WAC	Washington Administrative Code

Executive Summary

TerraGraphics Environmental Engineering, Inc. (TerraGraphics) teamed with Hart Crowser, Inc. (under contract with the Washington State Department of Ecology [Ecology]) to identify potential soil and/or groundwater contamination at the Pet Health Clinic, located in Sunnyside, Washington (Figure 1). Soil and groundwater sample results were compared to Washington's Model Toxics Control Act (MTCA) (Washington Administrative Code [WAC] 173-340) Method A unrestricted cleanup levels (Tables 740-1 and 720-1, WAC 173-340-900). The objective of this assessment was to delineate the full lateral and vertical extent of petroleum contamination at the subject property through soil sampling and groundwater monitoring events (which may result in future vapor sampling activities during the next groundwater sampling event) in order to guide remediation efforts. This document summarizes field activities and analytical data collected, and provides recommendations.

Soil Quality

Direct Push Sampling: Soil borings were advanced at eleven locations (BH-7 through BH-17, Figure 2) on November 11 and 12, 2013. A total of nine soil samples (including one duplicate sample) were collected from the soil borings based on field screening results using a portable MiniRae photo-ionization detector (PID). Samples were not collected from borings BH-15, BH-16, or BH-17 due to the lack of any evidence of petroleum impacts at those locations. Samples were collected from the zone with the highest PID reading. The analytical results indicate that two samples (including a duplicate sample) were above one or more of the MTCA Method A Unrestricted Soil Cleanup Levels. Detected concentrations (expressed in milligrams per kilogram [mg/kg]) are summarized in Table 1 and the sample above the cleanup level is listed below:

	ethylbenzene	total xylenes	naphthalene	gasoline range organics
BH-14 6' (mg/kg)	2.3	89.9	8.7	1,600
Cleanup Level (mg/kg)	6	9	5	30

Note: (the higher concentration of the original and duplicate is listed)

Groundwater

Two groundwater monitoring wells (MW-4 and MW-5) were installed as part of this assessment on November 12, 2013. A total of five water samples were collected from the monitoring wells (three from the preexisting MW-1, MW-2, and MW-3 wells; two from the newly installed MW-4 and MW-5 wells) on November 13, 2013. Two additional samples (including one duplicate) were collected on November 14, 2013 from a drinking water well located on the adjacent property to the north. Analytes detected in two of the seven water samples (including the duplicate) were above the respective Method A Cleanup Levels. Detected concentrations

(expressed in micrograms per liter [$\mu\text{g}/\text{L}$]) are summarized in Table 2 and those samples above the cleanup levels are listed below:

	benzene	1,2-dichloroethane	gasoline range organics	heavy oil
MW-2 ($\mu\text{g}/\text{L}$)	70	NA	2,400	2,510
MW-3 ($\mu\text{g}/\text{L}$)	230	49	16,000	16,000
Cleanup Level ($\mu\text{g}/\text{L}$)	5	5	800	2,000

Notes:

- 1) MW-2 did not exceed the 1,2-dichloroethane cleanup level
- 2) Heavy oil concentration is the sum of the diesel range organics and motor oil

Vapor Intrusion

One or more petroleum constituents at wells MW-2, MW-3, and MW-4 exceed the MTCA Method B Table B-1 Unrestricted Groundwater Screening Levels for Vapor Intrusion, indicating that groundwater is a potential source for vapor intrusion.

Summary and Recommendations

This investigation confirmed that petroleum-impacted soil and groundwater are present at the site. The greatest soil and groundwater impacts appear to be near the former underground storage tanks (USTs) west of the Pet Health Clinic building. Groundwater flow varies in direction from the northwest, northeast, and southeast at a calculated average gradient of 0.013 ft/ft toward the northeast. This flow direction conflicts with historical data which suggested a gradient toward the southeast.

Based on the available information and site-specific data collected, TerraGraphics concludes the following:

- Soil and groundwater petroleum hydrocarbons exceed MTCA A Cleanup Levels.
- The presence of diesel range organics, 1,2-dichloroethane, and gasoline range organics indicate that a release likely occurred from both the former heating oil UST and the former gasoline UST. Although diesel results may be biased high because of gasoline interferences.
- Petroleum impacted soils on the site are estimated at 2,400 cubic yards. This calculation is based on the estimated extent of soil exceeding the MTCA A Cleanup Level for Gasoline Range Organics or benzene and a depth range from 0 to 15 feet bgs.
- Petroleum impacted soil and groundwater are likely present under the Pet Health building to the east of the form tanks..

Based on the available information and site-specific data collected, TerraGraphics recommends the following:

- Perform a Tier 1 Vapor Assessment by conducting outdoor ambient, indoor ambient, and sub-slab vapor sampling to estimate the strength of the potential vapor intrusion source.
- Implement a remediation strategy following additional vapor sampling activities.
- Continue groundwater monitoring program.

Section 1.0 Introduction

The Pet Health Clinic property (hereinafter, referred to as the site) is located at 2210 East Edison Avenue, Sunnyside, Washington (Figure 1). The site currently operates as a veterinary clinic and has one main building, asphalt covered parking on the east, gravel covered parking on the west, and grass/landscaping covering the other areas of the property (Figure 2).

TerraGraphics Environmental Engineering, Inc. (TerraGraphics) teamed with Hart Crowser, Inc. (under contract with the Washington State Department of Ecology [Ecology]) to identify potential soil and/or groundwater contamination at the site.

