from the boring for monitoring well MW-1 bounds the lateral extent of PCE to the southeast. The lateral extent of PCE-contaminated soil to the west, east, and south was not defined with the existing data.

Concentrations of TCE exceeding the MTCA Method A cleanup level are associated with high concentrations of PCE. The vertical limit of TCE-contaminated soil was not defined at boring FB-3, although the concentration only slightly exceeded the cleanup level in the soil sample collected at 7 feet bgs.

There are no data to suggest that a release of petroleum hydrocarbons occurred at the Site from the assumed heating oil underground storage tank or from the historical presence of a "wash rack" or service station west of the Site.

The lateral and vertical distribution of PCE and TCE in groundwater exceeding MTCA Method A cleanup levels was not fully defined by the three monitoring wells installed during the limited subsurface assessment. It is likely that the PCE-contaminated groundwater extends off the Site to the south and west. Geochemical conditions in the groundwater-bearing zone do not appear to be conducive to anaerobic biodegradation of PCE and TCE. This is supported by the relatively low concentration of cis-1,2-dichloroethene detected and absence of concentrations of vinyl chloride exceeding the laboratory practical quantitation limit in groundwater.

Recommendations identified by Farallon pertaining to the Site include:

- The release of PCE to soil and groundwater at the Site should be reported to Ecology in accordance with WAC 173-340-120;
- Consideration should be given to enrolling the Site in Ecology's Voluntary Cleanup Program and performing further characterization and cleanup actions as an independent remedial action;
- Historical research should be performed to identify other properties in the area that may have had a release of halogenated volatile organic compounds to the soil and/or groundwater that could impact subsurface conditions at the Site;
- The lateral and vertical distribution of PCE in soil should be further characterized to the west, south, and east of the identified source in the northern portion of the Site building to meet the requirements of WAC 173-340-350, and to support the evaluation of potentially feasible remediation technologies for soil;
- The lateral and vertical distribution of PCE and TCE in groundwater should be further characterized to meet the requirements of WAC 173-340-350, and to support the evaluation of potentially feasible remediation technologies for groundwater;
- Prior to performing additional characterization of groundwater conditions, the groundwater levels in the existing monitoring wells should be measured to confirm that the groundwater flow direction is consistently toward the south;
- The monitoring wells were designed to facilitate the evaluation of soil vapor extraction as a potentially feasible remediation technology for soil cleanup. A soil vapor extraction well screened from approximately 10 to 30 feet bgs should be installed at the Site and a soil vapor extraction pilot test performed to support an assessment of whether this technology may be applicable to subsurface conditions at the Site; and
- After completion of the recommendations above, a remedial investigation/feasibility study report should be prepared that identifies the media of concern, receptors, and potential cleanup levels, and evaluates the potential remediation approaches for each media of concern.

LIMITATIONS

The conclusions and recommendations contained in this letter report are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location, and are subject to the following limitation.

Certain information used by Farallon in this letter report has been obtained, reviewed, and evaluated from various sources believed to be reliable. Although Farallon's conclusions, opinions, and recommendations are based in part on such information, Farallon's services did not include verification of its accuracy or authenticity. Should such information prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.

CLOSING

Farallon appreciates the opportunity to provide you and Houlihan Law with environmental consulting services. Please call the undersigned at (425) 295-0800 if you have any questions or comments regarding this letter report.

Sincerely,

Farallon Consulting, L.L.C.

Jeff Keller
Project Chemist

Clifford T. Schmitt, L.G., L.H.G.
Principal Hydrogeologist

Re: Analytical Data for Project 129-001
Laboratory Reference No. 0801-026

Dear Jeff:

Enclosed are the analytical results and associated quality control data for samples submitted on January 4, 2008.

The standard policy of OnSite Environmental Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: January 16, 2008
Samples Submitted: January 4, 2008
Laboratory Reference: 0801-026
Project: 129-001

Case Narrative

Samples were collected on January 4, 2008 and received by the laboratory on January 4, 2008. They were maintained at the laboratory at a temperature of 2°C to 6°C except as noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Halogenated Volatiles EPA 8260B Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

Internal Standards Chlorobenzene-d5 and 1,4-Dichlorobenzene-d4 do not meet acceptance criteria for sample FB1-7 possibly due to sample matrix effects. The sample was re-analyzed for confirmation and all four internal standards failed to meet acceptance criteria. (Leaks in the sealed VOA environment caused by grit between the VOA lip and VOA cap septum have been shown to cause low recovery for all internal standards.) Therefore, all results from the original data, including Practical Quantitation Limits, from (trans) 1,3-Dichloropropene onward should be considered estimates.

Internal Standard 1,4-Dichlorobenzene-d4 does not meet acceptance criteria for samples FB3-7 and FB5-1 due to sample matrix effects. Dilutions of the samples had acceptable internal standard recoveries. All results, including Practical Quantitation Limits, from Bromobenzene onward should be considered estimates.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

Y - Sample extract treated with an acid/silica gel cleanup procedure.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Re: Analytical Data for Project 129-001
Laboratory Reference No. 0801-136

Dear Jeff:

Enclosed are the analytical results and associated quality control data for samples submitted on January 22, 2008.

The standard policy of OnSite Environmental Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: February 4, 2008
Samples Submitted: January 22, 2008
Laboratory Reference: 0801-136
Project: 129-001

Case Narrative

Samples were collected on January 21 and 22, 2008 and received by the laboratory on January 22, 2008. They were maintained at the laboratory at a temperature of 2°C to 6°C except as noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Halogenated Volatiles EPA 8260B Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

All four Internal Standards did not meet acceptance criteria for sample MW-2-15. The sample was re-analyzed with similar results. Leaks in the sealed VOA environment caused by grit between the VOA lip and VOA cap septum have been shown to cause low internal standard recovery. The sample was consequently extracted from the 4-ounce jar, analyzed, and reported. Some loss of volatiles may have occurred.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

Y - Sample extract treated with an acid/silica gel cleanup procedure.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Re: Analytical Data for Project 129-001
Laboratory Reference No. 0801-153

Dear Jeff:

Enclosed are the analytical results and associated quality control data for samples submitted on January 24, 2008.

The standard policy of OnSite Environmental Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: February 4, 2008
Samples Submitted: January 24, 2008
Laboratory Reference: 0801-153
Project: 129-001

Case Narrative

Samples were collected on January 23, 2008 and received by the laboratory on January 24, 2008. They were maintained at the laboratory at a temperature of 2°C to 6°C except as noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Halogenated Volatiles EPA 8260B Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

All four Internal Standards did not meet acceptance criteria for samples MW-3-10 and MW-3-20. The samples were re-analyzed with similar results. Leaks in the sealed VOA environment caused by grit between the VOA lip and VOA cap septum have been shown to cause low internal standard recovery. The samples were consequently extracted from 4-ounce jars, analyzed, and reported. Some loss of volatiles may have occurred.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

Y - Sample extract treated with an acid/silica gel cleanup procedure.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Re: Analytical Data for Project 129-001
Laboratory Reference No. 0801-158

Dear Jeff:

Enclosed are the analytical results and associated quality control data for samples submitted on January 25, 2008.

The standard policy of OnSite Environmental Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: February 4, 2008
Samples Submitted: January 25, 2008
Laboratory Reference: 0801-158
Project: 129-001

Case Narrative

Samples were collected on January 25, 2008 and received by the laboratory on January 25, 2008. They were maintained at the laboratory at a temperature of 2°C to 6°C except as noted below.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

Y - Sample extract treated with an acid/silica gel cleanup procedure.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Remedial Investigation (RI) and Feasibility Study (FS) report on behalf of Ms. Vera Benton, the owner of the Custom Cherry Cleaners property located at 2510 East Cherry Street in Seattle, Washington (Figure 1). A release of the dry cleaning solvent tetrachloroethene (PCE) to soil and groundwater has been confirmed at the Custom Cherry Cleaners property. The release has migrated beneath the west-adjacent property owned by the Islamic School of Seattle, an east-adjacent alley, and East Cherry Street to the south. Those areas where concentrations of PCE and its degradation products have come to be located as a result of the release at Custom Cherry Cleaners are referred to herein as "the Site" in accordance with the Washington State Model Toxics Control Act Cleanup Regulation (MTCA), as defined in Section 200 of Chapter 173-340 of the Washington Administrative Code (WAC 173-340-200).

The RI/FS was completed in accordance with the scope of work described in the *Proposal for Remedial Investigation/Feasibility Study, Cherry Street Cleaners, 2510 East Cherry Street, Seattle, Washington* dated March 11, 2008, prepared by Farallon. The scope of work was performed as an independent remedial action in accordance with MTCA. The RI/FS report summarizes the results of the RI field program completed at the Site and field testing of select potential remediation technologies. This report also includes a focused evaluation of technically feasible cleanup alternatives for the affected media of concern at the Site. The Site will be enrolled in the Washington State Department of Ecology (Ecology) Voluntary Cleanup Program (VCP) to allow for regulatory agency review and comment on the RI/FS report and future cleanup activities.

The scope of work performed by Farallon included an RI component, which was necessary to address the data gaps that remained following prior investigations at the Site. The suspected source area of PCE is associated with former dry cleaning operations in the building at the Site. The highest concentrations of PCE are present in the shallow soil where the dry cleaning equipment was formerly located. The RI/FS for the Site focused on sufficiently defining the source of PCE, characterizing the nature and extent of PCE contamination and associated degradation compounds in soil and groundwater, and evaluating potential feasible remedial technologies in order to support a cleanup action for the Site. The scope of the FS completed by Farallon included an initial screening of alternatives and detailed evaluation of the alternatives that are most likely to be technically feasible for existing Site conditions, that meet MTCA requirements, that will be protective of human health and the environment upon successful implementation, and will result in issuance of a No Further Action determination from Ecology under the VCP.

1.1 PURPOSE

The purpose of an RI is to collect and evaluate sufficient information to develop and evaluate technically feasible cleanup alternatives in accordance with WAC 173-340-360 through 173-340-390. The RI completed by Farallon provided sufficient data to further refine the conceptual site model for use in evaluating potential feasible remediation technologies.

The purpose of an FS is to develop and evaluate cleanup alternatives to facilitate selection of a final cleanup action at a site in accordance with WAC 173-340-350(8). The FS performed by Farallon was conducted to screen remediation technologies and eliminate those that are not technically practicable and whose costs are deemed to be disproportionate under the provisions of WAC 173-340-360(3)(e). The evaluation of remediation technologies was conducted under the assumption that the cleanup action would be conducted in conjunction with redevelopment of the Site into a mixed-use building with commercial tenant space on the ground floor and condominiums on the upper floor, with at-grade parking in the northern portion of the property.

The selection of a final cleanup action for the Site will be documented in a Cleanup Action Plan in conformance with WAC 173-340-360 through 173-340-390. The final cleanup action will be consistent with future use of the Site after redevelopment. This report is intended to provide sufficient information to support selection of a final cleanup action with concurrence from the Site owner that can be reviewed and approved by Ecology under the VCP.

1.2 REPORT ORGANIZATION

The RI/FS Report has been prepared to meet the general requirements under WAC 173-340-350(7) and (8). This report has been organized into the following sections:

- **Section 2—Site Background.** This section provides a description of the Site features and location; a summary of historical Site use; a description of the local geology, hydrogeology, and land use pertaining to the Site; and a summary of previous subsurface investigations conducted at the Site. The summary of previous subsurface investigations includes work by Farallon and Adapt Engineering Inc. (Adapt Engineering) that was used to develop a preliminary conceptual site model for the Site, identify data gaps, and focus the scope of the FS.
- **Section 3—Remedial Investigation Field Program.** This section provides a description of the RI field program conducted at the Site during 2008. This section also includes a discussion of the findings of the Terrestrial Ecological Evaluation (TEE) completed pursuant to the requirements of MTCA.
- **Section 4—Remedial Investigation Results.** This section presents the results of the RI field program. In addition, a conceptual site model is presented that is derived from the results of all subsurface investigations performed at the Site. Included in the conceptual site model is a discussion of the source area, the constituents of potential concern (COPCs), affected media, fate and transport characteristics of the releases of hazardous substances, and a preliminary exposure assessment.
- **Section 5—Feasibility Study.** This section provides a summary of the scope of work and results of the FS, including data collected to support the evaluation of feasible remediation technologies such as soil vapor extraction pilot testing, assessment of the hydrogeologic characteristics at the Site, and collection of geochemical data. This section also presents the cleanup action objectives, and a screening and overview of the evaluation of potential remediation technologies.

- **Section 6—Bibliography.** This section provides a list of the source materials used in preparing the RI/FS Report.
- **Section 7—Limitations.** This section presents Farallon's standard limitations associated with conducting the work reported herein and preparing this RI/FS Report.

2.0 SITE DESCRIPTION AND BACKGROUND

This section provides a description and the historical background of the Site and surrounding area, the environmental setting, and the prior investigations conducted in association with the Site. The sources of historical information used to develop the Site background include the previous Site investigations by Adapt Engineering (2007) and Farallon (2008); Ecology files; Site plans; aerial photographs; and information from the City of Seattle Department of Planning and Development, Seattle Public Utilities, King County Assessor, Sanborn Fire Insurance Maps, Kroll Atlases, Polk and Cole City Directories, and Puget Sound Regional Archives.

2.1 ENVIRONMENTAL SETTING

The Site is located in the Madrona neighborhood of Seattle, approximately 2 miles east of downtown, in King County, Washington (Figure 1). The Site is located between First Hill and Lake Washington. Topographically the Site is in a gently north-sloping valley between two north-south trending low hills. The ground surface elevation at the Site is approximately 280 feet above mean sea level (Figure 1).

According to King County Assessor Parcel Records, the Custom Cherry Cleaners property type is listed as Commercial (King County 2008). Land use in the vicinity of the Site is predominantly schools, commercial retail use, and residential properties. Features surrounding the Custom Cherry Cleaners property include the Islamic School of Seattle to the west and north, residential properties to the northeast, an alley followed by commercial properties to the east, an apartment building to the south-southeast, and Garfield High School to the southwest. The fenced lot west of the Custom Cherry Cleaners building is used for automobile parking and as a play yard for the Islamic School of Seattle. The school building is a multi-story brick structure northwest of the Custom Cherry Cleaners property.

2.2 SITE DESCRIPTION

The Site is located in Section 33, Township 25 South, Range 4 East in King County, Washington. The Custom Cherry Cleaners property consists of King County tax parcel number 6840700205, with a total area of 4,000 square feet. The Custom Cherry Cleaners property is located north of East Cherry Street between 25th Avenue and 26th Avenue, and is adjacent to and west of an unnamed alley. The Custom Cherry Cleaners property is an approximately 90- by 40-foot lot occupied by a one-story building with a small shed abutting the north-central building wall (Figure 2). The northern portion of the lot is unpaved and fenced. Doors exiting the north side of the dry cleaner building are located on the east and west sides of the shed. The shed formerly held a boiler that provided steam to the dry cleaning facility. Both the building and shed are constructed of masonry block walls and concrete slab-on-grade floors. A fill port for an underground storage tank that is assumed to have been used for storage of heating oil is located in the east-central portion of the unpaved area.

Electrical power to the Custom Cherry Cleaners building is provided by overhead lines from the southeast (Figure 2). Natural gas is provided from a line running beneath the alley that enters the

building on the north side of the shed where the boiler was formerly located. The sanitary sewer piping exits the north end of the building and runs northeast to the alley where it connects to a main line. The restrooms are located in the northeastern corner of the building. A floor drain was observed by Farallon inside the building in the area just south of the restrooms. The surface of the concrete floor in the vicinity of the floor drain was observed to be in poor condition due to etching and pitting.

2.3 SITE HISTORY

Farallon understands that a dry cleaner operated in the building at the Site from the late 1960s until early 2007. During the period of dry cleaning operations, three dry cleaning machines were used successively. The first dry cleaning machine was replaced shortly after the current property owner took over the business in approximately 1968. The second dry cleaning machine was replaced in approximately 1996 or 1997. All three dry cleaning machines were installed in the same location at the rear of the building and between the two doors that exit the north side of the structure (Figure 2). The dry cleaning equipment and other fixtures were removed in 2007. The Custom Cherry Cleaners building currently is leased to a construction company that uses it as a carpentry shop and for material storage (primarily wood).

The following information was obtained during a telephone interview with the current property owner, Ms. Vera Benton (Personal Communication, January 2008). Ms. Benton did not recall any specific instance when PCE was spilled during operation of the dry cleaner business but did state that if a spill did occur, the fluid would likely have been washed out the back door. Prior to implementation of regulations governing disposal of waste PCE in the 1980s, used dry cleaning machine filters and other wastes were disposed to a dumpster located outside the eastern back door or in the adjacent alley. The condensate from the boiler was discharged to the ground surface north of the shed. At some time in the 1980s, a waste disposal service was contracted to periodically pick up and properly dispose of waste PCE.

According to a 1920 Sanborn fire insurance map, a service station was historically located on the west-adjacent Islamic School of Seattle property at the northeast corner of East Cherry Street and 25th Avenue. In addition, a "wash rack" was shown on the map at the eastern boundary of the school property adjacent to the northwest corner of the Custom Cherry Cleaners building. The purpose of the wash rack is not known.

2.4 HYDROGEOLOGY

A summary of the Site and Site vicinity geology and hydrology is provided below.

2.4.1 Geology

The Site vicinity is dominated by a series of north-trending elongate ridges and drift uplands separated by glacial troughs that are occupied by tidal waters, large lake, or have been alluviated by streams and rivers. Pleistocene glacial deposits, indicating at least five separate periods of continental glaciation, underlie the major part of the Seattle metropolitan area. The glacial deposits are clearly distinguished from non-glacial periods, represented by fluvial sand, overbank

silt and clay deposits and peat. The Site is located in the East Madison Low physiographic division of the Seattle metropolitan area. The geology of the Site consists of glacial drift deposits of the Vashon Stade of the Fraser glaciation comprised of the basal lodgment Vashon Till. The till generally ranges from gravelly, sandy silt to silty sand with varied quantities of clay and scattered cobbles and boulders (Galster and Laprade 1991).

The general subsurface stratigraphy encountered in the borings drilled during investigations at the Site by Farallon and Adapt Engineering consisted of up to 4 feet of fill underlain by silt, silty sand and sandy silt, and sand with some gravel to the total depth drilled of 35 feet below ground surface (bgs). A thin sand and gravel layer was present at approximately 25 feet bgs at monitoring well MW-1 (Figure 3). The native soil at the Site is typical of dense glacial till. Groundwater was present under unconfined conditions at a depth of approximately 30 feet bgs at all three monitoring well borings.

2.4.2 Surface Water

There are no perennial streams in the Site vicinity. The nearest surface water body is Lake Washington, which is located approximately 1 mile east. Lake Washington was formed during the Vashon glaciation approximately 12,000 to 18,000 years ago. Lake Washington is connected to Lake Union through the Montlake Cut, and both lakes drain to Puget Sound via the Ship Canal locks and dam. It is inferred that shallow groundwater in the Site vicinity discharges to Lake Washington to the east-southeast.

2.4.3 Groundwater

City of Seattle water is supplied from the Cedar River and South Fork Tolt River watersheds. A small amount of city water is also supplied by groundwater wells. There are no drinking water supply wells within a 0.5-mile radius of the Site (Ecology 2003).

Shallow groundwater in the Seattle area is generally confined to the most recent alluvial deposits overlying the glacial till or over-consolidated sands and gravels (Esperance Sand) that underlie the glacial till. The dense and relatively impermeable nature of the glacial till and the commonly discontinuous lateral continuity of the groundwater-bearing materials impede the lateral and vertical migration of groundwater. Permeability values for the glacial till range from 0.003 foot per day to 30 feet per day (Galster and Laprade 1991).

A shallow groundwater-bearing zone is present within the glacial till deposits beneath the Site. Groundwater was present under unconfined conditions at approximately 30 feet bgs at the initial three monitoring wells installed at the direction of Farallon. Groundwater level measurements indicate that the groundwater flow direction is to the south at a gradient of 0.002 foot per foot.

2.5 PREVIOUS INVESTIGATIONS

These sections describe the previous investigations conducted by Adapt Engineering and Farallon at the Site. Additional information on the investigation procedures and results are provided in the referenced reports.

