Appendix C

Groundwater, Surface Water, and Freshwater Sediment Quality Data

Appendix C provides groundwater, surface water, and freshwater sediment quality data for the Site. Specific notes for the tables are as follows:

1. Blanks indicate no analysis for a specific constituent.
2. Data qualifiers include the following:

   U Not detected at associated detection limit
   J Estimated concentration
   UJ Not detected; associated detection limit is an estimate
   R Rejected data, as determined during data validation
   S Sum of individual constituent concentrations (e.g., total cPAH and total PCBs)
3. Surface water sample ID suffixes include the month and year of sample collection (e.g., -3-88 sample ID suffix indicates sample collection in March 1988).
4. Field duplicate samples are designated with sample ID suffixes of D or DUP (these suffixes have identical meanings).

Notes:

Blanks indicate no analysis

U: not detected at associated reporting limit concentration

J: estimated concentration

NS: Not sampled in accordance with Ecology agreement for interim sampling dated March 6, 1998

Analyses performed by MultiChem Analytical Services Inc.

Total DNT equals sum of 2,4-DNT and 2,6-DNT concentrations with 1/2 detection limits used for nondetects.

Surface Water and Freshwater Sediment Quality Data

The following appendix material was developed in draft form by Hart Crowser for the 1994 Draft RI (Hart Crowser 1994d). For completeness, it is retained here as it was developed. It includes references to all sampling conducted as specified in the RI/FS Management Plan (Hart Crowser 1992a). As a result, it refers to locations sampled outside the Consent Decree Boundary that will be the subject of additional reports.

Appendix D

Laboratory Physical Soils Testing

This appendix material was developed in draft form by Hart Crowser for the 1994 Draft RI (Hart Crowser 1994d). For completeness, it is retained here as it was developed. It includes references to all sampling conducted as specified in the RI/FS Management Plan (Hart Crowser 1992a). As a result, it refers to locations sampled outside the Consent Decree Boundary that will be the subject of additional reports.

The Hart Crowser soils laboratory conducted mechanical (sieve) and hydrometer analyses to provide grain size distributions for aquifer and aquitard materials, respectively. In addition, flexible-wall permeability tests were conducted to estimate vertical hydraulic conductivity of the aquitard material.

Mechanical Analyses. The Hart Crowser soils laboratory conducted mechanical grain size analyses using standard sieve sizes in accordance with ASTM D 422. The wet sieve analyses were performed to determine the size distribution greater than the No. 200 mesh sieve. Figure 1 presents the classification system used for the grain size analyses. The results of the tests are presented as curves in Figures 2 through 12, plotting percent finer against grain size.

Hydrometer Analyses. Samples of the Kitsap Aquitard material were analyzed using the hydrometer method, or a combined analysis (mechanical plus hydrometer), to determine the size distribution smaller than the No. 200 mesh sieve (i.e., determine percent silt and percent clay). The hydrometer testing was conducted in accordance with ASTM D 422. The results of the tests are presented as curves in Figures 2 and 4.

Laboratory Vertical Hydraulic Conductivity Testing. Testing of vertical hydraulic conductivity was conducted on two undisturbed samples of the Kitsap Aquitard material.

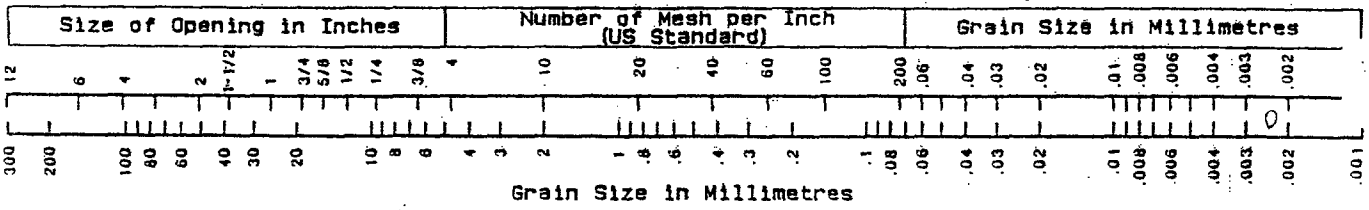
The tests were performed in a triaxial cell using "flexible wall" permeameter techniques, which allowed application of confining stresses approximately equal to the in situ effective overburden stresses. The sample was oriented in its stratigraphically correct position (up versus down) and flow was directed vertically downward through the sample using falling head techniques. The tests were run until steady state conditions were established. The results of the vertical hydraulic conductivity testing are presented in Table 1.

Table 1
Summary of Laboratory Vertical Hydraulic Conductivity (K) Results for Kitsap Aquitard Samples

Sample No.	Sample Description	Estimated Vertical K in cm/sec
MW-20, S-24E	Slightly clayey, sandy SILT	8×10^{-7}
MW-23, S-25A	Very sandy SILT with trace peat and sand partings	1×10^{-7}
	Geometric Mean:	3×10^{-7} cm/sec

Unified Soil Classification (USC) System

Soil Grain Size



COBBLES	GRAVEL	SAND	SILT and CLAY
Coarse-Grained Soils			Fine-Grained Soils

Coarse-Grained Soils

G W	G P	G M	G C	S W	S P	S M	S C
Clean GRAVEL <5% fines		GRAVEL with >12% fines		Clean SAND <5% fines		SAND with >12% fines	
GRAVEL >50% coarse fraction larger than No. 4				SAND >50% coarse fraction smaller than No. 4			
Coarse-Grained Soils >50% larger than No. 200 sieve							

G W and S W $\left(\frac{D_{60}}{D_{10}}\right) > 4$ for G W, > 6 for S W & $1 \leq \left(\frac{(D_{30})^2}{D_{10} \times D_{60}}\right) \leq 3$

G P and S P Clean GRAVEL or SAND not meeting requirements for G W and S W

G M and S M Atterberg limits below A Line with PI <4

G C and S C Atterberg limits above A Line with PI >7

* Coarse-grained soils with percentage of fines between 5 and 12 are considered borderline cases requiring use of dual symbols.

D_{10}, D_{30}, and D_{60} are the particle diameter of which 10, 30, and 60 percent, respectively, of the soil weight are finer.

Fine-Grained Soils

M L	C L	O L	M H	C H	O H	Pt
SILT	CLAY	Organic	SILT	CLAY	Organic	Highly Organic Soils
Soils with Liquid Limit <50%			Soils with Liquid Limit >50%			
Fine-Grained Soils >50% smaller than No. 200 sieve

Appendix E
Data Quality Assessments

Recent Data Quality Assessment

Laboratory Analytical Data Validation Results

1 Summary

The soil sample analytical data reviewed for the 2001 Interim Corrective Actions at the Former DuPont Works Site in DuPont, Washington are acceptable for use based on a majority of acceptable quality control data. The data meet criteria specified in the 1992 Hart Crowser Management Plan.[1] The data may be used to assess analyte concentrations with the stated qualifications.

2 Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of samples for the 2001 Interim Corrective Actions at the former DuPont Works Site in Dupont, Washington, from May 7, 2001 through September 19, 2001. Samples were submitted to Sound Analytical Services, Inc. (SAS) located in Tacoma, Washington for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Surrogate recoveries
- Matrix spike / blank spike (MS / BS) recoveries
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using guidance from the following documents:

- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992. (Management Plan)
- Work Plan, Interim Source Removal Actions: Impacted Foundations and Narrow Gauge Railroad Beds at the Former DuPont Works Site, Dupont, Washington, Pioneer Technologies Corporation, West Shore Corporation, NW, December 6, 2000.
- National Functional Guidelines for Inorganic Data Review, EPA, February 1994.
- National Functional Guidelines for Organic Data Review, EPA, February 1994.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data were compared to criteria referenced in the Management Plan. The samples were analyzed for one or more of the following chemicals by the analytical methods shown:

• Metals (Arsenic, Lead and/or 23 metal target analyte list)	EPA 6000/7000 series
• Explosives (2,4-Dinitrotoluene, 2,6-Dinitrotoluene and 2,4,6-Trinitrotoluene)	EPA 8330
• Diesel-range and motor oil-range total petroleum hydrocarbons (TPH)	NWTPH-Dx

[1] Hart Crowser. January 17, 1992. Management Plan. Remedial Investigation/Feasibility Study, Former DuPont Works Site, DuPont, WA.

3 Sample Case

The sample data groups (SDGs) identified in Table . 1 were included in this data review.

100856	9/17/01
100921	9/19/01

4 Laboratory Report and Reporting of Required Analyses

The laboratory reports included method blanks, surrogate recoveries (if appropriate), sample results, sample preparation logs, matrix spike results and matrix duplicate results. Blank spike data were reported for all organic analyses and were reported for metals only when matrix spike recovery data were outside of the control limits. Generally, the reports were adequate to evaluate the data quality given that blank spikes are not consistently reported. All sample analyses were reported as requested.

5 Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. With the exception of the samples collected on September 10, 2001 (SAS # 100780), samples were submitted to the laboratory on the day of sample collection. All sample bottles were received in good condition. All samples were digested or extracted and analyzed within the method-required holding times.

6 Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met.

Field blanks (rinse blanks) were collected to assess potential cross-contamination in the field. Forty-five (45) field blanks were collected and analyzed for arsenic and lead. Arsenic was detected in 2 of the field blanks at concentrations of 0.02 mg/L and 0.01 mg/L. These field blanks are associated with the analytical groups 98830 and 100052, respectively. Lead was detected in 15 field blanks at concentrations ranging from 0.01 mg/L to 0.11 mg/L. These field blanks are associated with the analytical groups 98976, 99001, 99474, 99620, 99660, 99700, 99729, 99996, 100020, 100052, 100171, 100198, 100330, 100606 and 100645. Concentrations of arsenic and lead detected in the soil samples associated with these field blanks typically were reported with significantly higher concentrations of the metals (i.e. greater than 10X the concentration in the field blank). Data qualifiers were not assigned to associated soil analytical data based on method or field blank results.

7 Surrogate Recoveries

Laboratory performance on individual samples analyzed for explosives and TPH was assessed by reviewing the recoveries of system monitoring compounds (surrogates). Surrogate recoveries for samples analyzed for explosives and TPH were acceptable and data qualifiers were not assigned.

8 Matrix Spikes/Blank Spikes

Matrix spike (MS) analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement of one MS per analytical batch or one MS per 20 samples was met. In some cases, the MS was performed on samples unrelated to this site. Thirty (30) SDGs contained MS analyses on samples unrelated to this site. These SDGs are listed in the Laboratory Duplicates section of this report. Data qualifiers were not assigned based on results from MS analyses performed on samples unrelated to this site. Blank spike (BS) analyses were used to assess the overall performance of the analytical system when matrix spike recoveries were not acceptable.

Arsenic and Lead by EPA 6010

The MS results were compared to the method control limits of 75 to 125%. The lead recovery (376%) and the arsenic recovery (51%) for the MS performed on sample 01-OS02-SS[LR-68-600E-TRANSECT]-C1-000 (SDG 100529) were outside of the control limits. Per data validation guidelines, when the concentration of the analyte in the parent sample is greater than 4X the spike level, data are not qualified based on the MS recovery. Lead results were not qualified due to the MS recovery in sample 01-OS02-SS[LR-68-600E-TRANSECT]-C1-000 based on the 4X rule. Results for arsenic in the samples in the same analytical batch as 01-OS02-SS[LR-68-600E-TRANSECT]-C1-000 (SDG 100529) were qualified as estimated and flagged "J" or "UJ" based on MS results.

The recovery of lead (44%) in the MS performed on sample 02-N01-SS[NGRR-145-2]C2-025 (SDG 100558) was below the control limits due to sample matrix interference. Results for lead for samples in the same analytical batch as sample 02-N01-SS[NGRR-145-2]C2-025 (SDG100558) were qualified as estimated and flagged "J" based on the MS results. The results for arsenic in SDG 100558 were not qualified.

Based on review of the sample preparation log sheets, blank spikes were prepared at the appropriate frequency although the results were reported only when MS recoveries were outside of control limits. The blank spike recoveries provided were all within the control limits of 80 to 120%. Data provided included sets of blank spike/blank spike duplicates for lead associated with samples from SDGs 100529 and 100558 and arsenic associated with samples from SDG 100529. Blank spike/blank spike duplicate data were also provided for chromium and nickel associated with samples from SDG 99002 and lead associated with samples from SDG 100375, where the MS was performed on a non-project sample. Data qualifiers were not assigned to associated samples based on blank spike/blank spike duplicate results.

Explosives by EPA 8330

The recovery of 2,4,6-trinitrotoluene (2,4,6-TNT) in the MS (1,900 %) and the recoveries of 2,4-dinitrotoluene (2,4-DNT, 465%), 2,6-dinitrotoluene (2,6-DNT, 132%) and 2,4,6-TNT (200,000%) in the MSD performed on sample 03-IN01-SS[10-VS-5]D2-7.0 (SDG 99905) were outside of the laboratory control limits of 69–110% for 2,4,6-TNT, 78-105% for 2,4-DNT, and 68-108% for 2,6-DNT. The relative percent differences (RPDs) for 2,4,6-TNT (200%), 2,4-DNT (130%) and 2,6-DNT (21%) were greater than the RPD control limits of 9%, 13%, and 10% for 2,4,6-TNT, 2,4-DNT and 2,6-DNT, respectively. Recoveries of explosives in the blank spike/blank spike duplicate were acceptable. Results for 2,4,6-TNT, 2,4-DNT and 2,6-TNT for sample 03-IN01-SS[10-VS-5]D2-7.0 were qualified as estimated and assigned "J" or "UJ" flags based on MS/MSD results.

Diesel-Range and Motor Oil-Range TPH by NWTPH-Dx

A MS/MSD was not performed on any of the samples submitted for diesel-range and motor oil-range TPH analysis. Data were assessed based on the BS/BSD results that were acceptable.

9 Laboratory Duplicates

Laboratory duplicate results were used to assess the precision of laboratory measurements. The laboratory duplicate results were compared to the project control limit for relative percent difference (RPD) of 35% when sample results were greater than or equal to five times the reporting limit. A control limit of plus or minus the reporting limit was used for evaluation of duplicate samples where one or both of the results are less than five times the reporting limit. The QC frequency requirement of one duplicate per analytical batch or one duplicate per 20 samples was met. In some cases, the duplicate was performed on samples unrelated to this site. Thirty (30) SDGs include samples or subsets of samples that are associated with duplicate analyses performed on samples unrelated to this site (summarized below). Data qualifiers were not assigned to sample data based on duplicate analyses of non-project samples.

SDGs with MS and Laboratory Duplicate Analysis performed on non-project samples

98654*	99100*	99474	100052	100308	100558

* Associated with water samples only

Arsenic and Lead by EPA 6010

A total of sixty-two samples were qualified as estimated based on the results of laboratory duplicate analyses. All qualified results for metals analysis are summarized in Table A-2. Of the samples qualified based on laboratory duplicates, 20 samples were qualified due to an RPD that is greater than 35% and 42 sample results were qualified due to a difference of greater than the reporting limit between a sample and

its duplicate. Qualified data were assigned "J" flags if the sample result was reported as detected and "UJ" flags if reported as not detected.

Explosives by EPA 8330

Second column confirmation for detected compounds was performed on samples analyzed for explosives by EPA Method 8330. The RPDs of the results were evaluated by the laboratory and found to be greater than 40% for 2,4,6-TNT in samples 03-IN01-SS[10-VS-8]D2-5.0, 03-IN01-SS[10-VS-9]D2-5.0 and 03-IN01-SS[10-VS-10]D3-5.0, and for 2,4-DNT in sample 03-IN01-SS[10-VS-5]D2-7.0 (SDG 99905). Sample results were qualified as estimated and flagged with a "J" for 2,4,6-TNT in samples 03-IN01-SS[10-VS-8]D2-5.0, 03-IN01-SS[10-VS-9]D2-5.0 and 03-IN01-SS[10-VS-10]D3-5.0 and for 2,4-DNT in sample 03-IN01-SS[10-VS-5]D2-7.0.

10 Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples collected was met for metals and explosives analyses. Forty-nine (49) sets of field duplicate samples for metals analysis were collected and one set of duplicate samples were collected for explosives. A field duplicate was not collected for diesel-range and motor oil-range TPH analysis. Table A-3 presents the RPDs of detected compounds that were calculated for the duplicate pairs of soil samples analyzed for metals and explosives.

11 Reporting Limits

Reporting limits were reviewed to ensure that results reported meet project goals. The reporting limits are acceptable for the project needs. The data are summarized in Tables A-4 through A-12:

Analytical Results for Sampling, May - September 2001

Table A-4	Foundations
Table A-5	NGRR
Table A-6	Industrial
Table A-7	Sequalitchew Creek
Table A-8	Hot Spot
Table A-9	Historical Areas
Table A-10	Core Drilling
Table A-11	Topsoil Laydown Areas
Table A-12	Production Well
Table A-13	Hoffman Reservoir

Arsenic and Lead by EPA 6010

The samples analyzed on August 23, 2001 were reported with elevated PQLs. This affects the samples collected on August 20, 2001 (SDG 100280) and a subset of samples collected August 21, 2001 (SDG 100308). The typical PQLs for lead and arsenic analyses performed on soil samples for this project were approximately 2 mg/kg for both metals. Samples analyzed on August 23, 2001 were reported with PQLs of approximately 20 mg/kg for lead and 40 mg/kg for arsenic. The soil screening levels for lead and arsenic (118 mg/kg and 64 mg/kg, respectively) are greater than the elevated PQLs reported for the August 23 analyses, therefore the elevated PQLs do not affect the use of these data for project objectives.

Explosives by EPA 8330

The result for 2,4-DNT reported by the laboratory for sample 18-TR-18N,S-1 (0.023 mg/kg) was below the reported PQL for 2,4-DNT (0.045 mg/kg). The laboratory assigned a "J" flag to the sample result, as they typically do when reporting below the PQL. The Corps of Engineers requires SAS to report all confirmed detections of explosives even if compounds are detected below the PQL.

Diesel-Range and Motor Oil-Range TPH by NWTPH-Dx

The result for diesel-range TPH reported by the laboratory for sample WEY-GEO-4 (18 mg/kg) was below the reported PQL for diesel-range TPH (30 mg/kg). The laboratory assigned a "J" flag to the sample result, as they typically do when reporting below the PQL.

Equipment (field) blank sample. Results given as mg/L.

U The analyte was analyzed for, but was not detected above the reporting limit shown.
J Estimated Value, qualifier assigned during data review
UJ Analyte was analyzed for, but was not detected above the reporting limit shown. The reporting limit is estimated.
Dup (1) Both the sample and duplicate results were less than 5X the PQL. Data were evaluated by comparing the difference between values and qualifying data that were outside of +/- the reporting limit.
Dup (2) Both the sample and duplicate results were greater than or equal to 5X the PQL. Data were evaluated based on their relative percent difference (RPD).
MS - Data was qualified based on the matrix or matrix spike duplicate.

* Reported as mg/kg unless otherwise specified
Rinsate blank sample. Results are reported as mg/L
U The analyte was analyzed for, but was not detected above the reporting limit shown.
J Estimated value, qualifier assigned during data review
UJ Analyte was analyzed for, but was not detected above the reporting limit shown. The reporting limit is estimated.

Laboratory Analytical Data Validation Results

1 Summary

The soil sample analytical data reviewed from the Stockpile Interim Action Program are acceptable for use based on a majority of acceptable quality control data. The data meet criteria specified in the 1992 Hart Crowser Management Plan.[1] The data may be used to assess analyte concentrations with the stated qualifications.

2 Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of soil stockpile samples from the former DuPont Works Site in Dupont, Washington, from March 19, 2001 through May 7, 2001. Samples were submitted to Sound Analytical Services, Inc. (SAS) located in Tacoma, Washington for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Surrogate recoveries
- Matrix spike / blank spike (MS / BS)
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using guidance from the following documents:

- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992. (Management Plan)
- Work Plan, Interim Source Removal Actions: On-site Stockpiles, Pioneer Technologies Corporation, West Shore Corporation, NW, March 9, 2001.
- National Functional Guidelines for Inorganic Data Review, EPA, February 1994.
- National Functional Guidelines for Organic Data Review, EPA, February 1994.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data have been compared to criteria referenced in the Management Plan. The samples were analyzed for one or more of the following chemicals by the analytical methods shown.

• Metals (Arsenic and Lead)	EPA 6010
• Explosives (2,4-Dinitrotoluene, 2,6-Dinitrotoluene and 2,4,6-Trinitrotoluene)	EPA 8330
• Diesel range and motor oil range total petroleum hydrocarbons	NWTPH-Dx

[1] Hart Crowser. January 17, 1992. Management Plan. Remedial Investigation/Feasibility Study, Former DuPont Works Site, DuPont, WA.

3 Sample Case

The sample data groups (SDGs) identified in Table A-1 were included in this data review.

Table A-1 – Sample Data Groups Included in the Data Review

Sound Analytical Services Data Group Number	Date Sampled
96864	March 19, 2001
96890	March 20, 2001
96924	March 21, 2001
96959	March 22, 2001
97027	March 27, 2001
97185	April 3, 2001
97281	April 5, 2001
97962	May 7, 2001

.4 Laboratory Report and Reporting of Required Analyses

The laboratory reports included method blanks, surrogate recoveries, sample results, sample preparation logs, matrix spike results and matrix duplicate results. Blank spike data were reported only when matrix spike recovery data were outside of the control limits. Generally, the reports were adequate to evaluate the data quality given that blank spikes are not consistently reported. All sample analyses were reported as requested.

.5 Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were submitted to the laboratory on the day of sample collection. All sample bottles were received in good condition. The samples were digested and analyzed within the method-required holding times. Holding times were within specifications of the Management Plan.

.6 Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met.

Field blanks (rinse blanks) were collected to assess potential cross-contamination in the field. Two rinse blanks were collected and analyzed for arsenic and lead. The field blanks were free of contamination. Data qualifiers were not assigned to associated data based on method or field blank results.

7 Surrogate Recoveries

Laboratory performance on individual samples was assessed by reviewing the recoveries of system monitoring compounds (surrogates).

Explosives by EPA 8330

Recoveries of the surrogate 3,4-dinitrotoluene were above the laboratory control limits of 63-119% due to sample matrix interference in seven samples in SDG 97281: (01-S648-SO- [DS-648-A-2]-C-000 (356%), 01-S648-SO- [DS-648-B-2]-C-000 (622%), 01-S648-SO- [DS-648-C-2]-C-000 (136%), 01-S648-SO-

[DS-648-D-2]-C-000 (175%), 01-S648-SO- [DS-648-F-2]-C-000 (646%), 01-S648-SO- [DS-648-G-2]-C-000 (265%) and 01-S648-SO- [DS-648-H-2]-C-000 (520%)) and in seven samples in SDG 97027: (01-C648-SO- [648-DS-A]-C1-000 (287%), 01-C648-SO-[648-DS-B]-C1-000 (243%), 01-C648-SO-[648-DS-C]-C1-000 (588%), 01-C648-SO-[648-DS-D]-C1-000 (193%), 01-C648-SO-[648-DS-E]-C1-000 (129%), 01-C648-SO-[648-DS-F]-C1-000 (124%) and 01-C648-SO-[648-DS-G]-C1-000 (130%)). Sample results for 2,4,6-trinitrotoluene (2,4,6-TNT), 2,4-dinitrotoluene (2,4-DNT), and 2,6-dinitrotoluene (2,6-DNT) reported above the reporting limits for these samples have been qualified as estimated and flagged "J". Sample results reported as not detected were not qualified based on surrogate recoveries.

8 Matrix Spikes/Blank Spikes

Matrix spike (MS) analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement of one MS per analytical batch or one MS per 20 samples was met. In some cases, the MS was performed on samples unrelated to this site. Samples included in SAS sample delivery groups (SDGs) 97185 and 97962 and a subset of samples included in SDGs 96890 and 96924 are associated with MS analyses performed on samples unrelated to this site. Data qualifiers were not assigned to sample data based on MS recoveries from non-project samples. Blank spike (BS) analyses were used to assess the overall performance of the analytical system when matrix spike recoveries were not acceptable.

Arsenic and Lead by EPA 6010

The MS results were compared to the method control limits of 75 to 125%. For matrix spikes performed on site samples, spike recoveries ranged from 93 to 122 percent for arsenic and 4 to 106 percent for lead. The lead recovery (4%) for the MS performed on sample 01-C625-SO- [625-A-DS]-C6-000 (SDG 96864) was outside of the control limits due to high concentrations of lead in the parent sample. Per data validation guidelines, when the concentration of the analyte in the parent sample is greater than 4X the spike level, data are not qualified based on the matrix spike recovery. Data qualifiers were not assigned to associated data based on matrix spike results.

Based on review of the sample preparation log sheets, blank spikes were prepared at the appropriate frequency although the results were reported only when MS recoveries were outside of control limits. The blank spike recoveries provided were all within the control limits of 80 to 120%. Data provided included sets of blank spike/blank spike duplicates for lead associated with samples from SDG 96864 and one set for lead associated with samples from SDG 96924 where the MS was performed on a non-project sample. Data qualifiers were not assigned to associated samples based on blank spike/blank spike duplicate results.

Explosives by EPA 8330

The recoveries of 2,4,6-trinitrotoluene 2,4,6-TNT (72.8%) in the MS and 2,6-DNT (149%) in the MSD performed on sample 01-S648-SO- [DS-648-A-2]-C-000 (SDG 97281) were outside of the laboratory control limits of 73-108% for 2,4,6-TNT and 79-103% for 2,6-DNT. The relative percent differences (RPDs) for 2,4,6-TNT (36%) and 2,6-DNT (47%) were greater than the RPD control limits of 18% for 2,4,6-TNT and 10% for 2,6-DNT. The recoveries of 2,4,6-TNT in the MS (69.2%) and the MSD (72.3%) performed on sample 01-S648-SO- [648-DS-J]-C1-000 (SDG 97027) were outside the control limits of 73-108% for 2,4,6-TNT. Sample results for samples 01-S648-SO- [DS-648-A-2]-C-000 and 01-S648-SO- [648-DS-J]-C1-000 were previously qualified based on surrogate recovery.

Diesel Range and Motor Oil Range TPH by NWTPH-Dx

An MS/MSD was not performed on the sample submitted for diesel range and motor oil range TPH analysis. Data were assessed based on the BS/BSD results that were acceptable.

9 Laboratory Duplicates

Laboratory duplicate results were used to assess the precision of laboratory measurements. The laboratory duplicate results were compared to the project control limit for relative percent difference (RPD) of 35%. The QC frequency requirement of one duplicate per analytical batch or one duplicate per 20 samples was met. In some cases, the duplicate was performed on samples unrelated to this site. Samples included in SAS SDG 97185 and a subset of samples included in SDGs 96890, 96924 and 97962 are associated with duplicate analyses performed on samples unrelated to this site. Data qualifiers were not assigned to associated sample data based on duplicate results from non-project samples.

10 Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples collected was met for metals and explosives analyses. Eight sets of field duplicate samples (seven for metals analysis, one for explosives analysis) were collected. Table A-2 presents the RPDs of detected compounds that were calculated for the duplicate pairs. Because only one sample was analyzed for diesel-range and motor oil-range petroleum hydrocarbons, a field duplicate was not collected for this analysis.

Table A-2 – RPD of Detected Compounds

Sample ID	Duplicate ID	Analyte	Primary Result (mg/kg)	Duplicate Result (mg/kg)	RPD %
01-C620-SO-[620-DS-C]-C1-000	01-C620-SO-[620-DS-G]-C1-000	Arsenic	61	90	38
		Lead	430	420	2

		Lead	36	29	22
01-C648-SO-[648-DS-I]-C1-000	01-C648-SO-[648-DS-J]-C1-000	2,4,6-TNT	0.11	0.12	9
		2,4-DNT	0.16	0.098	48
		2,6-DNT	0.076	0.057	29

11 Reporting Limits

Reporting limits were reviewed to ensure that results reported meet project goals. The reporting limits are acceptable for the project needs. The data are summarized in Tables A-3, A-4, and A-5 for metals, explosives and petroleum hydrocarbons, respectively.

J - Estimated Value, Qualifier assigned during data review

Note: Two rinsate blanks were collected on March 19, 2001 (RIN-031901) and April 3, 2001 (RIN-040301).
Arsenic and lead were not detected in either rinsate blank and results were reported as not detected for both elements (< 0.01 mg/L).

HOFRES	7-May-01	0.05 U	0.05 U	0.05 U	

J - Estimated Value, qualifier assigned during data review

U - The analyte was analyzed for, but was not detected above the reporting limit shown.

Table A-5
Soil Analytical Results for Petroleum Hydrocarbons
Stockpile Interim Action Program

Sample ID	Date Sampled	Total Petroleum Hydrocarbons	
		Diesel-range (mg/kg)	Motor Oil-range (mg/kg)
807	7-May-01	260*	250**

* The chromatogram suggests this may be aged or degraded diesel.

** The chromatogram does not match a typical motor oil pattern.

Laboratory Analytical Data Validation Results

1 Summary

The soil analytical data reviewed from the background samples are acceptable for use based on a majority of acceptable quality control data. The data meet criteria specified in the 1992 Hart Crowser Management Plan.[1] The data may be used to assess analyte concentrations with the stated qualifications.

2 Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of soil samples from the former DuPont Works Site in Dupont, Washington, from January 29 through April 3, 2001. Samples were submitted to Sound Analytical Services, Inc. for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Matrix spike / blank spikes (MS / BS)
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using guidance from the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits. The samples were analyzed for the following chemicals, using the noted analytical methods.

- Arsenic EPA 6010
- Lead EPA 6010

3 Sample Case

The sample data groups identified in Table A-1 were included in this data review.

Table A-1 – Sample Data Groups Included in the Data Review

Sound Analytical Services Data Group Number	Date Sampled
95757	1/29/2001
95881	1/30, 1/31, and 2/1/2001
95897	2/2/2001

[1] Hart Crowser. January 17, 1992. Management Plan. Remedial Investigation/Feasibility Study, Former DuPont Works Site, DuPont, WA.

Table A-1 – Sample Data Groups Included in the Data Review

95980	2/5/2001
96014	2/7/2001
96084	2/8 – 2/9/2001
96171	2/12 – 2/14/2001
96257	2/14 – 2/15/2001
96322	2/20 – 2/21/2001
96362	2/22 – 2/23/2001
97186	4/3/2001
97187	4/3/2001

.4 Laboratory Report and Reporting of Required Analyses

The laboratory report was complete; all QC results were included. The project scope of work stated that URS Inc., (URS) would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody. The reports provide all necessary information to complete this review. All analytical methods were reported as requested.

5 Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were preserved and cooled until arrival at the laboratory. Sample bottles were in good condition. The samples were extracted and analyzed within the 6 month holding time. Holding times were within specifications of the Management Plan.

.6 Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met. One rinse blank was collected. The field rinse blank was free of contamination. No data require qualification based on field rinse blank contamination.

7 Matrix Spikes/Blank Spikes

Matrix spike (MS) analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement of one MS and one blank spike (BS) per analytical batch or one MS and one BS per 20 samples, was met. In instances where the concentration of the sample is at least 4 times greater than the spike added, the MS percent recoveries are not used to validate the associated sample data. The laboratory included BS reports only if the MS data were non-compliant.

The MS results were compared to evaluate the accuracy of laboratory procedures. The spike recoveries ranged from 81 to 107 percent and were within the laboratory-established control limits of 75-125, with the exception listed below. One blank spike was reported and was within the laboratory-established control limits of 80-120.

- MS 95881-01 (2/9/01): the lead percent recovery was below the control limit at 69%. Associated sample lead results were qualified as estimated and flagged with a "J".

8 Laboratory Duplicates

The relative percent differences (RPDs) ranged from 0 to 29 percent and were within the laboratory-established control limits of 35%, with two exceptions. The lead RPD for laboratory duplicate 96322-61 (3/5/01) was above the control limit at 39% due to matrix interference. Associated sample lead results

were qualified as estimated and were flagged with a "J". The arsenic and lead RPDs for laboratory duplicate 95881-61 (2/13/01) were greater than the control limit at 45%. Associated sample arsenic and lead results were qualified as estimated and flagged with a "J".

9 Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, or one field duplicate per day at a minimum, specified in the Management Plan, was met. Twenty-seven sets of field duplicate samples were collected. Table A-2 presents the RPD of detected compounds that were calculated for the duplicate pairs. The RPD is calculated only for sample results that are 5 times greater than the detection limit. The RPDs were acceptable (i.e., less than 35%) with the exception of twelve duplicate pairs with RPD greater than 35%. Arsenic and lead results for the sample and duplicate pairs were qualified as estimated and flagged with a "J" if the RPD was greater than 35%. The average RPD for all field duplicates collected was 30%, which is acceptable for this project.

Table A-2 – RPD of Detected Compounds

Sample ID & Duplicate ID	Analyte	Primary Result (mg/kg)	Duplicate Result (mg/kg)	RPD %
R74C67/R74C66	Arsenic	47	20	**81**

	Lead	40	37	**8**

10 Reporting Limits

To ensure the level of analytical reporting sensitivity meets project goals, reporting limits were reviewed. The reporting limits are acceptable for the project needs. No data require qualification based on reporting limits.

Laboratory Analytical Data Validation Results

1 Summary

The soil analytical data reviewed from the Sequalitchew Creek Canyon NGRR are acceptable for use based on a majority of acceptable quality control data. The data meet criteria specified in the 1992 Hart Crowser Management Plan.[1] The data may be used to assess analyte concentrations with the stated qualifications.

2 Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of soil samples from the former DuPont Works Site in Dupont, Washington, from January 10, through 16, 2001. Samples were submitted to Sound Analytical Services, Inc. for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Matrix spike / blank spikes (MS / BS)
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using guidance from the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits. The samples were analyzed for the following chemicals, using the noted analytical methods.

- Arsenic EPA 6010
- Lead EPA 6010

3 Sample Case

The sample data groups identified in Table A-1 were included in this data review.

Table A-1 – Sample Data Groups Included in the Data Review

95438	12 Jan 01	01-OS02-SS-[LR-68-4425W]-C1-000
95438	12 Jan 01	01-OS02-SS-[LR-68-4475W]-C1-000

4 Laboratory Report and Reporting of Required Analyses

The laboratory report was complete; all QC results were included. The project scope of work stated that URS Inc., (URS) would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody. The reports provide all necessary information to complete this review. All analytical methods were reported as requested.

5 Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were preserved and cooled until arrival at the laboratory. Sample bottles were in good condition. The samples were extracted and analyzed within the 6 month holding time. Holding times were within specifications of the Management Plan.

6 Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met. Three rinse blanks were analyzed. The field rinse blanks were free of contamination. No data require qualification based on field rinse blank contamination.

7 Matrix Spikes/Blank Spikes

Matrix spike (MS) analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement of one MS and one blank spike (BS) per analytical batch or one MS and one BS per 20 samples, was met. In instances where the concentration of the sample is at least 4 times greater than the spike added, the MS percent recoveries are not used to validate the associated sample data. The laboratory included BS reports only if the MS data were non-compliant.

The MS results were compared to evaluate the accuracy of laboratory procedures. The spike recoveries ranged from 88 to 117 percent and were within the laboratory-established control limits of 75-125 with the exceptions listed below. One blank spike was reported and was within the laboratory-established control limits of 80-120. No data require qualification based on MS or BS percent recoveries because the concentration of the spiked sample (matrix spike 95344-20, 1/18/01) was at least 4 times greater than the spike added.

8 Laboratory Duplicates

The relative percent differences (RPDs) ranged from 0 to 26 percent and were within the laboratory-established control limits of less than 35%, with one exception. The lead RPD for laboratory duplicate 95344-20 (1/17/01) was above the control limit at 78% due to matrix interference. Associated sample lead results were qualified as estimated and were qualified with a "J".

9 Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, or one field duplicate per day at a minimum, specified in the Management Plan, was met. Seven sets of field duplicate samples were collected. Table A-2 presents the RPD of detected compounds that were calculated for the duplicate pairs. The RPDs were acceptable (i.e., less than 35%) with the exception of two duplicate pairs LR-68-1575W/1600W and LR-68-4425/4475. The arsenic results for LR-68-1575W and the lead results for LR-68-4425 were qualified as estimated and flagged with a "J" due to the high duplicate RPD.

Table A-2 – RPD of Detected Compounds

Sample ID & Duplicate ID	Analyte	Primary Result (mg/kg)	Duplicate Result (mg/kg)	RPD %
LR-68-1575W/LR-68-1600W	Arsenic	180	120	**40**
	Lead	21	17	21
LR-68-3975W/LR-68-4025W	Arsenic	420	380	10
	Lead	28	26	7
LR-68-4125W/LR-68-4175W	Arsenic	350	270	26
	Lead	37	33	11
LR-68-4275W/LR-68-4325W	Arsenic	420	430	2
	Lead	55	60	9
LR-68-4425W/LR-68-4475W	Arsenic	290	370	24
	Lead	39	190	**132**
LR-68-2550W/LR-68-2600W	Arsenic	340	270	23
	Lead	33	26	24

10 Reporting Limits

To ensure the level of analytical reporting sensitivity meets project goals, reporting limits were reviewed. The reporting limits are acceptable for the project needs. No data require qualification based on reporting limits.

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data meet criteria specified in the 1992 Hart Crowser Management Plan. The data may be used to assess analyte concentrations with the stated qualifications.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of soil samples from the Weyerhaeuser-Dupont site in Dupont, Washington, from September 10, 1999 through July 17, 2000. Samples were submitted to Sound Analytical Services, Inc. for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Matrix spike / blank spikes (MS / BS)
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using guidance from the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Arsenic	EPA 6010
Lead	EPA 6010

Sample Case

The following sample data groups were included in this review.

SOUND ANALYTICAL SERVICES DATA GROUP NUMBER	DATE SAMPLED
84030	10 Sep 99
84055	13 Sep 99
84078	14 Sep 99
84117	15 Sep 99
84151	16 Sep 99

Laboratory Report and Reporting of Required Analyses

The laboratory report was complete; all QC results were included. The project scope of work stated that URSGWC would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody. The reports provide all necessary information to complete this review.

Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were preserved and cooled. Sample jars were in good condition.

The samples were extracted and analyzed within the 6 month holding time. No data require qualification based on missed holding times.

Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met. Field blanks were used to determine if samples were contaminated through sampling procedures or equipment. The rinse blanks had detections of lead or arsenic. No data require qualification based on these results.

SAMPLE ID	BATCH	ANALYTE	RESULT (mg/L)
Rinse Blank (rinsate)	84078	Lead	0.0032
Rinse Blank (rinsate 2)	84117	Lead	0.026
Rinse Blank (rinsate 3)	84117	Lead	0.016
Rinse Blank (rinsate 4)	84151	Lead	0.088
Rinse Blank (rinsate 5)	84215	Lead	0.031
Rinse Blank (rinsate 6)	84245	Arsenic Lead	0.034 0.026
Rinse Blank (rinsate 7)	84297	Lead	0.0061
Rinse Blank (rinsate 8)	84401	Lead	0.0065

Matrix Spikes / Blank Spikes

Matrix spike analyses were used to assess matrix effects with respect to the analytical data. Blank spike analyses were used to monitor the overall performance of the analysis, including sample preparation. The QC frequency requirement of one matrix spike and one blank spike per analytical batch or one matrix spike and one blank spike per 20 samples, was met.

The spike recoveries ranged from were within the control limits, with the following exceptions.

- Matrix spike 84055-1 (9-15/99): The lead percent recovery was above the control limits. The concentration of the spiked sample was at least 10 times greater than the spike added; therefore, no data were qualified.
- Matrix spike 84055-21 (9-15/99): The lead percent recovery was above the control limits. The concentration of the spiked sample was at least 10 times greater than the spike added; therefore, no data were qualified.

- Matrix spike 84078-42 (9/20/99): The lead matrix spike was not recovered. The concentration of the spiked sample was at least 10 times greater than the spike added; therefore, no data were qualified.
- Matrix spike 84117-1 (9/17/99): The lead matrix spike was not recovered. The concentration of the spiked sample was at least 10 times greater than the spike added; therefore, no data were qualified.
- Matrix spike 84117-21 (9/20/99): The lead matrix spike was not recovered. The concentration of the spiked sample was at least 10 times greater than the spike added; therefore, no data were qualified.
- Matrix spike 84151-1 (9/20/99): The arsenic percent recovery was below the control limits at 74%. The associated blank spike was within the control limits; therefore, no data were qualified.
- Matrix spike 84215-2 (9/22/99): The lead percent recovery was above the control limits. The concentration of the spiked sample was at least 10 times greater than the spike added; therefore, no data were qualified.
- Matrix spike 84215-22 (9/22/99): The lead percent recovery was below the control limits at 74%. The associated blank spike was within the control limits; therefore, no data were qualified.
- Matrix spike 84245-2 (9/21/99): The lead percent recovery was below the control limits at 64%. The associated blank spike was within the control limits; therefore, no data were qualified.
- Matrix spike 84245-40 (9/23/99): The percent recoveries were below the control limits for arsenic at 74% and lead at 72%. The associated blank spike percent recoveries were within the control limits; therefore, no data were qualified.
- Matrix spike 84297-22 (9/27/99): The percent recoveries were below the control limits for arsenic at 73% and lead at 72%. Associated quality control data were within the control limits; therefore, no data were qualified.
- Matrix spike 84297-42 (9/27/99): The percent recoveries were below the control limits for arsenic at 71% and lead at 69%. Associated quality control data were within the control limits; therefore, no data were qualified.
- Matrix spike 84320-1 (9/28/99): The percent recoveries were below the control limits for arsenic at 71% and lead at 66%. Associated quality control data were within the control limits; therefore, no data were qualified.
- Matrix spike 84320-21 (9/28/99): The percent recovery was above the control limit for lead at 133%. Associated quality control data were within the control limits; therefore, no data were qualified.
- Matrix spike 59069-21 (4/21/00): The arsenic and lead matrix spike percent recoveries were not recovered. The associated LCS and an additional matrix spike percent recoveries were within the control limits; therefore, no data were qualified.

- Blank spike S382 (9/20/99): The lead percent recovery was greater than the control limits at 133%. Associated data were qualified as estimated (J).
- Blank spike S392 (9/17/99): The lead percent recovery was greater than the control limits at 130%. Associated data were qualified as estimated (J).

Laboratory Duplicates

The laboratory duplicate relative percent differences (RPDs) were within the control limits, with the following exceptions.

- Laboratory duplicate 84030-15 (9/14/99): The lead RPD was above the control limit at 49% due to matrix interference. Associated quality control data were within the control limits; therefore, no data were qualified.
- Laboratory duplicate 84078-42 (9/20/99): The lead RPD was above the control limit at 58% due to matrix interference. Associated quality control data were within the control limits; therefore, no data were qualified.
- Laboratory duplicate 84508-21 (10/4/99): The arsenic RPD was above the control limit at 200%. The sample and duplicate results were not greater than five times the reporting limit; therefore, no data were qualified.
- Laboratory duplicate 85323-41 (11/5/99): The lead RPD was above the control limit at 46% due to matrix interference. Associated quality control data were within the control limits; therefore, no data were qualified.
- Laboratory duplicate 87040-41 (1/27/00): The arsenic RPD was above the control limit at 50% due to matrix interference. Associated quality control data were within the control limits; therefore, no data were qualified.

Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The RPD was calculated only for sample results greater than 5 times the reporting limit. A total of 42 duplicate pairs were collected which meets the QC frequency requirement of one field duplicate for 5 percent of the total samples or one field duplicate for each day of sampling, specified in the Management Plan. The duplicate pairs show good agreement, with the following exceptions:

- Duplicate pair 38-VS-96/117: the arsenic and lead results were qualified as estimated (J) due to the high duplicate RPDs.
- Duplicate pair 31-VS-586/587: the arsenic and lead results were qualified as estimated (J) due to the high duplicate RPDs.
- Duplicate pair 31-VS-639/686: the arsenic and lead results were qualified as estimated (J) due to the high duplicate RPDs.

Reporting Limits

To ensure the level of sensitivity meets project goals, reporting limits were reviewed. Reported results are acceptable.

