Limitation of Use: Leidos' project activities were restricted to collection and analysis of a limited number of environmental samples and visual observations obtained during the physical site visit, and from records made available by Ecology or third parties during the project. In preparing this report, Leidos has relied on verbal and written information provided by secondary sources and interviews, including information provided by the customer. Leidos has made no independent investigations concerning the accuracy or completeness of the information relied upon. Because the project activities consisted of collecting and evaluating a limited supply of information, Leidos may not have identified all potential items of concern and, therefore, Leidos warrants only that the project activities under this contract have been performed within the parameters and scope communicated by Ecology and reflected in the contract. Maps presented in this report were accurate based on the information available to Leidos at the time that the facility inspections were conducted.

King County International Airport (KCIA) is located at 7277 Perimeter Road S. KCIA is a general aviation airport and is owned and operated by King County as a public utility. Approximately 435 acres of the 615 acres site are impervious surfaces covered by buildings and paved areas. The remaining 180 acres are made up of grass and landscape areas (King County 2012).

KCIA has permitted activities related to the KCIA Maintenance Shop and anti-icing of the airport's primary runway and taxiway & aircraft de-icing. The KCIA Maintenance Shop located at the northwest corner of the airport is approximately 1.69 acres. A portion of this area (0.4 acres) drains into the Washington State Department of Transportation (WSDOT) storm drain after passing through an oil water separator. The shop performs fueling of maintenance vehicles, maintenance of grounds equipment, conducts runway/taxiway anti-icing, provides de-icing pads/locations for general aviation, and stores bulk materials and equipment (King County 2012).

A variety of materials are stored at the maintenance facility including: potassium acetate for anti-icing, bulk construction materials, paint, landscaping material, coolant, fuels, oils, and grease. While the majority of the maintenance vehicles and equipment are stored inside buildings, fleet vehicles, large vehicles, and equipment are stored outside. Two 1,000-gallon above-ground fuel storage tanks (unleaded gasoline and diesel) are not covered. The tanks have a seven-gallon overfill containment feature for spill protection during filling operations and are double-lined with a monitoring tube to detect if the primary tank has leaked. Oil trap devices with downturned elbow pipes are placed in downstream catch basins to act as oil water separators (King County 2012).

Some activities such as aircraft testing and painting, aircraft maintenance/storage, aircraft fueling, aircraft de-icing and washing are primarily performed by the tenants along the eastern boundary of the KCIA property. KCIA provides leases to large aircraft companies such as Boeing, Galvin Flying, and Clay Lacy to operate at the airport. Tenants control operations and must comply with any federal, state and local requirements including airport policies, procedures, and maintenance provisions in accordance with lease requirements. All airport and tenant activities have the potential to release petroleum products, such as fuels, oil, and greases, deicing/anti-icing agents, suspended solids, and other chemical contaminants into the storm drain system (King County 2012). A facility map is presented in Figure G-1.

G-1.1 Stormwater Conveyance and Treatment System

The KCIA storm drainage system includes approximately 15 miles of drainage pipes. All of the stormwater drainage system connects to outfalls that discharge to the Lower Duwamish Waterway (LDW).

There are two pumping stations in Drainage Basins 1 and 2, which lift the water and pump it to two outfalls, Slip 4 (Discharge Point 1) and Slip 5 (Discharge Point 2) (Figure G-1). Gravity lines in Drainage Basins 3 and 4 at the southern end of KCIA that discharge to the LDW at Slip 6 (Discharge Point 3) and Discharge Point 4 (Figure G-1). Several off-site stormwater sources discharge into the KCIA drainage system, including The Boeing Company, Museum of Flight and City of Seattle; these convey stormwater into Drainage Basins 3 and 4. Some facilities at the north end of KCIA are connected to a storm system owned by WSDOT, which serves the I-5 freeway (King County 2012).