2.5.1 Adapt Engineering Phase II Environmental Site Assessment—2007

Adapt Engineering conducted a limited subsurface investigation at the Custom Cherry Cleaners property as part of the due diligence process for a prospective purchaser of the property (Adapt Engineering 2007). The subsurface investigation included drilling boring B-1 to a depth of 35 feet bgs adjacent to a suspected heating oil underground storage tank to collect soil samples and a reconnaissance groundwater sample (Figure 3). The soil samples were analyzed for petroleum hydrocarbon constituents, and the water sample was analyzed for petroleum hydrocarbon constituents as well as halogenated volatile organic compounds (HVOCs). The soil analytical results did not indicate that a release of petroleum hydrocarbons had occurred from the suspected heating oil underground storage tank. The reconnaissance groundwater sample analytical results indicated that the concentrations of PCE and the degradation product trichloroethene (TCE) present exceeded the MTCA Method A cleanup level for these compounds of 5 micrograms per liter (µg/l).

2.5.2 Farallon Limited Subsurface Assessment—2008

Farallon conducted a limited subsurface assessment at the Site in January 2008 to identify the location(s) where PCE had been released to the subsurface, to characterize the extent of PCE in shallow soil, to install monitoring wells to estimate the groundwater gradient at the Site, and to characterize groundwater quality. The limited subsurface assessment included drilling six borings to investigate soil beneath the Site building floor slab and adjacent to the back doors, and installing three monitoring wells to assess groundwater conditions (Figure 3). A detailed description of the scope of work for the limited subsurface assessment is provided in the Limited Subsurface Assessment Report (Farallon 2008). The soil and groundwater analytical results indicate that a release of petroleum hydrocarbons did not occur at the Custom Cherry Cleaners property from the assumed heating oil underground storage tank or from the presence of the wash rack or service station at the school property. However, the results of the limited subsurface assessment confirmed that a release of PCE occurred to soil in the northern portion of the Custom Cherry Cleaners building. Concentrations of PCE in soil beneath the building ranged from 0.11 milligrams per kilogram (mg/kg) to 440 mg/kg at borings FB-2 and FB-4, respectively. The deepest soil samples collected at each boring from 7 to 8 feet bgs all exceeded the MTCA Method A cleanup level for PCE of 0.05 mg/kg. The lateral and vertical extent of PCE in soil was not fully delineated by the data collected during the limited subsurface assessment.

The estimated groundwater flow direction beneath the Site was to the south based on groundwater levels measured at monitoring wells MW-1, MW-2, and MW-3. The lateral and vertical extent of PCE and TCE in groundwater was not defined by the three monitoring wells installed in January 2008. The data indicated that contaminated groundwater extended beyond the Custom Cherry Cleaners property boundary to the south, west, and east (Farallon 2008).

2.6 DATA GAPS

Analytical results from the January 2008 investigation conducted by Farallon indicate that the primary source of PCE at the Site was a release in the northeastern portion of the Custom Cherry Cleaners building. The release of PCE has impacted the shallow water-bearing zone beneath the

Site. The limited subsurface investigation performed by Farallon in January 2008 did not fully characterize the lateral and vertical extent of HVOCs in soil and groundwater at the Site.

Review of the data previously collected by Farallon and Adapt Engineering identified the following data gaps to be addressed as part of the RI. Addressing these data gaps during the RI was necessary to support the evaluation of potential feasible remedial alternatives and to develop estimates of cleanup costs:

- The lateral and vertical distribution of HVOCs in soil had not been characterized west, south, and east of the suspected source in the northeastern portion of the Site building;
- The lateral and vertical distribution of HVOCs in groundwater had not been characterized at the Site;
- Previous investigations identified a groundwater flow direction to the south at a gradient of 0.002 foot per foot. The flow direction and gradient had not been measured over a period of time to assess potential seasonal variability;
- The hydraulic conductivity of the shallow water-bearing zone had not been evaluated;
- The historical use of the surrounding properties had not been thoroughly researched to assess whether an off-Site source may potentially be impacting soil or groundwater conditions at the Site; and
- Subsurface conditions at the Site had not been assessed sufficiently to support the evaluation of potential feasible remedial technologies.

The information obtained by addressing these data gaps during the RI was necessary to facilitate development of a conceptual site model to support the evaluation of potential feasible remedial technologies and to estimate cleanup costs.

3.0 REMEDIAL INVESTIGATION FIELD PROGRAM

Farallon conducted the limited subsurface assessment and RI field work at the Site between January 2008 and April 2008 to address the data gaps identified during previous investigations and to provide sufficient information to support the evaluation of technically feasible cleanup alternatives for the Site. The RI field program consisted of four primary work elements, including soil sampling; reconnaissance groundwater sampling; monitoring well installation, development, and groundwater sampling; and aquifer testing and soil vapor extraction pilot testing. A detailed description of the scope of work for each work element is provided in the Proposal for Remedial Investigation/Feasibility Study (Farallon 2008a). A summary of the scope of work completed for each work element is provided below. This section also includes a discussion of the TEE completed for the Site according to the provisions of MTCA.

3.1 SOIL SAMPLING

This work element included advancement of nine borings to further characterize the nature and extent of HVOCs in soil at the Site. Boring FB-7 was drilled in the alley east of the source beneath the northeast corner of the Custom Cherry Cleaners building to assess the eastern extent of PCE in soil. Borings FB-8 and FB-9 were drilled west of the Custom Cherry Cleaners building to assess the western extent of PCE in soil.

Four of the borings drilled for the RI field program were converted to groundwater monitoring wells MW-1D, MW-4, MW-5, and MW-6, and one boring was converted to soil vapor extraction well SVE-1. In addition, boring FB-10 was drilled for the installation of monitoring well MW-1D but did not reach the required depth for installing this well. Boring FB-10 was logged for lithology and then abandoned. No soil samples were submitted for laboratory analysis from boring FB-10 due to its close proximity to the boring for monitoring well MW-1.

Prior to drilling, a private utility locating survey was conducted by Applied Professional Services, Incorporated of North Bend, Washington to locate utilities in the vicinity of each of the proposed boring locations. The One-Call Center was contacted to perform public utility locating at the Site a minimum of 48 hours prior to each drilling event. Cascade Drilling, Inc. of Woodinville, Washington (Cascade Drilling) provided drilling services for the advancement of the borings at the Site. Metro Rooter Plumbing (MRP) Services of Tacoma, Washington was contracted to perform a non-conductible utility locate at the Site prior to the drilling activities. The non-conductible survey was performed to locate the sewer connections on the northern side of the Site building.

Borings FB-7 through FB-10, SVE-1, MW-5, and MW-6 were advanced using a limited-access hollow-stem auger drill rig. Soil samples were collected continuously in 5-foot intervals to the maximum depth drilled in each hollow-stem boring using an 18-inch split-spoon sampler driven by a 140-pound hammer. Borings MW-4 and MW-1D were advanced using a Central Mining Equipment 75 hollow-stem auger rig. Soil samples were collected continuously in 5-foot intervals to the maximum depth drilled using an 18-inch split-spoon sampler driven with a 300-pound hammer.

A Farallon Scientist observed the subsurface conditions and collected soil samples for potential laboratory analysis at each boring location. Soil samples were collected in accordance with the American Society for Testing and Materials and U.S. Environmental Protection Agency (EPA) Method 5035 protocols, and were classified in accordance with the Unified Soil Classification System. Field screening included noting indications of visual or olfactory evidence of contamination, and conducting headspace analysis for the presence of volatile organic vapors using a photoionization detector. Headspace analysis was conducted by placing a portion of soil from each sample interval into a resealable plastic bag and allowing the sample to warm for several minutes. The probe of the photoionization detector was then inserted into the bag and the highest reading obtained over an approximate 30-second interval was recorded. The Unified Soil Classification System symbol, visual and olfactory notations regarding the samples, and photoionization detector readings were recorded on boring log forms. Upon completion, the borings not converted into monitoring wells or the SVE well were backfilled with bentonite and finished to match the surrounding ground surface (e.g., soil, asphalt, concrete). The logs for the borings are provided in Appendix A.

A total of 14 soil samples collected from selected intervals at the eight RI boring locations were submitted for laboratory analysis of HVOCs. Soil samples were selected for laboratory analysis based on the photoionization detector readings that exhibited the most significant indications of the presence of volatile compounds, in areas intended to delineate the lateral extent of soil contamination, or from the maximum depth of the borings. Soil samples collected from the borings were transferred directly into laboratory-prepared containers in accordance with EPA Method 5035A, following Ecology guidance. Care was taken to not handle the seal or the inside cap of the container when the sample was placed into the containers. Any soil residue on the threads of the sample container and vial was removed prior to capping to ensure that a proper seal was attained.

The soil samples were labeled, placed on ice, and transported for laboratory analysis to OnSite Environmental Inc. in Redmond, Washington under chain-of-custody protocols. Soil samples were submitted for analysis of HVOCs by EPA Method 8260B. In addition, a soil sample collected from the screened interval of monitoring wells MW-1D, MW-5, and MW-6 were analyzed for total organic carbon content by EPA Method 9060-Modified.

3.2 RECONNAISSANCE GROUNDWATER SAMPLING

The RI field program included collection of a reconnaissance groundwater sample from boring FB-8. Boring FB-8 was advanced west of the Custom Cherry Cleaners on the Islamic School of Seattle property to a total depth of 35 feet bgs in order to assess the western extent of PCE in soil and groundwater. These data were used to identify the appropriate location for monitoring well MW-5.

Groundwater was encountered in boring FB-8 at a depth of approximately 30 feet bgs. Cascade Drilling constructed a temporary well to facilitate collection of a reconnaissance groundwater sample. The temporary well was constructed using 2-inch inner-diameter, Schedule 40 polyvinyl chloride (PVC) blank casing, flush-threaded to 5 feet of 2-inch inside diameter, Schedule 40, 0.010-inch slotted PVC well screen. The temporary well screen interval was placed at

approximately 30 to 35 feet bgs. The temporary well groundwater was purged prior to sampling using a submersible pump. A reconnaissance groundwater sample was subsequently collected from the temporary well screen interval using a disposable baler. The reconnaissance groundwater sample was collected in laboratory-preserved containers and submitted to OnSite Environmental Inc. under standard chain-of-custody protocols for analysis of HVOCs by EPA Method 8260B.

3.3 WELL INSTALLATION AND DEVELOPMENT

A total of three shallow monitoring wells (MW-4, MW-5, and MW-6), one deep monitoring well (MW-1D), and one SVE pilot test well (SVE-1) were installed and developed at the Site as part of the RI (Figure 4). The purpose of the new monitoring wells and SVE well was to further assess the nature and extent of PCE and its degradation products in groundwater at the Site, estimate the groundwater flow direction and gradient, conduct aquifer testing, and perform an SVE pilot test.

Cascade Drilling constructed the monitoring wells in accordance with WAC 173-160, *Minimum Standards for Construction and Maintenance of Wells*. Monitoring wells MW-1D and MW-4 through MW-6 were constructed of 2-inch-diameter blank polyvinyl chloride (PVC) casing, flush-threaded with 0.010-inch slotted well screen. Monitoring well MW-1D was screened from 50 to 55 feet bgs, monitoring well MW-4 was screened from 25 to 35 feet bgs, and monitoring wells MW-5 and MW-6 were screened from 31.5 to 41.5 feet bgs. Well SVE-1 was constructed of 4-inch-diameter blank PVC, flush-threaded with 0.010-inch slotted well screen from 15 to 25 feet bgs. The bottom and top of each well were fitted with a threaded PVC bottom cap and a compression-fit well cap. The annulus of the monitoring well borings was filled with #2/12 silica sand to a minimum height of 2 feet above the top of the screened interval. A bentonite seal was installed above the sand pack to approximately 1 foot below grade. The wells were completed at the surface with a flush-mounted, traffic-rated well box set in concrete.

The monitoring wells were developed by Farallon following installation using a surge block and submersible pump. The monitoring well development consisted of surging and purging the wells until a minimum of five well casing volumes were removed and the groundwater no longer appeared turbid. The boring logs/well construction details for the seven monitoring wells and SVE well provided in Table 1 and Appendix A.

Professional Land Surveyors, Inc. of Issaquah, Washington surveyed the elevation of the north side of the top of the casing at each of the monitoring wells. The vertical survey for the monitoring wells was correlated to mean sea level using an existing benchmark at the Site (Table 1).

3.4 GROUNDWATER MONITORING

Groundwater levels were measured in monitoring wells MW-1 through MW-6 and MW-1D on May 1, 2008. Prior to obtaining groundwater level measurements, the monitoring wells were opened to facilitate equilibration with atmospheric pressure for a minimum of 30 minutes prior to

measuring the depth to groundwater. The depth to groundwater was measured at each monitoring well using an electronic water level indicator.

Groundwater samples were collected from newly installed monitoring wells MW-1D and MW-4 through MW6 on May 1, 2008. Groundwater purging and sampling was conducted in accordance with EPA guidance for low-flow purging and sampling of groundwater. The monitoring wells were purged using a QED Systems bladder pump at flow rates between 100 and 300 milliliters per minute. Groundwater geochemical parameters, including temperature, specific conductance, pH, dissolved oxygen, oxidation/reduction potential, and turbidity were recorded approximately every 3 minutes during purging using a Yellow Spring Instrument multi-parameter meter equipped with a flow-through cell. Groundwater samples were collected upon stabilization of the geochemical parameters. Stabilization is determined as a relative percent difference of less than 3 percent for temperature and specific conductivity, and a change of $\pm$ 0.1 pH unit between readings for three consecutive measurements. The samples were collected by pumping groundwater directly from each monitoring well through the dedicated polyethylene tubing into laboratory-prepared containers. The samples were labeled, placed on ice, and transported to OnSite Environmental Inc. under chain-of-custody protocols. Groundwater samples collected from the monitoring wells were submitted following standard chain-of-custody protocols for laboratory analysis for HVOCs by EPA Method 8260B.

In addition, the groundwater samples collected from monitoring wells MW-1D, MW-2, and MW-4, were submitted for laboratory analysis for nitrate and sulfate by EPA Method 300.0; and methane, ethene, and ethane by Headspace. The groundwater samples were placed on ice in a cooler and transported to Onsite Environmental Inc. under standard chain-of-custody protocols.

3.5 SOIL VAPOR EXTRACTION PILOT TEST

The SVE pilot test was performed at the Site on April 11, 2008. Monitoring wells MW-1 through MW-4 were used as observation points for the pilot test at well SVE-1. The screened intervals for each well are summarized in Table 1, and the well construction diagrams for each of the monitoring and SVE wells are provided in Appendix A.

The SVE pilot test conducted at well SVE-1 was performed by applying two increments of vacuum using a METEK EN 454 1.5-horsepower explosion-proof regenerative blower. A Dwyer Magnehelix vacuum gage was connected to well SVE-1 to monitor the applied vacuum throughout the pilot test. Monitoring was conducted to measure changes in pressure/vacuum at 2-inch-diameter observation wells MW-1 and MW-4, and at 4-inch-diameter observation wells MW-2 and MW-3. Prior to start-up of the test, the observation wells were fitted with monitoring ports on modified well caps to facilitate measurement of pressure/vacuum within each well. Ambient pressure/vacuum measurements were collected in each observation well immediately prior to start-up of the pilot test.

During the pilot test, the rate at which soil vapor was extracted from well SVE-1 at each vacuum setting and the changes in pressure/vacuum at the observation wells were monitored at approximately 5-minute intervals. The first increment of vacuum applied to well SVE-1 was 26 inches of water (IOW), which was increased to 27.5 IOW after approximately 20 minutes. The

second increment of vacuum applied to well SVE-1 was 48 IOW, which decreased to 47.5 after approximately 45 minutes. The vacuum applied to well SVE-1 subsequently was reduced to 40.5 IOW after an additional 10 minutes and maintained until stabilization of the vapor flow rate and the pressure/vacuum within the observation wells was indicated (approximately 50 minutes).

3.6 AQUIFER TEST

Farallon performed a total of 10 aquifer slug tests on April 10, 2008 at monitoring wells MW-1, MW-2, and MW-3. The purpose of the aquifer slug tests was to qualitatively evaluate the hydrologic characteristics of the shallow water-bearing zone at the Site. Prior to measuring water levels, the monitoring wells were opened to facilitate equilibration with atmospheric pressure for a minimum of 30 minutes. Farallon measured initial and final water levels in each monitoring well manually using a Heron electronic water level meter. Water level measurements were recorded in each well during the aquifer slug tests using a 15-pound-per-square-inch pressure transducer and data loggers manufactured by In-Situ, Inc. of Fort Collins, Colorado. The data logger was programmed to record data at 0.25-second intervals. The field equipment was cleaned prior to installation in each well.

3.7 MANAGEMENT OF INVESTIGATION-DERIVED WASTE

All soil cuttings, decontamination water, purge water, and other wastewater generated during the RI field program were temporarily stored on the Site in labeled 55-gallon steel drums. The analytical results of the soil and groundwater samples will be used to develop a waste profile for disposal at an approved transport, storage, and disposal facility.

3.8 TERRESTRIAL ECOLOGICAL EVALUATION

A TEE is intended to assess potential risk to plants and animals that live entirely or primarily on affected land. A simplified TEE was required as part of the RI/FS under MTCA to assess the potential ecological risk posed by COPCs at the Site and whether a more detailed investigation of potential ecological risk would be required. Farallon conducted a simplified TEE in accordance with Table 749.1 of WAC 173-340-7492 to document the potential ecologic risk associated with the presence of COPCs at the Site.

4.0 REMEDIAL INVESTIGATION RESULTS

This section presents the results of the RI field program performed by Farallon. The results include a description of soil and groundwater conditions, soil and groundwater analytical data, SVE pilot test and aquifer slug test results, and the screening assessment. The RI results are summarized in a conceptual site model that addresses the source, contaminant fate and transport in each affected media, and exposure pathways for contaminants at the Site.

4.1 SOIL

Figure 4 shows the location of cross-sections A-A' (Figure 5) and B-B' (Figure 6) in relation to features at the Site, and the boring and well locations. The cross-sections illustrate the soil types encountered during drilling at the Site. As shown on these cross-sections, the general stratigraphy encountered at the Site is composed predominantly of silt and silty sand from near the ground surface to approximately 10 feet bgs. Below this layer, poorly graded sand with silt was present from depths of approximately 10 to 30 feet bgs. The soil encountered from 30 to 55 feet bgs consisted of poorly graded fine- to medium-grained sand and silty sand, and soil encountered at 55 feet bgs at boring MW-1D consisted of silt. Below the silt layer was sand to the total depth explored of 60 feet bgs.

The analytical results for soil samples collected during the RI that were analyzed for HVOCs by EPA Method 8260B are summarized on Table 2. Figure 7 shows the concentrations of PCE and TCE in soil for the borings drilled at the Site, and Figures 5 and 6 depict the vertical distribution of PCE and TCE in soil along the cross-section lines. The analytical results for soil samples analyzed for total organic carbon are summarized in Table 2. The laboratory analytical reports for the soil samples collected during the RI field program are included in Appendix B.

Concentrations of PCE detected in soil samples collected from borings drilled during the RI field investigation ranged from 0.0088 mg/kg at 20 feet bgs at boring MW-6 to 0.43 mg/kg at 20 feet bgs at boring FB-8. Concentrations of other HVOCs in the soil samples were below the laboratory practical quantitation limit (PQL) except in the soil sample collected at boring MW-1D at 25 feet bgs. The concentration of TCE in this sample was above the PQL, but less than the MTCA Method A cleanup level of 0.03 mg/kg.

The lateral extent of PCE in soil exceeding the MTCA Method A cleanup level is shown on Figure 7. Soil samples analyzed from borings MW-5 and MW-6 bounded the western and southern extent of PCE in soil at the Site. Soil samples collected from borings MW-2 and MW-3 during the limited subsurface assessment by Farallon bounded the northern extent of PCE. Due to the presence of a building to the east of the alley, the eastern extent of PCE in soil exceeding the MTCA Method A cleanup level was not confirmed. However, concentrations of PCE were less than 0.2 mg/kg in soil samples collected from borings located in the alley, which demonstrates that concentrations of PCE to the east were attenuating with distance from the source area east (Figure 7).

The total organic carbon content of soil in the water-bearing zone was assessed by collection of soil samples from borings MW-1D, MW-5, and MW-6. Total organic carbon content ranged from 0.036 to 0.062 percent (Table 4). These low organic carbon results are typical of glacially deposited soil.