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data generally meet criteria specified in the 1992 Hart Crowser Management Plan. The data may be used to assess analyte concentrations without qualification.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of two soil samples from the Weyerhaeuser-Dupont site in Dupont, Washington, on February 17, 1999. Two primary samples were submitted to MultiChem Analytical Services for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Matrix spike / blank spikes (MS / BS)
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using guidance from the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Arsenic	EPA 6010
Lead	EPA 6010

Sample Case
The following sample data group was included in this review:

MAS#: 902024

Laboratory Report and Reporting of Required Analyses

The laboratory report was complete; all QC results were included. The project scope of work stated that URSGWC would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody. Comprehensive data validation was not

requested for this round of sampling. The reports provide all necessary information to complete this review.

All analytical methods were reported as requested.

Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were preserved and cooled. Sample jars were in good condition.

The samples were extracted and analyzed within the 6 month holding time. Holding times were within specifications of the Management Plan.

Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met. No data were qualified due to these results.

Matrix Spikes / Blank Spikes

Matrix spike analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement of one MS and one BS per analytical batch or one MS and one BS per 20 samples, was met.

The spike recoveries ranged from 93 to 99 percent and were within the control limits. No data were qualified due to these results.

Laboratory Duplicates

The laboratory relative percent difference (RPD) was 17 percent and was within the control limits. No data were qualified.

Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, specified in the Management Plan, was not met. No data were qualified.

Reporting Limits

To ensure the level of sensitivity meets project goals, reporting limits were reviewed. All sample results were detections. Reported results are acceptable.

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data generally meet criteria specified in the 1992 Hart Crowser Management Plan. The data may be used to assess analyte concentrations without qualification.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of soil samples from the Weyerhaeuser-Dupont site in Dupont, Washington, in November and December, 1998. Sixty-eight primary samples and three field duplicates were submitted to MultiChem Analytical Services for analysis. This review includes evaluation of the following:

- Laboratory report and reporting of required analyses
- Chain of custody and holding times
- Method blanks
- Matrix spike / blank spikes (MS / BS)
- Laboratory duplicates
- Field duplicates
- Reporting limits

The data quality review was conducted using the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Arsenic	EPA 6010/7060
Lead	EPA 6010/7421

Sample Case
The following sample data groups were included in this data review:

MAS#: 811052
MAS#: 812020
MAS#: 812021

Laboratory Report and Reporting of Required Analyses

The laboratory report was complete; all QC results were included. The project scope of work stated that Woodward-Clyde would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody. Comprehensive data validation was not requested for this round of sampling. The reports provide all necessary information to complete this review.

All analytical methods were reported as requested.

Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were preserved and cooled until arrival at the laboratory. Sample bottles were in good condition.

The samples were extracted and analyzed within the 6 month holding time. Holding times were within specifications of the Management Plan.

Method and Field Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of target analytes. The QC frequency requirement of one laboratory blank per analytical batch was met.

Three rinse blanks were analyzed. The field rinse blanks were free of target analytes. No data were qualified due to these results.

Matrix Spikes / Blank Spikes

Matrix spike analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement of one MS and one BS per analytical batch or one MS and one BS per 20 samples, was met.

The matrix spike and blank spike results were compared to evaluate the accuracy of laboratory procedures. The spike recoveries ranged from 67 to 112 percent and were within the control limits with the following exception. Two of the lead MS percent recoveries were not calculated as the sample concentration was greater than four times the spike concentration. No data were qualified due to these results.

Laboratory Duplicates

The relative percent differences (RPDs) ranged from 0 to 26 percent and were within the control limits established by the laboratory. No data were qualified.

Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, specified in the Management Plan, was met. Three sets of field duplicate samples were collected. The RPD of detected compounds were calculated for the duplicate pairs (shown below). The RPDs were acceptable.

Sample ID	Analyte	Primary (mg/kg)	Duplicate (mg/kg)	Relative Percent Difference (percent)
98SCOM0105 / COM0111	arsenic	4.9	4.4	11
	lead	4.6	5.3	14
98SCHR0302 / CHR0311	arsenic	87	82	5.9
	lead	34000	42000	21
98SCHR0407 / CHR0411	arsenic	26	30	14
	lead	190	230	19

Reporting Limits

To ensure the level of sensitivity meets project goals, reporting limits were reviewed. All sample results were detections. Reported results are acceptable.

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data generally meet criteria specified in the 1992 Management Plan. The data may be used to assess analyte concentrations in the groundwater without qualification.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of groundwater samples from the former DuPont Works site in Dupont, Washington, on October 17, 1997. Eight primary samples and one QC sample (field duplicate) were submitted to MultiChem Analytical Services for analysis. This review includes evaluation of the following:

- Chain of custody and holding times
- Laboratory report and reporting of required analyses
- Laboratory blanks
- Rinsate (field) blanks
- Field duplicates
- Laboratory duplicates
- Matrix spike/matrix spike duplicates (MS/MSD)
- Surrogate recoveries (where applicable)
- Reporting limits

The data quality review was conducted using the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former DuPont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Explosives (NAX): SW846 8090 (modified)

Sample Case

The following samples were included in this data review:

MW-22
MW-22-D (Blind field duplicate of MW-22)
Seep-1
MW-3
MW-19
MW-6
MW-8
W-2
W-1

Chain of Custody and Holding Times

Samples were maintained under chain of custody until arrival at the laboratory. Samples were preserved and cooled.

The sample holding times were within specifications of the Management Plan.

Laboratory Report and Reporting of Required Analyses

The laboratory report was complete and all QC results were included. The project scope of work stated that Woodward-Clyde would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody.

Section 5.0 of the Management Plan gives the required QC level of effort, including QC measures such as calibration frequency. Some of these QC measures may have been met by the laboratory, but were not confirmed through data evaluation because comprehensive data validation was not requested. The reports provide all necessary information to complete this data assurance review.

All analytical methods were reported as requested.

Method Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of contamination. The QC frequency requirement specified in the Management Plan of one laboratory blank per analytical batch was met.

Rinsate (Field) Blanks

No rinsate blanks were associated with the samples because samples were transferred directly from dedicated bailers into sample jars.

Field Duplicates

Field duplicate samples were used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, specified in the Management Plan, was met. One set of field duplicate samples was collected at MW-22 and the duplicate was identified as MW-22-D. Only two compounds were detected; all other compounds were non-detect. The relative percent difference (RPD) of detected compounds were calculated for the duplicate pair (shown below). All RPDs were acceptable.

ANALYTE	PRIMARY (µg/L)	DUPLICATE (µg/L)	RELATIVE PERCENT DIFFERENCE (percent)
2,6-dinitrotoluene	0.14	0.14	0%
2,4-dinitrotoluene	0.029	0.027	7%

Laboratory Duplicates

The laboratory analyzed matrix spike/matrix spike duplicates for the explosives method.

Matrix Spike/Matrix Spike Duplicates

Matrix spike analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement specified in the Management Plan of one MS and one MSD per analytical batch was met.

The matrix spike and matrix spike duplicate results were compared to identify the laboratory precision. The MS/MSD RPDs were all within the control limits established by the laboratory and found in the Management Plan. No data were qualified.

All blank spike/blank spike duplicate (BS/BSD) recoveries were within the control limits. No data were qualified.

Surrogate Recoveries

Surrogate compounds were used in the analysis of organic compounds (EPA Method 8090 modified) to monitor analyte extraction efficiency/method accuracy on a per sample basis. All surrogate recoveries were within the Management Plan control limits. No data were qualified due to surrogate results.

Reporting Limits

To ensure that the level of sensitivity required for project goals was met, reporting limits were reviewed. The reporting limits requested in the Management Plan were met or exceeded.

ANALYTE	REQUESTED RL (µg/L)	ACTUAL RL (µg/L)
nitrobenzene	1.7	0.40
1,3-dinitrobenzene	0.44	0.040
2,6-dinitrotoluene	0.13	0.010
2,4-dinitrotoluene	0.13	0.020
1,3,5-trinitrobenzene	0.16	0.040
2,4,6-trinitrotoluene	2.9	0.040

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data generally meet criteria specified in the 1992 Hart Crowser Management Plan. The data may be used to assess analyte concentrations in the groundwater with the stated qualifications.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of groundwater samples from the Weyerhaeuser-Dupont site in Dupont, Washington, on March 23, 1999. Five primary samples, and one field duplicate were submitted to MultiChem Analytical Services for analysis. This review includes evaluation of the following:

- Chain of custody and holding times
- Laboratory report and reporting of required analyses
- Laboratory blanks
- Rinsate (field) blanks
- Field duplicates
- Laboratory duplicates
- Matrix spike/matrix spike duplicates (MS/MSD)
- Blank spike review
- Surrogate recoveries
- Reporting limits

The data quality review was conducted using the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- National Functional Guidelines for Inorganic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Explosives (NAX): SW846 8091 (modified)

Sample Case

The following table includes samples associated with this data review, the laboratories sample identification number, any analytes that were qualified, and any qualifiers that were added to the laboratory data.

Sample ID	Laboratory ID	Analyte	Qualified Result
MW-3	903061-1	1,3-dinitrobenzene	0.21 J
MW-6	903061-2	1,3-dinitrobenzene	0.32 J
MW-19	903061-3	1,3-dinitrobenzene	0.39 J
MW-22	903061-4	1,3-dinitrobenzene	0.37 J
MW-29 duplicate of MW-19	903061-5	1,3-dinitrobenzene	0.4 J
W-2	903061-6	1,3-dinitrobenzene	none

Chain of Custody and Holding Times

The chain of custody forms indicate that the samples were maintained under chain of custody, the forms were signed during release and receipt, and the samples were appropriately preserved., with the following exception. The cooler temperature was 9.8 °C, outside of the recommended temperature range of 4±2 °C. No data were qualified due to chain of custody or holding time issues.

The water holding time for NAX is 7 days from collection to extraction, and 40 days from extraction to analysis. Holding times were met.

Laboratory Report and Reporting of Required Analyses

The laboratory reported all requested analyses and the laboratory report is complete. The project scope of work stated that Woodward-Clyde would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody.

Section 5 of the Management Plan gives the required QC level of effort, including QC measures such as calibration frequency. These QC measures may have been met by the laboratory, but were not confirmed through data evaluation because comprehensive data validation was not requested. The reports provide all necessary information to complete this data assurance review.

Method Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The laboratory method blanks were free of contamination. The QC frequency requirement specified in the Management Plan of one laboratory blank per analytical batch was met.

Rinsate (Field) Blanks

No rinsate blanks were associated with the samples.

Field Duplicates

Field duplicate samples are used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, specified in the Management Plan, was met. One set of field duplicate samples was collected at MW-19 and the duplicate was identified as MW-29. Four compounds were detected; all other compounds were non-detect. The relative percent difference (RPD) of detected compounds were calculated for the duplicate pair (shown below). All RPDs were acceptable.

Analyte	Primary (µg/L)	Duplicate (µg/L)	Relative Percent Difference (percent)
nitrobenzene	1.4	1.1	24%
2,4-dinitrotoluene	0.064	0.074	14%
1,3-dinitrobenzene	0.39	0.40	2.5%
2,4,6-trinitrotoluene	0.21	0.23	9%

Laboratory Duplicates

The laboratory analyzed matrix spike/matrix spike duplicates for the explosives method.

Matrix Spike/Matrix Spike Duplicates

Matrix spike analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement specified in the Management Plan of one matrix spike/matrix spike duplicate (MS/MSD) per analytical batch was met.

The matrix spike/matrix spike duplicate results were compared to identify the laboratory precision. The MS/MSD percent recoveries and RPDs were all within the control limits, with the following exceptions.

- The MS/MSD percent recoveries were above the control limits for 1,2-dinitrobenzene at 183% and 192%. Associated data above the reporting limit were qualified as estimated (J).
- The RPD for 2,4,6-trinitrotoluene was above the control limit at 76%. Since both the MS and MSD percent recoveries were within the control limits, no data were qualified due to these results.

Blank Spike Review

All blank spike/blank spike duplicate (BS/BSD) recoveries were within the control limits, with the following exception. The percent recovery for 1,3-dinitrobenzene was above the control limit at 164%. Since the associated matrix spike quality control data were also above the control limits, the associated data above the reporting limit were qualified as estimated (J).

Surrogate Recoveries

Surrogate compounds are used in the analysis of organic compounds to monitor analyte extraction efficiency/method accuracy on a per sample basis. All surrogate recoveries were within the Management Plan control limits. No data were qualified due to surrogate results.

Reporting Limits

To ensure that the level of sensitivity required for project goals was met, reporting limits were reviewed. The reporting limits requested in the Management Plan were met or exceeded.

Analyte	Requested RL (µg/L)	Actual RL (µg/L)
nitrobenzene	1.7	0.40
1,3-dinitrobenzene	0.44	0.040
2,6-dinitrotoluene	--	0.010
2,4-dinitrotoluene	--	0.020
1,3,5-trinitrobenzene	0.16	0.040
2,4,6-trinitrotoluene	--	0.040

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data generally meet criteria specified in the 1992 Hart Crowser Management Plan. The data may be used to assess analyte concentrations in the groundwater with the stated qualifications.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of groundwater samples from the Weyerhaeuser-Dupont site in Dupont, Washington, on March 28, 2000. Four primary samples and one field duplicate were submitted to MultiChem Analytical Services for analysis. This review includes evaluation of the following:

- Chain of custody and holding times
- Laboratory report and reporting of required analyses
- Laboratory blanks
- Rinsate (field) blanks
- Field duplicates
- Laboratory duplicates
- Matrix spike/matrix spike duplicates (MS/MSD)
- Blank spike review
- Surrogate recoveries
- Reporting limits

The data quality review was conducted using the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- National Functional Guidelines for Inorganic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Explosives (NAX): SW846 8091 (modified)

Sample Case

The following table includes samples associated with this data review, the laboratory sample identification number, any analytes that were qualified, and any qualifiers that were added to the laboratory data. Monitoring well MW-3 was not sampled due to an inadequate amount of sample available.

Sample ID	Laboratory ID	Analyte	Qualified Result
MW-3	not sampled		
W-2	89066-1	all NAX results	J or UJ
MW-19	89066-2	all NAX results	J or UJ
MW-29 duplicate of MW-19	89066-5	all NAX results	J or UJ
MW-22	89066-22	all NAX results	J or UJ
MW-6	89066-7	all NAX results	J or UJ

Chain of Custody and Holding Times

The chain of custody forms indicate that the samples were maintained under chain of custody, the forms were signed during release and receipt, and the samples were appropriately preserved. The samples were submitted to Multichem Analytical Services for analysis. Multichem went out of business on March 31, 2000; however, they were able to extract the samples. After confirming that Multichem was closed and would not be able to analyze the extracts, the samples and extracts were retrieved from Multichem on April 18, 2000. The samples and extracts were submitted to Sound Analytical for analysis.

The water holding time for NAX is 7 days from collection to extraction, and 40 days from extraction to analysis. Holding times were met.

Laboratory Report and Reporting of Required Analyses

The laboratory reported all requested analyses and the laboratory report is complete. The project scope of work stated that Woodward-Clyde would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody.

Section 5 of the Management Plan gives the required QC level of effort, including QC measures such as calibration frequency. These QC measures may have been met by the laboratory, but were not confirmed through data evaluation because comprehensive data validation was not requested. The reports provide all necessary information to complete this data assurance review.

Method Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The QC frequency requirement specified in the Management Plan of one laboratory blank per analytical batch was met. Target analytes in the method blank were below detection with the exceptions listed in the following table. Qualified data are summarized in the Sample Case section.

SAMPLE ID	ANALYTE	RESULT (µg/L)
Method Blank 89066-08	RDX	0.15
	1,3,5-Trinitrobenzene	0.083
	Tetryl	0.082
	2,4,6-Trinitrotoluene	0.084
	2-Amino-4,6-dinitrotoluene	0.12
	4-Amino-2,6-dinitrotoluene	0.074

Rinsate (Field) Blanks

No rinsate blanks were associated with the samples.

Field Duplicates

Field duplicate samples are used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, specified in the Management Plan, was met. One set of field duplicate samples was collected at MW-19 and the duplicate was identified as MW-29. One compound was detected; all other compounds were qualified as non-detect. The relative percent difference (RPD) of the detected compound was calculated for the duplicate pair (shown below). All RPDs were acceptable.

Analyte	Primary (µg/L)	Duplicate (µg/L)	Relative Percent Difference (percent)
2,6-dinitrotoluene	0.42	0.42	0

Laboratory Duplicates

The laboratory analyzed matrix spike/matrix spike duplicates for the explosives method.

Matrix Spike/Matrix Spike Duplicates

Matrix spike analyses were used to assess matrix effects with respect to the analytical data. The QC frequency requirement specified in the Management Plan of one matrix spike/matrix spike duplicate (MS/MSD) per analytical batch was met.

The matrix spike/matrix spike duplicate results were compared to identify the laboratory precision. The MS/MSD percent recoveries and RPDs were all within the control limits, with the following exceptions.

- The MSD percent recovery was above the control limits for nitrobenzene at 174%. The associated MS percent recovery was within the control limits; therefore, no data were qualified.

Blank Spike Review

All blank spike recoveries were within the control limits. No data require qualification based on blank spike percent recoveries.

Surrogate Recoveries

Surrogate compounds are used in the analysis of organic compounds to monitor analyte extraction efficiency/method accuracy on a per sample basis. Surrogate percent recoveries for all samples, except the blank spike, were outside of the control limits. All data were qualified as estimated (J).

Reporting Limits

To ensure that the level of sensitivity required for project goals was met, reporting limits were reviewed. The reporting limits requested in the Management Plan were met or exceeded.

Analyte	Requested RL (µg/L)	Actual RL (µg/L)
nitrobenzene	1.7	0.10
1,3-dinitrobenzene	0.44	0.05
2,6-dinitrotoluene	--	0.05
2,4-dinitrotoluene	--	0.05
1,3,5-trinitrobenzene	0.16	0.05
2,4,6-trinitrotoluene	--	0.05

Summary

The data reviewed are acceptable for use based on a majority of acceptable quality control data. The data meet most criteria specified in the 1992 Hart Crowser Management Plan. The data may be used to assess analyte concentrations in the groundwater without qualification.

Introduction

This section presents a quality control (QC) review of data generated from collection and analysis of groundwater samples from the Weyerhaeuser-Dupont site in Dupont, Washington, on March 28, 2001. Five primary samples and one field duplicate were submitted to Sound Analytical Services for analysis. This review includes evaluation of the following:

- Chain of custody and holding times
- Laboratory report and reporting of required analyses
- Laboratory blanks
- Field duplicates
- Laboratory duplicates
- Matrix spike/matrix spike duplicates (MS/MSD)
- Blank spike review
- Surrogate recoveries
- Reporting limits

The data quality review was conducted using the following documents:

- National Functional Guidelines for Organic Data Review, EPA, February 1994.
- Remedial Investigation/Feasibility Study, Former Dupont Works Site Management Plan, Hart Crowser, January 1992.

Criteria used to assess the data are found in Section 5 of the Management Plan. The analytical data has been compared to the Management Plan limits.

The samples were analyzed for the following chemicals and chemical groups.

Nitroamine & Nitroaromatic Compounds: SW846 8330

Sample Case

The following table includes samples associated with this data review, the laboratory sample identification number, any analytes that were qualified, and any qualifiers that were added to the laboratory data.

Sample ID	Laboratory ID	Analyte	Qualified Result
MW-44 (dup of MW-22)	97075-01	none	
MW-3	97075-02	none	
MW-6	97075-03	none	
MW-19	97075-04	none	
MW-22	97075-05	none	
W-2	97075-06	none	

Chain of Custody and Holding Times

The chain of custody forms indicate that the samples were maintained under chain of custody, the forms were signed during release and receipt, and the samples were appropriately preserved.

The water holding time for NAX is 7 days from collection to extraction, and 40 days from extraction to analysis. Holding times were met for all samples.

Laboratory Report and Reporting of Required Analyses

The laboratory reported all requested analyses and the laboratory report is complete. The project scope of work stated that URS would provide industry-accepted evaluation of data quality and documentation of sample acquisition and custody.

Section 5 of the Management Plan gives the required QC level of effort, including QC measures such as calibration frequency. These QC measures may have been met by the laboratory, but were not confirmed through data evaluation because comprehensive data validation was not requested. The reports provide all necessary information to complete this data assurance review.

Method Blanks

Method blanks were used to determine if samples were contaminated through laboratory procedures or equipment. The QC frequency requirement specified in the Management Plan of one laboratory blank per analytical batch was met. Target analytes in the method blank were below detection. No data require qualification based on method blank contamination.

Field Duplicates

Field duplicate samples are used to assess sampling precision and representativeness. The QC frequency requirement of one field duplicate for 5 percent of the total samples, specified in the Management Plan, was met. One set of field duplicate samples was collected at MW-22 and the duplicate was identified as MW-44. The primary and duplicate samples did not have any detections greater than the reporting limit. No data require qualification based on the field duplicate.

Laboratory Duplicates

The laboratory analyzed matrix spike/matrix spike duplicates for the explosives method.

Matrix Spike/Matrix Spike Duplicates

Matrix spike analyses are used to assess matrix effects with respect to the analytical data. The QC frequency requirement specified in the Management Plan of one matrix spike/matrix spike duplicate (MS/MSD) per analytical batch was not met. The laboratory did not have enough sample volume to perform an MS/MSD. The laboratory did perform a blank spike/blank spike duplicate. No data were qualified.

Blank Spike Review

All blank spike recoveries were within the control limits. No data require qualification based on blank spike percent recoveries.

Surrogate Recoveries

Surrogate compounds are used in the analysis of organic compounds to monitor analyte extraction efficiency/method accuracy on a per sample basis. Surrogate percent recoveries were within the control limits for all samples, with the following exception. The surrogate percent recovery for sample MW-19 was greater than the control limits at 158%. The associated sample results were less than the reporting limit; therefore, no data were qualified.

Reporting Limits

To ensure that the level of sensitivity required for project goals was met, reporting limits were reviewed. The reporting limits requested in the Management Plan were met or exceeded with the exception of the reporting limits for 2,4-dinitrotoluene and 2,5-dinitrotoluene. No data were qualified.

Analyte	Requested RL (µg/L)	Actual RL (µg/L)
nitrobenzene	8	0.4
1,3-dinitrobenzene	1.6	0.5

Analyte	Requested RL (µg/L)	Actual RL (µg/L)
2,6-dinitrotoluene	0.13	0.4
2,4-dinitrotoluene	0.13	0.4
1,3,5-trinitrobenzene	0.8	0.5
2,4,6-trinitrotoluene	2.9	0.4

Pre-1994 Data Quality Assessment

This appendix material was developed in draft form by Hart Crowser for the 1994 Draft RI (Hart Crowser 1994d). For completeness, it is retained here as it was developed. It includes references to all sampling conducted as specified in the RI/FS Management Plan (Hart Crowser 1992a). As a result, it refers to locations sampled outside the Consent Decree Boundary that will be the subject of additional reports.

DATA QUALITY ASSESSMENT

This appendix describes the assessment of data quality of the chemical analyses performed for the remedial investigation (RI) as outlined in the RI/FS Management Plan (Hart Crowser, 1992), including the pre-RI, RI, and interim source removal data. Much of the previous investigation data quality work conducted on the Site is summarized in the data quality sections of the pre-RI reports (Hart Crowser, 1986 and 1987, respectively). If data quality review was not conducted on pre-RI data, we reviewed the data as part of this project, and any data quality considerations are addressed in this appendix. A data quality review was conducted in order to evaluate data usability to determine the distribution of chemicals on the Site in the RI and to evaluate risk to human health and the environment (EPA, 1990).

The data validation and data quality review reports as of April 1994 are for results of approximately 4,800 soil samples, 28 freshwater sediment samples, 11 marine sediment samples, 16 Bunker C samples, 70 surface water samples, and 335 groundwater samples as summarized in this appendix.

This data quality assessment appendix contains the following sections:

- Section F.1 — Summary of analytical methods used for chemical analysis of samples collected for the RI as specified in the Management Plan;
- Section F.2 — Evaluation of Site data for explosives method performance;
- Section F.3 — Summary of specific data quality results; and
- Section F.4 — Evaluation of overall precision, accuracy, representativeness, completeness, and comparability, and RI sample handling, holding times, and reporting limits. The detailed data validation reports are contained in supplemental reports in Hart Crowser's Weyerhaeuser/DuPont Project File.

Table F-1 summarizes the total number of critical data points and the extent of data qualification. Table F-2 presents a list of critical data that have been qualified based on our validation efforts and includes reasons for the qualification. Critical data include sample results that were greater than or within twenty percent of the MTCA screening level as specified in Section 1-1 of the RI. This list was analyzed to identify trends in quality control parameters that may impact specific data sets and overall data quality. Critical data were evaluated in order to assess the level of uncertainty in the data used to define chemical distribution for the RI, evaluate FS cleanup options, and quantify risk. No trends impacting overall critical data quality were identified; therefore, there is a high level of confidence associated with the data.

Analytical Methods

Sampling and analysis of soil, sediment, surface water, and groundwater from the Site used analytical methods and data quality objectives specified in the Quality Assurance Project Plan (QAPP; Section 5.0 of Hart Crowser, 1992a). Analytical methods were based on SW-846 protocols or other Ecology-approved methods in accordance with WAC 173-340-830(4)(a) (see page 5-5 of the Management Plan). Ecology approved the analytical methods for explosives analyses and lead (see Attachment 5-8 of the Management Plan). Appropriate methods were selected to achieve sufficient reporting limits to evaluate results against MTCA screening levels.

Chemical analyses were performed by Analytical Technologies, Incorporated (ATI). Explosives analyses were performed at the ATI Fort Collins laboratory. The other chemical analyses were performed at ATI in Renton, Washington, or San Diego, California. Samples for a given chemical analysis method were performed by the same ATI regional laboratory except for metals. Most soil samples were analyzed for metals by the ATI Renton laboratory. A limited number of soil samples were analyzed for metals at the ATI San Diego laboratory (see discussion in Section F.4.5 on comparability).

In addition, a limited number of soil samples were analyzed by the Hart Crowser *FAST* Laboratory for lead and TPH. These data received a limited review, which is also discussed in this appendix.

Evaluation of Explosives Method Performance

Analysis methods were developed by Hart Crowser and ATI for nitroaromatic explosives, MMAN, and nitroglycerin in order to achieve reporting limits low enough to meet MTCA screening levels. Method performance was evaluated in order to determine if reporting limits were achievable. Results of ATI's Method Detection Limit (MDL) study for nitroaromatic explosives were compared with reporting limits and MTCA screening levels for groundwater and surface water. The MDL study was performed according to EPA guidance (40 CFR 136B). Reporting limits are less than MTCA screening levels; however, in some cases dilution was required prior to analysis and as a result, sample detection limits for selected samples were elevated above the screening levels.

Reporting limits and MTCA screening levels were also compared to ATI instrument calibration ranges. For all analytes, the reporting limit is comparable to the lowest level calibration standard, indicating that accurate quantitation can be achieved at this concentration.

Summary of Specific Data Quality Results

In general, overall data quality for this project was very good. Table F-1 summarizes by matrix the total number of critical data points, the number of estimated (J) and rejected (R) critical data points, and the percent of the critical data not requiring qualification. The percent of critical data not requiring qualification was in most cases greater than 90 percent. This indicates that overall data quality was high and meets data usability requirements as defined by EPA (1990). The limited amount of qualification of critical data indicates that the data are highly reliable for use in the RI/RA/FS.

In two cases, data review resulted in the rejection of data based on EPA guidance (EPA, 1988a and 1988b) (or on professional judgment). Two data sets were identified that were rejected or not used: organophosphate pesticides (OP Pesticides) in freshwater sediments and PAHs in marine sediments.

Freshwater Sediment OP Pesticides. OP pesticide results were rejected for all freshwater sediments analyzed by EPA Method 8140 for several reasons. Initial and continuing calibration was outside of established control limits, surrogate recoveries were high, ranging from 164 to 501 percent (outside the control limits of 50 to 150 percent), and matrix spike recovery was high (outside the control limit of 120 percent). Because of the cumulative effect of multiple qualifiers, all sample results were qualified as rejected (R) based on EPA guidance.

Marine Sediment PAHs. PAH results were not used for all marine sediment samples analyzed by EPA Method 8310 because of data quality issues and the availability of a more reliable data set. PAH results from the semivolatiles analyses (EPA Method 8270) for these samples were used instead. PAHs were determined by two analytical methods in order to meet sediment management standards for all compounds. Method 8310 may be able to achieve lower detection limits than Method 8270 for some PAH compounds; however, the 8310 results may be less qualitatively reliable due to matrix interferences and associated compound resolution problems, and lack of confirmation of compound identities. The 8270 method is a confirmation method and thus more qualitatively reliable; however, detection limits may be higher for some compounds than can be achieved by Method 8310.

Results from the 8310 analyses indicated there were interferences that resulted in poor matrix spike recovery, and the duplicate precision was not as good as those from the 8270 analysis. Method 8270 was also able to achieve sufficiently low sample detection limits for all compounds to evaluate results against sediment management standards, therefore only the PAH results from the Method 8270 analysis for marine sediments were used.

Data Quality Review Results

In general, the data quality objectives of the project as specified in the QAPP were met with the exception of the rejected data. The analytical data, as qualified, are deemed acceptable for use in this RI/RA/FS. All laboratory data were subjected to one of two levels of quality

assurance review as described below by either Hart Crowser, or EcoChem, Inc., of Seattle, Washington. The detailed data validation reports and original laboratory data are available in Hart Crowser's project files. The following discussion summarizes the findings detailed in the data validation reports.

To confirm the usability of the data for the RI/RA/FS, approximately twenty percent of all soil data produced by ATI received full validation in accordance with EPA's Laboratory Data Validation Functional Guidelines for Evaluating Organics Analysis (EPA, 1988a) and with Laboratory Data Validation Functional Guidelines for Evaluating Inorganics Analysis (EPA, 1988b), including evaluation of raw data sample chromatograms and initial and continuing calibration verifications. In addition, all Round 1 and Round 8 groundwater, surface water, and freshwater and marine sediments received full validation.

The remaining soil and water chemical data used in the risk assessment and any field screening data were reviewed with regard to the following, as appropriate to the particular analysis:

- Holding times;
- Blanks;
- Detection limits;
- Duplicates;
- MS/MSDs;
- Surrogate recoveries;
- Completeness;
- Comparability; and
- Reporting limits.

Chemical analyses of quality control samples such as method blanks, MS/MSD, and laboratory duplicates were performed as specified in the applicable analytical protocols and in the QAPP. Field duplicates were collected to evaluate field and laboratory precision with respect to sample homogeneity, collection, handling, shipping, storage, preparation, and analysis.

Assessment of overall data quality was based upon quantitative (precision, accuracy, completeness) and qualitative (representativeness, comparability) quality assurance objectives. Definitions of these parameters and the applicable quality control procedures are given below in Sections F.4.1 through F.4.5.

Precision

Precision measures the reproducibility of measurements under a specific set of conditions. It is a quantitative measure of the variability of a group of measurements compared to their average values. Analytical precision is measured through matrix spike/matrix spike duplicate (MS/MSD) samples for organics analyses and through laboratory duplicate samples for inorganic analyses. Analytical precision is quantitatively expressed as the relative percent difference (RPD) between the MS/MSD or duplicates. Analytical precision measurements

were carried out on site matrices at a minimum frequency of one per laboratory analysis group or one in 20 samples, whichever was more frequent, per matrix analyzed.

The RPD is calculated as follows:

$$RPD = \frac{(C_1 - C_2) \times 100\%}{(C_1 + C_2)/2}$$

Where:
C_1 = Larger of the two observed values
C_2 = Smaller of the two observed values

MS/MSD and laboratory duplicate precision generally met data quality performance criteria and were deemed acceptable. A number of metals including cadmium, chromium, lead, mercury, and nickel, and PAH data were qualified based on poor laboratory duplicate precision (see Table
F-2). The poor PAH precision values were caused by sample dilution that was required due to high concentrations and/or matrix interference. The poor metals precision may be due to the heterogeneous sample matrix.

Field duplicates were used to assess both laboratory and field precision. Field duplicate precision is discussed in Section F.4.4.

Accuracy

Accuracy measures the closeness of the measured value to the true value. The accuracy of chemical test results is assessed by "spiking" samples with known standards (surrogates or matrix spike) and establishing the percent recovery (%R). Accuracy measurements on matrix spike samples were carried out at a minimum frequency of one in 20 samples per matrix analyzed for both organic and inorganic analyses. Surrogate recoveries were determined for every sample analyzed for organics in accordance with SW-846 requirements for organic analysis.

Percent recovery is calculated as follows:

$$\%R = 100\% \times (S-U)/C_{SA}$$

Where:
S = Measured concentration in spiked aliquot
U = Measured concentration in unspiked aliquot
C_{SA} = Actual concentration of spike added

In general, the data accuracy is adequate for the purposes of this RI/RA/FS. Several sample matrix spike and/or surrogate recoveries of organics analyses were outside of control limits and the data were qualified accordingly (see Table F-2). Samples were qualified as rejected (R) when either matrix or analytical spikes were not recovered in a number of metals

analysis, including cadmium and antimony, and one nitroglycerin and one sample analyzed for nitroaromatic explosives.

Surrogate recoveries were often out of control limits when sample dilution was required. This occurred primarily with explosives and PAH data.

Completeness

Completeness is defined as the percentage of measurements made which are judged to be valid measurements. Results will be considered valid if all the precision, accuracy, and representativeness objectives are met. The target completeness goal for this RI/RA/FS is 90 percent as defined in the QAPP.

Measurement of completeness (C) is based on overall usefulness of the data and is defined as the ratio of acceptable measurements obtained to the total number of planned measurements for an activity.

$$C = \frac{\text{Total No. of data within target QC limits}}{\text{Total No. of data points}} \times 100$$

Total number of data within target QC limits is calculated by subtracting the total number of rejected (R) data points from the total number of data points. (Note that each analyte counts as one point.)

A total of approximately 64,300 data points were generated as part of the sampling and analysis program outlined in the Management Plan and conducted during the RI.

Overall completeness of the data is 99.5 percent. A number of specific data points were rejected for various quality control reasons. Table F-2 outlines the reasons for rejecting specific data points.

Representativeness

Representativeness is a measure of how closely the measured results reflect the actual concentration or distribution of the chemical compounds in the matrix sampled. The sampling plan design, sampling techniques, and sample handling protocols (e.g., storage, preservation, and transportation) were designed to assure representative samples with respect to the site. Representativeness is evaluated based on the collection and analysis of field duplicates, rinseate blanks, trip blanks, and laboratory method blanks.

- Field duplicates were used to assess field and method variation.

- Rinseate blanks were used as a quality control check on the effectiveness of sampling equipment decontamination procedures and possible contamination carry over during collection of the samples.

- Trip blanks were used to assess the potential contamination of water samples by volatile organic compounds during sample handling, storage, and transport to the laboratory.

- Laboratory method blanks were used to assess laboratory contamination during the performance of the method.

Additionally, elevated dissolved antimony concentrations were found to be derived from filters from the manufacturer and were therefore not representative of Site conditions (see the discussion below and in Section 3.2.3 of the RI).

Field Duplicates. Field duplicates and blind field duplicates were used to assess field and analysis method variation and were obtained at a minimum frequency of 1 per 20 samples, except groundwater field duplicates, which were collected at a frequency of 1 per 28 samples. Blind field duplicates were submitted to the laboratory without identifying them as field duplicates.

Field duplicate precision was evaluated by calculating the relative percent difference (RPD) between the reported results for a sample and its duplicate. Field duplicate precision data quality performance criteria have not been established by EPA (EPA, 1988a and 1988b). A screening level of 50 percent was used to evaluate detected sample results. Non-detected results cannot be reliably evaluated for precision.

Since duplicate analyses measure both field and laboratory precision, results may be quite variable. Poor precision can be a reflection of the difficulties associated with collecting identical field samples and sample heterogeneity. Poor precision can also be attributed to low levels detected near the detection limit as observed with the explosives and PAH analyses. Precision was generally acceptable at higher concentrations of these analyte groups.

The overall precision of the field duplicate analysis was acceptable. For all matrices and analytes combined, 80% of the RPDs calculated were below 50 percent. In addition to field duplicates, approximately 40 blind duplicates were submitted for analysis during the last round of surface soil sampling for arsenic. Blind duplicates were submitted to evaluate potential bias in precision of the non-blind field duplicate samples. No field duplicate bias was found. The average RPD of the field duplicates and blind duplicates were essentially equal, at 20 and 21 percent, respectively.

No data were qualified based on field duplicate or blind duplicate precision.

Rinseate Blanks. Potential contamination of groundwater samples in the field is assessed through analysis of rinseate blanks. Rinseate blanks are collected from the final rinse with de-ionized water of decontaminated sampling equipment. Rinseate blanks contained low concentrations (less than screening levels) of one or more of the following target analytes:

- Total aluminum, cadmium, antimony, copper, chromium, selenium, and zinc were detected in one of five rinseate blank samples;
- Dissolved antimony (detected in four of five samples) and zinc (detected in one of five

samples);

- 2,4,6-TNT and 2,4-DNT were detected in one of five samples;
- PCBs were detected in three of five samples;
- PAHs were detected in four of five samples;
- TOC was detected in four of five samples; and
- TDS was detected in one of five samples.

Detections may be attributed to poor decontamination techniques. However, all detections were less than screening levels and therefore cross-contamination from sampling equipment did not impact reported sample results.

For samples associated with a blank containing a detectable concentration of a target analyte, action was taken by comparing sample detects to 5X (10X for common organic laboratory contaminants) the level detected in the blank (action level). If the sample result was less than the action level, the result was qualified as not detected (U) with an elevated reporting limit.

Trip Blanks. Trip blanks, consisting of organic-free distilled, de-ionized water in sealed VOA bottles, were carried into the field during groundwater sampling operations. Two trip blanks were stored and shipped to ATI with each round of groundwater samples and analyzed for volatile organics to assess outside sources of contamination. Two trip blanks had detectable concentrations of chloroform, a common laboratory contaminant. The chloroform contamination may be due to residual solvent from the laboratory bottle decontamination process.

Laboratory Blanks. Laboratory method blanks were analyzed by the laboratory at a minimum of 5 percent frequency to assess laboratory contamination. Several laboratory method and instrument blanks associated with both soil and water analyses contained analytes at concentrations at or above the reporting limit. Common laboratory contaminants were methylene chloride, acetone, hexane, di-n-butylphthalate, bis(2-ethylhexyl) phthalate, and di-n-octylphthalate.

Dissolved Antimony Related to Sample Filtration. Filters used in the collection of filtered groundwater and surface water samples for dissolved metals analyses contributed antimony to the filtered samples. Antimony was detected consistently in filtered groundwater and surface water samples from the Site, but not in unfiltered samples. This is contrary to the typical situation, where total metals concentrations were substantially higher than dissolved concentrations due to sample turbidity. Strong evidence, including independent data from the manufacturer, exists that the filters contributed antimony to the filtered water samples, and that antimony is not present at detectable concentrations in Site groundwater or surface water. Section 3.2.3 in Volume 1 provides additional details.

Comparability

Comparability is a qualitative parameter expressing the confidence of one data set compared with another. The use of standard techniques for both sample collection and laboratory analysis should make data collected comparable to data generated by different laboratories or by the same laboratory at different times. Comparability can be judged by evaluating the consistency in sampling and analysis methods used, and the differences between results produced by different laboratories.

Field Sampling. Throughout field activities, field sampling procedures were followed as outlined in the RI/FS Management Plan (Hart Crowser, 1992). Field audits were conducted during soil and groundwater sampling activities during the RI to evaluate adherence to sampling protocols. Three audits were conducted during soil sampling events on November 18, 1993, December 10, 1993, and January 7,1994. One audit was conducted during groundwater sampling on January 4, 1993.

Due to the non-homogeneous nature of the soil matrix, it is essential that consistent sampling methods are used to collect representative samples. We noted during our field audits that surface soil samples were consistently collected from 0- to 6-inch depths. Care was taken to collect approximately equal amounts from the entire soil horizon and to mix the sample well prior to placing in the sample jar. We found that the sampling methods were consistent between sampling events and field teams.

Groundwater sampling consistency is maintained by routinely purging three casing volumes of water from each well prior to sampling, monitoring pH, temperature, and conductivity during well purging, and using dedicated bailers to avoid cross contamination. Purging the well and collecting only fresh water from the aquifer assures samples are representative of aquifer conditions.

Based on the results of these audits, samples were collected according to protocols outlined in the RI/FS Management Plan and therefore results for soil and groundwater are considered representative of site conditions.

Ecology Split Data Evaluation. Fifty-two field duplicate samples were collected and submitted to ATI and Manchester for analysis for arsenic in soil. ATI and Manchester prepared the samples according to ATI's SOP which was approved by Ecology as part of the Sampling and Analysis Plan in the Management Plan (Hart Crowser, 1992). RPDs ranged from 0.71 to 49 percent, typical values for the preparation and analysis of soil samples. Four of 52 RPD values were greater than 35 percent, EPA's precision criteria for evaluating soil laboratory duplicates (EPA, 1988b). No EPA or state criteria have been established for evaluating field duplicate precision.
Results for field duplicates analyzed by ATI were confirmed by Manchester, therefore, arsenic results reported by ATI for this project are considered to be representative of conditions on the Site.

Analysis Methods. SW-846 or EPA-approved methods (see page 5-5 and Attachment 5-8 of the Management Plan) were used during all sampling for all parameters. Although our analyses of explosives compounds by GC/ECD, MMAN by GC/FPD, and nitroglycerin by HPLC did not employ a standard SW-846 method, Standard Operating Procedures (SOPs) were used by ATI which produced internally comparable results. All RI data collected for this work were comparable because samples of a given matrix that were analyzed by a specific analytical method were consistently sent to the same ATI laboratory with only one exception.

A small number of soil samples were analyzed in the ATI San Diego laboratory for total metals. SW-846 methods were employed as by the ATI Renton laboratory with only one exception. Matrix spikes from the graphite furnace analyses in Renton were not analytically spiked like the samples analyzed at ATI San Diego. Matrix spike percent recoveries were therefore evaluated based on sample and matrix spike results which were derived from the same calculations and do not account for analytical spike corrections. Because SW-846 methods were followed by both laboratories, data produced by the San Diego laboratory are considered comparable to that produced by the Renton laboratory.

Total lead in soil was also analyzed by the Hart Crowser *FAST* Laboratory using an Ecology-approved method (see Attachment 5-8 of the Management Plan). The *FAST* Laboratory digestion method is different than the
SW-846 method. The Hart Crowser mobile laboratory used a microwave digestion technique for determination of total lead by atomic absorption. At the start of this project microwave digestion was not an SW-846 method; however, an approval letter from Ecology for use of Hart Crowser lead analyses as an approved method in accordance with WAC 173-340-830(4)(a)(vii) was included as Attachment 5-8 in the QAPP. Evaluation of the correlation between the *FAST* Laboratory and SW-846 methods indicate comparable results. A total of 16 samples were analyzed by both Hart Crowser's *FAST* Lab and ATI. A regression analysis of the data resulted in a correlation coefficient (r^2) of 0.91. The *FAST* Lab screening results show excellent comparability when compared to ATI's SW-846 method for the analysis of lead.

Sample Handling. Sample handling involved the collection of samples and the transportation of intact samples from field to laboratory. This pathway was monitored through field notes, custody forms, and data tracking sheets completed by Hart Crowser personnel. Samples were collected and handled following appropriate procedures to obtain representative samples (40 CFR Part 136, 1985 and EPA, 1986) (see Section 5-6 of the Management Plan). Appropriate containers and preservatives were used to maintain sample integrity. Samples were received by ATI within 24 hours of collection. Samples were received in good condition with the accompanying chain of custody documentation.

Holding Times. Holding time requirements for compounds are stated in Table 5-2 of the Management Plan (Hart Crowser, 1992). Holding times were calculated according to the date of sample collection. In general, all samples were extracted and analyzed within the recommended holding times. However, a number of PAH and mercury data were qualified as estimated (J) due to extraction or analysis beyond the recommended holding times (see

Table F-2).

Reporting Limits. Required reporting limits were established to meet the MTCA screening levels listed in Table 1-1 of the RI. For most analyses, reporting limits were less than or equal to MTCA screening levels. Reporting limits for non-detected results, which were above screening levels, were elevated due to dilution and were primarily associated with nitroaromatic explosives analyses for soil samples, chlorinated benzene in the marine sediment samples, and indeno(1,2,3-c,d)pyrene in the groundwater samples.

