1.0 INTRODUCTION

This annual summary report describes the results of quarterly environmental monitoring (groundwater, surface water, and landfill gas) conducted at the Hansville Landfill Site during 2014. The landfill monitoring was conducted on behalf of Kitsap County (the County) and Waste Management of Washington, Inc. (WMW). Groundwater and surface water were sampled quarterly during January, April, July, and October. Landfill gas measurements were also recorded on a quarterly basis.

Site monitoring activities completed during the 2014 reporting period were performed in accordance with the final Cleanup Action Plan (CAP) for the Hansville Landfill. The CAP, which was approved in August 2011, is the central component of the Amended Consent Decree (No. 95-2-03005-1) that was formally executed on August 5, 2011. The environmental sampling, data management, and reporting required under the final CAP is documented in *Compliance Monitoring Plan, with Sampling & Analysis Plan (SAP) and Quality Assurance Plan (QAP), Remedial Action at the Hansville Landfill, Kitsap County, WA* (SCS Engineers, dated September 2011).

1.1 REGULATORY FRAMEWORK

The Hansville Landfill is a former municipal landfill that stopped accepting waste and officially closed in 1989. The closure met the requirements of Chapter 173-304 Washington Administrative Code (WAC). The closure consisted of final site grading, surface capping (including the installation of a high-density polyethylene [HDPE] liner over three distinct disposal areas), and the installation of surface water controls. A passive landfill gas collection system, including horizontal piping installed beneath the HDPE liner and a flaring station, was also constructed at this time. In 1991, an active landfill gas extraction and flaring system was installed within the municipal solid waste and demolition landfill units to better control methane migration and the removal of volatile organic compounds (VOCs) from subsurface soil and groundwater.

Also, in 1991, the Washington Department of Ecology (Ecology) performed a Site Hazard Assessment (SHA) under the Model Toxics Control Act (MTCA) Regulations which resulted in an initial ranking of 3. This ranking was subsequently changed to a 1 (the highest rank on a scale of 1 to 5) in 1992, based on changes in the state ranking model. Throughout this period, Kitsap County Sanitary Landfill (KCSL, which merged into WMW) conducted additional investigations, continued environmental monitoring, and implemented additional improvements at the Site as part of a corrective action program.

In October 1995, Ecology signed a consent decree with the County and KCSL to conduct a Remedial Investigation/Feasibility Study (RI/FS) for the Site. The RI was completed in 2007 and the FS was completed in 2009. The RI/FS identified arsenic and vinyl chloride in groundwater (and in seepage to surface water) as the primary contaminants of concern (COCs) related to the landfill. The highest concentrations of these COCs generally occur adjacent to the waste disposal areas with decreasing concentrations at increasing distances from the landfill.

Based on these findings, site-specific cleanup levels were developed for arsenic, vinyl chloride and manganese in groundwater, and arsenic and vinyl chloride in surface water.

A preferred remedial alternative of Natural Attenuation of Groundwater with Enhanced Monitoring and Institutional Controls was selected for implementation at the Hansville Landfill Site. The CAP was specifically developed to implement the selected remedy. Along with a restrictive covenant for the Landfill Property, the CAP was incorporated into the Amended Consent Decree executed on August 5, 2011. A Compliance Monitoring Plan (CMP), including a MTCA compliant SAP and QAP, was prepared by SCS in September 2011 to document the revised monitoring program to be executed under the CAP. Compliance monitoring under the CAP was initiated during the fourth quarter of 2011 and continues through the present time.

1.2 REPORT CONTENTS

This report includes:

- Site description and background sections. Figure 1 shows the Landfill Property location (Appendix A).
- A summary of the 2014 groundwater and surface water monitoring activities, including water level measurements and sample collection and analysis techniques. Figure 2 illustrates the locations of the groundwater monitoring wells and surface water sampling stations on the Site (Appendix A).
- Summary data tables of the fourth quarter 2014 water quality monitoring results including water table elevations, analytical data, and a contour map depicting groundwater elevations and flow directions for the quarter (Appendix B).
- Summary data tables and groundwater contour maps, previously reported, for the preceding three quarters of 2014 (Appendix C).
- An evaluation of water quality results, including comparisons to regulatory standards, tracking natural attenuation parameters, and statistical analysis (Appendix D), as defined under the CAP.
- A presentation of the fourth quarter 2014 landfill gas monitoring results, including a summary table for the reporting period (Appendix B). Figure 3 illustrates the layout of the landfill gas system and monitoring probe locations (Appendix A).
- Summary landfill gas data tables, previously reported, for the preceding three quarters of 2014 (Appendix C).
- Field report forms and laboratory analytical reports (including data validation summaries) for the fourth quarter 2014 (Appendices E and F, respectively).
- Copies of landfill inspection reports prepared by the Kitsap Public Health District (KPHD) (Appendix G).

All terms used in this report are consistent with those defined in the Consent Decree as well as in Revised Code of Washington (RCW) 70.1050.020 and WAC 173-340-200.

2.0 SITE BACKGROUND

2.1 SITE LOCATION AND DESCRIPTION

The Site subject to the CAP and subject to the monitoring described in this report contains the Landfill, the Landfill Property, and a portion of land owned by the Port Gamble S'Klallam Tribe. The closed Hansville Landfill is located on an approximately 73-acre parcel within the northeast quarter of Section 9, Township 27 North, Range 2 East of the Willamette Meridian, in Kitsap County, Washington. It consists of three separate, inactive, disposal areas. These include the following:

- 13-acre municipal solid waste disposal cell situated within the central portion of the property;
- 4-acre demolition disposal cell situated on the northeast corner of the property, which accepted construction, demolition, and land clearing wastes (CDC); and
- 1/3-acre septage lagoon located immediately southwest of the demolition disposal area, which accepted residential septic tank waste until 1982. A second septage disposal area was also reportedly located near the northeast corner of the demolition disposal area.

The Site lies approximately five miles south of the unincorporated community of Hansville on the northernmost reach of the Kitsap Peninsula and is situated on the upper portions of several west sloping drainages with perennial creeks that ultimately discharge into Port Gamble Bay. The topography ranges between 310 and 390 feet above mean sea level (msl). A Landfill Property location map is provided as Figure 1 (Appendix A).

The County owns the Landfill Property and currently operates a drop box, known as a recycling and garbage facility in Kitsap County, on the eastern end. This portion of the property has been used for solid waste transfer and/or recycling operations since the landfill ceased accepting refuse in 1989. The remaining portions of the Landfill Property are largely comprised of a soil borrow area and wooded land. As previously mentioned, the landfill was active between approximately 1962 and 1989. Prior to development of the landfill, the property was undeveloped forested land.