4.2 GROUNDWATER

A shallow, unconfined groundwater-bearing zone is present beneath the Site. Groundwater levels were measured at monitoring wells MW-1 through MW-3 on January 25, 2008 and at all monitoring wells at the Site for the RI field program on May 1, 2008 (Table 1). The depth to groundwater below the top of the well casings on May 1, 2008 ranged from 22.16 feet at monitoring well MW-4 to 29.96 feet at monitoring well MW-6. Groundwater levels at monitoring wells MW-1 through MW-3 rose approximately 0.75 feet between the January and May 2008 monitoring events. Figure 8 depicts the groundwater level contours for the May 1, 2008 monitoring event. As shown on Figure 8, the estimated groundwater flow direction is towards the southeast at a gradient of 0.003 foot per foot.

A purpose of monitoring wells MW-1 and MW-1D was to provide data on the vertical gradient in the shallow water-bearing zone and the vertical distribution of HVOCs. These wells were proposed to be located in close proximity and the screened intervals were selected to be vertically separate. The top of the screened interval for monitoring well MW-1D is 8 feet below the base of the screen at monitoring well MW-1. However, due to access limitations for the drill rig, monitoring well MW-1D could not be installed adjacent to monitoring well MW-1, but was located approximately 20 feet to the north. Comparison of the groundwater levels at monitoring wells MW-1 and MW-1D during the May 1, 2008 monitoring event indicate that there is a slight downward gradient between the intervals of the shallow water-bearing zones screened by these wells.

The aquifer testing results for the slug tests conducted in the shallow water-bearing zone at the Site are summarized below. The aquifer testing included performing a series of slug tests at monitoring wells MW-1, MW-2, and MW-3 to qualitatively evaluate the hydrologic characteristics of the shallow water-bearing zone, including hydraulic conductivity.

The aquifer testing analysis software package AQTESOLV™ (Duffield, 1998) was used to expedite the fitting of type-curves to the aquifer testing data. The corrected water level data expressed as drawdown in the spreadsheet files were written to temporary files and then imported to the files for AQTESOLV™. A data filter was applied with the AQTESOLV™ program to discard any negative drawdown values.

The analytical solution chosen for the slug tests performed at monitoring wells MW-1, MW-2, and MW-3 was the Bouwer-Rice Method, based on the assumption that these wells are screened within the shallow water-bearing zone under unconfined conditions. The horizontal hydraulic conductivity results calculated for each well using AQTESOLV™ are summarized on Table 6. Data analysis plots for the slug tests are provided in Appendix C.

The geometric mean value of horizontal hydraulic conductivity calculated from the three shallow water-bearing zone monitoring wells is 2.09 x 10^{-3} centimeters per second (5.93 feet/day) (Table 6). The estimated hydraulic conductivity at monitoring wells MW-1, MW-2, and MW-3 is consistent with the typical range for silty sand to clean sand (Freeze and Cherry, *Groundwater*, 1979, page 29, Table 2.2). This corresponds with the subsurface soil encountered in all of the borings while drilling.

The groundwater sampling results are discussed below. Table 3 summarizes the analytical results for selected HVOCs for groundwater samples collected from the borings and monitoring wells at the Site. Figure 9 shows concentrations of PCE in groundwater at the monitoring wells and for the reconnaissance groundwater sample collected at boring location FB-8. This figure also depicts the PCE isoconcentration contours based on groundwater quality data for samples collected from monitoring wells and the estimated direction of groundwater flow towards the southeast. As shown on this figure, the lateral extent of PCE-contaminated groundwater was bounded to the north by monitoring well MW-4. The relatively low concentrations of PCE in monitoring well MW-5 of 53 micrograms per liter (µg/l) suggest that the up-gradient extent of PCE-contaminated groundwater is in the area just west-northwest of this well. The highest concentration of PCE was detected in the groundwater sample collected from monitoring well MW-1. This was anticipated due to the location of this monitoring well immediately down-gradient of the source area. The down-gradient extent of PCE-contaminated groundwater past monitoring well MW-1 was not fully delineated by the existing monitoring well network. Based on the estimated southeast groundwater flow direction, the plume of PCE-contaminated groundwater is likely migrating to the south of the intersection of East Cherry Street with 26th Avenue.

The vertical distribution of PCE in groundwater extends over 25 feet below the surface of the groundwater table based on the analytical results for the sample collected from monitoring well MW-1D (Figures 5 and 6). It is inferred that the concentrations of PCE decrease to below the MTCA Method A cleanup level within 5 to 10 feet below the depth screened by monitoring well MW-1D of 55 feet bgs.

Groundwater geochemical parameters monitored during sampling indicate that the shallow water-bearing zone is aerobic and oxidizing to slightly reducing. Dissolved oxygen levels in groundwater ranged from 6 mg/l to greater than 16 mg/l, with the lowest dissolved oxygen levels measured at monitoring wells MW-1 and MW-1D in the central portion of the PCE plume (Table 4). ORP measurements were generally consistent with the dissolved oxygen levels except at monitoring well MW-5 where the dissolved oxygen level was greater than 10 mg/l, but the ORP measurement of -128 millivolts was typical of a moderately reducing environment.

Concentrations of the end products of PCE breakdown ethene, ethane, and methane were detected in the groundwater sample collected from monitoring well MW-1D (Table 4). In addition, the concentration of nitrate in the groundwater sample from this well was lower than at monitoring wells MW-2 or MW-4. These results suggest that conditions deeper in the shallow water-bearing zone may be more conducive to anaerobic degradation of HVOCs than in the upper portion of the shallow water-bearing zone.

4.3 SVE PILOT TEST RESULTS

The soil vapor extraction pilot test was performed on April 11, 2008 and the pilot test results are summarized in Table 5. The pilot test was initially conducted by applying 27.5 inches of water (IOW) vacuum, which was later increased to 48 IOW vacuum applied.

The steady-state airflow resulting from application of a vacuum of 27.5 IOW at well SVE-1 was approximately 8.3 standard cubic feet per minute (scfm). The increase in the applied well-head vacuum increments to 48 IOW produced a steady-state airflow rate of approximately 10.3 scfm. The flow rate achieved at the test well was consistent with expectations based on the soil type and density observed at the Site.

The vacuum response was measured in observation wells MW-1 through MW-4 during the test at well SVE-1 (Table 5). The vacuum responses were the greatest in observation well MW-2, which is located approximately 13 feet from the test well. The results of the pilot rest indicated that an applied vacuum of 48 IOW with a flow rate of 15.7 scfm produced optimal conditions and a significant radius of influence.

Soil vapor samples were collected periodically from the discharge from pilot test well SVE-1, and were analyzed using GasTech colorimetric tubes. Concentrations of PCE above the 0.5 parts per million volume detection limit were not observed in the soil vapor discharged from well SVE-1. Calculations based on the actual flow rates achieved at well SVE-1 during the test indicate that the test duration of approximately 4 hours of applied vacuum likely was insufficient to mobilize PCE soil vapor concentrations from the suspected source area at boring FB-4 to the extraction point at pilot test well SVE-1.

The vacuum responses observed during the pilot test at SVE-1 indicate that SVE is a feasible technology for the removal of COPCs from the vadose zone. Measurable responses to the vacuum applied at well SVE-1 were documented at monitoring well MW-4, which was located approximately 115 feet from well SVE-1. Due to the observed response to the SVE pilot test, the conceptual design of the SVE well network will be based on a conservative radius of influence (ROI) of approximately 30 feet from each SVE well, except for two SVE wells that would be located at the source area and screened in the shallow silt layer. These wells were assumed to have a radius of influence of 15 feet. These design radii are anticipated to be adequate to account for the expected variability of the vadose zone soil permeability across the Site.

4.4 TERRESTRIAL ECOLOGICAL EVALUATION RESULTS

A TEE is required by WAC 173-340-7490 at any site where there has been a release of a hazardous substance to soil. The regulation requires that one of the following actions be taken:

- Documenting a TEE exclusion using the criteria presented in WAC 173-340-7491;
- Conducting a simplified TEE in accordance with WAC 173-340-7492; or
- Conducting a site-specific TEE in accordance with WAC 173-340-7493.

The Site qualifies for a TEE exclusion based on the provisions of WAC 173-340-7491. The results of the ranking for the simplified TEE under Table 749-1 of MTCA yielded a score of 12, which qualified the Site for the TEE exclusion under the criteria set forth in WAC 173-340-7491. No further consideration of ecological impacts is required under MTCA.

4.5 CONCEPTUAL SITE MODEL

A conceptual site model identifies suspected sources of contamination, affected media, transport mechanisms, contaminant fate, and potential receptors and exposure pathways. A conceptual site model serves as the basis for developing technically feasible cleanup alternatives and selecting a final cleanup action. A conceptual site model is dynamic, and may be refined throughout a cleanup action as additional information becomes available.

This section discusses the components of the conceptual site model developed for the Site based on completion of the phases of investigation conducted by Farallon and others. Included in the following subsections is a discussion of the confirmed and suspected source areas, contaminants of concern and corresponding affected media, contaminant fate and transport, and the preliminary exposure assessment.

4.5.1 Source Area

A source area is the location of a release of COPCs that have affected soil, groundwater, and/or air quality at a site. The observed distribution of high concentrations of PCE in soil beneath the northeast portion of the Custom Cherry Cleaners building and in shallow groundwater down-gradient (southeast) of this area at monitoring well MW-1 indicate that PCE was released in the vicinity of the former dry cleaning equipment and/or the floor drain (Figures 5, 6, 7, and 9). However, other minor release(s) of PCE may have occurred that have commingled with the primary source at the northeast corner of the building and its resulting vapor plume, and may not be distinguishable from the release at the primary source.

4.5.2 Contaminants of Potential Concern and Affected Media

The COPCs for the Site are PCE and its degradation compounds TCE, cis-1,2-dichloroethene, and vinyl chloride. Concentrations of PCE and TCE exceeding MTCA Method A cleanup levels have been confirmed in soil and groundwater at the Site. Concentrations of cis-1,2-dichloroethene have been detected in soil and groundwater, but the concentrations were below the MTCA Method B cleanup levels. Under certain conditions, cis-1,2-dichloroethene degrades to vinyl chloride in the subsurface. Although vinyl chloride was not detected in soil or groundwater samples at the Site, the PQL for vinyl chloride for the groundwater sample analytical results exceeded the MTCA Method A cleanup level of 0.2 µg/l due to the presence of high concentrations of PCE and required dilution of the sample prior to analysis. Therefore, concentrations of vinyl chloride may potentially be present in groundwater samples that were not identified due to the elevated PQL. Because concentrations of cis-1,2-dichloroethene have been detected and may degrade to vinyl chloride, and vinyl chloride may be present in groundwater at concentrations exceeding the MTCA Method A cleanup level but less than the laboratory PQL, Farallon retained both cis-1,2-dichloroethene and vinyl chloride as COPCs.

Soil and groundwater have been confirmed as affected media of concern at the Site. Indoor air has been retained as a medium of concern based on the elevated concentrations of PCE in shallow soil beneath the Custom Cherry Cleaner building slab.

4.5.3 Contaminant Fate and Transport

This section includes a discussion of the fate and transport characteristics of the COPCs identified in the affected media at the Site that are relevant to the evaluation of potentially feasible remedial technologies. These include PCE, TCE, cis-1,2-DCE, and vinyl chloride, which are confirmed to be present at levels requiring further action under MTCA in both soil (PCE and TCE only) and groundwater (PCE, TCE, and potentially cis-1,2-DCE and vinyl chloride). The presence of TCE, cis-1,2-dichloroethene, and vinyl chloride is attributed to the chemical or biological degradation of PCE. Because both PCE and the other COPCs share similar environmental fate and transport characteristics and are present in the same media, PCE will be the focus of the discussion of contaminant fate and transport.

4.5.3.1 Transport Mechanisms Affecting Distribution of PCE in the Subsurface

The lateral distribution of PCE concentrations in soil likely is a result of vapor-phase transport by diffusion from the source area via natural mechanisms such as barometric pumping. Over time, soil in contact with the PCE vapor plume became contaminated and has resulted in the identified distribution of PCE in soil and the underlying shallow groundwater.

In addition to vapor-phase transport, PCE in the subsurface will also be transported in the dissolved-phase via groundwater or other water that comes into contact with contaminated soil (e.g., infiltration of precipitation). PCE in groundwater will follow the horizontal and vertical groundwater gradients (Figures 5, 6, and 8). The direction of groundwater flow at the Site is inferred to be to the southeast. Concentrations of PCE in groundwater will be greatest in monitoring wells located closest to the source area and will typically diminish along the groundwater flow path due to dilution with unaffected groundwater and sorption onto soil particles.

The results of the TOC laboratory analysis conducted for selected soil samples indicate that the total organic carbon concentrations in soil are relatively low. These data suggest that the retardation capacity of the soil matrix within the shallow water-bearing zone may not substantially impede the migration of PCE in groundwater down-gradient of the source area.

4.5.3.2 Environmental Fate of PCE in the Subsurface

The physical components of the natural attenuation process include dispersion, dilution, sorption, volatilization, and to a lesser extent, barometric pumping. Dispersion and dilution components of the natural attenuation process result in reduction of the contaminant mass both laterally and vertically along the migration pathway. Due to the configuration of the monitoring well network and limited groundwater quality data down-gradient of the source area, no detailed evaluation of these processes on COPC distribution was performed.

The effect of sorption to the soil matrix is likely not substantial based on the relatively low total organic content of the soil in the water-bearing zone. The relatively low sorptive capacity of the soil matrix will decrease the retention time for HVOCs within the source area. The decreased retention time may not allow chemical and biodegradation processes to occur at rates that exceed those of dispersion and dilution. The two other physical factors affecting the attenuation of HVOCs are volatilization and barometric pumping, both of which involve the loss and/or movement of the gaseous phase of the contaminant in the vadose zone. The contribution of these processes to the natural attenuation may be significant at this Site for PCE present in the upper portion of the water-bearing zone and where soil is relatively permeable (sand), the water table is shallow, and the ground surface is not capped by asphalt or concrete. Once in the atmosphere, PCE will rapidly disperse via physical transport and photodegradation.

Once PCE enters the subsurface, chemical attenuation processes such as hydrolysis, direct mineralization, and reductive dehalogenation may affect the HVOCs in soil and groundwater, resulting in a natural reduction or breakdown of the HVOCs into non-toxic components such as ethene. Biological attenuation processes such as reductive dechlorination and cometabolic degradation also may affect the reduction of HVOCs in soil and groundwater under conducive subsurface conditions. If biodegradation of PCE is occurring, the first line of evidence is the presence of degradation compounds that include TCE, isomers of dichloroethene, and vinyl chloride. The soil and groundwater analytical data indicate that concentrations of TCE and cis-1,2-dichloroethene have been detected in the shallow water-bearing zone, suggesting that some biological and possibly chemical attenuation processes are occurring for these HVOCs (vinyl chloride may be present in groundwater at concentrations below the elevated PQLs for the groundwater samples).

The dissolved oxygen measurements for groundwater at the monitoring well network indicate that the water-bearing zone is aerobic. ORP measurements generally indicate an oxidizing environment, except at monitoring well MW-5 where ORP was -128 millivolts. This suggests that conditions are reducing (anaerobic) in the vicinity of this well. The depletion of nitrite at monitoring well MW-1D and the detection of methane, ethane, and ethene at monitoring well MW-1D suggest that conditions in the lower portion of the shallow water-bearing zone are more conducive to anaerobic biodegradation than in the upper portion of the shallow water-bearing zone.

4.5.4 Preliminary Exposure Assessment

The two types of risk for exposure associated with the presence of COPCs at the Site are terrestrial ecological risk and human health risk. Because the Site qualifies for a TEE exclusion based on WAC 173-340-7491, mitigating the potential human health risk associated with exposure to the COPCs in the affected media at the Site will be the primary objective of the cleanup action implemented. This subsection presents the evaluation and conclusions pertaining to the exposure pathways at the Site. The goal of this subsection is to identify potential exposure scenarios that will assist in the evaluation of potential feasible remediation technologies.

4.5.4.1 Soil Pathway

The exposure pathways for shallow soil include the direct contact pathway, which comprises direct contact via dermal contact with and/or ingestion of soil beneath the Site. Direct contact with soil would require excavation activities. At present, soil with concentrations of PCE that exceed the concentration of 1.9 mg/kg considered protective of the direct contact pathway for dermal contact and/or ingestion are covered with the concrete floor slab of the Custom Cherry Cleaners building, which makes the risk of direct contact negligible. Future redevelopment activities at the Site could result in exposure to contaminated soil. A construction contingency plan would be developed to govern the handling of potentially contaminated soil and/or groundwater during future construction, as necessary.

4.5.4.2 Groundwater Pathways

Potential exposure pathways for groundwater include the direct contact pathway, which comprises both the dermal contact and ingestion pathways. There are no groundwater supply wells at or in the vicinity of the Site that are used for potable water supply. The shallow water-bearing zone groundwater is not used as a drinking water source, but may qualify as a potential future source of potable water. However, because of the availability of the municipal water supply in the Site vicinity, there is a low probability that groundwater in the shallow water-bearing zone at the Site would be used as a potable water source. Because there is no practical use of shallow groundwater and groundwater is located over 25 feet bgs, direct contact with groundwater would require deep excavation activities to become a potential risk to human health. Future redevelopment activities at the Site would likely not extend to the depth of groundwater. If future redevelopment plans indicate that groundwater may be encountered, a construction contingency plan would need to be developed to govern the handling of potentially contaminated soil and/or groundwater during construction, as necessary.

4.5.4.3 Vapor Pathway

The presence of PCE in soil at concentrations exceeding 0.05 mg/kg has the potential to result in vapor intrusion to indoor and outdoor air. Potential exposure would occur through the inhalation pathway. In the areas down-gradient of the source area such as the alley and East Cherry Street, concentrations of PCE in soil and groundwater were detected but there are no structures for the vapors to accumulate in (Figures 7 and 9). As a result, the vapors would be dispersed into the atmosphere, where dilution and degradation would occur. The exposure risk posed by the vapor pathway in this area of the Site is minimal, as is the probability that outdoor air concentrations of PCE would exceed the MTCA Method B cleanup level for air.

In the vicinity of the source area at the Custom Cherry Cleaners or at the east-adjacent building, the concrete slab of the building serves as a vapor barrier. However, no indoor air screening has been conducted to evaluate if the concrete slab is sufficiently protective to prevent vapor intrusion into the structures. Addressing the exposure risk posed by the

vapor pathway in this area of the Site is a remedial action objective considered in the FS (Section 5).

4.6 CONCEPTUAL SITE MODEL SUMMARY

The geologic and hydrogeologic information and the soil and groundwater analytical data were compiled on cross-sections of the Site to illustrate the conceptual model of Site conditions. As shown on cross sections A-A' and B-B' (Figures 5 and 6, respectively), the stratigraphy is complex with the upper 10 feet of the vadose zone primarily composed of silt and sandy silt. Below 10 feet bgs, the soil encountered was silty sand, sand with silt, and sand. A thin silt layer was encountered at 55 feet bgs in boring MW-1D. It is not known if this silt layer is laterally continuous and may act as an aquitard to the downward migration of contaminated groundwater.

The soil analytical data collected during the investigations conducted at the Site indicate that concentrations of PCE decrease rapidly in the vadose zone with distance from the source area, with PCE values going from 440 mg/kg at boring FB-4 to less than 13 mg/kg within 15 feet laterally from this at boring FB-5 (Figure 7). The soil analytical data further indicate that concentrations of PCE appear to attenuate to less than 1 mg/kg at depths below approximately 8 feet (Figures 5 and 6). The presence of concentrations of PCE exceeding the MTCA Method A cleanup level in soil at borings beyond the Custom Cherry Cleaners property boundary is likely due to partitioning from PCE in soil vapor onto soil.

The distribution of PCE in groundwater is consistent with a concentrated source at the northeastern corner of the Custom Cherry Cleaners building, surrounded by a large vapor plume, with concentrations of PCE in vapor sufficient to cause groundwater contamination, and migration of PCE in groundwater along the southeastern groundwater flow direction (Figure 9). The lateral distribution of PCE in groundwater was not fully characterized with the existing monitoring well network, but may be as broad as 200 feet based on the presence of PCE in groundwater at monitoring well MW-4. The vertical distribution of PCE in groundwater appears limited to approximately the upper 30 feet of the water-bearing zone assuming that concentrations of PCE attenuate to less than 5 µg/l within 5 to 10 feet below the base of monitoring well MW-1D. There is no evidence to suggest that dense nonaqueous-phase liquid is present in the shallow water-bearing zone at the Site and the vertical gradient in the shallow water-bearing zone is low.

The target media for the cleanup action will be soil, soil vapor, and groundwater because these media represent the highest probable risk to human health and the environment based on the exposure pathway analysis performed.