1.1 Notable Site Features

The Pet Health Clinic building and adjacent home (Querin residence) were constructed at the same time prior to 1960. The drinking water well historically serviced both the Pet Health Clinic building and the Querin home. In 1960 or sometime thereafter, the property was subdivided and while the Pet Health Clinic building received a new water connection to the city service, the Querin residence and irrigation remained connected to the drinking water well. In addition a septic drain field is located in front of the clinic building (Figure 2). Utilities including water, communications, and natural gas trend parallel to Edison Avenue along the southern edge of the property boundary.

1.2 Site History

Two underground storage tanks (USTs) were used historically to fuel company vehicles and to supply heating oil for the clinic building. In 1992, a 500-gallon gasoline UST was removed and petroleum odors were observed in surrounding soils. A 500-gallon heating oil tank located just west of the clinic building was removed in 1994. A subsequent investigation of the subsurface soils indicated concentrations of gasoline- and diesel-range petroleum hydrocarbons above Model Toxics Control Act (MTCA) Method A Unrestricted Cleanup Levels (Table 740-1), along with visual evidence of tank failure. Groundwater was not sampled during tank removal activities, but was present at depths of approximately 5 feet to 7 feet below ground surface (bgs).

1.3 Previous Assessment Activities

TerraGraphics completed an environmental assessment at the site in December 2011 (TerraGraphics 2011). Site investigation activities confirmed that soil concentrations exceeded MTCA Method A cleanup levels. The full lateral extent of petroleum-impacted soil likely extended beyond the assessment boundaries.

During the 2011 assessment, soil borings were advanced at six locations (BH-1 through BH-6) on December 8 and 9, 2011. A total of six soil samples were collected from the soil borings based on field screening results using a portable MiniRae® photo-ionization detector (PID). Samples were collected from the zone with the highest PID reading. The analytical results indicate that four of the six samples contained petroleum hydrocarbons at concentrations above one or more of the MTCA Method A Unrestricted Soil Cleanup Levels. It should be noted that

the diesel range organics result is due primarily to a mixture of gasoline range product and weathered diesel fuel as indicated by the analytical laboratory. Detected concentrations (expressed in milligrams per kilogram [mg/kg]) above the cleanup levels are listed below:

- BH-2 5 ft
 - benzene = 1.0 mg/kg, Cleanup Level = 0.03 mg/kg.
 - total xylenes = 13.8 mg/kg, Cleanup Level = 9 mg/kg.
 - gasoline range organics = 130 mg/kg, Cleanup Level = 30 mg/kg.
- BH-3 6 ft
 - benzene = 4.9 mg/kg, Cleanup Level = 0.03 mg/kg.
 - toluene = 60 mg/kg, Cleanup Level = 7 mg/kg.
 - ethylbenzene = 28 mg/kg, Cleanup Level = 6 mg/kg.
 - total xylenes = 164 mg/kg, Cleanup Level = 9 mg/kg.
 - naphthalene = 6.4 mg/kg, Cleanup Level = 5 mg/kg.
 - gasoline range organics = 2,200 mg/kg, Cleanup Level = 30 mg/kg.
 - diesel range organics = 2,200 mg/kg, Cleanup Level = 2,000 mg/kg.
- BH-4 11 ft
 - benzene = 0.06 mg/kg, Cleanup Level = 0.03 mg/kg.
- BH-5 6 ft
 - benzene = 0.067 mg/kg, Cleanup Level = 0.03 mg/kg.

Three groundwater monitoring wells (MW-1, MW-2, and MW-3) were installed on December 8 and 9, 2011. A total of four water samples, including one duplicate, were collected from the monitoring wells on December 15, 2011. Analytes detected in two of the three water samples were above the respective Method A Cleanup Levels. It should be noted that the diesel and oil range organics results were due primarily to a mixture of gasoline range product and weathered diesel fuel as indicated by the analytical laboratory. Detected concentrations (expressed in micrograms per liter [$\mu\text{g}/\text{L}$]) above the screening levels are listed below:

- MW-2
 - benzene = 120 $\mu\text{g}/\text{L}$, Cleanup Level = 5 $\mu\text{g}/\text{L}$.
 - total xylenes = 1,360 $\mu\text{g}/\text{L}$, Cleanup Level = 1,000 $\mu\text{g}/\text{L}$.
 - gasoline range organics = 7,800 $\mu\text{g}/\text{L}$, Cleanup Level = 800 $\mu\text{g}/\text{L}$.
 - diesel range organics = 2,100 $\mu\text{g}/\text{L}$, Cleanup Level = 500 $\mu\text{g}/\text{L}$.
- MW-3
 - benzene = 1,700 $\mu\text{g}/\text{L}$, Cleanup Level = 5 $\mu\text{g}/\text{L}$.
 - total xylenes = 1,740 $\mu\text{g}/\text{L}$, Cleanup Level = 1,000 $\mu\text{g}/\text{L}$.
 - 1,2-dichloroethane = 130 $\mu\text{g}/\text{L}$, Cleanup Level = 5 $\mu\text{g}/\text{L}$.
 - gasoline range organics = 11,000 $\mu\text{g}/\text{L}$, Cleanup Level = 800 $\mu\text{g}/\text{L}$.
 - diesel range organics = 21,000 $\mu\text{g}/\text{L}$, Cleanup Level = 500 $\mu\text{g}/\text{L}$.
 - motor oil = 3,000 $\mu\text{g}/\text{L}$, Cleanup Level = 500 $\mu\text{g}/\text{L}$.