The property is bordered to the south and west by lands owned by the Port Gamble S'Klallam Tribe. Tribal lands in the immediate vicinity of the Landfill Property principally consist of woodland and recreational land, with scattered commercial (a tribal casino) and rural residential development further to the south and southwest. Surrounding areas to the north and east of the Landfill Property are zoned low-density residential, rural wooded, or light industrial and are sparsely developed. The area directly east of the Landfill Property has been recently cleared and is reportedly under development for light industrial use. The nearest permanent residence is located approximately 1,500 feet (ft) east of the solid waste disposal area.

As part of the landfill closure activities, the three disposal areas were capped, a landfill gas extraction/flaring system was installed, and surface water drainage controls were implemented. The passive landfill gas extraction system was upgraded in 1991 to an active system that

includes interior landfill gas extraction wells and trenches (installed in refuse), perimeter gas extraction wells located in native soil adjacent to the solid waste disposal area, a condensate collection system, and a fenced blower/flare facility. A series of seven landfill gas monitoring probes are also located in the vicinity of the property borders to monitor for potential offsite methane migration. The surface water drainage control system controls storm water flow and minimizes erosion and offsite migration of sediment-bearing water. Drainage and erosion protection improvements include hydroseeding, culverts, and drainage ditches.

2.2 LOCAL AND REGIONAL HYDROGEOLOGY

The regional near-surface geology in the vicinity of the Hansville Landfill is dominated by glacio-fluvial and glacio-lacustrine deposits associated with the Vashon glaciation. The RI (Parametrix, 2007) identifies the following main stratigraphic units at the site (from ground surface downward):

- Sand - This unit was reported in all the investigative borings from the ground surface to depths ranging from 62 to 142 feet below ground surface (bgs). The sand deposit consists primarily of poorly graded, fine- and medium-grained sand with trace amounts of silt and gravel. The material is dark yellowish brown to dark gray in color, dense to very dense, and dry to saturated. The RI references the sand unit as the upper aquifer. This unit has been interpreted as outwash associated within the Vashon Drift.
- Transition Zone - This zone was reported at three boring locations (MW-8, MW-9, and MW-14) and is approximately 15 feet thick. It consists of interbedded layers of sand, silty sand, and silt and does not appear to be areally extensive.
- Silt - This unit was reported in all the soil borings advanced through the upper aquifer. It occurred at depths ranging from approximately 66 feet bgs (at MW-9) to 163 feet bgs (at MW-14). The silt is dark gray, slightly to moderately plastic, very dense, and dry. This unit has been interpreted to be the Kitsap Formation.

Groundwater in the immediate vicinity of the landfill occurs within the upper aquifer at depths ranging between 41 feet bgs (at MW-1) to 104 feet bgs (at MW-5). The water table beneath the landfill is reported to range between 251 and 271 feet above msl. To the west (downgradient) of the landfill, groundwater within the upper aquifer reportedly occurs between 7 feet bgs (at MW-12I) and 45 feet bgs (at MW-8). The corresponding water table elevations recorded in these wells has historically ranged from approximately 238 to 260 feet above msl.

Groundwater flow in the upper aquifer in the vicinity of the Hansville Landfill has been consistently reported to be towards the west-southwest. The 2007 RI noted that groundwater from the upper aquifer discharges into the headwaters of several perennial creeks west (downgradient) of the landfill. These creeks reportedly include Little Boston Creek, Creek A, Creek B, Creek C, and Middle Creek. Within the deeper hydrologic unit, the dense silts reported for the Kitsap Formation have a relatively low hydraulic conductivity, restricting vertical movement of groundwater through the formation.

2.3 HISTORY OF LANDFILL COMPLIANCE MONITORING

2.3.1 Water Quality

Groundwater monitoring was initiated at the site in 1982 with the installation of three groundwater monitoring wells (MW-1 through MW-3). Three additional groundwater monitoring wells (MW-4 through MW-6) were added to the monitoring program in 1988. Beginning in 1996, more groundwater wells were installed as part of a phased RI including wells MW-7 through MW-12 during Phase I, and five additional wells (MW-8D, MW-12I, MW-13S, MW-13D, and MW-14) during Phase II.

Monitoring of surface water commenced in 1991 at two locations on Middle Creek (SW-1 and SW-2). Two additional locations (SW-SB and SW-3) were added in 1992 and 1994, respectively. Seven new surface water sampling locations (SW-4, SW-5, SW-6, SW-7, SW-8, SW-9, and SW-10) were subsequently established during the 1996 RI.

Four comprehensive quarterly RI sampling events for groundwater and surface water were conducted between August 1996 and June 1997. Ecology-directed quarterly monitoring was initiated in March 1998 using a subset of the groundwater and surface water locations established during the RI. In the first quarter of 2000, Ecology approved further streamlining of the monitoring program, which remained largely unchanged through the third quarter of 2011. The streamlined monitoring program included:

- Quarterly sampling of six (6) groundwater monitoring wells (MW-5, MW-6, MW-7, MW-12I, MW-13D and MW-14). The groundwater parameter suite included: alkalinity, ammonia, bicarbonate, carbonate, chloride, chemical oxygen demand (COD), hydroxide (alkalinity), nitrate, nitrite, sulfate, total organic carbon (TOC), total coliform, dissolved metals (calcium, copper, iron, lead, magnesium, manganese, potassium, sodium and low-level arsenic), and vinyl chloride by selected ion monitoring (SIM). Annual sampling and analysis is also conducted for the complete EPA 8260 VOCs suite.
- Quarterly sampling of five (5) surface water monitoring stations (SW-1, SW-4, SW-6, SW-7 and SW-10). The surface water parameter suite included all the groundwater parameters (except that fecal coliform replaced total coliform analysis), as well as total suspended solids (TSS), turbidity and hardness.

Beginning with the fourth quarter 2011 sampling event, the water quality monitoring program was further modified to comply with the final CAP developed for the site. As detailed in Section 2.4, the CAP-defined water quality monitoring program includes quarterly monitoring of six (6) groundwater compliance wells and four (4) surface water sampling stations.

2.3.2 Landfill Gas

Closure construction was completed at the landfill in 1990, including the installation of a passive landfill gas (LFG) collection system. The passive LFG collection system in the solid waste disposal areas was subsequently converted to an active extraction and flaring system in 1991. Additional modifications to the LFG system were completed in 1994 to separate the perimeter

LFG extraction well flow from the in-refuse LFG extraction well and trench flow. The perimeter LFG extraction system ceased operation in 1995 (Parametrix, 2011).

The LFG control system layout is shown on Figure 3 (Appendix A). Four perimeter probes (GP-1 through GP-4) were initially installed on the property in 1990 to monitor LFG migration. An additional LFG migration probe (GP-5) was subsequently installed in 1994. The probes were placed in the native soils around the perimeter of the property to a depth approximately equal to the depth of refuse. All probes are single-completion except GP-2, which is a triple-completion probe screened within a shallow, middle, and deeper zone. Monitoring frequency for LFG was increased to quarterly in 1987 and monthly in 1991.