KCIA collects quarterly stormwater samples at downstream locations of the four major drainage basins at the facility. The discharge points include SP1 (CB-229), SP2 (CB Midfield), SP3 (CB 1060), SP4 (OWS SW), and SPM (CB 1075). KCIA exceeded benchmarks for turbidity at SP2 during the 3rd quarter 2012, triggering a Level One Corrective Action. A 2011 Level Three Corrective Action was being implemented during the 3rd and 4th quarters of 2012, which included repair of stormwater system pipes and installation of a water quality vault. KCIA exceeded benchmarks for copper at SPM during the 2nd and 3rd quarters of 2012, triggering a Level Two Corrective Action. KCIA replaced metalzorb bags and cleaned downgradient oil water separators to address copper exceedances (King County 2013).

G-2 Inspection and Sampling

G-2.1 May 2013 Stormwater Compliance Inspection

On May 30 and 31, 2013, Ecology conducted a stormwater compliance inspection at KCIA. Leidos assisted Ecology with the inspection and sampling of the facility's stormwater conveyance system. The inspection included investigating influent and effluent points at each selected drainage structure, written and photographic documentation, and assessing whether the drainage structure contained sufficient sampleable material. The coordinates of sample locations were measured with a survey-quality global positioning system and plotted on Figure G-2 using geographic information system software. An inspection photographic log and field documentation are presented in Attachments G-1 and G-2, respectively.

The field team inspected the following stormwater conveyance structures at KCIA (Figure G-2): south pump station (IV-SPS), oil water separator 1592 (OWS-1592), catch basin vault 1593 (VT-1593), catch basin 01 (CB-01), drainage ditch 2009 (DD-2009), oil water separator 2009 (OWS-2009), catch basin 229 (CB-229), and catch basin 229a (CB-229a), and unknown catch basin 27 (UNKCB27). Locations CB-229, CB-229a, and UNKCB27 did not contain sufficient material to collect a solids sample. Solids samples were collected from VT-1593, CB-01, DD-2009, and IV-SPS. A water sample was collected from VT-1593. Additional information for each sample location is provided below.

G-2.2 Stormwater Conveyance System Sampling

Ecology collected one water sample and four solids samples from the stormwater conveyance system at KCIA. Laboratory analyses for the water sample are listed on Table G-1. Analytical data for the water sample are presented in Tables G-2 through G-5. Laboratory analyses for the solids sample are listed on Table G-6. Analytical data are presented in Tables G-7 and G-8. Chain of custody forms and the laboratory reports are provided as Attachments G-3 and G-4, respectively.

G-2.2.1 Water Sample

Water sample KC-VT-1593-20130530-W was collected from VT-1593 located on the downstream portion of Drainage Basin 3 (Figure G-2, Attachment G-1). Stormwater enters on the upstream side of a weir at the center of the vault and is conveyed through VT-1593 to OWS-1592. After passing through OWS-1592, stormwater reenters VT-1593 on the downstream side of the weir and is conveyed west towards the LDW. The sample is representative of stormwater in Drainage Basin 3. Low flow was observed in the vault during sample collection. KCIA did not receive rainfall in the previous 24-hour period and the discharge was attributed to groundwater infiltration. The water sample was collected on the upstream side of the weir. The sample's turbidity was not measured during sample collection.

G-2.2.2 Solids Samples

Solids sample KC-VT-1593-20130530-S was collected from the upstream side of the weir located in VT-1593 (Figure G-2, Attachment G-1). The top layer of the initial solids grabs

contained primarily reddish-orange organic matter believed to be composed of iron bacteria precipitate. Following the initial grab attempts, an area in the center of the upstream vault was located that consisted of primarily solids. The sample is representative of storm drain solids in Drainage Basin 3.The reddish-orange organic material was not containerized for analysis. The sample consisted of dark brown and black coarse- to fine-grained sand, organic matter, and debris. No odor was detected during sample collection. After multiple solids grabs, sufficient sample volume was obtained for all analyses. Per discussion with Ecology, dioxin/furan analysis was requested for this sample.