The 2011 investigation confirmed that petroleum-impacted soil and groundwater are present at the site. The greatest soil and groundwater impacts appeared to be near the former USTs west of the Pet Health Clinic building. Groundwater flow was calculated in 2011 toward the southeast at a gradient of 0.008 ft/ft which indicated the potential for migration to the southeast under the Pet Health Clinic building and toward East Edison Avenue.

Based on the available information and site-specific data collected in 2011, TerraGraphics concluded the following:

- Soil and groundwater petroleum hydrocarbons exceeded MTCA A Cleanup Levels.
- The extent of petroleum impacted soil and groundwater had not been fully characterized to the south and to the southeast of the former USTs.
- The presence of diesel range organics, 1,2-dichloroethane, and gasoline range organics indicated that a release likely occurred from both the former heating oil UST and the former gasoline UST. Although diesel results may be biased high because of gasoline interferences.

Based on the available information and site-specific data collected in 2011, TerraGraphics recommended the following:

- Evaluate potential downgradient migration to the south and southeast of the site through additional borings, soil samples, monitoring wells, and groundwater sampling.
- Sample the drinking water well from the adjacent property to the north (Querin residence) to investigate petroleum impacts to this extent.
- Utilize a multiparameter flow cell to more accurately characterize the groundwater field parameters.
- Use information obtained during additional characterization to determine most suitable remediation approach.
- Implement a remediation strategy following the remedial alternatives evaluation.

1.4 2013 Site Assessment Activities

In August 2013, Ecology requested additional site assessment and cleanup support. Ecology contracted Hart Crowser, Inc. and TerraGraphics to perform additional site assessment and characterization activities. The objective of this supplemental assessment is to provide additional assessment to delineate the full extent of petroleum contamination at the Site to support selection and design of remedial actions. The results from the 2013 supplemental site assessment activities are presented in the Supplemental Environmental Site Assessment Report herein.

Section 2.0 Field Activities

In general, sampling procedures followed the Sampling and Analysis Plan (SAP) for Site Assessment at the Pet Health Clinic, Sunnyside, Washington (TerraGraphics 2011) except for the following change:

- Two groundwater monitoring wells were installed instead of three. Only two additional wells were needed since a network of 5 wells sufficiently bounded the observed groundwater plume. In addition, the presence of the drain field prevented monitoring well MW-4 from being placed any further south near the property boundary

2.1 Soil Sampling

A total of eleven borings were completed on November 11 and 12, 2013 (BH-7 through BH-17). Samples were not collected from borings BH-15, BH-16, or BH-17 due to the lack of any evidence of petroleum impacts at those locations. See Figure 2 for the soil boring locations. Photographs were taken during the soil boring process, and are included as Appendix A. Borings were advanced using a track-mounted AMS PowerProbe™ utilizing a single tube Geoprobe® 2-inch diameter 5-foot length macro-core barrel driven in 5-foot increments (e.g., 0-5 feet, 5-10 feet, 10-15 feet, etc.) to the target depth of the borehole. A new Geoprobe® macro-core liner was used to collect each sample interval. All soil samples were screened in the field using a portable MiniRae® PID to check for the presence of volatile organic compounds.

A total of nine soil samples (including one duplicate sample) were collected based on the highest PID reading and sent to Test America Labs in Seattle, Washington. The samples were analyzed for the following:

- Benzene, toluene, ethylbenzene, total xylenes, and naphthalene (BTEXN) by US Environmental Protection Agency (USEPA) Method 8260B (USEPA 1992);
- Methyl tert-butyl ether (MTBE) using USEPA Method 8260B (USEPA 1992);
- Tertiary-butyl alcohol (TBA) by USEPA Method 8260B (USEPA 1992);
- Tertiary-amyl methyl ether (TAME) by USEPA Method 8260B (USEPA 1992);
- Ethyl tertiary-butyl ether (ETBE) by USEPA Method 8260B (USEPA 1992);
- Ethylene dibromide (EDB) by USEPA Method 8260B (USEPA 1992);
- 1,2-dichloroethane (EDC) using USEPA Method 8260B (USEPA 1996);
- Total Petroleum Hydrocarbons-Gasoline Range Organics (TPH-Gx) using Ecology's Analytical Methods for Petroleum Hydrocarbons (Ecology 1997);
- Total Petroleum Hydrocarbons-Diesel and Oil Range Organics (TPH-Dx) using Ecology's Analytical Methods for Petroleum Hydrocarbons (Ecology 1997); and
- Total recoverable lead using USEPA Method 200.8/6020 (USEPA 1994).

Complete laboratory data sheets and chain-of-custody documentation are included as Appendix B.

2.2 Groundwater Sampling

Two groundwater monitoring wells were installed on November 12, 2013 (MW-4 and MW-5) (see Figure 2, and boring logs in Appendix C). The top of casing of each groundwater monitoring well was surveyed by a Washington licensed surveyor, Gray Surveying and Engineering Inc., in NAVD88 datum in the State Plane Projection, converted and expressed as elevation in feet above mean level (famsl). Wells were constructed of 2-inch schedule 40 poly-vinyl chloride pre-pack assemblies. The screened interval was placed to ensure that the maximum water table fluctuations are fully captured by the screen while still maintaining a sufficient well seal. Screen intervals were placed from 6 to 11 feet bgs and are noted on the boring logs. Wells were developed using over-purge methods until groundwater quality stabilized (ph, conductivity, temperature, dissolved oxygen, and oxidation/reduction potential). Groundwater samples were collected using a low-flow peristaltic pump. New peristaltic tubing was used to collect water from each groundwater monitoring well.