Two additional LFG probes (GP-6 and GP-7) were installed for the RI in 1996. Probe GP-6 was installed on the northeastern corner of the landfill near the demolition disposal area. Probe GP-7 was installed adjacent to groundwater monitoring well MW-9 southwest of the solid waste disposal area on Tribal land. These probes were constructed as single-completions and are screened in the soil column above the saturated zone of the upper aquifer (Parametrix 2007).

A downsized flare was installed in 2003 to handle the decreased volume of LFG generated at the landfill. In November 2006, system piping was upgraded from aboveground polyvinyl chloride (PVC) to below ground high density polyethylene (HDPE) pipe within the solid waste disposal area and demolition footprint areas. During November 2013, the primary and backup blowers were replaced with a pair of new, 1.0 horsepower, high-efficiency blowers to improve the performance of the LFG system. Additional upgrades were completed during December 2014 at five LFG extraction wellheads (R-3, R-6, R11, R-12 and T-7) which included the installation of improved orifice plates and sampling ports.

Routine LFG monitoring includes field measurements for methane gas, oxygen gas, carbon dioxide gas, and pressure at 21 extraction well/trench ports, 2 blower/flare ports, and the 7 perimeter gas probes. The final CAP, which was implemented during the final quarter of 2011, requires that quarterly LFG monitoring be performed at these locations.

2.4 CURRENT MONITORING PROGRAM UNDER THE SITE REMEDY

Beginning with the fourth quarter of 2011, the compliance monitoring program for the Hansville Landfill Site transitioned to that outlined in the final CAP. As previously noted, the CAP identified arsenic and vinyl chloride in groundwater and surface water as the primary COCs. Manganese was also identified as an additional COC. The table below summarizes the final site-specific cleanup levels that have been established for the site.

FINAL SITE CLEANUP LEVELS – HANSVILLE LANDFILL REMEDY ¹			
Chemical	Media	Site Cleanup Level ($\mu\text{g/L}$)	Origin of Cleanup Level
Vinyl chloride	Groundwater	0.025	EPA Human Health, 2004
Arsenic		5	Background
Manganese		2,240	Method B Formula Value
Vinyl chloride	Surface Water	0.025	EPA Human Health, 2004
Arsenic		5	Background

¹ As referenced in Section 5.3 in the June 2011 Cleanup Action Plan.

The groundwater, surface water and LFG monitoring networks specified in the final CAP are as follows:

- Groundwater: One (1) upgradient monitoring well (MW-5) and five (5) downgradient monitoring wells (MW-6, MW-7, MW-12I, MW-13D and MW-14).
- Surface Water: Four (4) monitoring stations (SW-1, SW-4, SW-6 and SW-7).
- Landfill Gas: Twenty-one (21) LFG extraction well/trench ports, two (2) blower/flare ports, and seven (7) perimeter LFG probes (GP-1 through GP-7, with GP-2 being a triple completion).

Under the final CAP, the following water quality parameters are included in the quarterly analysis for both groundwater and surface water: arsenic, manganese, chloride, ammonia, nitrate, nitrite, bicarbonate, carbonate, alkalinity, sulfate, TOC, orthophosphate, and vinyl chloride (by SIM). A full EPA method 8260 scan for VOCs is also conducted annually. Quarterly LFG field measurements continue to include methane gas, oxygen gas, and carbon dioxide gas (by percent volume), as well as gas pressure and gas temperature.

3.0 2014 GROUNDWATER AND SURFACE WATER MONITORING

Water quality monitoring for groundwater and surface water was conducted at the Hansville Landfill Site by SCS on January 16th, April 17th, July 17th and 29th, and October 8th and 9th, 2014. Dual sampling crews were utilized during the first two calendar quarters, which permitted the water quality monitoring activities to be completed during the course of a single field day. During the second half of 2014, water quality monitoring was completed by a single field sampler over a two day period.

Consistent with the procedures detailed in the Compliance Monitoring Plan (SCS 2011), six groundwater monitoring wells (MW-5, MW-6, MW-7, MW-12I, MW-13D, and MW-14) were purged and sampled utilizing low-flow/low-volume collection techniques using dedicated Grundfos submersible electric pumps. Prior to initiating purging activities, an electronic water level meter was deployed to record depth to water measurements at each well location. Stabilization during purging and sampling was documented through field measurement of pH, specific conductivity, dissolved oxygen, oxidation-reduction potential/redox (Eh) and temperature. Samples tested for dissolved metals were field-filtered through a 0.45-micron filter. A field duplicate was collected during each monitoring event.

Surface water samples (SW-1, SW-4, SW-6 and SW-7) were collected directly from the surface flow into laboratory-provided containers. Samples to be tested for dissolved metals were field-filtered through a 0.45-micron filter. Surface water samples were tested in the field for pH, specific conductivity, dissolved oxygen, oxidation-reduction potential/redox (Eh) and temperature. During July 2014, surface water station SW-7 had to be relocated approximately 1,200 feet downslope of its original location due to unstable slopes and downed woody debris restricting safe access. A request to permanently relocate the SW-7 monitoring station to a safer section within the drainage was approved by Ecology and the KPHD in August. The new SW7 sampling location is shown on Figure 2.

All water quality samples were submitted to TestAmerica, Inc. (Denver, Colorado) for chemical analysis, except for low-level dissolved arsenic, which were sent to Analytical Resources, Inc. in Tukwila, Washington. Groundwater and surface water samples collected during the 2014 quarterly monitoring events were analyzed for the CAP-defined parameter suite previously detailed in Section 2.4. The full suite of VOCs was analyzed as part of the January 2014 quarterly event. Analytical results for the fourth quarter 2014 are tabulated in Appendix B. Summary data tables for the three preceding 2014 monitoring quarters, which have been previously reported, are attached in Appendix C.

A quality assurance/quality control (QA/QC) evaluation of the laboratory data was conducted for each quarterly event. The QA/QC evaluation included evaluating data for completeness, and reviewing the data package for holding times, method blanks, trip blanks, laboratory control samples, laboratory duplicates, and matrix spike/matrix spike duplicates. With the exception of a holding time delay noted for the third quarter nitrate, nitrite, and orthophosphate samples, no significant data quality issues were identified for the 2014 analytical data set. Due to an express shipping delay, the laboratory ran these third quarter analytes slightly outside their recommended

48 hour holding time. Where appropriate, qualifiers were added to the reported results, as noted on each data table.