Most elevated nitroaromatic reporting limits were due to dilution of soil samples for quantitation of high positive levels of one or more analyte(s). Chlorinated benzene reporting limits were elevated due to high sample moisture content. The screening level for indeno(1,2,3-c,d)pyrene is between the MDL and reporting limit. ATI identifies compounds that are detected below the reporting limit and qualifies them as estimated because they are below the quantitation limit; however, since none of the sample results were qualified for this reason, it is unlikely that indeno
(1,2,3-c,d)pyrene was present in the samples at concentrations above the screening level. Additionally, semivolatile results were qualified as estimated mainly because target compounds were detected below the reporting limit.

Notes:
Areas 20 and 40 (Parcel 2) achieved No Further Action status in 1993 and 1996, respectively.
Areas 15 and 32 within the CDB underwent Independent Cleanup Actions (1981 to 1988).
Areas outside the CDB that are/will be the subject of other reports: 9, 13, 14, 17, 21, 24B, 27, 28, 29, 33, 34, and 37.
Areas outside the CDB that underwent Independent Cleanup Actions (1981 to 1988): 9, 21, 27, 28, 29, and 33.
Areas outside the CDB that achieved No Further Action status: 21, 27, 28, and 29.
CDB - Consent Decree Boundary
NGRR - Narrow Gauge Railroad
RR - railroad

Table 2.2-1
Summary Statistics of Soil Quality in Area Background Samples

	Range of Concentrations	Maximum Detection	Detection Frequency	Arithmetic Mean	Arithmetic Std. Dev.	Nat. Log. Mean	Nat. Log. Std. Dev.
Metal (total) in mg/kg

Table 3.1-1
Summary of Hydraulic Conductivity (K) Estimates

Water Table Aquifer

Site-Specific Data:

Well No.	Method	Estimated K in cm/sec
MW-12	Short-term pumping test	2×10^{-2}
MW-7	Short-term pumping test	7×10^{-2}
MW-8	Slug test	2×10^{-3}
MW-14	Slug test	1×10^{-2}
MW-22	Slug test	2×10^{-3}
MW-24	Slug test	2×10^{-3}
Various[a]	Grain size data	5×10^{-1} to 4

Regional Data:

Well No.	Method	Estimated K in cm/sec
City of DuPont No. 1[b]	Pumping test	4×10^{-3}
PW-1A[c]	Pumping test	9×10^{-3} to 2×10^{-2}

Best Estimate Range[d] for Water Table Aquifer:	5×10^{-3} to 5×10^{-2}

Semi-confined Sea Level Aquifer (East of "Cutoff")

Site-Specific Data:

Well No.	Method	Estimated K in cm/sec
MW-18	Slug test	4×10^{-3}

Regional Data:

Well No.	Method	Estimated K in cm/sec
Bell Hill No. 1[e]	Pumping test	5×10^{-2}
Bell Hill No. 2[f]	Pumping test	4×10^{-2}
Weyerhaeuser No. 3[b]	Pumping test	1×10^{-2}
Fort Lewis No. 18[b]	Pumping test	6×10^{-3}

Best Estimate Range[d] for Semi-confined Sea Level Aquifer:	1×10^{-2} to 5×10^{-2}

Unconfined Sea Level Aquifer (West of "Cutoff")

Site-Specific Data:

Well No.	Method	Estimated K in cm/sec
MW-2	Slug test	3×10^{-3}
MW-4	Slug test	2×10^{-3}
MW-6	Slug test	4×10^{-2}
MW-16	Slug test	2×10^{-2}
Various[a]	Grain size data	2×10^{-1} to 1

Regional Data:

Well No.	Method	Estimated K in cm/sec
None[c]	Literature review	4×10^{-1} to 4

Best Estimate Range[d] for Unconfined Sea Level Aquifer:	1×10^{-2} to 1

Table 3.1-1 (Continued)
Summary of Hydraulic Conductivity (K) Estimates

[a]K estimates from grain size data are presented in Table 3.1-2.
[b]From Associated Earth Sciences 1984.
[c]From Woodward-Clyde Consultants 1990.
[d]The Best Estimate Range represents the best estimate of the reasonable range of aquifer K values based on all available data.
[e]From Hart Crowser 1988b.
[f]Pumping test conducted in Bell Hill No. 1 during drilling of Bell Hill No. 2 to deeper aquifer (from Hart Crowser 1990).

Note:
cm/sec - centimeter per second

Table 3.1-2
Hydraulic Conductivity (K) Estimates Based on Application of Kozeny-Carmen Equation to Grain Size Data

Sample No.	Sample Description From Grain Size	d50 in cm	Estimated K in cm/sec assuming	
			porosity = 0.2	porosity = 0.35
Water Table Aquifer				
MW-13, S-3	Slightly silty, very sandy GRAVEL	0.7	3	24
MW-20, S-17	Very gravelly SAND	0.178	0.2	2
MW-21, S-17	Slightly silty, very sandy GRAVEL	0.484	1	11
MW-22, S-20	Slightly silty, very sandy GRAVEL	0.807	4	32
MW-24, S-11	Slightly silty, very sandy GRAVEL	0.383	0.9	7
	Geometric Mean of Values:		1.2	10
Unconfined Sea Level Aquifer (West of Cutoff)				
MW-4, S-8	Gravelly SAND	0.1	0.06	0.5
MW-5, S-8	Slightly silty, gravelly SAND	0.3	0.5	4
	Geometric Mean of Values:		0.2	1

Notes:

Grain size data for wells MW-20 through MW-24 presented in Appendix D.

Grain size data for MW-13, MW-4, and MW-5 from Hart Crowser 1988a.

Kozeny Carmen Equation is $(\rho g/1.8\mu) * (d50)^2 * [n^3/(1-n)^2]$ (Freeze and Cherry 1979),

where ρ = density of water in kg/m^3; g = gravitational acceleration in m/sec^2; 1.8 is units correction factor;

n = porosity; d50 is median grain size in cm. At 15°C, $\rho g/1.8\mu$ is 478 $cm^{-1}sec^{-1}$.

cm/sec - centimeter per second

Table 3.1-1 (Continued)
Summary of Hydraulic Conductivity (K) Estimates

[a]K estimates from grain size data are presented in Table 3.1-2.
[b]From Associated Earth Sciences 1984.
[c]From Woodward-Clyde Consultants 1990.
[d]The Best Estimate Range represents the best estimate of the reasonable range of aquifer K values based on all available data.
[e]From Hart Crowser 1988b.
[f]Pumping test conducted in Bell Hill No. 1 during drilling of Bell Hill No. 2 to deeper aquifer (from Hart Crowser 1990).

Note:
cm/sec - centimeter per second

Notes:

Blanks indicate constituent was not proposed for analysis at that sampling location in the RI/FS Management Plan.

Numbers in brackets [ ] are usable data points for constituents not proposed for analysis in RI/FS Management Plan, but analyses were conducted.

Total number of total or dissolved lead analyses are equal to the sum of the lead only (pre-RI) and 14 metals (RI) numbers of analyses.

Table 3.2-2 (Continued)
Number of Usable Data Points (Analyses) for Each Groundwater Sampling Location

FS - feasibility study
MMAN - monomethylamine nitrate
NAX - nitroaromatic explosives
NG - nitroglycerine
OC - organochlorine
OP - organophosphorus
PAH - polycyclic aromatic hydrocarbon
PCB - polychlorinated biphenyl
RI - remedial investigation
SVOC - semivolatile organic compound
TPH - total petroleum hydrocarbons
VOC - volatile organic compound

Notes:

1. Exploration number consists of the area number–exploration type–discrete number for the exploration. The addition of a GS designation (–TP–GS– or –SS–GS–) to the exploration number indicates a grid sampling location. Symbol types do not differentiate between pre–RI and RI explorations.
2. Area 18 has four maps, each map delineating the locations of a specific sample type.

APPENDIX D

MSU REMEDIATION DOCUMENTATION

APPENDIX D- MSU REMEDIATION

The purpose of this appendix is to document the successful remediation of all of the Miscellaneous Small Units (MSUs). MSUs are areas where isolated, small occurrences of total petroleum hydrocarbons, (i.e., TPH , which includes motor oil and Bunker C), 2,4-ditrotoluene (2,4-DNT), 2,6-dinitrotoluene (2,6-DNT), 2,4,6-trinitrotoluene (TNT), nitrobenzene, benzo(a)pyrene, aldrin, tetrachloroethene, arsenic, copper, lead, and/or mercury were present and required remediation.

The cleanup goals for constituents in each MSU were either cleanup levels (CL), remediation levels (RL), or a screening level (SL). RLs were derived using human health risk assessment procedures, incorporating exposure assumptions and other media-specific factors reflecting future Site conditions. There was one SL used, which was a value for lead derived by Ecology for protection of terrestrial ecological receptors. The CL, RL or SL for the same constituent varies according to the Remediation Unit (RU) where they are located. For example, the RL for arsenic in a Placement Area (PA) is 530 mg/kg, while the RL in Commercial Areas is 60 mg/kg. In Open Space Areas the target arsenic level is a CL of 32 mg/kg. To see a list of the CLs, RLs, and the SL for the different RUs see Tables 2-1, 3-1, 4-1, 5-1, and 6-1 of the main document.

In general, the process for achieving CLs, RLs, or the SL at each MSU was to excavate a box of a prescribed dimension around the sample location where there was an exceedance. CLs were either MTCA table values derived by Ecology using default exposure assumptions, or Site-specific values derived by Ecology. After excavation, verification samples were then collected to confirm that the concentration of the constituents of concern (COC) was below the associated CL, RL, or SL. If the concentration of the COC was not below the CL, RL, or SL, then further excavation and sampling was performed until the verification samples confirmed that concentration of the COC was below the cleanup goal. All verification samples collected from the bottom of excavations were five-point composite samples. A five-point composite sample consisted of soil collected from the center of an excavation and from locations equidistant from the center and the four corners of the excavation. All verification samples identified as sidewall samples were collected by scraping the excavation sidewall at the depth interval where the COC was originally identified.

In this appendix, general MSUs are presented first followed by the Narrow Gauge Railroad (NGRR) MSUs, Foundation MSUs, and Debris Area MSUs.

The majority of the historical TPH-impacted soil was associated with Bunker-C fuel oil that was used at the Old Powerhouse. In a couple of instances it was confirmed that TPH-impacted soil was not due to a release of Bunker C and in those cases TPH was reported as motor oil. More recent analytical results for both constituents are reported as a motor oil concentration.

D.1 MSUs–General

For MSUs not associated with specific NGRR, Foundations, or Debris areas, a historical sample that exceeded cleanup goals would identify the location and associated COC for an MSU. An area, usually 20

x 20 feet, would delineate the dimensions of the MSU for excavation and sampling purposes. After excavation, if verification sample results were below cleanup goals, excavation and sampling at that MSU would be finished. If, however, verification sample results were above cleanup goals, excavation and sampling would continue until such time as sample results verified that the concentration of the COC was below cleanup the goal.

Many MSUs overlap with excavations that were part of previous Interim Remedial Actions (IRAs), (i.e. previous cleanup programs). Where this occurred, sample and excavation depths were adjusted based on previous excavations.

If excavation at an MSU exceeded two feet, then sidewall samples were collected to verify COCs were not present laterally. However, if the MSU excavation depth was less than two feet, then sidewall samples were not collected.

In some cases, MSU footprints in close proximity merged together when excavations of one MSU extended into the area of another MSU. In some instances data from merged MSUs were used collectively to show compliance. In addition, in some instances a location with the 75-foot sampling grid (completed as part of the Large-Scale Excavation program across the Site) was included in the data set to demonstrate that an MSU excavation boundary was adequate.

D.1.1 MSU-1

Bunker C was identified in a one historical sample (7-SS-505) at MSU-1 at a concentration of 10,000 mg/kg and was greater than the CL of 7,600 mg/kg, at a depth of a half foot. An area 50 x 50 feet surrounding this sample location was excavated to a depth of one and a half feet. The excavated soil was placed on the MSU Laydown Area (i.e., an asphalt pad) for off-Site disposal. Verification samples were collected from the bottom of the excavation, and from the north, east and west sidewalls from a depth of zero to a half foot. The resulting motor oil concentration for the bottom sample was 37 mg/kg which was less than the CL of 7,600 mg/kg, and motor oil was not detected in any of the three sidewall samples. The sidewall sample to the south could not be collected because the excavation depth of the adjoining MSU caused it to be no longer in place (NLIP). The excavation boundary, confirmation sample locations and analytical results are presented on Figure D-1.

D.1.2 MSU-2

Bunker C was identified in one historical sample (8-VS-81) at MSU-2 at a concentration of 11,000 mg/kg which was greater than the CL of 7,600 mg/kg, at a depth of 20 to 20.5 feet. This area (i.e., the Area 8 Pipeline) had been previously excavated to a depth of 20 feet and then backfilled with clean fill when the original Bunker C pipeline was removed. An area 20 x 20 feet was excavated at a depth beginning at 20 feet to a depth of 21.5 feet surrounding the sample location. This resulted in a 20 x 20 x 1.5 foot layer being excavated at this MSU. The top 20 feet of excavated soil was placed to the side in a stockpile and the remaining one and a half feet of excavated soil was placed on the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east and west sidewalls at a depth of 20 to 21.5 feet. The verification sample concentrations ranged from 48.2 to 49.8 mg/kg which were all less than the CL of 7,600 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-2.

D.1.3 MSU-3

Lead was identified in one historical sample (7-B-503-S-1C-DAVG) at MSU-3 at a concentration of 530 mg/kg which was greater than the SL of 118 mg/kg, at a depth of two and a half to four feet. An area 80 x 120 feet was excavated from a depth beginning at two and a half feet to a depth of five feet surrounding the sample location, and the soil was placed in the closest Placement Area (PA). Verification samples were collected from the bottom of the excavation, and from each of the sidewalls at depth of two and a half to four feet. The lead concentrations in the verification samples ranged from 5.0 to 88.2 mg/kg and were all below the lead SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-1.

D.1.4 MSU-10

2,4-DNT and 2,6-DNT (reported as DNT-Total) and TNT were identified in one historical sample (25-VS-13) at MSU-10. DNT-Total was found at a concentration of 5.0 mg/kg, which was greater than the CL of 3.0 mg/kg at a depth of 15 to 16 feet. TNT was found at a concentration of 7.0 mg/kg which was greater than the CL of 1.75 mg/kg, at a depth of 15 to 16 feet. An area 15 x 15 feet was excavated at a depth beginning at 15 feet to a depth of 21 feet. This resulted in a 15 x 15 x 6 foot layer being excavated at this MSU. The excavated soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of 15 to 17 feet. The concentrations of TNT detected in the verification samples ranged from 0.2 mg/kg to 0.3 mg/kg which were all less than the CL of 1.75. The concentrations of DNT-Total detected in the verification samples ranged from 0.30 mg/kg to 0.60 mg/kg, which were all less than the CL of 3.0 mg/kg. As this MSU location was within the final boundary of PA-01, it was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-3.

D.1.5 MSU-13

One foot of soil had previously been removed from this area as part of the Pilot Scraping Study. Lead was identified in one historical sample (APC-PS-VS-04-05) at MSU-13 at a concentration of 150 mg/kg which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area 15 x 15 feet was excavated at a depth of one to two and a half feet surrounding this sample location. The excavated soil was placed in the closest PA. A verification sample was collected from the bottom of the excavation and the lead concentration was 22.8 mg/kg which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-4.

D.1.6 MSU-14, 15, 16

Lead was identified in one historical sample (26-B-503-S-1-DAVG) at MSU-14 at a concentration of 250,000 mg/kg, at a depth of zero to one foot. This concentration was greater than the PA RL of 4,100 mg/kg. An area 20 x 20 feet surrounding this sample location was excavated to a depth of three feet. The excavated soil was placed on the MSU Laydown Area for off-Site disposal. After the MSU was excavated, one verification sample was collected from the bottom of the excavation. The resulting lead

concentration was 85.2 mg/kg which was less than the PA RL of 4,100 mg/kg. The excavation boundary and sample locations and results are presented on Figure D-5.

Motor oil was identified in one historical sample (26-B-503-S-1-DAVG) at MSU-14 at concentration of 5,600 mg/kg, in one historical sample (26-B-502-S-1) at MSU-15 at concentration of 2,200 mg/kg, and in one historical sample (26-TP-516-S-1) at MSU-16 at a concentration of 3,500 mg/kg. Each of these results was greater than the CL of 2,000 mg/kg, and all were collected at a depth of zero to one foot. Excavations began around each of these historical sample locations, but enlarged excavations around each area caused the MSUs to merge into one large MSU. To define a perimeter for this merged MSU, samples were collected around the perimeter of a natural depression, as defined by the pre-existing topography. The motor oil concentrations measured in samples collected ranged from 50.5 mg/kg to 1,980 mg/kg and were all less than the CL of 2,000 mg/kg. The excavated soil was placed on the MSU Laydown Area for off-Site disposal. As this MSU location was within the final boundary of PA-04, it was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-5.

D.1.7 MSU-18

Tetrachloroethene was identified in one historical sample (1234-TP-510-S-2-DAVG) at MSU-18 at a concentration of 0.063 mg/kg which was greater than the CL of 0.0091 mg/kg, at a depth of three to six feet. An area approximately 30 x 30 feet was excavated from a depth beginning at three feet to a depth of seven feet surrounding the sample location. The first three feet of soil was placed in the nearest PA and the remaining four feet of soil was placed on the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation at a depth of three to six feet, and tetrachloroethene was not detected in any of these samples. As this MSU location was within the final boundary of PA-05, it was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-6.

D.1.8 MSU-19

Nitrobenzene was identified in one historical sample (31-B-501-S-3) at MSU-19 at a concentration of 0.064 mg/kg at a depth of 10 to 14.5 feet, and in another historical sample (31-B-501-S-3) at a concentration of 0.067 mg/kg at a depth of 15 to 19.5 feet. Both of these concentrations were greater than the CL of 0.051 mg/kg. An area 30 x 30 feet was excavated from a depth beginning at zero feet to a depth of 20.5 feet surrounding the sample locations. The soil from a depth of zero to five feet was placed in a PA, and the remaining dirt from a depth of five to 20.5 feet was placed in the MSU Laydown Area, for off-Site disposal. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east, and west sidewalls at a depth between five to eight feet, 10 to 14.5 feet, and 15 to 19.5 feet. Nitrobenzene was not detected in any of these verification samples. The excavation boundary, sample locations and analytical results are presented on Figure D-7.

D.1.9 MSU-20

Nitrobenzene was identified in one historical sample (10-TP-501-S-3) at MSU-20 at a concentration of 0.065 mg/kg at a depth of four to six feet, and in another historical sample (31-B-503-S-3) at a

concentration of 0.073 mg/kg at a depth of 10 to 13 feet. Both of these concentrations were greater than the CL of 0.051 mg/kg. An area 20 x 30 feet was excavated from a depth beginning at zero feet to a depth of 14 feet surrounding the sample locations. The soil from a depth of 0 to 4 feet was placed in a PA, and the remaining soil from a depth of four to 14 feet was placed in the MSU Laydown Area, for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at a depth between four to six and a half feet, and 10 to 13 feet. Nitrobenzene was not detected in any of these verification samples. The excavation boundary, sample locations and analytical results are presented on Figure D-7.

D.1.10 MSU-21

Copper was identified in one historical sample (38-B-501-S-3) at MSU-21 at a concentration of 330 mg/kg which was greater than the CL of 263 mg/kg, at a depth of 12 to 13 feet. An area approximately 15 x 25 feet was excavated at a depth beginning at 12 feet to a depth of 14 feet surrounding the sample location and the soil was placed in the closest MSU Laydown Area. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of 12 to 14 feet. The concentrations of copper detected in the verification samples ranged from 9.7 mg/kg to 18.0 mg/kg which were all less than the CL of 263 mg/kg. As this MSU location was within the final boundary of PA-03, it was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-8.

D.1.11 MSU-22

Nitrobenzene was identified in a historical sample (11-TP-501-S-1) at MSU 22 at a concentration of 0.092 at a depth of zero to one foot. Another historical sample taken at the same location (11-TP-501-S-2) had a nitrobenzene concentration of 0.12 mg/kg at a depth of three to six feet. A third historical sample (11-TP-501-S-3) at the same location had a nitrobenzene concentration of 0.068 mg/kg at a depth of eight to 10 feet. All three of these samples had nitrobenzene concentrations that exceeded the CL of 0.051 mg/kg. An area 30 x 30 feet was excavated from a depth beginning at zero feet to a depth of 11 feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at a depth between zero to one foot, three to six feet, and eight to 11 feet. Nitrobenzene was not detected in any of these verification samples. The excavation boundary, sample locations and analytical results are presented on Figure D-9.

D.1.12 MSU-23

Nitrobenzene was identified in one historical sample (11-TP-502-S-1) at MSU 23 at a concentration of 0.078 which was greater than the CL of 0.051 mg/kg, at a depth of zero to one foot. Two more historical samples at depths of three to six feet (11-TP-502-S-2) and eight to 10 feet (11-TP-502-S-3) had nitrobenzene concentrations below the CL of 0.051 mg/kg. An area 30 x 20 feet was excavated from a depth beginning at zero feet to a depth of 11 feet surrounding these sample locations and the soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at a depth between zero to one foot, three to six feet, and eight to 11 feet. Nitrobenzene was not detected in any of these

verification samples. The excavation boundary, sample locations and analytical results are presented on Figure D-9.

D.1.13 MSU-24

TNT was identified in one historical sample (11-TP-6-S-2) at MSU-24 at a concentration of 42 mg/kg which was greater than the CL of 1.75 mg/kg, at a depth of three to six feet. An area 55 x 60 feet was excavated from a depth beginning at zero feet to a depth of seven feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at a depth between three to six feet. The concentrations of TNT in the verification samples ranged from undetected to 0.20 mg/kg, which were all less than the CL of 1.75 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-9.

D.1.14 MSU-25

TNT was identified in one historical sample (11-TP-5-S-2-DAVG) at MSU-25 at a concentration of 15 mg/kg, which was greater than the CL of 1.75 mg/kg, at a depth of three to six feet. An area 40 x 55 feet was excavated from a depth beginning at zero feet to a depth of seven feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. After the MSU was excavated, verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at a depth between three to six feet. The concentrations of TNT in the verification samples ranged from undetected to 1.6 mg/kg, which were all less than the CL of 1.75 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-9.

D.1.15 MSU-26

TNT was identified in one historical sample (18-TP-600-S-1) at MSU-26 at a concentration of 2.4 mg/kg, which was greater than the CL of 1.75 mg/kg, at a depth of three to six feet. An area 15 x 15 feet was excavated from a depth beginning at zero feet to a depth of eight feet surrounding the sample location. The soil from a depth of zero to three feet was placed in the nearest PA and the remaining soil from a depth of three to eight was placed in the MSU Laydown Area, for off-Site disposal. Verification samples were collected from each of the north, south, east, and west sidewalls at a depth between three to eight feet. The concentrations of TNT in the verification samples ranged from 0.20 mg/kg to 0.30 mg/kg, which were all less than the CL of 1.75 mg/kg. No verification sample was collected at the bottom of the excavation since a historical sample (18-TP-600) had a concentration of 0.8 mg/kg at a depth of eight feet. The excavation boundary, sample locations and analytical results are presented on Figure D-10.

D.1.16 MSU-27

TNT was identified in one historical sample (18-VS-117) at MSU-27 at a concentration of 1.98 mg/kg, which was greater than the CL of 1.75 mg/kg, at a depth of one to three feet. An area 15 x 15 feet was excavated from a depth beginning at zero feet to a depth of four feet surrounding the sample location. The soil from a depth of zero to one foot was placed in the closest PA and the remaining soil from a depth of one to four feet was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at

a depth between one to four feet. The concentrations of TNT detected in the verification samples ranged from 0.080 mg/kg to 0.20 mg/kg, which were all less than the CL of 1.75 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-11.

D.1.17 MSU-28

TNT was identified in one historical sample (18-VS-106) at MSU-28 at a concentration of 3.1 mg/kg, which was greater than the CL of 1.75 mg/kg, at a depth of 15 to 16 feet. An area 15 x 15 feet was excavated from a depth beginning at zero feet to a depth of 17 feet surrounding the sample location. The soil from a depth of zero to 17 feet was placed in the MSU Laydown Area, for off-Site disposal. Verification samples were collected from the bottom of the excavation and from each of the north, south, east, and west sidewalls at a depth between one to 17 feet. In addition, samples were collected a half foot outside the excavation to the north, south, east and west at a depth of six to six and a half feet. The concentrations of TNT in the verification samples ranged from 0.050 mg/kg to 0.80 mg/kg, which were all less than the CL of 1.75 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-12.

D.1.18 MSU-29

Arsenic was identified in one historical sample (01-C013-SS-[R66C88]-D1-000) at MSU-29 at a concentration of 160 mg/kg which was greater than the RL of 60 mg/kg, at a depth of zero to a half foot. An area 30 x 25 feet was excavated from a depth of zero to a half foot surrounding the sample location, and placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to a half foot. The concentrations of arsenic in the verification samples ranged from 10.6 mg/kg to 54.1 mg/kg, which were all less than the RL of 60 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-55.

D.1.19 MSU-30

Arsenic was identified in one historical sample (LR-207) at MSU-30 at a concentration of 140 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of zero to a half foot. An area 25 x 25 feet was excavated from a depth of zero to one and a half feet surrounding the sample location, and placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to a half foot. The concentrations of arsenic in the verification samples ranged from 13.0 mg/kg to 56.1 mg/kg, which were all less than the RL of 60 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-55.

D.1.20 MSU-31

One foot of soil had previously been removed from this area as part of the Pilot Scraping Study. Lead was identified in one historical sample (APC-PS-VS-04-08) at MSU-31 at a concentration of 250 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one to one and a half feet. An area 15 x 15 feet was excavated at a depth of one to two and a half feet surrounding the sample location. This resulted in a one and a half foot layer being excavated at this MSU. The excavated soil was placed in the closest PA. A verification sample was collected from the bottom of the excavation. The lead concentration in this

verification sample was 15 mg/kg, which was less than the SL of 118 mg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-4.

D.1.21 MSU-32

Lead was identified in one historical sample (7-VS-5) at MSU-32 at a concentration of 120 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one foot. Soil was excavated at a depth beginning at one foot to a depth of two and a half feet surrounding the sample location, extending out to the borders of adjacent MSUs. The one and a half feet of excavated soil was moved to the closest PA. A verification sample was collected from the bottom of the excavation. The lead concentration in this verification sample was 31.3 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-1.

D.1.22 MSU-33

Lead was identified in one historical sample (7-B-6-S-1) at MSU-33 at a concentration of 140 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of three and a half feet. An area 110 x 125 feet was excavated at a depth beginning at three and a half feet to a depth of five feet surrounding the sample location. This resulted in a one and a half foot layer being excavated at this MSU. The excavated soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of three to four and a half feet. The lead concentrations in these verification samples ranged from 7.0 mg/kg to 103.0 mg/kg, which were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-1.

D.1.23 MSU-34

Lead was identified in one historical sample (7-B-7-S-4-DAVG) at MSU-34 at a concentration of 230 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of 12 to 12.5 feet. Soil was excavated at a depth beginning at 12 feet to a depth of 13.5 feet, extending out to the borders of adjacent MSUs. The excavated soil was placed in the closest PA. A verification sample was collected from the bottom of the excavation. The lead concentration in the verification sample was 42.4 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-1.

D.1.24 MSU-35

Lead was identified in one historical sample (7-B-501-S-1A) at MSU-35 at a concentration of 350 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of two and a half feet. Lead was identified in another historical sample (7-B-501-S-2-DAVG) at MSU-35 at a concentration of 280 mg/kg at a depth of five to eight feet. An area 50 x 80 feet was excavated at a depth beginning at two and a half feet to a depth of nine feet surrounding the sample locations and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east, and west sidewalls at a depth of two and a half to nine feet. The lead concentrations in the verification samples ranged from 7.4 mg/kg to 103.0 mg/kg, which were less than the SL of 118 mg/kg.

The excavation boundary, sample locations and analytical results are presented on Figure D-1.

D.1.25 MSU-36

Lead was identified in one historical sample (7-B-5-S-1-DAVG) at MSU-36 at a concentration of 320 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of three to four and a half feet. An area 30 x 40 feet was excavated at a depth beginning at three feet to a depth of five and a half feet surrounding the sample location and the soil was placed in the closest PA. The southern verification sample result exceeded the SL for lead. Therefore, MSU excavation was extended to the south until results were less than the SL. Verification samples were collected from the bottom of the excavation and from each of the north, south, east and west sidewalls from a depth of three to five and a half feet. The lead concentrations in the verification samples ranged from 43.3 mg/kg to 117.0 mg/kg, which were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-1.

D.1.26 MSU-37

Lead was identified in one historical sample (7-HA-501-S-2) at MSU-37 at a concentration of 650 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one to two feet. An area 60 x 45 feet was excavated at a depth of one to three feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east, and west sidewalls at a depth of one to two feet. The lead concentrations in the verification samples ranged from 10.0 mg/kg to 86.0 mg/kg, which were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-13.

D.1.27 MSU-38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52 and 53

Three feet of soil was removed from this whole area as part of the Sand Laydown Area Excavation IRA (See Appendix C). Verification samples from this IRA defined the lateral extent of the excavation. Lead exceeded the SL of 118 mg/kg in all of these16 MSUs based on historical sample results (MSU 38: 7-HA-501-S-2; MSU 39: SA1-28-51, MSU 40: SA1-29-49, MSU 41: SA1-29-50; MSU-42: SA1-29-51; MSU-43: 04-F02-SS-[F-79-4]-C2-060; MSU-44: 04-F02-SS-[F-80-4]-C2-060; MSU-45: SA1-30-50; MSU-46: SA1-31-50; MSU-47: SA1-31-51; MSU-48: SA1-32-50; MSU-49: SA1-33-50; MSU-50: SA1-33-51; MSU-51: SA1-33-52; MSU-52: 25-TP-514-S-4; and MSU-53: 04-F02-SS-[F-90-4]-C2-060-DAVG). Each of these historical samples exceeded the lead SL of 118 mg/kg and all samples were collected at a depth ranging from zero to a half foot, except for: MSU-43, MSU-44, and MSU-53, which were collected at a sample depth of two to two and a half feet, and MSU-52, which was collected at a sample depth of six to eight feet. As each MSU was excavated, the borders began to merge until it became one large MSU. Sample labels on the figure indicate the location of the initial MSU (e.g., the sample location labeled MSU-39-VS-B was located in MSU-39 initially). Verification samples were collected from each MSU until the results were less than the SL. This resulted in different excavation depths in this merged MSU. The excavation depth near MSU-38, MSU-49, MSU-50, and MSU-51 was four and a half to five feet. The excavation depth near MSU-46, MSU-47 and MSU-48 was six and a half feet. The excavation depth near MSU-45 was eight feet. The excavation depth near MSU-40, and MSU-41 was nine feet. The excavation depth near MSU-39 and MSU-42 was 10 to 11 feet. The excavation

depth near MSU-43, MSU-44, MSU-52, and MSU-53 was 12 to 13 feet. All of the soil excavated for these16 MSUs was placed in the nearest PA. The lead concentrations in the verification samples for MSU-38 to MSU-53 ranged from 6.6 mg/kg to 106.0 mg/kg, which were all less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.1.28 MSU-54

Two and a half feet of soil had previously been excavated from this area as part of the Sand Laydown Area IRA (See Appendix C). Lead was identified in one historical sample (SA2-42-67) at MSU-54 at a concentration of 160 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area 15 x 15 feet was excavated at a depth beginning at zero feet to a depth of four feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 16.5 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-15.

D.1.29 MSU-55

Four feet of soil had previously been excavated as part of the 2000 Foundation Excavations IRA (See Appendix C). Lead was identified in one historical sample (03-F11-SS-[F-254-3]-C2-050) at MSU-55 at a concentration of 170 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 25 x 40 feet was excavated at a depth beginning at zero feet to a depth of five and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 72.8 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.1.30 MSU-56

Lead was identified in one historical sample (26-TP-518-S-2) at MSU-56 at a concentration of 1,100 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one to two feet. Another historical sample (26-TP-518-S-3) in MSU-56 also had a lead concentration of 1,100 mg/kg, at a depth of three to five feet. An area approximately 20 x 20 feet surrounding the two historical samples initially defined MSU-56. However, in the course of excavation debris was encountered. This debris expanded the size of MSU-56 mostly to the east and to the north, creating an area approximately 95 x 185 feet, and excavation depths ranging from three and a half to six and a half feet. Verification samples were collected from the bottom of the excavation. The concentrations of lead in the verification samples ranged from 2.0 mg/kg to 6.5 mg/kg, which were all less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-17.

D.1.31 MSU-57

Four feet of soil had previously been excavated as part of the 2000 Foundation Excavations IRA (See Appendix C). Lead was identified in one historical sample (03-F11-SS-[F-252-3]-C2-050) at MSU-57 at a concentration of 360 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half

foot. An area approximately 22 x 38 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The concentration of lead in the verification sample collected from the bottom of the excavation was 80.2 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.1.32 MSU-58

Four feet of soil had previously been excavated as part of the 2000 Foundation Excavations IRA (See Appendix C). Lead was identified in one historical sample (03-F11-SS-[F-249-3]-C2-050) at MSU-58 at a concentration of 190 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 20 x 55 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet. Additional rounds of excavation and sampling were performed until the excavation reached a depth of seven and a half feet. All excavated soil was placed in the closest PA. The concentration of lead in the verification sample collected from the bottom of the excavation was 106 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.1.33 MSU-59

Four feet of soil had previously been excavated as part of the 2000 Foundation Excavations IRA (See Appendix C). Lead was identified in one historical sample (03-F11-SS-[F-244-3]-C2-050) at MSU-59 at a concentration of 120 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 35 x 25 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location. Further excavation and sampling was performed until the MSU reached a depth of three and a half feet. Excavated soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 4.5 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.1.34 MSU-60

Four feet of soil had previously been excavated as part of the 2000 Hot Spot Excavations IRA (See Appendix C). Lead was identified in one historical sample (26-VS-55) at MSU-60 at a concentration of 3,800 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 25 x 18 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location. Additional excavation and sampling was performed until the excavation reached a depth of six and a half feet. All excavated soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 59.1 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.1.35 MSU-61

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (See Appendix C). Lead was identified in one historical sample (26-VS-54) at MSU-61 at a concentration of 2,600 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of two to two and a half feet. An area approximately 25 x 15 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 46 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in adjacent MSU-60 also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.1.36 MSU-62

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of this MSU was defined by previous excavation verification sampling results and the HI-02 boundary. Lead was identified in one historical sample (19-VS-27) at MSU-62 at a concentration of 1,100 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half feet. An area approximately 28 x 10 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location. Additional excavation and sampling increased the excavation depth to five and a half feet. The lead concentration in the verification sample collected from the bottom of the excavation was 3.6 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.37 MSU-63

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of the MSU was defined by previous excavation verification sampling results. Lead was identified in one historical sample (19-VS-27) at MSU-63 at a concentration of 1,500 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 28 x 10 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location. Additional excavation and sampling increased the excavation to a depth of five feet. The excavated soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 29.3 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.38 MSU-64

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of the MSU was defined by previous excavation verification sampling results and the HI-02 boundary. Lead was identified in one historical sample (19-VS-29) at MSU-64 at a concentration of 270 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 28 x 10 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location. Further excavation and sampling increased the excavation to

a depth of 3.5 feet. The excavated soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 19.3 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.39 MSU-65

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of the MSU was defined by previous excavation verification sampling results and the HI-02 boundary. Lead was identified in one historical sample (19-VS-49) at MSU-65 at a concentration of 250 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 10 x 15 feet was excavated at a depth beginning at zero feet to a depth of 2.5 feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 17.1 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.40 MSU-66

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of the MSU was defined by previous excavation verification sampling results and the HI-02 boundary. Lead was identified in one historical sample (19-VS-25) at MSU-66 at a concentration of 200 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 20 x 10 feet was excavated at a depth beginning at zero feet to a depth of two and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 15.5 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.41 MSU-67

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of the MSU was defined by previous excavation verification sampling results and the HI-02 boundary. Lead was identified in one historical sample (19-VS-47) at MSU-67 at a concentration of 240 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 20 x 15 feet was excavated at a depth beginning at zero feet to a depth of two and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 37.3 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.42 MSU-68

Two feet of soil was removed as part of the 2000 Hot Spot Excavation IRA (see Appendix C). In addition, the lateral extent of the MSU was defined by previous excavation verification sampling results. Lead was identified in one historical sample (19-VS-53) at MSU-68 at a concentration of 310 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 30 x 9 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 16.3 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-18.

D.1.43 MSU-69

Lead was identified in one historical sample (26-TP-508-S-2) at MSU-69 at a concentration of 1,300 mg/kg at a depth of three to six feet and in another historical sample (26-TP-508-S-3) at a concentration of 230 mg/kg at a depth of eight to 10 feet. Both of these results were greater than the SL of 118 mg/kg. An area approximately 15 x 20 feet was excavated at a depth beginning at three feet to a depth of 11 feet surrounding these sample locations and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at depths of three to six feet and eight to 10 feet. The lead concentrations in these verification samples ranged from 2.5 mg/kg to 29.3 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-19.

D.1.44 MSU-70

Lead was identified in one historical sample (26-TP-508-S-2) at MSU-70 at a concentration of 240 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of two to two and a half feet. An area approximately 15 x 15 feet was excavated at a depth beginning at two feet to a depth of four feet surrounding the sample location and the soil was placed in the closest PA. A verification sample was collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at depths of two to two and a half feet. In addition, other samples collected for MSU-70 were used to characterize this area. The lead concentrations in these verification samples were 4.7 mg/kg and 15.4 mg/kg, and were less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-12.

D.1.45 MSU-71

Lead was identified in one historical sample (18-VS-90) at MSU-71 at a concentration of 120 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one to one and a half feet. An area approximately 15 x 15 feet was excavated at a depth beginning at one foot to a depth of three and a half feet surrounding the sample location and the soil was placed in the closest PA. A verification sample was collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of one and a half to two feet. The lead concentrations in these verification samples ranged from

3.8 mg/kg to 40.5 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-11.

D.1.46 MSU-72

Lead was identified in one historical sample (18-VS-175-ST) at MSU-72 at a concentration of 520 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one to two feet. An area approximately 15 x 70 feet was excavated at a depth beginning at one foot to a depth of four and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of one to four and a half feet. The lead concentrations in these verification samples ranged from 11.5 mg/kg to 118 mg/kg and were all less than or equal to the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-20.

D.1.47 MSU-73

Lead was identified in one historical sample (1234-TP-525-S-2) at MSU-73 at a concentration of 330 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to one foot. However, this historical sample was located within the final boundaries of PA-05, where the target lead concentration is the RL of 4,100 mg/kg. Since the sample was less than the RL, no additional sampling or excavation was performed. The location of MSU-73 is presented on Figure D-6.

D.1.48 MSU-74

One and a half feet of soil was removed from this area as part of the Sand Laydown Area Excavation IRA (see Appendix C). Lead was identified in one historical sample (SA6-71-33) at MSU-74 at a concentration of 1,600 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 15 x 15 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 4.6 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-21.

D.1.49 MSU-75

One and a half feet of soil was removed from this area as part of the Sand Laydown Area Excavation IRA (see Appendix C). Lead was identified in one historical sample (SA6-71-33) at MSU-75 at a concentration of 120 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 15 x 15 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 4.6 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-22.

D.1.50 MSU-76

Lead was identified in one historical sample (18-TP-31- S-1) at MSU-76 at a concentration of 390 mg/kg,

which was greater than the SL of 118 mg/kg, at a depth of zero to five feet. Copper was also identified in one historical sample (18-TP-535-S-2) at a concentration of 2,400, which was greater than the CL of 263 mg/kg, at a depth of 15 to 16 feet. An area approximately 25 x 15 feet was excavated at a depth beginning at zero feet to a depth of 17.5 feet surrounding the sample location. The soil from zero to 15 feet was placed in the closest PA, and the soil from 15 to 17.5 feet was placed in the MSU Laydown Area for off-Site disposal. A verification sample was collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at depths of zero to a half foot, zero to six feet, and 15 to 17 feet. The lead concentrations in the verification samples ranged from 2.0 mg/kg to 101.0 mg/kg, which were all less than the SL of 118 mg/kg. The copper concentrations in the verification samples ranged from 22.9 to 59.0 mg/kg and were all less than the CL of 263 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-23.

D.1.51 MSU-77

One and a half feet of soil was removed in this area as part of the NGRR Excavation IRA (See Appendix C). Lead was identified in one historical sample (18-TP-30-S-1) at MSU-77 at a concentration of 730 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to three and a half feet. An area approximately 20 x 20 feet was excavated at a depth beginning at zero feet to a depth of five and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to three and a half feet. The lead concentrations in these verification samples ranged from 1.5 mg/kg to 3.2 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-23.

D.1.52 MSU-78

One foot of soil was removed as part of the 2000 Hot Spot IRA (see Appendix C). Lead was identified in one historical sample (18-VS-202) at MSU-78 at a concentration of 580 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 25 x 25 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 21.7 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-24.

D.1.53 MSU-79

One foot of soil was removed as part of the 2000 Hot Spot IRA (See Appendix C). Arsenic was identified in one historical sample (18-VS-201) at MSU-79 at a concentration of 110 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of zero to a half foot. An area approximately 25 x 25 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The arsenic concentration in the verification sample collected from the bottom of the excavation was 4.2 mg/kg, which was less than the RL of 60 mg/kg. This area was further characterized by surrounding samples collected for nearby MSU and NGRR locations. Samples collected in close proximity to this MSU also had arsenic concentrations less than the

RL. The excavation boundary, sample locations and analytical results are presented on Figure D-24.

D.1.54 MSU-80

One foot of soil was removed as part of the 2000 Hot Spot IRA (see Appendix C). Lead was identified in one historical sample (18-VS-199) at MSU-80 at a concentration of 380 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 25 x 25 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 11.9 mg/kg, which was less than the SL of 118 mg/kg. This area was further characterized by surrounding samples collected for nearby MSU and NGRR locations. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-24.

D.1.55 MSU-81

One foot of soil was removed as part of the 2000 Hot Spot IRA (see Appendix C). Lead was identified in one historical sample (18-VS-200) at MSU-81 at a concentration of 200 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 25 x 25 feet was excavated at a depth beginning at zero feet to a depth of two and a half feet surrounding the sample location. Further excavation and sampling was performed until the MSU reached a depth of three and a half feet. The excavated soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 8.6 mg/kg, which was less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-24.

D.1.56 MSU-82

Lead was identified in one historical sample (18-TP-29,S-1) at MSU-82 at a concentration of 390 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to five feet. An area approximately 25 x 20 feet was excavated at a depth beginning at zero feet to a depth of six and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation and from the north, south, east, and west sidewalls. The lead concentrations in these verification samples ranged from 8.1 mg/kg to 26.7 mg/kg, and were less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-22.

D.1.57 MSU-83

Two feet of soil was removed from this area as part of the 2000 Foundation Excavation IRA (see Appendix C). Lead was identified in one historical sample (18-TP-33-S-1-DAVG) at MSU-83 at a concentration of 2,900 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to two feet. An area approximately 15 x 15 feet was excavated at a depth beginning at zero feet to a depth of three feet surrounding the sample location and the soil was placed in the closest PA. Foundations bound the lateral extent of this MSU. Verification samples were collected from the bottom of the excavation and from the north sidewall at a depth of zero to three feet. The lead concentrations in all of these verification samples ranged from 3.9 mg/kg to 54.0 mg/kg and were all below the SL of 118 mg/kg. The excavation

boundary, sample locations and analytical results are presented on Figure D-25.

D.1.58 MSU-84

Lead was identified in one historical sample (18-TP-26-S-1) at MSU-84 at a concentration of 520 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to four feet. An area approximately 25 x 25 feet was excavated at a depth beginning at zero feet to a depth of five feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to four feet. The lead concentrations in these verification samples ranged from 5.3 mg/kg to 19.9 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-26.

D.1.59 MSU-85

Lead was identified in one historical sample (18-TP-27-S-1) at MSU-85 at a concentration of 120 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to five feet. An area approximately 25 x 25 feet was excavated at a depth beginning at zero feet to a depth of seven and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to five feet. The lead concentrations in these verification samples ranged from 4.0 mg/kg to 48.1 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-26.