Prior to collecting samples from the drinking well, water was purged to the grass for approximately 30 minutes using water pressure from the faucet instead of a peristaltic pump. New tubing was placed several feet down the spigot pipe. The outside diameter of the new tubing fit tightly into the inside diameter of the spigot pipe and sealed off the water allowing it to pass only through the interior tubing.. When water parameters were stable, the samples were collected.

A total of five water samples were collected from the monitoring wells (three from the preexisting MW-1, MW-2, and MW-3 wells; two from the newly installed MW-4 and MW-5 wells) on November 13, 2013. Two additional drinking water samples were collected (including one duplicate) on November 14, 2013. All seven samples were labeled and placed in a cooler on ice for transportation to Test America along with the chain-of-custody documentation.

The samples were analyzed for the following:

- BTEXN by (USEPA) Method 8260B (USEPA 1992);
- MTBE using USPEA Method 8260B (USEPA 1992);
- TBA by USEPA Method 8260B (USEPA 1992);
- TAME by USEPA Method 8260B (USEPA 1992);
- ETBE by USEPA Method 8260B (USEPA 1992);
- EDB by USEPA Method 8260B (USEPA 1992);
- EDC using USEPA Method 8260B (USEPA 1996);
- TPH-Gx using Ecology's Analytical Methods for Petroleum Hydrocarbons (Ecology 1997);
- TPH-Dx using Ecology's Analytical Methods for Petroleum Hydrocarbons (Ecology 1997); and
- Total recoverable lead using USEPA Method 200.8/6020 (USEPA 1994);
- Natural attenuation parameters (including nitrates, manganese, sulfate, ferrous iron and alkalinity) using USEPA Methods 300.0/9056 (USEPA 2007a), 200.7/6010 (USEPA 2007b), 200.8/6020 (USEPA 1994), and 310.1/2320B (USEPA 1978);
- Total Suspended Solids using Standard Method 2540D (1997)

Complete laboratory data sheets and chain-of-custody documentation are included as Appendix B.

Section 3.0 Results

The data quality objectives as set forth in the Sampling and Analysis Plan (SAP) (TerraGraphics, 2011) have been achieved. As a result, no data were reduced and the final completeness of the study was assessed at 100%. The following sections summarize the soil and groundwater analytical results.

3.1 Soil Sample Analysis

Petroleum hydrocarbon concentrations in two (including one duplicate) of the nine soil samples collected were above one or more of the Method A Unrestricted Cleanup Levels. Detected concentrations (expressed in mg/kg) are summarized in Table 1, and those above the cleanup levels are summarized below:

	ethylbenzene	total xylenes	naphthalene	gasoline range organics
BH-14 6' (mg/kg)	2.3	89.9	8.7	1,600
Cleanup Level (mg/kg)	6	9	5	30

Note: the higher concentration of the original and duplicate is listed

Although many constituents were not detected, a few constituents (benzene, EDC, and EDB) had detection limits that exceeded their respective cleanup levels as indicated in Table 1. However, these sample locations (BH-14) had other constituents that were detected well above their respective cleanup levels.

In addition to these analytical results other boring locations that exhibited petroleum impacts (primarily gasoline) are indicated by PID readings and staining noted in the borings logs.

3.1.1 Estimated Volume of Petroleum Impacted Soil

Petroleum impacted soil appears to be greatest to the north of the Pet Health Clinic building in close proximity to the former USTs, as indicated by the analytical results from soil boring BH-14. Previous assessment also showed significant petroleum impacted soil at BH-3, located southwest of the former USTs. The vertical extent of impacted soil extends from approximately 1 feet bgs to 10 feet bgs with the highest concentration of contaminants observed at the groundwater interface (approximately 6 feet bgs). At two boring locations (BH-2 and BH-3) petroleum impacts extended to 15 feet bgs.

The lateral extent of petroleum impacted soil has been bounded to the north, east, west and south. Along the southeastern edges it appears to extend beneath the Pet Health Clinic Building.

Figure 3 shows a map of benzene and gasoline range organics soil concentrations expressed in mg/kg that provide a display of the lateral extent of petroleum impacted soils that exceed their respective cleanup levels.

Using a conservative approach, an estimate of the petroleum impacted soil was calculated using a depth range of 1 to 15 feet bgs and a lateral extent as interpreted from either the gasoline range organics or benzene concentrations that exceed their respective cleanup levels. Petroleum impacted soil volumes are estimated at 2,400 cubic yards including overburden (un-impacted soil from 0 to 1 feet bgs).

3.2 Groundwater Sample Analysis

Water quality field parameter data were collected during the groundwater purging process prior to sample collection. Field parameters include temperature, pH, specific conductance, dissolved oxygen, and oxidation-reduction potential. These parameters provide information on the water chemistry and are used as stabilization criteria. The stabilization criteria were used to indicate that the well has been sufficiently purged and that the extracted groundwater is representative of the groundwater from the aquifer. Appendix D Table 4 lists the field parameter data.