Solids sample KC-CB-01-20130530-S was collected from a catch basin located in a grassy area along a fenceline adjacent to the Boeing Military Flight Center (MFC) facility (Figure G-2, Attachment G-1). The location has the potential to receive sheet flow from the Boeing MFC to the west. It was unclear where the catch basin connected to the drainage system at KCIA. The sample was collected from the center and corners of the catch basin. The sample consisted of brown and gray sand, gravel, and cobble. No odor was detected during sample collection. Due to the large grain size of the sample, volatile organic compounds (VOCs) and total petroleum hydrocarbons (TPH) were not selected for analysis. Per discussion with Ecology, dioxins and furans were not selected for analysis. After multiple grab attempts, sufficient sample volume was obtained for all other analyses.

Solids sample KC-DD-2009-20130530-S was collected from drainage ditch DD-2009, which is located upstream of OWS-2009 (Figure G-2, Attachment G-1). The location is at the southwest corner of KCIA adjacent to the Boeing MFC. The location has the potential to receive sheet flow from the Boeing MFC to the west. Ecology requested that a sample be collected from this location to replicate a July 2012 solids sample that contained high concentrations of polychlorinated biphenyls (PCBs). Rocks approximately 4 inches in diameter were removed from the drainage ditch to expose solids below. The sample was collected from undisturbed solids in the ditch and consisted of brown medium- to fine-grained sand, organic matter, and woody debris. No odor was detected during sample collection. Per discussion with Ecology, dioxins/furans, VOCs, and TPH were not selected for analysis. Sufficient sample volume was obtained for all other analyses.

Solids sample KC-IV-SPS-20130531-S was collected from the influent vault of the south pump station. The pump station is located in Drainage Basin 2 and receives stormwater from the southern portion of KCIA (Figure G-2, Attachment G-1). The sample is representative of storm drain solids in Drainage Basin 2.The sample was collected from the upstream side of the pump station and consisted of brown and gray medium- and fine-grained sand, silt, and trace amounts of clay. A moderate hydrogen sulfide odor was detected during sample collection. After multiple solids grabs, sufficient sample volume was obtained for all analyses. Per discussion with Ecology, dioxin/furan analysis was requested for this sample.

G-3 Results

G-3.1 Chemical Analysis

Ecology collected one water sample and four solids samples during the May 2013 stormwater compliance inspection at KCIA. Analytical methods, chemical results and regulatory criteria are presented in Tables G-1 through G-8.

All chemical results were independently validated by EcoChem, Inc. of Seattle, WA. A summary-level, U.S. Environmental Protection Agency (EPA) Stage 2B data validation was performed on all chemistry results; a full-level, EPA Stage 4 data validation was performed on the dioxin/furan results. A compliance-level screening (EPA Stage 2A), including a comparison of detected results to sample concentrations, was performed on the rinse blank samples. Data validation was performed following EPA guidance (EPA 1994, 2008, 2009, 2010). The data validation report is available as Attachment 2 to the draft LDW NPDES Inspection Sampling Support Technical Memorandum (Leidos 2014).

G-3.2 Inspection Results and Permit Compliance Requirements

During the May 2013 inspection, Ecology identified the following compliance issues and requirements (Ecology 2013):

- KCIA must clean up petroleum leaks and spills immediately.
- Drip pains or equivalent containment measures and storm drain catch basin inlet covers must be used during all petroleum transfer operations.
- KCIA must store all liquids, fluids, and petroleum products in proper secondary containment. The facility must keep all containment structure drain valves in the closed position.
- KCIA must develop and implement written procedures for proper handling and disposal of accumulated stormwater from within uncovered containment structures.
- A spill log must be maintained for chemical and petroleum spills.
- KCIA must locate spill kits within 25 feet of all stationary fueling stations, fuel transfer stations, and mobile fueling units.