D.1.60 MSU-86

Two feet of soil was removed from this area as part of the 2000 Foundation Excavation IRA (see Appendix C). Lead was identified in one historical sample (18-TP-25-S-1) at MSU-86 at a concentration of 2,400 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to two feet. An area approximately 15 x 15 feet was excavated at a depth beginning at zero feet to a depth of three feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, east and west sidewalls at a depth of zero to three feet. The lead concentrations in these verification samples ranged from 1.8 mg/kg to 43.9 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by one historical sample (18-TP-538-S-3) to the south, which had a lead concentration below the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-27.

D.1.61 MSU-87

Lead was identified in one historical sample (18-VS-176-ST) at MSU-87 at a concentration of 300 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of one to two feet. An area approximately 25 x 50 feet was excavated at a depth beginning at one foot to a depth of three feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 2.7 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary was delineated by surrounding foundation and narrow gauge excavations, and adjacent foundations. The excavation boundary, sample locations and analytical results are presented on

Figure D-28.

D.1.62 MSU-88

Lead was identified in one historical sample (18-TP-555-S-2-DAVG) at MSU-88 at a concentration of 160 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to six feet. An area approximately 20 x 20 feet was excavated at a depth of zero to seven feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the northwest and southeast sidewalls. The lead concentrations in these verification samples ranged from 3.6 mg/kg to 16.6 mg/kg and were all less than the SL of 118 mg/kg. The extent of the northern edge of MSU-88 is verified by MSU-F-27, which has a lead concentration below the SL. The southwest sidewall sample was extended to a still-in-place bunker foundation. The lead and arsenic concentrations in the sidewall sample taken at the base of the foundation were 710 mg/kg, and 118 mg/kg, respectively, which exceeded both the lead SL of 118 mg/kg and the arsenic RL of 60 mg/kg. However, the bunker foundation prevented any additional excavation to the southwest. The excavation boundary, sample locations and analytical results are presented on Figure D-29.

D.1.63 MSU-89

Two feet of soil was removed from this area as part of the 2000 Foundation Excavation IRA (see Appendix C). Lead was identified in one historical sample (18-TP-34-S-1) at MSU-89 at a concentration of 250 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to one foot. An area approximately 50 x 40 feet was excavated at a depth of zero to two feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to two feet. The lead concentrations in the verification samples ranged from 3.1 mg/kg to 39.9 mg/kg and were all less than the SL of 118 mg/kg. Samples collected in close proximity to this MSU also had lead concentrations less than the SL. The excavation boundary, sample locations and analytical results are presented on Figure D-30.

D.1.64 MSU-90

One and a half feet of soil was removed from this area as part of the Sand Laydown IRA (see Appendix C). Lead was identified in one historical sample (SA3-79-121) at MSU-90 at a concentration of 120 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to one and a half feet. An area approximately 15 x 15 feet was excavated to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to one and a half feet. The lead concentrations in the verification samples ranged from 1.6 mg/kg to 3.32 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-31.

D.1.65 MSU-91

Arsenic was identified in one historical sample (5-VS-122) at MSU-91 at a concentration of 490 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of one and a half to two feet. An area

approximately 15 x 15 feet was excavated at a depth of zero to three feet surrounding the sample location. Additional excavation and sampling was performed until the MSU reached a depth of 14 feet. The excavated soil was placed in the closest PA. The location of this MSU was later included in the final boundary of PA-02A, where the RL for arsenic was 530 mg/kg. The arsenic concentration in the verification sample collected from the bottom of the excavation was 21.7 mg/kg, which was less than the PA and non-PA golf course RLs. This MSU was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.1.66 MSU-92

Arsenic was identified in one historical sample (5-VS-113) at MSU-92 at a concentration of 370 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of one to one and a half feet. An area approximately 15 x 20 feet was excavated at a depth beginning at one foot to a depth of two and a half feet surrounding the sample location and the soil was placed in the closest PA. Additional excavation and sampling was performed until the MSU reached a depth of eight feet. The arsenic concentration in the verification sample was collected from the bottom of the excavation was 110 mg/kg, which exceeded the non-PA golf course RL of 60 mg/kg. However, the location of this MSU was later included in the final boundary of PA-02A, where the RL for arsenic was 530 mg/kg. Therefore, additional soil excavation was not required, and this area was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.1.67 MSU-93

Between one and two feet of soil was removed from this area as part of a Hot Spot, NGRR, or Foundation Excavation IRAs (see Appendix C). Arsenic was identified in one historical sample (38-VS-94) at MSU-93 at a concentration of 75 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of zero to a half foot. An area approximately 50 x 30 feet was excavated at a depth of zero to one and a half feet surrounding the sample location and the soil was placed in the closest PA. Arsenic was not detected in the verification sample collected from the bottom of the excavation. Samples collected in close proximity to this MSU also had arsenic concentrations less than the RL. The excavation boundary, sample locations and analytical results are presented on Figure D-8.

D.1.68 MSU-94

One and a half feet of soil was previously removed as part of the NGRR Excavation IRA (see Appendix C). Arsenic was identified in one historical sample (01-C011-SS-[R47C71]-D1-000) at MSU-94 at a concentration of 89 mg/kg, and was greater than the RL of 60 mg/kg, at a depth of zero to a half foot. An area approximately 35 x 25 feet was excavated to a depth of one foot surrounding the sample location and the soil was placed in the closest PA. The arsenic concentration in the verification sample collected from the bottom of the excavation was 4.0 mg/kg, and was less than the RL of 60 mg/kg. Samples collected in close proximity to this MSU also had arsenic concentrations less than the RL. The excavation boundary, sample locations and analytical results are presented on Figure D-8.

D.1.69 MSU-96

Arsenic was identified in one historical sample (5-VS-125) at MSU-96 at a concentration of 1500 mg/kg,

which was greater than the RL of 60 mg/kg, at a depth of one to one and a half feet. An area approximately 20 x 25 feet was excavated at a depth of one to two and a half feet surrounding the sample location and the soil was placed in the closest PA. Additional excavation and sampling was performed until the MSU reached a depth of 12 feet. The arsenic concentration in the verification sample collected from the bottom of the excavation was 431 mg/kg, which exceeded the non-PA golf course RL of 60 mg/kg. However, the location of this MSU was included in the final boundary of PA-02A, where the RL for arsenic was 530 mg/kg. Therefore, additional soil excavation was not required, and this area was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.1.70 MSU-97

Arsenic was identified in one historical sample (5-VS-126) at MSU-97 at a concentration of 1500 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of one to one and a half feet. An area approximately 30 x 30 feet was excavated at a depth beginning at one foot to a depth of two and a half feet surrounding the sample location and the soil was placed in the closest PA. Further excavation and sampling was performed until the MSU reached a depth of 12 feet. The arsenic concentration in the verification sample collected from the bottom of the excavation was 463 mg/kg, which exceeded the non-PA golf course RL of 60 mg/kg. However, the location of this MSU was later included in the final boundary of PA-02A, where the RL for arsenic was 530 mg/kg. Therefore, additional soil excavation was not required, and this area was covered by the ecological cap and human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.1.71 MSU-98

Arsenic was identified in one historical sample (RR-592) at MSU-98 at a concentration of 39 mg/kg, which was greater than the Open Space arsenic CL of 32 mg/kg, at a depth of zero to a half foot. An area approximately 40 x 45 feet was excavated to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to one and a half feet. The arsenic concentrations in these verification samples ranged from 4.6 mg/kg to 12.6 mg/kg and were all less than the CL of 32 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-33.

D.1.72 MSU-99

Arsenic was identified in one historical sample (RR-548-B2) at MSU-99 at a concentration of 61 mg/kg, which was greater than the Open Space arsenic CL of 32 mg/kg, at a depth of zero to a half foot. An area approximately 60 x 60 feet was excavated at a depth beginning at zero feet to a depth of one and a half feet surrounding the sample location and the soil was placed in the closest PA. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to one and a half feet. All but one of the arsenic concentrations in these verification samples were less than the CL of 32 mg/kg with concentrations that ranged from 5.3 mg/kg to 28 mg/kg. The north sidewall sample had an arsenic concentration of 41.9 mg/kg and was located on the top of the bank, overlooking Sequalitchew Creek. A steep slope leads down from the north sidewall sample

location to the creek, and any additional excavation in this direction would have caused soil to be deposited into the creek. Therefore, based on an evaluation of the net environmental benefit, no additional excavation was performed in this direction. The excavation boundary, sample locations and analytical results are presented on Figure D-34.

D.1.73 MSU-100

Arsenic was identified in one historical sample (LR-137) at MSU-100 at a concentration of 33 mg/kg, which was greater than the Open Space arsenic CL of 32 mg/kg, at a depth of zero to a half foot. An area approximately 50 x 50 feet was excavated at a depth of zero to one and a half feet surrounding the sample location and the soil was placed in the closest PA. Further excavation and sampling was performed until the MSU increased to an area approximately 75 x 50 feet. Verification samples were collected from the bottom of the excavation, and from each of the north, south, east and west sidewalls at a depth of zero to one and a half feet. All but one of the arsenic concentrations in these verification samples were less than the CL of 32 mg/kg, and ranged from undetected to 8.5 mg/kg. The north sidewall sample had an arsenic concentration of 50.3 mg/kg, and was located on the top of a bank overlooking Sequalitchew Creek. A steep slope leads down from the north sidewall sample location to the creek, and any additional excavation in this direction would have caused soil to be deposited into the creek. Therefore, based on an evaluation of the net environmental benefit, no additional excavation was performed in this direction. The excavation boundary, sample locations and analytical results are presented on Figure D-33.

D.1.74 MSU-101

Arsenic was identified in one historical sample (LR-117) at MSU-101 at a concentration of 80 mg/kg, which was greater than the RL of 60 mg/kg, at a depth of zero to a half foot. An area approximately 50 x 50 feet was excavated at a depth of zero to one and a half feet surrounding the sample location and the soil was placed in the closest PA. Further excavation and sampling increased the size of the MSU to an area approximately 75 x 55 feet. Verification samples were collected from the bottom of the excavation, and from each of the north, east and west sidewalls at a depth of zero to one and a half feet. The arsenic concentrations in these verification samples ranged from 6.2 mg/kg to 50.2 mg/kg and were all less than the RL of 60 mg/kg. A sample was not collected on the south sidewall because this area was added to the future commercial property. As a result, the soil surrounding this MSU was excavated to a depth of one foot as part of the mass excavation program, thereby removing the interval of concern. The excavation boundary, sample locations and analytical results are presented on Figure D-34.

D.1.75 MSU-102, 103

Arsenic was identified in one historical sample (LR-135) at MSU-102 at a concentration of 110 mg/kg, which was greater than the Open Space CL of 32 mg/kg, at a depth of zero to a half foot. Arsenic also exceeded the Open Space CL in another historical sample (LR-135) at MSU-103 at a concentration of 50 mg/kg, at a depth of zero to a half foot. An area approximately 50 x 50 feet was excavated at a depth of zero to one and a half feet surrounding the sample location in each of these MSUs and the soil was placed in the closest PA. Further excavation and sampling was performed until the MSUs merged, increasing the size of this new MSU to an area approximately 85 x 430 feet. An eastern sidewall sample taken for the initial MSU-103 verified the concentration of arsenic was less than the CL. Additional verification

samples were then collected from the bottom of the excavation going toward the west, at a depth of zero to one and a half feet. The arsenic concentrations in these verification samples ranged from 6.2 mg/kg to 29.2 mg/kg and were all less than the CL of 32 mg/kg. Verification samples were not collected from the north sidewall because it was located on the top of a bank overlooking Sequalitchew Creek. A steep slope leads down from the north sidewall sample location to the creek, and any additional excavation in this direction would have caused soil to be deposited into the creek. Therefore, based on an evaluation of the net environmental benefit, no additional excavation was performed in this direction. The excavation boundary, sample locations and analytical results are presented on Figure D-33.

D.1.76 MSU-104, 105, 106

Lead was identified in one historical sample (6-SS-501) at MSU-104 at a concentration of 180 mg/kg, which was greater than the SL of 118 mg/kg. Lead also exceeded the SL in another historical sample (6-SS-502) at MSU-105 at a concentration of 410 mg/kg. In MSU-106 lead exceeded the SL in one historical sample (6-SS-503) at a concentration of 400 mg/kg. All of these samples exceeded the SL at a depth of zero to a half foot. Soil was excavated at a depth of zero to one and a half feet surrounding each of these sample locations, and the soil was placed in the closest PA. Additional excavation and sampling was performed until the MSUs merged, increasing the size of this new MSU to an area approximately 90 x 85 feet. Excavations in the western side of the merged MSU, around sample locations taken for MSU-104 and 106, were at a depth of zero to one and a half feet, while excavations in the eastern side of the merged MSU, around sample locations collected for MSU-105, were at a depth of zero to three feet. Verification samples were collected from the bottom of the merged MSU, and from each of the north, south, east and west sidewalls of each MSU. The lead concentrations in the verification samples taken from this merged MSU ranged from15.8 mg/kg to 109.0 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-35.

D.1.77 MSU-108, 109, 110, 111, 112, 113 (Shell Midden Historical Area)

Aldrin, arsenic and lead were identified in historical samples in concentrations that exceeded the RL, CL and SL, respectively. However, no excavation was performed in this Historical Area to ensure the preservation of historical artifacts. Soil remediation in this area involved the placement of a protective soil cap constructed in the same manner as the golf course cap over the entire area. The Shell Midden area is identified in this report as Historical Area RU HI-04. The location and boundary of these MSUs within HI-04 are presented on Figure D-64.

D.1.78 MSU-114, 115, 116, 117 (1833 Fort Nisqually Historical Area)

Lead was identified in historical samples in concentrations that exceeded the SL. However, minimal remediation was performed in this Historical Area to ensure the preservation of the historical artifacts. No excavation was performed for MSU-116 because it was within the boundary of the 1833 Fort Nisqually Site and the arsenic concentration was only slightly above the Commercial RL. Remediation activities included the excavation of two small areas, MSU-114,115 and MSU-117, to remove elevated lead concentrations. The lead concentrations in the verification samples taken from these MSUs ranged from 6.9 mg/kg to 101.0 mg/kg, and were all less than the SL of 118 mg/kg. The 1833 Fort Nisqually Site is identified in this report as Historical Area RU HI-01. The excavation boundary, sample locations

and analytical results are presented on Figure D-65.

D.1.79 MSU-118

Lead was identified in one historical sample (18-SS-883) at MSU-118 at a concentration of 220 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 20 x 20 feet was excavated at a depth of zero to one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 14.9 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-19.

D.1.80 MSU-119

Lead was identified in one historical sample (18-SS-932) at MSU-119 at a concentration of 160 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. An area approximately 15 x 20 feet was excavated at a depth of zero to one and a half feet surrounding the sample location and the soil was placed in the closest PA. The lead concentration in the verification sample collected from the bottom of the excavation was 3.0 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-19.

D.1.81 MSU-120

The arsenic CL for the 1833 Fort Nisqually Site was 32 mg/kg. Because MSU-120 originally fell within the boundary of the 1833 Fort Nisqually Site and one historical sample result identified an arsenic concentration of 50 mg/kg, excavation was required. However, when the boundary for the 1833 Historical Site changed, MSU-120 fell within the bounds of a Commercial Area, where the arsenic RL was 60 mg/kg. Because the historical sample that had exceeded the arsenic CL was now below the Commercial Area RL, no excavation or sampling was required at MSU-120. The location of MSU-120 is presented on Figure D-65.

D.1.82 MSU-121

Mercury was identified in one historical sample (16-B-501-Hg-2) at a concentration of 86.7 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 10 x 10 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Additional rounds of excavation and sampling were performed until the excavation reached an area of 30 x 20 feet. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.020 mg/kg to 7.5 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-61.

D.1.83 MSU-122

Mercury was identified in one historical sample (16-B-501-S-1) at a concentration of 100 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 20 x 10 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area

for off-Site disposal. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.020 mg/kg to 17.8 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-61.

D.1.84 MSU-123

Mercury was identified in one historical sample (5D-VS-95) at a concentration of 130 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 15 x 10 feet was originally excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Additional rounds of excavation and sampling were performed until the excavation reached an area of 15 x 35 feet. Verification samples were collected from the bottom, and from each of the south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.40 mg/kg to 21.1 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-61.

D.1.85 MSU-124

Mercury was identified in one historical sample (16-SS-513) at a concentration of 42 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 15 x 15 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.5 mg/kg to 4.4 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-61.

D.1.86 MSU-125

Mercury was identified in one historical sample (16-SS-524) at a concentration of 59 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 55 x 55 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.030 mg/kg to 0.80 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-61.

D.1.87 MSU-126

Mercury was identified in one historical sample (24-VS-107) at a concentration of 31 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 15 x 10 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Verification samples were collected from the bottom, and from each of the south, east and west sidewalls at a depth of zero to two and a half feet. A foundation to the north of the MSU-126 prevented a sidewall sample from being taken. The mercury concentrations in the verification samples ranged from 0.20 mg/kg to 9.5 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-62.

D.1.88 MSU-127

Mercury was identified in one historical sample (39-VS-9) at a concentration of 44 mg/kg, which was greater than the CL of 24 mg/kg. Originally, an area approximately 10 x 10 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Additional rounds of excavation and sampling were performed until the excavation reached an area of 10 x 30 feet. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.030 mg/kg to 8.2 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-63.

D.1.89 MSU-128

Mercury was identified in one historical sample (39-VS-12) at a concentration of 72 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 15 x 15 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Additional rounds of excavation and sampling were performed until the excavation reached an area of 15 x 25 feet. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.10 mg/kg to 6.7 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-63.

D.1.90 MSU-129

Mercury was identified in one historical sample (39-VS-16-Hg-5) at a concentration of 35.2 mg/kg, which was greater than the CL of 24 mg/kg. An area approximately 15 x 15 feet was excavated to a depth of two and a half feet surrounding the sample location and the soil was placed in the MSU Laydown Area for off-Site disposal. Additional rounds of excavation and sampling were performed until the excavation reached an area of 10 x 25 feet. Verification samples were collected from the bottom, and from each of the north, south, east and west sidewalls at a depth of zero to two and a half feet. The mercury concentrations in the verification samples ranged from 0.060 mg/kg to 3.0 mg/kg and were all less than the CL of 24 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-63.

D.1.91 MSU-133, 134, 135, 136, 137, and 138 (Fort Nisqually Cemetery)

Arsenic and lead were identified in historical samples in concentrations that exceeded the RL, CL and SL, respectively. However, no excavation was performed in this Historical Area to ensure the preservation of historical artifacts. Soil remediation in this area involved the placement of a protective soil cap over the entire area, constructed in the same manner as the golf course cap. The Fort Nisqually Cemetery is identified in this report as Historical Area RU HI-02. The location and boundary of RU HI-02 is presented on Figure D-66.

D.1.92 MSU-150

MSU-150 falls within a small ravine where motor oil was visually identified. An area approximately 35 x 40 feet was excavated following the natural contours of the pre-existing topography to a depth of zero to one foot. The motor oil concentrations in the verification samples collected from the bottom of the excavation were 48.1 mg/kg and 997.00 mg/kg and were less than the CL of 2,000 mg/kg for motor oil. The excavation boundary, sample locations and analytical results are presented on Figure D-13.

D.2 MSU–NGRR

Elevated arsenic and lead concentrations were found associated with the NGRR. Consistent with the previous work plan (PIONEER and West Shore, 2000), the top one and a half feet of soil was excavated along the total length of the NGRR outside the proposed golf course land-use footprint.

The sections of NGRR identified as MSUs were those that remained after IRAs were completed. The top one and a half feet of soil within 25 feet of the centerline of the NGRR was excavated and placed in the nearest PA. Following excavation, verification soil sampling was conducted. One five-point composite verification sample was collected from the excavation floor every 50 feet along the NGRR. This resulted in 50 x 50 foot boxes with one five-point composite verification sample collected from each box. Each sample was composited from soil in the middle of the track and soil collected on both sides of the track, no more than 10 feet from the track centerline.

Cleanup goals for NGRR MSUs were a RL of 60 mg/kg for arsenic and a SL of 118 mg/kg for lead, unless otherwise noted.

Work plan: Interim Source Removal Actions: Impacted Foundations and Narrow Gauge Railroad Beds at the Former DuPont Works Site. DuPont, Washington. Prepared for the Weyerhaeuser Company and E.I. duPont de Nemours and Company. December 6, 2000.

D.2.1 NGRR-1

NGRR-1 is an area approximately 40 x 45 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One five-point composite verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.2 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration collected was 3.0 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-42.

D.2.2 NGRR-01-1

NGRR-01-1 is an area approximately 25 x 40 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One five-point composite verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 4.5 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration was 3.9 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are

presented on Figure D-53.

D.2.3 NGRR-01-2

NGRR-01-2 is an area approximately 95 x 20 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One five-point composite verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 4.6 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration was 3.3 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-53.

D.2.4 NGRR-02

NGRR-02 is an area approximately 95 x 20 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One composite verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 4.2 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration was 4.1 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-46.

D.2.5 NGRR-03

NGRR-03 is an area approximately 50 x 35 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One composite verification sample had arsenic and lead concentrations that were less than the RL and SL The arsenic concentration in the verification sample was 6.3 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration was 65.3 mg/kg, which was less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations below the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-14

D.2.6 NGRR-04

NGRR-04 is an area approximately 35 x 50 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One composite verification sample had arsenic and lead concentrations that were less than the RL and SL The arsenic concentration in the verification sample was 2.6 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration was 24.6 mg/kg, which was less than the SL 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-35.

D.2.7 NGRR-05

NGRR-05 is an area approximately 75 x 40 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. One composite verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 34.2 mg/kg, which was less than the RL of 60 mg/kg and the lead concentration was 49.5 mg/kg, which was less than the SL 118 mg/kg. This area was further characterized by sampling results from surrounding non-PA locations, which had arsenic and lead concentrations below the RL and SL. The excavation boundary,

sample locations and analytical results are presented on Figure D-14.

D.2.8 NGRR-06

NGRR-06 is an area approximately 340 x 65 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.0 mg/kg to 33.3 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.7 mg/kg to 15.8 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.2.9 NGRR-07

NGRR-07 is an area approximately 55 x 240 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.3 mg/kg to 8.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.2 mg/kg to 7.8 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-38.

D.2.10 NGRR-08

NGRR-08 is an area approximately 180 x 65 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.64 mg/kg to 4.06 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.03 mg/kg to 6.93 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-3.

D.2.11 NGRR-09

NGRR-09 is an area approximately 180 x 65 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 19.7 mg/kg and 39.2 mg/kg, and were less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 12.1 mg/kg to 26.2 mg/kg and were both less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-45.

D.2.12 NGRR-11

NGRR-11 is an area approximately 255 x 55 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.9 mg/kg to 36.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.2 mg/kg to 6.0 mg/kg and were all less than the SL of 118 mg/kg. The excavation

boundary, sample locations and analytical results are presented on Figure D-40.

D.2.13 NGRR-12A

NGRR-12A is an area approximately 60 x 290 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.4 mg/kg to 25.7 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.1 mg/kg to 7.7 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-41.

D.2.14 NGRR-12B

NGRR-12B is an area approximately 50 x 390 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.3 mg/kg to 11.1 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 5.9 mg/kg to 80.9 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-45.

D.2.15 NGRR-14

NGRR-14 is an area approximately 45 x 65 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 15.6 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 21.7 mg/kg and was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-42.

D.2.16 NGRR-15

NGRR-15 is an area approximately 395 x 15 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 3.6 mg/kg and 4.8 mg/kg, which were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 2.9 mg/kg and 6.5 mg/kg, which were both less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-44.

D.2.17 NGRR-16

NGRR-16 is an area approximately 50 x 35 feet. Soil was excavated at a depth of one and a half feet and

was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 5.4 mg/kg and was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 2.6 mg/kg and was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-8.

D.2.18 NGRR-19

NGRR-19 is an area approximately 50 x 450 feet. Soil was excavated at a depth of one and a half feet and removed to the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.2 mg/kg to 6.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.4 mg/kg to 8.0 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-37.

D.2.19 NGRR-20

NGRR-20 is an area approximately 50 x 205 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.4 mg/kg to 7.5 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.1 mg/kg to 15.5 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-37

D.2.20 NGRR-21

NGRR-21 is an area approximately 1,460 x 65 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.1 mg/kg to 39.9 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.2 mg/kg to 9.5 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-39.

D.2.21 NGRR-22

NGRR-22 is an area approximately 45 x 570 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.2 mg/kg to 29.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.8 mg/kg to 23.3 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-50.

D.2.22 NGRR-23

NGRR-23 is an area approximately 165 x 40 feet. Soil was excavated at a depth of one and a half feet and removed to the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.0 mg/kg to 9.7 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from undetected to 7.4 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-43.

D.2.23 NGRR-24

NGRR-24 is an area approximately 80 x 45 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 5.1 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 3.7 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-43.

D.2.24 NGRR-25

NGRR-25 is an area approximately 50 x 120 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 25.6 mg/kg to 46.5 mg/kg, and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 11.8 mg/kg to 28.2 mg/kg, and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-30.

D.2.25 NGRR-26

NGRR-26 is an area approximately 60 x 35 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 4.9 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 5.1 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-30.

D.2.26 NGRR-27

NGRR-27 is an area approximately 89 x 45 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 4.3 mg/kg and 50.8 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 6.8 mg/kg and 7.9 mg/kg and were both less than the RL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-30.

D.2.27 NGRR-28

NGRR-28 is an area approximately 730 x 75 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.6 mg/kg to 31.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.8 mg/kg to 61.0 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which also had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary and sample location and results are presented on Figure D-30.

D.2.28 NGRR-29

NGRR-29 is an area approximately 30 x 40 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 5.4 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 5.6 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-27.

D.2.29 NGRR-30

NGRR-30 is an area approximately 30 x 45 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 4.6 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 6.4 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-27.

D.2.30 NGRR-31

NGRR-31 is an area approximately 50 x 50 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 6.6 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 6.9 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-51.

D.2.31 NGRR-32

NGRR-32 is an area approximately 190 x 40 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 8.2 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 7.9 mg/kg, which was less than the SL of 118 mg/kg. This area was further characterized by sampling results from an adjacent location, which had arsenic and lead concentrations that were less than the RL and SL. The

excavation boundary, sample locations and analytical results are presented on Figure D-39.

D.2.32 NGRR-33A

NGRR-33A is an area approximately 1,280 x 65 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.1 mg/kg to 53.5 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.6 mg/kg to 118.0 mg/kg and were all at or less than the SL 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-20.

D.2.33 NGRR-33B

NGRR-33B is an area approximately 105 x 70 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.9 mg/kg to 17.7 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.4 mg/kg to 34.9 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-28.

D.2.34 NGRR-33C

NGRR-33C is an area approximately 455 x 55 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.7 mg/kg to 53.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.3 mg/kg to 65.4 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-29.

D.2.35 NGRR-33D

NGRR-33D is an area approximately 93 x 64 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 5.08 mg/kg and 29.30 mg/kg and were less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 8.23 mg/kg and 69.60 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-28.

D.2.36 NGRR-34

NGRR-34 is an area approximately 135 x 25 feet. Soil was excavated at a depth of one and a half feet

and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 2.8 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 2.5 mg/kg, which was less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which also show lead and arsenic concentrations below the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-40.

D.2.37 NGRR-35A

NGRR-35A is an area approximately 155 x 175 feet. Soil was excavated to a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.2 mg/kg to 24.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.5 mg/kg to 76 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-12.

D.2.38 NGRR-35B

NGRR-35B is an area approximately 265 x 60 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.5 mg/kg to 21.9 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.4 mg/kg to 61.5 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-49.

D.2.39 NGRR-36

NGRR-36 is an area approximately 200 x 50 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.1 mg/kg to 59.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 4.2 mg/kg to 75.4 mg/kg and all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-21.

D.2.40 NGRR-37A

NGRR-37A is an area approximately 105 x 70 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.8 mg/kg to 18.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.2 mg/kg to 41.5 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from adjacent MSU locations, which had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-24.

D.2.41 NGRR-37B

NGRR-37B is an area approximately 35 x 100 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. This area was characterized by verification sampling results from surrounding locations, which all had lead and arsenic concentrations below the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-58.

D.2.42 NGRR-38

NGRR-38 is an area approximately 45 x 45 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.5 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 2.7 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-25.

D.2.43 NGRR-39

NGRR-39 is an area approximately 265 x 70 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.1 mg/kg to 8.9 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 5.3 mg/kg to 17.5 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from adjacent MSU locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-24.

D.2.44 NGRR-40

NGRR-40 is an area approximately 45 x 115 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.5 mg/kg to 11.4 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 4.1 mg/kg to 19.8 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-52.

D.2.45 NGRR-41

NGRR-41 is an area approximately 35 x 35 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.8 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 16.0 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-47.

D.2.46 NGRR-42

NGRR-42 is an area approximately 15 x 35 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 6.0 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 7.1 mg/kg, which was less than the SL 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-48.

D.2.47 NGRR-43

NGRR-43 is an area approximately 45 x 50 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 7.5 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 6.0 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-47.

D.2.48 NGRR-44

NGRR-44 is an area approximately 30 x 60 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.5 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 5.1 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-4.

D.2.49 NGRR-46

NGRR-46 is an area approximately 25 x 50 feet. Soil was excavated at a depth of one and a half feet and was placed in the closest PA. A verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 4.1 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 2.7, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-53.

D.2.50 NGRR-47

NGRR-47 is an area approximately 2,280 x 20 feet. Soil was excavated to a depth of one and a half feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.8 mg/kg to 51.9 mg/kg, which were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.8 m/kg to 117 mg/kg, which were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-56.

D.2.51 NGRR-48

NGRR-48 is an area approximately 50 x 20 feet. Lead was identified in one historical sample (01-OS02-SS [LR-68-600E-TRANSECT]-C1-000) at NGRR-48 at a concentration of 1,700 mg/kg, which was greater than the SL of 118 mg/kg, at a depth of zero to a half foot. Soil was excavated to a depth of two and a half feet and was placed in the closest PA. Verification samples had concentrations that exceeded the SL for lead, at concentrations of 152.0 and 142.0 mg/kg. A steep slope leads down from the south of this MSU to the creek, and any additional excavation in this direction would have caused soil to be deposited into the creek. Therefore, based on an evaluation of the net environmental benefit, no additional excavation was performed in this direction. The excavation boundary, sample locations and analytical results are presented on Figure D-56.

D.2.52 NGRR-49

NGRR-49 is an area approximately 50 x 20 feet. Lead was identified in one historical sample (02-SS-[LR-68-A-VS-B]-C2) at NGRR-48 at a concentration of 3,460 mg/kg, and in another historical sample (01SS-[LR68-B-VS-B]-C2) at a concentration of 1,260 mg/kg, both of which exceeded the SL of 118 mg/kg, at a depth of zero to a half foot. Soil was excavated to a depth of two and a half feet and was placed in the closest PA. Verification samples had lead concentrations that exceeded the SL for lead, at concentrations of 3,460 mg/kg and 368 mg/kg. A steep slope leads down from the south of this MSU to the creek, and any further excavation in this direction would have caused soil to be deposited into the creek. Therefore, based on an evaluation of the net environmental benefit, no additional excavation was performed in this direction. The excavation boundary, sample locations and analytical results are presented on Figure D-56.

D.3 MSU–Foundations

Historical soil sampling at the Site identified elevated lead concentrations in soil adjacent to building foundations. The source of this lead was lead sheeting that had been used to line the buildings, and/or lead-based paint chips remaining after building demolition. Consistent with the previous work plan (PIONEER and West Shore, 2000), the top two feet of soil around selected foundations was excavated in areas outside of the proposed golf course land-use footprint and placed in the nearest PA.

Following excavation, verification samples were collected on the excavation floor on each side of the foundation. To ensure that adequate characterization was performed, each of the samples consisted of a composite of five different locations. Further details of the sampling design are described in the Interim Source Removal Action Work Plan (PIONEER and West Shore, 2000).

The soil cleanup goals for arsenic and lead in the areas around the foundations were an RL for arsenic of 60 mg/kg, and an SL for lead of 118 mg/kg.

D.3.1 MSU-F-02

MSU-F-02 is an area comprised of two neighboring foundations that are each an area approximately 30 x 70 feet. Soil was excavated at a depth of two feet and was placed in the closest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.9 mg/kg to 7.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.8 mg/kg to 13.9 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.3.2 MSU-F-03

MSU-F-03 is an area approximately 120 x 85 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.7 mg/kg to 5.7 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.0 mg/kg to 17.3 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-38.

D.3.3 MSU-F-04

MSU-F-04 is an area approximately 30 x 40 feet. Soil was excavated to a depth of two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 4.3 mg/kg and 4.4 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 6.1 mg/kg and 14.9 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-47.

D.3.4 MSU-F-CU-4A

MSU-F-CU-4A is an area approximately 60 x 60 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.2 mg/kg to 14.9 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 8.4 mg/kg to 65.9 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-49.

D.3.5 MSU-F-CU-5A

MSU-F-CU-5A is an area approximately 55 x 60 feet. Soil was removed to a depth of two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 2.7 mg/kg and 3.4 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 3.5 mg/kg and 11.9 mg/kg and were both less than the SL 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-21.

D.3.6 MSU-F-08

MSU-F-08 is an area approximately 60 x 65 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.7 mg/kg to 5.7 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.9 mg/kg to 7.1 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-36.

D.3.7 MSU-F-09

MSU-F-09 is an area approximately 105 x 70 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.2 mg/kg to 12.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.1 mg/kg to 23.7 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-36.

D.3.8 MSU-F-19

MSU-F-19 is an area approximately 60 x 90 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.7 mg/kg to 6.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.1 mg/kg to 9.3 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-37.

D.3.9 MSU-F-20

MSU-F-20 is an area approximately 75 x 110 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.8 mg/kg to 5.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.0 mg/kg to 11.3 mg/kg and were all less than the SL 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-37.

D.3.10 MSU-F-21

MSU-F-21 is an area approximately 110 x 90 feet. Soil was excavated to a depth two feet and was placed

in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.9 mg/kg to 13.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 14.2 mg/kg to 97.6 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-20.

D.3.11 MSU-F-23

MSU-F-23 is an area approximately 65 x 60 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.1 mg/kg to 51.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.3 mg/kg to 32.9 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-28.

D.3.12 MSU-F-24

MSU-F-24 is an area approximately 115 x 115 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.6 mg/kg to 6.5 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.7 mg/kg to 7.3 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-29.

D.3.13 MSU-F-25

MSU-F-25 is an area approximately 200 x 25 feet. Soil was excavated to a depth of two to three feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 1.5 mg/kg to 21.1 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.5 mg/kg to 83.2 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-28.

D.3.14 MSU-F-26

MSU-F-26 is an area approximately 480 x 25 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.6 mg/kg to 40.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.9 mg/kg to 28.6 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-

28.

D.3.15 MSU-F-27

MSU-F-27 is an area approximately 140 x 75 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.4 mg/kg to 9.9 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 5.3 mg/kg to 20.0 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL, with the exception of the sample that was collected on the southwest sidewall of MSU-88 (i.e., where a bunker foundation prevented any additional excavation). The excavation boundary, sample locations and analytical results are presented on Figure D-29.

D.3.16 MSU-F-28

MSU-F-28 is an area approximately 160 x 80 feet. Soil was excavated to a depth two to three feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.5 mg/kg to 10.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.6 mg/kg to 9.2 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-28.

D.3.17 MSU-F-29

MSU-F-29 is an area approximately 120 x 80 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.1 mg/kg to 3.8 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.3 mg/kg to 34.4 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-30.

D.3.18 MSU-F-31

MSU-F-31 is an area approximately 125 x 85 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.9 mg/kg to 5.1 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 8.4 mg/kg to 107.0 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-29.

D.3.19 MSU-F-32

MSU-F-32 is an area approximately 125 x 50 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.0 mg/kg to 5.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 4.8 mg/kg to 16.6 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-39.

D.3.20 MSU-F-33

MSU-F-33 is an area approximately 65 x 125 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.5 mg/kg to 6.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 4.0 mg/kg to 19.7 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-39.

D.3.21 MSU-F-35

MSU-F-35 is an area approximately 170 x 55 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.0 mg/kg to 7.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from undetected to 45.8 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-43.

D.3.22 MSU-F-36

MSU-F-36 is an area approximately 85 x 70 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.5 mg/kg to 35.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.2 mg/kg to 10.8 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-39.

D.3.23 MSU-F-37A

MSU-F-37A is an area approximately 100 x 25 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the

RL and SL. The arsenic concentration in the verification sample was 4.6 mg/kg and was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 58.6 mg/kg and was all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-29.

D.3.24 MSU-F-37B

MSU-F-37B is an area approximately 100 x 25 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.2 mg/kg to 6.9 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 6.2 mg/kg to 83.1 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-58.

D.3.25 MSU-F-38

MSU-F-38 is an area approximately 205 x 25 feet around this foundation. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 3.6 mg/kg to 7.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.6 mg/kg to 7.8 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from an adjacent MSU, which had an arsenic and lead concentration less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-40.

D.3.26 MSU-F-39

MSU-F-39 is an area approximately 50 x 85 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 2.1 mg/kg and 3.1 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were undetected and 2.4 mg/kg and were both less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-41.

D.3.27 MSU-F-40

MSU-F-40 is an area approximately 30 x 215 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.8 mg/kg to 6.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 2.4 mg/kg to 7.7 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-42.

D.3.28 MSU-F-41

MSU-F-41 is an area approximately 230 x 10 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. A verification sample was less than the RL and SL for arsenic and lead. The arsenic concentration in the verification sample was 7.6 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 30.2 mg/kg, which was less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-44.

D.3.29 MSU-F-42

MSU-F-42 is an area approximately 55 x 60 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.7 mg/kg to 36.1 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.7 mg/kg to 8.8 mg/kg and were all less than the SL of 118 mg/kg. This area was further characterized by sampling results from surrounding locations, which had arsenic and lead concentrations less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-36.

D.3.30 MSU-F-44

MSU-F-44 is an area approximately 145 x 75 feet. Soil was excavated to a depth two to three feet and placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.1 mg/kg to 7.1 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 3.0 mg/kg to 74.1 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-38.

D.3.31 MSU-F-45

MSU-F-45 is an area approximately 40 x 45 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 3.5 mg/kg and 4.4 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 3.3 mg/kg and 7.7 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-45.

D.3.32 MSU-F-46

MSU-F-46 is an area approximately 100 x 90 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 2.5 mg/kg to 5.6 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 5.3 mg/kg to 45.0 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample

locations and analytical results are presented on Figure D-17.

D.3.33 MSU-F-47

MSU-F-47 is an area approximately 84 x 29 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 3.8 mg/kg and 4.3 mg/kg which were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 5.1 and 4.4 which were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-3.

D.3.34 MSU-F-48

MSU-F-48 is an area approximately 52 x 30 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. The verification sample had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification samples was 2.7 mg/kg which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 4.3 mg/kg which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-65.

D.3.35 MSU-F-49

MSU-F-49 is an area approximately 30 x 115 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentration that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 8.9 mg/kg to 34.3 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 21.9 mg/kg to 84.0 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.3.36 MSU-F-50

MSU-F-50 is an area approximately 50 x 65 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 2.1 mg/kg and 5.2 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 2.7 mg/kg and 11.4 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-46.

D.3.37 MSU-F-51

MSU-F-51 is an area 65 x 60 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 4.4 mg/kg and 4.8 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 8.8 mg/kg and 8.8 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-47.

D.3.38 MSU-F-52

MSU-F-52 is an area approximately 50 x 50. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were undetected and 2.8 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 3.6 mg/kg and 3.7 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-48.

D.3.39 MSU-F-53

MSU-F-53 is an area approximately 55 x 55. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 2.5 mg/kg and 2.8 mg/kg and were both less than the RL of 60 mg/kg. The lead concentration in the verification samples were 4.4 mg/kg and 4.9 mg/kg and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-48.

D.3.40 MSU-F-54

MSU-F-54 is an area approximately 60 x 90 feet. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 13.9 mg/kg and 33.5 mg/kg and were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 15.1 mg/kg and 17.0 and were both less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-31.

D.3.41 MSU-F-55

MSU-F-55 is an area approximately 85 x 35. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 5.5 mg/kg to 13.1 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 4.4 mg/kg to 13.4 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-54.

D.3.42 MSU-F-56

MSU-F-56 is an area approximately 15 x 25. Soil was excavated to a depth two feet and was placed in the nearest PA. Verification samples had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 4.4 mg/kg to 6.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 4.7 mg/kg to 58.9 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-54.

D.4 MSU–Debris Areas

In the course of excavation, areas of debris were identified. Debris consisted of piping, brick and other construction materials. Some of the debris was painted at one time and was tested to determine if the paint was lead-based.

Depending on the results of the lead screening evaluation, debris was excavated and moved either to a PA or the MSU Laydown Area for off-Site disposal. Verification samples were then collected from the soil below the debris if the debris pile extended greater than one foot below the ground surface. In other cases, the debris was removed, and additional soil was excavated as part of the mass excavation program. Verification soil sample results were collected after excavation and compared to cleanup goals to determine the need for additional excavation.

The soil cleanup goals for arsenic and lead in the areas around the debris piles were an RL for arsenic of 60 mg/kg and an SL for lead of 118 mg/kg.

D.4.1 MSU-D-1

MSU-D-1 consisted of brick, wood, and soil debris defining an area approximately 30 x 30 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were negative, indicating that the material could be placed in a PA. Excavation of the debris resulted in an estimated 50 cubic yards of material being removed and placed in the nearest PA. Verification samples and additional samples from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 1.0 mg/kg to 15.2 mg/kg and were all less than the RL of 60 mg/kg. The lead concentration in the verification sample was 3.5 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.4.2 MSU-D-2

MSU-D-2 was identified as a debris area, but was actually unpainted brick that was part of an existing foundation. Therefore no action was taken. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 6.2 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 24.5 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.4.3 MSU-D-3

MSU-D-3 consisted of brick and soil debris, defining an area approximately 3 x 5 feet. No paint was evident on the debris. The small size of this debris area resulted in an estimated one cubic yard of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.7 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 10.0 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.4.4 MSU-D-4

MSU-D-4 consisted of brick, wood and soil debris, defining an area approximately 115 x 25 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were negative, indicating that the material could be placed in a PA. Debris was excavated to a depth of 15 feet resulting in an estimated 90 cubic yards of material being removed and placed in the nearest PA. The arsenic concentration in the verification sample was 10.9, which was less than the RL of 60 mg/kg. The lead concentration at this depth was 554 mg/kg, which was above the SL of 118 mg/kg. Since this excavation depth was 15 feet below ground surface, which is below the depth of concern for direct contact under MTCA, additional excavation was not performed. The existing lead concentration is not a concern for potential groundwater impacts. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.4.5 MSU-D-5

MSU-D-5 consisted of brick, wood and soil debris, defining an area approximately 15 x 10 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were negative, indicating that the material could be placed in a PA. Excavation resulted in an estimated 10 cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.4.6 MSU-D-6

MSU-D-6 consisted of brick and soil debris, defining an area approximately 45 x 15 feet. No paint was evident on the debris. Excavation resulted in 30 cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.4.7 MSU-D-7

MSU-D-7 consisted of brick and soil debris, defining an area 75 x 15 feet. No paint was evident on the debris. This debris area fell almost entirely within the boundary of NGRR-05, and the excavation of NGRR-05 to a depth of two and a half feet brought arsenic and lead concentrations in MSU-D-7 to less than the RL and SL. The composite verification sample collected for NGRR-05 characterized MSU-D-7, confirming that arsenic and lead were less than the RL and SL. The arsenic concentration in the verification sample was 34.2 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 49.5 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-14.

D.4.8 MSU-D-8

MSU-D-8 consisted of brick, wood and soil debris, defining an area approximately 15 x 15 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were negative, indicating that the material could be placed in a PA. Excavation resulted in an estimated five cubic yards

of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.4.9 MSU-D-9

MSU-D-9 consisted of brick, wood and soil debris, defining an area approximately 10 x 13 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were negative, indicating that the material could be placed in a PA. Excavation resulted in an estimated five cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-32.