5.0 FEASIBILITY STUDY

The purpose of a feasibility study is to develop and evaluate cleanup action alternatives to facilitate selection of a final cleanup action at a site in accordance with WAC 173-340-350(8). An initial screening of remediation technologies was performed consistent with the provisions of WAC 173-340-350(8)(b) to eliminate cleanup alternatives that are clearly not technically feasible; whose costs are clearly disproportionate under WAC 173-340-360(3)(e); or that will be inconsistent with the planned redevelopment of the former Custom Cherry Cleaners property or use of adjacent properties that comprise the Site. Data collection was performed during the RI to demonstrate the applicability and/or performance of remedial technologies under Site-specific conditions and to support a recommendation for a cleanup alternative for the Site in conformance with WAC 173-340-360 through WAC 173-340-390. The RI/FS Report is intended to provide sufficient information to enable Ecology and the owner of the former Custom Cherry Cleaners property to concur on the selection of a final cleanup action, dependent on the outcome of field pilot testing of one or more cleanup alternatives for groundwater. Selection of a final cleanup action will be documented in a Cleanup Action Plan prepared in accordance with WAC 173-340-380.

5.1 EVALUATION OF FEASIBLE REMEDIATION TECHNOLOGIES

As part of the FS, Farallon evaluated remediation technologies for the Site with respect to the cleanup requirements set forth in MTCA. The FS considered the requirements under WAC 173-340-350, Site-specific conditions, and the criteria defined in WAC 173-340-360 for screening of potentially feasible remedial alternatives for the Site. A cleanup alternative must satisfy all of the following threshold criteria as specified in WAC 173-340-360(2):

- Protect human health and the environment;
- Comply with cleanup standards;
- Comply with applicable state and federal laws; and
- Provide for compliance monitoring.

These criteria represent the minimum standards for an acceptable cleanup action. In addition to meeting the threshold criteria, cleanup actions under MTCA will also:

- Use permanent solutions to the maximum extent practicable;
- Provide for a reasonable restoration time frame, and
- Consider public concerns on the cleanup action plan.

The scope of work and results of the FS are provided below.

5.2 EVALUATION OF POTENTIALLY FEASIBLE CLEANUP ALTERNATIVES

This section presents the evaluation of potentially feasible cleanup alternatives for the Site with respect to the requirements set forth in MTCA under WAC 173-340-350 through 173-340–370.

During the screening of potentially feasible remedial alternatives, Farallon also considered Site-specific conditions, including the distribution of PCE in the affected media, impacts to redevelopment of the Custom Cherry Cleaners property, and use of adjacent properties, specifically the west-adjacent Islamic School of Seattle play yard and parking area. This section presents remedial action objectives, an overview of the evaluation of potential remediation technologies conducted by Farallon using the screening process set forth in WAC 173-340-350(8)(b), and the screening of potential remediation technologies using the requirements and procedures for selecting cleanup actions set forth in MTCA under WAC 173-340-360(2)(a)(b).

The key Site-specific conditions that were considered during an initial screening of potential feasible remedial technologies include:

- A source beneath a building with high concentrations of PCE;
- Predominately silty soil in the upper 10 feet of the vadose zone which would limit the effectiveness of technologies that are influenced by soil permeability and likely preclude the use of other in-situ remedies such as chemical oxidation due to low permeability and organic content;
- The presence of a dissolved PCE groundwater plume exceeding the MTCA Method A cleanup level of 5 µg/l extending to an estimated depth of over 55 feet; and
- Access limitations due to the presence of numerous subsurface utilities, streets, alleys, and adjacent off-Site buildings in an urban area.

5.3 REMEDIAL ACTION OBJECTIVES

Remedial action objectives address the primary goals that a remedial action should achieve in order to be retained for further evaluation for the FS. The remedial action objective for the cleanup action at the Site is to remediate contaminated soil and groundwater that poses a potential threat to human health via the direct contact and inhalation pathways, and that poses a potential future threat to human health and environment via the groundwater pathway, in a timely and cost-effective manner that minimizes the impacts to redevelopment and property use at the Site to the maximum extent practicable. The Site-specific goals for remediation of contaminated soil and groundwater include:

- Substantially reduce or eliminate concentrations of COPCs in shallow soil in the immediate vicinity of the source area to below the MTCA Method B cleanup level for the direct contact exposure pathway for soil to the extent practicable;
- Reduce concentrations of COPCs in groundwater in the area proximate to the source area to below the MTCA Method A cleanup level for groundwater to the extent practicable;
- Reduce concentrations of COPCs in groundwater in the water-bearing zone in areas down-gradient of the source area to below the MTCA Method A cleanup level for groundwater to the extent practicable;

- Reduce PCE concentrations in soil vapor to mitigate potential soil vapor migration into existing or future buildings at concentrations exceeding the MTCA Method B indoor air value for PCE to the extent practicable; and
- Implement institutional controls on the Site to ensure long term-maintenance of the risk management procedures in accordance with WAC 173-340-440, which may include deed restrictions for soil and prohibiting the domestic use of groundwater beneath the Site, and provide for continued monitoring of groundwater and maintenance of engineering controls, if required. In addition, a construction contingency plan would be developed to govern the handling of potentially contaminated media during future redevelopment or utility work, as necessary.

These Site-specific cleanup goals would be achieved using a combination of remediation technologies including, but not limited to, removal of fine-grained soil with high concentrations of PCE at the source area, in-situ treatment of remaining soil with low concentrations of PCE, and in-situ treatment of groundwater contamination. If necessary, engineering controls may be implemented to mitigate potential intrusion of soil vapor into structures, and groundwater monitoring may be performed to demonstrate that natural attenuation is occurring in areas down-gradient of the source area within a reasonable timeframe. Institutional goals would also be implemented where COPCs remain at concentrations above cleanup levels following completion of the cleanup action, if necessary.

5.4 EVALUATION PROCESS

The criteria used by Farallon to qualitatively evaluate potentially applicable cleanup alternatives were derived from WAC 173-340-360(3)(f) and include:

- Protectiveness: Overall protectiveness of human health and the environment, including the degree to which existing risks are reduced, time required to reduce risk at the Site and attain cleanup standards, on-Site risks resulting from implementing the alternative, and improvement of overall environmental quality.
- Permanence: The degree to which the alternative permanently reduces the toxicity, mobility, or volume of hazardous substances, including the adequacy of the alternative in destroying the hazardous substances, the reduction or elimination of hazardous substance releases and sources of releases, the degree of irreversibility of waste treatment process, and the characteristics and quantity of treatment residuals generated.
- Cost: The cost to implement the alternative, including the cost of construction, the net present value of any long-term costs, and Ecology oversight costs recoverable under the Voluntary Cleanup Program. Long-term costs include operation and maintenance costs, monitoring costs, and reporting costs.
- Effectiveness over the long term: Long-term effectiveness includes the degree of certainty that the alternative will be successful, the reliability of the alternative during the period of time that hazardous substances are expected to remain on the Site at concentrations that exceed cleanup levels, and the magnitude of residual risk with the alternative in place. The following types of cleanup action components may be used as a

guide, in descending order, when assessing the relative degree of long-term effectiveness: reuse or recycling; destruction or detoxification; immobilization or solidification; on-Site or off-Site disposal in an engineered, lined, and monitored facility; on-Site isolation or containment with attendant engineering controls; and institutional controls and monitoring.

- Management of short-term risks: The risk to human health and the environment associated with the alternative during construction and implementation, and the effectiveness of measures that will be taken to manage such risks. This criterion includes risks to workers and customers at businesses adjoining the dry cleaning equipment source area resulting from implementation of the cleanup alternative.
- Technical and administrative implementability: Ability to be implemented, including consideration of whether the alternative is technically feasible, administrative and regulatory requirements, permitting, scheduling, complexity, monitoring requirements, access for construction operations and monitoring, and integration with the redevelopment of the Custom Cherry Cleaners property.
- Consideration of public concerns: Whether the community has concerns regarding the alternative and if so, the extent to which the alternative addresses those concerns. This process includes concerns from individuals, community groups, local governments, federal and state agencies, or any other organization that may have an interest in or knowledge of the Site.

An initial screening of all potential remediation technologies typically applied to sites contaminated with PCE and associated HVOCs was performed by Farallon to eliminate technologies that did not meet the minimum requirements for protectiveness, permanence, implementability, and cost as described above. A number of remediation technologies were eliminated during the initial screening process as set forth in WAC 173-340-350(8)(b). These technologies included, but were not limited to, soil flushing (co-solvents) and extraction, stabilization, resistive or microwave heating, chemical oxidation, excavation of all soil with concentrations of PCE above the MTCA Method A cleanup level for cleanup of vadose zone soil. Technologies eliminated from consideration for groundwater cleanup include the use of dual-phase extraction, groundwater pumping and aboveground treatment, chemical oxidation (except to augment air sparging), and use of permeable reactive barriers such as zero-valent iron. Farallon also considered a "no action" alternative but this did not meet the remedial action objectives, protectiveness criteria, and/or permanence minimum requirements.

5.5 FOCUSED SCREENING OF POTENTIAL TREATMENT TECHNOLOGIES

The focused screening of potential technically feasible cleanup alternatives considered all practicable remediation technologies confirmed to be effective at treating PCE and its degradation compounds in the affected media of concern. Farallon also considered whether Site-specific constraints may preclude application of a remediation technology due to creation of a greater risk to human health and/or the environment, or result in substantial costs not proportional to the benefits of implementing that remediation technology.

The key assumptions used by Farallon in the focused screening of cleanup alternatives were:

- PCE is a valid indicator hazardous compound for the COPCs at the Site and that implementation of cleanup alternatives that are successful at meeting the cleanup objectives for PCE would also be successful for the other COPCs throughout the Site;
- The distribution of PCE in soil and groundwater described in the conceptual site model (Section 4.6) has been defined sufficiently to support the evaluation of potential remediation technologies;
- MTCA Method A cleanup levels for soil and groundwater are the target cleanup levels for PCE. Attaining these levels will be required to obtain an opinion of sufficiency for the cleanup action from Ecology,
- Groundwater monitoring in areas down-gradient of the source area will be the approved remediation alternative to demonstrate that natural attenuation is occurring within a reasonable timeframe following source removal and reduction of contaminants to the maximum extent practicable;
- Engineering controls may be required to mitigate the potential vapor intrusion pathway for protection of indoor air quality following redevelopment;
- Implementation of institutional controls on the Site will be necessary to ensure long-term maintenance of the risk management procedures in accordance with WAC 173-340-440. The institutional controls would include deed restrictions for soil and prohibiting the domestic use of groundwater beneath the Site, provide for continued monitoring of groundwater, and maintenance of engineering controls, if required. In addition, a construction contingency plan would be developed to govern the handling of potentially contaminated media during future redevelopment or utility work, as necessary; and
- The remediation technologies would need to be compatible with potential future redevelopment with minimal interference on business operations while accomplishing the cleanup.

Based on these key assumptions, the subsurface investigation results for the Site, and the feasibility testing results, three cleanup alternatives for soil and three cleanup alternatives for groundwater were retained for further consideration. These cleanup alternatives include:

Soil Cleanup Alternatives

- Soil Cleanup Alternative 1 – Soil Vapor Extraction;
- Soil Cleanup Alternative 2 – Limited Excavation of Contaminated Soil to 8 Feet at Source and Soil Vapor Extraction; and
- Soil Cleanup Alternative 3 – Excavation of Contaminated Soil to 12 Feet at Source and Soil Vapor Extraction.

Groundwater Cleanup Alternatives

- Groundwater Cleanup Alternative 1 – Air Sparging with Ozone and Monitored Natural Attenuation of Groundwater;

- Groundwater Cleanup Alternative 2 – In-Situ Air Stripping Using Groundwater Recirculation Wells, and Natural Attenuation for Groundwater; and
- Cleanup Alternative 3 – Enhanced Bioremediation and Monitored Natural Attenuation for Groundwater.

These cleanup alternatives for soil and groundwater meet the criteria under MTCA for protection of human health and the environment, compliance with cleanup standards, permanence of the remedy, and completion within a reasonable time frame. The implementation of these alternatives likely would not result in public concern. A description of the components of each cleanup alternative for soil and groundwater is provided in the following sections.

Farallon assumed that implementation of the cleanup action for soil and groundwater would be performed in conjunction with redevelopment of the Custom Cherry Cleaners property. Under this scenario, the cost of demolishing the building was considered a redevelopment cost and was not included in the cleanup cost estimates. Also, Farallon assumed that access would be permitted to the west adjoining school yard parking area to install air sparge wells for Groundwater Cleanup Alternative 1 or injection wells for Groundwater Cleanup Alternative 2.

5.5.1 Soil Cleanup Alternative 1 – Soil Vapor Extraction

Soil Cleanup Alternative 1 includes installation of an SVE system to address contamination in the vadose zone soil. The conceptual design of the SVE system is to install eight SVE wells, conveyance piping, aboveground system components (blower and controls), and potential emissions treatment on the Custom Cherry Cleaners property. An additional three SVE wells would be installed on the west-adjacent school yard and parking area if Groundwater Cleanup Alternative 1 were implemented to capture vapors from the westernmost air sparge wells. The treatment area would include the area within the 0.05 mg/kg isopleth shown on Figure 7. In addition, it is inferred that the area of influence of the SVE system would be sufficient in the lower portion of the vadose zone to capture PCE stripped from groundwater by the air sparging system (Groundwater Cleanup Alternative 1) based on the results of the SVE pilot test and subsurface soil types.

Although SVE was demonstrated to be effective at the Site during pilot testing, the time frame to achieve the cleanup goal for soil of reducing contamination to MTCA Method A cleanup levels in the fine-grained silt and silty sand present at the source area would likely be relatively long. Concentrations of PCE exceed the MTCA Method B direct contact cleanup level of 1.9 mg/kg in shallow soil in the vicinity of borings FB-3, FB-4, and FB-5. Redevelopment of the Custom Cherry Cleaners property would likely expose workers, if not adequately protected, to contaminated soil at the source area. Therefore, Soil Cleanup Alternatives 2 and 3 involve the excavation of contaminated soil to eliminate the direct contact pathway by removing highly contaminated soil in addition to installation of a SVE system to treat residual PCE-contaminated soil in the vadose zone.

While operating, the SVE system will be protective of the indoor air pathway for the planned slab-on-grade multi-use building at the Custom Cherry Cleaners property and likely for the adjacent building to the east currently occupied by Joanna's Soul Café and Jazz Club. However,

other buildings located further down-gradient over the PCE plume in groundwater may require the installation of subslab depressurization systems to mitigate the vapor intrusion pathway. The subslab depressurization systems would need to operate until concentrations of PCE in groundwater down-gradient of the groundwater treatment area had attenuated and no longer represented a potential threat. The estimated cost of a subslab depressurization system ranges from $20,000 to $40,000 per building and these systems have low annual operation and maintenance costs.

5.5.2 Soil Cleanup Alternative 2 – Limited Excavation of Contaminated Soil to 8 Feet at Source and Soil Vapor Extraction

This alternative has an SVE component similar to Soil Cleanup Alternative 1 except that the highly contaminated soil at the source would be excavated for treatment and disposal off the Site. The number of SVE wells would be reduced by two, from eight wells to six wells, due to removal of soil at the source (or from 11 SVE wells to nine SVE wells if Groundwater Cleanup Alternative 1 were implemented). The removal of soil at the source would reduce the potential for worker exposure to elevated concentrations of PCE during redevelopment of the Custom Cherry Cleaners property. Farallon assumed that the limited excavation would target the area encompassed by the 10 mg/kg PCE isopleth on Figure 7 to a depth of 8 feet bgs. The volume of contaminated soil in this area is approximately 70 cubic yards or 120 tons at 1.7 tons per cubic yard. Some shoring would be required on the east side of the excavation to protect the alley and underlying subsurface utilities. The excavated soil will be designated as a dangerous waste under WAC 173-303 and will require incineration or other treatment prior to disposal.

The excavation will be backfilled with structural fill to grade. Because soil with the highest concentrations of PCE is removed, two of the SVE wells would be eliminated from the SVE system described in Soil Cleanup Alternative 1, and approximately six to nine SVE wells would be installed at the Site.

5.5.3 Soil Cleanup Alternative 3 – Excavation of Contaminated Soil to 12 Feet at Source and Soil Vapor Extraction

This alternative has an SVE component similar to Soil Cleanup Alternative 2 except that additional contaminated soil at the source would be excavated for treatment and disposal off the Site. The removal of soil at the source would reduce the potential for worker exposure to elevated concentrations of PCE during redevelopment of the Custom Cherry Cleaners property and decrease the time frame for cleanup. Farallon assumed that the excavation would target a 30-foot by 30-foot area encompassed by the 1 mg/kg PCE isopleth on Figure 7 to a depth of 12 feet bgs. Soil in this area was assumed to have concentrations of PCE exceeding the MTCA Method B direct contact cleanup level of 1.9 mg/kg. The estimated volume of soil in this area is approximately 300 cubic yards or 510 tons at 1.7 tons per cubic yard. Shoring would be required on the east side of the excavation to protect the alley and underlying subsurface utilities. Of the 510 tons of soil removed, 120 tons was assumed to be dangerous waste, which is consistent with Soil Cleanup Alternative 2. The remainder of the excavated soil containing PCE would be disposed of as non-hazardous under a Contained-In determination from Ecology to an approved Subtitle D Landfill.

The excavation will be backfilled with structural fill to grade. Because soil with the highest concentrations of PCE is removed, two of the SVE wells would be eliminated from the system described in Soil Cleanup Alternative 1 and only six to nine SVE wells would be installed at the Site.

5.5.4 Groundwater Cleanup Alternative 1 – Air Sparging with Ozone and Monitored Natural Attenuation

Groundwater Cleanup Alternative 1 includes the use of air sparging to remediate concentrations of COPCs in groundwater at the Custom Cherry Cleaners property and the southern portion of the west-adjacent school property. To accelerate the groundwater cleanup process, Farallon assumed that ozone would be added to the air sparging influent to chemically oxidize the COPCs in groundwater within the treatment area. This has been shown to be an effective technology at other dry cleaner sites being remediated by Farallon. Air sparging is used in conjunction with SVE so that PCE stripped from the water-bearing zone is captured by the SVE system and removed from the subsurface for treatment and/or discharge to the atmosphere. Farallon assumed that eight air sparge wells would be located at the Custom Cherry Cleaners property and that three air sparge wells would be located at the west-adjacent school yard parking area to affect contaminated groundwater at these properties. The screened interval of the air sparge wells will be set 25 to 30 feet below the groundwater table.

Air sparging requires that injected air at the well screen be able to migrate vertically upward through the water-bearing zone to the vadose zone to remediate contaminated groundwater effectively. The presence of laterally continuous low permeability layers within the water-bearing zone will preclude the use of this technology. Boring logs depicting the stratigraphy encountered at the Site do not suggest there were laterally continuous low permeability zone(s) present at the Site. However, only well MW-1D extended deep enough into the water-bearing zone to provide information sufficient to evaluate the application of this technology. A thin silt layer of unknown lateral extent was encountered at approximately 55 feet bgs during installation of monitoring well MW-1D. This silt layer was near the inferred base of the contaminated portion of the groundwater-bearing zone and likely would not preclude the use of this technology.

Long-term monitoring for natural attenuation of COPCs in groundwater down-gradient of the Site would be necessary under each of the three groundwater cleanup alternatives. This is based on the groundwater analytical data currently available, which indicates that moderate degradation of PCE is occurring in the water-bearing zone. Key assumptions for this component of the cleanup action were that the concentrations of HVOCs in groundwater in areas down-gradient of the source area will naturally attenuate within a reasonable restoration time frame following source reduction at the Custom Cherry Cleaners property and groundwater treatment at the Custom Cherry Cleaners property and the southern portion of the Islamic School of Seattle property. Compliance groundwater monitoring would be conducted at select locations beneath the dry cleaning equipment source area and at up-gradient and down-gradient locations to satisfy the requirements under MTCA for monitored natural attenuation.

5.5.5 Groundwater Cleanup Alternative 2 – In-Situ Air Stripping Using Groundwater Recirculation Wells and Natural Attenuation for Groundwater

Groundwater Cleanup Alternative 2 includes the use of groundwater recirculation wells to strip COPCs from groundwater in situ. Groundwater is extracted from a screen interval near the base of the well where it is air-lifted to an upper screened interval near the top of the water-bearing zone and discharged. Volatile organic compounds are stripped from the water inside the well and conveyed under vacuum through piping to an aboveground treatment compound for treatment (if necessary) and discharge to the atmosphere.