Standard analytical protocols were followed in the analysis of the samples, and laboratory quality control samples analyzed in conjunction with the samples in this project remained within established control limits. Limitations are stated and clearly identified in the report where applicable. Based on this review, all the 2014 analytical data were found to be acceptable as reported by the laboratory for the intended use in this project.

3.1 WATER QUALITY RESULTS

3.1.1 Groundwater Elevations

Depth to groundwater measurements and calculated water table elevations for the fourth quarter 2014 monitoring event are presented in Table 1 (Appendix B). A potentiometric surface map illustrating groundwater flow across the Site on October 8-9th, 2014 is presented as Figure 4 (Appendix B). Tabulated groundwater data and groundwater contour maps previously reported for the first three quarters of the 2014 monitoring year are attached in Appendix C.

Water table elevations measured over the current reporting period remained generally stable, ranging between 236.42 feet msl (MW-12I in October) to 266.90 feet msl (MW-5 in January). The annual range of water table elevations recorded during 2014 are generally consistent with the past several year's monitoring results (SCS 2011 through 2013 and Parametrix 2010), and continue to indicate that groundwater in the upper aquifer flows to the west and southwest and discharges to the headwaters of creeks downgradient of the landfill.

3.1.2 Groundwater Quality

Chemicals of Concerns

Downgradient well MW-14 was the only location where arsenic concentrations were reported above this parameter's 0.005 mg/L site-specific groundwater cleanup level during the 2014 compliance period. The reported concentrations ranged between 0.0151 mg/L (in January) and 0.0246 mg/L (in October). Low, but detectable, levels of arsenic (ranging from 0.00087 mg/L at MW-7 in October to 0.00356 mg/L at MW-13D in July) were consistently reported during all four quarters in the remaining groundwater wells. Time-series diagrams for arsenic in groundwater are provided in Appendix D.

During 2014, MW-14 remained the only monitoring well where manganese routinely exceeded its 2.24 mg/L site-specific groundwater cleanup level. The reported exceedances ranged between 2.5 mg/L (in January and April) to 2.8 mg/L (in October). The July 2014 manganese result (2.2 mg/L) remained slightly below the cleanup level. As noted for previous monitoring years, the highest manganese concentrations were generally observed in those wells (MW-6 and MW-14) situated immediately downgradient of the solid waste landfill.

Vinyl chloride exceeded its 0.025 µg/L site-specific groundwater cleanup level in three wells during the 2014 reporting period. These exceedances were detected in MW-6 (ranging from 0.19 µg/L in October to 0.51 µg/L in January), MW-12I (ranging from 0.089 µg/L in April to 0.28

µg/L in July) and MW-14 (ranging from 0.14 µg/L in October to 0.21 µg/L in April). On average, vinyl chloride concentrations were lower in October than during the three preceding quarters. A full EPA 8260 analysis conducted during the January 2014 event reported sporadic, low-level detections of four additional VOCs, including 1,1-dichloroethane, ethyl ether, 1,1-dichloroethene (total), and cis-1,2-dichloroethene in the groundwater samples. However, none of these latter VOC detections approached their respective groundwater protection standards. Similar low levels of these same four VOCs were reported during the full EPA 8260 scan conducted in January 2013. Time-series diagrams for vinyl chloride in groundwater are also provided in Appendix D.

The largest number of parameter exceedances (arsenic, manganese and vinyl chloride) reported at the Hansville Landfill during 2014 continue to be associated with groundwater well MW-14, which is situated on the downgradient (southwest) edge of the solid waste landfill. As noted during previous monitoring years, concentrations of site COCs generally decrease with increasing distance from the landfill.

Geochemical Parameters Indicative of Natural Attenuation

The final CAP identified two field (dissolved oxygen and redox) and three laboratory (sulfate, orthophosphate, and TOC) groundwater analytes as geochemical indicator parameters to be tracked under the site remedy to monitor natural attenuation processes at the Hansville Landfill Site. Low dissolved oxygen levels, low or negative redox, and low sulfate concentrations are typically associated with the reducing/anoxic groundwater conditions that are commonly encountered immediately beneath and downgradient of solid waste landfills. Elevated orthophosphate levels are often associated with septic wastes leakage, and may result in excessive nutrient loading if discharged to surface waters. Decay of organic materials (such as decomposing refuse) can elevate TOC in groundwater beneath and downgradient of a landfill.

Reducing groundwater conditions were typically observed during 2014 in downgradient wells MW-6, MW-13D and MW-14. These wells generally reported the lowest dissolved oxygen (0.10 to 0.98 mg/L) and redox (-50 to 288 mV) levels. It should be noted, however, that anomalously elevated redox measurements reported at several downgradient wells during the July and October events are suspected to have been related to a field meter malfunction. The most oxidized groundwater conditions were noted in upgradient well MW-5, and to a lesser extent in well MW-7 (which is the most cross-gradient well in the monitoring network).

As noted during past monitoring years, sulfate and TOC levels remained generally low throughout 2014, with sulfate concentrations ranging from 3.5 mg/L (MW-7 in October) to 26 mg/L (MW-6 in July) and TOC concentrations ranging from < 1 mg/L (MW-6 in January and April, and MW-5 and 13D throughout the year) to 2.9 mg/L (MW-12I in July). Also, similar to previous years, orthophosphate was not detected in any of the groundwater (or surface water) samples analyzed during the 2014 monitoring period.

The geochemical indicator parameter results reported during 2014 continue to suggest that reductive groundwater conditions occur immediately beneath and downgradient of the Hansville landfill. It should also be noted that landfill leachate indicator parameter results, showing

relatively low, but higher than background, levels of ammonia, chloride and nitrate/nitrite, support the conclusion that the landfill continues to locally affect groundwater quality.

3.1.3 Surface Water Quality

None of the surface water samples analyzed during the 2014 monitoring period reported any of the Hansville Landfill COCs at levels in excess of their site-specific cleanup levels. VOCs, including vinyl chloride, were not detected in any of the surface water samples analyzed during the reporting year.

Low, but detectable concentrations of arsenic and manganese were consistently reported at the majority of the surface water monitoring stations during the monitoring year. Arsenic concentrations in surface water ranged between 0.00083 mg/L (SW-1 in July) to 0.00246 mg/L (SW-6 in October). Manganese concentrations ranged between < 0.001 mg/L (SW-1 in April and July) to 0.067 mg/L (SW-6 in October).

As reported for previous monitoring years, surface water stations SW-4 and SW-6, which are situated immediately west (downgradient) of the landfill, generally report the highest levels of site COCs and related landfill indicator parameters. However, the levels of arsenic and vinyl chloride observed at these locations during 2014 remain substantially reduced from those initially reported at the Site. Similarly, levels of chloride (ranging from 3.2 mg/L [SW-6 and SW-7 in April] to 18 mg/L [SW-4 in July]), sulfate (ranging from 6.4 mg/L [SW-6 in April] to 28 mg/L [SW-4 in July]), TOC (ranging from 1.5 mg/L [SW-1 in October] to 24 mg/L [SW-6 in January]), and ammonia (< 0.030 mg/L at all locations, except for 0.037 mg/L detected at SW-1 in April) at these locations have also declined over the same period. In addition, orthophosphate was not detected in any of the surface water monitoring locations during 2014.