D.4.10 MSU-D-10

MSU-D-10 consisted of brick, wood and soil debris, defining an area approximately 20 x 45 feet. No paint was evident on the debris. Excavation resulted in an estimated 30 cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The final boundary of MSU-D-10 was located within PA-01; therefore this area was placed under the ecological cap and the human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-57.

D.4.11 MSU-D-11

MSU-D-11 consisted of brick, wood and soil debris, defining an area approximately 25 x 10 feet. No paint was evident on the debris. Excavation resulted in an estimated 10 cubic yards of material being removed and placed in the nearest PA. Samples surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The final boundary of MSU-D-11 was located within placement area PA-01; therefore this area was placed under the ecological cap and the human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-57.

D.4.12 MSU-D-12

MSU-D-12 consisted of brick debris, defining an area approximately 100 x 95 feet. No paint was evident on the debris. Excavation resulted in an estimated 300 cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples ranged from 8.9 mg/kg to 24.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the verification samples ranged from 47.0 mg/kg to 110.0 mg/kg, and were all less than the SL of 118 mg/kg. In addition, verification samples for MSU-55, MSU-57 and MSU-58 were used to characterize the soil in MSU-D-12. Arsenic and lead concentrations from these MSUs were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.4.13 MSU-D-13

MSU-D-13 consisted of brick, wood and soil debris, defining an area approximately 25 x 30 feet. No paint was evident on the debris. Excavation resulted in an estimated 20 cubic yards of material being

removed and placed in the nearest PA. Samples from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentrations in the verification samples were 3.0 mg/kg and 6.5 mg/kg which were both less than the RL of 60 mg/kg. The lead concentrations in the verification samples were 470 mg/kg and 525 mg/kg, which were less than the RL of 4,100 mg/kg. The final boundary of MSU-D-13 was located within placement area PA-04; therefore this area was placed under the ecological cap and the human health cap. The excavation boundary, sample locations and analytical results are presented on Figure D-16.

D.4.14 MSU-D-14

MSU-D-14 consisted of brick and wood debris, defining an area 25 x 40 feet. No paint was evident on the debris. Excavation resulted in an estimated 40 cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-41.

D.4.15 MSU-D-15

MSU-D-15 consisted of brick and wood debris, defining an area 15 x 20 feet. No paint was evident on the debris. Excavation resulted in an estimated 15 cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-41.

D.4.16 MSU-D-16

MSU-D-16 consisted of brick, wood and soil debris, defining an area approximately 5 x 20 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were negative, indicating that the material could be placed in a PA. Excavation resulted in an estimated five cubic yards of material being removed and placed in the nearest PA. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 24.0 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 16.0 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-58.

D.4.17 MSU-D-17

MSU-D-17 consisted of brick, wood and soil debris, defining an area approximately 40 x 65 feet. No paint was evident on the debris. Excavation resulted in an estimated 90 cubic yards of material being removed and placed in the nearest PA. The arsenic concentrations in the surrounding samples ranged from 3.9 mg/kg to 17.0 mg/kg and were all less than the RL of 60 mg/kg. The lead concentrations in the surrounding samples ranged from 10.0 mg/kg to 74.0 mg/kg and were all less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-59.

D.4.18 MSU-D-18

MSU-D-18 consisted of defining an area 45 x 35 feet. Sample results from an adjacent location had

arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.6 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 3.9 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-30.

D.4.19 MSU-D-19

MSU-D-19 consisted of brick, wood and soil debris, defining an area approximately 45 x 30 feet. Because paint was evident on the some of the debris, lead screening was performed. The results were positive, indicating that the material had to be disposed of off Site. Excavation resulted in an estimated 45 cubic yards of material being removed and placed in the MSU Laydown Area for off-Site disposal. A verification sample and additional samples from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 5.8 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 16.8 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-53.

D.4.20 MSU-D-20

MSU-D-20 consisted of brick, wood and soil debris, defining an area approximately 45 x 30 feet. No paint was evident on the debris. Excavation resulted in an estimated 45 cubic yards of material being removed and placed in the nearest PA. Samples from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-60.

D.4.21 MSU-D-21

MSU-D-21 consisted of brick, wood and soil debris, defining an area approximately 45 x 30 feet. No paint was evident on the debris. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-60.

D.4.22 MSU-D-22

MSU-D-22 consisted of brick, wood and soil debris, defining an area approximately 45 x 30 feet. No paint was evident on the debris. Sample results from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The excavation boundary, sample locations and analytical results are presented on Figure D-35.

D.4.23 MSU-D-23

MSU-D-23 consisted of brick, wood and soil debris, defining an area approximately 45 x 30 feet. No paint was evident on the debris. Excavation resulted in an estimated 45 cubic yards of material being removed and placed in the nearest PA. Samples from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 3.5 mg/kg which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 8.8 mg/kg which was less than the SL of 118 mg/kg. The excavation boundary, sample

locations and analytical results are presented on Figure D-45.

D.4.24 MSU-D-24

MSU-D-24 consisted of brick, wood and soil debris, defining an area approximately 45 x 30 feet. No paint was evident on the debris. Excavation resulted in an estimated 45 cubic yards of material being removed and placed in the nearest PA. Samples from surrounding locations had arsenic and lead concentrations that were less than the RL and SL. The arsenic concentration in the verification sample was 6.5 mg/kg, which was less than the RL of 60 mg/kg. The lead concentration in the verification sample was 3.4 mg/kg, which was less than the SL of 118 mg/kg. The excavation boundary, sample locations and analytical results are presented on Figure D-43.

Lead 4,100 mg/kg
Motor Oil 2,000 mg/kg

The two historical samples for TPH were compared to the cleanup goal for Motor Oil.

Data for this MSU can be found in Appendix B, where they are grouped by Remediation Unit.

APPENDIX E

TREE ROOT ZONE REMEDIATION PROGRAM

E.1 Introduction

This appendix presents the results of the Tree Root Zone Remediation Program conducted to retain trees in the Golf Course and Commercial areas. The tree root zone remediation program was focused on trees located in the Commercial Areas which could provide a buffer around the Site perimeter, and on trees in the Golf Course Areas that were chosen to remain for aesthetic reasons. The Tree Root Zone Remediation program was conducted in response to public comment obtained as part of the Site Environmental Impact Statement (EIS). Members of the public asked the Project Team and the Washington State Department of Ecology (Ecology) to determine areas of the property could be left in their natural condition.

This remedial action involved sampling soil within tree drip lines (i.e., the approximate horizontal distance of the outstretched limbs and roots) for arsenic and lead. In instances where the soil arsenic or lead cleanup standards were exceeded, one foot of soil was carefully removed within the drip line of the tree, soil samples were collected, and the excavation was immediately filled with clean topsoil. If the confirmation sample results exceeded the cleanup standards, additional rounds of excavation and confirmation sampling were undertaken until the cleanup standards were achieved.

The data presented in this report were collected between April 2 and April 29, 2003. All data were collected according to the 2001 Site Characterization Program: Areas for Additional Sampling Work Plan (PIONEER and WSNW, 2001).

E.2 Summary of Field Activities

The Tree Root Zone Remediation program was accomplished in the following steps:

1. The trees identified for preservation within the commercial and golf course remediation unit (RU) areas were assigned a unique number and a tag was attached to the tree.
2. The location of each tree was recorded using a Global Positioning System (GPS). A total of 334 trees were sampled. Tree locations are shown in Figure E-1.
3. The drip line, the approximate horizontal distance of the outstretched limbs and roots, was estimated for each tree. The drip line approximates the spread of the tree root and identifies the area where only limited soil removal can be done without damaging the tree.
4. One composite sample was collected around the base of each tree or groups of trees to characterize the soil concentrations of arsenic and lead. The number of sample points necessary for the composite sample was determined based on the drip line size of the individual tree. Trees with a drip line of 1,500 sq ft or less had a 3-point composite soil sample, those with a drip line between 1,500 and 2,500 sq. ft. had a 4-point composite soil sample, and those with a drip line greater than 2,500 sq. ft. had a 5-point composite soil sample. Trees with drip lines that covered more than 6,000 sq. ft. were divided into a north and south region, and a 5-point composite soil sample was taken in each region. Trees that had overlapping drip lines were grouped together and the number of points needed for the composite sample was determined by the combined square

footage of the drip lines. Drip lines and diameters were verified when sampling took place and were corrected if needed.

5. Trees with surrounding soil concentrations of arsenic and lead that were below the cleanup standards were tagged to ensure that they would be saved (273 of the 334 trees were designated as clean after the first round of soil sampling, and did not require remediation). Trees with surrounding soil concentrations that were above the cleanup standards were identified for removal of one foot of soil (61 trees required an initial round of soil remediation). The excavation activities consisted of careful removal of one foot of soil around the base of the tree, out to the drip line. Following soil removal, another composite soil sample was collected, and the remediated area was covered with one foot of clean topsoil to protect the tree roots, pending results of the soil analysis.
6. Trees with surrounding soil concentrations of arsenic and lead that were below cleanup standards were tagged to be saved (60 of the 61 remediated trees were identified as clean). The remaining tree required one more round of excavation. After this second round of excavation, the soil concentrations of arsenic and lead met the remediation levels.

E.3 Sampling Results

Soil sampling results from the tree root zone remediation program are shown in Table E.1. As shown in this table, following remediation all arsenic and lead soil concentrations were below the cleanup standards of 60 mg/kg and 118 mg/kg, respectively.

June 10, 2004 Job No. 129-044-004-0800

GRADE VERIFICATION REPORT FOR PLACEMENT AREAS AT DUPONT WORKS SITE

BACKGROUND

ESM Consulting Engineers has been retained by the Weyerhaeuser Company to measure the final shape of the top of contaminated soils placement areas. Measurement of the outer edge of the placement areas and the preparation of corresponding legal descriptions is also included in the scope of work.

ESM is receiving direction from West Shore Corporation NW and Pioneer Technologies while performing these tasks.

EQUIPMENT AND METHODS

Real Time Kinematic (RTK) data collection using a dual frequency Global Positioning System (GPS) was utilized during this process. The rover unit was mounted to an ATV. The rover GPS unit was set to record measurements for every ten (10) feet of travel. Transects were spaced approximately 25 feet apart to generate a grid spacing measuring approximately 10' x 25'. The edges of the placement areas were also measured utilizing RTK GPS.

DURATION

Work for this project was performed February through May, 2004.

PRODUCTS:

Topography Exhibits – A contour map with a one-foot contour interval as generated from GPS survey points for each placement area is provided herein.
Legal Descriptions – A metes and bounds legal description of each placement area based upon each surveyed placement area boundary is provided herein.
Legal Description Exhibits – A graphic exhibit depicting the general location of each placement area is provided herein.

Job No. 129-044-004-0800
June 2, 2004

EXHIBIT "A"

LEGAL DESCRIPTION FOR PLACEMENT AREA 7

That portion of the northeast quarter Section 27, Township 19 North, Range 1 East, Willamette Meridian., in Pierce County, Washington, being more particularly described as follows:

COMMENCING at the southeast corner of said Section 27, being a 6" x 6" concrete monument with a chiseled "X" as shown on that Record of Survey by ESM, Inc. recorded under Pierce County Recording No. 9303050249;

THENCE along the south line of the southeast quarter of said Section 27, N 87°34'19" W, 2588.68 feet to the south quarter corner thereof, being a 6" x 6" concrete monument with a chiseled "X" as shown on said Record of Survey;

THENCE along the north-south centerline of said Section 27, N 01°23'53" E, 3986.79 feet;

THENCE S 88°36'07" E, 637.27 feet to the TRUE POINT OF BEGINNING;

THENCE N 30°12'00" E, 66.61 feet;

THENCE N 23°34'40" E, 164.84 feet;

THENCE N 27°48'04" E, 52.37 feet;

THENCE N 01°07'45" E, 193.19 feet;

THENCE N 23°41'28" W, 221.27 feet;

THENCE N 53°27'00" W, 101.80 feet;

THENCE N 61°09'44" W, 61.16 feet;

THENCE N 36°23'18" W, 82.59 feet;

THENCE N 89°49'36" W, 43.66 feet;

THENCE S 82°56'41" W, 78.86 feet;

THENCE S 13°47'53" W, 66.23 feet;

THENCE S 17°58'08" E, 50.58 feet;

THENCE S 33°45'48" E, 72.97 feet;

THENCE S 07°09'41" E, 159.32 feet;

THENCE S 14°04'25" E, 73.65 feet;

THENCE S 29°06'44" E, 49.57 feet;

THENCE S 17°21'33" E, 138.77 feet;

THENCE S 12°32'43" E, 122.80 feet;

THENCE S 22°37'29" E, 70.56 feet;

THENCE S 50°25'28" E, 41.83 feet;

THENCE S 78°22'12" E, 38.59 feet, to the TRUE POINT OF BEGINNING.

Containing 4.38 acres, more or less.

See attached Exhibit "PA-7".

1 Introduction

Workspace air monitoring is an essential part of the Health and Safety Program at the former DuPont Works Site in DuPont, Washington. Such a program was implemented during the 2001 interim source removal actions taken to excavate arsenic and lead contaminated soil around building foundations and along former narrow gauge railroad (NGRR) track beds. The monitoring program was established to assess airborne arsenic and lead concentrations as dust. During this program concentrations of lead and arsenic may have been present at levels up to 4,100 mg/kg and 530 mg/kg, respectively.

To ensure that workers were not exposed to elevated levels of these contaminants, the following air monitoring plan was prepared and implemented during excavation activities. This plan included provisions for both personal air monitoring and real-time air monitoring. Personal air samples were taken in the breathing zone of workers assumed to have the highest potential exposure, and real-time air samples were taken in areas adjacent to workers, where airborne particulate levels were assumed to be highest. The workers were informed of the results of the air monitoring at daily health and safety meetings.

2 Summary of Activities

The results of the personal air monitoring and real-time air monitoring conducted during the interim source removal action are presented below.

2.1 Action Level Calculations:

To develop conservative action levels lead and arsenic concentration levels 10,000 mg/kg for lead and 1,000 mg/kg for arsenic where selected to be used in all calculations. These concentrations are at least two times the expected highest concentration in the soil to be excavated. These concentrations were combined with the 8-hour time-weighted-average (TWA) permissible exposure levels (PEL) to determine site-specific airborne dust action levels. PELs are the highest average concentrations a worker may be exposed to for a 40-hour workweek without experiencing any adverse health effects.

2.2 Personal Air Monitoring

Personal air samples were collected during the first week of excavation activities. Five individuals (see Table 1) expected to receive the highest exposure, were monitored during an entire work shift. The samples were analyzed for arsenic and lead by AT Labs, Pleasanton, CA, an American Industrial Hygiene Association (AIHA)-accredited laboratory, using the Occupational Safety and Health Administration (OSHA) Method 125. AIHA-accredited laboratories are preferred because these laboratories participate in extensive quality control and quality assurance procedures that are monitored by OSHA. The results of this analysis are presented in Table 1.

2.2 Real Time Air Monitoring

Real time air monitoring was conducted using a mini-ram (personalDataRAM™, model pDR-1000AN, Monitoring Instruments for the Environment, Inc.) in order to ensure that that the PELs for arsenic and lead would not be exceeded. The use of the mini-ram was initiated during the first week of field activities. The frequency of sampling was determined based on the readings, changes in work patterns, or changes in soil conditions that could potentially result in increased dust emissions.

Using the calculations presented in Table 2 the mini-ram concentration that would result in exposure to lead at the PEL was 5.0 mg/m^3 (assuming a soil concentration of 10,000 mg/kg lead). This level was also protective for exposure to arsenic. To provide an additional margin of safety continued measurements above 2.5 mg/m^3 (one half of the PEL) were set as the action level for upgrading Personal Protective Equipment (PPE) to Level C. Air measurements were recorded as one-minute averages, daily averages (corresponding to the logging period of the instrument), and short-term exposure levels (STELs), which are 15-minute average concentrations. Daily average concentrations were the values compared to the 2.5 mg/m^3 action level.

3 Results

3.1 Personal Air Monitoring Results

As shown in Table 1, arsenic and lead were not detected in any of the samples above the sample detection limits which ranged from 0.2 ug/m^3 to 0.5 ug/m^3. This detection limit is well below the Washington Industrial Safety and Health Administration (WISHA) PEL of 500 ug/m^3 for arsenic and 50 ug/m^3 for lead. These samples were collected in an area of the site with reported soil concentrations ranging from 60 to 300 mg/kg for arsenic and 2,100 to 4,100 mg/kg for lead. Since no airborne arsenic and lead particulate was detected in this area of high concentrations further sampling was discontinued.

3.2 Real Time Air Monitoring Results

During periods of heavy equipment operation and other times of maximum soil disturbance, continuous particulate readings were taken adjacent to the person assumed to have the maximum exposure. This person was chosen as the ground worker who directed the excavator operator. The excavator operator was not chosen for daily monitoring, because this person works inside a closed cab equipped with a high efficiency particulate arresting (HEPA) filter. A summary of the real-time air monitoring results is presented in Table 3. As shown in this table, at no time were air concentrations above the 2.5 mg/m^3 action level (maximum of 1.312 mg/$m^{3)}$. As a result of this data monitoring was reduced to once a month, or during periods of visible dust. All of the real-time sampling results are presented in Appendix A.

Table 1 – Personal Air Sample Results

Worker Activity	Sample Number	Date Sampled	Arsenic (ug/m^3)[a]	Lead (mg/m^3)[b]
Excavator Operator	2001018718	6/6/2001	<0.2	<0.2
Ground person next to excavator	2001018719	6/6/2001	<0.2	<0.2
Excavator Operator	2001018720	6/6/2001	<0.2	<0.2
Truck Driver	2001018721	6/7/2001	<0.5	<0.5
Truck Driver	2001018722	6/6/2001	<0.3	<0.3

[a] The 8-hour time weighted average PEL for arsenic is 500 ug/m^3

[b] The 8-hour time weighted average PEL for lead is 50 ug/m^3

Table 2 – Derivation of Site-specific Action Levels for 8-hour Time Weighted Exposures

Action Level Concentration in Air (mg/m^3) = $\frac{\text{Occupational exposure limit (mg/m3) x 1,000,000 (mg/kg)}}{\text{Soil concentration (mg/kg) x safety factor}}$		
Parameter	**Value**	**Units**
Site-specific particulate Action Level for lead	2.5	mg/m^3
Occupational exposure Limit for lead (8-hour TWA)	0.05	mg/m^3
Current Maximum lead concentration in soil on site	10,000	mg/kg
Safety Factor	2	
Conversion Factor	1,000,000	mg/kg
Site-specific particulate Action Level for arsenic	250	mg/m^3
Occupational exposure Limit for arsenic (8-hour TWA)	0.5	mg/m^3
Current Maximum arsenic concentration in soil on site	1,000	mg/kg
Safety Factor	2	
Conversion Factor	1,000,000	mg/kg

Table 3 – Real-Time Air Monitoring Results

[a]Concentration is the average respirable particulate concentration measured during the logging period of the miniram.
[b]Concentration is the maximum 15-minute average concentration measured during the logging period of the miniram. There is no WISHA 15-minute STEL for arsenic or lead.
[c]Worker was inside the cab of an excavator.

Appendix A – Real Time Air Monitoring Results

A copy of all real time air monitoring data is presented in this appendix. This data was logged on a miniram portable respirable dust monitors. The data is presented in chronological order, as identified in Table 2. Note the site-specific 8-hour TWA is 2.5 mg/m^3 and zero values are instances where the measured concentration was less than 0.001 mg/m^3.

July 17, 2001

pDR-1000 S/N: 04061
User ID: DuPont Site #1
Tag Number: 03
Number of logged points: 3122
Start time and date: 08:38:51 17-Jul
Elapsed time: 08:40:20
Logging period (sec): 10 (changed to 60 minute average for presentation in table below)
Calibration Factor (%): 100
Max Display Concentration: 2.140 mg/m³
Time at maximum: 15:34:38 Jul 17
Max STEL Concentration: 0.250 mg/m³
Time at max STEL: 15:48:22 Jul 17
Overall Avg Conc: 0.036 mg/m³

pDR-1000 S/N: 00000
User ID: DuPont Site #2
Tag Number: 04
Number of logged points: 1042
Start time and date: 08:37:24 17-Jul
Elapsed time: 08:41:00
Logging period (sec): 30 (changed to 60 minute average for presentation in table below)
Calibration Factor (%): 100
Max Display Concentration: 7.182 mg/m³
Time at maximum: 14:37:48 Jul 17
Max STEL Concentration: 1.149 mg/m³
Time at max STEL: 09:31:24 Jul 17
Overall Avg Conc: 0.419 mg/m³

July 18, 2001

pDR-1000 S/N: 04061
User ID: DuPont Site #2
Tag Number: 01
Number of logged points: 591
Start time and date: 07:27:17 18-Jul
Elapsed time: 09:51:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 3.553 mg/m³
Time at maximum: 16:56:43 Jul 18
Max STEL Concentration: 0.511 mg/m³
Time at max STEL: 17:05:48 Jul 18
Overall Avg Conc: 0.101 mg/m³

pDR-1000 S/N: 00000
User ID: DuPont Site #2
Tag Number: 05
Number of logged points: 585
Start time and date: 07:29:25 18-Jul
Elapsed time: 09:45:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 2.522 mg/m³
Time at maximum: 11:28:45 Jul 18
Max STEL Concentration: 0.893 mg/m³
Time at max STEL: 11:41:55 Jul 18
Overall Avg Conc: 0.331 mg/m³

July 24, 2001

pDR-1000 S/N: 04061
User ID: DuPont Site #1
Tag Number: 04
Number of logged points: 586
Start time and date: 07:20:14 24-Jul
Elapsed time: 09:46:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 5.732 mg/m³
Time at maximum: 07:37:49 Jul 24
Max STEL Concentration: 0.677 mg/m³
Time at max STEL: 07:41:15 Jul 24
Overall Avg Conc: 0.248 mg/m³

July 30, 2001

pDR-1000
User ID: DuPont Site #1
Tag Number: 07
Number of logged points: 581
Start time and date: 07:17:20 30-Jul
Elapsed time: 09:41:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 4.307 mg/m³
Time at maximum: 10:37:04 Jul 30
Max STEL Concentration: 0.637 mg/m³
Time at max STEL: 15:20:51 Jul 30
Overall Avg Conc: 0.228 mg/m³

pDR-1000 S/N: 00000
User ID: DuPont Site #2
Tag Number: 01
Number of logged points: 581
Start time and date: 07:39:43 13-Aug
Elapsed time: 09:41:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 7.732 mg/m³
Time at maximum: 13:37:33 Aug 13
Max STEL Concentration: 1.380 mg/m³
Time at max STEL: 15:00:14 Aug 13
Overall Avg Conc: 0.498 mg/m³

Logged Data:

SECTION 1 – INTRODUCTION

Workplace air monitoring is an essential part of the Health and Safety Program at the former DuPont Works Site in DuPont, Washington. Such a program was implemented during 2002 for the following programs:

- Grubbing of Site Vegetation
- Chipping of Site Vegetation
- Interim corrective action taken to excavate arsenic and lead contaminated soil near the perimeter of the Site property.

The monitoring program was established to assess airborne arsenic and lead concentrations as dust. During this program concentrations of lead and arsenic in soil may have been present at levels up to 10,000 mg/kg and 1,000 mg/kg, respectively.

To ensure that workers were not exposed to elevated levels of these contaminants, an air monitoring plan was prepared and implemented during excavation activities. This plan included provisions for both personal air monitoring and real-time air monitoring. Personal air samples were taken in the breathing zone of workers assumed to have the highest potential exposure, and real-time air samples were taken in areas adjacent to workers, where airborne particulate levels were assumed to be highest. The workers were informed of the results of the air monitoring at daily health and safety meetings.

SECTION 2 – SUMMARY OF ACTIVITIES

The results of the personal air monitoring and real-time air monitoring conducted during the interim source removal actions, clearing, and grubbing are presented below.

2.1 Action Level Calculations

Conservative air monitoring action levels were developed for lead and arsenic. It was assumed that concentration of lead in soil was 10,000 mg/kg and the concentration of arsenic in soil was 1,000 mg/kg for the purpose of calculating an action level. These concentrations are at least two times the expected highest concentration in the soil to be excavated. These concentrations were combined with the 8-hour time-weighted-average (TWA) permissible exposure levels (PEL) to determine site-specific airborne dust action levels. PELs are the highest average concentrations a worker may be exposed to for a 40-hour work week without experiencing any adverse health effects. Using the calculations presented in Table 2-1 the mini-ram concentration that would result in exposure to lead at the PEL was 5.0 mg/m^3 (assuming a soil concentration of 10,000 mg/kg lead). This level was also protective for exposure to arsenic. To provide an additional margin of safety continued measurements above 2.5 mg/m^3 (one half of the PEL) were set as the action level for instituting additional soil wetting to suppress dust, or if this was ineffective, to upgrade Personal Protective Equipment (PPE) to Level C.

2.2 Personal Air Monitoring

Personal air samples were collected throughout the duration of excavation activities. During excavation activities, individuals expected to receive the highest exposure were monitored during an entire work shift. The samples were analyzed for arsenic and lead by STL Labs, Fife, WA using the Environmental Protection Agency (EPA) Method SW 6020. The results of this analysis are presented in Table 2-2.

2.3 Real Time Air Monitoring

Real time air monitoring was conducted using a mini-ram (personal DataRAM™, model pDR-1000AN, Monitoring Instruments for the Environment, Inc.) in order to ensure that the PELs for arsenic and lead would not be exceeded. The mini-ram measures respirable particulate concentrations and was used throughout the duration of field activities. The frequency of sampling was determined based on the readings, changes in work patterns, or changes in soil conditions that could potentially result in increased dust emissions. The action level for the miniram was set at 2.5 mg/m^3 (one half of the PEL) Air measurements were recorded as one-minute averages, daily averages (corresponding to the logging period of the instrument), and short-term exposure levels (STELs), which are 15-minute average concentrations. Daily average concentrations were the values compared to the 2.5 mg/m^3 action level.

Table 2-1 – Derivation of Site-specific Action Levels for 8-hour Time Weighted Exposures

Action Level Concentration in Air (mg/m^3) = $\frac{\text{Occupational exposure limit (mg/m3) x 1,000,000 (mg/kg)}}{\text{Soil concentration (mg/kg) x safety factor}}$		
Parameter	**Value**	**Units**
Site-specific particulate Action Level for lead	2.5	mg/m^3
Occupational exposure Limit for lead (8-hour TWA)	0.05	mg/m^3
Current Maximum lead concentration in soil on site	10,000	mg/kg
Safety Factor	2	
Conversion Factor	1,000,000	mg/kg
Site-specific particulate Action Level for arsenic	250	mg/m^3
Occupational exposure Limit for arsenic (8-hour TWA)	0.5	mg/m^3
Current Maximum arsenic concentration in soil on site	1,000	mg/kg
Safety Factor	2	
Conversion Factor	1,000,000	mg/kg

NOTES:
[(1)]The 8-hour time weighted average PEL for arsenic is 500 ug/m^3.
[(2)]The 8-hour time weighted average PEL for lead is 50 ug/m^3.
[(3)]Values with a "<" sign indicate that the analyte w as undetected in that sample. The value after the "<" sign is the sample detection limit.

SECTION 3 – RESULTS

3.1 Personal Air Monitoring Results

As shown in Table 2, all arsenic and lead levels were well below the Washington Industrial Safety and Health Administration (WISHA) PEL of 500 ug/m^3 for arsenic and 50 ug/m^3 for lead. The highest detected arsenic level was 3.32 ug/m^3, and the highest detected lead concentration was 16.9 ug/m^3. Both of these concentrations were measured on a bulldozer operator.

3.2 Real -Time Air Monitoring Results

During periods of heavy equipment operation and other times of maximum soil disturbance, continuous particulate readings were taken next to workers assumed to have the potential for maximum exposure. Workers chosen for monitoring included Heavy Equipment Operators, Archeologists and Ground People working adjacent to heavy equipment. A summary of the real-time air monitoring results is presented in Table 3-1. As shown in this table, there were three instances where the average air concentrations were above the 2.5 mg/m^3 action level. When these results were noted, additional soil wetting was implemented to reduce airborne dust levels. All average air concentrations were below the PEL of 5.0 (the maximum average concentration was 3.47 mg/m^3). All of the real-time sampling results are presented in Appendix A.

Table 3-1 – Real-Time Air Monitoring Results

Date	Average Concentration (mg/m^3)[1]	Activity of Person Sampled

[1]Concentration is the average respirable particulate concentration measured during the logging period of the miniram.
[2]Shaded values indicate levels that exceeded the action level of 2.5 mg/m^3.

APPENDIX A – REAL-TIME AIR MONITORING RESULTS – 2002

A copy of all real time air monitoring data is presented in this appendix. These data were logged on a miniram portable respirable dust monitors. The data is presented in chronological order, as identified in Table 3-1. Note the site-specific 8-hour TWA is 2.5 mg/m^3 and zero values are instances where the measured concentration was less than 0.001 mg/m^3.

June 20, 2002

pDR-1000 S/N: 04848
User ID: DuPont Site PDR-1
Tag Number: 01
Number of logged points: 448
Start time and date: 08:04:52 20-Jun
Elapsed time: 07:28:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 28.569 mg/m³
Time at maximum: 08:30:26 Jun 20
Max STEL Concentration: 1.506 mg/m³
Time at max STEL: 12:05:52 Jun 20
Overall Avg Conc: 0.346 mg/m³

pDR-1000 S/N: 04881
User ID: DuPont Site #1
Tag Number: 01
Number of logged points: 307
Start time and date: 12:54:38 01-Aug
Elapsed time: 05:07:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 0.222 mg/m³
Time at maximum: 12:57:11 Aug 01
Max STEL Concentration: 0.067 mg/m³
Time at max STEL: 13:11:38 Aug 01
Overall Avg Conc: 0.044 mg/m³

August 8, 2002

pDR-1000 S/N: 04848
User ID: DuPont Site #1
Tag Number: 04
Number of logged points: 497
Start time and date: 07:46:53 08-Aug
Elapsed time: 08:17:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 107.722 mg/m³
Time at maximum: 08:43:35 Aug 08
Max STEL Concentration: 13.379 mg/m³
Time at max STEL: 08:57:53 Aug 08
Overall Avg Conc: 3.468 mg/m³

Logged Data:

pDR-1000 S/N: 04848
User ID: DuPont Site PDR-1
Tag Number: 01
Number of logged points: 207
Start time and date: 07:57:44 22-Aug
Elapsed time: 03:27:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 39.840 mg/m³
Time at maximum: 08:50:00 Aug 22
Max STEL Concentration: 3.413 mg/m³
Time at max STEL: 11:10:14 Aug 22
Overall Avg Conc: 1.515 mg/m³

Logged Data:

September 5, 2002

pDR-1000 S/N: 04848
User ID: DuPont Site PDR-1
Tag Number: 02
Number of logged points: 629
Start time and date: 07:03:48 05-Sep
Elapsed time: 10:29:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 27.298 mg/m³
Time at maximum: 07:27:44 Sep 05
Max STEL Concentration: 1.448 mg/m³
Time at max STEL: 13:04:19 Sep 05
Overall Avg Conc: 0.114 mg/m³

Logged Data:

pDR-1000 S/N: 04848
User ID: DuPont Site PDR-1
Tag Number: 04
Number of logged points: 453
Start time and date: 08:01:14 26-Sep
Elapsed time: 07:33:00
Logging period (sec): 60
Calibration Factor (%): 100
Max Display Concentration: 9.180 mg/m³
Time at maximum: 15:09:50 Sep 26
Max STEL Concentration: 0.199 mg/m³
Time at max STEL: 13:59:45 Sep 26
Overall Avg Conc: 0.029 mg/m³

Logged Data:

3.2 Real -Time Air Monitoring Results 3-1

APPENDIX A – REAL-TIME AIR MONITORING RESULTS – 2002 ..... A-1

TABLES

Table 2-1 – Derivation of Site-specific Action Levels for 8-hour Time Weighted Exposures 2-2
Table 2-2 – Personal Air Sample Results 2-3

SECTION 1 – INTRODUCTION

Workplace air monitoring is an essential part of the Health and Safety Program at the former DuPont Works Site in DuPont, Washington. Such a program was implemented during 2003 for the following programs:

- Corrective action taken to excavate arsenic and lead contaminated soil on the entire site.
- Corrective Action taken to excavate arsenic and lead contaminated soils around foundations and previously removed narrow gauge railroad.
- Excavation of miscellaneous small units.
- Loading miscellaneous small unit stockpiles onto trucks to be hauled off site.
- Soil sampling

The monitoring program was established to assess airborne arsenic and lead concentrations as dust. During this program concentrations of lead and arsenic in soil may have been present at levels up to 10,000 mg/kg and 1,000 mg/kg, respectively.

To ensure that workers were not exposed to elevated levels of these contaminants, an air monitoring plan was prepared and implemented during excavation activities. This plan included provisions for both personal air monitoring and real-time air monitoring. Personal air samples were taken in the breathing zone of workers assumed to have the highest potential exposure, and real-time air samples were taken in areas adjacent to workers, where airborne particulate levels were assumed to be highest. The workers were informed of the results of the air monitoring at daily health and safety meetings.

SECTION 2 – SUMMARY OF ACTIVITIES

The results of the personal air monitoring and real-time air monitoring conducted during the interim source removal actions, clearing, and grubbing are presented below.

2.1 Action Level Calculations

Conservative air monitoring action levels were developed for lead and arsenic. It was assumed that concentration of lead in soil was 10,000 mg/kg and the concentration of arsenic in soil was 1,000 mg/kg for the purpose of calculating an action level. These concentrations are at least two times the expected highest concentration in the soil to be excavated. These concentrations were combined with the 8-hour time-weighted-average (TWA) permissible exposure levels (PEL) to determine site-specific airborne dust action levels. PELs are the highest average concentrations a worker may be exposed to for a 40-hour work week without experiencing any adverse health effects. Using the calculations presented in Table 2-1 the mini-ram concentration that would result in exposure to lead at the PEL was 5.0 mg/m^3 (assuming a soil concentration of 10,000 mg/kg lead). This level was also protective for exposure to arsenic. To provide an additional margin of safety continued measurements above 2.5 mg/m^3 (one half of the PEL) were set as the action level for instituting additional soil wetting to suppress dust, or if this was ineffective, to upgrade Personal Protective Equipment (PPE) to Level C.

2.2 Personal Air Monitoring

Personal air samples were collected throughout the duration of excavation activities. During excavation activities, individuals expected to receive the highest exposure were monitored during an entire work shift. The samples were analyzed for arsenic and lead by STL Labs, Fife, WA using the Environmental Protection Agency (EPA) Method SW 6020. The results of this analysis are presented in Table 2-2.

2.3 Real Time Air Monitoring

Real time air monitoring was conducted using a mini-ram (personal DataRAM™, model pDR-1000AN, Monitoring Instruments for the Environment, Inc.) in order to ensure that the PELs for arsenic and lead would not be exceeded. The mini-ram measures respirable particulate concentrations and was used throughout the duration of field activities. The frequency of sampling was determined based on the readings, changes in work patterns, or changes in soil conditions that could potentially result in increased dust emissions. The action level for the miniram was set at 2.5 mg/m^3 (one half of the PEL). Air measurements were recorded as one-minute averages, daily averages (corresponding to the logging period of the instrument), and short-term exposure levels (STELs), which are 15-minute average concentrations. Daily average concentrations were the values compared to the 2.5 mg/m^3 action level.

Table 2-1 – Derivation of Site-specific Action Levels for 8-hour Time Weighted Exposures

Action Level Concentration in Air (mg/m^3) = $\frac{\text{Occupational exposure limit (mg/m3) x 1,000,000 (mg/kg)}}{\text{Soil concentration (mg/kg) x safety factor}}$		
Parameter	**Value**	**Units**
Site-specific particulate Action Level for lead	2.5	mg/m^3
Occupational exposure Limit for lead (8-hour TWA)	0.05	mg/m^3
Current Maximum lead concentration in soil on site	10,000	mg/kg
Safety Factor	2	
Conversion Factor	1,000,000	mg/kg
Site-specific particulate Action Level for arsenic	250	mg/m^3
Occupational exposure Limit for arsenic (8-hour TWA)	0.5	mg/m^3
Current Maximum arsenic concentration in soil on site	1,000	mg/kg
Safety Factor	2	
Conversion Factor	1,000,000	mg/kg

Table 2-2 – Personal Air Sample Results

NOTES:
[1]The 8-hour time weighted average PEL for arsenic is 500 ug/m^3.
[2]The 8-hour time weighted average PEL for lead is 50 ug/m^3.
[3]Values with a "<" sign indicate that the analyte was undetected in that sample. The value after the "<" sign is the sample detection limit.

SECTION 3 – RESULTS

3.1 Personal Air Monitoring Results

As shown in Table 2, all arsenic and lead levels were well below the Washington Industrial Safety and Health Administration (WISHA) PEL of 500 ug/m^3 for arsenic and 50 ug/m^3 for lead. The highest detected arsenic level was 10.0 ug/m^3, measured on an open-cab track truck operator, and the highest detected lead concentration was 23.9 ug/m^3, measured on a ground worker.

3.2 Real -Time Air Monitoring Results

During periods of heavy equipment operation and other times of maximum soil disturbance, continuous particulate readings were taken next to workers assumed to have the potential for maximum exposure. Workers chosen for monitoring included Heavy Equipment Operators, Archeologists and Ground People working adjacent to heavy equipment. A summary of the real-time air monitoring results is presented in Table 3-1. As shown in this table, there were no instances where the average air concentrations were above the 2.5 mg/m^3 action level. In the dry weather additional soil wetting was implemented to reduce airborne dust levels All average air concentrations were below the PEL of 5.0 (the maximum average concentration was 1.39 mg/m^3). All of the real-time sampling results are presented in Appendix A.

[1]Concentration is the average respirable particulate concentration measured during the logging period of the miniram.

APPENDIX A – REAL-TIME AIR MONITORING RESULTS – 2003

A copy of all real time air monitoring data is presented in this appendix. These data were logged on a miniram portable respirable dust monitors. The data is presented in chronological order, as identified in Table 3-1. The overall average concentration presented in this appendix is different than that identified in Table 3-1. The miniram's internal average concentration presented in this appendix is inconsistent with the hand-calculated average of each day's one minute average. Table 3-1 presents the hand-calculated average. The appendix displays both the internally calculated average along with each minute average. Note the site-specific 8-hour TWA is 2.5 mg/m^3 and zero values are instances where the measured concentration was less than 0.001 mg/m^3.

SECTION 1 – INTRODUCTION

1.1 Introduction

This report presents the results of respirable airborne particulate (i.e., particulate matter less than 10 microns in size or PM_{10}) sampling that was conducted during the perimeter soil interim corrective action (ICA) at the former DuPont Works Site in DuPont, Washington between June 19 and July 12, 2002 (See Figure 1). This work was undertaken after Ecology approved the work plan (PIONEER and WSNW, 2002). The perimeter soil ICA involved excavation of 1 foot of contaminated soil along a 250-foot wide stretch of land adjacent to the South boundary of the Site. The PM_{10} sampling presented in this report was performed in addition to the work place air monitoring done to document worker protection. The purpose of the PM_{10} sampling was to document the effectiveness of engineering controls in limiting off-Site migration of particulate during on-Site excavation and remediation work.

1.2 Objectives

The objectives of the PM_{10} monitoring program were the following:

- Quantify levels of respirable particulate matter (PM_{10}) on-Site, along the property fence line, to serve as a worst-case surrogate for particulate levels that may migrate off-Site;
- Quantify the amount of arsenic and lead present in the PM_{10} samples;
- Compare sample results to health-based standards;
- Evaluate wind speed and wind directions at the Site during the sampling period; and
- Evaluate the effectiveness of engineering controls used at the Site to suppress dust.

SECTION 2 – SUMMARY OF ACTIVITIES

2.1 Sampling Approach

The sampling approach, including sampling procedure, sample locations, and analytical methods are described below.

2.1.1 Sampling Procedure

Sampling for PM_{10} was conducted using Hi-Volume particulate samplers (GMW Model IP 10-8000 PM-10) obtained from Clean Air Engineering (See Figure 2-1). Prior to use in the field, these samplers were assembled, checked for leaks, and calibrated to identify the appropriate flow rate set point for each sampler. Information regarding the calibration of each individual sampler is contained in Appendix A.

Following calibration, the monitors were attached to wooden platforms and transported to the monitoring locations. At the start of the work shift every morning, the PM_{10} samplers were inspected and set up for the day. At the same time the previous day's samples were removed from the samplers and sent to Severn Trent Laboraties, Inc. (STL) for analysis. A generator was used to power the samplers. The procedure followed to inspect the samplers and set up for daily sampling is contained in Appendix A.

2.1.2 Sample Locations

PM_{10} samplers were set up along the south fence on the property boundary, approximately 250 feet apart. The daily sampler locations are presented in Figure 2-2. Samplers were located directly adjacent to excavation activities to enable measurement of "worst case" particulate levels. Samplers were moved regularly to stay adjacent to the excavation activities as they progressed along the property boundary. Due to the close proximity of the samplers to excavation activities, it is likely that the measured concentrations were markedly elevated over what would reasonably be expected to migrate off-Site. However, this sampling approach was adopted as a screening approach to identify what a "worst case" exposure would be. Depending on the size of the area to be excavated, 3 to 4 PM_{10} samplers were set up each day during excavation activities. Samples were collected on a 24-hour basis.

2.1.3 Analytical Methods

The sample filters were dessicated and weighed by STL and then placed in the sampler at the beginning of the sampling period. Specifically, the filters were pre-conditioned at a controlled temperature and relative humidity and were weighed in the laboratory prior to sample collection in the field. The sample filters were removed daily and sent to STL for analysis of PM_{10}, arsenic, and lead. Samples were analyzed in accordance with applicable EPA methods contained in 40 CFR Chapter 1, Part 50. Following sampling, the filters were weighed again at the laboratory. Using temperature and barometric pressure conditions measured during the sampling period, the total volume of air sampled in standard volume conditions was calculated. Based on the determination of total air volume, and pre-and post filter weight, PM_{10} was calculated. After PM_{10} was calculated, arsenic and lead levels were determined using EPA Method 6010. The EPA analytical methods used for PM_{10} and metals analysis are described in Appendix B.

2.2 Identification of Health-Based Standards

To ensure that airborne particulates generated during excavation and remediation activities did not pose a threat to the general population who might work or live adjacent to the Site, measured concentrations of PM_{10} (particles with diameter of 10 micrometers or less, that are able to penetrate into lungs), arsenic, and lead were compared to health-based concentrations. The air concentrations chosen were developed for protection of the general public, including potentially sensitive individuals such as children and the elderly.

The preferred health-based concentrations were the National Ambient Air Quality Standards (NAAQS), developed by the Environmental Protection Agency. Because there was not a NAAQS available for arsenic, a risk-based air quality concentration was determined based on the methodology presented in the Washington State Model Toxics Control Act (MTCA). The MTCA default exposure parameter values were developed to protect a resident who might receive continuous exposure for 30 years, and was therefore not directly applicable to off-Site exposure that might result from the shorter duration Site remediation activities, estimated to be a maximum duration of 1 year. Therefore, Site-specific exposure parameters were used to derive the health-based air concentration for arsenic. The factors and equation used to derive the health-based concentration for arsenic are shown in Table 2-1. The health-based concentrations used to evaluate the site data are presented in Table 2-2.

2.3 Preparation of Wind Rose Diagrams

Wind rose diagrams were used in this study to determine what the predominant wind speed and direction was during the sampling period. This information was then compared with both the typical wind speed and direction pattern present during summer months, and with the typical wind speed and direction pattern present over an entire year. To assess typical wind speed and direction patterns in the area of the Site, data collected from the area over a 10-year period was used. The meteorological data and the program used to generate the wind rose diagrams are discussed below.

2.3.1 Meteorological Data

Data used to prepare the wind rose diagrams was obtained from the National Oceanic and Atmospheric Administration (NOAA) National Data Center, National Environmental Satellite, Data and Information Service. The data consists of surface meteorological data collected from monitoring station #742060, located at McChord Air Force Base, in Tacoma, Washington. The data used in preparation of the wind rose diagrams consisted of average wind speed and direction data, taken hourly every day between January 1, 1992 and August 31, 2002. The data were obtained in TD-3280 format, and then reformatted to extract the information regarding station number, year, date, time, wind speed, and wind direction which was used to prepare the wind rose diagrams.