The process of extracting groundwater at the base of the contaminated water-bearing zone and discharge to the top creates a convection cell of groundwater movement radially around the well, which expedites the rate of groundwater transport through the treatment area. Typically, the radius of the treatment area is 50 feet or more per well for sand water-bearing zones.

Similar to air sparging, this remediation technology is not effective if there is a laterally continuous low-permeability soil layer(s) in the contaminated portion of the water-bearing zone. The groundwater recirculation well network will include four recirculation wells on the Custom Cherry Cleaners property and two recirculation wells in the southern portion of the Islamic School of Seattle property. Compressed air to the groundwater recirculation wells will be provided by compressors located in an aboveground equipment compound located on the Custom Cherry Cleaners property.

Cleanup of groundwater down-gradient of the Custom Cherry Cleaners property will be accomplished by natural attenuation of the COPCs similar to the other two groundwater cleanup alternatives.

5.5.6 Groundwater Cleanup Alternative 3 – Enhanced Bioremediation and Monitored Natural Attenuation for Groundwater

Groundwater Cleanup Alternative 3 would include enhancing biodegradation of the COPCs to stimulate reductive dechlorination through long-term anaerobic biodegradation. This is accomplished by injection of a solution consisting of a slow-release carbon source and electron donor, non-ionic surfactants, nutrients, and a specific bacteria strain (*Dehalococcoides sp.)* into the water-bearing zone at the Site. Reductive dechlorination of PCE results in production of its degradation compounds TCE, cis- and trans-1,2-dichloroethene, and vinyl chloride to nonhazardous by-products. The laboratory analytical results of groundwater samples collected from monitoring wells demonstrate that partial reductive dechlorination is occurring naturally at the Site. However, reductive dechlorination is not effectively proceeding from PCE to completion as nonhazardous by-products at the Custom Cherry Cleaners property and Islamic School of Seattle property.

Biodegradation enhancement will require installation of an injection well network on the southern portion of the Islamic School of Seattle property and the Custom Cherry Cleaners property. Farallon assumed that a total of 15 injection wells would be installed and screened across the upper 25 feet of the shallow water-bearing zone. Multiple injection events would be required at approximately 18-month intervals to remediate groundwater. This cleanup

alternative is amenable to heterogeneous soil in the water-bearing zone, unlike Groundwater Cleanup Alternatives 1 and 2. Implementation of Groundwater Cleanup Alternative 3 would likely facilitate the natural attenuation of HVOCs down-gradient of the Custom Cherry Cleaners property as a result of creating anaerobic conditions within the enhanced bioremediation treatment areas that will extend down-gradient over time. Anaerobic conditions are more conducive to COPC degradation than are aerobic conditions.

5.6 SUMMARY

The evaluation of feasible cleanup alternatives identified three alternatives for soil and three alternatives for groundwater. Tables 6, 7, and 8 present a summary of costs for each cleanup alternative and list the other activities that will need to be conducted to achieve the remedial action objectives for the Site. The recommendation of a preferred cleanup alternative for soil and groundwater is presented in Section 5.6.2 and is based on the expected effectiveness of each alternative, the time frame for cleanup levels to be attained, and the relative cost of implementation compared to the other identified alternatives.

5.6.1 Other Cleanup Activities

This section presents an overview of the other activities that will need to be conducted during the cleanup action that are common to each of the cleanup alternatives.

Regulatory Interaction. Farallon assumed that the cleanup action will be performed as an independent remedial action with review and comment by Ecology under the Voluntary Cleanup Program. The cost for regulatory interaction includes meetings and other communications with Ecology, and Ecology oversight costs.

Supplemental RI. Farallon identified some data gaps that would need to be addressed during the cleanup action. The data gaps are primarily related to characterizing the lateral and vertical extent of groundwater contamination down-gradient of the Custom Cherry Cleaners property.

Pilot Testing. Prior to design and implementation of the cleanup action, the groundwater cleanup technologies would need to be assessed for effectiveness by conducting field pilot tests and bench scale tests (the enhanced bioremediation alternative only).

Cleanup Action Plan. A Cleanup Action Plan will need to be prepared that describes the rationale for selecting the soil and groundwater cleanup alternatives and presents a detailed description of the cleanup action components in accordance with WAC 173-340-380. The Cleanup Action Plan would be submitted to Ecology for review and comment as to the likely sufficiency of the cleanup alternatives to attain the requirements under MTCA.

Vapor Intrusion Interim Action. Ecology is increasingly requiring the assessment of the vapor intrusion pathway in areas where PCE and other volatile compounds are present in groundwater. The purpose of the assessment is to evaluate whether there is a potential for intrusion of contaminated vapor into structures. Farallon assumed that an assessment will be required at this Site, and that three to five buildings will require an interim action to mitigate the potential intrusion of PCE into structures due to volatilization from contaminated groundwater.

Closure Reporting. The results of the cleanup action will need to be documented in a Site Closure Report. The Site Closure Report will be submitted to Ecology for review and comment with a request for an opinion on the sufficiency on the cleanup action to have met the requirements of MTCA and protect human health and the environment.

5.6.2 Recommendations for Selecting Preferred Cleanup Action

This section presents recommendations for further evaluation of the potential feasible remediation technologies for soil and groundwater which will justify selection of the remediation alternative in a Cleanup Action Plan. The soil vapor extraction pilot test confirmed that this technology is applicable to conditions at the Site. However, Farallon is of the opinion that the relatively high concentrations of PCE in the shallow, fine-grained soil at the source area may require a substantial number of years of active cleanup to meet the MTCA Method A cleanup level of 0.05 mg/kg PCE. Therefore, Farallon recommends that Soil Cleanup Alternative 2 be implemented. The estimated difference in costs between Soil Cleanup Alternative 1 and Soil Cleanup Alternatives 2 and 3 is $105,000 to $280,000, respectively (Tables 7, 8, and 9).

Groundwater Cleanup Alternative 1 involves the use of air sparging with the addition of ozone. The success of air sparging is highly dependent on there not being low permeability soil layers (silt or clay) in the saturated soil interval at the Site that would prohibit the vertical movement of air bubbles through the water-bearing zone and capture by the soil vapor extraction system. Field pilot testing of air sparging could be performed by injecting air at monitoring well MW-1D, then performing observations and physical measurements at the surrounding monitoring wells over a period of a few days to confirm the effectiveness of this technology to decrease concentrations of COPCs in groundwater.

Because the effectiveness of Groundwater Cleanup Alternative 1 is highly dependent on the vertical permeability of soil in the water-bearing zone, and three SVE wells and three air sparge wells would need to be installed on the southern portion of the Islamic School of Seattle property, Farallon recommends pilot testing of both Groundwater Cleanup Alternatives 1 and 2 to assess whether one or both of these alternatives would meet the cleanup goals in a reasonable time frame. The conceptual design for Groundwater Cleanup Alternative 2 does not include any SVE wells or groundwater recirculation wells on the southern portion of the Islamic School of Seattle property, which is preferable to the six wells that would be installed at the west-adjacent property under Groundwater Cleanup Alternative 1. In addition, implementing the combined Groundwater Cleanup Alternative 2/Soil Cleanup Alternative 2 is $100,000 to $200,000 less than Groundwater Cleanup Alternatives 1 and 3/Soil Cleanup Alternative 2 (Tables 7, 8, and 9). Pilot testing of Groundwater Cleanup Alternative 2 would require the installation of a groundwater recirculation well, then performing operation of the well for a period of a month or more to assess the effectiveness of this remedial technology.

Groundwater Cleanup Alternative 3 would require installation of up to six injection wells on the Islamic School of Seattle property and potentially some injection wells in the alley east of the Custom Cherry Cleaners property. Due to the aerobic conditions in the water-bearing zone, enhanced bioremediation may not be effective at the Site without substantial pilot testing to identify the best enhancement products and injection parameters. This cleanup approach is the

least affected by minor heterogeneity of the soil types in the water bearing zone. However, the estimated cost and timeframe for cleanup is substantially higher for this approach than for Groundwater Cleanup Alternatives 1 and 2 (Table 9).

7.0 LIMITATIONS

The conclusions and recommendations contained in this report/assessment are based on professional opinions with regard to the subject matter. These opinions have been arrived at in accordance with currently accepted hydrogeologic and engineering standards and practices applicable to this location and are subject to the following inherent limitations:

- **Accuracy of Information.** Certain information utilized by Farallon in this report/assessment has been obtained, reviewed, and evaluated from various sources believed to be reliable, including the local health districts, fire departments, and the previously discussed interviews. Although Farallon's conclusions, opinions, and recommendations are based in part on such information, Farallon's services did not include the verification of its accuracy or authenticity. Should such information prove to be inaccurate or unreliable, Farallon reserves the right to amend or revise its conclusions, opinions, and/or recommendations.

- **Reconnaissance**. Farallon performed a reconnaissance of the site that is the subject of this report/assessment to document current conditions. Farallon focused on areas deemed more likely to exhibit hazardous materials conditions, while other areas received limited attention or were inaccessible at the time of our reconnaissance.

- FB-8 ◆ RECONNAISSANCE GROUNDWATER SAMPLE (FARALLON 2008)
- UST UNDERGROUND STORAGE TANK
- M AND W RESTROOMS
- APPROXIMATE DIRECTION OF GROUNDWATER FLOW

ALL GROUNDWATER ANALYTICAL RESULTS IN MICROGRAMS PER LITER (ug/L)

PCE = TETRACHLOROETHENE
TCE = TRICHLOROETHENE
cis-1,2-DCE = cis-1,2-DICHLOROETHENE
VC = VINYL CHLORIDE

BOLD = INDICATES CONCENTRATIONS EXCEED WASHINGTON STATE MODEL TOXICS CONTROL ACT CLEANUP REGULATION METHOD A CLEANUP LEVELS

< = INDICATES CONCENTRATIONS NOT DETECTED AT OR ABOVE THE STATED LABORATORY PRACTICAL QUANTITATION LIMIT

2,000 ISOCONCENTRATION CONTOUR FOR PCE IN GROUNDWATER IN ug/L

NOTES:

1. ALL LOCATIONS ARE APPROXIMATE
2. RECONNAISSANCE GROUNDWATER SAMPLES WERE COLLECTED AT BORINGS B-1 AND FB-8. THE ANALYTICAL RESULTS ARE SHOWN ON THIS FIGURE FOR BORINGS B-1 AND FB-8, BUT MAY BE BIASED HIGH DUE TO THE SAMPLE COLLECTION METHODOLOGY. THE RECONNAISSANCE GROUNDWATER SAMPLING ANALYTICAL RESULTS WERE NOT CONSIDERED DURING CONTOURING OF PCE CONCENTRATIONS IN GROUNDWATER AT THE MONITORING WELLS.

Table 7
Cost Estimate Summary for Groundwater Cleanup Alternative 1
Air Sparging with Ozone and Monitored Natural Attenuation
Custom Cherry Cleaners
Seattle, Washington
Farallon PN: 129-001

Cleanup Action Costs	Soil Cleanup Alternative 1	Soil Cleanup Alternative 2	Soil Cleanup Alternative 3
Excavation	$0	$125,000	$300,000
Air Sparge/SVE System	$310,000 (11 AS wells and 11 SVE wells)	$295,000 (11 AS wells and 9 SVE wells)	$295,000 (11 AS wells and 4 SVE wells)
O&M AS/SVE System	$130,000 (5 years)	$110,000 (4 years)	$90,000 (3 years)
Monitored Natural Attenuation	$40,000	$40,000	$40,000
Subtotal	**$480,000**	**$570,000**	**$725,000**

Additional Costs	Low Estimate	High Estimate
Regulatory Interaction	$8,000	$12,000
Supplemental RI	$35,000	$60,000
Pilot Testing (AS Test)	$20,000	$25,000
Cleanup Action Plan	$20,000	$30,000
Vapor Intrusion Interim Action	$90,000	$160,000
Closure Reporting	$20,000	$30,000
Subtotal	**$193,000**	**$317,000**

Summary Ranges	Soil Cleanup Alternative 1		Soil Cleanup Alternative 2		Soil Cleanup Alternative 3	
Cleanup Action and Additional Costs	Low	High	Low	High	Low	High
	$673,000	$797,000	$763,000	$887,000	$918,000	$1,042,000

NOTES:
AS = air sparging
O&M = operations and maintenance
RI = remedial investigation
SVE = soil vapor extraction

Table 8
Cost Estimate Summary for Groundwater Cleanup Alternative 2
In-Situ Air Stripping Using Groundwater Recirculation Wells and Monitored Natural Attenuation
Custom Cherry Cleaners
Seattle, Washington
Farallon PN: 129-001

Cleanup Action Costs	Soil Cleanup Alternative 1	Soil Cleanup Alternative 2	Soil Cleanup Alternative 3
Excavation	$0	$125,000	$300,000
SVE System	$115,000 (8 wells)	$95,000 (6 wells)	$95,000 (6 wells)
Recirculation Well System (6 wells)	$120,000	$120,000	$120,000
O&M (SVE & Recirculation)	$110,000 (4 years)	$90,000 (3 years)	$90,000 (3 years)
Monitored Natural Attenuation (2 years)	$40,000	$40,000	$40,000
Subtotal	**$385,000**	**$470,000**	**$645,000**

Additional Costs	Low Estimate	High Estimate
Regulatory Interaction	$8,000	$12,000
Supplemental RI	$35,000	$60,000

Vapor Intrusion Interim Action	$90,000	$160,000
Closure Reporting	$20,000	$30,000
Subtotal	**$193,000**	**$317,000**

Summary Ranges	Soil Cleanup Alternative 1		Soil Cleanup Alternative 2		Soil Cleanup Alternative 3	
Cleanup Action and Additional Costs	Low	High	Low	High	Low	High
	$578,000	$702,000	$663,000	$787,000	$838,000	$962,000

NOTES:
AS = air sparging
O&M = operations and maintenance
RI = remedial investigation
SVE = soil vapor extraction

Table 9
Cost Estimate Summary for Groundwater Cleanup Alternative 3
Enhanced Bioremediation and Monitored Natural Attenuation
Custom Cherry Cleaners
Seattle, Washington
Farallon PN: 129-001

Cleanup Action Costs	Soil Cleanup Alternative 1	Soil Cleanup Alternative 2	Soil Cleanup Alternative 3
Excavation	$0	$125,000	$300,000
SVE System	$115,000 (8 wells)	$95,000 (6 wells)	$95,000 (6 wells)
Enhanced Bioremediation (13 wells & first injection)	$162,000	$162,000	$162,000
O&M (SVE & Bioremediation) (3 to 5 years SVE) (Years 2 to 6 bioremediation)	$250,000	$235,000	$226,000
Monitored Natural Attenuation (2 years)	$40,000	$40,000	$40,000
Subtotal	**$567,000**	**$657,000**	**$823,000**

Additional Costs	Low Estimate	High Estimate
Regulatory Interaction	$8,000	$12,000
Supplemental RI	$35,000	$60,000
Pilot Testing (2 wells enhanced bioremediation)	$35,000	$45,000
Cleanup Action Plan	$20,000	$30,000
Vapor Intrusion Interim Action	$90,000	$160,000
Closure Reporting	$20,000	$30,000
Subtotal	**$208,000**	**$337,000**

Summary Ranges	Soil Cleanup Alternative 1		Soil Cleanup Alternative 2		Soil Cleanup Alternative 3	
Cleanup Action and Additional Costs	Low	High	Low	High	Low	High
	$775,000	$904,000	$865,000	$994,000	$1,031,000	$1,160,000

NOTES:
AS = air sparging
O&M = operations and maintenance
RI = remedial investigation
SVE = soil vapor extraction

APPENDIX A
BORING LOGS

REMEDIAL INVESTIGATION/FEASIBILITY STUDY
Custom Cherry Cleaners
2510 East Cherry Street

USCS Classification and Graphic Legend

Major Divisions			USCS Graphic Symbol	USCS Letter Symbol	Lithologic Description
Coarse-Grained Soil (More than 50% of material is larger than No. 200 sieve size)	GRAVEL AND GRAVELLY SOIL (More than 50% of coarse fraction retained on No. 4 sieve)	CLEAN GRAVEL (Little or no fines)		GW	Well graded GRAVEL, well graded GRAVEL with sand
				GP	Poorly graded GRAVEL, GRAVEL with sand
		GRAVEL WITH FINES (Appreciable amount of fines)		GP-GM	Poorly graded GRAVEL - GRAVEL with sand and silt
				GM	Silty GRAVEL
				GC	Clayey GRAVEL
	SAND AND SANDY SOIL (More than 50% of coarse fraction passed through No. 4 sieve)	CLEAN SAND (Little or no fines)		SW	Well graded SAND
				SP	Poorly graded SAND
		SAND WITH FINES (Appreciable amount of fines)		SP-SM	Poorly graded SAND - silty SAND
				SM	Silty SAND
				SC	Clayey SAND
				SM-ML	SILT - Silty SAND
Fine-Grained Soil (More than 50% of material is smaller than No. 200 sieve size)	SILT AND CLAY (Liquid limit less than 50)			ML	SILT
				CL	CLAY
				OL	Organic SILT
	SILT AND CLAY (Liquid limit greater than 50)			MH	Inorganic SILT
				CH	Inorganic CLAY
				OH	Organic CLAY
		Highly Organic Soil		PT	Peat
OTHER MATERIALS	PAVEMENT			AC	Asphalt concrete
				CO	Concrete
	OTHER			RK	Bedrock
				WD	Wood Debris
				DB	Debris (Miscellaneous)
				PC	Portland cement

Legend

- Sample Interval
- G — Grab Sample Interval
- Water level at time of drilling
- Water level at time of sampling
- Blank Casing
- Screened Casing
- Cement Grout
- Bentonite
- Sand Pack
- Well Cap
- ——— Solid line indicates sharp contact between units well defined.
- - - - - - - Dashed line indicates gradational contact between units.

feet bgs = feet below ground surface
NE = Not Encountered
NA = Not Applicable
PID = Photoionization Detector
PN = Project Number
units = PID units calibrated to 100 ppm isobutylene
USCS = Unified Soil Classification System

1.0 INTRODUCTION

Farallon Consulting, L.L.C. (Farallon) has prepared this Addendum to the Remedial Investigation/Feasibility Study (Addendum) on behalf of Ms. Vera Benton, owner of the Custom Cherry Cleaners property located at 2510 East Cherry Street in Seattle, Washington. A release of the dry cleaning solvent tetrachloroethene (PCE) to soil and groundwater at the Custom Cherry Cleaners property has migrated beneath the west-adjacent property owned by the Islamic School of Seattle, an east-adjacent alley, and East Cherry Street to the south. The areas where concentrations of PCE and its degradation products have come to be located as a result of the release at the Custom Cherry Cleaners property are referred to herein as the Site in accordance with the Washington State Model Toxics Control Act Cleanup Regulation (MTCA), as defined in Section 200 of Chapter 173-340 of the Washington Administrative Code (WAC 173-340-200) (Figure 1).

This Addendum supplements the *Remedial Investigation/Feasibility Study, Custom Cherry Cleaners, 2510 East Cherry Street, Seattle, Washington* dated June 3, 2008, prepared by Farallon (2008) (RI/FS Report) and was prepared in accordance with the substantive requirements of MTCA, as established in WAC 173-340. The Site was enrolled in the Washington State Department of Ecology (Ecology) Voluntary Cleanup Program (VCP) in November 2008 and has been assigned VCP ID#NW2009.

1.1 PURPOSE

The additional subsurface assessment was performed to characterize the extent of PCE and trichloroethene (TCE) in groundwater to the west, south, and east of the Custom Cherry Cleaners property. The AS pilot test was conducted to assess the effectiveness of AS as a technically feasible cleanup alternative for the Site.

The purpose of this Addendum is to present the results of the additional subsurface assessment and air sparge (AS) pilot testing conducted to supplement the information presented in the RI/FS Report. The purpose of the Remedial Investigation/Feasibility Study was to collect and evaluate sufficient information to support the development and evaluation of technically feasible cleanup alternatives in accordance with WAC 173-340-360 through 173-340-390 to facilitate selection of

a final cleanup action at the Site in accordance with WAC 173-340-350(8). Selection of a final cleanup action for the Site will be documented in a Cleanup Action Plan to be prepared in conformance with WAC 173-340-360 through 173-340-390.