3.2 STATISTICAL EVALUATION

Consistent with Appendix D of the final Hansville Landfill CAP, groundwater data reported for the 2014 monitoring period were statistically evaluated for selected site COCs. Vinyl chloride and arsenic groundwater results that exceeded their respective site-specific cleanup standards during 2014 were evaluated through a statistical trend analysis and a three-year projection of the calculated trendlines. In addition, the statistical mean and the upper and lower confidence limits (UCL and LCL) were calculated for all of the vinyl chloride and arsenic data obtained over the reporting period.

The statistical analysis was performed using AquaChem (ver. 2012.1) software and curve-fitting modules of Microsoft Excel (ver. 2010). Summary statistics, including calculated means, Mann-Kendall/Sens Slope Test trends, and UCL/LCL results are provided in Table D-1 (Appendix D). The data set used to run the Mann-Kendall/Sens Slope tests is presented on Table B-2. Time-series charts for arsenic and vinyl chloride, including trend projections where appropriate, are also provided in Appendix D.

3.2.1 Statistical Trend Analysis and Time-Series Plots

Three downgradient groundwater monitoring wells (MW-6, MW-12I, and MW-14) reported vinyl chloride concentrations during the 2014 reporting period that exceeded the 0.025 µg/L site-specific cleanup standard. Downgradient well MW-14 also continued to report arsenic concentrations in excess of the 0.005 mg/L site-specific arsenic cleanup standard.

Mann-Kendall tests performed for these wells generated negative values (indicative of a possible decreasing trend) for both arsenic and vinyl chloride in MW-14. Although a statistically significant negative Mann-Kendall trend was calculated for vinyl chloride in this well, a decreasing trend could not be confirmed for arsenic in MW-14. Downgradient wells MW-6 and MW-12I did not report any statistically significant Mann-Kendall trends for vinyl chloride.

As shown on Table D-1, follow-up Sens Slope tests for these same wells confirmed a statistically significant decreasing trend in vinyl chloride levels in MW-12I. However, statistically significant Sens Slope concentration trends (either increasing or decreasing) were not reported for either vinyl chloride or arsenic in any of the remaining wells.

Vinyl chloride and arsenic data reported since January 2007 are plotted versus time (time series graphs) for all the remaining groundwater wells monitored during 2014 (Appendix D).

3.2.2 Trend Projections

Vinyl chloride concentration trends in downgradient wells MW-6, MW-12I, and MW-14, and arsenic concentration trends in downgradient well MW-14, were projected through 2017 (a three-year projection) to evaluate the convergence of these COCs towards their respective site-specific cleanup levels. An exponential decay/least-squares regression curve has been overlain on the time-series charts for these wells (Appendix D).

The vinyl chloride trendlines for MW-6, MW-12I, and MW-14 all continue to display a decreasing slope. Similar to previous reporting years, the 2014 attenuation curve projections appear to predict a slightly more rapid reduction in vinyl chloride concentrations in wells MW-12I and MW-14, than that forecast for well MW-6. The calculated attenuation curve for arsenic in MW-14 also continues to display a pronounced decreasing slope.

3.2.3 Calculation of Upper and Lower Confidence Limits

Employing the statistical procedures and assumptions documented in Appendix D of the final CAP, the AquaChem software was used to calculate the mean and the 95% normal confidence UCL and LCL for the 2014 vinyl chloride and arsenic concentrations in the groundwater monitoring wells in accordance with ASTM D7048-04. The calculated mean, UCL, and LCL for these COCs were then compared to the site specific cleanup levels (0.025 µg/L and 0.005 mg/L for vinyl chloride and arsenic, respectively) to determine the position of the UCL/LCL relative to the cleanup levels (above or below) and confirm whether the confidence limits are still converging and approaching the cleanup level.

As summarized in Table D-1, the calculated means for the 2014 vinyl chloride results in downgradient wells MW-6, MW-12I, and MW-14 (which were 0.318 µg/L, 0.205 µg/L and 0.168 µg/L, respectively) exceeded the 0.025 µg/L site specific cleanup level. The calculated UCLs and LCLs for vinyl chloride in these same three groundwater monitoring wells also continue to exceed this parameter's site specific cleanup level. UCL/LCL values could not be calculated for vinyl chloride in MW-5, MW-7 or MW-13D for 2014 because insufficient detections (one or less) were reported in these wells during the current reporting period. The latter detections remained well below the 0.025 µg/L cleanup level.

The calculated mean, UCL, and LCL for arsenic in MW-14 (0.01783 mg/L, 0.02316 mg/L and 0.01250 mg/L, respectively) all exceeded the parameter's 0.005 mg/L site specific cleanup level. However, none of the UCL/LCL values calculated for arsenic in the remaining groundwater monitoring wells (MW-5, MW-6, MW-7, MW-12I and MW-13D) exceeded the 0.005 mg/L cleanup level.

4.0 2014 LANDFILL GAS MONITORING

During 2014, the LFG collection system, including the interior wells and trenches and the blower/flare facility, were monitored on a quarterly basis. Performance parameters include methane, oxygen, carbon dioxide, static pressure, and temperature. Operational checks of the LFG system, and system tuning as required, were also conducted on an approximately monthly schedule. The LFG collection system operated normally throughout the reporting year.

Improvements to the LFG collection system, including the installation of a new pair of high efficiency blowers, were completed during 2013. Additional upgrades were completed during December 2014 at five LFG extraction wellheads (R-3, R-6, R11, R-12 and T-7) which included the installation of improved orifice plates and sampling ports. The wellhead upgrades are intended to allow for better flow control and system monitoring at these individual extraction wells. The new wellheads will enable the more precise tuning of the well field at these locations with the goal of safely enhancing the removal of LFG and associated VOCs, including vinyl chloride.

LFG probes were also monitored on a quarterly schedule for methane, oxygen, carbon dioxide, and static pressure. The monitoring instruments were calibrated prior to monitoring according to manufacturer recommendations. A zero check against ambient (atmospheric) conditions was performed on each instrument prior to use. Given the inherit sensitivity of the GEM-2000 portable multi-gas analyzer, the detection limit for field measurements of methane can range between 0.3 to 0.5 percent by volume.

4.1 GAS MONITORING RESULTS

Landfill gas monitoring data for the fourth quarter 2014 are presented in Table 4 (Appendix B). LFG monitoring data tables that were previously reported during the preceding 2014 quarters are also attached in Appendix C.