A total of five water samples were collected from the monitoring wells (three from the preexisting MW-1, MW-2, and MW-3 wells; two from the newly installed MW-4 and MW-5 wells) on November 13, 2013. Two additional drinking water samples were collected (including one duplicate) on November 14, 2013. Analytes detected in two of the seven water samples (including the duplicate) were above their respective Method A Cleanup Levels. Detected concentrations are summarized in Table 2 and those above the screening levels are listed below:

	benzene	1,2-dichloroethane	gasoline range organics	Heavy oil
MW-2 ($\mu\text{g/L}$)	70	NA	2,400	2,510
MW-3 ($\mu\text{g/L}$)	230	49	16,000	16,000
Cleanup Level ($\mu\text{g/L}$)	5	5	800	2,000

Notes:

- 1) MW-2 did not exceed the 1,2-dichloroethane cleanup level
- 2) Heavy oil concentration is the sum of the diesel range organics and motor oil

Petroleum impacted groundwater appears to be greatest west of the Pet Health Clinic building in close proximity to the former USTs, as indicated by the analytical results from groundwater monitoring wells MW-2 and MW-3 (Figure 4). In addition, during sampling these wells exhibited petroleum impacts (primarily gasoline) including a slight sheen and odor (see Appendix D). The presence of diesel range organics, EDC (likely the result of a lead scavenger additive that was used up until the late 1980's), and gasoline range organics indicate that a release likely occurred

from both the former heating oil UST and the former gasoline UST. Although diesel results may be biased high because of gasoline interferences. Petroleum hydrocarbons were not detected in significant amounts at wells MW-1, MW-4 or MW-5. Elevated petroleum constituents are present at monitoring well MW-3 and based upon the groundwater elevations (discussed in Section 3.4) this appears to be an upgradient well. However, 2011 sampling results show that MW-3 is a downgradient well. MW-3 is also in close proximity to BH-3 (the soil boring with the highest gasoline detection and may indicate that the impacted soils extend soil towards MW-3. Future groundwater sampling will help define the potential temporal and spatial trends in order to clarify this discrepancy.

3.3 Vapor Intrusion

Groundwater results from the 2011 and 2013 assessments were compared to MTCA Method B Unrestricted (residential) Table B-1 Groundwater Screening Levels. One or more petroleum constituents at wells MW-2, MW-3, and MW-4 exceed the screening levels (Table 2) indicating the potential for groundwater to be a vapor intrusion source and could lead to unacceptable indoor air levels.

3.4 Geology and Hydrogeology

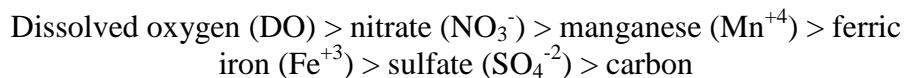

In general, the site lithology consists of silts and silty sands from 0 feet to 15 feet bgs with occasional clay layers (1-2 feet thick) from 7 to 15 feet bgs. Groundwater was encountered at the site at approximately 6 feet bgs. More detailed information of the subsurface conditions can be found in the boring logs included as Appendix C.

Depth to water was measured in each groundwater monitoring well prior to groundwater sampling activities. Groundwater elevations were calculated by subtracting the depth to water measurement from the top of casing elevation (expressed in famsl). Groundwater elevations ranged from 744.61 famsl at MW-4 to 746.36 famsl at MW-3 (Table 2). Groundwater flow varies in direction from the northwest, northeast, and southeast at a calculated average gradient of 0.013 ft/ft toward the northeast (Figure 5). This flow direction conflicts with historical data which suggested a gradient toward the southeast. Groundwater elevations are highest at MW-3 and appear to flow away from MW-3 toward all other monitoring points. This apparent mounding at MW-3 is an uncommon feature in unconfined shallow groundwater systems and suggests the possibility that the variability is due to seasonal irrigation or from other water sources (e.g. leaking from buried water line). A temporal distribution will be established through future groundwater monitoring activities and will help to quantify this potential seasonal variability and the dominant flow directions.

3.5 Natural Attenuation Analysis

The effectiveness of natural attenuation as an acceptable remedial measure is based upon decreasing contaminant concentrations in groundwater together with a stable or receding contaminant plume. Additional supporting geochemical data trends can also be indicative of biodegradative processes in groundwater. General geochemical and water quality parameters were collected and results are located in Tables 3 and 4 respectively.

The geochemical parameters selected for monitoring are based upon the sequential use of terminal electron acceptors (TEAs) as microorganisms consume petroleum contaminants in the plume. TEAs and the sequence of use are:

The use of a specific TEA is closely related to the oxidation-reduction potential (ORP) of the groundwater. The more reducing the groundwater conditions, the greater the depletion of the available electron acceptors. Monitoring wells MW-2, MW-3, and MW-4 have negative ORPs and therefore are under reducing conditions.

Natural attenuation parameters collected during this sampling event serve as a baseline measurement to which future measurements will be compared to. Once multiple data sets are available through ongoing groundwater monitoring, temporal and spatial relationships can be established to assist in evaluating natural attenuation of remaining hydrocarbons.

3.6 Data Evaluation

Data quality objectives and criteria were outlined in Section 4.0 of the SAP/QAPP (TerraGraphics 2013). TerraGraphics reviewed field documentation, results of field and laboratory quality assurance/quality control (QA/QC) samples, and data reported by the laboratory to ensure that the data had been recorded, transmitted, and processed correctly, and to determine that data quality objectives were met.

3.6.1 Sample Preservation & Holding Time

For groundwater, sample holding times were exceeded for nitrate (samples MW-1, MW-2, MW-3, MW-4, and MW-5), and benzene, ethylbenzene, total xylenes, naphthalene, toluene, and EDC (sample MW-3). For soil, sample holding times were exceeded for volatile organic compounds (VOCs) (samples BH-7-8', BH-8-6' BH-9-5', BH-10-6', BH-11-5', BH-12-6', BH-13-6', BH-14-6', and BH-14D-6'). These samples have been J qualified as estimates.