Results in underline exceed the WA NPDES ISGP Benchmark for that parameter.
Results in **bold** exceed the WA WQC Marine Chronic.
Results in ***bold italics*** exceed the WA WQC Marine Acute.
Results that are shaded gray exceed the NTR HHO criteria.
Exceedance Factors (EFs) are presented for detected concentrations that exceed the WA, NTR, or NR WQC.
The EFs are calculated (result/criterion) and have no regulatory relevance. They provide an indication of concentration relative to the WA, NTR, or NR WQC.

a - Total PCBs and total PCB homologs include only congeners that met identification criteria as required by EPA Method1668B.
b - Estimated total PCBs and estimated total PCB homologs include congeners that were identified
"estimated maximum possible concentration" or EMPC. The EMPC values were qualified by EcoChem as "U" to indicate
the analyte was not detected at an elevated reporting limit that met criteria required by EPA Method1668B. Estimated total PCBs
and estimated total PCB homolog values were qualified as estimated (J) where EMPCs were included in the reported totals.
c - This is a field duplicate of the sample directly preceding it.

Results in **bold** exceed the WA WQC Marine Chronic.
Results in ***bold italics*** exceed the WA WQC Marine Acute.
Results that are shaded gray exceed the NTR HHO criteria.
Exceedance Factors (EFs) are presented for detected concentrations that exceed the WA, NTR, or NR WQC.
The EFs are calculated (result/criterion) and have no regulatory relevance. They provide an
indication of the general magnitude of the concentration relative to the WA, NTR, or NR WQC.

< - not detected

Conveyance Structure Information	
Structure Identification Number: KC-VT-1593	**N←**
Structure Type: Vault	
General Location: Southwestern portion of facility	
Characteristics: 8 feet to bottom of structure Diversion weir	
Pump Capacity (gpm): n/a	
Design Storm: n/a	
Access: Catch basin grate	
Volume Gauge: No	
Sample ID: KC-VT-1593-20130530-W KC-VT-1593-20130530-S	
Drainage Information:	
The vault receives stormwater from the southwest portion of King County International Airport. The vault has a central weir that diverts stormwater northeast to an oil water separator. Stormwater re-enters the vault on the northwest side of the weir prior to discharging to the west. During periods of high flow, a portion stormwater flows over the weir and bypasses the oil water separator. Observed flow was attributed to groundwater infiltrating the storm drain system. Iron bacteria precipitate was observed on top layer of sediment.	**N↑**

Conveyance Structure Information	
Structure Identification Number: KC-CB-01	**N➔**
Structure Type: Catch Basin	
General Location: Southwestern portion of facility	
Characteristics: n/a	
Pump Capacity (gpm): n/a	
Design Storm: n/a	
Access: Open catch basin grate	
Volume Gauge: No	
Sample ID: KC-CB-01-20130530-S	
Drainage Information:	
This catch basin is located in grassy area along the southwestern fence line. The potential for sheet flow from the Boeing facility to the west was observed. Investigation was unable to determine where/if the catch basin connects to the storm drain system at King County International Airport.	**N➔**

Conveyance Structure Information	
Structure Identification Number: KC-DD-2009	**N↑**
Structure Type: Drainage Ditch	
General Location: Southwestern corner of facility	
Characteristics: Open drainage channel	
Pump Capacity (gpm): n/a	
Design Storm: n/a	
Access: Open	
Volume Gauge: No	
Sample ID: KC-DD-2009-20130530-S	
Drainage Information	
KC-DD-2009 drains the southwestern corner of King County International Airport. Stormwater is conveyed from the drainage ditch to an oil water separator prior to discharge to the public storm drain system. The drainage ditch has potential to receive sheet flow from the Boeing facility to the west.	**N←**

Conveyance Structure Information	
Structure Identification Number: KC-IV-SPS	**N➔**
Structure Type: Vault/Pump Station	
General Location: Western portion of facility	
Characteristics: 17 feet to bottom of structure Grated weir	
Pump Capacity (gpm): n/a	
Design Storm: n/a	
Access: Concrete grates	
Volume Gauge: No	
Sample ID: KC-IV-SPS-20130531-S	
Drainage Information	
Stormwater from Drainage Area 2 is conveyed to the vault. Stormwater passes through the grated weir in the vault to the South Pump Station. Stormwater discharges from the pump station to the LDW via Outfall 2. A sample was collected from the influent portion of the vault/pump station.	**N➔**