Over the first three quarters of 2014, the LFG blowers operated using adjusted air flows that ranged between 39 and 41 standard cubic feet per minute (scfm). In mid-September, the flow control valves on the majority of the LFG extraction wells were fully opened, and the adjusted air flow at the blowers was increased to rates as high as 257 scfm. However, the air flow was subsequently reduced to 170 scfm during the fourth quarter to reduce the risk of overdraining the extraction wells and possibly creating aerobic conditions that could promote subsurface combustion. After wellhead upgrades (see preceding section) were completed in December, the extraction well valves were tightened, and the adjusted air flow at the blower was further reduced to 85 scfm. Over the entire 2014 reporting period, the adjusted air flow measured through the system ranged between 39 and 257 scfm.

During the fourth quarter of 2014, methane concentrations measured within the active landfill extraction system ranged between 0.0 and 20.3 methane (by percent volume). A similar range of methane concentrations were reported in the active extraction system during preceding 2014 quarters. LFG temperatures measured within the extraction well field during 2014 ranged

between 26 and 73 degrees $^{\circ}$ F. These temperatures are typical for LFG generated at older solid waste landfills.

The regulatory limit for LFG probes stated in WAC 173-304-460 is 5 percent methane by volume (the lower explosive limit [LEL]) at the site boundary. During 2014, detectable methane concentrations were not reported above the equipment detection limits in any of the perimeter gas probes. Over the 2014 reporting year, oxygen concentrations in the perimeter probes ranged between 13.7 and 20.9 percent volume, with most measurements remaining near ambient conditions. Carbon dioxide levels measured during the reporting period ranged between 0.0 and 5.6 percent volume.

The 2014 LFG monitoring results continue to indicate that the site remains in compliance with the subsurface methane threshold limits at the property boundary. These data also suggest that degraded LFG remains present in the soils immediately beneath and surrounding the solid waste disposal areas. Overall, the LFG extraction and monitoring systems at the Hansville Landfill operated within design parameters during the 2014 reporting period.

Appendix C

Summary of Previous Quarter Monitoring Results (Q3, Q2 and Q1 2014)

This page intentionally blank.

**Q3 - JULY 2014 SUMMARY TABLES
& GROUNDWATER FLOW MAP**

Table A-1. Water Level Elevations, Third Quarter 2014 Monitoring Event
Hansville Landfill, Kitsap County, Washington, July 29, 2014

Location ID	Elevations (ft-msl)		Screen Elevation (ft-msl)		Depth to Water (feet)	Water Level Elevation (ft-msl)
	Ground	PVC	Top	Bottom		
MW-5	363.7	366.9	244	234	102.13	264.77
MW-6	332.0	332.7	260	245	75.80	256.90
MW-7	344.3	346.0	259	244	86.50	259.50
MW-12I	245.6	248.1	217	207	10.92	237.18
MW-13D	258.1	260.4	205	195	12.25	248.15
MW-14	338.6	341.1	262	247	84.10	257.00

PVC: PVC wellhead casing measuring point elevation.

ft-msl: Elevation in feet above mean sea level.

Table A-2. Groundwater Quality Data, Third Quarter 2014 Monitoring Event
Hansville Landfill, Kitsap County, Washington, July 29, 2014

Parameter	Site Cleanup Level (SCL) ¹	MW-05	MW-06	MW-06 DUP	MW-07	MW-12I	MW-13D	MW-14	Trip Blank

Vinyl chloride	0.025	0.020	U	0.35	0.35	0.020	U	0.28	0.020
							U	0.16	0.020
							U	0.16	U

¹ SCLs defined in August 2011 consent decree/cleanup action plan.

- Not Tested.

Shaded results exceed site cleanup levels.

DUP The MW-6 DUP identifier is blind duplicate MW-20DD.

U Compound not detected at reporting limit.

NF Field meter probe for pH failed, probe would not calibrate.

Table A-3. Surface Water Quality Data, Third Quarter 2014 Monitoring Event
Hansville Landfill, Kitsap County, Washington, July 17, 2014

Parameter	Site Cleanup Level (SCL) ¹	SW-1	SW-4	SW-6	SW-7	Trip Blank

**Q2 - APRIL 2014 SUMMARY TABLES
& GROUNDWATER FLOW MAP**

Table A-1. Water Level Elevations, Second Quarter 2014 Monitoring Event
Hansville Landfill, Kitsap County, Washington, April 17, 2014

Location ID	Elevations (ft-msl)		Screen Elevation (ft-msl)		Depth to Water (feet)	Water Level Elevation (ft-msl)
	Ground	PVC	Top	Bottom		
MW-5	363.7	366.9	244	234	NM	--
MW-6	332.0	332.7	260	245	75.23	257.47
MW-7	344.3	346.0	259	244	86.13	259.87
MW-12I	245.6	248.1	217	207	10.35	237.75
MW-13D	258.1	260.4	205	195	11.62	248.78
MW-14	338.6	341.1	262	247	83.88	257.22

PVC: PVC wellhead casting measuring point elevation.

ft-msl: Elevation in feet above mean sea level.

NM Depth to water in MW-5 could not be measured due to an obstruction within the well casing that could not be cleared by the water level transducer.

Footnotes:

N = 4 (Mean, LCL, UCL); 16 (Mann-Kendall/Sen's Test)

Mean, LCL and UCL at 95%

N/A = Not applicable, data are all non-detect.

NDs set at 1/2 the MDL

Probability % is the Mann-Kendall p-value shown in a percentage format (i.e., raw p-value multiplied by factor of 100).

(—) not applicable

95% confidence level

(↑) Test identifies a significant increasing trend

(↓) Test identifies a significant decreasing trend

(N) Test identifies no significant trend

ANALYTICAL REPORT

Job Number: 280-61044-1

Job Description: Hansville Landfill

For:
SCS Engineers
2405 140th Avenue NE
Suite 107
Bellevue, WA 98005-1877

Attention: Mr. Dan Venchiarutti

Approved for release.
Betsy A Sara
Project Manager II
10/23/2014 4:44 PM

Betsy A Sara, Project Manager II
4955 Yarrow Street, Arvada, CO, 80002
(303)736-0189
betsy.sara@testamericainc.com
10/23/2014

cc: Mr. Greg Helland
Mr. Charles Luckie

The test results in this report relate only to the samples in this report and meet all requirements of NELAC, with any exceptions noted. Pursuant to NELAP, this report shall not be reproduced except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Denver Project Manager.

The Lab Certification ID# is 4025.

Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

TestAmerica Laboratories, Inc.

CASE NARRATIVE

Client: SCS Engineers

Project: Hansville Landfill

Report Number: 280-61044-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

Sample Receiving

The samples were received on 10/10/2014; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 4.3° C and 4.6° C.