2.3.2 Wind Rose Diagrams

Wind rose diagrams were generated using EPA's WRPLOT Utility Program. A wind rose diagram prepared with this program depicts the frequency of occurrence of winds in each of 16 direction sectors (north, north-northeast, northeast, etc.) and six wind speed classes (ranges of knot speeds of 1-3, 4-6, 7-10, 11-16, 17-21, and >21) for a given location and time period. Also included in the wind rose diagram is the percent frequency of calm winds (defined as a wind

speed below the threshold of the wind instrument used at the monitoring station). Extensive documentation of the WRPLOT Utility Program can be found on EPA's Website at http://www.epa.gov/scram001/tt24.htm#relatedprograms.

Table 2-1 – Derivation of Health-Based Standard for Arsenic

$$Air\ Cleanup\ Level\ (ug/m^3) = \frac{Risk\ x\ ABW\ x\ AT\ x\ UCF}{CPF\ x\ BR\ x\ ABS\ x\ ED\ x\ EF}$$

Where:

Risk = The target acceptable cancer risk (1×10^{-6})
ABW = Average body weight during the time of exposure (70 kg, for an adult)
AT = Averaging time for carcinogens (75 years)
UCF = Unit conversion factor (1,000 *u*g/mg)
CPF = Cancer potency factor for arsenic [15.05 $(mg/kg\text{-}day)^{-1}$]
BR = Breathing Rate (20 m^3/day)
ABS = Inhalation Absorption Fraction (1.0 – unitless)
ED = Exposure Duration (1 year- Site Specific)
EF = Exposure Frequency (1.0 – unitless)

Resulting Health-Based Standard for Arsenic: 0.017 ug/m^3

Note:
Equation was taken from the Model Toxics Control Act (MTCA), Chapter 173-340-750(3)(B).

Table 2-2 – Health-Based Concentrations

Contaminant	Health-Based Concentration (ug/m^3)	Source
Arsenic	0.017	Site-specific[1]
Lead	1.5	NAAQS[2]
PM_{10}	150	NAAQS[2]

Notes:

[1] Arsenic level was derived based on an assumed exposure duration of one year. All other exposure factors were based on MTCA default values (Chapter 173-340-750 (3)(B)).

[2] Value is from the National Ambient Air Quality Standards (NAAQS), and is both a primary and secondary standard established under the EPA's Clean Air Act, as amended in 1990. Primary Standards are established to protect public health, including the health of sensitive individuals, such as asthmatics, children, and the elderly. Secondary standards are established to protect the public welfare, including protection against decreased visibility, damage to animals, crops, vegetation, and buildings. The value for lead is a quarterly average concentration; the value for PM_{10} is a 24-hour average concentration.

SECTION 3 – RESULTS

3.1 PM_{10}, Arsenic, and Lead Sampling Results

Particulate sampling results are shown in Table 3-1. As shown in this table, all PM_{10}, arsenic, and lead levels were below their associated health-based concentrations. Figure 3-1 presents a graphical summary of these data.

3.2 Evaluation of Wind Speed and Wind Direction at the Site

Wind speed and wind direction were evaluated by plotting meteorological data in wind rose diagrams, as described above. Wind rose diagrams were made to evaluate average wind speed and direction during the 2-month sampling period (June and July, 2002), during a typical three month summer season (i.e., June, July, and August), and over a typical year. Wind speed and direction were evaluated to determine if the sampling conducted during this perimeter soil ICA was successful in capturing a worst-case event, where wind direction and speed could contribute to maximum possible off-Site transport of particulate. For this evaluation, the following wind rose diagrams were prepared:

- A wind rose diagram presenting the average wind speed and direction for the period between January 1, 1992 and August 31, 2002. This 10-year period was used to define a "typical" annual pattern (Figure 3-2);

- A wind rose diagram presenting the average wind speed and direction for the summer months of June, July, and August for the years of 1992 through 2002. This 11-year period was used to define a "typical" summer pattern (Figure 3-3).

- A wind rose diagram presenting the average wind speed and direction during the June and July, 2002 sampling period (Figure 3-4).

Based on an evaluation of the wind rose diagrams, it can be seen that the wind speed and direction during the sampling period was a worst case scenario for off-Site particulate transport when compared to typical wind speed and direction patterns seen over a 12-month period, and over a 3-month summer period. During the sampling period, the wind direction was roughly 23 percent from the north, compared with an average of 18 percent from the north for a typical summer, and 14 percent from the north for a typical annual pattern. The nearest off-Site area that could potentially receive Site-generated particulate exposure is south of the Site, making wind flow from the north a worst case scenario. In addition, the amount of time when there were calms was also much lower during the sampling period (0.03%) than under normal summer conditions (3.3%).

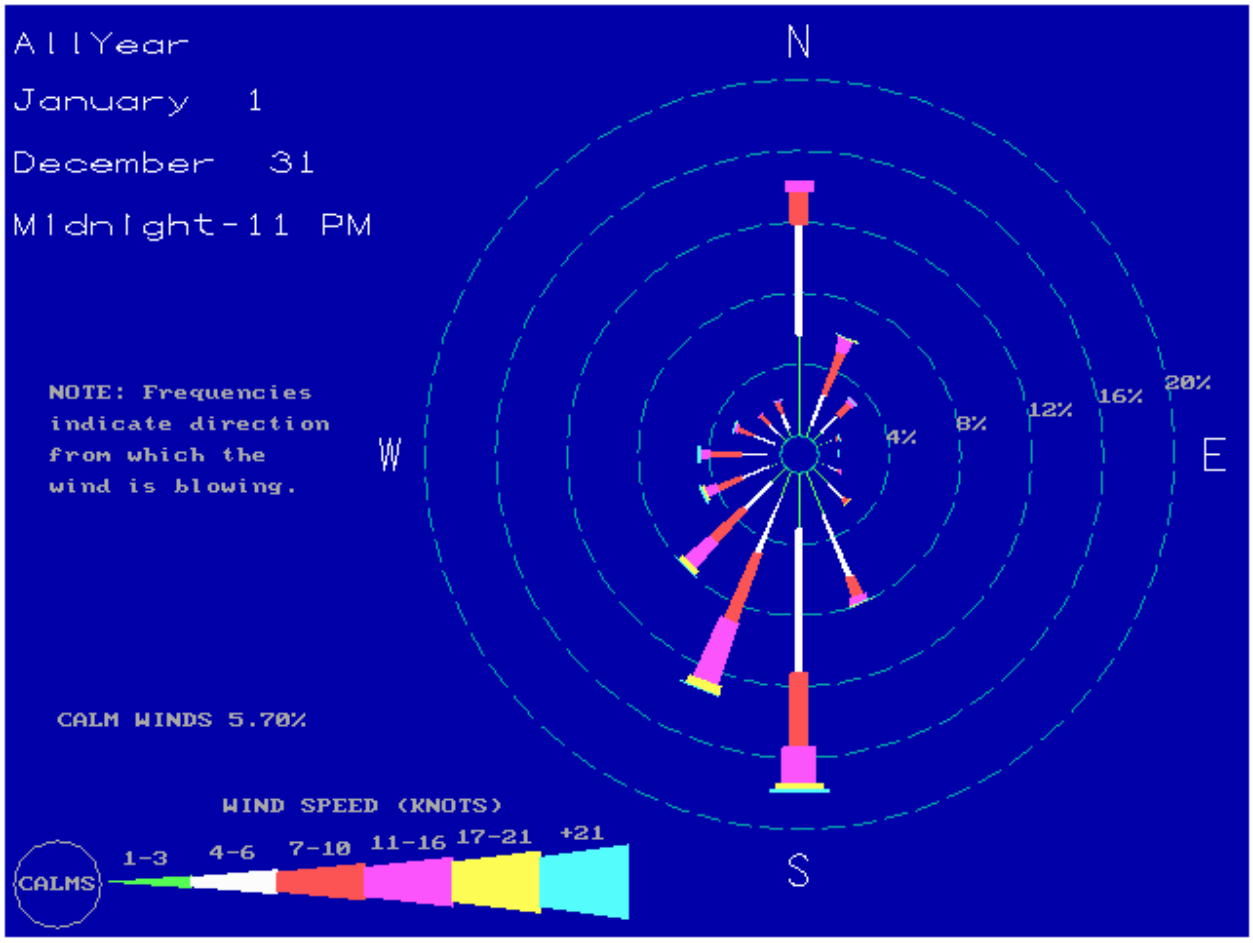

Figure 3-3 – Average Wind Speed and Direction during the Summer Months (June-August, 1992 - 2002)

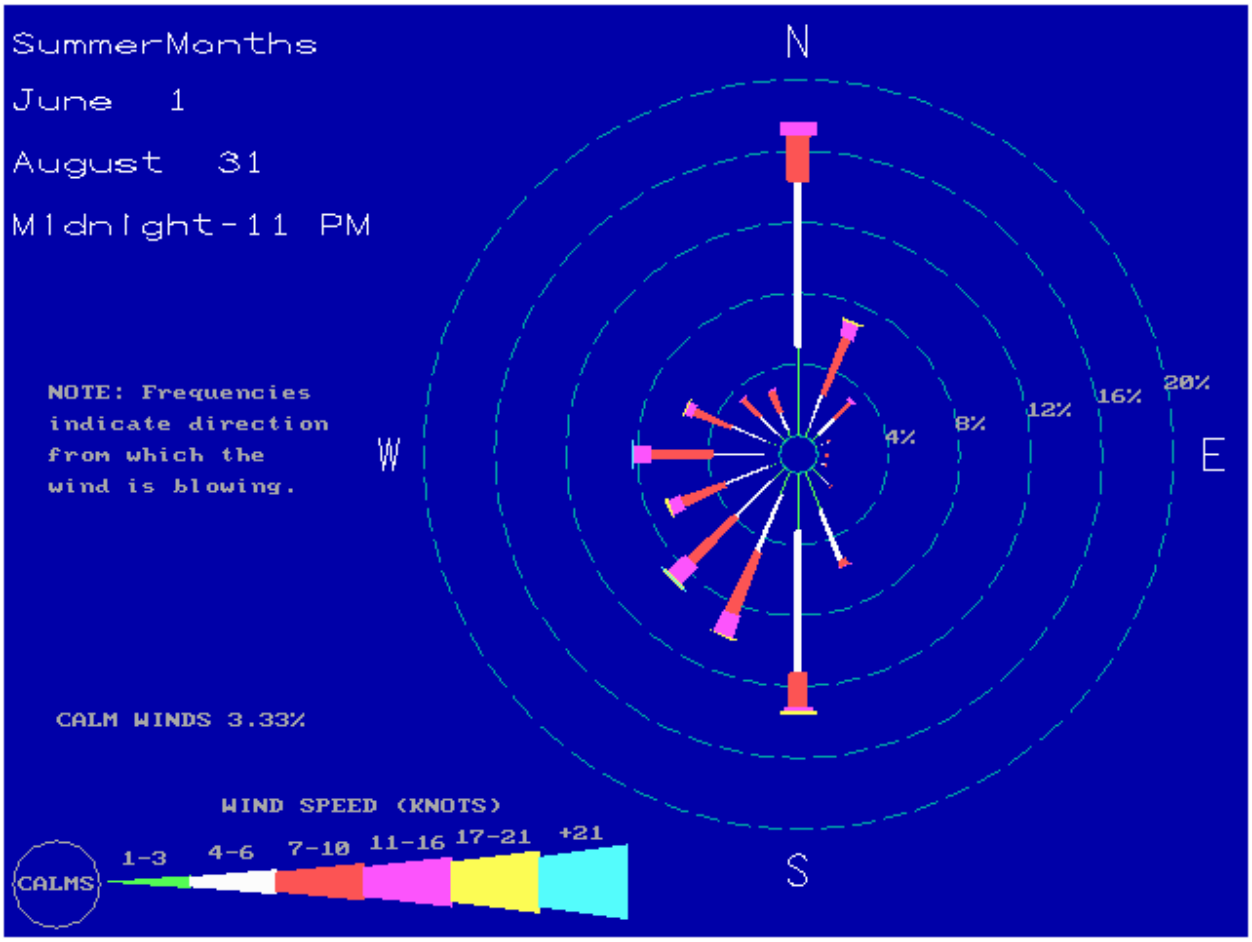

Figure 3-4 – Average Wind Speed and Direction during the Sampling Month s (June-July 2002)

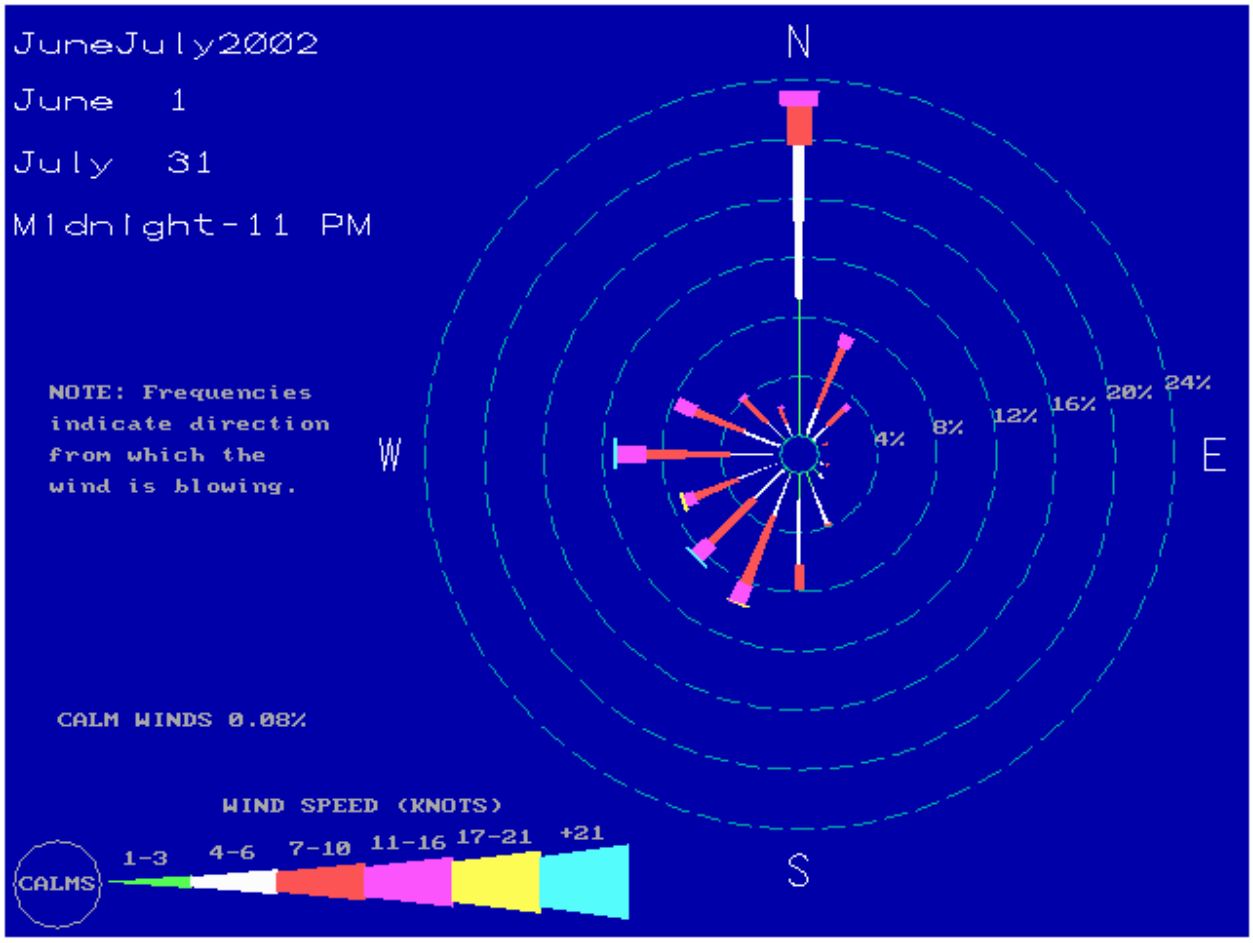

SECTION 4 – CONCLUSIONS

Based on the sampling results and an evaluation of the wind speed and direction during the sampling period and other typical time periods, the following conclusions can be made:

- The engineering controls used during the perimeter interim corrective action were successful in limiting off-Site particulate transport (see Table 3-1).

- The location of the excavation activities as well as the wind speed and direction during the sampling period could be considered a "worst case" scenario, therefore it is unlikely that future excavation work will result in off-Site particulate levels that are of concern.

- The results from this program indicate negligible impacts to surrounding property from site dust even under "worst case" conditions. The highest concentration of lead (0.014 ppb) was an order of magnitude below the health-based concentration (1.5 ppb). The highest concentration of arsenic (0.011 ppb) was below the health-based concentration of 0.017 ppb and the average arsenic concentration over the period (0.0030 ppb) was more than a factor of 5 less than the health-based concentration.

Mr. Brad Grimsted
PIONEER Technologies Corporation
2612 Yelm Highway S.E., Suite B
Olympia, WA 98501- 4826

Dear Mr. Grimsted:

As you know, MFG, Inc. was retained by PIONEER Technologies Corporation (PIONEER), to provide assistance with an ambient air monitoring program during this past summer in Dupont, Washington. MFG's participation in the air monitoring program consisted of assembly and calibration of the air samplers, and training of PIONEER personnel to operate the samplers. This letter and attachments summarize MFG's involvement in the air monitoring program and provide documentation of calibration of the air samplers.

PIONEER rented four Hi-Volume particulate samplers (GMW Model IP 10-8000 PM-10) from Clean Air Engineering of Palatine, Illinois. These specific PM-10 samplers are mass flow controlled. That is, the actual flow rate is controlled with a reference sensing flow probe mounted in the funnel section of the filter holder. The electrical output of the flow probe is used to increase or decrease the electrical power to the motor to maintain a constant velocity during the filter exposure. The actual flow is critical for particle fractionation

MFG visited the Dupont site on June 18, 2002 to assemble, calibrate, and train PIONEER personnel on sampler operation. Following assembly of the samplers, MFG first performed a leak check and then with the use of a Thermo Andersen calibration orifice (Serial Number W43) calibrated each of the four PM-10 samplers.

Based on flow rates and sampler responses obtained during the calibrations and seasonal average temperature and pressure obtained from Olympia historical climate data, MFG provided PIONEER personnel with individual sampler seasonally adjusted flow rate set points.

Individual sampler calibration data sheets, flow control set points, Olympia historical climate data, and the W43 orifice calibration certification are attachments to this summary.

Please do not hesitate to call me if you have any questions.

Regards,

Kris Hansen

	r =	0.999613		r =	0.999613

Calculations

$$Vstd = \Delta Vol((Pa - \Delta P)/Pstd)(Tstd/Ta) \qquad Va = \Delta Vol((Pa - \Delta P)/Pa)$$

$$Qstd = Vstd/\Delta Time \qquad Qa = Va/\Delta Time$$

For subsequent flow rate calculations:

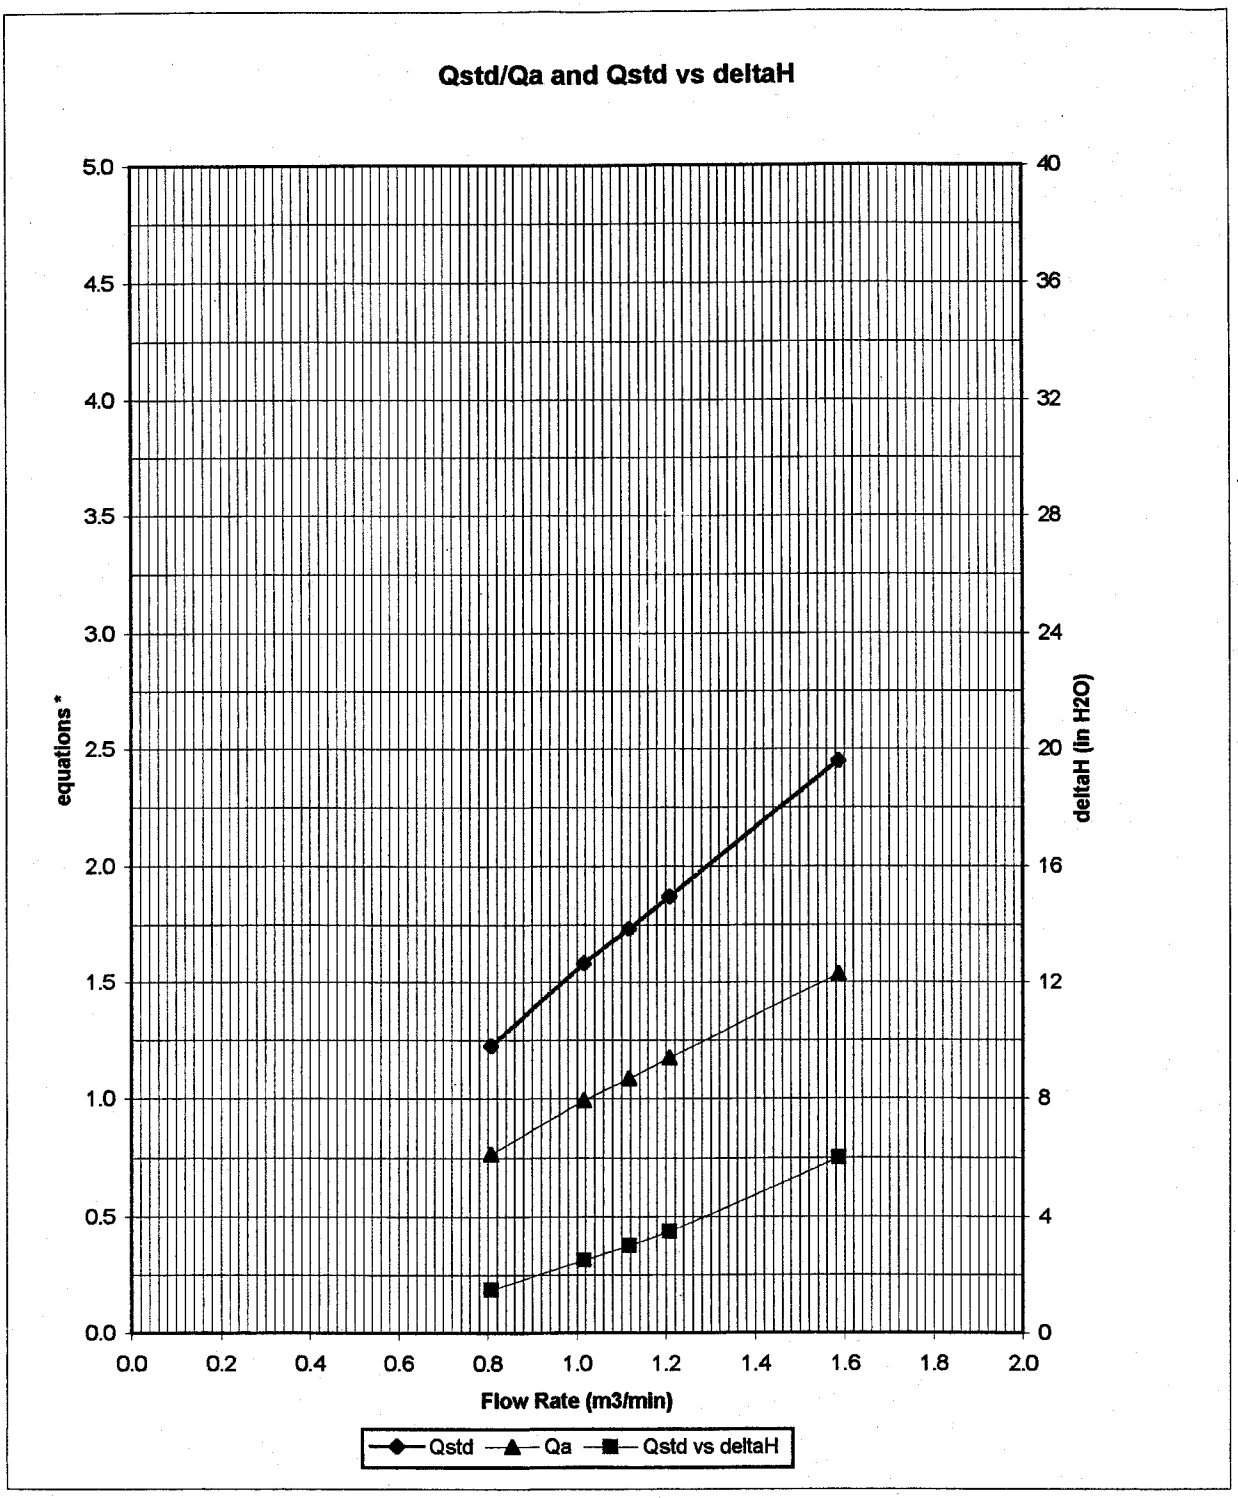
$$Qstd = 1/m\left(\left(\sqrt{\Delta H\left(\frac{Pa}{Pstd}\right)\left(\frac{Tstd}{Ta}\right)}\right) - b\right) \qquad Qa = 1/m\left(\left(\sqrt{\Delta H(Ta/Pa)}\right) - b\right)$$

Standard Conditions:
Tstd: 298.18 ° K
Pstd: 760 mm Hg

where:
ΔH: calibrator manometer reading (in H2O)
ΔP: rootsmeter manometer reading (mm Hg)
Ta: actual absolute temperature (° K)
Pa: actual barometric pressure (mm Hg)
b: intercept
m: slope

For additional information consult:
1. The Federal Register, Vol. 47, No.234, pp. 54896-54921, Dec. 6, 1982
2. Quality Assurance Handbook, Vol II (EPA 60074-77-277a), Section 2.11
3. Andersen Instruments, Inc. Instruction Manual

Notes:
1. Copies of this calibration are not kept on file.
2. EPA recommends calibrators should be recalibrated after one year of use.



*** y-axis equations:**

PIONEER Technologies Corporation - AQ Monitoring Program

Removal/Loading of Filter and Inspection of PM10 Hi-Vol for Sampling

1. Inspect the overall integrity of the sampler for signs of tampering or damage.

2. Turn on the hi-vol by switching the timer switch to "on" and let the hi-vol warm up for 5 minutes. Connect the manometer to the external pressure tap. Record the external manometer reading on the envelope. Set timer switch to "off".

3. Check the hi-vol timer and record the timer hours. Note the status of the power failure light on the timer.

4. Open the PM10 head and latch the head in the open position.

5. Clean the area around the faceplate removing any foreign matter, such as dust or insects. It may be necessary to wipe the inside of the enclosure and area around the faceplate with a damp cloth to remove any excessive dust.

6. Remove the filter cartridge by loosening the 4 wing nuts allowing the wing nuts to swing out of the way.

7. Check the edges of the exposed filter for sharpness of field to identify leakage of the faceplate gasket. Inspect the gasket for integrity and replace if required

8. Filter handling should be performed with clean gloves or flat-tipped tweezers

   Remove exposed filter

   a. Remove large matter (large dirt particles, spider webs, or insects) with tweezers if sample integrity can be maintained. Removal of these objects or damage to the filter would not invalidate sample, but loss of part of the sample would void the filter and must be noted

   b. Carefully remove the exposed filter from the supporting screen by holding it gently at the ends (not at the corners). Fold the filter lengthwise so that the exposed portions are folded against each other (the filter ID should appear on the outside of the exposed filter). Now fold the filter width wise. Place the filter in the plastic sleeve and then place the plastic sleeve in the manila folder. Check that the filter ID matches the ID on the manila folder.

   c. Remove the Dickson chart from the chart recorder and place it in the manila folder.

   Load unexposed filter

   a. Remove the filter from the plastic bag and manila folder then inspect the clean, weighed and numbered filter received from the laboratory to ensure that the filter has not been damaged or soiled. Check that the filter ID matches the ID on the manila folder and the Dickson chart.

   b. Carefully center the new filter, rough side up (filter ID down), on the supporting screen. The filter should be aligned such that an airtight seal on the outer edge (about 1 cm) of the filter can be achieved

   c. Place a new Dickson chart in the chart recorder.

9. Secure the filter with the faceplate and 4 wing nuts with sufficient pressure to avoid air leakage, but do not overtighten the nuts

10. Close the PM10 head.

11. Fill out the removal section of the **PM10 Filter Tracking Form** checking to ensure that the exposed filter number and sampling period were correct. Note any unusual weather conditions that occurred during the run (dust storm, snow, fog, stagnation) and particularly record any activities that might have caused high PM10 levels (visual wind-blown dust, materials handling upwind, wood smoke, forest fire, slash burning, and any other local sources of particulate matter)

12. Check the hi-vol timer for the correct current & starting times. Record the timer hours

13. If not already connected, connect the manometer to the external pressure tap and switch the timer to the "on" position. Record the manometer reading. Set the timer switch to "timed" and ensure that hi-vol turns off.

14. Fill out the install portion of the **PM10 Filter Tracking Form** with the filter number, hi-vol ID, location, pressure readings, timer hours, and sampling period

15. Store the exposed filter in a safe, clean place until delivery to the lab

SOP NO.: 0200.10
DATE: November 15, 2002
AUTHOR: SPP

TITLE: Trace Metals Analysis by ICP

Approved By: _____ 11/15/02
Department Manager Date

Approved By: Lori Howard 11/15/02
Quality Assurance Manager Date

Copy No.: CC4

Issued To: B. Dee, Pioneer Technologies, Corp.

1.0 SCOPE AND APPLICATION

1.1 This SOP describes the procedure for analysis of trace metals in solution by ICP. Analysis request may be for dissolved metals, suspended metals, total metals, total recoverable metals, or TCLP leachate metals.

1.2 Routine target analytes and associated PQLs are provided in Tables 1.

2.0 REFERENCES

This Standard Operating Procedure has been prepared for the sole use of STL Seattle. This is a controlled document, intended as information only for the person or organization to which it has been issued.

4.0 DEFINITIONS

4.1 ICP = Inductively Coupled Plasma Spectrophotometry.

4.2 Dissolved metals = those metals that will pass through a 0.45 um membrane filter.

4.3 Suspended metals = those elements which are retained by a 0.45 um membrane filter.

4.4 Total metals = the concentration determined of an unfiltered sample after digestion; or, the sum of the dissolved plus suspended concentrations.

4.5 Total recoverable metals = the concentration determined of an unfiltered sample after treatment with hot, dilute mineral acid.

4.6 Method Detection Limit = the concentration equivalent of a metal analyte equal to three times the standard deviation of the results from seven replicates done on three non-consecutive days. The solution used to make these determinations is a standard that is three to five times the manufacturer's suggested IDL for that metal.

4.7 PQL = Practical Quantitation Limit.

4.8 SOP = Standard Operating Procedure.

5.0 PROCEDURE

5.1 SUMMARY

5.1.1 This method describes the simultaneous, multi-elemental determination of metals in solution by ICP. Samples, sample extracts, or sample digests are nebulized, and the resulting aerosols are injected into the plasma torch. Element-specific atomic line emission spectra are produced by radio frequency inductively coupled plasma. The spectra are dispersed by a grating spectrometer. The intensity of the lines are monitored by a charge-coupled device. Intensity of emission is directly related to the concentration of the analyte by comparison with standards. Emission lines used for each target analyte are provided as an attachment to this SOP.

5.2 INTERFERENCE.

5.2.1 Spectral interference: results from an overlap of spectral lines, molecular band spectra and background contribution from continuous, recombination phenomena or stray light. These interferences are described in detail in Method 6010B and should be reviewed if necessary.

5.2.2 Physical interference: resulting from viscosity or dissolved solids in the sample. In general, physical interferences must be diluted out; these interferences are described in detail in Method 6010B and should be reviewed if necessary.

5.2.3 Chemical interference: not significant with ICP. These interferences are described in detail in Method 6010B and should be reviewed if necessary.

5.3 SAMPLE HANDLING, PRESERVATION, AND HOLDING TIME REQUIREMENTS.

5.3.1 Samples are stored at $4^{o}C \pm 2^{o}C$, in the container received.

5.3.2 Holding time for analysis of samples for metals analysis is 6 months.

5.3.3 Dissolved samples should be filtered and preserved within 3 days of sampling.

5.4 EQUIPMENT

5.4.1 Simultaneous or Sequential ICP with background correction.

5.4.2 Computer controlled data system for ICP.

5.4.3 Volumetric flasks, 100 mL, 200 mL, 500 mL, 1000 mL.

5.4.4 Specimen cups with poly lids.

5.4.5 Disposable culture tubes, borosilicate glass.

5.5 REAGENTS/STANDARDS

5.5.1 ASTM Type II reagent water.

5.5.2 Leeman Labs, Inc., Plasma-Pure, Custom Multi-element Standards (calibrating standards). Standard Certificates attached for the three standards.

5.5.2.1 Preparation of calibration standards: Serial dilution of standards, in the following ratios:

4.0 mL each standard, dilute to 200 mL (High Standard);
0.8 mL each standard, dilute to 200 mL (Med. Standard);
0.4 mL each standard, dilute to 200 mL (Low Standard);
2.5 mL each standard, dilute to 500 mL (CCV Standard) *note: the CCV standard concentration varies within the calibration range.*

The final concentrations of each analyte in the high standard and the CCV standard are provided in tabular form as an Attachment to this SOP.

5.5.3 PLASMACHEM, matrix spiking standard. Concentrations provided in tabular form as an Attachment to this SOP.

5.5.4 PLASMACHEM, Standards A and AB (interference check standard). Concentrations provided in tabular form as an Attachment to this SOP.

5.5.5 Outside check standards. Check Standard 4 is at a concentration of 10 times the STL Seattle reporting limit. Check Standard 5 is at a concentration of 2 times the STL Seattle reporting limit. Specific analyte concentrations provided in tabular form as an Attachment to this SOP.

5.5.6 Argon gas, high purity grade.

5.5.7 Concentrated HCl.

5.5.8 Concentrated HNO3.

5.5.9 1:1 HCl.

5.5.9.1 Preparation: add 500 mLs of concentrated HCl to 400 mLs Type II water. Allow to cool, and dilute to 1 L with Type II water.

5.5.10 1:1 Nitric acid.

5.5.10.1 Preparation: add 500 mLs of concentrated HNO3 to 400 mLs Type II water. Allow to cool, dilute to 1 liter with Type II water.

5.5.11 Internal Standard solution. Add 0.5 mL each of 10,000 mg/L Lu, Sc, and Y to a 1-Liter volumetric flask. Dilute to volume with Type II water.

5.6 INSTRUMENT CALIBRATION

5.6.1 Initial Calibration Procedures. One instrument blank and three standards containing all analytes of interest are analyzed for initial calibration (analyte-specific concentrations). Standards are analyzed in triplicate, three readings for each analysis, and the results are averaged. A calibration curve is generated using the blank and the average values for the three standards. An initial calibration is performed as needed. An initial calibration verification (ICV) and initial calibration blank (ICB) standard are analyzed daily.

5.6.2 Continuing Calibration Procedures. A continuing calibration standard containing a mid-range concentration of each analyte is analyzed immediately after the ICV and ICB, after 10 samples, and at the end of the analytical sequence. The calculated concentration is compared to the actual concentration of the standard analytes. If QC criteria are not met, the standard is rerun, or a "curve update" is performed. An "update" is a linear adjustment of the curve using the highest concentration standard.

5.7 SAMPLE PREPARATION

5.7.1 Refer to the appropriate SOP (see section 3) for sample preparation.

5.8 SAMPLE ANALYSIS

5.8.1 Samples, sample leachates, and sample digests are provided to the analyst in specimen cups labeled with laboratory number.

5.8.2 Samples are poured into disposable culture tubes and placed in a rack for analysis.

5.8.3 Samples are nebulized and injected into the plasma torch. The solution concentrations are determined and reported as raw instrument data.

5.9 CALCULATIONS

5.9.1 Liquid samples, report as mg/L.

$$mg/L = (\text{instrument reading}) * (\text{final dilution})$$

5.9.2 Solid samples (except filters), report as mg/kg:

$$mg/kg = \frac{(\text{instrument reading}) * (\text{final dilution})}{(\text{sample weight}) (\text{percent solids})}$$

5.9.3 Filters, report as ug (or as ug/cm^3)

$$ug = (\text{instrument reading}) * (\text{final dilution})$$

$$ug/cm^3 = \frac{(\text{instrument reading}) * (\text{final dilution}) * (1000)}{(\text{air volume in L})}$$

5.10 QUALITY CONTROL

5.10.1 Initial calibration. Acceptance criterion is a curve with a minimum correlation coefficient of 0.995. The agreement between the replicate injections of each standard must be a relative standard deviation of less than or equal to 25. The ICV standard must agree within 10% of the true value for samples analyzed by EPA Method 6010B, or within 5% of the true value for samples analyzed by EPA Method 200.7.

5.10.2 Continuing calibration. Acceptance criteria is a percent difference (%D) of 10% between the calculated concentration of the continuing calibration standard and the true value of the standard

5.10.3 Interference check standards. Analyzed daily to ensure that the instrument is compensating for interferences; For analytical sequences associated with NPDES samples analyzed by Method 200.7 (as stated in 40CFR Part 136 Appendix C), the results should fall within 1.5 times the standard deviation of the mean value. For all other sequences the calculated concentrations of the analytes must agree within 20% of the true values.

5.10.4 External calibration check standard (Initial Calibration Verification, ICV). Immediately following the initial calibration, and at the beginning of each analysis batch or every 24 hours, an external calibration check standard is analyzed. The external calibration check must agree within 10% of the true value.

5.10.5 The associated method blank for each sample batch is analyzed and reported with the sample results.

5.10.6 Matrix spike or blank spike samples will be prepared with a minimum frequency of 5% of the samples. If there are fewer than 20 samples in a batch, at least one matrix spike sample should be prepared. Matrix spike solutions will contain all target analytes. Results from analysis of these

digest will be used to assess accuracy of the digestion and analysis procedure. For preparation, 2.0 mL of spiking solution is applied directly to a solid matrix, or 1.0 mL of spiking solution is added to a liquid matrix or a blank volume.

5.10.7 Duplicate samples will be prepared at a minimum frequency of 5% of the samples. If there are fewer than 20 samples in a batch, at least one duplicate sample should be prepared. Duplicate will be used to assess precision of the digestion and analysis procedure.

5.10.8 Inter-element correction factors are determined annually.

5.10.9 Linear calibration limits are analyzed on an annual basis.

5.10.10 Method detection limit studies are performed on an annual basis.

5.10.11 Where required by specific client or project (i.e., Corps of Engineers, Navy NFESC), one or more of the following quality control analyses will be performed:

5.10.11.1 Serial Dilution. A 1:5 dilution of the sample selected for batch QC is analyzed.

5.10.11.2 Post Digest Spike. The sample selected for batch QC is spiked after digestion at a concentration equivalent to the matrix spike concentration.

5.10.11.3 Method of Standard Additions. For samples analyzed under the Corps of Engineers Shell Document, whenever both the serial dilution analysis agreement and post digest spike recoveries are outside QC limits, sample results must be calculated based on the method of standard additions in accordance with Method 6010B.

5.11 METHOD PERFORMANCE

5.11.1 Accuracy is evaluated based on blank spike and matrix spike recovery. The recoveries of all spiked target analytes in blank spikes must be between 80 - 120% (85 – 115% for samples analyzed by method 200.7). The recoveries of all spiked target analytes in matrix spikes should be within 75 - 125% (50 – 150% for TCLP). Post digestion spike recoveries should be within 75 – 125% of the true value. Results for the serial dilution analysis should agree within 10% when compared to the original analysis for analytes that are at a concentration of 10 times the MDL after dilution, or matrix interference is suspected.

5.11.2 Precision Determination. Duplicate results should be within 20% for the water matrix and within 35% for all other matrices.

5.12 METHOD DETECTION LIMITS/REPORTING LIMITS/PRACTICAL QUANTITATION LIMITS

5.12.1 Method Detection Limit Studies are performed annually for each matrix. Detection limit study data are maintained in the QA files.

5.12.2 Table 1 includes reporting limits for routine target analytes.

5.13 MODIFICATIONS TO PUBLISHED METHODS

5.13.1.1 None.

6.0 HEALTH AND SAFETY/SPECIAL CONSIDERATIONS

6.1 Gloves and safety goggles should be worn during sample preparation and analysis.

7.0 NONCONFORMANCE AND CORRECTIVE ACTION

7.1 Any nonconformance encountered during sample preparation (e.g., insufficient sample volume or matrix-specific problems) should be documented in a laboratory nonconformance memorandum and appropriate corrective action taken.

7.2 If the client is contacted regarding sample nonconformance, a client contact is completed and placed in the master file.

8.0 RECORDS MANAGEMENT/DOCUMENTATION

8.1 Each digestion batch identifier and appropriate QA/QC should be recorded in thelogbook on the batch QC form for soils or waters. All analysis information should be recorded in the logbook on the worksheet form. Date and signature must accompany the recorded information.

8.2 A copy of the raw data is placed in the data file.

8.3 Logbooks are archived with the QC department when completed for permanent storage.

8.4 If client contact is required, a Client Contact Record is completed and maintained in the master file.

8.5 If nonconformance is observed during sample extraction or analysis, a nonconformance memorandum is completed; the memorandum is placed in the file, and a copy of the memorandum is given to the QA Manager.

9.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

9.1 All laboratory waste must be handled in accordance with SOP 0036.6.

9.2 All laboratory procedures must comply with the policies set forth in STL Seattle's Pollution Prevention Plan.

Table 1. Analyte List and Reporting Limits for ICP Metals

	Reporting Limit	
	Soil	*Water*
Analyte	*mg/kg*	*mg/L*
Aluminum	10	0.10
Antimony	10	0.05
Arsenic	3	0.01
Barium	1	0.005
Beryllium	0.4	0.002
Boron	60	0.20
Cadmium	1	0.005
Calcium	200	1.0
Chromium	5	0.01
Cobalt	1	0.005
Copper	3	0.01
Iron	20	0.1
Lead	4	0.01
Magnesium	200	1.0
Manganese	1	0.01
Molybdenum	2	0.01
Nickel	2	0.01
Selenium	10	0.05
Silver	2	0.01
Sodium	500	1.0
Strontium	20	0.05
Thallium	4	0.02
Tin	20	0.05
Titanium	10	0.01
Vanadium	2	0.01
Zinc	4	0.01

Calib: Initial Calibration Options

When opening this method manually :

Use the calibrations curves in memory.

When using this method in a multimethod sequence:

* Start by constructing new calibration curves.

Method Name: Initial-4 Point

Start using the existing calibration curve set.
Start using the stored calibration curve set:

Calib : Multi Line Calibration

Not Enabled

SECTION 1 – INTRODUCTION

1.1 Introduction

This report presents the results of arsenic and lead analysis performed on respirable airborne particulate (i.e., particulate matter less than 10 microns in size or PM_{10}) sampling that was conducted during soil interim corrective actions (ICA) at the former DuPont Works Site in DuPont, Washington between August 18 and November 14, 2003. The soil ICAs involved excavation of 1 foot of contaminated soil at various locations across the entire site. The PM_{10} sampling presented in this report was performed in addition to the work place air monitoring done to document worker protection. The purpose of the PM_{10} sampling was to supplement sampling conducted in 2002 (PIONEER and WSNW, 2003), and provide additional documentation of the effectiveness of engineering controls in limiting generation of respirable airborne particulate during on-Site excavation and remediation work.

1.2 Objectives

The objectives of the PM_{10} monitoring program were the following:

- Quantify the amount of arsenic and lead present in the PM_{10} samples;
- Compare sample results to health-based standards; and
- Evaluate the effectiveness of engineering controls used at the Site to suppress dust.

SECTION 2 – SUMMARY OF ACTIVITIES

2.1 Sampling Approach

The sampling approach, including sampling procedure, sample locations, and analytical methods are described below.

2.1.1 Sampling Procedure

Sampling for PM_{10} was conducted using Hi-Volume particulate samplers (GMW Model IP 10-8000 PM-10) obtained from MFG Incorporated (See Figure 2-1). Prior to use in the field, these samplers were assembled, checked for leaks, and calibrated to identify the appropriate flow rate set point for each sampler. Information regarding the calibration of each individual sampler is contained in Appendix A.