All sample holding times that exceed lab specifications have been qualified as estimates (with a J flag). Since the samples were delivered to lab beyond the 48 hour hold time the lab was not able to process the samples within the specified holding time. The sample results may be biased slightly low and are acceptable for use as qualified.

Preservation requirements were met for all samples. TerraGraphics delivered samples on ice to Test America Labs and sample receiving documentation indicates the cooler temperature upon delivery was 0.1°C for groundwater samples and 0.4°C for soil samples, which is within the temperature requirements specified in the SAP/QAPP (TerraGraphics 2013).

3.6.2 Data Tracking and Field Documentation

Collection dates and times for all samples were recorded in a field logbook. Samples submitted for laboratory analysis were recorded on a chain-of-custody form, which was completed and checked before samples were delivered to the lab.

3.6.3 Accuracy

Accuracy was assessed based on percent recoveries of laboratory control sample (LCS) analyses. The required frequency of LCS sample analysis was met. All LCS percent recoveries were within the acceptable range.

3.6.4 Precision

Precision was assessed based on relative percent difference (RPD) of a laboratory LSC duplicate. The required frequency of laboratory duplicates or LCS duplicates and RPD range were met. No data were qualified based on laboratory duplicate analysis.

A field duplicate was collected to examine variability in field procedures. One soil field duplicate was collected immediately after the original sample was collected at borehole BH-14-6'. The calculated RPDs for soil results where both results were above the reporting limit are as follows:

- ethylbenzene (56%) is above the SAP/QAPP requirement (<50%) and is J qualified as estimated;
- total xylenes (57%) is above the SAP/QAPP requirement (<50%) and is J qualified as estimated;
- naphthalene (42%) is below the SAP/QAPP requirement (<50%) and is not qualified;
- gasoline range organics (59%) is above the SAP/QAPP requirement (<50%) and is J qualified as estimated; and
- diesel range organics (98%) is above the SAP/QAPP requirement (<50%) and is J qualified as estimated.

One groundwater field duplicate was collected immediately after the original sample was collected at well DW. All results for the original groundwater sample and the field duplicate sample analyses were below the laboratory reporting limits and no qualifiers were placed on the groundwater data based on these results.

3.6.5 Data Comparability

Soil and groundwater samples were collected and analyzed using current accepted methods and procedures. All results are usable and are suitable for comparison with past or future laboratory data collected at this site.

3.6.6 Data Completeness

The final completeness for the study is assessed at 100%. Based on a complete review of the field QA/QC sample results and the laboratory's QA/QC sample results, the dataset for the Pet Health Clinic site sampling is determined to be of usable quality.

The final completeness for the study is assessed at 100%.

Section 4.0 Summary

This investigation confirmed that petroleum-impacted soil and groundwater are present at the site. The greatest soil and groundwater impacts appear to be near the former underground storage tanks (USTs) west of the Pet Health Clinic building. The greatest soil impacts appear to be near the former USTs as indicated by the previous analytical results from borings BH-2 and BH-3 and the current analytical results from boring BH-14. The vertical extent of impacted soil is from 1-foot bgs to 10 feet bgs with the highest analyte concentrations at approximately 6 feet bgs. Near the former UST impacts are observed to 15 feet bgs. Groundwater is impacted to the extent of MW-2 and MW-3 in close proximity to the former USTs. Groundwater flow varies in direction from the northwest, northeast, and southeast at a calculated average gradient of 0.013 ft/ft toward the northeast. This flow direction conflicts with historical data which suggested a gradient toward the southeast.

One or more petroleum constituents at wells MW-2, MW-3, and MW-4 exceed MTCA Method B Table B-1 Unrestricted Groundwater Screening Levels for Vapor Intrusion indicating the potential for groundwater to be a vapor intrusion source and could lead to unacceptable indoor air levels.

Section 5.0 Conclusions and Recommendations

Based on the information obtained during these site assessment activities, remedial action is recommended at the site. Conclusions and recommendations are summarized in the following sections.

5.1 Conclusions

Based on the available information and site-specific data collected, TerraGraphics concludes the following:

- Soil and groundwater petroleum hydrocarbons exceed MTCA A Cleanup Levels.
- The presence of diesel range organics, 1,2-dichloroethane, and gasoline range organics indicate that a release likely occurred from both the former heating oil UST and the former gasoline UST. Although diesel results may be biased high because of gasoline interferences.
- Petroleum impacted soils on the site are estimated at 2,400 cubic yards. This calculation is based on the estimated extent of soil exceeding the MTCA A Cleanup Level for Gasoline Range Organics or benzene and a depth range from 0 to 15 feet bgs.
- Petroleum impacted soil and groundwater are likely present under the Pet Health building to the east of the former tanks.
- There is potential for a vapor intrusion risk based on groundwater concentrations.

5.2 Recommendations

Based on the available information and site-specific data collected, TerraGraphics recommends the following:

- Perform a Tier 1 Vapor Assessment by conducting outdoor ambient, indoor ambient, and sub-slab vapor sampling to estimate the strength of the potential vapor intrusion source.
- Implement a remediation strategy following additional vapor sampling activities
- Continue groundwater monitoring program.

Notes:

all concentrations reported in mg/kg = milligrams per kilogram

GRO = Gasoline Range Organics analyzed by Method NWTTPH-Gx

DRO = Diesel Range Organics analyzed by Method NWTTPH-Dx

MTBE = methyl tert-butyl ether

EDC = 1,2-dichloroethane

EDB = ethylene dibromide

< = less than the method detection limit

ETBE = Ethyl tert-Butyl Ether

TAME = Tert-amyl methyl ether

TBA = Tert-butyl alcohol

bgs = below ground surface

Concentrations in **BOLD** are above the Screening Levels as defined by Washington's Model Toxics Control Act (MTCA) (WAC 173-340)

Method A unrestricted cleanup levels (Table 740-1, WAC 173-340-900).