1.2 ORGANIZATION

This Addendum has been prepared to meet the documentation requirements delineated in WAC 173-340-840. The report has been organized into the following sections:

- **Section 2—Background.** This section briefly describes the Site location, features, historical background, and previous environmental investigations conducted at the Site.
- **Section 3—Field Program.** This section summarizes the scope of work for the additional subsurface assessment and describes the installation of borings and monitoring wells, monitoring well development, groundwater monitoring and sampling, and AS pilot test procedures.
- **Section 4—Results.** This section presents the results of the additional subsurface assessment, including soil and groundwater conditions and soil sampling and groundwater monitoring results, and the results of the AS pilot test.
- **Section 5—Conclusions.** This section summarizes Farallon's conclusions regarding the results of the additional subsurface assessment and the AS pilot test.
- **Section 6—Data Gaps and Future Work**. This section briefly discusses remaining data gaps and work yet to be performed at the Site based on the results of the work conducted at the Site to date.
- **Section 7—References.** This section presents a list of the documents cited in the Addendum.
- **Section 8—Limitations.** This section presents Farallon's standard limitations pertinent to this Addendum.

2.0 BACKGROUND

This section provides a brief description of the Site, historical background, and a summary of previous investigations conducted at the Site. A summary of the geology and hydrology of the Site and Site vicinity and a more detailed description of previous investigations are provided in Sections 2.4 and 2.5 of the RI/FS Report, respectively. Detailed descriptions of the remedial investigation field program (RI field program), results, and the feasibility study are presented in Sections 3, 4, and 5 of the RI/FS Report, respectively.

2.1 ENVIRONMENTAL SETTING

The Site is located approximately 2 miles east of downtown Seattle in the Madrona neighborhood, between First Hill and Lake Washington in King County, Washington (Figure 1). Topographically, the Site is in a gently north-sloping valley between two north-south-trending low hills. The ground surface elevation at the Site is approximately 280 feet above mean sea level (Figure 1).

King County Assessor Office parcel records list the Custom Cherry Cleaners property as being zoned Commercial. Land use in the vicinity of the Site consists predominantly of schools, commercial retail, and residential properties (King County, Washington 2008). Properties surrounding the Site include the Islamic School of Seattle to the west and north, residential properties to the northeast, an alley followed by commercial properties to the east, East Cherry Street and an apartment building to the south-southeast, and Garfield High School to the southwest. The fenced lot west of the Custom Cherry Cleaners building is used for automobile parking and as a play yard for the Islamic School of Seattle. The school building is a multi-story brick structure northwest of the Custom Cherry Cleaners property.

2.2 SITE DESCRIPTION

The Site is located in Section 33, Township 25 South, Range 4 East in King County, Washington. The Custom Cherry Cleaners property consists of King County tax parcel number 6840700205, totaling 4,000 square feet in area. The Custom Cherry Cleaners property is an approximately 90- by 40-foot lot occupied by a one-story building, with a small shed abutting the

center of the northern exterior wall (Figure 2). The northern portion of the lot is unpaved and fenced. Doors exiting the northern end of the building are located to the east and west of the shed. The shed formerly held a boiler that provided steam to the dry cleaning facility that formerly operated in the building. Both the building and the shed are constructed of masonry block walls and concrete slab-on-grade floors. A fill port for an underground storage tank that is assumed to have been used to store heating oil is located in the east-central portion of the unpaved area.

Electrical power to the building is provided via overhead lines from the southeast (Figure 2). Natural gas is provided via a gas line beneath the alley that enters the building on the northern end of the shed where the boiler formerly was located. A sanitary sewer line exits the northern end of the building and runs to the northeast toward the alley, where it connects to a main line. Restrooms are located in the northeastern corner of the building. Farallon observed a floor drain inside the building in the area immediately south of the restrooms. The surface of the concrete floor in the vicinity of the floor drain was observed to be in poor condition due to etching and pitting.

2.3 SITE HISTORY

Farallon understands that a dry cleaner operated in the Custom Cherry Cleaners building from the late 1960s until early 2007. During the period of dry cleaning operations, three successive dry cleaning machines were used. The first dry cleaning machine was replaced shortly after the current property owner took over the business in approximately 1968. The second machine was replaced in approximately 1996 or 1997. All three dry cleaning machines were installed in the same location at the rear of the building between the two doors that exit the northern end of the structure (Figure 2). The dry cleaning equipment and other fixtures were removed in 2007. The Custom Cherry Cleaners building currently is vacant.

2.4 PREVIOUS INVESTIGATIONS

Previous investigations conducted at the Site include multiple subsurface investigations conducted by Adapt Engineering and Farallon, and the remedial investigation and feasibility study conducted by Farallon (2008). Farallon conducted the RI field program as part of the

remedial investigation and feasibility study to address data gaps and provide sufficient information to support the evaluation of technically feasible cleanup alternatives for the Site. The RI field program consisted of four primary work elements, including soil sampling; reconnaissance groundwater sampling; monitoring well installation, development, and groundwater sampling; and aquifer testing and soil vapor extraction (SVE) pilot testing. A detailed description of the scope of work for each of these work elements is provided in Section 3 of the RI/FS Report. Based on the results of the RI field program and previous investigations conducted at the Site, Farallon developed a conceptual site model to support the evaluation of potential remediation technologies and to estimate cleanup costs. The conceptual site model is presented in detail in Section 4.5 of the RI/FS Report and is summarized below.

The conceptual site model identified concentrations of PCE in soil at and in the vicinity of the northeastern corner of the dry cleaner building at concentrations exceeding the MTCA Method A cleanup level. The concentrations of PCE in soil decreased rapidly with distance from the source area, with PCE concentrations decreasing from 440 milligrams per kilogram (mg/kg) at the source area to less than 13 mg/kg approximately 15 feet laterally from the source area (Figure 3). The soil analytical data further indicate that concentrations of PCE attenuate to less than 1 mg/kg at depths below approximately 8 feet below ground surface (bgs) (Farallon 2008). The presence of concentrations of PCE exceeding the MTCA Method A cleanup level in soil at borings beyond the Custom Cherry Cleaners property boundary likely is due to partitioning of PCE in soil vapor onto soil.

The distribution of PCE in groundwater was determined to be consistent with a concentrated source at the northeastern corner of the Custom Cherry Cleaners building, surrounded by a large subsurface vapor plume, with concentrations of PCE in soil vapor sufficient to cause groundwater contamination, and migration of PCE in groundwater along the southeastern groundwater flow direction (Figure 4). The lateral distribution of PCE in groundwater was not fully characterized with the monitoring well network installed during the RI field program. The lateral distribution of concentrations of PCE in soil vapor was assessed to be as broad as 200 feet based on the presence of PCE in groundwater at monitoring well MW-4, approximately 130 feet north and cross-gradient of the source area (Figure 4). The results of the RI field program

suggest that the vertical distribution of PCE in groundwater may be limited to approximately the upper 30 feet of the water-bearing zone, assuming that concentrations of PCE attenuate to less than 5 micrograms per liter, 5 to 10 feet below the base of deepest monitoring well MW-1D. Evidence suggesting that dense nonaqueous-phase liquid is present in the shallow water-bearing zone was not observed during previous investigations conducted at the Site.

Based on the conceptual site model, a feasibility study was conducted to develop and evaluate cleanup alternatives to facilitate selection of a final cleanup action at the Site in accordance with WAC 173-340-350(8). The feasibility study is described in detail in Section 5 of the RI/FS Report. During the feasibility study, Farallon evaluated remediation technologies based on the cleanup requirements set forth in MTCA, a set of key assumptions (described in Section 5.5 of the RI/FS Report), the subsurface investigation results, and the pilot testing results. Based on these considerations, Farallon recommended limited excavation of contaminated soil to 8 feet bgs at the source and SVE as the soil cleanup alternative, and air sparging with ozone and monitored natural attenuation of groundwater as the groundwater cleanup alternative. These soil and groundwater alternatives are described in Sections 5.5.2 and 5.5.4 of the RI/FS Report, respectively.

The recommended cleanup alternatives presented in the RI/FS Report were subject to confirmation that the selected remediation technology would be applicable to Site-specific subsurface conditions, which would be confirmed by conducting an AS pilot test at the Site. In addition, the results of the remedial investigation indicated that the extent of concentrations of PCE exceeding the MTCA Method A cleanup level in groundwater had not been fully characterized to the west, south, and east of the Custom Cherry Cleaners property.

3.0 FIELD PROGRAM

The scope of work for the additional subsurface assessment program included the following elements:

- Installation of monitoring wells MW-7 through MW-10;
- Collection of soil samples from borings MW-7 through MW-10;
- Submittal of selected soil samples for laboratory analysis of PCE and associated degradation compounds;
- Measurement of groundwater levels to estimate the groundwater gradient and flow direction;
- Sampling groundwater at monitoring wells MW-7 through MW-10;
- Submittal of groundwater samples for laboratory analysis of halogenated volatile organic compounds (HVOCs);
- Performance of AS pilot testing at monitoring well MW-1D; and
- Preparation of this Addendum.

The additional subsurface assessment field activities are described in the following sections.

3.1 SOIL BORINGS

Prior to drilling at the Site, a private utility location survey was conducted by Applied Professional Services, Incorporated of Issaquah, Washington to locate underground utilities. After all boring locations had been cleared of underground utilities, four borings were advanced by Cascade Drilling, Inc., of Woodinville, Washington using hollow-stem auger drilling methods. The drilling activities were conducted on September 16 and 17, 2008. The approximate locations of the borings are depicted on Figure 3.

Boring MW-7 was installed in the alley east-adjacent to the Site, approximately 11 feet north of monitoring well MW-1D. Boring MW-8 was installed on the western side of 25th Avenue, north

of East Cherry Street. Borings MW-9 and MW-10 were installed on the western side of 26th Avenue, north and south of East Cherry Street, respectively (Figure 3).

Farallon collected soil samples from borings MW-7 through MW-10 to screen for evidence of HVOCs and to generate a lithologic description of subsurface soil. The lateral extent of PCE and degradation products west of the Site was defined during the previous investigations; therefore, soil samples were not submitted for laboratory analysis of HVOCs at boring MW-8.

Soil samples were collected at 5-foot intervals from the ground surface to the total depth of each boring. The samples were collected in accordance with ASTM International and U.S. Environmental Protection Agency (EPA) standard protocols. A Farallon Scientist documented the soil lithology in accordance with the Unified Soil Classification System. The soil samples were screened in the field for the presence of volatile organic vapors using a photoionization detector (PID) and were inspected for obvious signs of contamination, including visible discoloration, sheen, and odor. The detailed lithologic descriptions and PID readings for each sample interval are presented in the boring logs in Appendix A.

Based on field observations and PID readings, Farallon selected two samples from boring MW-7 and one sample each from borings MW-9 and MW-10 for laboratory analysis of HVOCs by EPA Method 8260B. The soil samples collected for potential laboratory analysis were transferred directly from the split-spoon sampling device into laboratory-prepared sample containers in accordance with EPA Method 5035 sample collection protocols. All non-dedicated sampling equipment and supplies were decontaminated between uses. The labeled sample containers were sealed immediately with Teflon-lined screw caps and placed on ice in a cooler pending transport under chain-of-custody protocols to OnSite Environmental Inc. of Redmond, Washington for laboratory analysis.

3.2 MONITORING WELL INSTALLATION

Farallon installed groundwater monitoring wells MW-7 through MW-10 to evaluate groundwater conditions in the upper portion of the water-bearing zone; to assess the areal distribution of PCE; to measure groundwater levels and estimate the groundwater gradient and flow direction; and to provide an observations well for the AS pilot test conducted at monitoring well MW-1D. The

well locations are depicted on Figure 4. The location and purpose of each monitoring well is as follows:

- Monitoring well MW-7 is located in the alley east-adjacent to the Custom Cherry Cleaners building, approximately 11 feet north of monitoring well MW-1D. The purpose of monitoring well MW-7 is to monitor the performance of the AS pilot test to be conducted at monitoring well MW-1D and to serve as a potential SVE well during cleanup activities at the Site, if required.
- Monitoring well MW-8 is located on the western side of 25th Avenue north of East Cherry Street to assess the lateral extent of PCE in groundwater west of the Site;
- Monitoring well MW-9 is located on the western side of 26th Avenue, north of East Cherry Street to assess the lateral extent of PCE in groundwater east of the Site.
- Monitoring well MW-10 is located on the western side of 26th Avenue, south of East Cherry Street to assess the lateral extent of PCE in groundwater southeast of the Site.

Monitoring wells MW-7 through MW-10 were installed to total depths of 30.5 to 40.5 feet bgs and were constructed in accordance with WAC 173-160 guidelines. Monitoring well MW-7 was constructed with 4-inch diameter polyvinyl chloride (PVC) casing. Monitoring wells MW-8 through MW-10 were constructed with 2-inch diameter PVC casing. All four monitoring wells were installed with traffic-rated, 8-inch steel flush-mounted monuments. The monitoring wells were constructed with a 20-foot well screen interval at the base of each well, with approximately 10 feet of submerged screen based on observed groundwater levels at the time of drilling. The screened intervals were constructed with 0.010-inch slotted PVC. Logs of the monitoring well construction are included in Appendix A.

Development of the monitoring wells occurred immediately after well construction. Each monitoring well was surged using a stainless steel surge rod to flush water into the soil surrounding the well screen and loosen fine-grained sediment, and then extracted from the monitoring well and surrounding sand filter pack. A submersible pump was used to evacuate the water from the monitoring well. This process was repeated until approximately 10 well-casing

volumes of water was removed from the monitoring well and the turbidity of the extracted groundwater was minimized.

A survey of the northern side of the top of the monitoring well casings with respect to mean sea level was completed to an accuracy of 0.01 foot by Professional Land Surveyors, Inc. of Issaquah, Washington to facilitate estimation of the groundwater gradient and flow direction. The surveyed elevations are summarized in Table 1.

Decontamination and development purge water generated during drilling and well development was placed into labeled steel drums and stored at the Site pending profiling for disposal. Additional details on waste handling and disposal are provided in Section 4.4, Waste Disposal.

3.3 GROUNDWATER MONITORING AND SAMPLING

Groundwater levels in the new and existing monitoring wells were measured on October 17, 2008 to assess the approximate direction of groundwater flow and the hydraulic gradient. Prior to measurement, the water level was allowed to equilibrate to atmospheric conditions for a minimum of 30 minutes after the well was opened. The groundwater level in each monitoring well was measured from the surveyed reference point on the top of the well casing using an electronic water-level measurement instrument. The groundwater level measurements are presented in Table 1.

Monitoring wells MW-7 through MW-10 were purged using a submersible bladder pump and dedicated polyethylene tubing. Before the monitoring wells were purged, the pump intake was placed at the approximate center of the water column in each monitoring well. Groundwater was then purged from each well at flow rates ranging from approximately 100 to 500 milliliters per minute. Prior to sampling at each monitoring well, field measurements for pH, temperature, specific conductivity, dissolved oxygen, and oxidation-reduction potential were collected during purging of groundwater using a YSI Model 600XL water-quality analyzer equipped with a flow-through cell. Groundwater samples were collected after the parameters for pH, temperature, specific conductivity, and dissolved oxygen had stabilized. Stabilization is determined for pH as a change of less than 0.1 pH unit, for temperature and specific conductivity

as a relative percent difference of less than 3 percent between readings and for dissolved oxygen as a relative percent difference of less than 10 percent for three consecutive measurements.

Following stabilization of pH, temperature, conductivity, and dissolved oxygen, groundwater samples were collected from the pump outlet. Groundwater samples were placed directly into laboratory-supplied sample containers, with care taken to minimize turbulence and to prevent handling the seal and/or lid of the container when the sample was placed into the container. The containers were completely filled to eliminate headspace, and the seal and/or lid was secured. The groundwater samples were placed on ice in a cooler and transported under standard chain-of-custody protocols to OnSite Environmental Inc. for analysis of HVOCs by EPA Method 8260B.

3.4 AIR SPARGE PILOT TEST METHODS

Farallon conducted an AS pilot test at the Site to assess the feasibility of applying AS technology to remediate groundwater in the source area. The AS pilot test was conducted at monitoring well MW-1D while the surrounding monitoring wells were used as observation wells.

Air was injected into AS pilot test well MW-1D using a 1.5-horsepower Rotron Model EN454W58L blower. A Dwyer rotometer with a range of 0 to 250 standard cubic feet per hour (scfh) was connected to monitoring well MW-1D to monitor the flow rate throughout the AS pilot test. The observation wells were fitted with modified well caps equipped with a monitoring port to allow measurement of air pressure within each well. Air pressure and groundwater level measurements were taken in each observation well immediately prior to the start of the AS pilot test. An ambient PCE concentration in air was collected within the casing of monitoring well MW-7 prior to the start of the AS pilot test.

Air was injected at monitoring well MW-1D at rates of 65, 160, and 240 scfh. During injection, the observation wells were monitored periodically for changes in air pressure using pressure gauges with ranges of 0 to 0.25, 0 to 0.50, 0 to 1.0, or 0 to 5.0 inches of water (IOW). Following completion of the AS pilot test, groundwater levels were measured, and another PCE concentration in air was collected within the casing of monitoring well MW-7. The AS pilot

testing was conducted for a duration of 1 to 3 hours at each flow rate until equilibrium of the pressure responses in the observation wells was achieved.

4.0 RESULTS

This section presents the results of the additional subsurface assessment conducted by Farallon. Included is a description of soil and groundwater conditions, soil and groundwater analytical results, waste disposal activities, and the results of the air sparge pilot test conducted at the Site.

4.1 SOIL CONDITIONS

The stratigraphy encountered during the installation of monitoring wells MW-7, MW-8, and MW-9 is generally consistent with that encountered during the RI field program, consisting predominantly of silt and silty sand from near the ground surface to approximately 10 to 20 feet bgs. Below this layer, poorly graded sand was present from depths of 10 to 20 feet bgs to the total depth explored during the additional subsurface assessment. Descriptions of the subsurface conditions encountered during previous investigations and during the RI field program are provided in Sections 2.4.1 and 4.2 of the RI/FS Report, respectively. The stratigraphy encountered in monitoring well MW-10 was not consistent with that encountered at other borings during the RI field program as a poorly graded sand was present from near the ground surface to the total depth explored. The boring logs for the monitoring well borings installed during the additional subsurface assessment are included in Appendix A.

4.2 GROUNDWATER CONDITIONS

Groundwater levels were measured at monitoring wells MW-1 through MW-10 and MW-1D on September 26 and October 17, 2008 (Table 1). With the exception of monitoring well MW-10, the depth to groundwater below the top of the well casings ranged from 23.31 feet at monitoring well MW-4 to 29.97 feet at monitoring well MW-1 on September 26, 2008. Groundwater levels at the monitoring wells did not vary significantly between the September and October 2008 monitoring events. Figure 5 depicts the groundwater level contours for the October 17, 2008 monitoring event. As shown on Figure 5, the estimated groundwater flow direction is toward the southeast at a gradient of 0.002 foot per foot. The depth to groundwater in monitoring well MW-10 ranged from 7.76 feet bgs in September 2008 to 7.71 feet in October 2008. During drilling, groundwater was encountered in the borehole for monitoring well MW-10 at 20 feet bgs, a depth

approximately 10 feet shallower than first-encountered groundwater in all of the other boreholes at the Site. As a result, the groundwater elevation for monitoring well MW-10 was not used to estimate the groundwater gradient and direction for the Site.

4.3 SOIL RESULTS

Analytical results for the soil samples analyzed for HVOCs that were collected during the additional subsurface assessment and RI field program are summarized in Table 2. Figure 3 shows the concentrations of PCE and TCE in soil for the borings drilled at the Site. The laboratory analytical reports for the soil samples collected during the additional subsurface assessment are provided in Appendix B.

Concentrations of PCE above the MTCA Method A cleanup level were detected in the two soil samples collected from the boring for monitoring well MW-7. PCE concentrations above the laboratory practical quantitation limits (PQLs) were not detected in soil samples collected from borings for monitoring wells MW-9 or MW-10. The concentrations of PCE detected at monitoring well MW-7 ranged from 0.21 mg/kg between 15 and 16 feet bgs to 0.15 mg/kg between 25 and 26 feet bgs. Concentrations of other HVOCs in the soil samples were below laboratory PQLs, with the exception of the soil samples collected at boring MW-7 between 15 and 16 feet bgs and 25 and 26 feet bgs. Concentrations of TCE and cis-1,2-dichloroethene were detected in this sample above the PQL, but below the MTCA Method A cleanup levels of 0.03 and 800 mg/kg, respectively.