Following calibration, the monitors were attached to wooden platforms and transported to the monitoring locations. At the start of the work shift every morning, the PM_{10} samplers were inspected and set up for the day. At the same time the previous day's samples were removed from the samplers and sent to Severn Trent Laboraties, Inc. (STL) for analysis. A generator was used to power the samplers. The procedure followed to inspect the samplers and set up for daily sampling is contained in Appendix A.

2.1.2 Sample Locations

PM_{10} samplers were set up adjacent to daily excavation activities. The daily sampler locations are presented in Figure 2-2. Samplers were located directly adjacent to excavation activities to enable measurement of "worst case" particulate levels. Samplers were moved regularly to stay adjacent to the excavation activities as they progressed along the property boundary. Depending on the size of the area to be excavated, 1 to 2 PM_{10} samplers were set up each day during excavation activities. Samples were collected on a 24-hour basis.

2.1.3 Analytical Methods

The sample filters were dessicated and weighed by STL and then placed in the sampler at the beginning of the sampling period. Specifically, the filters were pre-conditioned at a controlled temperature and relative humidity and were weighed in the laboratory prior to sample collection in the field. The sample filters were removed daily and sent to STL for analysis of arsenic and lead. Samples were analyzed in accordance with applicable EPA methods contained in 40 CFR Chapter 1, Part 50. Following sampling, the filters were weighed again at the laboratory. Using temperature, barometric pressure conditions, and the differential pressure of the filter averaged during the sampling period, the total volume of air sampled in standard volume conditions was calculated. Based on the determination of total air volume, and pre-and post filter weight, PM_{10} was calculated. After PM_{10} was calculated, arsenic and lead levels were determined using EPA Method 6010. The EPA analytical methods used for metals analysis are described in Appendix B.

2.2 Identification of Health-Based Standards

To ensure that arsenic and lead-containing particulates generated during excavation and remediation activities did not pose a threat to site workers or to the general population who might

work or live adjacent to the Site, measured concentrations of arsenic and lead were compared to health-based concentrations. The air concentrations chosen were developed for protection of the general public, including potentially sensitive individuals such as children and the elderly.

The preferred health-based concentrations were the National Ambient Air Quality Standards (NAAQS), developed by the Environmental Protection Agency. Because there was not a NAAQS available for arsenic, a risk-based air quality concentration was determined based on the methodology presented in the Washington State Model Toxics Control Act (MTCA). The MTCA default exposure parameter values were developed to protect a resident who might receive continuous exposure for 30 years, and was therefore not directly applicable to off-Site exposure that might result from the shorter duration Site remediation activities, estimated to be a maximum duration of 1 year. Therefore, Site-specific exposure parameters were used to derive the health-based air concentration for arsenic. The factors and equation used to derive the health-based concentration for arsenic are shown in Table 2-1. The health-based concentrations used to evaluate the site data are presented in Table 2-2.

Table 2-1 – Derivation of Health-Based Standard for Arsenic

$$Air\ Cleanup\ Level\ (ug/m^3) = \frac{Risk\ x\ ABW\ x\ AT\ x\ UCF}{CPF\ x\ BR\ x\ ABS\ x\ ED\ x\ EF}$$

Where:

- Risk = The target acceptable cancer risk (1×10^{-6})
- ABW = Average body weight during the time of exposure (70 kg, for an adult)
- AT = Averaging time for carcinogens (75 years)
- UCF = Unit conversion factor (1,000 *u*g/mg)
- CPF = Cancer potency factor for arsenic [15.05 $(mg/kg\text{-}day)^{-1}$]
- BR = Breathing Rate (20 m^3/day)
- ABS = Inhalation Absorption Fraction (1.0 – unitless)
- ED = Exposure Duration (1 year- Site Specific)
- EF = Exposure Frequency (1.0 – unitless)

Resulting Health-Based Standard for Arsenic: 0.017 ug/m^3

Note:
Equation was taken from the Model Toxics Control Act (MTCA), Chapter 173-340-750(3)(B).

Table 2-2 – Health-Based Concentrations

Contaminant	Health-Based Concentration (ug/m^3)	Source
Arsenic	0.017	Site-specific[1]
Lead	1.5	NAAQS[2]

Notes:

[1] Arsenic level was derived based on an assumed exposure duration of one year. All other exposure factors were based on MTCA default values (Chapter 173-340-750 (3)(B)).

[2] Value is from the National Ambient Air Quality Standards (NAAQS), and is both a primary and secondary standard established under the EPA's Clean Air Act, as amended in 1990. Primary Standards are established to protect public health, including the health of sensitive individuals, such as asthmatics, children, and the elderly. Secondary standards are established to protect the public welfare, including protection against decreased visibility, damage to animals, crops, vegetation, and buildings. The value for lead is a quarterly average concentration.

SECTION 3 – RESULTS

3.1 Arsenic, and Lead Sampling Results

Arsenic and lead sampling results are shown in Table 3-1. As shown in this table, arsenic and lead were not detected in any of the samples, and the quantitation limits for all samples were below the associated health-based concentrations of arsenic and lead.

Table 3-1 - Arsenic and Lead Sampling Results

117713	7048963	11/14/2003	0.006 U	0.006 U

Note:
Results with a "U" indicate that the analyte was not detected. The numerical value associated with the "U" is the sample quantitation limit.

SECTION 4 – CONCLUSIONS

Based on the sampling results the following conclusions can be made:

- Arsenic and lead were not detected in any samples collected during these ICAs, and the detection limits for each sample were well below the health-based concentrations.
- The engineering controls used during the interim corrective actions were successful in limiting particulate generation.

Dear Mr. Grimsted:

As you know, MFG, Inc. (MFG) was retained by PIONEER Technologies Corporation (PIONEER), to provide assistance with an ambient air-monitoring program during this past summer and fall in Dupont, Washington. MFG's participation in the air-monitoring program consisted of delivery, assembly, and calibration of the air samplers, as well as training of PIONEER personnel in the operation of the samplers. This letter and attachments summarize MFG's involvement in the air-monitoring program and provide documentation of air sampler calibration.

Air Sampler Description

Two General Metal Works Hi-Volume particulate samplers (GMW Model GUV-15H PM-10) were utilized for this air-monitoring program. The particulate samplers operate by a simple filtration process. A known volume of air is drawn through a quartz-fiber filter. Before passing through the filter, particles larger than 10 micrometers in mass-mean diameter are aerodynamically removed. The smaller particulate matter (PM-10) is then collected on the filter. Under laboratory conditions, the filter is weighed before and after sampling to determine the mass of PM-10 particles in the volume of air sampled. The mass is then divided by the volume of air to determine the concentration, usually expressed in micrograms per cubic meter ($\mu g/m^3$).

The air volume is an important part of this process. The high volume-sampling device requires over 50,000 cubic feet of air to be drawn through the sampler during the 24-hour period. It is critical that this volume be known to a high degree of accuracy. Equally important is the requirement that the rate of air flow through the sampler be maintained at a constant level so that all portions of the 24-hour sampling period are treated equally. Consequently, strict controls are placed on the air flow through a sampler. Theses controls fall into two categories: time control and flow rate control.

The sampling time in the air samplers are controlled by a Graseby/Anderson digital timer. This timer records the actual duration of the filter exposure. Two separate records of sampler operation and duration are provided, so that the operator can verify that the sample was actually taken as scheduled: digital timer and a Dickson chart recorder. A mechanical dial timer provides a record of the hours of pump operation, and a Dickson chart recorder provides a record of

Printed on recycled paper

pressure drop in the sampler, indicative of flow through the system. The Dickson charts were changed for each sample and then transmitted to the laboratory, along with the filters, as a positive indication of sampler operation.

A volumetric-flow controller controls sampler flow rate. The natural tendency for all filtration devices is to reduce flow rate as particulate matter increases and the pressure drop increases across the filter. To offset this effect, the air is drawn through a critical orifice to maintain constant airflow. The pressure drop across the critical orifice is so high that flow has already passed the critical point and further changes in pressure drop do not cause any change in flow rate. The actual flow is critical for particle fractionation.

In addition to the timers, chart recorders, and flow controllers, measurements of pressure drop are made by the operator before and after each sampling event to determine the flow rate for each sampling period, which varies slightly with temperature and barometric pressure. Based on flow rates and local temperature and pressure readings from Olympia, PIONEER personnel calculated concentration data.

Site Visits

MFG visited the Dupont site on July 9, 2003 to assemble, calibrate, and train PIONEER personnel on sampler operation. Following assembly of the samplers, MFG first performed a leak check and then with the use of a Thermo Andersen calibration orifice (Serial Number W43) calibrated the PM-10 samplers.

On September 30, 2003 a second visit by MFG was conducted to perform motor maintenance on the samplers. Following the maintenance, MFG performed a flow audit of the samplers.

The third and final visit to the site occurred on November 24, 2003 marking the completion of the air-monitoring program. The samplers were audited, cleaned, and dismantled.

Individual sampler calibration data sheets and the W43 orifice calibration certification are attachments to this summary. Please do not hesitate to call me if you have any questions 425.921.4000.

Regards,

Kris Hansen

Qstd slope (m) =		1.55510		Qa slope (m) =		0.97378
intercept (b) =		-0.00194		intercept (b) =		-0.00121
coefficient (r) =		0.99994		coefficient (r) =		0.99994
y axis = SQRT[H2O(Pa/760)(298/Ta)]				y axis = SQRT[H2O(Ta/Pa)]		

CALCULATIONS

Vstd = Diff. Vol[(Pa-Diff. Hg)/760](298/Ta)
Qstd = Vstd/Time

Va = Diff Vol [(Pa-Diff Hg)/Pa]
Qa = Va/Time

For subsequent flow rate calculations:

Qstd = 1/m{[SQRT(H2O(Pa/760)(298/Ta))]- b}
Qa = 1/m{[SQRT H2O(Ta/Pa)]- b}

PIONEER Technologies Corporation - AQ Monitoring Program

Removal/Loading of Filter and Inspection of PM10 Hi-Vol for Sampling

1. Inspect the overall integrity of the sampler for signs of tampering or damage.

2. Turn on the hi-vol by switching the timer switch to "on" and let the hi-vol warm up for 5 minutes. Connect the manometer to the external pressure tap. Record the external manometer reading on the envelope. Set timer switch to "off".

3. Check the hi-vol timer and record the timer hours. Note the status of the power failure light on the timer.

4. Open the PM10 head and latch the head in the open position.

5. Clean the area around the faceplate removing any foreign matter, such as dust or insects. It may be necessary to wipe the inside of the enclosure and area around the faceplate with a damp cloth to remove any excessive dust.

6. Remove the filter cartridge by loosening the 4 wing nuts allowing the wing nuts to swing out of the way.

7. Check the edges of the exposed filter for sharpness of field to identify leakage of the faceplate gasket. Inspect the gasket for integrity and replace if required

8. Filter handling should be performed with clean gloves or flat-tipped tweezers

   Remove exposed filter

   a. Remove large matter (large dirt particles, spider webs, or insects) with tweezers if sample integrity can be maintained. Removal of these objects or damage to the filter would not invalidate sample, but loss of part of the sample would void the filter and must be noted

   b. Carefully remove the exposed filter from the supporting screen by holding it gently at the ends (not at the corners). Fold the filter lengthwise so that the exposed portions are folded against each other (the filter ID should appear on the outside of the exposed filter). Now fold the filter width wise. Place the filter in the plastic sleeve and then place the plastic sleeve in the manila folder. Check that the filter ID matches the ID on the manila folder.

   c. Remove the Dickson chart from the chart recorder and place it in the manila folder.

   Load unexposed filter

   a. Remove the filter from the plastic bag and manila folder then inspect the clean, weighed and numbered filter received from the laboratory to ensure that the filter has not been damaged or soiled. Check that the filter ID matches the ID on the manila folder and the Dickson chart.

   b. Carefully center the new filter, rough side up (filter ID down), on the supporting screen. The filter should be aligned such that an airtight seal on the outer edge (about 1 cm) of the filter can be achieved

   c. Place a new Dickson chart in the chart recorder.

9. Secure the filter with the faceplate and 4 wing nuts with sufficient pressure to avoid air leakage, but do not overtighten the nuts

10. Close the PM10 head.

11. Fill out the removal section of the **PM10 Filter Tracking Form** checking to ensure that the exposed filter number and sampling period were correct. Note any unusual weather conditions that occurred during the run (dust storm, snow, fog, stagnation) and particularly record any activities that might have caused high PM10 levels (visual wind-blown dust, materials handling upwind, wood smoke, forest fire, slash burning, and any other local sources of particulate matter)

12. Check the hi-vol timer for the correct current & starting times. Record the timer hours

13. If not already connected, connect the manometer to the external pressure tap and switch the timer to the "on" position. Record the manometer reading. Set the timer switch to "timed" and ensure that hi-vol turns off.

14. Fill out the install portion of the **PM10 Filter Tracking Form** with the filter number, hi-vol ID, location, pressure readings, timer hours, and sampling period

15. Store the exposed filter in a safe, clean place until delivery to the lab

SOP NO.: 0200.10
DATE: November 15, 2002
AUTHOR: SPP

TITLE: Trace Metals Analysis by ICP

Approved By: _____ 11/15/02
Department Manager Date

Approved By: Lori Howard 11/15/02
Quality Assurance Manager Date

Copy No.: CC4

Issued To: B. Dee, Pioneer Technologies, Corp.

1.0 SCOPE AND APPLICATION

1.1 This SOP describes the procedure for analysis of trace metals in solution by ICP. Analysis request may be for dissolved metals, suspended metals, total metals, total recoverable metals, or TCLP leachate metals.

1.2 Routine target analytes and associated PQLs are provided in Tables 1.

This Standard Operating Procedure has been prepared for the sole use of STL Seattle. This is a controlled document, intended as information only for the person or organization to which it has been issued.

4.0 DEFINITIONS

4.1 ICP = Inductively Coupled Plasma Spectrophotometry.

4.2 Dissolved metals = those metals that will pass through a 0.45 um membrane filter.

4.3 Suspended metals = those elements which are retained by a 0.45 um membrane filter.

4.4 Total metals = the concentration determined of an unfiltered sample after digestion; or, the sum of the dissolved plus suspended concentrations.

4.5 Total recoverable metals = the concentration determined of an unfiltered sample after treatment with hot, dilute mineral acid.

4.6 Method Detection Limit = the concentration equivalent of a metal analyte equal to three times the standard deviation of the results from seven replicates done on three non-consecutive days. The solution used to make these determinations is a standard that is three to five times the manufacturer's suggested IDL for that metal.

4.7 PQL = Practical Quantitation Limit.

4.8 SOP = Standard Operating Procedure.

5.0 PROCEDURE

5.1 SUMMARY

5.1.1 This method describes the simultaneous, multi-elemental determination of metals in solution by ICP. Samples, sample extracts, or sample digests are nebulized, and the resulting aerosols are injected into the plasma torch. Element-specific atomic line emission spectra are produced by radio frequency inductively coupled plasma. The spectra are dispersed by a grating spectrometer. The intensity of the lines are monitored by a charge-coupled device. Intensity of emission is directly related to the concentration of the analyte by comparison with standards. Emission lines used for each target analyte are provided as an attachment to this SOP.

5.2 INTERFERENCE.

5.2.1 Spectral interference: results from an overlap of spectral lines, molecular band spectra and background contribution from continuous, recombination phenomena or stray light. These interferences are described in detail in Method 6010B and should be reviewed if necessary.

5.2.2 Physical interference: resulting from viscosity or dissolved solids in the sample. In general, physical interferences must be diluted out; these interferences are described in detail in Method 6010B and should be reviewed if necessary.

5.2.3 Chemical interference: not significant with ICP. These interferences are described in detail in Method 6010B and should be reviewed if necessary.

5.3 SAMPLE HANDLING, PRESERVATION, AND HOLDING TIME REQUIREMENTS.

5.3.1 Samples are stored at $4^{o}C \pm 2^{o}C$, in the container received.

5.3.2 Holding time for analysis of samples for metals analysis is 6 months.

5.3.3 Dissolved samples should be filtered and preserved within 3 days of sampling.

5.4 EQUIPMENT

5.4.1 Simultaneous or Sequential ICP with background correction.

5.4.2 Computer controlled data system for ICP.

5.4.3 Volumetric flasks, 100 mL, 200 mL, 500 mL, 1000 mL.

5.4.4 Specimen cups with poly lids.

5.4.5 Disposable culture tubes, borosilicate glass.

5.5 REAGENTS/STANDARDS

5.5.1 ASTM Type II reagent water.

5.5.2 Leeman Labs, Inc., Plasma-Pure, Custom Multi-element Standards (calibrating standards). Standard Certificates attached for the three standards.

5.5.2.1 Preparation of calibration standards: Serial dilution of standards, in the following ratios:

4.0 mL each standard, dilute to 200 mL (High Standard);
0.8 mL each standard, dilute to 200 mL (Med. Standard);
0.4 mL each standard, dilute to 200 mL (Low Standard);
2.5 mL each standard, dilute to 500 mL (CCV Standard) *note: the CCV standard concentration varies within the calibration range.*

The final concentrations of each analyte in the high standard and the CCV standard are provided in tabular form as an Attachment to this SOP.

5.5.3 PLASMACHEM, matrix spiking standard. Concentrations provided in tabular form as an Attachment to this SOP.

5.5.4 PLASMACHEM, Standards A and AB (interference check standard). Concentrations provided in tabular form as an Attachment to this SOP.

5.5.5 Outside check standards. Check Standard 4 is at a concentration of 10 times the STL Seattle reporting limit. Check Standard 5 is at a concentration of 2 times the STL Seattle reporting limit. Specific analyte concentrations provided in tabular form as an Attachment to this SOP.

5.5.6 Argon gas, high purity grade.

5.5.7 Concentrated HCl.

5.5.8 Concentrated HNO3.

5.5.9 1:1 HCl.

5.5.9.1 Preparation: add 500 mLs of concentrated HCl to 400 mLs Type II water. Allow to cool, and dilute to 1 L with Type II water.

5.5.10 1:1 Nitric acid.

5.5.10.1 Preparation: add 500 mLs of concentrated HNO3 to 400 mLs Type II water. Allow to cool, dilute to 1 liter with Type II water.

5.5.11 Internal Standard solution. Add 0.5 mL each of 10,000 mg/L Lu, Sc, and Y to a 1-Liter volumetric flask. Dilute to volume with Type II water.

5.6 INSTRUMENT CALIBRATION

5.6.1 Initial Calibration Procedures. One instrument blank and three standards containing all analytes of interest are analyzed for initial calibration (analyte-specific concentrations). Standards are analyzed in triplicate, three readings for each analysis, and the results are averaged. A calibration curve is generated using the blank and the average values for the three standards. An initial calibration is performed as needed. An initial calibration verification (ICV) and initial calibration blank (ICB) standard are analyzed daily.

5.6.2 Continuing Calibration Procedures. A continuing calibration standard containing a mid-range concentration of each analyte is analyzed immediately after the ICV and ICB, after 10 samples, and at the end of the analytical sequence. The calculated concentration is compared to the actual concentration of the standard analytes. If QC criteria are not met, the standard is rerun, or a "curve update" is performed. An "update" is a linear adjustment of the curve using the highest concentration standard.

5.7 SAMPLE PREPARATION

5.7.1 Refer to the appropriate SOP (see section 3) for sample preparation.

5.8 SAMPLE ANALYSIS

5.8.1 Samples, sample leachates, and sample digests are provided to the analyst in specimen cups labeled with laboratory number.

5.8.2 Samples are poured into disposable culture tubes and placed in a rack for analysis.

5.8.3 Samples are nebulized and injected into the plasma torch. The solution concentrations are determined and reported as raw instrument data.

5.9 CALCULATIONS

5.9.1 Liquid samples, report as mg/L.

$$mg/L = (\text{instrument reading}) * (\text{final dilution})$$

5.9.2 Solid samples (except filters), report as mg/kg:

$$mg/kg = \frac{(\text{instrument reading}) * (\text{final dilution})}{(\text{sample weight}) (\text{percent solids})}$$

5.9.3 Filters, report as ug (or as ug/cm^3)

$$ug = (\text{instrument reading}) * (\text{final dilution})$$

$$ug/cm^3 = \frac{(\text{instrument reading}) * (\text{final dilution}) * (1000)}{(\text{air volume in L})}$$

5.10 QUALITY CONTROL

5.10.1 Initial calibration. Acceptance criterion is a curve with a minimum correlation coefficient of 0.995. The agreement between the replicate injections of each standard must be a relative standard deviation of less than or equal to 25. The ICV standard must agree within 10% of the true value for samples analyzed by EPA Method 6010B, or within 5% of the true value for samples analyzed by EPA Method 200.7.

5.10.2 Continuing calibration. Acceptance criteria is a percent difference (%D) of 10% between the calculated concentration of the continuing calibration standard and the true value of the standard

5.10.3 Interference check standards. Analyzed daily to ensure that the instrument is compensating for interferences; For analytical sequences associated with NPDES samples analyzed by Method 200.7 (as stated in 40CFR Part 136 Appendix C), the results should fall within 1.5 times the standard deviation of the mean value. For all other sequences the calculated concentrations of the analytes must agree within 20% of the true values.

5.10.4 External calibration check standard (Initial Calibration Verification, ICV). Immediately following the initial calibration, and at the beginning of each analysis batch or every 24 hours, an external calibration check standard is analyzed. The external calibration check must agree within 10% of the true value.

5.10.5 The associated method blank for each sample batch is analyzed and reported with the sample results.

5.10.6 Matrix spike or blank spike samples will be prepared with a minimum frequency of 5% of the samples. If there are fewer than 20 samples in a batch, at least one matrix spike sample should be prepared. Matrix spike solutions will contain all target analytes. Results from analysis of these

digest will be used to assess accuracy of the digestion and analysis procedure. For preparation, 2.0 mL of spiking solution is applied directly to a solid matrix, or 1.0 mL of spiking solution is added to a liquid matrix or a blank volume.

5.10.7 Duplicate samples will be prepared at a minimum frequency of 5% of the samples. If there are fewer than 20 samples in a batch, at least one duplicate sample should be prepared. Duplicate will be used to assess precision of the digestion and analysis procedure.

5.10.8 Inter-element correction factors are determined annually.

5.10.9 Linear calibration limits are analyzed on an annual basis.

5.10.10 Method detection limit studies are performed on an annual basis.

5.10.11 Where required by specific client or project (i.e., Corps of Engineers, Navy NFESC), one or more of the following quality control analyses will be performed:

5.10.11.1 Serial Dilution. A 1:5 dilution of the sample selected for batch QC is analyzed.

5.10.11.2 Post Digest Spike. The sample selected for batch QC is spiked after digestion at a concentration equivalent to the matrix spike concentration.

5.10.11.3 Method of Standard Additions. For samples analyzed under the Corps of Engineers Shell Document, whenever both the serial dilution analysis agreement and post digest spike recoveries are outside QC limits, sample results must be calculated based on the method of standard additions in accordance with Method 6010B.

5.11 METHOD PERFORMANCE

5.11.1 Accuracy is evaluated based on blank spike and matrix spike recovery. The recoveries of all spiked target analytes in blank spikes must be between 80 - 120% (85 – 115% for samples analyzed by method 200.7). The recoveries of all spiked target analytes in matrix spikes should be within 75 - 125% (50 – 150% for TCLP). Post digestion spike recoveries should be within 75 – 125% of the true value. Results for the serial dilution analysis should agree within 10% when compared to the original analysis for analytes that are at a concentration of 10 times the MDL after dilution, or matrix interference is suspected.

5.11.2 Precision Determination. Duplicate results should be within 20% for the water matrix and within 35% for all other matrices.

5.12 METHOD DETECTION LIMITS/REPORTING LIMITS/PRACTICAL QUANTITATION LIMITS

5.12.1 Method Detection Limit Studies are performed annually for each matrix. Detection limit study data are maintained in the QA files.

5.12.2 Table 1 includes reporting limits for routine target analytes.

5.13 MODIFICATIONS TO PUBLISHED METHODS

5.13.1.1 None.

6.0 HEALTH AND SAFETY/SPECIAL CONSIDERATIONS

6.1 Gloves and safety goggles should be worn during sample preparation and analysis.

7.0 NONCONFORMANCE AND CORRECTIVE ACTION

7.1 Any nonconformance encountered during sample preparation (e.g., insufficient sample volume or matrix-specific problems) should be documented in a laboratory nonconformance memorandum and appropriate corrective action taken.

7.2 If the client is contacted regarding sample nonconformance, a client contact is completed and placed in the master file.

8.0 RECORDS MANAGEMENT/DOCUMENTATION

8.1 Each digestion batch identifier and appropriate QA/QC should be recorded in thelogbook on the batch QC form for soils or waters. All analysis information should be recorded in the logbook on the worksheet form. Date and signature must accompany the recorded information.

8.2 A copy of the raw data is placed in the data file.

8.3 Logbooks are archived with the QC department when completed for permanent storage.

8.4 If client contact is required, a Client Contact Record is completed and maintained in the master file.

8.5 If nonconformance is observed during sample extraction or analysis, a nonconformance memorandum is completed; the memorandum is placed in the file, and a copy of the memorandum is given to the QA Manager.

9.0 WASTE MANAGEMENT AND POLLUTION PREVENTION

9.1 All laboratory waste must be handled in accordance with SOP 0036.6.

9.2 All laboratory procedures must comply with the policies set forth in STL Seattle's Pollution Prevention Plan.

Table 1. Analyte List and Reporting Limits for ICP Metals

Calib: Initial Calibration Options

When opening this method manually :

Use the calibrations curves in memory.

When using this method in a multimethod sequence:

* Start by constructing new calibration curves.

Method Name: Initial-4 Point

Start using the existing calibration curve set.
Start using the stored calibration curve set:

Calib : Multi Line Calibration

Not Enabled

DECLARATION OF RESTRICTIVE COVENANT

COMMERCIAL

This Declaration of Restrictive Covenant ("Restrictive Covenant") is made pursuant to RCW 70.105D.030(1)(f) and (g) and WAC 173-340-440 this _____ day of _____, 2006, by the Weyerhaeuser Company ("Weyerhaeuser"), its successors and assigns, and the State of Washington, Department of Ecology ("Department of Ecology"), and its successors and assigns.

The undersigned, Weyerhaeuser, covenants that it is the fee owner of real property in Pierce County, Washington, legally described in Exhibit A and depicted in Exhibit B, attached hereto and incorporated herein by this reference ("Property").

The Property is within an area commonly referred to as "Parcel One" of the "Former DuPont Works Site" that was the subject of work to clean up the Property ("Remedial Action") under the Washington Model Toxics Control Act ("MTCA"), Chapter 70.105D RCW. The Remedial Action is described in the Consent Decree entered in *State of Washington, Department of Ecology v. Weyerhaeuser Company and E.I. DuPont de Nemours and Company* (Thurston County Cause No. 03-2-10484-7), in attachments to the Decree and in documents referenced in the Decree, including without limitation the Cleanup Action Plan attached to the Consent Decree as Exhibit A, and incorporated therein by reference. The Cleanup Action Plan is on file and available for inspection at the Washington State Department of Ecology, Toxics Cleanup Program, P.O. Box 47775, Olympia, WA 98504-7775. The boundary of Parcel One is depicted in Exhibit B, attached hereto.

This Restrictive Covenant is required because the Remedial Action resulted in residual concentrations at some portions of the Property of hazardous substances which exceed the soil and groundwater cleanup levels specified in MTCA for unrestricted land uses. The Remedial Action resulted in removal of all hazardous substances which exceed site specific remediation levels, as established by the Department of Ecology, for commercial land use. Large sections of the Property were remediated with resulting chemical concentrations below the soil and groundwater cleanup levels specified under MTCA for unrestricted land uses. As a result, individual parcels may contain different levels of residual contamination, if any. This Restrictive Covenant applies to all of the Property, regardless of whether residual contamination remains or not.

Weyerhaeuser makes the following declaration as to limitations, conditions, restrictions, and uses to which the Property may be put and specifies that such declarations shall run with the land as provided by law and shall be binding on Weyerhaeuser, its successors and assigns, and any and all parties and persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereafter, "Owner").

Section 1: Restrictions on Use of Property. The Property may be developed and used only for commercial use as allowed under the City of DuPont zoning regulations and Comprehensive Land Use Plan and under MTCA; provided, however that the Property shall not be developed and used for any of the following: residential uses, schools, daycares, parks, recreational uses (with the exception of potential future golf course expansion), or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 2: Restrictions on Activities. The Owner may maintain and develop the Property consistent with this Restrictive Covenant. Normal construction and maintenance for permitted development is not restricted by this Section. Maintenance of any impervious surfaces is expressly permitted without prior approval so long as appropriate health and safety protocols are followed. For development activities permitted under this Restrictive Covenant, excavated soils must be managed properly and unless put back in place must be either placed in an area within the boundaries of the Former DuPont Works Site, or disposed off-site in accordance with applicable regulations. Excavated soils shall be managed to minimize exposure to workers and other adults, including but not limited to the use of best management practices to control dust and surface water runoff; and to prevent exposure to children. Any activity on the Property that could interfere with the continued protection of human health and the environment is prohibited without prior written approval from the Department of Ecology.

Section 3: Change of Use. The Owner must notify and obtain approval from the Department of Ecology prior to any use of the Property that is inconsistent with the terms of this Restrictive Covenant. The Department of Ecology may approve any inconsistent use only after public notice and comment; provided, however, in no event may any change in use be approved that would allow for residential uses, schools, daycares, parks, recreational uses (with the exception of potential future golf course expansion), or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 4: Notice of Conveyance. The Owner must give thirty (30) days' advance written notice to the Department of Ecology of the Owner's intent to convey any interest in the Property. Within thirty (30) days of the date any instrument conveying a fee title interest is executed, grantor must provide the Department of Ecology with a certified true copy of the instrument and, if it has been recorded in the public land records, its recording reference. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Remedial Action.

Section 5: Leasehold Interests. The Owner must restrict leases to uses and activities consistent with this Restrictive Covenant and notify all lessees of the restrictions on the use of the Property.

Section 6: Recordation. Within thirty (30) days of the date of execution, the Owner shall record this Restrictive Covenant with the Pierce County Assessor's Office, and provide evidence of recordation to the Department of Ecology.

Section 7: Notice Requirement. The Owner shall include in any instrument conveying any interest in any portion of the Property, including but not limited to deeds, leases, and mortgages a notice which is in substantially the following form:

NOTICE: THE INTEREST CONVEYED HEREBY IS SUBJECT TO THE EFFECT OF A RESTRICTIVE COVENANT, DATED _____, RECORDED IN THE PUBLIC LAND RECORDS ON _____, IN BOOK _____, PAGE _____, IN FAVOR OF, AND ENFORCEABLE BY THE STATE OF WASHINGTON.

Section 8: Notices. Any notice, demand, request, consent, approval, or communication that either party desires or is required to give the other shall be in writing and shall be served personally or sent by first class mail postage prepaid, addresses as follows:

To Weyerhaeuser:

Director, Environmental Affairs
Mail Stop EC2 2C1
P.O. Box 9777
Federal Way, WA 98063-9777

To the Department of Ecology:

Washington State Department of Ecology
Toxics Cleanup Program
P.O. Box 47775
Olympia, WA 98504-7775

Section 9: Groundwater Withdrawal. The Owner of the Property must not permit withdrawal of groundwater from the Property for drinking water purposes, unless authorized by the Department of Ecology. Withdrawal of groundwater from monitoring wells for the purpose of extracting samples for analysis is expressly permitted.

Section 10: Access. The Owner shall allow authorized representatives of the Department of Ecology, E.I. DuPont de Nemours Company and Weyerhaeuser the right to enter the Property at reasonable times for the purposes of monitoring compliance with the terms of this Restrictive Covenant, evaluating the Remedial Action, taking samples, inspecting remedial actions conducted at the Property, and inspecting records that are related to the Remedial Action.

Section 11: No Public Access and Use. No right of access or use by the general public to any portion of the Property is conveyed by this Restrictive Covenant.

Section 12: Enforcement. Weyerhaeuser, the E.I. DuPont de Nemours Company, and the Department of Ecology shall each have the right, but not the obligation, to enforce the terms of this Restrictive Covenant by resort to specific performance or any legal process; provided, however, that no provision of this Restrictive Covenant shall be construed or intended to impose any obligations, by law or by contract, on the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to take action to enforce said restrictions. Neither the right nor authority of the Department of Ecology and Weyerhaeuser and E.I. DuPont de Nemours Company to enforce this Restrictive Covenant nor a decision made to exercise or not to exercise such authority to right shall give rise to any duty or responsibility on the party of the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to exercise or not exercise

this right on behalf of any Party or other person or entity. All remedies available hereunder shall be in addition to any and all remedies at law or in equity, including MTCA. Any forbearance, delay or omission to exercise the enforcement rights under this Restrictive Covenant in the event of a breach of any term of this Restrictive Covenant shall not be deemed to be a waiver of such term or of any subsequent breach of the same or any other term, or of any of the rights under this Restrictive Covenant. Should legal counsel be employed to enforce this Restrictive Covenant, all costs incurred in such enforcement, including reasonable attorneys' fees shall be paid by the Owner found to be in violation.

Section 13: No Third Party Beneficiary. This Restrictive Covenant is intended for the sole and exclusive benefit of the Parties hereto and their respective successors and assigns, including all current and future owners of any portion or interest in the property. The Parties to this Restrictive Covenant expressly do not intend to benefit any other person or entity, and expressly do not intend to create any third-party beneficiaries to any provision of this Restrictive Covenant, including but not limited to any enforcement provisions.

Section 14: Run with the Land. To the extent that this Restrictive Covenant is construed as a restrictive covenant, it shall run with the land, and shall be binding on the Owners, their successors and assigns, of all or any portion of the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the property owner without adequate and complete provision for the continued observation of this Restrictive Covenant.

Section 15: Severability. Invalidation of any provision or application of a provision of this Restrictive Covenant by any court shall not affect any other provisions or applications.

Section 16: Easement in Gross. To the extent that this Restrictive Covenant creates a negative easement, it shall be construed as an easement in gross for the sole benefit of Weyerhaeuser, without whose consent it cannot be released, modified or amended.

Section 17: Reserved Rights. Weyerhaeuser reserves unto itself and its successors and assigns all rights and privileges in and to the use of the Property which are not incompatible with the restrictions, and rights granted herein.

Weyerhaeuser Company has caused this Restrictive Covenant to be signed in its name.

EXECUTED this _____ day of _____, 2006.

WEYERHAEUSER COMPANY

By:

_____
Richard E. Hanson
Executive Vice President and Chief
Operating Officer

STATE OF WASHINGTON)
) ss.
County of _____)

On this ____ day of _____, 2006, before me, the undersigned, a Notary Public in and for the State of Washington, duly commissioned and sworn, personally appeared Richard E. Hanson, known to be the Executive Vice President and Chief Operating Officer of Weyerhaeuser Company, the corporation that executed the foregoing Restrictive Covenant, and acknowledged the said Restrictive Covenant to be the free and voluntary act and deed of said corporation, for the uses and purposes therein mentioned, and on oath stated that he is authorized to execute said Restrictive Covenant.

WITNESS my hand and official seal hereto affixed the day and year written above.

NOTARY PUBLIC in and for the State of
Washington. My commission expires:

EXHIBIT "A"

LEGAL DESCRIPTION FOR COMMERCIAL PROPERTY LOT 5

That portion of Lot 5 of that Record of Survey as recorded under Recording No. 200601275001, Records of Pierce County, Washington, being more particularly described as follows:

BEGINNING at the southwesterly corner of Lot C of that Record of Survey for Boundary Line Adjustment No. 05-04, recorded under Recording No. 200508245006, Records of Pierce County, Washington, said point being on the easterly line of said Lot 5;

THENCE along the boundary of said Lot 5 the following courses:

N 00°23'40" W, 1044.01 feet;

Northwesterly 282.64 feet along the arc of a tangent curve to the left, having a radius of 205.00 feet, through a central angle of 78°59'48";

N 47°56'54" E, 18.37 feet;

N 72°03'32" W, 71.78 feet;

N 61°13'57" W, 62.70 feet;

N 47°38'05" W, 103.73 feet;

N 22°41'31" W, 82.14 feet;

N 73°54'16" W, 55.51 feet;

N 84°05'26" W, 82.17 feet;

S 32°18'51" W, 21.44 feet;

S 86°21'14" W, 135.81 feet;

N 50°58'05" W, 108.58 feet;

N 72°38'29" W, 226.91 feet;

N 77°20'02" W, 170.54 feet;

N 60°41'16" W, 162.72 feet;

N 53°43'56" W, 129.34 feet;

S 76°15'11" W, 48.33 feet;

N 24°28'05" W, 65.64 feet;

N 62°11'03" W, 69.39 feet;

N 49°11'02" W, 72.59 feet;

N 34°19'20" W, 87.42 feet;

N 27°00'43" W, 112.04 feet;

N 01°08'02" E, 348.96 feet;

N 25°53'50" W, 76.38 feet;

N 08°22'48" W, 74.15 feet;

N 41°59'44" E, 49.87 feet;

N 32°06'13" W, 81.14 feet;

DECLARATION OF RESTRICTIVE COVENANT

COMMERCIAL

This Declaration of Restrictive Covenant ("Restrictive Covenant") is made pursuant to RCW 70.105D.030(1)(f) and (g) and WAC 173-340-440 this _____ day of _____, 2006, by the Weyerhaeuser Company ("Weyerhaeuser"), its successors and assigns, and the State of Washington, Department of Ecology ("Department of Ecology"), and its successors and assigns.

The undersigned, Weyerhaeuser, covenants that it is the fee owner of real property in Pierce County, Washington, legally described in Exhibit A and depicted in Exhibit B, attached hereto and incorporated herein by this reference ("Property").

The Property is within an area commonly referred to as "Parcel One" of the "Former DuPont Works Site" that was the subject of work to clean up the Property ("Remedial Action") under the Washington Model Toxics Control Act ("MTCA"), Chapter 70.105D RCW. The Remedial Action is described in the Consent Decree entered in *State of Washington, Department of Ecology v. Weyerhaeuser Company and E.I. DuPont de Nemours and Company* (Thurston County Cause No. 03-2-10484-7), in attachments to the Decree and in documents referenced in the Decree, including without limitation the Cleanup Action Plan attached to the Consent Decree as Exhibit A, and incorporated therein by reference. The Cleanup Action Plan is on file and available for inspection at the Washington State Department of Ecology, Toxics Cleanup Program, P.O. Box 47775, Olympia, WA 98504-7775. The boundary of Parcel One is depicted in Exhibit B, attached hereto.

This Restrictive Covenant is required because the Remedial Action resulted in residual concentrations at some portions of the Property of hazardous substances which exceed the soil and groundwater cleanup levels specified in MTCA for unrestricted land uses. The Remedial Action resulted in removal of all hazardous substances which exceed site specific remediation levels, as established by the Department of Ecology, for commercial land use. Large sections of the Property were remediated with resulting chemical concentrations below the soil and groundwater cleanup levels specified under MTCA for unrestricted land uses. As a result, individual parcels may contain different levels of residual contamination, if any. This Restrictive Covenant applies to all of the Property, regardless of whether residual contamination remains or not.

Weyerhaeuser makes the following declaration as to limitations, conditions, restrictions, and uses to which the Property may be put and specifies that such declarations shall run with the land as provided by law and shall be binding on Weyerhaeuser, its successors and assigns, and any and all parties and persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereafter, "Owner").

Section 1: Restrictions on Use of Property. The Property may be developed and used only for commercial use as allowed under the City of DuPont zoning regulations and Comprehensive Land Use Plan and under MTCA; provided, however that the Property shall not be developed and used for any of the following: residential uses, schools, daycares, parks, recreational uses (with the exception of potential future golf course expansion), or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 2: Restrictions on Activities. The Owner may maintain and develop the Property consistent with this Restrictive Covenant. Normal construction and maintenance for permitted development is not restricted by this Section. Maintenance of any impervious surfaces is expressly permitted without prior approval so long as appropriate health and safety protocols are followed. For development activities permitted under this Restrictive Covenant, excavated soils must be managed properly and unless put back in place must be either placed in an area within the boundaries of the Former DuPont Works Site, or disposed off-site in accordance with applicable regulations. Excavated soils shall be managed to minimize exposure to workers and other adults, including but not limited to the use of best management practices to control dust and surface water runoff; and to prevent exposure to children. Any activity on the Property that could interfere with the continued protection of human health and the environment is prohibited without prior written approval from the Department of Ecology.

Section 3: Change of Use. The Owner must notify and obtain approval from the Department of Ecology prior to any use of the Property that is inconsistent with the terms of this Restrictive Covenant. The Department of Ecology may approve any inconsistent use only after public notice and comment; provided, however, in no event may any change in use be approved that would allow for residential uses, schools, daycares, parks, recreational uses (with the exception of potential future golf course expansion), or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 4: Notice of Conveyance. The Owner must give thirty (30) days' advance written notice to the Department of Ecology of the Owner's intent to convey any interest in the Property. Within thirty (30) days of the date any instrument conveying a fee title interest is executed, grantor must provide the Department of Ecology with a certified true copy of the instrument and, if it has been recorded in the public land records, its recording reference. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Remedial Action.

Section 5: Leasehold Interests. The Owner must restrict leases to uses and activities consistent with this Restrictive Covenant and notify all lessees of the restrictions on the use of the Property.

Section 6: Recordation. Within thirty (30) days of the date of execution, the Owner shall record this Restrictive Covenant with the Pierce County Assessor's Office, and provide evidence of recordation to the Department of Ecology.

Section 7: Notice Requirement. The Owner shall include in any instrument conveying any interest in any portion of the Property, including but not limited to deeds, leases, and mortgages a notice which is in substantially the following form:

NOTICE: THE INTEREST CONVEYED HEREBY IS SUBJECT TO THE EFFECT OF A RESTRICTIVE COVENANT, DATED _____, RECORDED IN THE PUBLIC LAND RECORDS ON _____, IN BOOK _____, PAGE _____, IN FAVOR OF, AND ENFORCEABLE BY THE STATE OF WASHINGTON.

Section 8: Notices. Any notice, demand, request, consent, approval, or communication that either party desires or is required to give the other shall be in writing and shall be served personally or sent by first class mail postage prepaid, addresses as follows:

To Weyerhaeuser:

Director, Environmental Affairs
Mail Stop EC2 2C1
P.O. Box 9777
Federal Way, WA 98063-9777

To the Department of Ecology:

Washington State Department of Ecology
Toxics Cleanup Program
P.O. Box 47775
Olympia, WA 98504-7775

Section 9: Groundwater Withdrawal. The Owner of the Property must not permit withdrawal of groundwater from the Property for drinking water purposes, unless authorized by the Department of Ecology. Withdrawal of groundwater from monitoring wells for the purpose of extracting samples for analysis is expressly permitted.

Section 10: Access. The Owner shall allow authorized representatives of the Department of Ecology, E.I. DuPont de Nemours Company and Weyerhaeuser the right to enter the Property at reasonable times for the purposes of monitoring compliance with the terms of this Restrictive Covenant, evaluating the Remedial Action, taking samples, inspecting remedial actions conducted at the Property, and inspecting records that are related to the Remedial Action.

Section 11: No Public Access and Use. No right of access or use by the general public to any portion of the Property is conveyed by this Restrictive Covenant.

Section 12: Enforcement. Weyerhaeuser, the E.I. DuPont de Nemours Company, and the Department of Ecology shall each have the right, but not the obligation, to enforce the terms of this Restrictive Covenant by resort to specific performance or any legal process; provided, however, that no provision of this Restrictive Covenant shall be construed or intended to impose any obligations, by law or by contract, on the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to take action to enforce said restrictions. Neither the right nor authority of the Department of Ecology and Weyerhaeuser and E.I. DuPont de Nemours Company to enforce this Restrictive Covenant nor a decision made to exercise or not to exercise such authority to right shall give rise to any duty or responsibility on the party of the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to exercise or not exercise

this right on behalf of any Party or other person or entity. All remedies available hereunder shall be in addition to any and all remedies at law or in equity, including MTCA. Any forbearance, delay or omission to exercise the enforcement rights under this Restrictive Covenant in the event of a breach of any term of this Restrictive Covenant shall not be deemed to be a waiver of such term or of any subsequent breach of the same or any other term, or of any of the rights under this Restrictive Covenant. Should legal counsel be employed to enforce this Restrictive Covenant, all costs incurred in such enforcement, including reasonable attorneys' fees shall be paid by the Owner found to be in violation.