Client: SAIC	**ARI Job No.:** WR99
Client Project: NPDES Sampling Support	**Client Project No.:** 209977

Case Narrative

1. Three samples were submitted for analysis on May 31, 2013.
2. The samples were submitted for grain size analysis by means of X-ray diffraction using a Sedigraph 5120. The values are calculated using Stokes' Law of sedimentation and Beer's law of extinction.
3. The samples were run in a single batch and one sample from another job was chosen for triplicate analysis.
4. The standard operating procedure calls for the sample to be measured on the #4 (4750 µm) sieve, down to the 1.0 µm particle size with the Sedigraph 5120. If there were no particles measured at these extremes, the data is not included in the report.
5. Organic material does not absorb X-rays, and is not included in the fine portion of the analysis.
6. The data is provided in summary tables and plots.
7. There were no other noted anomalies in the sample or methods on this project.

Data Reporting Qualifiers

Effective 2/14/2011

Inorganic Data

U	Indicates that the target analyte was not detected at the reported concentration
*	Duplicate RPD is not within established control limits
B	Reported value is less than the CRDL but ≥ the Reporting Limit
N	Matrix Spike recovery not within established control limits
NA	Not Applicable, analyte not spiked
H	The natural concentration of the spiked element is so much greater than the concentration spiked that an accurate determination of spike recovery is not possible
L	Analyte concentration is ≤5 times the Reporting Limit and the replicate control limit defaults to ±1 RL instead of the normal 20% RPD

Organic Data

U	Indicates that the target analyte was not detected at the reported concentration
*	Flagged value is not within established control limits
B	Analyte detected in an associated Method Blank at a concentration greater than one-half of ARI's Reporting Limit or 5% of the regulatory limit or 5% of the analyte concentration in the sample.
J	Estimated concentration when the value is less than ARI's established reporting limits
D	The spiked compound was not detected due to sample extract dilution
E	Estimated concentration calculated for an analyte response above the valid instrument calibration range. A dilution is required to obtain an accurate quantification of the analyte.
Q	Indicates a detected analyte with an initial or continuing calibration that does not meet established acceptance criteria (<20%RSD, <20%Drift or minimum RRF).

S Indicates an analyte response that has saturated the detector. The calculated concentration is not valid; a dilution is required to obtain valid quantification of the analyte

NA The flagged analyte was not analyzed for

NR Spiked compound recovery is not reported due to chromatographic interference

NS The flagged analyte was not spiked into the sample

M Estimated value for an analyte detected and confirmed by an analyst but with low spectral match parameters. This flag is used only for GC-MS analyses

M2 The sample contains PCB congeners that do not match any standard Aroclor pattern. The PCBs are identified and quantified as the Aroclor whose pattern most closely matches that of the sample. The reported value is an estimate.

N The analysis indicates the presence of an analyte for which there is presumptive evidence to make a "tentative identification"

Y The analyte is not detected at or above the reported concentration. The reporting limit is raised due to chromatographic interference. The Y flag is equivalent to the U flag with a raised reporting limit.

EMPC Estimated Maximum Possible Concentration (EMPC) defined in EPA Statement of Work DLM02.2 as a value "calculated for 2,3,7,8-substituted isomers for which the quantitation and /or confirmation ion(s) has signal to noise in excess of 2.5, but does not meet identification criteria" **(Dioxin/Furan analysis only)**

C The analyte was positively identified on only one of two chromatographic columns. Chromatographic interference prevented a positive identification on the second column

P The analyte was detected on both chromatographic columns but the quantified values differ by ≥40% RPD with no obvious chromatographic interference

X Analyte signal includes interference from polychlorinated diphenyl ethers. **(Dioxin/Furan analysis only)**

Z Analyte signal includes interference from the sample matrix or perfluorokerosene ions. **(Dioxin/Furan analysis only)**