* = gasoline mixtures without benzene and the total of ethylbenzene, toluene, and xylenes are less than 1% of the gasoline mixture then cleanup level is 100 mg/kg, all other gasoline mixtures then cleanup level is 30 mg/kg.

**= summation of DRO and Motor Oil values. 1/2 detection limit used where necessary in summation of heavy oil concentrations.

***= reporting limit exceeds the cleanup level.

m+p-Xylene and o-Xylene results were added to represent Total Xylene concentration and compared to Total Xylene Cleanup Level.

J = reported result was flagged "J" because it is an estimated value.

B = reported result was flagged "B" because the compound was found in the blank and sample.

For EDC a MTCA Method A Cleanup Level has not been established therefore the MTCA Method B Cleanup Level is listed which was established based on the leaching pathway (protective of groundwater).

- = no value established.

Y = reported result was flagged "Y" because the result is resembles a typical fuel pattern as indicated by the analytical laboratory.

Notes:

NS = Not sampled.

NA = Not applicable.

famsl = feet above mean sea level

all concentrations reported in µg/L = micrograms per Liter

GRO = Gasoline Range Organics analyzed by Method NWTPH-Gx

DRO = Diesel Range Organics analyzed by Method NWTPH-Dx

MTBE = methyl tert-butyl ether

EDC = 1,2-dichloroethane

EDB = ethylene dibromide

ETBE = Ethyl tert-Butyl Ether

TAME = Tert-amyl methyl ether

TBA = Tert-butyl alcohol

< = less than the method detection limit

Concentrations in **BOLD** are above the Screening Levels as defined by Washington's Model Toxics Control Act (MTCA) (WAC 173-340)

Method A cleanup levels (Table 720-1, WAC 173-340-900)

m+p-Xylene and o-Xylene results were added to represent Total Xylene concentration and compared to Total Xylene Cleanup Level.

* = cleanup level when benzene is present 800 µg/L , and 1,000 µg/L when there is no detectable benzene present.

**= summation of DRO and Motor Oil values

J = reported result was flagged "J" because it is an estimated value.

T = reported result was flagged "T" because the result is less than the reporting limit but greater than or equal to the method detection limit and the concentration is an approximate value.

B = reported result was flagged "B" because the compound was found in the blank and sample.

Y = reported result was flagged "Y" because the result is due primarily to a mixture of jet fuel/gasoline range product, weathered diesel fuel, and a mineral/transformer oil range product.

C = substance's toxicity as a carcinogen.

NC = substance's toxicity as a non-carcinogen.

- = No established value.

Notes:

mS = milli Siemens

C = celcius

mg/L = milligrams per Liter

ORP = oxidation reduction potential

mV = millivolts

NTU = Nephelometric Turbidity Units

- = Not sampled. Well purged dry.

* = instrument readings were unstable and as a result recorded values are flagged as estimates.

Narrative

Receipt

The samples were received on 11/16/2013 10:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.8° C.

Except:

The following samples MW-1 (580-41314-1), MW-2 (580-41314-2), MW-3 (580-41314-3), MW-4 (580-41314-4), MW-5 (580-41314-5) were received outside of holding time for Nitrate analysis. All samples were logged in and analysis has been assigned.

Manganese was not listed on the Chain-of-Custody (COC), but was requested by the client when the bottle order was received. It has been added to the log-in.

GC/MS VOA - Method 8260B

In analytical batch 149922 and 150048, the following sample MW-3 (580-41314-3) required a dilution in which the analysis was performed outside of the analytical holding time. The target analytes 1,2-Dichloroethane, Benzene, Ethylbenzene, m-Xylene & p-Xylene, Naphthalene, o-Xylene and Toluene were qualified "E" in the initial in hold analysis. The 50X dilution in analytical batch 150048 was analyzed two minutes outside the analytical holding time. Therefore the in hold analysis was reported as the primary analysis for compounds qualified "E" and the outside holding time dilution results are reported as secondary data and are qualified "H".

The following sample MW-3 (580-41314-3) was diluted to bring the concentration of target analytes within the calibration range. Elevated reporting limits (RLs) are provided.

In analytical batch 150048, the associated samples DW (580-41314-6), MW-4 (580-41314-4), MW-5 (580-41314-5) were reanalyzed due to the likelihood of carryover from a previously analyzed heavily contaminated sample in the original analysis.

GC/MS VOA - Method NWTPH-Gx

The continuing calibration verification (CCV) associated with analytical batch 149705 recovered above the upper control limit for GRO. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been qualified "^" and reported. The following samples are impacted: (CCB 580-149705/28), (CCV 580-149705/27), DWD (580-41314-7).

The continuing calibration blank (CCB 580-149705/28) in analytical batch 149705 contained GRO analyte above the reporting limit (RL). The sample DWD (580-41314-7) associated with this blank did not contain the target compound; therefore, re-extraction and/or re-analysis of samples were not performed. The data have been qualified "^" and reported.

No other analytical or quality issues were noted.

GC Semi VOA - Method NWTPH-Dx

In analytical batch 150077, for the following samples MW-2 (580-41314-2), MW-3 (580-41314-3) from preparation batch 149998, the results in the #2 Diesel Fuel (C10-C24) and Motor Oil (>C24-C36) ranges are due to what most closely resembles a complex mixture of a gasoline/kerosene range product, heavily weathered/degraded diesel fuel, a mineral/transformer oil range product, motor oil and biogenic interference.