Section 13: No Third Party Beneficiary. This Restrictive Covenant is intended for the sole and exclusive benefit of the Parties hereto and their respective successors and assigns, including all current and future owners of any portion or interest in the property. The Parties to this Restrictive Covenant expressly do not intend to benefit any other person or entity, and expressly do not intend to create any third-party beneficiaries to any provision of this Restrictive Covenant, including but not limited to any enforcement provisions.

Section 14: Run with the Land. To the extent that this Restrictive Covenant is construed as a restrictive covenant, it shall run with the land, and shall be binding on the Owners, their successors and assigns, of all or any portion of the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the property owner without adequate and complete provision for the continued observation of this Restrictive Covenant.

Section 15: Severability. Invalidation of any provision or application of a provision of this Restrictive Covenant by any court shall not affect any other provisions or applications.

Section 16: Easement in Gross. To the extent that this Restrictive Covenant creates a negative easement, it shall be construed as an easement in gross for the sole benefit of Weyerhaeuser, without whose consent it cannot be released, modified or amended.

Section 17: Reserved Rights. Weyerhaeuser reserves unto itself and its successors and assigns all rights and privileges in and to the use of the Property which are not incompatible with the restrictions, and rights granted herein.

Weyerhaeuser Company has caused this Restrictive Covenant to be signed in its name.

EXECUTED this _____ day of _____, 2006.

DECLARATION OF RESTRICTIVE COVENANT

GOLF COURSE

This Declaration of Restrictive Covenant ("Restrictive Covenant") is made pursuant to RCW 70.105D.030(1)(f) and (g) and WAC 173-340-440 this _____ day of _____, 2006, by the Weyerhaeuser Company ("Weyerhaeuser"), its successors and assigns, and the State of Washington, Department of Ecology ("Department of Ecology"), and its successors and assigns.

The undersigned, Weyerhaeuser, covenants that it is the fee owner of real property in Pierce County, Washington, legally described in Exhibit A and depicted in Exhibit B, attached hereto and incorporated herein by this reference ("Property").

The Property is within an area commonly referred to as "Parcel One" of the "Former DuPont Works Site" that was the subject of work to clean up the Property ("Remedial Action") under the Washington Model Toxics Control Act ("MTCA"), Chapter 70.105D RCW. The Remedial Action is described in the Consent Decree entered in *State of Washington, Department of Ecology v. Weyerhaeuser Company and E.I. DuPont de Nemours and Company* (Thurston County Cause No. 03-2-10484-7), in attachments to the Decree and in documents referenced in the Decree, including without limitation the Cleanup Action Plan attached to the Consent Decree as Exhibit A, and incorporated therein by reference. The Cleanup Action Plan is on file and available for inspection at the Washington State Department of Ecology, Toxics Cleanup Program, P.O. Box 47775, Olympia, WA 98504-7775. The boundary of Parcel One is depicted in Exhibit B, attached hereto.

This Restrictive Covenant is required because the Remedial Action resulted in residual concentrations at portions of the Property of hazardous substances which exceed the soil and groundwater cleanup levels specified in MTCA for unrestricted land uses.

Weyerhaeuser makes the following declaration as to limitations, conditions, restrictions, and uses to which the Property may be put and specifies that such declarations shall run with the land as provided by law and shall be binding on Weyerhaeuser, its successors and assigns, and any and all parties and persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereafter, "Owner").

Section 1: Restrictions on Use of Property. The Property may be developed and used only for a golf course and related amenities, such as roadways, parking, club house facilities, a golf museum, training facility, conference center, banquet facility, meeting rooms, and offices, to the extent permitted under the City of DuPont zoning regulations and Comprehensive Land Use Plan and under MTCA; provided, however that the Property shall not be developed and used for any of the following: residential uses, schools, daycares, parks, recreational uses (with the exception of golf course uses), or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 2: Restrictions on Activities. The Owner may maintain and develop the Property consistent with its intended use as a golf course and related amenities. Normal construction and maintenance activities for golf course development are not restricted by this Section. Maintenance of any impervious surfaces is expressly permitted without prior approval so long as appropriate health and safety protocols are followed. For development activities permitted under this Restrictive Covenant, excavated soils must be managed properly and unless put back in place, must be either placed in an area within the boundaries of the Former DuPont Works Site, or disposed off-site in accordance with applicable regulations; provided, however, that any excavated soils removed from the areas identified in Exhibit C and discussed in Section 3 below that cannot be put back in place **must** be disposed off-site in accordance with applicable regulations. Excavated soils shall be managed to minimize exposure to workers and other adults, including but not limited to the use of best management practices to control dust and surface water runoff; and to prevent exposure to children. Any activity on the Property that could interfere with the integrity of the Remedial Action and continued protection of human health and the environment is prohibited without prior written approval from the Department of Ecology.

Section 3: Protection of Residual Contaminants. The Owner shall not penetrate, alter, damage, remove or breach in any manner the durable, permeable, engineered material ("Cap") installed over contaminated soils at various places throughout the Property; nor remove or excavate any contaminated soils below the Cap in any manner that may result in the release of or exposure to hazardous substances without prior written approval from the Department of Ecology. Only plants with shallow roots that will not penetrate the Cap are allowed to be installed and maintained above the Cap. The locations of the Property where contaminated soil has a Cap over it, as well as the elevations and contours of the Caps themselves, are described in Exhibit C, attached hereto and incorporated herein by this reference.

Section 3.1: Cap Integrity. Specifically, the Owner shall not perform or allow any person to perform any of the following activities through or under the Cap:

a. drilling, digging, placement of any objects or use of any equipment which deforms or stresses the surface of the Cap beyond its load bearing capability, piercing the surface with a rod, spike or similar item other than for the repair of in-place drainage lines which were installed in clean, imported gravels and do not require special handling; or

b. excavation or removal of loam, peat, sand, gravel, rock, or any other mineral or natural resource; or

c. planting of large trees or other vegetation the roots of which would breach the Cap; or

d. any other activity which penetrates, breaches, or disturbs the structural integrity of the Cap without first obtaining the express written consent of the Department of Ecology.

Section 3.2: Emergency or Accidental Damage to Cap. If it becomes necessary to excavate below or penetrate the Cap as part of a response to an emergency (e.g. repairing utility lines or responding to a fire or flood) or if the Cap is accidentally breached for any reason, the requirements of the previous subsection may be suspended, provided that the Owner:

a. notifies the Department of Ecology and Weyerhaeuser of such emergency or accident as soon as possible but no more than twenty-four hours after learning of such emergency or accident; and

b. limits the actual disturbance involved in such excavation or breach to the minimum reasonably necessary to adequately respond to the emergency.

Section 4: Change of Use. The Owner must notify and obtain approval from the Department of Ecology prior to any use of the Property that is inconsistent with the terms of this Restrictive Covenant. The Department of Ecology may approve any inconsistent use only after public notice and comment; provided, however, in no event may any change in use be approved that would allow for residential uses, schools, daycares, parks, recreational uses (with the exception of golf course uses), or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 5: Notice of Conveyance. The Owner must give thirty (30) days' advance written notice to the Department of Ecology of the Owner's intent to convey any interest in the Property. Within thirty (30) days of the date any instrument conveying a fee title interest is executed, grantor must provide the Department of Ecology with a certified true copy of the instrument and, if it has been recorded in the public land records, its recording reference. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Remedial Action.

Section 6: Leasehold Interests. The Owner must restrict leases to uses and activities consistent with this Restrictive Covenant and notify all lessees of the restrictions on the use of the Property.

Section 7: Recordation. Within thirty (30) days of the date of execution, the Owner shall record this Restrictive Covenant with the Pierce County Assessor's Office, and provide evidence of recordation to the Department of Ecology.

Section 8: Notice Requirement. The Owner shall include in any instrument conveying any interest in any portion of the Property, including but not limited to deeds, leases, and mortgages a notice which is in substantially the following form:

NOTICE: THE INTEREST CONVEYED HEREBY IS SUBJECT TO THE EFFECT OF A RESTRICTIVE COVENANT, DATED _____, RECORDED IN THE PUBLIC LAND RECORDS ON _____, IN BOOK _____, PAGE _____, IN FAVOR OF, AND ENFORCEABLE BY THE STATE OF WASHINGTON.

Section 9: Notices. Any notice, demand, request, consent, approval, or communication that either party desires or is required to give the other shall be in writing and shall be served personally or sent by first class mail postage prepaid, addresses as follows:

To Weyerhaeuser:

Director, Environmental Affairs
Mail Stop EC2 2C1
P.O. Box 9777
Federal Way, WA 98063-9777

To the Department of Ecology:

Washington State Department of Ecology
Toxics Cleanup Program
P.O. Box 47775
Olympia, WA 98504-7775

Section 10: Groundwater Withdrawal. The Owner of the Property must not permit withdrawal of groundwater from the Property for drinking water purposes, unless authorized by the Department of Ecology. Withdrawal of groundwater from monitoring wells for the purpose of extracting samples for analysis, and withdrawal and application of irrigation water for golf course maintenance are expressly permitted.

Section 11: Access. The Owner shall allow authorized representatives of the Department of Ecology, E.I. DuPont de Nemours Company and Weyerhaeuser the right to enter the Property at reasonable times for the purposes of monitoring compliance with the terms of this Restrictive Covenant, evaluating the Remedial Action, taking samples, inspecting remedial actions conducted at the Property, and inspecting records that are related to the Remedial Action.

Section 12: No Public Access and Use. No right of access or use by the general public to any portion of the Property is conveyed by this Restrictive Covenant.

Section 13: Enforcement. Weyerhaeuser, the E.I. DuPont de Nemours Company, and the Department of Ecology shall each have the right, but not the obligation, to enforce the terms of this Restrictive Covenant by resort to specific performance or any legal process; provided, however, that no provision of this Restrictive Covenant shall be construed or intended to impose any obligations, by law or by contract, on the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to take action to enforce said restrictions. Neither the right nor authority of the Department of Ecology and Weyerhaeuser and E.I. DuPont de Nemours Company to enforce this Restrictive Covenant nor a decision made to exercise or not to exercise such authority to right shall give rise to any duty or responsibility on the party of the Department

of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to exercise or not exercise this right on behalf of any Party or other person or entity. All remedies available hereunder shall be in addition to any and all remedies at law or in equity, including MTCA. Any forbearance, delay or omission to exercise the enforcement rights under this Restrictive Covenant in the event of a breach of any term of this Restrictive Covenant shall not be deemed to be a waiver of such term or of any subsequent breach of the same or any other term, or of any of the rights under this Restrictive Covenant. Should legal counsel be employed to enforce this Restrictive Covenant, all costs incurred in such enforcement, including reasonable attorneys' fees shall be paid by the Owner found to be in violation.

Section 14: No Third Party Beneficiary. This Restrictive Covenant is intended for the sole and exclusive benefit of the Parties hereto and their respective successors and assigns, including all current and future owners of any portion or interest in the property. The Parties to this Restrictive Covenant expressly do not intend to benefit any other person or entity, and expressly do not intend to create any third-party beneficiaries to any provision of this Restrictive Covenant, including but not limited to any enforcement provisions.

Section 15: Run with the Land. To the extent that this Restrictive Covenant is construed as a restrictive covenant, it shall run with the land, and shall be binding on the Owners, their successors and assigns, of all or any portion of the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the property owner without adequate and complete provision for the continued observation of this Restrictive Covenant.

Section 16: Severability. Invalidation of any provision or application of a provision of this Restrictive Covenant by any court shall not affect any other provisions or applications.

Section 17: Easement in Gross. To the extent that this Restrictive Covenant creates a negative easement, it shall be construed as an easement in gross for the sole benefit of Weyerhaeuser, without whose consent it cannot be released, modified or amended.

Section 18: Reserved Rights. Weyerhaeuser reserves unto itself and its successors and assigns all rights and privileges in and to the use of the Property which are not incompatible with the restrictions, and rights granted herein.

Weyerhaeuser Company has caused this Restrictive Covenant to be signed in its name.

EXECUTED this _____ day of _____, 2006.

DECLARATION OF RESTRICTIVE COVENANT

HISTORICAL PROPERTY (WITH CAP)

This Declaration of Restrictive Covenant ("Restrictive Covenant") is made pursuant to RCW 70.105D.030(1)(f) and (g) and WAC 173-340-440 this _____ day of _____, 2006, by the Weyerhaeuser Company ("Weyerhaeuser"), its successors and assigns, and the State of Washington, Department of Ecology ("Department of Ecology"), and its successors and assigns.

The undersigned, Weyerhaeuser, covenants that it is the fee owner of real property in Pierce County, Washington, legally described in Exhibit A and depicted in Exhibit B, attached hereto and incorporated herein by this reference ("Property"). See Exhibit B for illustrative purpose only. For specific boundaries rely on above legal description.

The Property is within an area commonly referred to as "Parcel One" of the "Former DuPont Works Site" that was the subject of work to clean up the Property ("Remedial Action") under the Washington Model Toxics Control Act ("MTCA"), Chapter 70.105D RCW. The Remedial Action is described in the Consent Decree entered in *State of Washington, Department of Ecology v. Weyerhaeuser Company and E.I. DuPont de Nemours and Company* (Thurston County Cause No. 03-2-10484-7), in attachments to the Decree and in documents referenced in the Decree, including without limitation the Cleanup Action Plan attached to the Consent Decree as Exhibit A, and incorporated therein by reference. The Cleanup Action Plan is on file and available for inspection at the Washington State Department of Ecology, Toxics Cleanup Program, P.O. Box 47775, Olympia, WA 98504-7775. A legal description of Parcel One is attached as Exhibit C, and a nonbinding illustration of the site's boundaries is shown on Exhibit B.

This Restrictive Covenant is required because the Remedial Action resulted in residual concentrations at portions of the Property of hazardous substances which exceed the soil and groundwater cleanup levels specified in MTCA for unrestricted land uses.

Weyerhaeuser makes the following declaration as to limitations, conditions, restrictions, and uses to which the Property may be put and specifies that such declarations shall run with the land as provided by law and shall be binding on Weyerhaeuser, its successors and assigns, and any and all parties and persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereafter, "Owner").

Section 1: Restrictions on Use of Property. The Property is a culturally-significant site. Development and use of the Property, if any, (a) shall be subject to prior approval and express permission of the Washington Department of Archaeology and Historical Preservation, the Nisqually Indian Tribe and the Department of Ecology; (b) shall be only as allowed under the City of DuPont zoning regulations and Comprehensive Land Use Plan and under MTCA; and (c) shall in no event be developed and used for any of the following: residential uses, schools, daycares, parks, recreational uses, or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 2: Restrictions on Activities. The Owner may maintain the Property consistent with its preservation as a culturally-significant site. Notification of any excavation, whether accidental or authorized by the Department of Ecology, must be provided to the Department of Archaeological and Historical Preservation and the Nisqually Indian Tribe. Maintenance of any impervious surfaces is expressly permitted without notice so long as appropriate health and safety protocols are followed. For development activities permitted under this Restrictive Covenant, excavated soils must be managed properly and unless put back in place, must be either placed in an area within the boundaries of the Former DuPont Works Site (including but not limited to the parcel on which this Restrictive Covenant is recorded), or disposed off-site in accordance with applicable regulations; provided, however, that any excavated soils removed from the areas identified in Exhibit C and discussed in Section 3 below that cannot be put back in place **must** be disposed off-site in accordance with applicable regulations. Excavated soils shall be managed to minimize exposure to workers and other adults, including but not limited to the use of best management practices to control dust and surface water runoff; and to prevent exposure to children. Any activity on the Property that could interfere with the integrity of the Remedial Action and continued protection of human health and the environment is prohibited without prior written approval from the Department of Ecology.

Section 3: Protection of Residual Contaminants. The Owner shall not penetrate, alter, damage, remove or breach in any manner the durable, permeable, engineered material ("Cap") installed over contaminated soils at various places throughout the Property; nor remove or excavate any contaminated soils below the Cap in any manner that may result in the release of or exposure to hazardous substances without prior written approval from the Department of Ecology. Only plants with shallow roots that will not penetrate the Cap are allowed to be installed and maintained above the Cap. The locations of the Property where contaminated soil has a Cap over it, as well as the elevations and contours of the Caps themselves, are described in Exhibit C, attached hereto and incorporated herein by this reference.

Section 3.1: Cap Integrity: Specifically, the Owner shall not perform or allow any person to perform any of the following activities through or under the Cap:

a. drilling, digging, placement of any objects or use of any equipment which deforms or stresses the surface of the Cap beyond its load bearing capability, piercing the surface with a rod, spike or similar item; or

b. excavation or removal of loam, peat, sand, gravel, rock, or any other mineral or natural resource; or

c. planting of large trees or other vegetation the roots of which would breach the Cap; or

d. any other activity which penetrates, breaches, or disturbs the structural integrity of the Cap without first obtaining the express written consent of the Department of Ecology.

Section 3.2: Emergency or Accidental Damage to Cap. If it becomes necessary to excavate below or penetrate the Cap as part of a response to an emergency (e.g. repairing utility lines or responding to a fire or flood) or if the Cap is accidentally breached for any reason, the requirements of the previous subsection may be suspended, provided that the Owner:

a. notifies the Department of Ecology and Weyerhaeuser of such emergency or accident as soon as possible but no more than twenty-four hours after learning of such emergency or accident; and

b. notifies the Washington Office of Archaeology and Historical Preservation and the Nisqually Indian Tribe as soon as possible but no more than forty-eight hours after learning of such emergency or accident; and

c. limits the actual disturbance involved in such excavation or breach to the minimum reasonably necessary to adequately respond to the emergency.

Section 4: Change of Use. The Owner must notify and obtain approval from the Department of Ecology prior to any use of the Property that is inconsistent with the terms of this Restrictive Covenant. The Department of Ecology may approve any inconsistent use only after public notice and comment; provided however, in no event may any change in use be approved that would allow for residential uses, schools, daycares, parks, recreational uses, or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 5: Notice of Conveyance. The Owner must give thirty (30) days' advance written notice to the Department of Ecology of the Owner's intent to convey any interest in the Property. Within thirty (30) days of the date any instrument conveying a fee title interest is executed, grantor must provide the Department of Ecology with a certified true copy of the instrument and, if it has been recorded in the public land records, its recording reference. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Remedial Action.

Section 6: Leasehold Interests. The Owner must restrict leases to uses and activities consistent with this Restrictive Covenant and notify all lessees of the restrictions on the use of the Property.

Section 7: Recordation. Within thirty (30) days of the date of execution, the Owner shall record this Restrictive Covenant with the Pierce County Assessor's Office, and provide evidence of recordation to the Department of Ecology.

Section 8: Notice Requirement. The Owner shall include in any instrument conveying any interest in any portion of the Property, including but not limited to deeds, leases, and mortgages a notice which is in substantially the following form:

NOTICE: THE INTEREST CONVEYED HEREBY IS SUBJECT TO THE EFFECT OF A RESTRICTIVE COVENANT, DATED _____, RECORDED IN THE PUBLIC LAND RECORDS ON _____, IN BOOK _____, PAGE _____, IN FAVOR OF, AND ENFORCEABLE BY THE STATE OF WASHINGTON.

Section 9: Notices. Any notice, demand, request, consent, approval, or communication that either party desires or is required to give the other shall be in writing and shall be served personally or sent by first class mail postage prepaid, addresses as follows:

To Weyerhaeuser:

Director, Environmental Affairs
Mail Stop EC2 2C1
P.O. Box 9777
Federal Way, WA 98063-9777

To the Department of Ecology:

Washington State Department of Ecology
Toxics Cleanup Program
P.O. Box 47775
Olympia, WA 98504-7775

Section 10: Groundwater Withdrawal. The Owner of the Property must not permit withdrawal of groundwater from the Property for drinking water purposes, unless authorized by the Department of Ecology. Withdrawal of groundwater from monitoring wells for the purpose of extracting samples for analysis is expressly permitted.

Section 11: Access. The Owner shall allow authorized representatives of the Department of Ecology, E.I. DuPont de Nemours Company and Weyerhaeuser the right to enter the Property at reasonable times for the purpose of monitoring compliance with the terms of this Restrictive Covenant, `evaluating the Remedial Action; to take samples, to inspect remedial actions conducted at the Property, and to inspect records that are related to the Remedial Action.

Section 12: No Public Access and Use. No right of access or use by the general public to any portion of the Property is conveyed by this Restrictive Covenant.

Section 13: Enforcement. Weyerhaeuser, the E.I. DuPont de Nemours Company, and the Department of Ecology shall each have the right, but not the obligation, to enforce the terms of this Restrictive Covenant by resort to specific performance or any legal process; provided, however, that no provision of this Restrictive Covenant shall be construed or intended to impose any obligations, by law or by contract, on the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to take action to enforce said restrictions. Neither the right nor authority of the Department of Ecology and Weyerhaeuser and E.I. DuPont de Nemours

Company to enforce this Restrictive Covenant nor a decision made to exercise or not to exercise such authority to right shall give rise to any duty or responsibility on the party of the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to exercise or not exercise this right on behalf of any Party or other person or entity. All remedies available hereunder shall be in addition to any and all remedies at law or in equity, including MTCA. Any forbearance, delay or omission to exercise the enforcement rights under this Restrictive Covenant in the event of a breach of any term of this Restrictive Covenant shall not be deemed to be a waiver of such term or of any subsequent breach of the same or any other term, or of any of the rights under this Restrictive Covenant. Should legal counsel be employed to enforce this Restrictive Covenant, all costs incurred in such enforcement, including reasonable attorneys' fees shall be paid by the Owner found to be in violation.

Section 14: No Third Party Beneficiary. This Restrictive Covenant is intended for the sole and exclusive benefit of the Parties hereto and their respective successors and assigns, including all current and future owners of any portion or interest in the property. The Parties to this Restrictive Covenant expressly do not intend to benefit any other person or entity, and expressly do not intend to create any third-party beneficiaries to any provision of this Restrictive Covenant, including but not limited to any enforcement provisions.

Section 15: Run with the Land. To the extent that this Restrictive Covenant is construed as a restrictive covenant, it shall run with the land, and shall be binding on the Owners, their successors and assigns, of all or any portion of the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the property owner without adequate and complete provision for the continued observation of this Restrictive Covenant.

Section 16: Severability. Invalidation of any provision or application of a provision of this Restrictive Covenant by any court shall not affect any other provisions or applications.

Section 17: Easement in Gross. To the extent that this Restrictive Covenant creates a negative easement, it shall be construed as an easement in gross for the sole benefit of Weyerhaeuser Company, without whose consent it cannot be released, modified or amended.

Section 18: Reserved Rights. Weyerhaeuser reserves unto itself and its successors and assigns all rights and privileges in and to the use of the Property which are not incompatible with the restrictions, and rights granted herein.

Weyerhaeuser Company has caused this Restrictive Covenant to be signed in its name.

DECLARATION OF RESTRICTIVE COVENANT

HISTORICAL PROPERTY (WITH CAP)

This Declaration of Restrictive Covenant ("Restrictive Covenant") is made pursuant to RCW 70.105D.030(1)(f) and (g) and WAC 173-340-440 this _____ day of _____, 2006, by the Weyerhaeuser Company ("Weyerhaeuser"), its successors and assigns, and the State of Washington, Department of Ecology ("Department of Ecology"), and its successors and assigns.

The undersigned, Weyerhaeuser, covenants that it is the fee owner of real property in Pierce County, Washington, legally described in Exhibit A and depicted in Exhibit B, attached hereto and incorporated herein by this reference ("Property"). See Exhibit B for illustrative purpose only. For specific boundaries rely on above legal description.

The Property is within an area commonly referred to as "Parcel One" of the "Former DuPont Works Site" that was the subject of work to clean up the Property ("Remedial Action") under the Washington Model Toxics Control Act ("MTCA"), Chapter 70.105D RCW. The Remedial Action is described in the Consent Decree entered in *State of Washington, Department of Ecology v. Weyerhaeuser Company and E.I. DuPont de Nemours and Company* (Thurston County Cause No. 03-2-10484-7), in attachments to the Decree and in documents referenced in the Decree, including without limitation the Cleanup Action Plan attached to the Consent Decree as Exhibit A, and incorporated therein by reference. The Cleanup Action Plan is on file and available for inspection at the Washington State Department of Ecology, Toxics Cleanup Program, P.O. Box 47775, Olympia, WA 98504-7775. A legal description of Parcel One is attached as Exhibit C, and a nonbinding illustration of the site's boundaries is shown on Exhibit B.

This Restrictive Covenant is required because the Remedial Action resulted in residual concentrations at portions of the Property of hazardous substances which exceed the soil and groundwater cleanup levels specified in MTCA for unrestricted land uses.

Weyerhaeuser makes the following declaration as to limitations, conditions, restrictions, and uses to which the Property may be put and specifies that such declarations shall run with the land as provided by law and shall be binding on Weyerhaeuser, its successors and assigns, and any and all parties and persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereafter, "Owner").

Section 1: Restrictions on Use of Property. The Property is a culturally-significant site. Development and use of the Property, if any, (a) shall be subject to prior approval and express permission of the Washington Department of Archaeology and Historical Preservation, the Nisqually Indian Tribe and the Department of Ecology; (b) shall be only as allowed under the City of DuPont zoning regulations and Comprehensive Land Use Plan and under MTCA; and (c) shall in no event be developed and used for any of the following: residential uses, schools, daycares, parks, recreational uses, or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 2: Restrictions on Activities. The Owner may maintain the Property consistent with its preservation as a culturally-significant site. Notification of any excavation, whether accidental or authorized by the Department of Ecology, must be provided to the Department of Archaeological and Historical Preservation and the Nisqually Indian Tribe. Maintenance of any impervious surfaces is expressly permitted without notice so long as appropriate health and safety protocols are followed. For development activities permitted under this Restrictive Covenant, excavated soils must be managed properly and unless put back in place, must be either placed in an area within the boundaries of the Former DuPont Works Site (including but not limited to the parcel on which this Restrictive Covenant is recorded), or disposed off-site in accordance with applicable regulations; provided, however, that any excavated soils removed from the areas identified in Exhibit C and discussed in Section 3 below that cannot be put back in place **must** be disposed off-site in accordance with applicable regulations. Excavated soils shall be managed to minimize exposure to workers and other adults, including but not limited to the use of best management practices to control dust and surface water runoff; and to prevent exposure to children. Any activity on the Property that could interfere with the integrity of the Remedial Action and continued protection of human health and the environment is prohibited without prior written approval from the Department of Ecology.

Section 3: Protection of Residual Contaminants. The Owner shall not penetrate, alter, damage, remove or breach in any manner the durable, permeable, engineered material ("Cap") installed over contaminated soils at various places throughout the Property; nor remove or excavate any contaminated soils below the Cap in any manner that may result in the release of or exposure to hazardous substances without prior written approval from the Department of Ecology. Only plants with shallow roots that will not penetrate the Cap are allowed to be installed and maintained above the Cap. The locations of the Property where contaminated soil has a Cap over it, as well as the elevations and contours of the Caps themselves, are described in Exhibit C, attached hereto and incorporated herein by this reference.

Section 3.1: Cap Integrity: Specifically, the Owner shall not perform or allow any person to perform any of the following activities through or under the Cap:

a. drilling, digging, placement of any objects or use of any equipment which deforms or stresses the surface of the Cap beyond its load bearing capability, piercing the surface with a rod, spike or similar item; or

b. excavation or removal of loam, peat, sand, gravel, rock, or any other mineral or natural resource; or

c. planting of large trees or other vegetation the roots of which would breach the Cap; or

d. any other activity which penetrates, breaches, or disturbs the structural integrity of the Cap without first obtaining the express written consent of the Department of Ecology.

Section 3.2: Emergency or Accidental Damage to Cap. If it becomes necessary to excavate below or penetrate the Cap as part of a response to an emergency (e.g. repairing utility lines or responding to a fire or flood) or if the Cap is accidentally breached for any reason, the requirements of the previous subsection may be suspended, provided that the Owner:

a. notifies the Department of Ecology and Weyerhaeuser of such emergency or accident as soon as possible but no more than twenty-four hours after learning of such emergency or accident; and

b. notifies the Washington Office of Archaeology and Historical Preservation and the Nisqually Indian Tribe as soon as possible but no more than forty-eight hours after learning of such emergency or accident; and

c. limits the actual disturbance involved in such excavation or breach to the minimum reasonably necessary to adequately respond to the emergency.

Section 4: Change of Use. The Owner must notify and obtain approval from the Department of Ecology prior to any use of the Property that is inconsistent with the terms of this Restrictive Covenant. The Department of Ecology may approve any inconsistent use only after public notice and comment; provided however, in no event may any change in use be approved that would allow for residential uses, schools, daycares, parks, recreational uses, or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 5: Notice of Conveyance. The Owner must give thirty (30) days' advance written notice to the Department of Ecology of the Owner's intent to convey any interest in the Property. Within thirty (30) days of the date any instrument conveying a fee title interest is executed, grantor must provide the Department of Ecology with a certified true copy of the instrument and, if it has been recorded in the public land records, its recording reference. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Remedial Action.

Section 6: Leasehold Interests. The Owner must restrict leases to uses and activities consistent with this Restrictive Covenant and notify all lessees of the restrictions on the use of the Property.

Section 7: Recordation. Within thirty (30) days of the date of execution, the Owner shall record this Restrictive Covenant with the Pierce County Assessor's Office, and provide evidence of recordation to the Department of Ecology.

Section 8: Notice Requirement. The Owner shall include in any instrument conveying any interest in any portion of the Property, including but not limited to deeds, leases, and mortgages a notice which is in substantially the following form:

NOTICE: THE INTEREST CONVEYED HEREBY IS SUBJECT TO THE EFFECT OF A RESTRICTIVE COVENANT, DATED _____, RECORDED IN THE PUBLIC LAND RECORDS ON _____, IN BOOK _____, PAGE _____, IN FAVOR OF, AND ENFORCEABLE BY THE STATE OF WASHINGTON.

Section 9: Notices. Any notice, demand, request, consent, approval, or communication that either party desires or is required to give the other shall be in writing and shall be served personally or sent by first class mail postage prepaid, addresses as follows:

To Weyerhaeuser:

Director, Environmental Affairs
Mail Stop EC2 2C1
P.O. Box 9777
Federal Way, WA 98063-9777

To the Department of Ecology:

Washington State Department of Ecology
Toxics Cleanup Program
P.O. Box 47775
Olympia, WA 98504-7775

Section 10: Groundwater Withdrawal. The Owner of the Property must not permit withdrawal of groundwater from the Property for drinking water purposes, unless authorized by the Department of Ecology. Withdrawal of groundwater from monitoring wells for the purpose of extracting samples for analysis is expressly permitted.

Section 11: Access. The Owner shall allow authorized representatives of the Department of Ecology, E.I. DuPont de Nemours Company and Weyerhaeuser the right to enter the Property at reasonable times for the purpose of monitoring compliance with the terms of this Restrictive Covenant, `evaluating the Remedial Action; to take samples, to inspect remedial actions conducted at the Property, and to inspect records that are related to the Remedial Action.

Section 12: No Public Access and Use. No right of access or use by the general public to any portion of the Property is conveyed by this Restrictive Covenant.

Section 13: Enforcement. Weyerhaeuser, the E.I. DuPont de Nemours Company, and the Department of Ecology shall each have the right, but not the obligation, to enforce the terms of this Restrictive Covenant by resort to specific performance or any legal process; provided, however, that no provision of this Restrictive Covenant shall be construed or intended to impose any obligations, by law or by contract, on the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to take action to enforce said restrictions. Neither the right nor authority of the Department of Ecology and Weyerhaeuser and E.I. DuPont de Nemours

Company to enforce this Restrictive Covenant nor a decision made to exercise or not to exercise such authority to right shall give rise to any duty or responsibility on the party of the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to exercise or not exercise this right on behalf of any Party or other person or entity. All remedies available hereunder shall be in addition to any and all remedies at law or in equity, including MTCA. Any forbearance, delay or omission to exercise the enforcement rights under this Restrictive Covenant in the event of a breach of any term of this Restrictive Covenant shall not be deemed to be a waiver of such term or of any subsequent breach of the same or any other term, or of any of the rights under this Restrictive Covenant. Should legal counsel be employed to enforce this Restrictive Covenant, all costs incurred in such enforcement, including reasonable attorneys' fees shall be paid by the Owner found to be in violation.

Section 14: No Third Party Beneficiary. This Restrictive Covenant is intended for the sole and exclusive benefit of the Parties hereto and their respective successors and assigns, including all current and future owners of any portion or interest in the property. The Parties to this Restrictive Covenant expressly do not intend to benefit any other person or entity, and expressly do not intend to create any third-party beneficiaries to any provision of this Restrictive Covenant, including but not limited to any enforcement provisions.

Section 15: Run with the Land. To the extent that this Restrictive Covenant is construed as a restrictive covenant, it shall run with the land, and shall be binding on the Owners, their successors and assigns, of all or any portion of the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the property owner without adequate and complete provision for the continued observation of this Restrictive Covenant.

Section 16: Severability. Invalidation of any provision or application of a provision of this Restrictive Covenant by any court shall not affect any other provisions or applications.

Section 17: Easement in Gross. To the extent that this Restrictive Covenant creates a negative easement, it shall be construed as an easement in gross for the sole benefit of Weyerhaeuser Company, without whose consent it cannot be released, modified or amended.

Section 18: Reserved Rights. Weyerhaeuser reserves unto itself and its successors and assigns all rights and privileges in and to the use of the Property which are not incompatible with the restrictions, and rights granted herein.

Weyerhaeuser Company has caused this Restrictive Covenant to be signed in its name.

DECLARATION OF RESTRICTIVE COVENANT

HISTORICAL PROPERTY (WITH CAP)

This Declaration of Restrictive Covenant ("Restrictive Covenant") is made pursuant to RCW 70.105D.030(1)(f) and (g) and WAC 173-340-440 this _____ day of _____, 2006, by the Weyerhaeuser Company ("Weyerhaeuser"), its successors and assigns, and the State of Washington, Department of Ecology ("Department of Ecology"), and its successors and assigns.

The undersigned, Weyerhaeuser, covenants that it is the fee owner of real property in Pierce County, Washington, legally described in Exhibit A and depicted in Exhibit B, attached hereto and incorporated herein by this reference ("Property").

The Property is within an area commonly referred to as "Parcel One" of the "Former DuPont Works Site" that was the subject of work to clean up the Property ("Remedial Action") under the Washington Model Toxics Control Act ("MTCA"), Chapter 70.105D RCW. The Remedial Action is described in the Consent Decree entered in *State of Washington, Department of Ecology v. Weyerhaeuser Company and E.I. DuPont de Nemours and Company* (Thurston County Cause No. 03-2-10484-7), in attachments to the Decree and in documents referenced in the Decree, including without limitation the Cleanup Action Plan attached to the Consent Decree as Exhibit A, and incorporated therein by reference. The Cleanup Action Plan is on file and available for inspection at the Washington State Department of Ecology, Toxics Cleanup Program, P.O. Box 47775, Olympia, WA 98504-7775. The boundary of Parcel One is depicted in Exhibit B, attached hereto.

This Restrictive Covenant is required because the Remedial Action resulted in residual concentrations at portions of the Property of hazardous substances which exceed the soil and groundwater cleanup levels specified in MTCA for unrestricted land uses.

Weyerhaeuser makes the following declaration as to limitations, conditions, restrictions, and uses to which the Property may be put and specifies that such declarations shall run with the land as provided by law and shall be binding on Weyerhaeuser, its successors and assigns, and any and all parties and persons claiming under them, including all current and future owners of any portion of or interest in the Property (hereafter, "Owner").

Section 1: Restrictions on Use of Property. The Property is a culturally-significant site. Development and use of the Property, if any, (a) shall be subject to prior approval and express permission of the Washington Department of Archaeology and Historical Preservation, the Nisqually Indian Tribe and the Department of Ecology; (b) shall be only as allowed under the City of DuPont zoning regulations and Comprehensive Land Use Plan and under MTCA; and (c) shall in no event be developed and used for any of the following: residential uses, schools, daycares, parks, recreational uses, or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 2: Restrictions on Activities. The Owner may maintain the Property consistent with its preservation as a culturally-significant site. Notification of any excavation, whether accidental or authorized by the Department of Ecology, must be provided to the Department of Archaeological and Historical Preservation and the Nisqually Indian Tribe. Maintenance of any impervious surfaces is expressly permitted without notice so long as appropriate health and safety protocols are followed. For development activities permitted under this Restrictive Covenant, excavated soils must be managed properly and unless put back in place, must be either placed in an area within the boundaries of the Former DuPont Works Site, or disposed off-site in accordance with applicable regulations; provided, however, that any excavated soils removed from the area discussed in Section 3 below that cannot be put back in place **must** be disposed off-site in accordance with applicable regulations. Excavated soils shall be managed to minimize exposure to workers and other adults, including but not limited to the use of best management practices to control dust and surface water runoff; and to prevent exposure to children. Any activity on the Property that could interfere with the integrity of the Remedial Action and continued protection of human health and the environment is prohibited without prior written approval from the Department of Ecology.

Section 3: Protection of Residual Contaminants. The Owner shall not penetrate, alter, damage, remove or breach in any manner the durable, permeable, engineered material ("Cap") installed over contaminated soils on the entire Property; nor remove or excavate any contaminated soils below the Cap in any manner that may result in the release of or exposure to hazardous substances without prior written approval from the Department of Ecology. Only plants with shallow roots that will not penetrate the Cap are allowed to be installed and maintained above the Cap.

Section 3.1: Cap Integrity: Specifically, the Owner shall not perform or allow any person to perform any of the following activities through or under the Cap:

a. drilling, digging, placement of any objects or use of any equipment which deforms or stresses the surface of the Cap beyond its load bearing capability, piercing the surface with a rod, spike or similar item; or

b. excavation or removal of loam, peat, sand, gravel, rock, or any other mineral or natural resource; or

c. planting of large trees or other vegetation the roots of which would breach the Cap; or

d. any other activity which penetrates, breaches, or disturbs the structural integrity of the Cap without first obtaining the express written consent of the Department of Ecology.

Section 3.2: Emergency or Accidental Damage to Cap. If it becomes necessary to excavate below or penetrate the Cap as part of a response to an emergency (e.g. repairing utility lines or responding to a fire or flood) or if the Cap is accidentally breached for any reason, the requirements of the previous subsection may be suspended, provided that the Owner:

a. notifies the Department of Ecology and Weyerhaeuser of such emergency or accident as soon as possible but no more than twenty-four hours after learning of such emergency or accident; and

b. notifies the Washington Office of Archaeology and Historical Preservation and the Nisqually Indian Tribe as soon as possible but no more than forty-eight hours after learning of such emergency or accident; and

c. limits the actual disturbance involved in such excavation or breach to the minimum reasonably necessary to adequately respond to the emergency.

Section 4: Change of Use. The Owner must notify and obtain approval from the Department of Ecology prior to any use of the Property that is inconsistent with the terms of this Restrictive Covenant. The Department of Ecology may approve any inconsistent use only after public notice and comment; provided however, in no event may any change in use be approved that would allow for residential uses, schools, daycares, parks, recreational uses, or any other use in which the likelihood of children having sustained access to soils can be reasonably anticipated.

Section 5: Notice of Conveyance. The Owner must give thirty (30) days' advance written notice to the Department of Ecology of the Owner's intent to convey any interest in the Property. Within thirty (30) days of the date any instrument conveying a fee title interest is executed, grantor must provide the Department of Ecology with a certified true copy of the instrument and, if it has been recorded in the public land records, its recording reference. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the Owner without adequate and complete provision for continued monitoring, operation, and maintenance of the Remedial Action.

Section 6: Leasehold Interests. The Owner must restrict leases to uses and activities consistent with this Restrictive Covenant and notify all lessees of the restrictions on the use of the Property.

Section 7: Recordation. Within thirty (30) days of the date of execution, the Owner shall record this Restrictive Covenant with the Pierce County Assessor's Office, and provide evidence of recordation to the Department of Ecology.

Section 8: Notice Requirement. The Owner shall include in any instrument conveying any interest in any portion of the Property, including but not limited to deeds, leases, and mortgages a notice which is in substantially the following form:

NOTICE: THE INTEREST CONVEYED HEREBY IS SUBJECT TO THE EFFECT OF A RESTRICTIVE COVENANT, DATED _____, RECORDED IN THE PUBLIC LAND RECORDS ON _____, IN BOOK _____, PAGE _____, IN FAVOR OF, AND ENFORCEABLE BY THE STATE OF WASHINGTON.

Section 9: Notices. Any notice, demand, request, consent, approval, or communication that either party desires or is required to give the other shall be in writing and shall be served personally or sent by first class mail postage prepaid, addresses as follows:

To Weyerhaeuser:

Director, Environmental Affairs
Mail Stop EC2 2C1
P.O. Box 9777
Federal Way, WA 98063-9777

To the Department of Ecology:

Washington State Department of Ecology
Toxics Cleanup Program
P.O. Box 47775
Olympia, WA 98504-7775

Section 10: Groundwater Withdrawal. The Owner of the Property must not permit withdrawal of groundwater from the Property for drinking water purposes, unless authorized by the Department of Ecology. Withdrawal of groundwater from monitoring wells for the purpose of extracting samples for analysis is expressly permitted.

Section 11: Access. The Owner shall allow authorized representatives of the Department of Ecology, E.I. DuPont de Nemours Company and Weyerhaeuser the right to enter the Property at reasonable times for the purpose of monitoring compliance with the terms of this Restrictive Covenant, `evaluating the Remedial Action; to take samples, to inspect remedial actions conducted at the Property, and to inspect records that are related to the Remedial Action.

Section 12: No Public Access and Use. No right of access or use by the general public to any portion of the Property is conveyed by this Restrictive Covenant.

Section 13: Enforcement. Weyerhaeuser, the E.I. DuPont de Nemours Company, and the Department of Ecology shall each have the right, but not the obligation, to enforce the terms of this Restrictive Covenant by resort to specific performance or any legal process; provided, however, that no provision of this Restrictive Covenant shall be construed or intended to impose any obligations, by law or by contract, on the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to take action to enforce said restrictions. Neither the right nor

authority of the Department of Ecology and Weyerhaeuser and E.I. DuPont de Nemours Company to enforce this Restrictive Covenant nor a decision made to exercise or not to exercise such authority to right shall give rise to any duty or responsibility on the party of the Department of Ecology or Weyerhaeuser or E.I. DuPont de Nemours Company to exercise or not exercise this right on behalf of any Party or other person or entity. All remedies available hereunder shall be in addition to any and all remedies at law or in equity, including MTCA. Any forbearance, delay or omission to exercise the enforcement rights under this Restrictive Covenant in the event of a breach of any term of this Restrictive Covenant shall not be deemed to be a waiver of such term or of any subsequent breach of the same or any other term, or of any of the rights under this Restrictive Covenant. Should legal counsel be employed to enforce this Restrictive Covenant, all costs incurred in such enforcement, including reasonable attorneys' fees shall be paid by the Owner found to be in violation.

Section 14: No Third Party Beneficiary. This Restrictive Covenant is intended for the sole and exclusive benefit of the Parties hereto and their respective successors and assigns, including all current and future owners of any portion or interest in the property. The Parties to this Restrictive Covenant expressly do not intend to benefit any other person or entity, and expressly do not intend to create any third-party beneficiaries to any provision of this Restrictive Covenant, including but not limited to any enforcement provisions.

Section 15: Run with the Land. To the extent that this Restrictive Covenant is construed as a restrictive covenant, it shall run with the land, and shall be binding on the Owners, their successors and assigns, of all or any portion of the Property. No conveyance of title, easement, lease, or other interest in the Property shall be consummated by the property owner without adequate and complete provision for the continued observation of this Restrictive Covenant.

Section 16: Severability. Invalidation of any provision or application of a provision of this Restrictive Covenant by any court shall not affect any other provisions or applications.

Section 17: Easement in Gross. To the extent that this Restrictive Covenant creates a negative easement, it shall be construed as an easement in gross for the sole benefit of Weyerhaeuser Company, without whose consent it cannot be released, modified or amended.

Section 18: Reserved Rights. Weyerhaeuser reserves unto itself and its successors and assigns all rights and privileges in and to the use of the Property which are not incompatible with the restrictions, and rights granted herein.

Weyerhaeuser Company has caused this Restrictive Covenant to be signed in its name.