4.4 GROUNDWATER RESULTS

Analytical results for selected HVOCs in groundwater samples collected from borings and monitoring wells during the RI field program and the additional subsurface assessment are summarized in Table 3. Figure 4 shows concentrations of PCE in groundwater samples collected at monitoring wells and the reconnaissance groundwater samples collected at borings FB-8 and B-1. This figure also depicts the PCE isoconcentration contours based on groundwater quality data for samples collected from monitoring wells and the estimated direction of groundwater flow toward the southeast. As depicted on the figure, the lateral extent of PCE-contaminated

groundwater was bounded to the north by monitoring well MW-4, to the west by monitoring well MW-8, and to the southeast by monitoring well MW-10. The relatively low concentration of 18 micrograms per liter of PCE in monitoring well MW-9 suggests that the down-gradient extent of PCE-contaminated groundwater is in the area immediately east-southeast of this well; however, the current down-gradient extent of PCE-contaminated groundwater has not been delineated. The laboratory analytical reports for groundwater samples collected during the additional subsurface assessment are provided in Appendix B.

4.5 WASTE DISPOSAL

All soil cuttings, decontamination water, purge water, and other wastewater generated during the additional subsurface assessment were temporarily stored on the Site in labeled 55-gallon steel drums. The analytical results for the soil and groundwater samples will be used to develop a waste profile for disposal of the wastes at an approved transport, storage, and disposal facility. Investigation-derived waste was removed by General Environmental Management Inc. of Seattle, Washington on November 3, 2008.

4.6 AIR SPARGE PILOT TEST RESULTS

Air sparging is a technology used in combination with SVE where groundwater has been affected by volatile organic compounds such as those identified at the Site. SVE and AS are proven technologies frequently selected as remedial alternatives and approved by Ecology for sites where conditions are conducive to their application. The feasibility of SVE at the Site was assessed during a previous site investigation, with positive results. The results of the AS pilot testing conducted at monitoring well MW-1D are discussed below. Summary tables showing the data collected during the AS pilot test and figures depicting the results of the test are provided in Appendix C.

4.6.1 Pilot Testing at Monitoring Well MW-1D

The air sparge pilot test was conducted at monitoring well MW-1D on October 17, 2008. The observation wells selected for the pilot test initially included monitoring wells MW-1, MW-2, and MW-7. Based on initial results from the pilot test, monitoring wells MW-4, MW-5, and

MW-6 were later added as observations wells based on their relative distances from well MW-1D.

The AS pilot test consisted of injecting air at constant flow rates of 65, 160, and 240 scfh until apparent equilibrium had been reached in the observation wells. A positive response is indicated by a rise in pressure in the observation wells that is equal to or greater than a 0.1-IOW change from the initial baseline wellhead pressure reading. A rise in groundwater elevation also was used as a means of assessing whether there was a positive response.

The pressure measurements taken during the AS pilot test indicated a positive response in all three of the initial observation wells at all of the flow rates. A positive response was observed also in monitoring well MW-4 at flow rates of 160 and 240 scfh. The greatest change in pressure in the observation wells occurred when the flow rate was increased from 65 to 160 scfh. The observation well caps were removed between the tests at 160 and 240 scfh to check groundwater elevations and to check for the presence of bubbles in the groundwater. A moderate amount of bubbles were noted in observation well MW-7, with no bubbles noted in groundwater at the other observation wells.

The greatest change in the groundwater level at observation wells during the pilot test was a rise of 1.01 feet noted at observation well MW-7. Groundwater level changes were observed also in observation wells MW-1, MW-2, and MW-4.

4.6.2 Air Sparge Test Results Summary

The results of the AS pilot testing confirmed that AS is a technically feasible remedial alternative for cleanup of groundwater at the Site. Field measurements of PCE concentrations in air within the casing of monitoring well MW-7 showed a 50 percent increase, from 200 parts per million before the AS pilot test was conducted to 300 parts per million at the completion of the pilot test. Reliable positive responses in air pressure were observed in observation wells located as far as 155 feet from AS pilot test injection well MW-1D. Based on these results, Farallon estimated that a maximum conservative radius of influence of 50 feet from each AS well should be used as the basis for the design of an AS system. This maximum design radius of influence is

anticipated to be adequate to account for the variability in the subsurface lithology and the response to air injection.

5.0 CONCLUSIONS

The conclusions from the additional subsurface assessment and the AS pilot test are summarized in the sections that follow. These conclusions are based on the results of the RI field program presented in the RI/FS Report and the additional subsurface assessment and AS pilot testing conducted at the Site.

5.1 ADDITIONAL SUBSURFACE ASSESSMENT

With the exception of monitoring well MW-10, soil conditions encountered during the additional subsurface assessment are similar to those encountered during previous subsurface investigations and indicate that the concentrations of PCE and its degradation products above MTCA cleanup levels in soil have been adequately defined (Figure 3).

Groundwater was measured at depths ranging from approximately 8 to 31 feet below the top of the monitoring well casings during the October 2008 groundwater monitoring and sampling event. The calculated groundwater flow direction determined from the groundwater measurements taken during the October 2008 monitoring and sampling event indicates that groundwater flow is generally toward the southeast, which is consistent with the flow direction determined during the RI field program. However, the groundwater level measured at monitoring well MW-10 were substantially higher than expected based on the gradient estimated from other wells. For this reason, the measurements at this monitoring well were not included when the general Site groundwater flow direction and gradient was calculated. The cause of the inconsistency in groundwater levels has not been determined.

The laboratory analytical results for soil samples collected during the additional subsurface assessment indicated concentrations of PCE and its degradation products above MTCA Method A cleanup levels at only the monitoring well MW-7 location. A detection of PCE and its degradation products in soil at this location was expected due to its proximity to the source area and the extent of PCE in soil determined during previous investigations. Concentrations of PCE or its degradation products above MTCA Method A cleanup levels were not detected in soil samples collected from other borings advanced during the additional subsurface assessment.

The results of groundwater monitoring and sampling in September 2008 indicate that concentrations of PCE exceeding the MTCA Method A cleanup level were present at only monitoring well locations MW-7 and MW-9. The concentrations detected at monitoring well MW-7 were anticipated due to the location of this well immediately down-gradient of the source area and the extent of PCE in groundwater previously determined at the Site. Prior to the additional subsurface assessment, the lateral extent of PCE exceeding the MTCA Method A cleanup level in groundwater was bounded to the north of the Site by monitoring well MW-4. Laboratory analysis of groundwater samples collected from newly installed monitoring wells MW-8 and MW-10 did not indicate concentrations of PCE exceeding the MTCA Method A cleanup level, thereby bounding the lateral extent of PCE to the west and south of the Site. The concentrations of PCE detected at monitoring well MW-9 exceed the MTCA Method A cleanup level for groundwater, and therefore do not fully delineate the lateral extent of PCE in groundwater to the east of the Site. Based on the estimated southeastly groundwater flow direction, the plume of PCE-contaminated groundwater likely is migrating to the east-southeast of the intersection of East Cherry Street and 26th Avenue.

The source of the low concentration of PCE in groundwater at monitoring well MW-10 was not confirmed. The presence of PCE at this location most likely is due to partitioning from PCE in soil vapor emanating from the source at the Custom Cherry Cleaners property to groundwater, or could potentially be due to a release at some other nearby property.

5.2 AIR SPARGE FEASIBILITY TESTING

The investigation data have confirmed that concentrations of PCE in groundwater exceeding the MTCA Method A cleanup level extend off the Custom Cherry Cleaners property to the north, south, east, and west and to depths greater than 25 feet bgs. The results of the AS feasibility test indicate that AS is a feasible remedial alternative for remediation of PCE in groundwater at the Site within the vicinity of the Custom Cherry Cleaners property boundaries and a limited distance around the property.

6.0 DATA GAPS AND FUTURE WORK

Remaining data gaps in the characterization of soil and groundwater conditions include defining the lateral extent of PCE contamination in groundwater to the east of the Site and the vertical extent of PCE in groundwater beneath the Site. Concentrations of PCE in soil at the Site have been adequately delineated. The vertical extent of PCE in groundwater will be further defined during AS well installations as part of the proposed cleanup action at the Site. Additionally, the lateral extent of PCE contamination in groundwater at the Site may be defined by installing an additional down-gradient well on the southeastern corner of East 26th Street and East Cherry Street. The down-gradient well will be installed during the proposed cleanup action at the Site.

Sufficient information is available to design an SVE and AS remediation system with ozone enhancement for use at the Custom Cherry Cleaners property to commence remediation of soil and groundwater. This technology will effectively reduce the PCE mass migrating from the Custom Cherry Cleaners property and result in attenuation of the plume down-gradient. The time frame for cleanup likely would be reduced if the highly contaminated shallow soil at the northeastern corner of the Site building was removed in conjunction with redevelopment of the property in the future. A Cleanup Action Plan that complies with WAC 173-340-360 and 173-340-380 and details the proposed cleanup action and system installation at the Site should be prepared and submitted as a draft for review and comment by Ecology.

MTCA Cleanup Levels for Soil				**0.05**[3]	**0.03**[3]	**800**[4]	**1,600**[4]	**67**[4]	

NOTES:

Results in **bold** denote analyte concentration exceeds applicable cleanup level.

< denotes analyte not detected at or above the laboratory practical quantitation limit indicated.

PCE = tetrachloroethene

TCE = trichloroethene

[1]Depth in feet below ground surface.

[2]Analyzed by U.S. Environmental Protection Agency Method 8260B.

[3]Washington State Model Toxics Control Act Cleanup Regulation (MTCA) Method A Soil Cleanup Level, Table 740-1 of Section 900 of Chapter 173-340 of the Washington Administrative Code, as revised November 2007.

[4]MTCA Cleanup Levels and Risk Calculations Standard Method B Formula Values, Version 3.1, updated November 2001.

[5]Analyzed by Plumb Method, 1981.

Re: Analytical Data for Project 129-001
Laboratory Reference No. 0809-109

Dear Jeff:

Enclosed are the analytical results and associated quality control data for samples submitted on September 17, 2008.

The standard policy of OnSite Environmental Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: September 30, 2008
Samples Submitted: September 17, 2008
Laboratory Reference: 0809-109
Project: 129-001

Case Narrative

Samples were collected on September 16 and 17, 2008 and received by the laboratory on September 17, 2008. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

Halogenated Volatiles EPA 8260B Analysis

Per EPA Method 5035A, samples were received by the laboratory in pre-weighed 40 mL VOA vials within 48 hours of sample collection. They were stored in a freezer at between -7°C and -20°C until extraction or analysis.

Internal Standard 1,4-Dichlorobenzene-d4 does not meet acceptance criteria for sample MW-9-20-21 due to sample matrix effects. The sample was re-analyzed with similar results. All results, including Practical Quantitation Limits, from Bromobenzene onward should be considered estimates.

Any other QA/QC issues associated with this extraction and analysis will be indicated with a footnote reference and discussed in detail on the Data Qualifier page.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

MW-7-25-26	09-109-24	12

This report pertains to the samples analyzed in accordance with the chain of custody,
and is intended only for the use of the individual or company to whom it is addressed.

OnSite Environmental Inc.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

Y - Sample extract treated with an acid/silica gel cleanup procedure.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Re: Analytical Data for Project 129-001
Laboratory Reference No. 0809-178

Dear Jeff:

Enclosed are the analytical results and associated quality control data for samples submitted on September 26, 2008.

The standard policy of OnSite Environmental Inc. is to store your samples for 30 days from the date of receipt. If you require longer storage, please contact the laboratory.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning the data, or need additional information, please feel free to call me.

Sincerely,

David Baumeister
Project Manager

Enclosures

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: October 6, 2008
Samples Submitted: September 26, 2008
Laboratory Reference: 0809-178
Project: 129-001

Case Narrative

Samples were collected on September 26, 2008 and received by the laboratory on September 26, 2008. They were maintained at the laboratory at a temperature of 2°C to 6°C.

General QA/QC issues associated with the analytical data enclosed in this laboratory report will be indicated with a reference to a comment or explanation on the Data Qualifier page. More complex and involved QA/QC issues will be discussed in detail below.

This report pertains to the samples analyzed in accordance with the chain of custody, and is intended only for the use of the individual or company to whom it is addressed.

Date of Report: October 6, 2008
Samples Submitted: September 26, 2008

OnSite Environmental Inc.

Data Qualifiers and Abbreviations

A - Due to a high sample concentration, the amount spiked is insufficient for meaningful MS/MSD recovery data.

B - The analyte indicated was also found in the blank sample.

C - The duplicate RPD is outside control limits due to high result variability when analyte concentrations are within five times the quantitation limit.

E - The value reported exceeds the quantitation range and is an estimate.

F - Surrogate recovery data is not available due to the high concentration of coeluting target compounds.

H - The analyte indicated is a common laboratory solvent and may have been introduced during sample preparation, and be impacting the sample result.

I - Compound recovery is outside of the control limits.

J - The value reported was below the practical quantitation limit. The value is an estimate.

K - Sample duplicate RPD is outside control limits due to sample inhomogeneity. The sample was re-extracted and re-analyzed with similar results.

L - The RPD is outside of the control limits.

M - Hydrocarbons in the gasoline range are impacting the diesel range result.

M1 - Hydrocarbons in the gasoline range (toluene-napthalene) are present in the sample.

N - Hydrocarbons in the lube oil range are impacting the diesel range result.

O - Hydrocarbons indicative of heavier fuels are present in the sample and are impacting the gasoline result.

P - The RPD of the detected concentrations between the two columns is greater than 40.

Q - Surrogate recovery is outside of the control limits.

S - Surrogate recovery data is not available due to the necessary dilution of the sample.

T - The sample chromatogram is not similar to a typical _____.

U - The analyte was analyzed for, but was not detected above the reported sample quantitation limit.

U1 - The practical quantitation limit is elevated due to interferences present in the sample.

V - Matrix Spike/Matrix Spike Duplicate recoveries are outside control limits due to matrix effects.

W - Matrix Spike/Matrix Spike Duplicate RPD are outside control limits due to matrix effects.

X - Sample extract treated with a mercury cleanup procedure.

Y - Sample extract treated with an acid/silica gel cleanup procedure.

Z -

ND - Not Detected at PQL
PQL - Practical Quantitation Limit
RPD - Relative Percent Difference

Appendix B
2013/14 Field Procedures

Appendix B

2013/14 Field Procedures

Since the previous reporting period (ECC Horizon, 2013a), ECC Horizon has directed the following work:

1. Building Demolition
2. Soil and Groundwater Investigation
3. EOS inspection and removal

The field procedures are further described below.

1.0 Building Demolition Activities

In July of 2013, the subject property building was demolished. Prior to demolition activities, the water, gas and sewer utilities were disconnected from the building and the work area was restricted from public access with security fencing, existing fencing, signage, delineators and danger tape.

Clear Creek Contractors, the demolition contractor, conducted the demolition activities by starting at the northwest corner of the site and proceeding to the south and east toward Cherry Street and the adjacent alleyway to the east. In doing so, care was taken to prevent material from falling into the alley, sidewalk or parking lot. Concrete and debris were disposed at local recycling facilities. Throughout the demolition, air quality readings of total organic vapor (TOV) were collected with a MiniRAE 2000 photoionization detector (PID) equipped with a 10.6 electron volt (eV) lamp to ensure a safe breathing environment.

Following the demolition activities, sewer caps were installed in accordance with local ordinances and fencing was replaced. In addition, ECC Horizon personnel staked a 10 feet-by-10 feet grid within the former building footprint. Samples were collected using a hand auger at a depth of 1 foot below ground surface from 35 separate locations, placed in a Ziploc bag and allowed approximately 10 minutes to volatilize vapors within the sealed bag. Thereafter, the TOVs were measured using a PID. Readings of 0.0 ppm were identified for every sample.

2.0 2013-2014 REMEDIAL ACTIVITIES

2.1 Sampling Rationale

To continue the site characterization effort and monitor the influence of EOS, ECC Horizon conducted the following:

1. Assess the cVOC impacts to soil and groundwater downgradient to the south and southeast

2. Conduct groundwater sampling events to evaluate both the stability of the cVOC plume and the performance of the EOS bioremediation effort
3. Inspect and remove impacted EOS material

The following sections further describe the aforementioned field efforts.

2.2 Soil Sampling Event

2.2.1 Drilling, Field Logging and Sampling Procedures

Prior to each drilling event, ECC Horizon contacted the Washington Utility Notification Center to locate buried utilities. In addition, up to the first eight feet of each soil boring was cleared using air knifing techniques to verify the presence or absence of utilities in each location.

Thereafter, between September 26, 2013, and July 23, 2014, four drilling events were conducted under ECC Horizon supervision. Multiple licensed Washington drillers advanced soil borings SB-12 through SB-37 and monitoring wells MW-15D, MW-17D, MW-18, MW-18D, MW-19, MW-19D, MW-20D, MW-21D, MW-22D and MW-23 within the subject property's source area and downgradient to the south and southeast of the subject property as shown on Figure 2.

Soil boring SB-21 and monitoring wells MW-15D, MW-17D, MW-18, MW-18D, MW-19, MW-19D, MW-20D and MW-23 were advanced with a drill rig using a split spoon sampler driven with a 140-pound hammer. Monitoring wells MW-21D and MW-22D were advanced using a Mini Sonic rig. Soil borings SB-12 through SB-37 were advanced using a truck mounted Geoprobe using direct push dual tube soil boring methods and were advanced to depths of 15 feet bgs for 21 borings and 30 feet bgs for 4 borings. To reduce the potential for cross-contamination, the drilling equipment was steam-cleaned before drilling at each location. The decontamination rinsate was placed into drums for subsequent transport and disposal.

The intersecting soils in each boring were field screened for total volatile organic vapors using a MiniRAE 2000 PID equipped with a 10.6 electron volt (eV) lamp. Prior to each day of drilling, the PID was calibrated to an isobutylene standard of 100 parts per million (ppm). Field observations were recorded on soil logging forms by an ECC Horizon geologist. The soil boring logs from this investigation are presented in Appendix C.

A total of 85 soil samples were collected for laboratory analysis from both the unsaturated and saturated zones within the 33 borings. The samples were placed in 40 milliliter (mL) pre-weighted glass vials and sealed with a Teflon®-lined lid in accordance with EPA Method 5035. ECC personnel donned new, disposable nitrile gloves prior to collecting each sample. After collection, each soil sample was immediately placed on ice in a cooler containing a trip blank sample, pending shipment under chain-of-custody to either Pace Analytical Services, Inc. (Pace) or TestAmerica Laboratories, Inc. (TestAmerica) of Seattle, Washington, for analysis of VOCs via EPA Method 8260B. An additional sample was collected and shipped under chain-of-custody to Hull and Associates of Bedford, Ohio and analyzed for USCS classification via ASTM D2488.

2.2.2 Monitoring Well Construction & Surveying Procedures

Permanent monitoring wells MW-15D, MW-17D, MW-18, MW-18D, MW-19, MW-19D, MW-20D and MW-23 were installed through 4.25-inch hollow stem augers (HSAs). Monitoring wells MW-21D and MW-22D were advanced using a mini sonic rig. At MW-21D, an 8-inch outer casing sealed off the shallow groundwater to 25 feet bgs. A cement-bentonite slurry plug was set at the base of the outer casing and allowed to cure for 24 hours prior to advancing the borehole deeper with 6-inch casing to the total boring depth of 70 feet bgs. 6-inch core barrel was advanced to the end of the boring for MW-22D. Each monitoring well was constructed using 2-inch-diameter 0.010-inch slotted polyvinyl chloride (PVC) well screen and finished with 2-inch diameter solid PVC casing to grade. Each boring's annular space was filled with #2/12 Monterey sand from the base of the boring to approximately two feet above the well screen and completed to within two feet of grade with hydrated cement-bentonite slurry. Each well was then completed to the ground surface with a locking cap and flush-mount protective steel monument set in concrete. Well construction diagrams for the monitoring wells are presented in Appendix C. The soil cuttings generated during the drilling activities were contained in drums, labeled and staged on the subject property for proper transport and disposal.

Each well was subsequently developed using a surge block and submersible pump to remove sediment and improve water flow. The well development water was placed into drum along with the decontamination rinsate for subsequent transport and disposal.

Following installation events, field personnel conducted a field survey that included locating and measuring each existing and newly installed well location to determine their respective top-of-casing (TOC) and top-of-ground elevations of each drilling location. The survey information is provided on each soil boring log and monitoring well diagram presented in Appendix C.

2.3 Groundwater Sampling Events

The current groundwater monitoring well network is comprised of 29 monitoring wells (20 shallow and 8 deep) located in and around the subject property as shown on Figure 2. A total of 22 wells were gauged, and 10 well were purged and sampled in November 2013 (4Q13), 25 wells were gauged and 23 wells were purged and sampled in May 2014 (2Q14) and 25 wells were gauged and 1 well was sampled in July 2014 (3Q14).