The affected analyte ranges have been qualified "Y" and reported.

In analytical batch 150077, for the following sample MW-4 (580-41314-4) from preparation batch 149998, the results in the #2 Diesel Fuel (C10-C24) range are due to what most closely resembles a complex mixture of weathered/degraded diesel fuel, a mineral/transformer oil range product, motor oil and biogenic interference.

The affected analyte range has been qualified "Y" and reported.

No other analytical or quality issues were noted.

Metals

No analytical or quality issues were noted.

General Chemistry - Method 300.0

Case Narrative

Client: TerraGraphics Inc
Project/Site: Pet Health Clinic (13073-2)

TestAmerica Job ID: 580-41314-1

Job ID: 580-41314-1 (Continued)

Laboratory: TestAmerica Seattle (Continued)

The following samples MW-1 (580-41314-1), MW-2 (580-41314-2), MW-3 (580-41314-3), MW-4 (580-41314-4), MW-5 (580-41314-5) were received outside of holding time for Nitrate. The data has been qualified "H" and reported.

No other analytical or quality issues were noted.

Organic Prep

No analytical or quality issues were noted.

Definitions/Glossary

Client: TerraGraphics Inc
Project/Site: Pet Health Clinic (13073-2)

TestAmerica Job ID: 580-41314-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
E	Result exceeded calibration range.
H	Sample was prepped or analyzed beyond the specified holding time

GC Semi VOA

Qualifier	Qualifier Description
Y	The chromatographic response resembles a typical fuel pattern.

General Chemistry

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	False	Refer to Job Narrative for details.
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	N/A	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

Narrative

Receipt

The samples were received on 11/16/2013 10:15 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.4° C.

Except:

The following samples BH-10 6' (580-41301-4), BH-11 5' (580-41301-5), BH-12 6' (580-41301-6), BH-13 6' (580-41301-7), BH-14 6' (580-41301-8), BH-14D 6' (580-41301-9), BH-7 8' (580-41301-1), BH-8 6' (580-41301-2), BH-9 5' (580-41301-3), Trip Blank (580-41301-10) were received outside of holding time. The stir bar vials were received out of hold. Stir bars were placed in the freezer upon receipt. Containers have been logged in and assigned analysis.

GC/MS VOA - Method 8260B

In analytical batch 149634, the following samples BH-7 8' (580-41301-1), BH-8 6' (580-41301-2), BH-9 5' (580-41301-3), BH-10 6' (580-41301-4), BH-11 5' (580-41301-5), BH-12 6' (580-41301-6), BH-13 6' (580-41301-7) and Trip Blank (580-41301-10) were received outside the 48 hour holding time. The data have been qualified "H" and reported.

The following samples BH-14 6' (580-41301-8), BH-14D 6' (580-41301-9) were diluted due to the nature of the sample matrix. Elevated reporting limits (RLs) are provided.

In analytical batch 149634 the trip blank (580-41301-10) associated with these samples contained a detection above the reporting limit (RL), for m-Xylene & p-Xylene and Ethylbenzene.

The %RPD of the laboratory control sample (LCS) and laboratory control standard duplicate (LCSD) for preparation batch 149751 recovered outside control limits for the following analytes: 2-methyl-2-Propanol. Individual recoveries within limits. The data have been qualified "*" and reported.

The laboratory control sample dup(LCSD) for batch 149751 recovered outside control limits for the following analytes: Bromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported. The data have been qualified "*" and reported.

The continuing calibration verification (CCV) for 2-Methyl-2-Propanol (TBA) associated with analytical batch 149751 recovered above the upper control limit. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been qualified "^" and reported.

The continuing calibration verification (CCV) for Bromomethane associated with analytical batch 149634 recovered above the upper control limit. The NaN result is due to response beyond the calibration limit of the instrument. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been qualified "^" and reported.

GC/MS VOA - Method 5035:

The following samples BH-7 8' (580-41301-1) and BH-8 6' (580-41301-2) were received without a recorded tare weight. After analysis, the sample container was emptied, cleaned, and refilled with 10 mL of MeOH to record the tare weight for calculation of the final results.

No other analytical or quality issues were noted.

GC Semi VOA - Method NWTPH-Dx

In analytical batch 149805, for the following samples BH-10 6' (580-41301-4), BH-12 6' (580-41301-6) from preparation batch 149733, the results in the #2 Diesel Fuel (C10-C24) range are due primarily to heavily degraded diesel fuel.

In analytical batch 149805, for the following samples BH-14 6' (580-41301-8), BH-14D 6' (580-41301-9) from preparation batch 149733, the results in the #2 Diesel Fuel (C10-C24) range are due to a complex mixture of a gasoline/kerosene range product and heavily degraded diesel fuel.

The affected analyte range has been qualified "Y" and reported.

No other analytical or quality issues were noted.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
H	Sample was prepped or analyzed beyond the specified holding time
^	ICV,CCV,ICB,CCB, ISA, ISB, CRI, CRA, DLCK or MRL standard: Instrument related QC exceeds the control limits.
*	LCS or LCSD exceeds the control limits
*	RPD of the LCS and LCSD exceeds the control limits

GC Semi VOA

Qualifier	Qualifier Description
Y	The chromatographic response resembles a typical fuel pattern.

Glossary

Abbreviation

These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Creator: McDaniel, Ronald T

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	True	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	False	Refer to Job Narrative for details.
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	N/A	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