Holding Times

All holding times were within established control limits.

Method Blanks

All Method Blanks were within established control limits.

Laboratory Control Samples (LCS)

All Laboratory Control Samples were within established control limits.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

Sample MW-5 was selected to fulfill the laboratory batch quality control requirements for Method 300.0. Analysis of the laboratory generated MS/MSD for this sample exhibited recoveries of Orthophosphate above the upper control limit indicating the possible presence of a matrix interference.

Sample MW-6 was selected to fulfill the laboratory batch quality control requirements for Method 350.1. Analysis of the laboratory generated MS/MSD for this sample exhibited recoveries of Ammonia above the upper control limit indicating the possible presence of a matrix interference.

All other MS and MSD samples were within established control limits.

General Comments

The analysis for Method 8260C and Method 8260C SIM was performed by TestAmerica Buffalo. Their address and phone number are:
TestAmerica Buffalo
10 Hazelwood Drive, Suite 106
Amherst, NY 14228
716-691-2600

The analysis for Dissolved Arsenic Method 200.8 was performed by ARI. Their address and phone number are:
Analytical Resources, Inc.
4611 S. 134th Place
Tukwila, WA 98168-3240
206-695-6200

RE: Project: Hansville LF
ARI Job No.: ZE42

Dear Betsy:

Please find enclosed the original Chain of Custody (COC) documentation and the final results for the samples from the project referenced above. Analytical Resources, Inc. (ARI) accepted ten water samples on October 10, 2014. The samples were received in good condition. The samples were analyzed for dissolved arsenic as requested.

No analytical complications were noted for these analyses.

Copies of these reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Mark D. Harris
Project Manager
206/695-6210

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: Unless specified by workorder or contract, all water/soil samples submitted to ARI will be discarded or returned, no sooner than 90 days after receipt or 60 days after submission of

Cooler Receipt Form

ARI Client SCS Engineers

COC No(s): _____ NA

Assigned ARI Job No: ZE42

Project Name Hansville LF

Delivered by: Fed-Ex UPS Hand Delivered Other: _____

Tracking No: _____ NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO

Were custody papers included with the cooler? YES NO

Were custody papers properly filled out (ink, signed, etc.) YES NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)

Time: 1155

4.2

If cooler temperature is out of compliance fill out form 00070F

Temp Gun ID#: 90877952

Cooler Accepted by: [Signature] Date: 10/10/14 Time: 1215

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO

What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: _____

Was sufficient ice used (if appropriate)? YES NO

Were all bottles sealed in individual plastic bags? YES NO

Did all bottles arrive in good condition (unbroken)? YES NO

Were all bottle labels complete and legible? YES NO

Did the number of containers listed on COC match with the number of containers received? YES NO

Did all bottle labels and tags agree with custody papers? YES NO

Were all bottles used correct for the requested analyses? YES NO

Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)... YES NO

Were all VOC vials free of air bubbles? YES NO

Was sufficient amount of sample sent in each bottle? YES NO

Date VOC Trip Blank was made at ARI NA YES Date/Time: _____ Time: _____

Was Sample Split by ARI : NA YES Date/Time: _____ Equipment: _____ Split by: _____

Samples Logged by: [Signature] Date: 10-10-14 Time: 1321

Data Reporting Qualifiers

Effective 12/31/13

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is \leq 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

**Analytical Resources,
Incorporated**
Analytical Chemists and
Consultants

- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NR Spiked compound recovery is not reported due to chromatographic interference
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" (**Dioxin/Furan analysis only**)
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference
- X Analyte signal includes interference from polychlorinated diphenyl ethers. (**Dioxin/Furan analysis only**)
- Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. (**Dioxin/Furan analysis only**)

**Analytical Resources,
Incorporated**
Analytical Chemists and
Consultants

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

cc: Mr. Greg Helland
Mr. Charles Luckie

The test results in this report relate only to the samples in this report and meet all requirements of NELAC, with any exceptions noted. Pursuant to NELAP, this report shall not be reproduced except in full, without the written approval of the laboratory. All questions regarding this report should be directed to the TestAmerica Denver Project Manager.

The Lab Certification ID# is 4025.

Reporting limits are adjusted for sample size used, dilutions and moisture content if applicable.

TestAmerica Laboratories, Inc.

CASE NARRATIVE

Client: SCS Engineers

Project: Hansville Landfill

Report Number: 280-60958-1

With the exceptions noted as flags or footnotes, standard analytical protocols were followed in the analysis of the samples and no problems were encountered or anomalies observed. In addition all laboratory quality control samples were within established control limits, with any exceptions noted below. Each sample was analyzed to achieve the lowest possible reporting limit within the constraints of the method. In some cases, due to interference or analytes present at high concentrations, samples were diluted. For diluted samples, the reporting limits are adjusted relative to the dilution required.

Calculations are performed before rounding to avoid round-off errors in calculated results.

All holding times were met and proper preservation noted for the methods performed on these samples, unless otherwise detailed in the individual sections below.

Sample Receiving

The samples were received on 10/09/2014; the samples arrived in good condition, properly preserved and on ice. The temperatures of the coolers at receipt were 2.1° C and 5.1° C.

Holding Times

Due to a laboratory error, the trip blank sample was analyzed for Method 8260C SIM one day outside of the 14-day holding time.

All other holding times were within established control limits.

Method Blanks

All Method Blanks were within established control limits.

Laboratory Control Samples (LCS)

All Laboratory Control Samples were within established control limits.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD)

Sample SW-1 was selected to fulfill the laboratory batch quality control requirements for Method 350.1. Analysis of the laboratory generated MS/MSD for this sample exhibited recoveries of Ammonia above the upper control limit indicating the possible presence of a matrix interference.

All other MS and MSD samples were within established control limits.

General Comments

The analysis for Method 8260C SIM was performed by TestAmerica Buffalo. Their address and phone number are:
TestAmerica Buffalo
10 Hazelwood Drive, Suite 106
Amherst, NY 14228
716-691-2600

The analysis for Dissolved Arsenic Method 200.8 was performed by ARI. Their address and phone number are:
Analytical Resources, Inc.
4611 S. 134th Place
Tukwila, WA 98168-3240
206-695-6200

RE: Project: Hansville LF
ARI Job No.: ZE42

Dear Betsy:

Please find enclosed the original Chain of Custody (COC) documentation and the final results for the samples from the project referenced above. Analytical Resources, Inc. (ARI) accepted ten water samples on October 10, 2014. The samples were received in good condition. The samples were analyzed for dissolved arsenic as requested.

No analytical complications were noted for these analyses.

Copies of these reports and all associated raw data will be kept on file at ARI. If you have any questions or require additional information, please contact me at your convenience.

Sincerely,

ANALYTICAL RESOURCES, INC.