During each sampling event, the bolted lid and well plugs were removed from all of the wells prior to gauging, to allow water levels to equilibrate to atmospheric conditions. Each well was then gauged using a Solinst® oil/water level interface probe and measured to 0.01 of a foot. Samples from each well were collected in accordance with ECY's *Standard Operating Procedure for Purging and Sampling Monitoring Wells*, dated 10/4/11. A bladder pump with dedicated polyethylene tubing was lowered to the midpoint of the screen, and the wells were purged utilizing low-flow techniques. To ensure that the drawdown of each well did not exceed 0.3 feet, water levels were measured every 5 minutes.

The conductivity, pH, oxidation-reduction potential, temperature, dissolved oxygen and turbidity of the groundwater within each well were measured using a YSI flow-cell equipped with a handheld monitoring device and monitored for stabilization.

After these parameters stabilized to prescribed ranges, groundwater samples were subsequently collected from each well and placed into 3 labeled 40-milliliter vials. A single field duplicate sample was also collected during each sampling event. Property personnel donned new, disposable nitrile gloves prior to collecting each individual sample. After collection, each groundwater sample was immediately placed on ice in a cooler containing a trip blank sample, pending shipment under chain-of-custody to Pace or TestAmerica for subsequent VOC analyses by EPA Method 8260B.

2.4 Groundwater Elevation Calculation

Groundwater elevations were determined by subtracting the measured depth to groundwater from the TOC elevations at each monitoring well location. Historical groundwater elevation data are presented in Table 4. A groundwater elevation map was constructed from the groundwater elevations for each sampling event and are shown on Figures 9a, 9b, 10a, 10b, 11a and 11b.

3.0 EOS INSPECTION AND REMOVAL

In November of 2013, May 2014 and July 2014 ECC Horizon subcontracted vacuum truck services from Ingenium to remove frere-phase EOS from the injection well network shown on Figure 7. Prior to removal, the EOS thickness was measured in each well. During vacuuming, a PVC pipe was lowered into each well and vacuumed for approximately one minute and visually monitored until the product was removed. Following the one minute vacuum, the EOS material was measured again for product, if product was noted then vacuuming was continued for another minute and the process was repeated until all product was removed.

Log of Exploratory Boring:

Notes

Drilling Co./Driller:	Cascade Drilling / Steve
Drilling Method:	HSA LAR
Location:	
Surface Condition:	Concrete
Total Depth:	40.5
First GW Depth:	31

Moisture Content:
Dry = Dry, Dp = Damp, Mst = Moist, Wet = Wet

Hydrocarbon Odor: NO = no odor, VFO = very faint odor
WO = weak odor, MO = moderate odor, SO = strong odor

Water Levels
▼ After Completion
▽ During Drilling

Depth (feet)	Blow Count	PID	Sample Recovery	Sample Interval	Sample ID	Lithography	USCS Class	Description	Moisture Content	Well Detail
0							CONC	Concrete (8 inches thick).		
1								Boring cleared to a depth of 6 feet below ground surface (bgs) with a vac truck prior to drilling.

Advanced an 8-inch diameter outer casing to 25.0' below ground surface (bgs) to seal off upper saturated unit before advancing deeper. The outer casing was removed after the permanent monitoring well was set. Refer to boring log SB-21 for soil logging between0' and 25' bgs.							
Outer casing sealed with hydrated bentonite from 23'-25' bgs. After outer casing set, initiated drilling at 14:27 on 5/14/14.							
25.0' - 26.0' - Hard, very dark gray (10YR 3/1) clayey SILT, trace sand, dry	5.0/5.0		X		4.6		
26.0' - 27.5' - Hard, dark grayish brown (2.5Y 4/2) clayey SILT, little fine sand, dry			X		7.6		
27.5' - 29.0' - Greenish gray (Gley 1 5/5GY) fine SAND, moist			X	X	6.2		
29.0' - 30.0' - Hard, light yellowish brown (10YR 6/4) clayey SILT, trace fine sand, dry, strong brown (7.5YR 5/4) mottling			X	X	7.6		14:48 (5/14)
30.0' - 33.6' - Reddish brown (2.5YR 4/4) silty SAND, trace coarse gravel, trace fine gravel, pyrite flakes, moist	5.0/5.0		X		0.7		
33.6' - 35.0' - Firm, reddish brown (2.5YR 5/3) silty fine SAND, some clay, little fine gravel, trace coarse gravel, moist, strong brown (7.5YR 5/4) mottling			X		0.4

			11.5' - 11.6' - No recovery, rock in split spoon	1.5/0.1	15 / 15 / 16					
			13.0' - 14.2' - Medium dense brown (10YR 5/3) fine SAND, some silt and trace gravel, saturated	1.5/1.2	11 / 9 / 8			1.0		
15	266.40		15.0' - 15.4' - SAA					0.1		
			15.4' - 16.0' - Stiff bluish gray (GLEY2 5/10B) SILT, trace fine gravel, moist	1.5/1.0	15 / 16 / 18			0.2		
			16.5' - 16.8' - SAA	1.5/0.3	16 / 17 / 18			1.0		
			18.0' - 18.5' - Very stiff black (10YR 2/1) SILT, trace fine gravel, moist	1.5/1.0	16 / 17 / 19			3.4		11:00 (7/23)
20	261.40		18.5' - 19.0' - Very stiff bluish gray (GLEY2 5/10B) SILT, trace fine gravel, moist					2.0		
			20.0' - 20.5' - Stiff gray (10YR 5/1) SILT, moist	1.5/1.5	14 / 15 / 16			1.5		
			20.5' - 21.5' - Medium dense light yellowish brown (10YR 6/4) fine SAND, trace silt, orange mottling, moist	1.5/0.9	10 / 12 / 17			1.5		
			21.5' - 22.4' - SAA	1.5/1.2	10 / 13 / 18			2.0		
			23.0' - 24.2' - Medium dense very pale brown (10YR 7/4) fine SAND, moist							
25	256.40		25.0' - 26.5' - SAA, orange and red mottling	1.5/1.5	13 / 17 / 19			1.2		
			26.5' - 28.0' - SAA, medium dense to dense with <0.1" interbedded layers of silt	1.5/1.5	12 / 20 / 30			3.9		11:20 (7/23)
			28.0' - 29.1' - SAA	1.5/1.5	30 / 16 / 21			2.6		
30	246.40		29.1' - 29.5' - Very stiff brownish yellow (10YR 6/6) SILT, moist					0.6		
			30.0' - 31.5' - No recovery Driller switched to 3" spoon with no recovery Driller noted hard layer augered through at 31.0'	1.5/0.0	50 / 1					
			32.0' - 33.5' - Loose grayish brown (10YR 5/2) fine SAND, saturated	1.5/1.5	24 / 44 / 55			4.9		11:35 (7/23)
			33.5' - 34.4' - SAA	1.5/0.9	6 / 9 / 11			3.0		
35	241.40		35.0' - 36.1' - SAA							
			End of boring.	1.5/1.1	7 / 10 / 12			4.3		11:45 (7/23)

Notes: 1) Samples MW23:S100115, MW23:S185190, MW23:S265280, MW23:S320335, MW23:S350361, and FD:S072314 were retained for laboratory analysis. 2) The density and consistency modifiers are based on the sum of the 2nd and 3rd 6-inch blow count intervals.

▽ = Water level noted during boring
▼ = Water level measured after completion
PID = photoionization detector
FID = flame ionization detector
ppmv = part per million by volume

TOC = top of casing
NA = Not Applicable
DT = dual tube
SAA = same as above
MSL = mean sea level

RE: Project: Cherry St Cleaner's
Pace Project No.: 10244705

Dear Robert Huebner:
Enclosed are the analytical results for sample(s) received by the laboratory on October 05, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: Cherry St Cleaner's
Pace Project No.: 10244705

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-M	Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

1M	Post-analysis pH measurement indicates insufficient VOA sample preservation. Therefore, analysis was conducted outside the recognized method holding time.
F1	The sample was analyzed at a dilution due to foaming of the sample in the purge vessel.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L3	Analyte recovery in the laboratory control sample (LCS) exceeded QC limits. Analyte presence below reporting limits in associated samples. Results unaffected by high bias.

RE: Project: Cherry St Cleaner's
Pace Project No.: 10244425

Dear Robert Huebner:
Enclosed are the analytical results for sample(s) received by the laboratory between October 03, 2013 and October 05, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: Cherry St Cleaner's
Pace Project No.: 10244425

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-M Pace Analytical Services - Minneapolis

BATCH QUALIFIERS

Batch: MSV/25242

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

RE: Project: W-52510-EC-I Cherry St Cleaner
Pace Project No.: 10248131

Dear Robert Huebner:
Enclosed are the analytical results for sample(s) received by the laboratory on November 05, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: W-52510-EC-I Cherry St Cleaner
Pace Project No.: 10248131

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-M	Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.

RE: Project: W-52510-EC-I Cherry St Cleaner
Pace Project No.: 10248131

Dear Robert Huebner:
Enclosed are the analytical results for sample(s) received by the laboratory on November 05, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: W-52510-EC-I Cherry St Cleaner
Pace Project No.: 10248131

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-M	Pace Analytical Services - Minneapolis

ANALYTE QUALIFIERS

CH	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased high.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.

RE: Project: W-52510EC-I CHERRY ST. CLEANER
Pace Project No.: 10249510

Dear Casey McFall:
Enclosed are the analytical results for sample(s) received by the laboratory on November 15, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: W-52510EC-I CHERRY ST. CLEANER
Pace Project No.: 10249510

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-M	Pace Analytical Services - Minneapolis

BATCH QUALIFIERS

Batch: MSV/25706

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

CL	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased low.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
SS	This analyte did not meet the secondary source verification criteria for the initial calibration. The reported result should be considered an estimated value.

RE: Project: W-52510EC-I CHERRY ST.CLEANERS
Pace Project No.: 10249511

Dear Casey McFall:
Enclosed are the analytical results for sample(s) received by the laboratory on November 15, 2013. The results relate only to the samples included in this report. Results reported herein conform to the most current TNI standards and the laboratory's Quality Assurance Manual, where applicable, unless otherwise noted in the body of the report.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jennifer Gross

QUALIFIERS

Project: W-52510EC-I CHERRY ST.CLEANERS
Pace Project No.: 10249511

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to changes in sample preparation, dilution of the sample aliquot, or moisture content.

ND - Not Detected at or above adjusted reporting limit.

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PRL - Pace Reporting Limit.

RL - Reporting Limit.

S - Surrogate

1,2-Diphenylhydrazine (8270 listed analyte) decomposes to Azobenzene.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The NELAC Institute.

LABORATORIES

PASI-M	Pace Analytical Services - Minneapolis

BATCH QUALIFIERS

Batch: MSV/25706

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

CL	The continuing calibration for this compound is outside of Pace Analytical acceptance limits. The results may be biased low.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
L2	Analyte recovery in the laboratory control sample (LCS) was below QC limits. Results may be biased low.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MS	Analyte recovery in the matrix spike was outside QC limits for one or more of the constituent analytes used in the calculated result.
SS	This analyte did not meet the secondary source verification criteria for the initial calibration. The reported result should be considered an estimated value.

Job ID: 580-42990-3

Laboratory: TestAmerica Seattle

Narrative

Receipt

The samples were received on 3/31/2014 3:35 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.3º C.

Metals

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

General Chemistry - Method(s) 9060

Total Organic Carbon was detected in the method blank (MB) 580-156805/3 at a level that was above the method detection limit but below the reporting limit. The value should be considered as an estimate, and has been “J” qualified. The associated sample results have been “B” qualified and reported.

No other analytical or quality issues were noted.

Client: Environmental Compliance & Control Inc
Project/Site: W-S2510EC-I

TestAmerica Job ID: 580-42990-3

Qualifiers

General Chemistry

Qualifier	Qualifier Description
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

List Number: 1

Creator: Blankinship, Tom X

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	False	Cooler temperature outside required temperature criteria.
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	False	All three vials of Drum 2 (-28)received broken.
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

CASE NARRATIVE
Client: Environmental Compliance & Control Inc
Project: W-S2510EC-I
Report Number: 580-42942-1

This case narrative is in the form of an exception report, where only the anomalies related to this report, method specific performance and/or QA/QC issues are discussed. If there are no issues to report, this narrative will include a statement that documents that there are no relevant data issues.

It should be noted that samples with elevated Reporting Limits (RLs) resulting from a dilution may not be able to satisfy customer reporting limits in some cases. Such increases in the RLs are an unavoidable but acceptable consequence of sample dilution that enables quantification of target analytes within the calibration range of the instrument or that reduces the interferences thereby enabling the quantification of target analytes.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

RECEIPT

The samples were received on 3/26/2014 1:00 PM, 3/27/2014 12:30 PM, 3/28/2014 2:15 PM and 3/31/2014 3:35 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 7 coolers at receipt time were -33.0º C, -30.4º C, 1.5º C, 3.3º C, 4.6º C, 7.1º C and 19.3º C.

Except:

The container labels for the following samples did not match the information listed on the Chain-of-Custody (COC): FD1:S032814 (580-42977-13), SB32:S060080 (580-42977-5). The container labels list SB32:S and FD1:S032614, while the COC lists SB:32:S060080 and FD1:S032814, respectively. The samples have been logged in per the COC.

For 8260 TCLP analysis, the following samples were received at the laboratory outside the required temperature criteria at 19.3°C: FD2:S032914 (580-42990-22), FD3:S032914 (580-42990-23), FD4:S032914 (580-42990-24), SB18:S010010 (580-42990-1), SB18:S100124 (580-42990-2), SB19:S017031 (580-42990-18), SB19:S070084 (580-42990-19), SB19:S200222 (580-42990-20), SB19:S250264 (580-42990-21), SB20:S027027 (580-42990-3), SB20:S050050 (580-42990-4), SB20:S100120 (580-42990-5), SB25:S000019 (580-42990-6), SB25:S070070 (580-42990-7), SB25:S125150 (580-42990-8), SB25:S150200 (580-42990-9), SB25:S200216 (580-42990-10), SB30:S150158 (580-42990-15), SB30:S158189 (580-42990-16), SB30:S200216 (580-42990-17), SB37:S011024 (580-42990-11), SB37:S079100 (580-42990-12), SB37:S200233 (580-42990-13), SB37:S275297 (580-42990-14).

Note: All samples which require thermal preservation are considered acceptable if the arrival temperature is within 2C of the required temperature or method specified range. For samples with a specified temperature of 4C, samples with a temperature ranging from just above freezing temperature of water to 6C shall be acceptable. Samples that are hand delivered immediately following collection may not meet these criteria, however they will be deemed acceptable according to NELAC standards, if there is evidence that the chilling process has begun, such as arrival on ice, etc.

TCLP VOLATILE ORGANIC COMPOUNDS (GC-MS)

The continuing calibration verification (CCV) associated with analysis batch 156720 recovered above the upper control limit for 1,1-Dichloroethene. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been "^" qualified and reported.

No other difficulties were encountered during the TCLP volatiles analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS) - Low Level

Job ID: 580-42942-1 (Continued)

Laboratory: TestAmerica Seattle (Continued)

Samples SB27:S000010 (580-42942-1), SB27:S118136 (580-42942-2), SB23:S010032 (580-42942-3), SB23:S103133 (580-42942-4), SB17:S005029 (580-42942-5), SB17:S100114 (580-42942-6), SB14:S005030 (580-42942-7), SB15:S005031 (580-42942-9), SB15:S119134 (580-42942-10), SB26:S134146 (580-42949-10), SB30:S100129 (580-42949-12), SB35:S080100 (580-42949-16), SB35:S107137 (580-42949-17), SB31:S128148 (580-42949-19), SB24:S000019 (580-42977-1), SB24:S115134 (580-42977-2), SB28:S017035 (580-42977-3), SB32:S060080 (580-42977-5), SB36:S000017 (580-42977-7), SB36:S100115 (580-42977-8), SB29:S000017 (580-42977-11), SB29:S105123 (580-42977-12), FD1:S032814 (580-42977-13), SB18:S010010 (580-42990-1), SB20:S027027 (580-42990-3), SB25:S000019 (580-42990-6), SB25:S125150 (580-42990-8), SB37:S011024 (580-42990-11), SB37:S275297 (580-42990-14), SB30:S150158 (580-42990-15), SB30:S158189 (580-42990-16), SB30:S200216 (580-42990-17), SB19:S017031 (580-42990-18), FD2:S032914 (580-42990-22) and FD3:S032914 (580-42990-23) contained Tetrachloroethene outside the upper calibration level for direct sparge soils 8260 method (low level). The analyte has been reported from this method with an “E” flag. The samples have been scheduled for reanalysis by 8260B MeOH extraction method. Both sets of data have been reported.

Sample SB30:S129149 (580-42949-13) is highly contaminated causing matrix interference and retention time shifts. The data has been reported from the MeOH analysis for all target compounds.

Internal standard (IS) 1,4-Dichlorobenzene-d4 responses were outside the lower acceptance limits for samples SB25:S000019 (580-42990-6) and SB37:S011024 (580-42990-11). The low recovery of this IS indicates a potential high bias for associated analytes in IS group 51. All associated compounds in IS group 51 were non-detects; therefore, the affected analytes have been “*” qualified and reported.

Internal standard (IS) 1,4-Dichlorobenzene-d4 response was outside the lower acceptance limits for sample SB19:S017031 (580-42990-18). The low recovery of this IS indicates a potential high bias for associated analytes in IS group 51. All associated compounds in IS group 51 were non-detects; except analyte 4-Isopropyltoluene. Due to the contamination levels seen in the sample, result for 4-Isopropyltoluene has been reported from the MeOH analysis.

Tetrachloroethene was detected in method blank MB 580-156514/1-A at a level exceeding the reporting limit. Associated samples were not re-extracted and/or re-analyzed because results were greater than 10X the value found in the method blank. The sample results have been “B” qualified and reported.

Tetrachloroethene was detected in method blank MB 580-156722/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been “J” flagged. The sample results have been “B” qualified and reported.

Tetrachloroethene was detected in method blank MB 580-156826/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been “J” flagged. The sample results have been “B” qualified and reported.

Tetrachloroethene was detected in method blank MB 580-156924/1-A at a level that was above the method detection limit but below the reporting limit. The value should be considered an estimate, and has been “J” flagged. The sample results have been “B” qualified and reported.

No other difficulties were encountered during the VOC analysis.

All other quality control parameters were within the acceptance limits.

VOLATILE ORGANIC COMPOUNDS (GC-MS) - MEOH Extraction

Due to the sample matrix and instrument’s capacity, samples SB26:S134146 (580-42949-10), SB24:S115134 (580-42977-2), SB28:S017035 (580-42977-3), SB36:S000017 (580-42977-7), SB36:S100115 (580-42977-8), SB29:S000017 (580-42977-11), SB29:S105123 (580-42977-12), FD1:S032814 (580-42977-13), SB18:S010010 (580-42990-1), SB20:S027027 (580-42990-3), SB25:S000019 (580-42990-6), SB25:S125150 (580-42990-8), SB37:S011024 (580-42990-11), SB37:S275297 (580-42990-14), SB30:S150158 (580-42990-15), SB30:S158189 (580-42990-16) and SB30:S200216 (580-42990-17) were reanalyzed for Tetrachloroethene outside of the holding time. The data have been “H” qualified and reported.

Due to the nature of sample matrix, sample SB30:S129149 (580-42949-13) required multiple dilutions to bring the concentration of Tetrachloroethene within the calibration range. The 1000X dilution was performed outside of holding time. Both sets of data have been

Job ID: 580-42942-1 (Continued)

Laboratory: TestAmerica Seattle (Continued)

reported.

Several analytes were detected in method blank MB 580-156550/1-A at levels that were above the method detection limit but below the reporting limit. The values should be considered estimates, and have been “J” flagged.

The continuing calibration verification (CCV) associated with analysis batch 156533 recovered above the upper control limit for Methylene Chloride. The samples associated with this CCV were non-detects for the affected analyte; therefore, the data have been “^” qualified and reported.

No other difficulties were encountered during the VOC analysis.

All other quality control parameters were within the acceptance limits.

PERCENT SOLIDS

No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.
B	Compound was found in the blank and sample.
E	Result exceeded calibration range.
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
H	Sample was prepped or analyzed beyond the specified holding time
F2	MS/MSD RPD exceeds control limits
*	ISTD response or retention time outside acceptable limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)