UB99 : 00022

Geotechnical Data

A	The total of all fines fractions. This flag is used to report total fines when only sieve analysis is requested and balances total grain size with sample weight.
F	Samples were frozen prior to particle size determination
SM	Sample matrix was not appropriate for the requested analysis. This normally refers to samples contaminated with an organic product that interferes with the sieving process and/or moisture content, porosity and saturation calculations
SS	Sample did not contain the proportion of "fines" required to perform the pipette portion of the grain size analysis
W	Weight of sample in some pipette aliquots was below the level required for accurate weighting

(1) Detection Limit (DL), Limit of Detection (LOD) and Limit of Quantitation (LOQ) are defined in ARI SOP 1018S
(2) Control limits calculated using all data from 1/1/12 through 5/31/12.
(3) Relative Percent Difference between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then

$$RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$$

(4) Highlighted control limits (**bold font**) are adjusted from the calculated values to reflect that:
a. ARI does not use control limits < 10 for the lower limit or < 100 for the upper limit or
b. Control limits for analyzes with no separate preparation procedure are adjusted to reflect the minimum uncertainty in the calibration of the instrument allowed by the referenced analytical method.

(1) Detection Limit (DL), Limit of Detection (LOD) & Limit of Quantitation (LOQ) are defined in ARI SOP 1018S.
(2) Highlighted control limits (**bold font**) are adjusted from the calculated values to reflect that ARI does not use control limits < 10 for the lower limit or < 100 for the upper limit.
(3) 30 – 160 are default limits used when there is insufficient data to calculate historic control limits
(4) Acceptance criteria for the relative percent difference (RPD) between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then

$$RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$$

(5) Control Limits calculated usng all data generated between 6/1/12 and 12/31/12

(1) Detection Limit (DL), Limit of Detection (LOD) and Limit of Quantitation (LOQ) as defined in ARI SOP 1018S.
(2) Highlighted control limits (bold font) are adjusted from the calculated values as follows:
a) Highlighted control limits (**bold font**) adjusted to demonstrate that ARI does not use control limits < 10 for the lower limit or < 100 for the upper limit.
b) Control limits for analytes with no separate preparation procedure are adjusted to reflect the minimum uncertainty in the calibration of the instrument allowed by the referenced analytical method.
(3) Acceptance criteria for the relative percent difference (RPD) between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then $RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$

(2) 20 mL sample with 20 mL final volume
(3) 0.2 g sample with 50 mL final volume assuming 100% dry weight. Soil and sediment are reported on a dry weight basis.
(4) Tissue LOQ is 0.005 mg/kg as received (wet weight) based on 1 g sample with 50 mL final volume.
(5) Relative Percent Difference between analytes in replicate analyzes. If C_O and C_D are the concentrations of the original and duplicate respectively then $RPD = \frac{|C_O - C_D|}{\frac{C_O + C_D}{2}} x100$

SPECIAL INSTRUCTIONS: 1. Weigh into beakers-lightly dry with Sodium Sulfate. 2. Transfer to microwave vessel. Note: do not fill vessel more than 2/3rd full. Some samples may require two vessels). 3. Add 1:1 DCM/ACE to the vessels (until solvent is 3" above soil layer after homogenization). 4. Add surr/spike. 5. Microwave on appropriate power setting determined by # of samples. 6. After microwave-rehomogenize while hot then let cool 15 min in cold water. Re-homogenize while cool. 7. Decant 1:1 DCM/ACE into Erlenmeyer flask with sodium sulfate in the bottom and funnel containing pre-deactivated glasswool. 8. Rinse with DCM 9. Microwave a 2nd time using DCM only (until solvent is 3" above soil layer after homogenization). 10. Let cool and decant the solvent then empty the soil into the funnel and rinse with DCM. 11. KD (small ~~or large~~ drying column with pre-deactivated glasswool-Blanks=5g sulfate)) to 5mL at 80- 85°C. 12. GPC Req. 13. (After GPC): KD at 80-85°. 14. TurboVap. 15. Vial in DCM.