Mark D. Harris
Project Manager
206/695-6210

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the Invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, notwithstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: Unless specified by workorder or contract, all water/soil samples submitted to ARI will be discarded or returned, no sooner than 90 days after receipt or 60 days after submission of

Cooler Receipt Form

ARI Client SCS Engineers

COC No(s): _____ NA

Assigned ARI Job No: ZE42

Project Name Hansville LF

Delivered by: Fed-Ex UPS Hand Delivered Other: _____

Tracking No: _____ NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of to cooler? YES NO

Were custody papers included with the cooler? YES NO

Were custody papers properly filled out (ink, signed, etc.) YES NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)

Time: 1155

4.2

If cooler temperature is out of compliance fill out form 00070F

Temp Gun ID#: 90877952

Cooler Accepted by: [Signature] Date: 10/10/14 Time: 1215

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler? YES NO

What kind of packing material was used? ... Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other: _____

Was sufficient ice used (if appropriate)? YES NO

Were all bottles sealed in individual plastic bags? YES NO

Did all bottles arrive in good condition (unbroken)? YES NO

Were all bottle labels complete and legible? YES NO

Did the number of containers listed on COC match with the number of containers received? YES NO

Did all bottle labels and tags agree with custody papers? YES NO

Were all bottles used correct for the requested analyses? YES NO

Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)... YES NO

Were all VOC vials free of air bubbles? YES NO

Was sufficient amount of sample sent in each bottle? YES NO

Date VOC Trip Blank was made at ARI NA YES Date/Time: _____ Time: _____

Was Sample Split by ARI : NA YES Date/Time: _____ Equipment: _____ Split by: _____

Data Reporting Qualifiers

Effective 12/31/13

Inorganic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Duplicate RPD is not within established control limits
- B Reported value is less than the CRDL but \geq the Reporting Limit
- N Matrix Spike recovery not within established control limits
- NA Not Applicable, analyte not spiked
- H The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
- L Analyte concentration is \leq 5 times the Reporting Limit and the replicate control limit defaults to ± 1 RL instead of the normal 20% RPD

Organic Data

- U Indicates that the target analyte was not detected at the reported concentration
- * Flagged value is not within established control limits
- B Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
- J Estimated concentration when the value is less than ARI's established reporting limits
- D The spiked compound was not detected due to sample extract dilution
- E Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.

**Analytical Resources,
Incorporated**
Analytical Chemists and
Consultants

- Q Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).
- S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte
- NA The flagged analyte was not analyzed for
- NR Spiked compound recovery is not reported due to chromatographic interference
- NS The flagged analyte was not spiked into the sample
- M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses
- N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"
- Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.
- EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" (**Dioxin/Furan analysis only**)
- C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column
- P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference
- X Analyte signal includes interference from polychlorinated diphenyl ethers. (**Dioxin/Furan analysis only**)
- Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. (**Dioxin/Furan analysis only**)

**Analytical Resources,
Incorporated**
Analytical Chemists and
Consultants

Geotechnical Data

- A The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
- F Samples were frozen prior to particle size determination
- SM Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
- SS Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
- W Weight of sample in some pipette aliquots was below the level required for accurate weighting

RE: 2014 1st QUARTER HANSVILLE LANDFILL INSPECTION

Dear Ms. McKinnon:

The Kitsap Public Health District (Health District) is writing to relay the results of the 1st quarter inspection of 2014 at the Hansville Landfill. Thank you for meeting me at the facility. It was a pleasure to see you and inspect the Hansville Landfill.

The inspection occurred on February 6, 2014. The facility was in compliance with state and local solid waste regulations.

The following items were noted or discussed during the inspection:

- We discussed the draft permit that is in process with the Health District.
- We noted that the landfill was mowed in the fall.
- The landfill was relatively dry because of the low rainfall totals.
- The next inspection is scheduled for April of 2014.

If you have any questions or comments please feel free to contact me at (360) 337-5605.

Sincerely,

A handwritten signature in black ink, appearing to read "Grant A. Holdcroft".

RE: 2014 2nd QUARTER HANSVILLE LANDFILL INSPECTION

Dear Ms. McKinnon:

The Kitsap Public Health District (Health District) is writing to relay the results of the 2nd quarter inspection of 2014 at the Hansville Landfill. Thank you for meeting me at the facility. It was a pleasure to see you and inspect the Hansville Landfill.

The inspection occurred on May 8, 2014. The facility was in compliance with state and local solid waste regulations.

The following items were noted or discussed during the inspection:

- No Inspection Form was filled out during this inspection.
- We discussed the draft permit that is in process with the Health District.
- We briefly discussed the tree cutting going on at the property to the south of the landfill.
- Mowing and Scotch Broom removal is planned for the summer.
- The next inspection is scheduled for August of 2014.

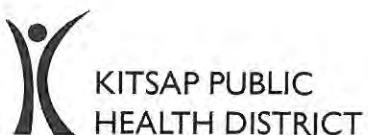

If you have any questions or comments please feel free to contact me at (360) 337-5605.

Sincerely,

A handwritten signature in black ink that reads "Grant A. Holdcroft".

RE: 2014 3rd QUARTER HANSVILLE LANDFILL INSPECTION

Dear Ms. McKinnon:

The Kitsap Public Health District (Health District) is writing to relay the results of the 3rd quarter inspection of 2014 at the Hansville Landfill. Thank you for meeting me at the facility. It was a pleasure to see you and inspect the Hansville Landfill.

The inspection occurred on August 29, 2014. The facility was in compliance with state and local solid waste regulations.

The following items were noted or discussed during the inspection:

- No Inspection Form was filled out during this inspection.
- We briefly discussed the ditch mowing that is in process.
- Mowing of the landfill took place over the summer.
- The next inspection is scheduled for November of 2014.

If you have any questions or comments please feel free to contact me at (360) 337-5605.

Sincerely,

RE: 2013 4th QUARTER HANSVILLE LANDFILL INSPECTION

Dear Ms. McKay-Means:

The Kitsap Public Health District is writing to relay the results of the 4th quarter inspection of 2013. Thank you for meeting me at the facility. As always it is a pleasure to see you and inspect the Hansville Landfill.

The inspection occurred on November 15, 2013. The facility was in compliance with state and local solid waste regulations.

The following items were noted or discussed during the inspection:

- The post closure permit comments have been received at the Health District and are under review. A separate comment letter will be forthcoming.
- The survey of the landfill is still on the list of items to be accomplished.
- We discussed the landfill gas blower system replacement. We looked at the new blowers and took several photos.
- The next inspection is scheduled for February 2014.

If you have any questions or comments please feel free to contact me at (360) 337-5605.

Sincerely,

A handwritten signature in black ink that appears to read "Grant A. Holdcroft".
